| INSERT_CLIP_TRIM_TAIL Procedure | Inserts numerical trimming definitions in a transformation definition table |
| INSERT_CLIP_WINSOR_TAIL Procedure | Inserts numerical winsorizing definitions in a transformation definition table |
| INSERT_MISS_CAT_MODE Procedure | Inserts categorical missing value treatment definitions in a transformation definition table |
| INSERT_MISS_NUM_MEAN Procedure | Inserts numerical missing value treatment definitions in a transformation definition table |
| INSERT_NORM_LIN_MINMAX Procedure | Inserts linear min-max normalization definitions in a transformation definition table |
| INSERT_NORM_LIN_SCALE Procedure | Inserts linear scale normalization definitions in a transformation definition table |
| INSERT_NORM_LIN_ZSCORE Procedure | Inserts linear zscore normalization definitions in a transformation definition table |
| SET_EXPRESSION Procedure | Adds a VARCHAR2 chunk to an expression |
| SET_TRANSFORM Procedure | Adds a transformation record to a transformation list |
| STACK_BIN_CAT Procedure | Adds a categorical binning expression to a transformation list |
| STACK_BIN_NUM Procedure | Adds a numerical binning expression to a transformation list |
| STACK_CLIP Procedure | Adds a clipping expression to a transformation list |
| STACK_COL_REM Procedure | Adds a column removal expression to a transformation list |
| STACK_MISS_CAT Procedure | Adds a categorical missing value treatment expression to a transformation list |
| STACK_MISS_NUM Procedure | Adds a numerical missing value treatment expression to a transformation list |
| STACK_NORM_LIN Procedure | Adds a linear normalization expression to a transformation list |
| XFORM_BIN_CAT Procedure | Creates a view of the data table with categorical binning transformations |

Table 53-3 (Cont.) DBMS_DATA_MINING_TRANSFORM Package Subprograms

| Subprogram | Purpose |
|--|---|
| XFORM_BIN_NUM Procedure | Creates a view of the data table with numerical binning transformations |
| XFORM_CLIP Procedure | Creates a view of the data table with clipping transformations |
| XFORM_COL_REM Procedure | Creates a view of the data table with column removal transformations |
| XFORM_EXPR_NUM Procedure | Creates a view of the data table with the specified numeric transformations |
| XFORM_EXPR_STR Procedure | Creates a view of the data table with the specified categorical transformations |
| XFORM_MISS_CAT Procedure | Creates a view of the data table with categorical missing value treatment |
| XFORM_MISS_NUM Procedure | Creates a view of the data table with numerical missing value treatment |
| XFORM_NORM_LIN Procedure | Creates a view of the data table with linear normalization transformations |
| XFORM_STACK Procedure | Creates a view of the transformation list |

53.6.1 CREATE_BIN_CAT Procedure

This procedure creates a transformation definition table for categorical binning.

The columns are described in the following table.

Table 53-4 Columns in a Transformation Definition Table for Categorical Binning

| Name | Datatype | Description |
|------|-----------------|--|
| col | VARCHAR2 (30) | Name of a column of categorical data. If the column is not nested, the column name is also the attribute name. For information about attribute names, see <i>Oracle Machine Learning for SQL User's Guide</i> . |
| att | VARCHAR2 (4000) | The attribute subname if <i>col</i> is a nested column. If <i>col</i> is nested, the attribute name is <i>col.att</i> . If <i>col</i> is not nested, <i>att</i> is null. |
| val | VARCHAR2 (4000) | Values of the attribute |
| bin | VARCHAR2 (4000) | Bin assignments for the values |

Syntax

```
DBMS_DATA_MINING_TRANSFORM.CREATE_BIN_CAT (
  bin_table_name  IN VARCHAR2,
  bin_schema_name IN VARCHAR2 DEFAULT NULL );
```

Parameters

Table 53-5 CREATE_BIN_CAT Procedure Parameters

| Parameter | Description |
|------------------------------|--|
| <code>bin_table_name</code> | Name of the transformation definition table to be created |
| <code>bin_schema_name</code> | Schema of <code>bin_table_name</code> . If no schema is specified, the current schema is used. |

Usage Notes

1. See *Oracle Machine Learning for SQL User's Guide* for details about categorical data.
2. See "Nested Data Transformations" for information about transformation definition tables and nested data.
3. You can use the following procedures to populate the transformation definition table:
 - [INSERT_BIN_CAT_FREQ Procedure](#) — frequency-based binning
 - [INSERT_BIN_SUPER Procedure](#) — supervised binning

See Also:

"Binning" in [DBMS_DATA_MINING_TRANSFORM Overview](#)
"Operational Notes"

Examples

The following statement creates a table called `bin_cat_xtbl` in the current schema. The table has columns that can be populated with bin assignments for categorical attributes.

```
BEGIN
    DBMS_DATA_MINING_TRANSFORM.CREATE_BIN_CAT('bin_cat_xtbl');
END;
/
DESCRIBE bin_cat_xtbl
```

| Name | Null? | Type |
|------|-------|----------------|
| COL | | VARCHAR2(30) |
| ATT | | VARCHAR2(4000) |
| VAL | | VARCHAR2(4000) |
| BIN | | VARCHAR2(4000) |

53.6.2 CREATE_BIN_NUM Procedure

This procedure creates a transformation definition table for numerical binning.

The columns are described in the following table.

Table 53-6 Columns in a Transformation Definition Table for Numerical Binning

| Name | Datatype | Description |
|------|----------------|--|
| col | VARCHAR2(30) | Name of a column of numerical data. If the column is not nested, the column name is also the attribute name. For information about attribute names, see <i>Oracle Machine Learning for SQL User's Guide</i> . |
| att | VARCHAR2(4000) | The attribute subname if <i>col</i> is a nested column. If <i>col</i> is nested, the attribute name is <i>col.att</i> . If <i>col</i> is not nested, <i>att</i> is null. |
| val | NUMBER | Values of the attribute |
| bin | VARCHAR2(4000) | Bin assignments for the values |

Syntax

```
DBMS_DATA_MINING_TRANSFORM.CREATE_BIN_NUM (
    bin_table_name    IN VARCHAR2,
    bin_schema_name  IN VARCHAR2 DEFAULT NULL );
```

Parameters

Table 53-7 CREATE_BIN_NUM Procedure Parameters

| Parameter | Description |
|-----------------|--|
| bin_table_name | Name of the transformation definition table to be created |
| bin_schema_name | Schema of <i>bin_table_name</i> . If no schema is specified, the current schema is used. |

Usage Notes

1. See *Oracle Machine Learning for SQL User's Guide* for details about numerical data.
2. See "[Nested Data Transformations](#)" for information about transformation definition tables and nested data.
3. You can use the following procedures to populate the transformation definition table:
 - [INSERT_AUTOBIN_NUM_EQWIDTH Procedure](#) — automatic equi-width binning
 - [INSERT_BIN_NUM_EQWIDTH Procedure](#) — user-specified equi-width binning
 - [INSERT_BIN_NUM_QTILE Procedure](#) — quantile binning
 - [INSERT_BIN_SUPER Procedure](#) — supervised binning

 **See Also:**

"Binning" in [DBMS_DATA_MINING_TRANSFORM Overview](#)
"Operational Notes"

Examples

The following statement creates a table called `bin_num_xtbl` in the current schema. The table has columns that can be populated with bin assignments for numerical attributes.

```
BEGIN
  DBMS_DATA_MINING_TRANSFORM.CREATE_BIN_NUM('bin_num_xtbl');
END;
/

DESCRIBE bin_num_xtbl
Name                                         Null?    Type
-----
COL                                         VARCHAR2(30)
ATT                                         VARCHAR2(4000)
VAL                                         NUMBER
BIN                                         VARCHAR2(4000)
```

53.6.3 CREATE_CLIP Procedure

This procedure creates a transformation definition table for clipping or winsorizing to minimize the effect of outliers.

The columns are described in the following table.

Table 53-8 Columns in a Transformation Definition Table for Clipping or Winsorizing

| Name | Datatype | Description |
|-------------------|-----------------------------|--|
| <code>col</code> | <code>VARCHAR2(30)</code> | Name of a column of numerical data. If the column is not nested, the column name is also the attribute name. For information about attribute names, see <i>Oracle Machine Learning for SQL User's Guide</i> . |
| <code>att</code> | <code>VARCHAR2(4000)</code> | The attribute subname if <code>col</code> is a nested column of <code>DM_NESTED_NUMERICALS</code> . If <code>col</code> is nested, the attribute name is <code>col.att</code> . If <code>col</code> is not nested, <code>att</code> is null. |
| <code>lcut</code> | <code>NUMBER</code> | The lowest typical value for the attribute. If the attribute values were plotted on an <i>xy</i> axis, <code>lcut</code> would be the left-most boundary of the range of values considered typical for this attribute. Any values to the left of <code>lcut</code> are outliers. |
| <code>lval</code> | <code>NUMBER</code> | Value assigned to an outlier to the left of <code>lcut</code> |

Table 53-8 (Cont.) Columns in a Transformation Definition Table for Clipping or Winsorizing

| Name | Datatype | Description |
|-------------------|----------|--|
| <code>rcut</code> | NUMBER | The highest typical value for the attribute If the attribute values were plotted on an <i>xy</i> axis, <i>rcut</i> would be the right-most boundary of the range of values considered typical for this attribute. Any values to the right of <i>rcut</i> are outliers. |
| <code>rval</code> | NUMBER | Value assigned to an outlier to the right of <i>rcut</i> |

Syntax

```
DBMS_DATA_MINING_TRANSFORM.CREATE_CLIP (
    clip_table_name    IN VARCHAR2,
    clip_schema_name  IN VARCHAR2 DEFAULT NULL );
```

Parameters

Table 53-9 CREATE_CLIP Procedure Parameters

| Parameter | Description |
|-------------------------------|---|
| <code>clip_table_name</code> | Name of the transformation definition table to be created |
| <code>clip_schema_name</code> | Schema of <i>clip_table_name</i> . If no schema is specified, the current schema is used. |

Usage Notes

1. See *Oracle Machine Learning for SQL User's Guide* for details about numerical data.
2. See "[Nested Data Transformations](#)" for information about transformation definition tables and nested data.
3. You can use the following procedures to populate the transformation definition table:
 - [INSERT_CLIP_TRIM_TAIL Procedure](#) — replaces outliers with nulls
 - [INSERT_CLIP_WINSOR_TAIL Procedure](#) — replaces outliers with an average value

See Also:

"Outlier Treatment" in [DBMS_DATA_MINING_TRANSFORM Overview](#)
"Operational Notes"

Examples

The following statement creates a table called `clip_xtbl` in the current schema. The table has columns that can be populated with clipping instructions for numerical attributes.

```
BEGIN
  DBMS_DATA_MINING_TRANSFORM.CREATE_CLIP('clip_xtbl');
END;
/

DESCRIBE clip_xtbl
Name                                         Null?    Type
-----
COL                                         VARCHAR2(30)
ATT                                         VARCHAR2(4000)
LCUT                                        NUMBER
LVAL                                        NUMBER
RCUT                                        NUMBER
RVAL                                        NUMBER
```

53.6.4 CREATE_COL_REM Procedure

This procedure creates a transformation definition table for removing columns from the data table.

The columns are described in the following table.

Table 53-10 Columns in a Transformation Definition Table for Column Removal

| Name | Datatype | Description |
|------------------|-----------------------------|---|
| <code>col</code> | <code>VARCHAR2(30)</code> | Name of a column of data. If the column is not nested, the column name is also the attribute name. For information about attribute names, see <i>Oracle Machine Learning for SQL User's Guide</i> . |
| <code>att</code> | <code>VARCHAR2(4000)</code> | The attribute subname if <code>col</code> is nested (<code>DM_NESTED_NUMERICALS</code> or <code>DM_NESTED_CATEGORICALS</code>). If <code>col</code> is nested, the attribute name is <code>col.att</code> . If <code>col</code> is not nested, <code>att</code> is null. |

Syntax

```
DBMS_DATA_MINING_TRANSFORM.CREATE_COL_REM (
  rem_table_name          VARCHAR2,
  rem_schema_name        VARCHAR2 DEFAULT NULL );
```

Parameters

Table 53-11 CREATE_COL_REM Procedure Parameters

| Parameter | Description |
|------------------------------|--|
| <code>rem_table_name</code> | Name of the transformation definition table to be created |
| <code>rem_schema_name</code> | Schema of <code>rem_table_name</code> . If no schema is specified, the current schema is used. |

Usage Notes

1. See "[Nested Data Transformations](#)" for information about transformation definition tables and nested data.
2. See "[Operational Notes](#)".

Examples

The following statement creates a table called `rem_att_xtbl` in the current schema. The table has columns that can be populated with the names of attributes to exclude from the data to be mined.

```
BEGIN
    DBMS_DATA_MINING_TRANSFORM.CREATE_COL_REM ('rem_att_xtbl');
END;
/
DESCRIBE rem_att_xtbl
Name                                                    Null?    Type
-----
COL                                                    VARCHAR2(30)
ATT                                                    VARCHAR2(4000)
```

53.6.5 CREATE_MISS_CAT Procedure

This procedure creates a transformation definition table for replacing categorical missing values.

The columns are described in the following table.

Table 53-12 Columns in a Transformation Definition Table for Categorical Missing Value Treatment

| Name | Datatype | Description |
|------------------|-----------------------------|---|
| <code>col</code> | <code>VARCHAR2(30)</code> | Name of a column of categorical data. If the column is not nested, the column name is also the attribute name. For information about attribute names, see <i>Oracle Machine Learning for SQL User's Guide</i> . |
| <code>att</code> | <code>VARCHAR2(4000)</code> | The attribute subname if <code>col</code> is a nested column of <code>DM_NESTED_CATEGORICALS</code> . If <code>col</code> is nested, the attribute name is <code>col.att</code> . If <code>col</code> is not nested, <code>att</code> is null. |
| <code>val</code> | <code>VARCHAR2(4000)</code> | Replacement for missing values in the attribute |

Syntax

```
DBMS_DATA_MINING_TRANSFORM.CREATE_MISS_CAT (
    miss_table_name      IN VARCHAR2,
    miss_schema_name    IN VARCHAR2 DEFAULT NULL );
```

Parameters

Table 53-13 CREATE_MISS_CAT Procedure Parameters

| Parameter | Description |
|-------------------------------|---|
| <code>miss_table_name</code> | Name of the transformation definition table to be created |
| <code>miss_schema_name</code> | Schema of <code>miss_table_name</code> . If no schema is specified, the current schema is used. |

Usage Notes

1. See *Oracle Machine Learning for SQL User's Guide* for details about categorical data.
2. See "[Nested Data Transformations](#)" for information about transformation definition tables and nested data.
3. You can use the [INSERT_MISS_CAT_MODE Procedure](#) to populate the transformation definition table.

See Also:

"Missing Value Treatment" in [DBMS_DATA_MINING_TRANSFORM Overview](#)
 "Operational Notes"

Examples

The following statement creates a table called `miss_cat_xtbl` in the current schema. The table has columns that can be populated with values for missing data in categorical attributes.

```
BEGIN
    DBMS_DATA_MINING_TRANSFORM.CREATE_MISS_CAT('miss_cat_xtbl');
END;
/

DESCRIBE miss_cat_xtbl
Name                                     Null?    Type
-----
COL                                       VARCHA2 (30)
ATT                                       VARCHA2 (4000)
VAL                                       VARCHA2 (4000)
```

53.6.6 CREATE_MISS_NUM Procedure

This procedure creates a transformation definition table for replacing numerical missing values.

The columns are described in [Table 53-14](#).

Table 53-14 Columns in a Transformation Definition Table for Numerical Missing Value Treatment

| Name | Datatype | Description |
|------|-----------------|--|
| col | VARCHAR2 (30) | Name of a column of numerical data. If the column is not nested, the column name is also the attribute name. For information about attribute names, see <i>Oracle Machine Learning for SQL User's Guide</i> . |
| att | VARCHAR2 (4000) | The attribute subname if <i>col</i> is a nested column of DM_NESTED_NUMERICALS. If <i>col</i> is nested, the attribute name is <i>col.att</i> . If <i>col</i> is not nested, <i>att</i> is null. |
| val | NUMBER | Replacement for missing values in the attribute |

Syntax

```
DBMS_DATA_MINING_TRANSFORM.CREATE_MISS_NUM (
    miss_table_name      IN VARCHAR2,
    miss_schema_name    IN VARCHAR2 DEFAULT NULL );
```

Parameters

Table 53-15 CREATE_MISS_NUM Procedure Parameters

| Parameter | Description |
|------------------|---|
| miss_table_name | Name of the transformation definition table to be created |
| miss_schema_name | Schema of <i>miss_table_name</i> . If no schema is specified, the current schema is used. |

Usage Notes

1. See *Oracle Machine Learning for SQL User's Guide* for details about numerical data.
2. See "[Nested Data Transformations](#)" for information about transformation definition tables and nested data.
3. You can use the [INSERT_MISS_NUM_MEAN Procedure](#) to populate the transformation definition table.

See Also:

"Missing Value Treatment" in [DBMS_DATA_MINING_TRANSFORM Overview](#)

"Operational Notes"

Example

The following statement creates a table called `miss_num_xtbl` in the current schema. The table has columns that can be populated with values for missing data in numerical attributes.

```
BEGIN
    DBMS_DATA_MINING_TRANSFORM.CREATE_MISS_NUM('miss_num_xtbl');
END;
/
```

```
DESCRIBE miss_num_xtbl
Name                                     Null?    Type
-----
COL                                     V        VARCHAR2(30)
ATT                                     V        VARCHAR2(4000)
VAL                                     V        NUMBER
```

53.6.7 CREATE_NORM_LIN Procedure

This procedure creates a transformation definition table for linear normalization.

The columns are described in [Table 53-16](#).

Table 53-16 Columns in a Transformation Definition Table for Linear Normalization

| Name | Datatype | Description |
|--------------------|-----------------------------|---|
| <code>col</code> | <code>VARCHAR2(30)</code> | Name of a column of numerical data. If the column is not nested, the column name is also the attribute name. For information about attribute names, see <i>Oracle Machine Learning for SQL User's Guide</i> . |
| <code>att</code> | <code>VARCHAR2(4000)</code> | The attribute subname if <code>col</code> is a nested column of <code>DM_NESTED_NUMERICALS</code> . If <code>col</code> is nested, the attribute name is <code>col.att</code> . If <code>col</code> is not nested, <code>att</code> is null. |
| <code>shift</code> | <code>NUMBER</code> | A constant to subtract from the attribute values |
| <code>scale</code> | <code>NUMBER</code> | A constant by which to divide the shifted values |

Syntax

```
DBMS_DATA_MINING_TRANSFORM.CREATE_NORM_LIN (
    norm_table_name      IN VARCHAR2,
    norm_schema_name    IN VARCHAR2 DEFAULT NULL );
```

Parameters

Table 53-17 CREATE_NORM_LIN Procedure Parameters

| Parameter | Description |
|-------------------------------|---|
| <code>norm_table_name</code> | Name of the transformation definition table to be created |
| <code>norm_schema_name</code> | Schema of <code>norm_table_name</code> . If no schema is specified, the current schema is used. |

Usage Notes

1. See *Oracle Machine Learning for SQL User's Guide* for details about numerical data.
2. See "[Nested Data Transformations](#)" for information about transformation definition tables and nested data.
3. You can use the following procedures to populate the transformation definition table:
 - [INSERT_NORM_LIN_MINMAX Procedure](#) — Uses linear min-max normalization
 - [INSERT_NORM_LIN_SCALE Procedure](#) — Uses linear scale normalization
 - [INSERT_NORM_LIN_ZSCORE Procedure](#) — Uses linear zscore normalization

See Also:

"Linear Normalization" in [DBMS_DATA_MINING_TRANSFORM Overview](#)

"Operational Notes"

Examples

The following statement creates a table called `norm_xtbl` in the current schema. The table has columns that can be populated with shift and scale values for normalizing numerical attributes.

```
BEGIN
  DBMS_DATA_MINING_TRANSFORM.CREATE_NORM_LIN('norm_xtbl');
END;
/
```

```
DESCRIBE norm_xtbl
```

| Name | Null? | Type |
|-------|-------|-----------------|
| COL | | VARCHAR2 (30) |
| ATT | | VARCHAR2 (4000) |
| SHIFT | | NUMBER |
| SCALE | | NUMBER |

53.6.8 DESCRIBE_STACK Procedure

This procedure describes the columns of the data table after a list of transformations has been applied.

Only the columns that are specified in the transformation list are transformed. The remaining columns in the data table are included in the output without changes.

To create a view of the data table after the transformations have been applied, use the [XFORM_STACK Procedure](#).

Syntax

```
DBMS_DATA_MINING_TRANSFORM.DESCRIBE_STACK (
    xform_list          IN  TRANSFORM_LIST,
    data_table_name    IN  VARCHAR2,
    describe_list      OUT DESCRIBE_LIST,
    data_schema_name   IN  VARCHAR2 DEFAULT NULL);
```

Parameters

Table 53-18 DESCRIBE_STACK Procedure Parameters

| Parameter | Description |
|-------------------------------|---|
| <code>xform_list</code> | A list of transformations. See Table 53-1 for a description of the <code>TRANSFORM_LIST</code> object type. |
| <code>data_table_name</code> | Name of the table containing the data to be transformed |
| <code>describe_list</code> | Descriptions of the columns in the data table after the transformations specified in <code>xform_list</code> have been applied. See Table 53-1 for a description of the <code>DESCRIBE_LIST</code> object type. |
| <code>data_schema_name</code> | Schema of <code>data_table_name</code> . If no schema is specified, the current schema is used. |

Usage Notes

See "[Operational Notes](#)" for information about transformation lists and embedded transformations.

Examples

This example shows the column name and datatype, the column name length, and the column maximum length for the view `oml_user.cust_info` after the transformation list has been applied. All the transformations are user-specified. The results of `DESCRIBE_STACK` do not include one of the columns in the original table, because the `SET_TRANSFORM` procedure sets that column to `NULL`.

```
CREATE OR REPLACE VIEW cust_info AS
    SELECT a.cust_id, c.country_id, c.cust_year_of_birth,
    CAST(COLLECT(DM_Nested_Numerical(
        b.prod_name, 1))
    AS DM_Nested_Numericals) custprods
    FROM sh.sales a, sh.products b, sh.customers c
    WHERE a.prod_id = b.prod_id AND
        a.cust_id=c.cust_id and
        a.cust_id between 100001 AND 105000
    GROUP BY a.cust_id, country_id, cust_year_of_birth;
```

```
describe cust_info
Name                                                    Null?    Type
-----
CUST_ID                                                NOT NULL NUMBER
COUNTRY_ID                                             NOT NULL NUMBER
CUST_YEAR_OF_BIRTH                                     NOT NULL NUMBER(4)
CUSTPRODS                                             SYS.DM_NESTED_NUMERICALS
```

```
DECLARE
    cust_stack    dbms_data_mining_transform.TRANSFORM_LIST;
```

```

cust_cols    dbms_data_mining_transform.DESCRIBE_LIST;
BEGIN

53.6.9 GET_EXPRESSION Function

This function returns a row from a VARCHAR2 array that stores a transformation expression. The array is built by calls to the SET_EXPRESSION Procedure.

The array can be used for specifying SQL expressions that are too long to be used with the SET_TRANSFORM Procedure.

Syntax

```

DBMS_DATA_MINING_TRANSFORM.GET_EXPRESSION (
expression          IN EXPRESSION_REC,
chunk_num           IN PLS_INTEGER DEFAULT NULL);
RETURN VARCHAR2;

```

Parameters

Table 53-19 GET_EXPRESSION Function Parameters

| Parameter | Description |
|------------|---|
| expression | An expression record (<code>EXPRESSION_REC</code>) that specifies a transformation expression or a reverse transformation expression for an attribute. Each expression record includes a <code>VARCHAR2</code> array and index fields for specifying upper and lower boundaries within the array. There are two <code>EXPRESSION_REC</code> fields within a transformation record (<code>TRANSFORM_REC</code>): one for the transformation expression; the other for the reverse transformation expression. See Table 53-1 for a description of the <code>EXPRESSION_REC</code> type. |
| chunk | A <code>VARCHAR2</code> chunk (row) to be appended to <i>expression</i> . |

Usage Notes

1. Chunk numbering starts with one. For chunks outside of the range, the return value is null. When a chunk number is null the whole expression is returned as a string. If the expression is too big, a `VALUE_ERROR` is raised.
2. See "[About Transformation Lists](#)".
3. See "[Operational Notes](#)".

Examples

See the example for the [SET_EXPRESSION Procedure](#).

Related Topics

- [SET_EXPRESSION Procedure](#)
This procedure appends a row to a `VARCHAR2` array that stores a SQL expression.
- [SET_TRANSFORM Procedure](#)
This procedure appends the transformation instructions for an attribute to a transformation list.

53.6.10 INSERT_AUTOBIN_NUM_EQWIDTH Procedure

This procedure performs numerical binning and inserts the transformation definitions in a transformation definition table. The procedure identifies the minimum and maximum values and computes the bin boundaries at equal intervals.

`INSERT_AUTOBIN_NUM_EQWIDTH` computes the number of bins separately for each column. If you want to use equi-width binning with the same number of bins for each column, use the [INSERT_BIN_NUM_EQWIDTH Procedure](#).

`INSERT_AUTOBIN_NUM_EQWIDTH` bins all the `NUMBER` and `FLOAT` columns in the data source unless you specify a list of columns to ignore.

Syntax

```
DBMS_DATA_MINING_TRANSFORM.INSERT_AUTOBIN_NUM_EQWIDTH (
    bin_table_name      IN VARCHAR2,
    data_table_name     IN VARCHAR2,
```

```

bin_num          IN PLS_INTEGER DEFAULT 3,
max_bin_num     IN PLS_INTEGER DEFAULT 100,
exclude_list    IN COLUMN_LIST DEFAULT NULL,
round_num       IN PLS_INTEGER DEFAULT 6,
sample_size     IN PLS_INTEGER DEFAULT 50000,
bin_schema_name IN VARCHAR2 DEFAULT NULL,
data_schema_name IN VARCHAR2 DEFAULT NULL,
rem_table_name  IN VARCHAR2 DEFAULT NULL,
rem_schema_name IN VARCHAR2 DEFAULT NULL);

```

Parameters

Table 53-20 INSERT_AUTOBIN_NUM_EQWIDTH Procedure Parameters

| Parameter | Description |
|-----------------|---|
| bin_table_name | <p>Name of the transformation definition table for numerical binning. You can use the CREATE_BIN_NUM Procedure to create the definition table. The following columns are required:</p> <pre> COL VARCHAR2(30) VAL NUMBER BIN VARCHAR2(4000) </pre> <p>CREATE_BIN_NUM creates an additional column, ATT, which may be used for specifying nested attributes. This column is not used by INSERT_AUTOBIN_NUM_EQWIDTH.</p> |
| data_table_name | Name of the table containing the data to be transformed |
| bin_num | <p>Minimum number of bins. If <i>bin_num</i> is 0 or NULL, it is ignored. The default value of <i>bin_num</i> is 3.</p> |
| max_bin_num | <p>Maximum number of bins. If <i>max_bin_num</i> is 0 or NULL, it is ignored. The default value of <i>max_bin_num</i> is 100.</p> |
| exclude_list | <p>List of numerical columns to be excluded from the binning process. If you do not specify <i>exclude_list</i>, all numerical columns in the data source are binned.</p> <p>The format of <i>exclude_list</i> is:</p> <pre> dbms_data_mining_transform.COLUMN_LIST('col1','col2', ...'coln') </pre> |
| round_num | <p>Specifies how to round the number in the VAL column of the transformation definition table.</p> <p>When <i>round_num</i> is positive, it specifies the most significant digits to retain. When <i>round_num</i> is negative, it specifies the least significant digits to remove. In both cases, the result is rounded to the specified number of digits. See the Usage Notes for an example.</p> <p>The default value of <i>round_num</i> is 6.</p> |
| sample_size | <p>Size of the data sample. If <i>sample_size</i> is less than the total number of non-NULL values in the column, then <i>sample_size</i> is used instead of the SQL COUNT function in computing the number of bins. If <i>sample_size</i> is 0 or NULL, it is ignored. See the Usage Notes.</p> <p>The default value of <i>sample_size</i> is 50,000.</p> |
| bin_schema_name | Schema of <i>bin_table_name</i> . If no schema is specified, the current schema is used. |

Table 53-20 (Cont.) INSERT_AUTOBIN_NUM_EQWIDTH Procedure Parameters

| Parameter | Description |
|-------------------------------|--|
| <code>data_schema_name</code> | Schema of <code>data_table_name</code> . If no schema is specified, the current schema is used. |
| <code>rem_table_name</code> | Name of a transformation definition table for column removal. The table must have the columns described in "CREATE_COL_REM Procedure". INSERT_AUTOBIN_NUM_EQWIDTH ignores columns with all nulls or only one unique value. If you specify a value for <code>rem_table_name</code> , these columns are removed from the mining data. If you do not specify a value for <code>rem_table_name</code> , these unbinned columns remain in the data. |
| <code>rem_schema_name</code> | Schema of <code>rem_table_name</code> . If no schema is specified, the current schema is used. |

Usage Notes

1. See *Oracle Machine Learning for SQL User's Guide* for details about numerical data.
2. INSERT_AUTOBIN_NUM_EQWIDTH computes the number of bins for a column based on the number of non-null values (COUNT), the maximum (MAX), the minimum (MIN), the standard deviation (STDDEV), and the constant $C=3.49/0.9$:

$$N = \text{floor}(\text{power}(\text{COUNT}, 1/3) * (\text{max} - \text{min}) / (c * \text{dev}))$$

If the `sample_size` parameter is specified, it is used instead of COUNT.

See *Oracle Machine Learning for SQL User's Guide* for information about the COUNT, MAX, MIN, STDDEV, FLOOR, and POWER functions.

3. INSERT_AUTOBIN_NUM_EQWIDTH uses absolute values to compute the number of bins. The sign of the parameters `bin_num`, `max_bin_num`, and `sample_size` has no effect on the result.
4. In computing the number of bins, INSERT_AUTOBIN_NUM_EQWIDTH evaluates the following criteria in the following order:
 - a. The minimum number of bins (`bin_num`)
 - b. The maximum number of bins (`max_bin_num`)
 - c. The maximum number of bins for integer columns, calculated as the number of distinct values in the range $\text{max} - \text{min} + 1$.
5. The `round_num` parameter controls the rounding of column values in the transformation definition table, as follows:

For a value of 308.162:

```

when round_num = 1      result is 300
when round_num = 2      result is 310
when round_num = 3      result is 308
when round_num = 0      result is 308.162
when round_num = -1     result is 308.16
when round_num = -2     result is 308.2
  
```

Examples

In this example, `INSERT_AUTOBIN_NUM_EQWIDTH` computes the bin boundaries for the `cust_year_of_birth` column in `sh.customers` and inserts the transformations in a transformation definition table. The `STACK_BIN_NUM Procedure` creates a transformation list from the contents of the definition table. The `CREATE_MODEL Procedure` embeds the transformation list in a new model called `nb_model`.

The transformation and reverse transformation expressions embedded in `nb_model` are returned by the `GET_MODEL_TRANSFORMATIONS Function`.

```
CREATE OR REPLACE VIEW mining_data AS
  SELECT cust_id, cust_year_of_birth, cust_postal_code
  FROM sh.customers;

```

53.6.11 INSERT_BIN_CAT_FREQ Procedure

This procedure performs categorical binning and inserts the transformation definitions in a transformation definition table. The procedure computes the bin boundaries based on frequency.

`INSERT_BIN_CAT_FREQ` bins all the `CHAR` and `VARCHAR2` columns in the data source unless you specify a list of columns to ignore.

Syntax

```

DBMS_DATA_MINING_TRANSFORM.INSERT_BIN_CAT_FREQ (
    bin_table_name          IN VARCHAR2,
    data_table_name        IN VARCHAR2,
    bin_num                 IN PLS_INTEGER DEFAULT 9,
    exclude_list           IN COLUMN_LIST DEFAULT NULL,
    default_num            IN PLS_INTEGER DEFAULT 2,
    bin_support            IN NUMBER DEFAULT NULL,
    bin_schema_name        IN VARCHAR2 DEFAULT NULL,
    data_schema_name       IN VARCHAR2 DEFAULT NULL);

```

Parameters

Table 53-21 INSERT_BIN_CAT_FREQ Procedure Parameters

| Parameter | Description |
|------------------------------|---|
| <code>bin_table_name</code> | <p>Name of the transformation definition table for categorical binning. You can use the CREATE_BIN_CAT Procedure to create the definition table. The following columns are required:</p> <pre>COL VARCHAR2(30) VAL VARCHAR2(4000) BIN VARCHAR2(4000)</pre> <p><code>CREATE_BIN_CAT</code> creates an additional column, <code>ATT</code>, which may be used for specifying nested attributes. This column is not used by <code>INSERT_BIN_CAT_FREQ</code>.</p> |
| <code>data_table_name</code> | Name of the table containing the data to be transformed |
| <code>bin_num</code> | <p>The number of bins to fill using frequency-based binning. The total number of bins will be <code>bin_num+1</code>. The additional bin is the default bin. Classes that are not assigned to a frequency-based bin will be assigned to the default bin.</p> <p>The default binning order is from highest to lowest: the most frequently occurring class is assigned to the first bin, the second most frequently occurring class is assigned to the second bin, and so on. You can reverse the binning order by specifying a negative number for <code>bin_num</code>. The negative sign causes the binning order to be from lowest to highest.</p> <p>If the total number of distinct values (classes) in the column is less than <code>bin_num</code>, then a separate bin will be created for each value and the default bin will be empty.</p> <p>If you specify <code>NULL</code> or <code>0</code> for <code>bin_num</code>, no binning is performed.</p> <p>The default value of <code>bin_num</code> is 9.</p> |
| <code>exclude_list</code> | <p>List of categorical columns to be excluded from the binning process. If you do not specify <code>exclude_list</code>, all categorical columns in the data source are binned.</p> <p>The format of <code>exclude_list</code> is:</p> <pre>dbms_data_mining_transform.COLUMN_LIST('col1','col2', ...'coln')</pre> |
| <code>default_num</code> | <p>The number of class occurrences (rows of the same class) required for assignment to the default bin</p> <p>By default, <code>default_num</code> is the minimum number of occurrences required for assignment to the default bin. For example, if <code>default_num</code> is 3 and a given class occurs only once, it will not be assigned to the default bin. You can change the occurrence requirement from minimum to maximum by specifying a negative number for <code>default_num</code>. For example, if <code>default_num</code> is -3 and a given class occurs only once, it <i>will</i> be assigned to the default bin, but a class that occurs four or more times will not be included.</p> <p>If you specify <code>NULL</code> or <code>0</code> for <code>default_bin</code>, there are no requirements for assignment to the default bin.</p> <p>The default value of <code>default_num</code> is 2.</p> |

Table 53-21 (Cont.) INSERT_BIN_CAT_FREQ Procedure Parameters

| Parameter | Description |
|-------------------------------|---|
| <code>bin_support</code> | <p>The number of class occurrences (rows of the same class) required for assignment to a frequency-based bin. <code>bin_support</code> is expressed as a fraction of the total number of rows.</p> <p>By default, <code>bin_support</code> is the minimum percentage required for assignment to a frequency-based bin. For example, if there are twenty rows of data and you specify .2 for <code>bin_support</code>, then there must be four or more occurrences of a class (.2*20) in order for it to be assigned to a frequency-based bin. You can change <code>bin_support</code> from a minimum percentage to a maximum percentage by specifying a negative number for <code>bin_support</code>. For example, if there are twenty rows of data and you specify -.2 for <code>bin_support</code>, then there must be four or less occurrences of a class in order for it to be assigned to a frequency-based bin.</p> <p>Classes that occur less than a positive <code>bin_support</code> or more than a negative <code>bin_support</code> will be assigned to the default bin.</p> <p>If you specify NULL or 0 for <code>bin_support</code>, then there is no support requirement for frequency-based binning.</p> <p>The default value of <code>bin_support</code> is NULL.</p> |
| <code>bin_schema_name</code> | Schema of <code>bin_table_name</code> . If no schema is specified, the current schema is used. |
| <code>data_schema_name</code> | Schema of <code>data_table_name</code> . If no schema is specified, the current schema is used. |

Usage Notes

1. See *Oracle Machine Learning for SQL User's Guide* for details about categorical data.
2. If values occur with the same frequency, `INSERT_BIN_CAT_FREQ` assigns them in descending order when binning is from most to least frequent, or in ascending order when binning is from least to most frequent.

Examples

1. In this example, `INSERT_BIN_CAT_FREQ` computes the bin boundaries for the `cust_postal_code` and `cust_city` columns in `sh.customers` and inserts the transformations in a transformation definition table. The [STACK_BIN_CAT Procedure](#) creates a transformation list from the contents of the definition table, and the [CREATE_MODEL Procedure](#) embeds the transformation list in a new model called `nb_model`.

The transformation and reverse transformation expressions embedded in `nb_model` are returned by the [GET_MODEL_TRANSFORMATIONS Function](#).

```
CREATE OR REPLACE VIEW mining_data AS
SELECT cust_id, cust_year_of_birth, cust_postal_code, cust_city
FROM sh.customers;
```

```
DESCRIBE mining_data
```

53.6.12 INSERT_BIN_NUM_EQWIDTH Procedure

This procedure performs numerical binning and inserts the transformation definitions in a transformation definition table. The procedure identifies the minimum and maximum values and computes the bin boundaries at equal intervals.

`INSERT_BIN_NUM_EQWIDTH` computes a specified number of bins (*n*) and assigns $(max-min)/n$ values to each bin. The number of bins is the same for each column. If you want to use equi-width binning, but you want the number of bins to be calculated on a per-column basis, use the [INSERT_AUTOBIN_NUM_EQWIDTH Procedure](#).

INSERT_BIN_NUM_EQWIDTH bins all the NUMBER and FLOAT columns in the data source unless you specify a list of columns to ignore.

Syntax

```
DBMS_DATA_MINING_TRANSFORM.INSERT_BIN_NUM_EQWIDTH (
  bin_table_name      IN VARCHAR2,
  data_table_name     IN VARCHAR2,
  bin_num             IN PLS_INTEGER DEFAULT 10,
  exclude_list       IN COLUMN_LIST DEFAULT NULL,
  round_num          IN PLS_INTEGER DEFAULT 6,
  bin_schema_name    IN VARCHAR2 DEFAULT NULL,
  data_schema_name   IN VARCHAR2 DEFAULT NULL);
```

Parameters

Table 53-22 INSERT_BIN_NUM_EQWIDTH Procedure Parameters

| Parameter | Description |
|------------------|--|
| bin_table_name | Name of the transformation definition table for numerical binning. You can use the CREATE_BIN_NUM Procedure to create the definition table. The following columns are required: COL VARCHAR2 (30) VAL NUMBER BIN VARCHAR2 (4000) CREATE_BIN_NUM creates an additional column, ATT, which may be used for specifying nested attributes. This column is not used by INSERT_BIN_NUM_EQWIDTH. |
| data_table_name | Name of the table containing the data to be transformed |
| bin_num | Number of bins. No binning occurs if <i>bin_num</i> is 0 or NULL. The default number of bins is 10. |
| exclude_list | List of numerical columns to be excluded from the binning process. If you do not specify <i>exclude_list</i> , all numerical columns in the data source are binned. The format of <i>exclude_list</i> is: dbms_data_mining_transform.COLUMN_LIST('col1','col2', ...'coln') |
| round_num | Specifies how to round the number in the VAL column of the transformation definition table. When <i>round_num</i> is positive, it specifies the most significant digits to retain. When <i>round_num</i> is negative, it specifies the least significant digits to remove. In both cases, the result is rounded to the specified number of digits. See the Usage Notes for an example. The default value of <i>round_num</i> is 6. |
| bin_schema_name | Schema of <i>bin_table_name</i> . If no schema is specified, the current schema is used. |
| data_schema_name | Schema of <i>data_table_name</i> . If no schema is specified, the current schema is used. |

Usage Notes

1. See *Oracle Machine Learning for SQL User's Guide* for details about numerical data.
2. The `round_num` parameter controls the rounding of column values in the transformation definition table, as follows:

For a value of 308.162:

```

when round_num = 1      result is 300
when round_num = 2      result is 310
when round_num = 3      result is 308
when round_num = 0      result is 308.162
when round_num = -1     result is 308.16
when round_num = -2     result is 308.2
    
```

3. `INSERT_BIN_NUM_EQWIDTH` ignores columns with all NULL values or only one unique value.

Examples

In this example, `INSERT_BIN_NUM_EQWIDTH` computes the bin boundaries for the `affinity_card` column in `mining_data_build` and inserts the transformations in a transformation definition table. The [STACK_BIN_NUM Procedure](#) creates a transformation list from the contents of the definition table. The [CREATE_MODEL Procedure](#) embeds the transformation list in a new model called `glm_model`.

The transformation and reverse transformation expressions embedded in `glm_model` are returned by the [GET_MODEL_TRANSFORMATIONS Function](#).

```

CREATE OR REPLACE VIEW mining_data AS
    SELECT cust_id, cust_income_level, cust_gender, affinity_card
    FROM mining_data_build;

DESCRIBE mining_data
Name                                Null?    Type
-----
CUST_ID                             NOT NULL NUMBER
CUST_INCOME_LEVEL                   VARCHAR2(30)
CUST_GENDER                          VARCHAR2(1)

53.6.13 INSERT_BIN_NUM_QTILE Procedure

This procedure performs numerical binning and inserts the transformation definitions in a transformation definition table. The procedure calls the SQL `NTILE` function to order the data and divide it equally into the specified number of bins (quantiles).

`INSERT_BIN_NUM_QTILE` bins all the `NUMBER` and `FLOAT` columns in the data source unless you specify a list of columns to ignore.

Syntax

```
DBMS_DATA_MINING_TRANSFORM.INSERT_BIN_NUM_QTILE (
  bin_table_name      IN VARCHAR2,
  data_table_name     IN VARCHAR2,
  bin_num             IN PLS_INTEGER DEFAULT 10,
  exclude_list       IN COLUMN_LIST DEFAULT NULL,
  bin_schema_name    IN VARCHAR2 DEFAULT NULL,
  data_schema_name   IN VARCHAR2 DEFAULT NULL);
```

Parameters

Table 53-23 INSERT_BIN_NUM_QTILE Procedure Parameters

| Parameter | Description |
|-------------------------------|--|
| <code>bin_table_name</code> | Name of the transformation definition table for numerical binning. You can use the CREATE_BIN_NUM Procedure to create the definition table. The following columns are required: <pre>COL VARCHAR2(30) VAL NUMBER BIN VARCHAR2(4000)</pre> <code>CREATE_BIN_NUM</code> creates an additional column, <code>ATT</code> , which may be used for specifying nested attributes. This column is not used by <code>INSERT_BIN_NUM_QTILE</code> . |
| <code>data_table_name</code> | Name of the table containing the data to be transformed |
| <code>bin_num</code> | Number of bins. No binning occurs if <code>bin_num</code> is 0 or <code>NULL</code> . The default number of bins is 10. |
| <code>exclude_list</code> | List of numerical columns to be excluded from the binning process. If you do not specify <code>exclude_list</code> , all numerical columns in the data source are binned. The format of <code>exclude_list</code> is: <pre>dbms_data_mining_transform.COLUMN_LIST('col1','col2', ...'coln')</pre> |
| <code>bin_schema_name</code> | Schema of <code>bin_table_name</code> . If no schema is specified, the current schema is used. |
| <code>data_schema_name</code> | Schema of <code>data_table_name</code> . If no schema is specified, the current schema is used. |

Usage Notes

1. See *Oracle Machine Learning for SQL User's Guide* for details about numerical data.
2. After dividing the data into quantiles, the `NTILE` function distributes any remainder values one for each quantile, starting with the first. See *Oracle Database SQL Language Reference* for details.
3. Columns with all `NULL` values are ignored by `INSERT_BIN_NUM_QTILE`.

Examples

In this example, `INSERT_BIN_NUM_QTILE` computes the bin boundaries for the `cust_year_of_birth` and `cust_credit_limit` columns in `sh.customers` and inserts the transformations in a transformation definition table. The [STACK_BIN_NUM Procedure](#) creates a transformation list from the contents of the definition table.

The SQL expression that computes the transformation is shown in `STACK_VIEW`. The view is for display purposes only; it cannot be used to embed the transformations in a model.

53.6.14 INSERT_BIN_SUPER Procedure

This procedure performs numerical and categorical binning and inserts the transformation definitions in transformation definition tables. The procedure computes bin boundaries based on intrinsic relationships between predictors and a target.

INSERT_BIN_SUPER uses an intelligent binning technique known as **supervised binning**. It builds a single-predictor decision tree and derives the bin boundaries from splits within the tree.

INSERT_BIN_SUPER bins all the VARCHAR2, CHAR, NUMBER, and FLOAT columns in the data source unless you specify a list of columns to ignore.

Syntax

```

DBMS_DATA_MINING_TRANSFORM.INSERT_BIN_SUPER (
  num_table_name      IN VARCHAR2,
  cat_table_name      IN VARCHAR2,
  data_table_name     IN VARCHAR2,
  target_column_name  IN VARCHAR2,
  max_bin_num         IN PLS_INTEGER DEFAULT 1000,
  exclude_list        IN COLUMN_LIST  DEFAULT NULL,
  num_schema_name     IN VARCHAR2     DEFAULT NULL,
  cat_schema_name     IN VARCHAR2     DEFAULT NULL,
  data_schema_name    IN VARCHAR2     DEFAULT NULL,
  rem_table_name      IN VARCHAR2     DEFAULT NULL,
  rem_schema_name     IN VARCHAR2     DEFAULT NULL);

```

Parameters

Table 53-24 INSERT_BIN_SUPER Procedure Parameters

| Parameter | Description | | | | | | |
|--------------------|---|-----|--------------|-----|----------------|-----|----------------|
| num_table_name | <p>Name of the transformation definition table for numerical binning. You can use the CREATE_BIN_NUM Procedure to create the definition table. The following columns are required:</p> <table border="0" style="margin-left: 20px;"> <tr> <td>COL</td> <td>VARCHAR2(30)</td> </tr> <tr> <td>VAL</td> <td>VNUMBER</td> </tr> <tr> <td>BIN</td> <td>VARCHAR2(4000)</td> </tr> </table> <p>CREATE_BIN_NUM creates an additional column, ATT, which may be used for specifying nested attributes. This column is not used by INSERT_BIN_SUPER.</p> | COL | VARCHAR2(30) | VAL | VNUMBER | BIN | VARCHAR2(4000) |
| COL | VARCHAR2(30) | | | | | | |
| VAL | VNUMBER | | | | | | |
| BIN | VARCHAR2(4000) | | | | | | |
| cat_table_name | <p>Name of the transformation definition table for categorical binning. You can use the CREATE_BIN_CAT Procedure to create the definition table. The following columns are required:</p> <table border="0" style="margin-left: 20px;"> <tr> <td>COL</td> <td>VARCHAR2(30)</td> </tr> <tr> <td>VAL</td> <td>VARCHAR2(4000)</td> </tr> <tr> <td>BIN</td> <td>VARCHAR2(4000)</td> </tr> </table> <p>CREATE_BIN_CAT creates an additional column, ATT, which is used for specifying nested attributes. This column is not used by INSERT_BIN_SUPER.</p> | COL | VARCHAR2(30) | VAL | VARCHAR2(4000) | BIN | VARCHAR2(4000) |
| COL | VARCHAR2(30) | | | | | | |
| VAL | VARCHAR2(4000) | | | | | | |
| BIN | VARCHAR2(4000) | | | | | | |
| data_table_name | Name of the table containing the data to be transformed | | | | | | |
| target_column_name | Name of a column to be used as the target for the decision tree models | | | | | | |
| max_bin_num | The maximum number of bins. The default is 1000. | | | | | | |
| exclude_list | <p>List of columns to be excluded from the binning process. If you do not specify <i>exclude_list</i>, all numerical and categorical columns in the data source are binned.</p> <p>The format of <i>exclude_list</i> is:</p> <pre>dbms_data_mining_transform.COLUMN_LIST('col1','col2', ... 'coln')</pre> | | | | | | |
| num_schema_name | Schema of <i>num_table_name</i> . If no schema is specified, the current schema is used. | | | | | | |
| cat_schema_name | Schema of <i>cat_table_name</i> . If no schema is specified, the current schema is used. | | | | | | |
| data_schema_name | Schema of <i>data_table_name</i> . If no schema is specified, the current schema is used. | | | | | | |
| rem_table_name | Name of a column removal definition table. The table must have the columns described in " CREATE_COL_REM Procedure ". You can use CREATE_COL_REM to create the table. See Usage Notes. | | | | | | |
| rem_schema_name | Schema of <i>rem_table_name</i> . If no schema is specified, the current schema is used. | | | | | | |

Usage Notes

1. See *Oracle Machine Learning for SQL User's Guide* for details about numerical and categorical data.
2. Columns that have no significant splits are not binned. You can remove the unbinned columns from the mining data by specifying a column removal definition table. If you do not specify a column removal definition table, the unbinned columns remain in the mining data.
3. See *Oracle Machine Learning for SQL Concepts* to learn more about decision trees in Oracle Machine Learning for SQL.

Examples

In this example, `INSERT_BIN_SUPER` computes the bin boundaries for predictors of `cust_credit_limit` and inserts the transformations in transformation definition tables. One predictor is numerical, the other is categorical. (`INSERT_BIN_SUPER` determines that the `cust_postal_code` column is not a significant predictor.) `STACK` procedures create transformation lists from the contents of the definition tables.

The SQL expressions that compute the transformations are shown in the views `MINING_DATA_STACK_NUM` and `MINING_DATA_STACK_CAT`. The views are for display purposes only; they cannot be used to embed the transformations in a model.

```
CREATE OR REPLACE VIEW mining_data AS
    SELECT cust_id, cust_year_of_birth, cust_marital_status,
           cust_postal_code, cust_credit_limit
    FROM sh.customers;
```

```
DESCRIBE mining_data

53.6.15 INSERT_CLIP_TRIM_TAIL Procedure

This procedure replaces numeric outliers with nulls and inserts the transformation definitions in a transformation definition table.

`INSERT_CLIP_TRIM_TAIL` computes the boundaries of the data based on a specified percentage. It removes the values that fall outside the boundaries (tail values) from the data. If you wish to replace the tail values instead of removing them, use the [INSERT_CLIP_WINSOR_TAIL Procedure](#).

`INSERT_CLIP_TRIM_TAIL` clips all the `NUMBER` and `FLOAT` columns in the data source unless you specify a list of columns to ignore.

Syntax

```

DBMS_DATA_MINING_TRANSFORM.INSERT_CLIP_TRIM_TAIL (
    clip_table_name    IN VARCHAR2,
    data_table_name    IN VARCHAR2,
    tail_frac          IN NUMBER DEFAULT 0.025,
    exclude_list       IN COLUMN_LIST DEFAULT NULL,
    clip_schema_name   IN VARCHAR2 DEFAULT NULL,
    data_schema_name   IN VARCHAR2 DEFAULT NULL);

```

Parameters

Table 53-25 INSERT_CLIP_TRIM_TAIL Procedure Parameters

| Parameter | Description | | | | | | | | | | |
|------------------|---|-----|--------------|------|--------|------|--------|------|--------|------|--------|
| clip_table_name | <p>Name of the transformation definition table for numerical clipping. You can use the CREATE_CLIP Procedure to create the definition table. The following columns are required:</p> <table border="1"> <tbody> <tr> <td>COL</td> <td>VARCHAR2(30)</td> </tr> <tr> <td>LCUT</td> <td>NUMBER</td> </tr> <tr> <td>LVAL</td> <td>NUMBER</td> </tr> <tr> <td>RCUT</td> <td>NUMBER</td> </tr> <tr> <td>RVAL</td> <td>NUMBER</td> </tr> </tbody> </table> <p>CREATE_CLIP creates an additional column, ATT, which may be used for specifying nested attributes. This column is not used by INSERT_CLIP_TRIM_TAIL.</p> | COL | VARCHAR2(30) | LCUT | NUMBER | LVAL | NUMBER | RCUT | NUMBER | RVAL | NUMBER |
| COL | VARCHAR2(30) | | | | | | | | | | |
| LCUT | NUMBER | | | | | | | | | | |
| LVAL | NUMBER | | | | | | | | | | |
| RCUT | NUMBER | | | | | | | | | | |
| RVAL | NUMBER | | | | | | | | | | |
| data_table_name | Name of the table containing the data to be transformed | | | | | | | | | | |
| tail_frac | <p>The percentage of non-null values to be designated as outliers at each end of the data. For example, if <i>tail_frac</i> is .01, then 1% of the data at the low end and 1% of the data at the high end will be treated as outliers.</p> <p>If <i>tail_frac</i> is greater than or equal to .5, no clipping occurs.</p> <p>The default value of <i>tail_frac</i> is 0.025.</p> | | | | | | | | | | |
| exclude_list | <p>List of numerical columns to be excluded from the clipping process. If you do not specify <i>exclude_list</i>, all numerical columns in the data are clipped.</p> <p>The format of <i>exclude_list</i> is:</p> <pre>dbms_data_mining_transform.COLUMN_LIST('col1','col2', ... 'coln')</pre> | | | | | | | | | | |
| clip_schema_name | Schema of <i>clip_table_name</i> . If no schema is specified, the current schema is used. | | | | | | | | | | |
| data_schema_name | Schema of <i>data_table_name</i> . If no schema is specified, the current schema is used. | | | | | | | | | | |

Usage Notes

1. See *Oracle Machine Learning for SQL User's Guide* for details about numerical data.
2. The DBMS_DATA_MINING_TRANSFORM package provides two clipping procedures: INSERT_CLIP_TRIM_TAIL and INSERT_CLIP_WINSOR_TAIL. Both procedures compute the boundaries as follows:
 - Count the number of non-null values, *n*, and sort them in ascending order
 - Calculate the number of outliers, *t*, as $n * tail_frac$
 - Define the lower boundary *lcut* as the value at position $1 + floor(t)$
 - Define the upper boundary *rcut* as the value at position $n - floor(t)$

(The SQL FLOOR function returns the largest integer less than or equal to *t*.)

- All values that are $\leq lcut$ or $\geq rcut$ are designated as outliers.

INSERT_CLIP_TRIM_TAIL replaces the outliers with nulls, effectively removing them from the data.

INSERT_CLIP_WINSOR_TAIL assigns $lcut$ to the low outliers and $rcut$ to the high outliers.

Examples

In this example, INSERT_CLIP_TRIM_TAIL trims 10% of the data in two columns (5% from the high end and 5% from the low end) and inserts the transformations in a transformation definition table. The STACK_CLIP Procedure creates a transformation list from the contents of the definition table.

The SQL expression that computes the trimming is shown in the view MINING_DATA_STACK. The view is for display purposes only; it cannot be used to embed the transformations in a model.

```
CREATE OR REPLACE VIEW mining_data AS
  SELECT cust_id, cust_year_of_birth, cust_credit_limit, cust_city
  FROM sh.customers;

53.6.16 INSERT_CLIP_WINSOR_TAIL Procedure

This procedure replaces numeric outliers with the upper or lower boundary values. It inserts the transformation definitions in a transformation definition table.

INSERT_CLIP_WINSOR_TAIL computes the boundaries of the data based on a specified percentage. It replaces the values that fall outside the boundaries (tail values) with the related boundary value. If you wish to set tail values to null, use the [INSERT_CLIP_TRIM_TAIL Procedure](#).

INSERT_CLIP_WINSOR_TAIL clips all the NUMBER and FLOAT columns in the data source unless you specify a list of columns to ignore.

Syntax

```

DBMS_DATA_MINING_TRANSFORM.INSERT_CLIP_WINSOR_TAIL (
    clip_table_name      IN VARCHAR2,
    data_table_name      IN VARCHAR2,
    tail_frac            IN NUMBER DEFAULT 0.025,
    exclude_list         IN COLUMN_LIST DEFAULT NULL,
    clip_schema_name     IN VARCHAR2 DEFAULT NULL,
    data_schema_name     IN VARCHAR2 DEFAULT NULL);

```

Parameters

Table 53-26 INSERT_CLIP_WINSOR_TAIL Procedure Parameters

| Parameter | Description | | | | | | | | | | |
|-----------------|--|-----|---------------|------|--------|------|--------|------|--------|------|--------|
| clip_table_name | Name of the transformation definition table for numerical clipping. You can use the CREATE_CLIP Procedure to create the definition table. The following columns are required: <table border="0" style="margin-left: 20px;"> <tr> <td>COL</td> <td>VARCHAR2 (30)</td> </tr> <tr> <td>LCUT</td> <td>NUMBER</td> </tr> <tr> <td>LVAL</td> <td>NUMBER</td> </tr> <tr> <td>RCUT</td> <td>NUMBER</td> </tr> <tr> <td>RVAL</td> <td>NUMBER</td> </tr> </table> CREATE_CLIP creates an additional column, ATT, which may be used for specifying nested attributes. This column is not used by INSERT_CLIP_WINSOR_TAIL. | COL | VARCHAR2 (30) | LCUT | NUMBER | LVAL | NUMBER | RCUT | NUMBER | RVAL | NUMBER |
| COL | VARCHAR2 (30) | | | | | | | | | | |
| LCUT | NUMBER | | | | | | | | | | |
| LVAL | NUMBER | | | | | | | | | | |
| RCUT | NUMBER | | | | | | | | | | |
| RVAL | NUMBER | | | | | | | | | | |
| data_table_name | Name of the table containing the data to be transformed | | | | | | | | | | |

Table 53-26 (Cont.) INSERT_CLIP_WINSOR_TAIL Procedure Parameters

| Parameter | Description |
|-------------------------------|--|
| <code>tail_frac</code> | <p>The percentage of non-null values to be designated as outliers at each end of the data. For example, if <code>tail_frac</code> is .01, then 1% of the data at the low end and 1% of the data at the high end will be treated as outliers.</p> <p>If <code>tail_frac</code> is greater than or equal to .5, no clipping occurs.</p> <p>The default value of <code>tail_frac</code> is 0.025.</p> |
| <code>exclude_list</code> | <p>List of numerical columns to be excluded from the clipping process. If you do not specify <code>exclude_list</code>, all numerical columns in the data are clipped.</p> <p>The format of <code>exclude_list</code> is:</p> <pre>dbms_data_mining_transform.COLUMN_LIST('col1','col2', ...'coln')</pre> |
| <code>clip_schema_name</code> | Schema of <code>clip_table_name</code> . If no schema is specified, the current schema is used. |
| <code>data_schema_name</code> | Schema of <code>data_table_name</code> . If no schema is specified, the current schema is used. |

Usage Notes

1. See *Oracle Machine Learning for SQL User's Guide* for details about numerical data.
2. The `DBMS_DATA_MINING_TRANSFORM` package provides two clipping procedures: `INSERT_CLIP_WINSOR_TAIL` and `INSERT_CLIP_TRIM_TAIL`. Both procedures compute the boundaries as follows:

- Count the number of non-null values, *n*, and sort them in ascending order
 - Calculate the number of outliers, *t*, as $n * tail_frac$
 - Define the lower boundary *lcut* as the value at position $1 + floor(t)$
 - Define the upper boundary *rcut* as the value at position $n - floor(t)$
- (The SQL `FLOOR` function returns the largest integer less than or equal to *t*.)
- All values that are $\leq lcut$ or $\geq rcut$ are designated as outliers.

`INSERT_CLIP_WINSOR_TAIL` assigns *lcut* to the low outliers and *rcut* to the high outliers.

`INSERT_CLIP_TRIM_TAIL` replaces the outliers with nulls, effectively removing them from the data.

Examples

In this example, `INSERT_CLIP_WINSOR_TAIL` winsorizes 10% of the data in two columns (5% from the high end, and 5% from the low end) and inserts the transformations in a transformation definition table. The [STACK_CLIP Procedure](#) creates a transformation list from the contents of the definition table.

The SQL expression that computes the transformation is shown in the view `MINING_DATA_STACK`. The view is for display purposes only; it cannot be used to embed the transformations in a model.

```

53.6.17 INSERT_MISS_CAT_MODE Procedure

This procedure replaces missing categorical values with the value that occurs most frequently in the column (the mode). It inserts the transformation definitions in a transformation definition table.

`INSERT_MISS_CAT_MODE` replaces missing values in all `VARCHAR2` and `CHAR` columns in the data source unless you specify a list of columns to ignore.

Syntax

```
DBMS_DATA_MINING_TRANSFORM.INSERT_MISS_CAT_MODE (
    miss_table_name    IN VARCHAR2,
    data_table_name    IN VARCHAR2,
    exclude_list       IN COLUMN_LIST DEFAULT NULL,
    miss_schema_name   IN VARCHAR2 DEFAULT NULL,
    data_schema_name   IN VARCHAR2 DEFAULT NULL);
```

Parameters

Table 53-27 INSERT_MISS_CAT_MODE Procedure Parameters

| Parameter | Description | | | | |
|-------------------------------|---|------------------|---------------------------|------------------|-----------------------------|
| <code>miss_table_name</code> | Name of the transformation definition table for categorical missing value treatment. You can use the CREATE_MISS_CAT Procedure to create the definition table. The following columns are required: <table border="0" style="margin-left: 20px;"> <tr> <td><code>COL</code></td> <td><code>VARCHAR2(30)</code></td> </tr> <tr> <td><code>VAL</code></td> <td><code>VARCHAR2(4000)</code></td> </tr> </table> <p><code>CREATE_MISS_CAT</code> creates an additional column, <code>ATT</code>, which may be used for specifying nested attributes. This column is not used by <code>INSERT_MISS_CAT_MODE</code>.</p> | <code>COL</code> | <code>VARCHAR2(30)</code> | <code>VAL</code> | <code>VARCHAR2(4000)</code> |
| <code>COL</code> | <code>VARCHAR2(30)</code> | | | | |
| <code>VAL</code> | <code>VARCHAR2(4000)</code> | | | | |
| <code>data_table_name</code> | Name of the table containing the data to be transformed | | | | |
| <code>exclude_list</code> | List of categorical columns to be excluded from missing value treatment. If you do not specify <code>exclude_list</code> , all categorical columns are transformed. The format of <code>exclude_list</code> is: <pre>dbms_data_mining_transform.COLUMN_LIST('col1','col2', ...'coln')</pre> | | | | |
| <code>miss_schema_name</code> | Schema of <code>miss_table_name</code> . If no schema is specified, the current schema is used. | | | | |
| <code>data_schema_name</code> | Schema of <code>data_table_name</code> . If no schema is specified, the current schema is used. | | | | |

Usage Notes

1. See *Oracle Machine Learning for SQL User's Guide* for details about categorical data.
2. If you wish to replace categorical missing values with a value other than the mode, you can edit the transformation definition table.

 **See Also:**

53.6.18 INSERT_MISS_NUM_MEAN Procedure

This procedure replaces missing numerical values with the average (the mean) and inserts the transformation definitions in a transformation definition table.

INSERT_MISS_NUM_MEAN replaces missing values in all NUMBER and FLOAT columns in the data source unless you specify a list of columns to ignore.

Syntax

```

DBMS_DATA_MINING_TRANSFORM.INSERT_MISS_NUM_MEAN (
    miss_table_name    IN VARCHAR2,
    data_table_name    IN VARCHAR2,
    exclude_list       IN COLUMN_LIST DEFAULT NULL,
    round_num          IN PLS_INTEGER DEFAULT 6,
    miss_schema_name   IN VARCHAR2 DEFAULT NULL,
    data_schema_name   IN VARCHAR2 DEFAULT NULL);

```

Parameters

Table 53-28 INSERT_MISS_NUM_MEAN Procedure Parameters

| Parameter | Description | | | | |
|-----------------|--|-----|---------------|-----|--------|
| miss_table_name | <p>Name of the transformation definition table for numerical missing value treatment. You can use the CREATE_MISS_NUM Procedure to create the definition table.</p> <p>The following columns are required by INSERT_MISS_NUM_MEAN:</p> <table border="1"> <tr> <td>COL</td> <td>VARCHAR2 (30)</td> </tr> <tr> <td>VAL</td> <td>NUMBER</td> </tr> </table> <p>CREATE_MISS_NUM creates an additional column, ATT, which may be used for specifying nested attributes. 53.6.19 INSERT_NORM_LIN_MINMAX Procedure

This procedure performs linear normalization and inserts the transformation definitions in a transformation definition table.

INSERT_NORM_LIN_MINMAX computes the minimum and maximum values from the data and sets the value of *shift* and *scale* as follows:

```

shift = min
scale = max - min

```

Normalization is computed as:

$$x_{new} = (x_{old} - shift) / scale$$

INSERT_NORM_LIN_MINMAX rounds the value of *scale* to a specified number of significant digits before storing it in the transformation definition table.

INSERT_NORM_LIN_MINMAX normalizes all the NUMBER and FLOAT columns in the data source unless you specify a list of columns to ignore.

Syntax

```

DBMS_DATA_MINING_TRANSFORM.INSERT_NORM_LIN_MINMAX (
  norm_table_name      IN VARCHAR2,
  data_table_name      IN VARCHAR2,

```

```

exclude_list      IN COLUMN_LIST DEFAULT NULL,
round_num        IN PLS_INTEGER DEFAULT 6,
norm_schema_name IN VARCHAR2 DEFAULT NULL,
data_schema_name IN VARCHAR2 DEFAULT NULL);

```

Parameters

Table 53-29 *INSERT_NORM_LIN_MINMAX Procedure Parameters*

| Parameter | Description | | | | | | |
|------------------|---|-----|--------------|-------|--------|-------|--------|
| norm_table_name | Name of the transformation definition table for linear normalization. You can use the CREATE_NORM_LIN Procedure to create the definition table. The following columns are required: <table border="1" data-bbox="617 609 941 714"> <tr> <td>COL</td> <td>VARCHAR2(30)</td> </tr> <tr> <td>SHIFT</td> <td>NUMBER</td> </tr> <tr> <td>SCALE</td> <td>NUMBER</td> </tr> </table> CREATE_NORM_LIN creates an additional column, ATT, which may be used for specifying nested attributes. This column is not used by INSERT_NORM_LIN_MINMAX. | COL | VARCHAR2(30) | SHIFT | NUMBER | SCALE | NUMBER |
| COL | VARCHAR2(30) | | | | | | |
| SHIFT | NUMBER | | | | | | |
| SCALE | NUMBER | | | | | | |
| data_table_name | Name of the table containing the data to be transformed | | | | | | |
| exclude_list | List of numerical columns to be excluded from normalization. If you do not specify <i>exclude_list</i> , all numerical columns are transformed. The format of <i>exclude_list</i> is: <pre>dbms_data_mining_transform.COLUMN_LIST('col1','col2', ... 'coln')</pre> | | | | | | |
| round_num | The number of significant digits to use for the minimum and maximum. The default number is 6. | | | | | | |
| norm_schema_name | Schema of <i>norm_table_name</i> . If no schema is specified, the current schema is used. | | | | | | |
| data_schema_name | Schema of <i>data_table_name</i> . If no schema is specified, the current schema is used. | | | | | | |

Usage Notes

See *Oracle Machine Learning for SQL User's Guide* for details about numerical data.

Examples

In this example, INSERT_NORM_LIN_MINMAX normalizes the *cust_year_of_birth* column and inserts the transformation in a transformation definition table. The [STACK_NORM_LIN Procedure](#) creates a transformation list from the contents of the definition table.

The SQL expression that computes the transformation is shown in the view MINING_DATA_STACK. The view is for display purposes only; it cannot be used to embed the transformations in a model.

```

CREATE OR REPLACE VIEW mining_data AS
  SELECT cust_id, cust_gender, cust_year_of_birth
  FROM sh.customers;

```

```
describe mining_data

```

53.6.20 INSERT_NORM_LIN_SCALE Procedure

This procedure performs linear normalization and inserts the transformation definitions in a transformation definition table.

`INSERT_NORM_LIN_SCALE` computes the minimum and maximum values from the data and sets the value of *shift* and *scale* as follows:

```

shift = 0
scale = max(abs(max), abs(min))

```

Normalization is computed as:

```

x_new = (x_old)/scale

```

INSERT_NORM_LIN_SCALE rounds the value of *scale* to a specified number of significant digits before storing it in the transformation definition table.

INSERT_NORM_LIN_SCALE normalizes all the NUMBER and FLOAT columns in the data source unless you specify a list of columns to ignore.

Syntax

```
DBMS_DATA_MINING_TRANSFORM.INSERT_NORM_LIN_SCALE (
  norm_table_name      IN VARCHAR2,
  data_table_name      IN VARCHAR2,
  exclude_list         IN COLUMN_LIST DEFAULT NULL,
  round_num            IN PLS_INTEGER DEFAULT 6,
  norm_schema_name     IN VARCHAR2 DEFAULT NULL,
  data_schema_name     IN VARCHAR2 DEFAULT NULL);
```

Parameters

Table 53-30 INSERT_NORM_LIN_SCALE Procedure Parameters

| Parameter | Description |
|------------------|--|
| norm_table_name | Name of the transformation definition table for linear normalization. You can use the CREATE_NORM_LIN Procedure to create the definition table. The following columns are required: COL VARCHAR2(30) SHIFT NUMBER SCALE NUMBER CREATE_NORM_LIN creates an additional column, ATT, which may be used for specifying nested attributes. This column is not used by INSERT_NORM_LIN_SCALE. |
| data_table_name | Name of the table containing the data to be transformed |
| exclude_list | List of numerical columns to be excluded from normalization. If you do not specify <i>exclude_list</i> , all numerical columns are transformed. The format of <i>exclude_list</i> is: dbms_data_mining_transform.COLUMN_LIST('col1','col2', ...'coln') |
| round_num | The number of significant digits to use for <i>scale</i> . The default number is 6. |
| norm_schema_name | Schema of <i>norm_table_name</i> . If no schema is specified, the current schema is used. |
| data_schema_name | Schema of <i>data_table_name</i> . If no schema is specified, the current schema is used. |

Usage Notes

See *Oracle Machine Learning for SQL User's Guide* for details about numerical data.

Examples

In this example, INSERT_NORM_LIN_SCALE normalizes the *cust_year_of_birth* column and inserts the transformation in a transformation definition table. The

STACK_NORM_LIN Procedure creates a transformation list from the contents of the definition table.

The SQL expression that computes the transformation is shown in the view `MINING_DATA_STACK`. The view is for display purposes only; it cannot be used to embed the transformations in a model.

```
CREATE OR REPLACE VIEW mining_data AS
  SELECT cust_id, cust_gender, cust_year_of_birth
  FROM sh.customers;

DESCRIBE mining_data
Name                               Null?    Type
-----
CUST_ID                            NOT NULL NUMBER
CUST_GENDER                        NOT NULL CHAR(1)
CUST_YEAR_OF_BIRTH                 NOT NULL NUMBER(4)

BEGIN
  dbms_data_mining_transform.CREATE_NORM_LIN(
    norm_table_name => 'norm_tbl');
  dbms_data_mining_transform.INSERT_NORM_LIN_SCALE(
    norm_table_name => 'norm_tbl',
    data_table_name => 'mining_data',
    exclude_list   => dbms_data_mining_transform.COLUMN_LIST('cust_id'),
    round_num      => 3);
END;
/

SELECT col, shift, scale FROM norm_tbl;

COL                SHIFT SCALE
-----
CUST_YEAR_OF_BIRTH      0  1990

DECLARE
  xforms      dbms_data_mining_transform.TRANSFORM_LIST;
BEGIN
  dbms_data_mining_transform.STACK_NORM_LIN (
    norm_table_name => 'norm_tbl',
    xform_list      => xforms);
  dbms_data_mining_transform.XFORM_STACK (
    xform_list      => xforms,
    data_table_name => 'mining_data',
    xform_view_name => 'mining_data_stack');
END;
/

set long 3000
SELECT text FROM user_views WHERE view_name IN 'MINING_DATA_STACK';

TEXT
-----
SELECT "CUST_ID","CUST_GENDER",("CUST_YEAR_OF_BIRTH"-0)/1990 "CUST_YEAR_OF_BIRTH
" FROM mining_data
```

53.6.21 INSERT_NORM_LIN_ZSCORE Procedure

This procedure performs linear normalization and inserts the transformation definitions in a transformation definition table.

INSERT_NORM_LIN_ZSCORE computes the mean and the standard deviation from the data and sets the value of *shift* and *scale* as follows:

```
shift = mean
scale = stddev
```

Normalization is computed as:

$$x_{new} = (x_{old} - shift) / scale$$

INSERT_NORM_LIN_ZSCORE rounds the value of *scale* to a specified number of significant digits before storing it in the transformation definition table.

INSERT_NORM_LIN_ZSCORE normalizes all the NUMBER and FLOAT columns in the data unless you specify a list of columns to ignore.

Syntax

```
DBMS_DATA_MINING_TRANSFORM.INSERT_NORM_LIN_ZSCORE (
  norm_table_name      IN VARCHAR2,
  data_table_name      IN VARCHAR2,
  exclude_list         IN COLUMN_LIST DEFAULT NULL,
  round_num            IN PLS_INTEGER DEFAULT 6,
  norm_schema_name     IN VARCHAR2 DEFAULT NULL,
  data_schema_name     IN VARCHAR2 DEFAULT NULL);
```

Parameters

Table 53-31 INSERT_NORM_LIN_ZSCORE Procedure Parameters

| Parameter | Description | | | | | | |
|-----------------|---|-----|--------------|-------|--------|-------|--------|
| norm_table_name | Name of the transformation definition table for linear normalization. You can use the CREATE_NORM_LIN Procedure to create the definition table. The following columns are required: <table border="1" data-bbox="646 1423 925 1507"> <tr> <td>COL</td> <td>VARCHAR2(30)</td> </tr> <tr> <td>SHIFT</td> <td>NUMBER</td> </tr> <tr> <td>SCALE</td> <td>NUMBER</td> </tr> </table> CREATE_NORM_LIN creates an additional column, ATT, which may be used for specifying nested attributes. This column is not used by INSERT_NORM_LIN_ZSCORE. | COL | VARCHAR2(30) | SHIFT | NUMBER | SCALE | NUMBER |
| COL | VARCHAR2(30) | | | | | | |
| SHIFT | NUMBER | | | | | | |
| SCALE | NUMBER | | | | | | |
| data_table_name | Name of the table containing the data to be transformed | | | | | | |
| exclude_list | List of numerical columns to be excluded from normalization. If you do not specify <i>exclude_list</i> , all numerical columns are transformed. The format of <i>exclude_list</i> is: <pre>dbms_data_mining_transform.COLUMN_LIST('col1','col2', ... 'coln')</pre> | | | | | | |

Table 53-31 (Cont.) INSERT_NORM_LIN_ZSCORE Procedure Parameters

| Parameter | Description |
|------------------|---|
| round_num | The number of significant digits to use for <i>scale</i> . The default number is 6. |
| norm_schema_name | Schema of <i>norm_table_name</i> . If no schema is specified, the current schema is used. |
| data_schema_name | Schema of <i>data_table_name</i> . If no schema is specified, the current schema is used. |

Usage Notes

See *Oracle Machine Learning for SQL User's Guide* for details about numerical data.

Examples

In this example, `INSERT_NORM_LIN_ZSCORE` normalizes the `cust_year_of_birth` column and inserts the transformation in a transformation definition table. The [STACK_NORM_LIN Procedure](#) creates a transformation list from the contents of the definition table.

The SQL expression that computes the transformation is shown in the view `MINING_DATA_STACK`. The view is for display purposes only; it cannot be used to embed the transformations in a model.

```
CREATE OR REPLACE VIEW mining_data AS
    SELECT cust_id, cust_gender, cust_year_of_birth
    FROM sh.customers;

DESCRIBE mining_data
Name                               Null?    Type
-----
CUST_ID                            NOT NULL NUMBER
CUST_GENDER                        NOT NULL CHAR(1)
CUST_YEAR_OF_BIRTH                 NOT NULL NUMBER(4)

BEGIN
    dbms_data_mining_transform.CREATE_NORM_LIN(
        norm_table_name => 'norm_tbl');
    dbms_data_mining_transform.INSERT_NORM_LIN_ZSCORE(
        norm_table_name => 'norm_tbl',
        data_table_name => 'mining_data',
        exclude_list   => dbms_data_mining_transform.COLUMN_LIST('cust_id'),
        round_num      => 3);
END;
/

SELECT col, shift, scale FROM norm_tbl;

COL                SHIFT SCALE
-----
CUST_YEAR_OF_BIRTH 1960    15

DECLARE
    xforms          dbms_data_mining_transform.TRANSFORM_LIST;
BEGIN
    dbms_data_mining_transform.STACK_NORM_LIN (
        norm_table_name => 'norm_tbl',
```

```

        xform_list      => xforms);
dbms_data_mining_transform.XFORM_STACK (
    xform_list          => xforms,
    data_table_name     => 'mining_data',
    xform_view_name     => 'mining_data_stack');
END;
/

set long 3000
SQL> SELECT text FROM user_views WHERE view_name IN 'MINING_DATA_STACK';

TEXT
-----
SELECT "CUST_ID","CUST_GENDER", ("CUST_YEAR_OF_BIRTH"-1960)/15 "CUST_YEAR_OF_BIRTH"
H" FROM mining_data

```

53.6.22 SET_EXPRESSION Procedure

This procedure appends a row to a `VARCHAR2` array that stores a SQL expression.

The array can be used for specifying a transformation expression that is too long to be used with the [SET_TRANSFORM Procedure](#).

The [GET_EXPRESSION Function](#) returns a row in the array.

When you use `SET_EXPRESSION` to build a transformation expression, you must build a corresponding reverse transformation expression, create a transformation record, and add the transformation record to a transformation list.

Syntax

```

DBMS_DATA_MINING_TRANSFORM.SET_EXPRESSION (
    expression      IN OUT NOCOPY EXPRESSION_REC,
    chunk           VARCHAR2 DEFAULT NULL);

```

Parameters

Table 53-32 SET_EXPRESSION Procedure Parameters

| Parameter | Description |
|-------------------------|---|
| <code>expression</code> | An expression record (<code>EXPRESSION_REC</code>) that specifies a transformation expression or a reverse transformation expression for an attribute. Each expression record includes a <code>VARCHAR2</code> array and index fields for specifying upper and lower boundaries within the array. There are two <code>EXPRESSION_REC</code> fields within a transformation record (<code>TRANSFORM_REC</code>): one for the transformation expression; the other for the reverse transformation expression. See Table 53-1 for a description of the <code>EXPRESSION_REC</code> type. |
| <code>chunk</code> | A <code>VARCHAR2</code> chunk (row) to be appended to <code>expression</code> . |

Notes

1. You can pass `NULL` in the `chunk` argument to `SET_EXPRESSION` to clear the previous chunk. The default value of `chunk` is `NULL`.
2. See "[About Transformation Lists](#)".

3. See "Operational Notes".

Examples

In this example, two calls to `SET_EXPRESSION` construct a transformation expression and two calls construct the reverse transformation.

Note:

This example is for illustration purposes only. It shows how `SET_EXPRESSION` appends the text provided in `chunk` to the text that already exists in `expression`. The `SET_EXPRESSION` procedure is meant for constructing very long transformation expressions that cannot be specified in a `VARCHAR2` argument to `SET_TRANSFORM`.

Similarly while transformation lists are intended for embedding in a model, the transformation list `v_xlst` is shown in an external view for illustration purposes.

```
CREATE OR REPLACE VIEW mining_data AS
  SELECT cust_id, cust_year_of_birth, cust_postal_code, cust_credit_limit
  FROM sh.customers;

DECLARE
  v_expr dbms_data_mining_transform.EXPRESSION_REC;
  v_rexp dbms_data_mining_transform.EXPRESSION_REC;
  v_xrec dbms_data_mining_transform.TRANSFORM_REC;
  v_xlst dbms_data_mining_transform.TRANSFORM_LIST :=
    dbms_data_mining_transform.TRANSFORM_LIST (NULL);

BEGIN
  dbms_data_mining_transform.SET_EXPRESSION(
    EXPRESSION => v_expr,
    CHUNK      => '("CUST_YEAR_OF_BIRTH"-1910)');
  dbms_data_mining_transform.SET_EXPRESSION(
    EXPRESSION => v_expr,
    CHUNK      => '/77');
  dbms_data_mining_transform.SET_EXPRESSION(
    EXPRESSION => v_rexp,
    CHUNK      => '"CUST_YEAR_OF_BIRTH"*77');
  dbms_data_mining_transform.SET_EXPRESSION(
    EXPRESSION => v_rexp,
    CHUNK      => '+1910');

  v_xrec := null;
  v_xrec.attribute_name := 'CUST_YEAR_OF_BIRTH';
  v_xrec.expression := v_expr;
  v_xrec.reverse_expression := v_rexp;
  v_xlst.TRIM;
  v_xlst.extend(1);
  v_xlst(1) := v_xrec;

  dbms_data_mining_transform.XFORM_STACK (
    xform_list      => v_xlst,
    data_table_name => 'mining_data',
    xform_view_name => 'v_xlst_view');

  dbms_output.put_line('====');
  FOR i IN 1..v_xlst.count LOOP
    dbms_output.put_line('ATTR: '||v_xlst(i).attribute_name);
```

```

dbms_output.put_line('SUBN: '||v_xlst(i).attribute_subname);
FOR j IN v_xlst(i).expression.lb..v_xlst(i).expression.ub LOOP
    dbms_output.put_line('EXPR: '||v_xlst(i).expression.lstmt(j));
END LOOP;
FOR j IN v_xlst(i).reverse_expression.lb..
    v_xlst(i).reverse_expression.ub LOOP
    dbms_output.put_line('REXP: '||v_xlst(i).reverse_expression.lstmt(j));
END LOOP;
dbms_output.put_line('====');
END LOOP;
END;
/

REXP: +1910
====

```

53.6.23 SET_TRANSFORM Procedure

This procedure appends the transformation instructions for an attribute to a transformation list.

Syntax

```

DBMS_DATA_MINING_TRANSFORM.SET_TRANSFORM (
    xform_list          IN OUT NOCOPY TRANSFORM_LIST,
    attribute_name      VARCHAR2,
    attribute_subname   VARCHAR2,
    expression          VARCHAR2,
    reverse_expression  VARCHAR2,
    attribute_spec      VARCHAR2 DEFAULT NULL);

```

Parameters

Table 53-33 SET_TRANSFORM Procedure Parameters

| Parameter | Description |
|--------------------|---|
| xform_list | A transformation list. See Table 53-1 for a description of the TRANSFORM_LIST object type. |
| attribute_name | Name of the attribute to be transformed |
| attribute_subname | Name of the nested attribute if <i>attribute_name</i> is a nested column, otherwise NULL. |
| expression | A SQL expression that specifies the transformation of the attribute. |
| reverse_expression | A SQL expression that reverses the transformation for readability in model details and in the target of a supervised model (if the attribute is a target) |

Table 53-33 (Cont.) SET_TRANSFORM Procedure Parameters

| Parameter | Description |
|----------------|--|
| attribute_spec | <p>One or more keywords that identify special treatment for the attribute during model build. Values are:</p> <ul style="list-style-type: none"> • <code>NOPREP</code> — When ADP is on, prevents automatic transformation of the attribute. If ADP is not on, this value has no effect. • <code>TEXT</code> — Causes the attribute to be treated as unstructured text data • <code>FORCE_IN</code> — Forces the inclusion of the attribute in the model build. Applies only to GLM models with feature selection enabled (<code>ftr_selection_enable = yes</code>). Feature selection is disabled by default. <p>If the model is not using GLM with feature selection, this value has no effect.</p> <p>See "Specifying Transformation Instructions for an Attribute" in <i>Oracle Machine Learning for SQL User's Guide</i> for more information about <code>attribute_spec</code>.</p> |

Usage Notes

1. See the following relevant sections in "Operational Notes":
 - About Transformation Lists
 - Nested Data Transformations
2. As shown in the following example, you can eliminate an attribute by specifying a null transformation expression and reverse expression. You can also use the `STACK` interface to remove a column ([CREATE_COL_REM Procedure](#) and [STACK_COL_REM Procedure](#)).

53.6.24 STACK_BIN_CAT Procedure

This procedure adds categorical binning transformations to a transformation list.

Syntax

```
DBMS_DATA_MINING_TRANSFORM.STACK_BIN_CAT (
  bin_table_name      IN          VARCHAR2,
  xform_list          IN OUT NOCOPY TRANSFORM_LIST,
  literal_flag        IN          BOOLEAN DEFAULT FALSE,
  bin_schema_name     IN          VARCHAR2 DEFAULT NULL);
```

Parameters

Table 53-34 STACK_BIN_CAT Procedure Parameters

| Parameter | Description |
|------------------------------|---|
| <code>bin_table_name</code> | Name of the transformation definition table for categorical binning. You can use the CREATE_BIN_CAT Procedure to create the definition table. The table must be populated with transformation definitions before you call <code>STACK_BIN_CAT</code> . To populate the table, you can use one of the <code>INSERT</code> procedures for categorical binning or you can write your own SQL. See Table 53-4 |
| <code>xform_list</code> | A transformation list. See Table 53-1 for a description of the <code>TRANSFORM_LIST</code> object type. |
| <code>literal_flag</code> | Indicates whether the values in the <code>bin</code> column in the transformation definition table are valid SQL literals. When <code>literal_flag</code> is <code>FALSE</code> (the default), the bin identifiers will be transformed to SQL literals by surrounding them with single quotes. Set <code>literal_flag</code> to <code>TRUE</code> if the bin identifiers are numbers that should have a numeric datatype, as is the case for an O-Cluster model. See " INSERT_BIN_NUM_EQWIDTH Procedure " for an example. |
| <code>bin_schema_name</code> | Schema of <code>bin_table_name</code> . If no schema is specified, the current schema is used. |

Usage Notes

See "[Operational Notes](#)". The following sections are especially relevant:

- "[About Transformation Lists](#)"
- "[About Stacking](#)"
- "[Nested Data Transformations](#)"

Examples

This example shows how a binning transformation for the categorical column `cust_postal_code` could be added to a stack called `mining_data_stack`.

Note:

This example invokes the [XFORM_STACK Procedure](#) to show how the data is transformed by the stack. `XFORM_STACK` simply generates an external view of the transformed data. The actual purpose of the `STACK` procedures is to assemble a list of transformations for embedding in a model. The transformations are passed to `CREATE_MODEL` in the `xform_list` parameter. See [INSERT_BIN_NUM_EQWIDTH Procedure](#) for an example.

```
CREATE or REPLACE VIEW mining_data AS
  SELECT cust_id, cust_postal_code, cust_credit_limit
  FROM sh.customers
```

```

        WHERE cust_id BETWEEN 100050 AND 100100;
BEGIN
    dbms_data_mining_transform.CREATE_BIN_CAT ('bin_cat_tbl');
    dbms_data_mining_transform.INSERT_BIN_CAT_FREQ (
        bin_table_name => 'bin_cat_tbl',
        data_table_name => 'mining_data',
        bin_num        => 3);
END;
/
DECLARE
    MINING_DATA_STACK dbms_data_mining_transform.TRANSFORM_LIST;
BEGIN
    dbms_data_mining_transform.STACK_BIN_CAT (
        bin_table_name => 'bin_cat_tbl',
        xform_list     => mining_data_stack);
    dbms_data_mining_transform.XFORM_STACK (
        xform_list     => mining_data_stack,
        data_table_name => 'mining_data',
        xform_view_name => 'mining_data_stack_view');
END;
/
-- Before transformation
column cust_postal_code format a16
SELECT * from mining_data
        WHERE cust_id BETWEEN 100050 AND 100053
        ORDER BY cust_id;

    CUST_ID CUST_POSTAL_CODE CUST_CREDIT_LIMIT
-----
    100050 76486                1500
    100051 73216                9000
    100052 69499                5000
    100053 45704                7000

-- After transformation
SELECT * FROM mining_data_stack_view
        WHERE cust_id BETWEEN 100050 AND 100053
        ORDER BY cust_id;

    CUST_ID CUST_POSTAL_CODE CUST_CREDIT_LIMIT
-----
    100050 4                    1500
    100051 1                    9000
    100052 4                    5000
    100053 4                    7000

```

53.6.25 STACK_BIN_NUM Procedure

This procedure adds numerical binning transformations to a transformation list.

Syntax

```

DBMS_DATA_MINING_TRANSFORM.STACK_BIN_NUM (
    bin_table_name    IN          VARCHAR2,
    xform_list        IN OUT      NOCOPY TRANSFORM_LIST,
    literal_flag      IN          BOOLEAN DEFAULT FALSE,
    bin_schema_name   IN          VARCHAR2 DEFAULT NULL);

```

Parameters

Table 53-35 STACK_BIN_NUM Procedure Parameters

| Parameter | Description |
|------------------------------|---|
| <code>bin_table_name</code> | Name of the transformation definition table for numerical binning. You can use the CREATE_BIN_NUM Procedure to create the definition table. The table must be populated with transformation definitions before you call <code>STACK_BIN_NUM</code> . To populate the table, you can use one of the <code>INSERT</code> procedures for numerical binning or you can write your own SQL. See Table 53-6 . |
| <code>xform_list</code> | A transformation list. See Table 53-1 for a description of the <code>TRANSFORM_LIST</code> object type. |
| <code>literal_flag</code> | Indicates whether the values in the <code>bin</code> column in the transformation definition table are valid SQL literals. When <code>literal_flag</code> is <code>FALSE</code> (the default), the bin identifiers will be transformed to SQL literals by surrounding them with single quotes. Set <code>literal_flag</code> to <code>TRUE</code> if the bin identifiers are numbers that should have a numeric datatype, as is the case for an O-Cluster model. See " INSERT_BIN_NUM_EQWIDTH Procedure " for an example. |
| <code>bin_schema_name</code> | Schema of <code>bin_table_name</code> . If no schema is specified, the current schema is used. |

Usage Notes

See "[Operational Notes](#)". The following sections are especially relevant:

- "[About Transformation Lists](#)"
- "[About Stacking](#)"
- "[Nested Data Transformations](#)"

Examples

This example shows how a binning transformation for the numerical column `cust_credit_limit` could be added to a stack called `mining_data_stack`.

Note:

This example invokes the [XFORM_STACK Procedure](#) to show how the data is transformed by the stack. `XFORM_STACK` simply generates an external view of the transformed data. The actual purpose of the `STACK` procedures is to assemble a list of transformations for embedding in a model. The transformations are passed to `CREATE_MODEL` in the `xform_list` parameter. See [INSERT_BIN_NUM_EQWIDTH Procedure](#) for an example.

```
CREATE OR REPLACE VIEW mining_data AS

100053   45704
100054   88021              3
100055   74673              3

```

53.6.26 STACK_CLIP Procedure

This procedure adds clipping transformations to a transformation list.

Syntax

```

DBMS_DATA_MINING_TRANSFORM.STACK_CLIP (
    clip_table_name      IN          VARCHAR2,
    xform_list           IN OUT NOCOPY TRANSFORM_LIST,
    clip_schema_name     IN          VARCHAR2 DEFAULT NULL);

```

Parameters

Table 53-36 STACK_CLIP Procedure Parameters

| Parameter | Description |
|-------------------------------|--|
| <code>clip_table_name</code> | Name of the transformation definition table for clipping. You can use the CREATE_CLIP Procedure to create the definition table. The table must be populated with transformation definitions before you call <code>STACK_CLIP</code> . To populate the table, you can use one of the <code>INSERT</code> procedures for clipping or you can write your own SQL. See Table 53-8 |
| <code>xform_list</code> | A transformation list. See Table 53-1 for a description of the <code>TRANSFORM_LIST</code> object type. |
| <code>clip_schema_name</code> | Schema of <code>clip_table_name</code> . If no schema is specified, the current schema is used. |

Usage Notes

See [DBMS_DATA_MINING_TRANSFORM Operational Notes](#). The following sections are especially relevant:

- “About Transformation Lists”
- “About Stacking”
- “Nested Data Transformations”

Examples

This example shows how a clipping transformation for the numerical column `cust_credit_limit` could be added to a stack called `mining_data_stack`.

Note:

This example invokes the [XFORM_STACK Procedure](#) to show how the data is transformed by the stack. `XFORM_STACK` simply generates an external view of the transformed data. The actual purpose of the `STACK` procedures is to assemble a list of transformations for embedding in a model. The transformations are passed to `CREATE_MODEL` in the `xform_list` parameter. See [INSERT_BIN_NUM_EQWIDTH Procedure](#) for an example.

```
CREATE OR REPLACE VIEW mining_data AS
  SELECT cust_id, cust_postal_code, cust_credit_limit
  FROM sh.customers
  WHERE cust_id BETWEEN 100050 AND 100100;
BEGIN
  dbms_data_mining_transform.create_clip ('clip_tbl');
  dbms_data_mining_transform.insert_clip_winsor_tail (
    clip_table_name => 'clip_tbl',
    data_table_name => 'mining_data',
    tail_frac       => 0.25,
    exclude_list   => dbms_data_mining_transform.COLUMN_LIST('cust_id'));
END;
```

```

END;
/
DECLARE
    MINING_DATA_STACK    dbms_data_mining_transform.TRANSFORM_LIST;
BEGIN
    dbms_data_mining_transform.STACK_CLIP (
        clip_table_name    => 'clip_tbl',
        xform_list         => mining_data_stack);
    dbms_data_mining_transform.XFORM_STACK (
        xform_list         => mining_data_stack,
        data_table_name    => 'mining_data',
        xform_view_name    => 'mining_data_stack_view');
END;
/
-- Before transformation
SELECT cust_id, cust_postal_code, round(cust_credit_limit)
   FROM mining_data
   WHERE cust_id BETWEEN 100050 AND 100054
   ORDER BY cust_id;

CUST_ID    CUST_POSTAL_CODE    ROUND(CUST_CREDIT_LIMIT)
-----
100050     76486                1500
100051     73216                9000
100052     69499                5000
100053     45704                7000
100054     88021                11000

-- After transformation
SELECT cust_id, cust_postal_code, round(cust_credit_limit)
   FROM mining_data_stack_view
   WHERE cust_id BETWEEN 100050 AND 100054
   ORDER BY cust_id;

CUST_ID    CUST_POSTAL_CODE    ROUND(CUST_CREDIT_LIMIT)
-----
100050     76486                5000
100051     73216                9000
100052     69499                5000
100053     45704                7000
100054     88021                11000

```

53.6.27 STACK_COL_REM Procedure

This procedure adds column removal transformations to a transformation list.

Syntax

```

DBMS_DATA_MINING_TRANSFORM.STACK_COL_REM (
    rem_table_name      IN          VARCHAR2,
    xform_list          IN OUT NOCOPY TRANSFORM_LIST,
    rem_schema_name     IN          VARCHAR2 DEFAULT NULL);

```

Parameters

Table 53-37 STACK_COL_REM Procedure Parameters

| Parameter | Description |
|-----------------|--|
| rem_table_name | Name of the transformation definition table for column removal. You can use the CREATE_COL_REM Procedure to create the definition table. See Table 53-10 . The table must be populated with column names before you call STACK_COL_REM. The INSERT_BIN_SUPER Procedure and the INSERT_AUTOBIN_NUM_EQWIDTH Procedure can optionally be used to populate the table. You can also use SQL INSERT statements. |
| xform_list | A transformation list. See Table 53-1 for a description of the TRANSFORM_LIST object type. |
| rem_schema_name | Schema of rem_table_name. If no schema is specified, the current schema is used. |

Usage Notes

See "[Operational Notes](#)". The following sections are especially relevant:

- "[About Transformation Lists](#)"
- "[About Stacking](#)"
- "[Nested Data Transformations](#)"

Examples

This example shows how the column cust_credit_limit could be removed in a transformation list called mining_data_stack.

Note:

This example invokes the [XFORM_STACK Procedure](#) to show how the data is transformed by the stack. XFORM_STACK simply generates an external view of the transformed data. The actual purpose of the STACK procedures is to assemble a list of transformations for embedding in a model. The transformations are passed to CREATE_MODEL in the xform_list parameter. See [INSERT_BIN_NUM_EQWIDTH Procedure](#) for an example.

```
CREATE OR REPLACE VIEW mining_data AS
  SELECT cust_id, country_id, cust_postal_code, cust_credit_limit
     FROM sh.customers;

BEGIN
  dbms_data_mining_transform.create_col_rem ('rem_tbl');
END;
/

INSERT into rem_tbl VALUES (upper('cust_postal_code'), null);

DECLARE
```

```

MINING_DATA_STACK dbms_data_mining_transform.TRANSFORM_LIST;
BEGIN
  dbms_data_mining_transform.stack_col_rem (
    rem_table_name => 'rem_tbl',
    xform_list     => mining_data_stack);
  dbms_data_mining_transform.XFORM_STACK (
    xform_list     => mining_data_stack,
    data_table_name => 'mining_data',
    xform_view_name => 'mining_data_stack_view');
END;
/

SELECT * FROM mining_data
  WHERE cust_id BETWEEN 100050 AND 100051
  ORDER BY cust_id;

CUST_ID  COUNTRY_ID  CUST_POSTAL_CODE  CUST_CREDIT_LIMIT
-----  -
100050      52773      76486                1500
100051      52790      73216                9000

SELECT * FROM mining_data_stack_view
  WHERE cust_id BETWEEN 100050 AND 100051
  ORDER BY cust_id;

CUST_ID  COUNTRY_ID  CUST_CREDIT_LIMIT
-----  -
100050      52773                1500
100051      52790                9000

```

53.6.28 STACK_MISS_CAT Procedure

This procedure adds categorical missing value transformations to a transformation list.

Syntax

```

DBMS_DATA_MINING_TRANSFORM.STACK_MISS_CAT (
  miss_table_name  IN  VARCHAR2,
  xform_list       IN OUT NOCOPY TRANSFORM_LIST,
  miss_schema_name IN  VARCHAR2 DEFAULT NULL);

```

Parameters

Table 53-38 STACK_MISS_CAT Procedure Parameters

| Parameter | Description |
|------------------|---|
| miss_table_name | Name of the transformation definition table for categorical missing value treatment. You can use the CREATE_MISS_CAT Procedure to create the definition table. The table must be populated with transformation definitions before you call STACK_MISS_CAT. To populate the table, you can use the INSERT_MISS_CAT_MODE Procedure or you can write your own SQL. See Table 53-12 . |
| xform_list | A transformation list. See Table 53-1 for a description of the TRANSFORM_LIST object type. |
| miss_schema_name | Schema of <i>miss_table_name</i> . If no schema is specified, the current schema is used. |

Usage Notes

See "Operational Notes". The following sections are especially relevant:

- ["About Transformation Lists"](#)
- ["About Stacking"](#)
- ["Nested Data Transformations"](#)

Examples

This example shows how the missing values in the column `cust_marital_status` could be replaced with the mode in a transformation list called `mining_data_stack`.

Note:

This example invokes the [XFORM_STACK Procedure](#) to show how the data is transformed by the stack. `XFORM_STACK` simply generates an external view of the transformed data. The actual purpose of the `STACK` procedures is to assemble a list of transformations for embedding in a model. The transformations are passed to `CREATE_MODEL` in the `xform_list` parameter. See [INSERT_BIN_NUM_EQWIDTH Procedure](#) for an example.

```
CREATE OR REPLACE VIEW mining_data AS
  SELECT cust_id, country_id, cust_marital_status
     FROM sh.customers
     where cust_id BETWEEN 1 AND 10;

BEGIN
  dbms_data_mining_transform.create_miss_cat ('miss_cat_tbl');
  dbms_data_mining_transform.insert_miss_cat_mode ('miss_cat_tbl',
'mining_data');
END;
/

DECLARE
  MINING_DATA_STACK  dbms_data_mining_transform.TRANSFORM_LIST;
BEGIN
  dbms_data_mining_transform.stack_miss_cat (
    miss_table_name => 'miss_cat_tbl',
    xform_list      => mining_data_stack);
  dbms_data_mining_transform.XFORM_STACK (
    xform_list      => mining_data_stack,
    data_table_name => 'mining_data',
    xform_view_name => 'mining_data_stack_view');
END;
/
SELECT * FROM mining_data
  ORDER BY cust_id;
```

| CUST_ID | COUNTRY_ID | CUST_MARITAL_STATUS |
|---------|------------|---------------------|
| 1 | 52789 | |
| 2 | 52778 | |
| 3 | 52770 | |

```

4      52770
5      52789
6      52769      single
7      52790      single
8      52790      married
9      52770      divorced
10     52790      widow

```

```

SELECT * FROM mining_data_stack_view
ORDER By cust_id;

```

```

CUST_ID  COUNTRY_ID  CUST_MARITAL_STATUS
-----  -
1         52789       single

3         52770       single
4         52770       single
5         52789       single
6         52769       single
7         52790       single
8         52790       married
9         52770       divorced
10        52790       widow

```

53.6.29 STACK_MISS_NUM Procedure

This procedure adds numeric missing value transformations to a transformation list.

Syntax

```

DBMS_DATA_MINING_TRANSFORM.STACK_MISS_NUM (
    miss_table_name      IN      VARCHAR2,
    xform_list           IN OUT  NOCOPY TRANSFORM_LIST,
    miss_schema_name     IN      VARCHAR2 DEFAULT NULL);

```

Parameters

Table 53-39 STACK_MISS_NUM Procedure Parameters

| Parameter | Description |
|------------------|---|
| miss_table_name | Name of the transformation definition table for numerical missing value treatment. You can use the CREATE_MISS_NUM Procedure to create the definition table. The table must be populated with transformation definitions before you call <code>STACK_MISS_NUM</code> . To populate the table, you can use the INSERT_MISS_NUM_MEAN Procedure or you can write your own SQL. See Table 53-14 . |
| xform_list | A transformation list. See Table 53-1 for a description of the <code>TRANSFORM_LIST</code> object type. |
| miss_schema_name | Schema of <code>miss_table_name</code> . If no schema is specified, the current schema is used. |

Usage Notes

See "[Operational Notes](#)". The following sections are especially relevant:

- "[About Transformation Lists](#)"

- ["About Stacking"](#)
- ["Nested Data Transformations"](#)

Examples

This example shows how the missing values in the column `cust_credit_limit` could be replaced with the mean in a transformation list called `mining_data_stack`.

Note:

This example invokes the [XFORM_STACK Procedure](#) to show how the data is transformed by the stack. `XFORM_STACK` simply generates an external view of the transformed data. The actual purpose of the `STACK` procedures is to assemble a list of transformations for embedding in a model. The transformations are passed to `CREATE_MODEL` in the `xform_list` parameter. See [INSERT_BIN_NUM_EQWIDTH Procedure](#) for an example.

53.6.30 STACK_NORM_LIN Procedure

This procedure adds linear normalization transformations to a transformation list.

Syntax

```

DBMS_DATA_MINING_TRANSFORM.STACK_NORM_LIN (
    norm_table_name      IN      VARCHAR2,
    xform_list           IN OUT  NOCOPY TRANSFORM_LIST,
    norm_schema_name    IN      VARCHAR2 DEFAULT NULL);

```

Parameters

Table 53-40 STACK_NORM_LIN Procedure Parameters

| Parameter | Description |
|------------------|--|
| norm_table_name | Name of the transformation definition table for linear normalization. You can use the CREATE_NORM_LIN Procedure to create the definition table. The table must be populated with transformation definitions before you call STACK_NORM_LIN. To populate the table, you can use one of the INSERT procedures for normalization or you can write your own SQL. See Table 53-16 . |
| xform_list | A transformation list. See Table 53-1 for a description of the TRANSFORM_LIST object type. |
| norm_schema_name | Schema of norm_table_name. If no schema is specified, the current schema is used. |

Usage Notes

See "[Operational Notes](#)". The following sections are especially relevant:

- "[About Transformation Lists](#)"

- ["About Stacking"](#)
- ["Nested Data Transformations"](#)

Examples

This example shows how the column `cust_credit_limit` could be normalized in a transformation list called `mining_data_stack`.

```

53.6.31 XFORM_BIN_CAT Procedure

This procedure creates a view that implements the categorical binning transformations specified in a definition table. Only the columns that are specified in the definition table are transformed; the remaining columns from the data table are present in the view, but they are not changed.

Syntax

```

DBMS_DATA_MINING_TRANSFORM.XFORM_BIN_CAT (
    bin_table_name      IN VARCHAR2,
    data_table_name     IN VARCHAR2,
    xform_view_name     IN VARCHAR2,
    literal_flag        IN BOOLEAN DEFAULT FALSE,
    bin_schema_name     IN VARCHAR2 DEFAULT NULL,
    data_schema_name    IN VARCHAR2 DEFAULT NULL,
    xform_schema_name   IN VARCHAR2 DEFAULT NULL);

```

Parameters

Table 53-41 XFORM_BIN_CAT Procedure Parameters

| Parameter | Description |
|------------------------------|---|
| <code>bin_table_name</code> | Name of the transformation definition table for categorical binning. You can use the CREATE_BIN_CAT Procedure to create the definition table. The table must be populated with transformation definitions before you call <code>XFORM_BIN_CAT</code> . To populate the table, you can use one of the <code>INSERT</code> procedures for categorical binning or you can write your own SQL. See Table 53-4 . |
| <code>data_table_name</code> | Name of the table containing the data to be transformed. |
| <code>xform_view_name</code> | Name of the view to be created. The view presents columns in <code>data_table_name</code> with the transformations specified in <code>bin_table_name</code> . |

Table 53-41 (Cont.) XFORM_BIN_CAT Procedure Parameters

| Parameter | Description |
|--------------------------------|---|
| <code>literal_flag</code> | Indicates whether the values in the <code>bin</code> column in the transformation definition table are valid SQL literals. When <code>literal_flag</code> is <code>FALSE</code> (the default), the bin identifiers will be transformed to SQL literals by surrounding them with single quotes. Set <code>literal_flag</code> to <code>TRUE</code> if the bin identifiers are numbers that should have a numeric datatype, as is the case for an O-Cluster model. See " INSERT_BIN_NUM_EQWIDTH Procedure " for an example. |
| <code>bin_schema_name</code> | Schema of <code>bin_table_name</code> . If no schema is specified, the current schema is used. |
| <code>data_schema_name</code> | Schema of <code>data_table_name</code> . If no schema is specified, the current schema is used. |
| <code>xform_schema_name</code> | Schema of <code>xform_view_name</code> . If no schema is specified, the current schema is used. |

Usage Notes

See "[Operational Notes](#)".

Examples

This example creates a view that bins the `cust_postal_code` column. The data source consists of three columns from `sh.customer`.

```
describe mining_data
Name                                     Null?    Type
-----
CUST_ID                                 NOT NULL NUMBER
CUST_POSTAL_CODE                        NOT NULL VARCHAR2(10)

53.6.32 XFORM_BIN_NUM Procedure

This procedure creates a view that implements the numerical binning transformations specified in a definition table. Only the columns that are specified in the definition table are transformed; the remaining columns from the data table are present in the view, but they are not changed.

Syntax

```

DBMS_DATA_MINING_TRANSFORM.XFORM_BIN_NUM (
    bin_table_name    IN VARCHAR2,
    data_table_name   IN VARCHAR2,
    xform_view_name   IN VARCHAR2,
    literal_flag      IN BOOLEAN DEFAULT FALSE,
    bin_schema_name   IN VARCHAR2 DEFAULT NULL,
    data_schema_name  IN VARCHAR2 DEFAULT NULL,
    xform_schema_name IN VARCHAR2 DEFAULT NULL);

```

Parameters

Table 53-42 XFORM_BIN_NUM Procedure Parameters

| Parameter | Description |
|--------------------------------|---|
| <code>bin_table_name</code> | Name of the transformation definition table for numerical binning. You can use the CREATE_BIN_NUM Procedure to create the definition table. The table must be populated with transformation definitions before you call <code>XFORM_BIN_NUM</code> . To populate the table, you can use one of the <code>INSERT</code> procedures for numerical binning or you can write your own SQL. See " Table 53-6 ". |
| <code>data_table_name</code> | Name of the table containing the data to be transformed |
| <code>xform_view_name</code> | Name of the view to be created. The view presents columns in <code>data_table_name</code> with the transformations specified in <code>bin_table_name</code> . |
| <code>literal_flag</code> | Indicates whether the values in the <code>bin</code> column in the transformation definition table are valid SQL literals. When <code>literal_flag</code> is <code>FALSE</code> (the default), the bin identifiers will be transformed to SQL literals by surrounding them with single quotes. Set <code>literal_flag</code> to <code>TRUE</code> if the bin identifiers are numbers that should have a numeric datatype, as is the case for an O-Cluster model. See " INSERT_BIN_NUM_EQWIDTH Procedure " for an example. |
| <code>bin_schema_name</code> | Schema of <code>bin_table_name</code> . If no schema is specified, the current schema is used. |
| <code>data_schema_name</code> | Schema of <code>data_table_name</code> . If no schema is specified, the current schema is used. |
| <code>xform_schema_name</code> | Schema of <code>xform_view_name</code> . If no schema is specified, the current schema is used. |

Usage Notes

See "[Operational Notes](#)".

Examples

This example creates a view that bins the `cust_credit_limit` column. The data source consists of three columns from `sh.customer`.

```
describe mining_data
Name                               Null?    Type
-----
CUST_ID                             NOT NULL NUMBER
CUST_POSTAL_CODE                     NOT NULL VARCHAR2(10)
CUST_CREDIT_LIMIT                    NUMBER

53.6.33 XFORM_CLIP Procedure

This procedure creates a view that implements the clipping transformations specified in a definition table. Only the columns that are specified in the definition table are transformed; the remaining columns from the data table are present in the view, but they are not changed.

Syntax

```
DBMS_DATA_MINING_TRANSFORM.XFORM_CLIP (
  clip_table_name      IN VARCHAR2,
  data_table_name      IN VARCHAR2,
  xform_view_name      IN VARCHAR2,
  clip_schema_name     IN VARCHAR2 DEFAULT NULL,
  data_schema_name     IN VARCHAR2,DEFAULT NULL,
  xform_schema_name    IN VARCHAR2,DEFAULT NULL);
```

Parameters

Table 53-43 XFORM_CLIP Procedure Parameters

| Parameter | Description |
|--------------------------------|---|
| <code>clip_table_name</code> | Name of the transformation definition table for clipping. You can use the CREATE_CLIP Procedure to create the definition table. The table must be populated with transformation definitions before you call XFORM_CLIP. To populate the table, you can use one of the INSERT procedures for clipping you can write your own SQL. See Table 53-8 . |
| <code>data_table_name</code> | Name of the table containing the data to be transformed |
| <code>xform_view_name</code> | Name of the view to be created. The view presents columns in <code>data_table_name</code> with the transformations specified in <code>clip_table_name</code> . |
| <code>clip_schema_name</code> | Schema of <code>clip_table_name</code> . If no schema is specified, the current schema is used. |
| <code>data_schema_name</code> | Schema of <code>data_table_name</code> . If no schema is specified, the current schema is used. |
| <code>xform_schema_name</code> | Schema of <code>xform_view_name</code> . If no schema is specified, the current schema is used. |

Examples

This example creates a view that clips the `cust_credit_limit` column. The data source consists of three columns from `sh.customer`.

```

describe mining_data
Name                               Null?   Type
-----
CUST_ID                             NOT NULL NUMBER
CUST_POSTAL_CODE                     NOT NULL VARCHAR2(10)
CUST_CREDIT_LIMIT                     NUMBER

BEGIN
  dbms_data_mining_transform.create_clip(
    clip_table_name => 'clip_tbl');
  dbms_data_mining_transform.insert_clip_trim_tail(
    clip_table_name => 'clip_tbl',
    data_table_name => 'mining_data',
    tail_frac       => 0.05,
    exclude_list    => dbms_data_mining_transform.COLUMN_LIST('cust_id'));
  dbms_data_mining_transform.xform_clip(
    clip_table_name => 'clip_tbl',
    data_table_name => 'mining_data',
    xform_view_name => 'clip_view');
END;
/
describe clip_view

```

53.6.34 XFORM_COL_REM Procedure

This procedure creates a view that implements the column removal transformations specified in a definition table. Only the columns that are specified in the definition table are removed; the remaining columns from the data table are present in the view.

Syntax

```

DBMS_DATA_MINING_TRANSFORM.XFORM_COL_REM (
  rem_table_name  IN      VARCHAR2,
  data_table_name IN      VARCHAR2,

```

```

xform_view_name    IN      VARCHAR2,
rem_schema_name    IN      VARCHAR2 DEFAULT NULL,
data_schema_name   IN      VARCHAR2 DEFAULT NULL,
xform_schema_name  IN      VARCHAR2 DEFAULT NULL);

```

Parameters

Table 53-44 XFORM_COL_REM Procedure Parameters

| Parameter | Description |
|-------------------|--|
| rem_table_name | Name of the transformation definition table for column removal. You can use the CREATE_COL_REM Procedure to create the definition table. See Table 53-10 . The table must be populated with column names before you call XFORM_COL_REM. The INSERT_BIN_SUPER Procedure and the INSERT_AUTOBIN_NUM_EQWIDTH Procedure can optionally be used to populate the table. You can also use SQL INSERT statements. |
| data_table_name | Name of the table containing the data to be transformed |
| xform_view_name | Name of the view to be created. The view presents the columns in <i>data_table_name</i> that are not specified in <i>rem_table_name</i> . |
| rem_schema_name | Schema of <i>rem_table_name</i> . If no schema is specified, the current schema is used. |
| data_schema_name | Schema of <i>data_table_name</i> . If no schema is specified, the current schema is used. |
| xform_schema_name | Schema of <i>xform_view_name</i> . If no schema is specified, the current schema is used. |

Usage Notes

See "[Operational Notes](#)".

Examples

This example creates a view that includes all but one column from the table `customers` in the current schema.

```

describe customers
Name                                     Null?    Type
-----
CUST_ID                                 NOT NULL NUMBER
CUST_MARITAL_STATUS                     VARCHAR2(20)
OCCUPATION                               VARCHAR2(21)
AGE                                       NUMBER
YRS_RESIDENCE                            NUMBER

BEGIN
  DBMS_DATA_MINING_TRANSFORM.CREATE_COL_REM ('colrem_xtbl');
END;
/
INSERT INTO colrem_xtbl VALUES('CUST_MARITAL_STATUS', null);

```

NOTE: This currently doesn't work. See bug 9310319

```

BEGIN
  DBMS_DATA_MINING_TRANSFORM.XFORM_COL_REM (
    rem_table_name      => 'colrem_xtbl',
    data_table_name     => 'customers',
    xform_view_name     => 'colrem_view');
END;
/
describe colrem_view

```

| Name | Null? | Type |
|---------------|----------|---------------|
| CUST_ID | NOT NULL | NUMBER |
| OCCUPATION | | VARCHAR2 (21) |
| AGE | | NUMBER |
| YRS_RESIDENCE | | NUMBER |

53.6.35 XFORM_EXPR_NUM Procedure

This procedure creates a view that implements the specified numeric transformations. Only the columns that you specify are transformed; the remaining columns from the data table are present in the view, but they are not changed.

Syntax

```

DBMS_DATA_MINING_TRANSFORM.XFORM_EXPR_NUM (
  expr_pattern      IN      VARCHAR2,
  data_table_name  IN      VARCHAR2,
  xform_view_name  IN      VARCHAR2,
  exclude_list     IN      COLUMN_LIST DEFAULT NULL,
  include_list     IN      COLUMN_LIST DEFAULT NULL,
  col_pattern      IN      VARCHAR2 DEFAULT ':col',
  data_schema_name IN      VARCHAR2 DEFAULT NULL,
  xform_schema_name IN     VARCHAR2 DEFAULT NULL);

```

Parameters

Table 53-45 XFORM_EXPR_NUM Procedure Parameters

| Parameter | Description |
|------------------------------|---|
| <code>expr_pattern</code> | A numeric transformation expression |
| <code>data_table_name</code> | Name of the table containing the data to be transformed |
| <code>xform_view_name</code> | Name of the view to be created. The view presents columns in <code>data_table_name</code> with the transformations specified in <code>expr_pattern</code> and <code>col_pattern</code> . |
| <code>exclude_list</code> | List of numerical columns to exclude. If NULL, no numerical columns are excluded. The format of <code>exclude_list</code> is: <code>dbms_data_mining_transform.COLUMN_LIST('col1','col2', ...'coln')</code> |

Table 53-45 (Cont.) XFORM_EXPR_NUM Procedure Parameters

| Parameter | Description |
|--------------------------------|---|
| <code>include_list</code> | List of numeric columns to include. If NULL, all numeric columns are included. The format of <code>include_list</code> is: <pre>dbms_data_mining_transform.COLUMN_LIST('col1','col2', ...'coln')</pre> |
| <code>col_pattern</code> | The value within <code>expr_pattern</code> that will be replaced with a column name. The value of <code>col_pattern</code> is case-sensitive. The default value of <code>col_pattern</code> is ':col' |
| <code>data_schema_name</code> | Schema of <code>data_table_name</code> . If no schema is specified, the current schema is used. |
| <code>xform_schema_name</code> | Schema of <code>xform_view_name</code> . If no schema is specified, the current schema is used. |

Usage Notes

- The XFORM_EXPR_NUM procedure constructs numeric transformation expressions from the specified expression pattern (`expr_pattern`) by replacing every occurrence of the specified column pattern (`col_pattern`) with an actual column name.

XFORM_EXPR_NUM uses the SQL REPLACE function to construct the transformation expressions.

```
REPLACE (expr_pattern, col_pattern, "column_name") || "column_name"
```

If there is a column match, then the replacement is made in the transformation expression; if there is not a match, then the column is used without transformation.

 **See:**

Oracle Database SQL Language Reference for information about the REPLACE function

- Because of the include and exclude list parameters, the XFORM_EXPR_NUM and XFORM_EXPR_STR procedures allow you to easily specify individual columns for transformation within large data sets. The other XFORM_* procedures support an exclude list only. In these procedures, you must enumerate every column that you do not want to transform.
- See "Operational Notes"

Examples

This example creates a view that transforms the datatype of numeric columns.

```
describe customers
Name                               Null?    Type
-----
```

```

CUST_ID                                NOT NULL NUMBER
CUST_MARITAL_STATUS                    VARCHAR2 (20)
OCCUPATION                              VARCHAR2 (21)
AGE                                      NUMBER
YRS_RESIDENCE                           NUMBER

BEGIN
  DBMS_DATA_MINING_TRANSFORM.XFORM_EXPR_NUM(
    expr_pattern      => 'to_char(:col)',
    data_table_name   => 'customers',
    xform_view_name   => 'cust_nonum_view',
    exclude_list      => dbms_data_mining_transform.COLUMN_LIST( 'cust_id'),
    include_list      => null,
    col_pattern       => ':col');
END;
/
describe cust_nonum_view
Name                                Null?    Type
-----
CUST_ID                             NOT NULL NUMBER
CUST_MARITAL_STATUS                  VARCHAR2 (20)
OCCUPATION                           VARCHAR2 (21)
AGE                                   VARCHAR2 (40)
YRS_RESIDENCE                        VARCHAR2 (40)

```

53.6.36 XFORM_EXPR_STR Procedure

This procedure creates a view that implements the specified categorical transformations. Only the columns that you specify are transformed; the remaining columns from the data table are present in the view, but they are not changed.

Syntax

```

DBMS_DATA_MINING_TRANSFORM.XFORM_EXPR_STR (
  expr_pattern      IN      VARCHAR2,
  data_table_name   IN      VARCHAR2,
  xform_view_name   IN      VARCHAR2,
  exclude_list      IN      COLUMN_LIST DEFAULT NULL,
  include_list      IN      COLUMN_LIST DEFAULT NULL,
  col_pattern       IN      VARCHAR2 DEFAULT ':col',
  data_schema_name IN      VARCHAR2 DEFAULT NULL,
  xform_schema_name IN      VARCHAR2 DEFAULT NULL);

```

Parameters

Table 53-46 XFORM_EXPR_STR Procedure Parameters

| Parameter | Description |
|------------------------------|--|
| <code>expr_pattern</code> | A character transformation expression |
| <code>data_table_name</code> | Name of the table containing the data to be transformed |
| <code>xform_view_name</code> | Name of the view to be created. The view presents columns in <code>data_table_name</code> with the transformations specified in <code>expr_pattern</code> and <code>col_pattern</code> . |

Table 53-46 (Cont.) XFORM_EXPR_STR Procedure Parameters

| Parameter | Description |
|--------------------------------|--|
| <code>exclude_list</code> | <p>List of categorical columns to exclude. If NULL, no categorical columns are excluded.</p> <p>The format of <code>exclude_list</code> is:</p> <pre>dbms_data_mining_transform.COLUMN_LIST('col1','col2', ...'coln')</pre> |
| <code>include_list</code> | <p>List of character columns to include. If NULL, all character columns are included.</p> <p>The format of <code>include_list</code> is:</p> <pre>dbms_data_mining_transform.COLUMN_LIST('col1','col2', ...'coln')</pre> |
| <code>col_pattern</code> | <p>The value within <code>expr_pattern</code> that will be replaced with a column name. The value of <code>col_pattern</code> is case-sensitive.</p> <p>The default value of <code>col_pattern</code> is <code>':col'</code></p> |
| <code>data_schema_name</code> | <p>Schema of <code>data_table_name</code>. If no schema is specified, the current schema is used.</p> |
| <code>xform_schema_name</code> | <p>Schema of <code>xform_view_name</code>. If no schema is specified, the current schema is used.</p> |

Usage Notes

1. The `XFORM_EXPR_STR` procedure constructs character transformation expressions from the specified expression pattern (`expr_pattern`) by replacing every occurrence of the specified column pattern (`col_pattern`) with an actual column name.

`XFORM_EXPR_STR` uses the SQL `REPLACE` function to construct the transformation expressions.

```
REPLACE (expr_pattern, col_pattern, "column_name") || "column_name"
```

If there is a column match, then the replacement is made in the transformation expression; if there is not a match, then the column is used without transformation.

 **See:**

Oracle Database SQL Language Reference for information about the `REPLACE` function

2. Because of the include and exclude list parameters, the `XFORM_EXPR_STR` and `XFORM_EXPR_NUM` procedures allow you to easily specify individual columns for transformation within large data sets. The other `XFORM_*` procedures support an exclude list only. In these procedures, you must enumerate every column that you do not want to transform.
3. See ["Operational Notes"](#)

Examples

This example creates a view that transforms character columns to upper case.

```

describe customers
Name                                     Null?   Type
-----
CUST_ID                                 NOT NULL NUMBER
CUST_MARITAL_STATUS                     VARCHAR2 (20)
OCCUPATION                               VARCHAR2 (21)
AGE                                       NUMBER
YRS_RESIDENCE                            NUMBER

SELECT cust_id, cust_marital_status, occupation FROM customers
       WHERE cust_id > 102995
       ORDER BY cust_id desc;

53.6.37 XFORM_MISS_CAT Procedure

This procedure creates a view that implements the categorical missing value treatment transformations specified in a definition table. Only the columns that are specified in the

definition table are transformed; the remaining columns from the data table are present in the view, but they are not changed.

Syntax

```
DBMS_DATA_MINING_TRANSFORM.XFORM_MISS_CAT (
    miss_table_name      IN VARCHAR2,
    data_table_name      IN VARCHAR2,
    xform_view_name      IN VARCHAR2,
    miss_schema_name     IN VARCHAR2 DEFAULT NULL,
    data_schema_name     IN VARCHAR2 DEFAULT NULL,
    xform_schema_name    IN VARCHAR2 DEFAULT NULL;
```

Parameters

Table 53-47 XFORM_MISS_CAT Procedure Parameters

| Parameter | Description |
|--------------------------------|---|
| <code>miss_table_name</code> | Name of the transformation definition table for categorical missing value treatment. You can use the CREATE_MISS_CAT Procedure to create the definition table. The table must be populated with transformation definitions before you call <code>XFORM_MISS_CAT</code> . To populate the table, you can use the INSERT_MISS_CAT_MODE Procedure or you can write your own SQL. See Table 53-12 . |
| <code>data_table_name</code> | Name of the table containing the data to be transformed |
| <code>xform_view_name</code> | Name of the view to be created. The view presents columns in <code>data_table_name</code> with the transformations specified in <code>miss_table_name</code> . |
| <code>miss_schema_name</code> | Schema of <code>miss_table_name</code> . If no schema is specified, the current schema is used. |
| <code>data_schema_name</code> | Schema of <code>data_table_name</code> . If no schema is specified, the current schema is used. |
| <code>xform_schema_name</code> | Schema of <code>xform_view_name</code> . If no schema is specified, the current schema is used. |

Usage Notes

See "[Operational Notes](#)".

Examples

This example creates a view that replaces missing categorical values with the mode.

53.6.38 XFORM_MISS_NUM Procedure

This procedure creates a view that implements the numerical missing value treatment transformations specified in a definition table. Only the columns that are specified in the definition table are transformed; the remaining columns from the data table are present in the view, but they are not changed.

Syntax

```
DBMS_DATA_MINING_TRANSFORM.XFORM_MISS_NUM (
    miss_table_name      IN VARCHAR2,
    data_table_name     IN VARCHAR2,
    xform_view_name     IN VARCHAR2,
    miss_schema_name    IN VARCHAR2 DEFAULT NULL,
    data_schema_name    IN VARCHAR2 DEFAULT NULL,
    xform_schema_name   IN VARCHAR2 DEFAULT NULL;
```

Parameters

Table 53-48 XFORM_MISS_NUM Procedure Parameters

| Parameter | Description |
|--------------------------------|---|
| <code>miss_table_name</code> | Name of the transformation definition table for numerical missing value treatment. You can use the CREATE_MISS_NUM Procedure to create the definition table. The table must be populated with transformation definitions before you call <code>XFORM_MISS_NUM</code> . To populate the table, you can use the INSERT_MISS_NUM_MEAN Procedure or you can write your own SQL. See Table 53-14 . |
| <code>data_table_name</code> | Name of the table containing the data to be transformed |
| <code>xform_view_name</code> | Name of the view to be created. The view presents columns in <code>data_table_name</code> with the transformations specified in <code>miss_table_name</code> . |
| <code>miss_schema_name</code> | Schema of <code>miss_table_name</code> . If no schema is specified, the current schema is used. |
| <code>data_schema_name</code> | Schema of <code>data_table_name</code> . If no schema is specified, the current schema is used. |
| <code>xform_schema_name</code> | Schema of <code>xform_view_name</code> . If no schema is specified, the current schema is used. |

Usage Notes

See "[Operational Notes](#)".

Examples

This example creates a view that replaces missing numerical values with the mean.

```
SELECT * FROM items;
```

```
ITEM_ID      QTY
-----
aa           200
bb           200
```

```

cc          250
dd
ee
ff          100
gg          250
hh          200
ii
jj          200

SELECT AVG(qty) FROM items;

AVG(QTY)
-----
      200

BEGIN
  DBMS_DATA_MINING_TRANSFORM.CREATE_MISS_NUM('misnum_xtbl');
  DBMS_DATA_MINING_TRANSFORM.INSERT_MISS_NUM_MEAN (
    miss_table_name      => 'misnum_xtbl',
    data_table_name      => 'items' );
END;
/

SELECT col, val FROM misnum_xtbl;

COL          VAL
-----
QTY          200

BEGIN
  DBMS_DATA_MINING_TRANSFORM.XFORM_MISS_NUM (
    miss_table_name      => 'misnum_xtbl',
    data_table_name      => 'items',
    xform_view_name      => 'items_view');
END;
/

SELECT * FROM items_view;

ITEM_ID      QTY
-----
aa           200
bb           200
cc           250
dd           200
ee           200
ff           100
gg           250
hh           200
ii           200
jj           200

```

53.6.39 XFORM_NORM_LIN Procedure

This procedure creates a view that implements the linear normalization transformations specified in a definition table. Only the columns that are specified in the definition table are

transformed; the remaining columns from the data table are present in the view, but they are not changed.

Syntax

```
DBMS_DATA_MINING_TRANSFORM.XFORM_NORM_LIN (
    norm_table_name      IN VARCHAR2,
    data_table_name      IN VARCHAR2,
    xform_view_name      IN VARCHAR2,
    norm_schema_name     IN VARCHAR2 DEFAULT NULL,
    data_schema_name     IN VARCHAR2 DEFAULT NULL,
    xform_schema_name    IN VARCHAR2 DEFAULT NULL);
```

Parameters

Table 53-49 XFORM_NORM_LIN Procedure Parameters

| Parameter | Description |
|--------------------------------|--|
| <code>norm_table_name</code> | Name of the transformation definition table for linear normalization. You can use the CREATE_NORM_LIN Procedure to create the definition table. The table must be populated with transformation definitions before you call <code>XFORM_NORM_LIN</code> . To populate the table, you can use one of the <code>INSERT</code> procedures for normalization or you can write your own SQL. See Table 53-12 . |
| <code>data_table_name</code> | Name of the table containing the data to be transformed |
| <code>xform_view_name</code> | Name of the view to be created. The view presents columns in <code>data_table_name</code> with the transformations specified in <code>miss_table_name</code> . |
| <code>norm_schema_name</code> | Schema of <code>miss_table_name</code> . If no schema is specified, the current schema is used. |
| <code>data_schema_name</code> | Schema of <code>data_table_name</code> . If no schema is specified, the current schema is used. |
| <code>xform_schema_name</code> | Schema of <code>xform_view_name</code> . If no schema is specified, the current schema is used. |

Usage Notes

See "[Operational Notes](#)".

Examples

This example creates a view that normalizes the `cust_year_of_birth` and `cust_credit_limit` columns. The data source consists of three columns from `sh.customer`.

```
CREATE OR REPLACE VIEW mining_data AS
    SELECT cust_id, cust_year_of_birth, cust_credit_limit
    FROM sh.customers;
```

```
describe mining_data
```

| Name | Null? | Type |
|--------------------|----------|-----------|
| CUST_ID | NOT NULL | NUMBER |
| CUST_YEAR_OF_BIRTH | NOT NULL | NUMBER(4) |

```

CUST_CREDIT_LIMIT                                NUMBER

SELECT * FROM mining_data WHERE cust_id > 104495
        ORDER BY cust_year_of_birth;

_CREDIT_LIMIT"-1500)/13500 "CUST_CREDIT_LIMIT" FROM mining_data

```

53.6.40 XFORM_STACK Procedure

This procedure creates a view that implements the transformations specified by the stack. Only the columns and nested attributes that are specified in the stack are transformed. Any remaining columns and nested attributes from the data table appear in the view without changes.

To create a list of objects that describe the transformed columns, use the [DESCRIBE_STACK Procedure](#).

See Also:

["Overview"](#)

Oracle Machine Learning for SQL User's Guide for more information about machine learning attributes

Syntax

```
DBMS_DATA_MINING_TRANSFORM.XFORM_STACK (
    xform_list          IN      TRANSFORM_list,
    data_table_name    IN      VARCHAR2,
    xform_view_name    IN      VARCHAR2,
    data_schema_name   IN      VARCHAR2 DEFAULT NULL,
    xform_schema_name  IN      VARCHAR2 DEFAULT NULL);
```

Parameters

Table 53-50 XFORM_STACK Procedure Parameters

| Parameter | Description |
|-------------------|---|
| xform_list | The transformation list. See Table 53-1 for a description of the TRANSFORM_LIST object type. |
| data_table_name | Name of the table containing the data to be transformed |
| xform_view_name | Name of the view to be created. The view applies the transformations in <i>xform_list</i> to <i>data_table_name</i> . |
| data_schema_name | Schema of <i>data_table_name</i> . If no schema is specified, the current schema is used. |
| xform_schema_name | Schema of <i>xform_view_name</i> . If no schema is specified, the current schema is used. |

Usage Notes

See ["Operational Notes"](#). The following sections are especially relevant:

- ["About Transformation Lists"](#)
- ["About Stacking"](#)
- ["Nested Data Transformations"](#)

Examples

This example applies a transformation list to the view `oml_user.cust_info` and shows how the data is transformed. The `CREATE` statement for `cust_info` is shown in "[DESCRIBE_STACK Procedure](#)".

```
BEGIN
  dbms_data_mining_transform.CREATE_BIN_NUM ('birth_yr_bins');
  dbms_data_mining_transform.INSERT_BIN_NUM_QTILE (
    bin_table_name => 'birth_yr_bins',
    data_table_name => 'cust_info',
    bin_num        => 6,
    exclude_list   => dbms_data_mining_transform.column_list(
                      'cust_id','country_id'));
END;
/
SELECT * FROM birth_yr_bins;
```

| COL | ATT | VAL | BIN |
|--------------------|-----|------|-----|
| CUST_YEAR_OF_BIRTH | | 1922 | |
| CUST_YEAR_OF_BIRTH | | 1951 | 1 |
| CUST_YEAR_OF_BIRTH | | 1959 | 2 |
| CUST_YEAR_OF_BIRTH | | 1966 | 3 |
| CUST_YEAR_OF_BIRTH | | 1973 | 4 |
| CUST_YEAR_OF_BIRTH | | 1979 | 5 |
| CUST_YEAR_OF_BIRTH | | 1986 | 6 |

```
DECLARE
  cust_stack dbms_data_mining_transform.TRANSFORM_LIST;
BEGIN
  dbms_data_mining_transform.SET_TRANSFORM (cust_stack,
    'country_id', NULL, 'country_id/10', 'country_id*10');
  dbms_data_mining_transform.STACK_BIN_NUM ('birth_yr_bins',
    cust_stack);
  dbms_data_mining_transform.SET_TRANSFORM (cust_stack,
    'custprods', 'Mouse Pad', 'value*100', 'value/100');
  dbms_data_mining_transform.XFORM_STACK(
    xform_list      => cust_stack,
    data_table_name => 'cust_info',
    xform_view_name => 'cust_xform_view');
END;
/

-- Two rows of data without transformations
SELECT * from cust_info WHERE cust_id BETWEEN 100010 AND 100011;
```

| CUST_ID | COUNTRY_ID | CUST_YEAR_OF_BIRTH | CUSTPRODS (ATTRIBUTE_NAME, VALUE) |

```

DBMS_DATAPUMP

The `DBMS_DATAPUMP` package is used to move all, or part of, a database between databases, including both data and metadata.

See Also:

Oracle Database Utilities for more information on the concepts behind the `DBMS_DATAPUMP` API, how it works, and how it is implemented in the Data Pump Export and Import utilities

This chapter contains the following topics:

- [Overview](#)
- [Security Model](#)
- [Constants](#)
- [Data Structures](#)
- [Summary of DBMS_DATAPUMP Subprograms](#)

54.1 DBMS_DATAPUMP Overview

`DBMS_DATAPUMP` provides the following support and functionality.

- The source and target databases can have different hardware, operating systems, character sets, time zones, and versions.
- All object types and datatypes existing in Oracle Database 11g and higher are supported.
- Data and metadata can be transferred between databases without using any intermediary files.
- A subset of a database can be moved based upon object type and names of objects.
- Schema names, data file names, tablespace names, and data can be transformed at import time.
- Previously aborted export and import jobs can be restarted without duplicating or omitting any data or metadata from the original job.
- The resources applied to an export or import job can be modified.
- Data in an Oracle proprietary format can be unloaded and loaded.

54.2 DBMS_DATAPUMP Security Model

Security for the `DBMS_DATAPUMP` package is implemented through roles.

The `DATAPUMP_EXP_FULL_DATABASE` and `DATAPUMP_IMP_FULL_DATABASE` roles allow privileged users to take full advantage of the API. The Data Pump API will use these roles to determine whether privileged application roles should be assigned to the processes comprising the job.

- `DATAPUMP_EXP_FULL_DATABASE`

The `DATAPUMP_EXP_FULL_DATABASE` role affects only Export operations. It allows users running these operations to do the following:

- Perform the operation outside of the scope of their schema
- Monitor jobs that were initiated by another user
- Export objects (for example, `TABLESPACE` definitions) that unprivileged users cannot reference

Although the `SYS` schema does not have the `DATAPUMP_EXP_FULL_DATABASE` role assigned to it, all security checks performed by Data Pump that require the `DATAPUMP_EXP_FULL_DATABASE` role will also grant access to the `SYS` schema.

- `DATAPUMP_IMP_FULL_DATABASE`

The `DATAPUMP_IMP_FULL_DATABASE` role affects only Import and `SQL_FILE` operations. It allows users running these operations to do the following:

- Perform the operation outside of the scope of their schema
- Monitor jobs that were initiated by another user
- Import objects (for example, `DIRECTORY` definitions) that unprivileged users cannot create

Although the `SYS` schema does not have the `DATAPUMP_IMP_FULL_DATABASE` role assigned to it, all security checks performed by Data Pump that require the `DATAPUMP_IMP_FULL_DATABASE` role will also grant access to the `SYS` schema.

54.3 DBMS_DATAPUMP Constants

There are several public constants defined for use with the `DBMS_DATAPUMP.GET_STATUS` procedure. All such constants are defined as part of the `DBMS_DATAPUMP` package. Any references to these constants must be prefixed by `DBMS_DATAPUMP.` and followed by the symbols in the following lists:

Mask Bit Definitions

The following mask bit definitions are used for controlling the return of data through the `DBMS_DATAPUMP.GET_STATUS` procedure.

- `KU$_STATUS_WIP` CONSTANT `BINARY_INTEGER` := 1;
- `KU$_STATUS_JOB_DESC` CONSTANT `BINARY_INTEGER` := 2;
- `KU$_STATUS_JOB_STATUS` CONSTANT `BINARY_INTEGER` := 4;
- `KU$_STATUS_JOB_ERROR` CONSTANT `BINARY_INTEGER` := 8;

Dump File Type Definitions

The following definitions are used for identifying types of dump files returned through the `DBMS_DATAPUMP.GET_STATUS` procedure.

- `KU$_DUMPFILTYPE_DISK` CONSTANT BINARY_INTEGER := 0;
- `KU$_DUMPFILTYPE_TEMPLATE` CONSTANT BINARY_INTEGER := 3;

54.4 DBMS_DATAPUMP Data Structures

The `DBMS_DATAPUMP` package defines `OBJECT` types. The types described in this section are defined in the `SYS` schema for use by the `GET_STATUS` function. *The way in which these types are defined and used may be different than what you are accustomed to. Be sure to read this section carefully.*

The collection of types defined for use with the `GET_STATUS` procedure are version-specific and include version information in the names of the types. Once introduced, these types will always be provided and supported in future versions of Oracle Database and will not change. However, in future releases of Oracle Database, new versions of these types might be created that provide new or different information. The new versions of these types will have different version information embedded in the type names.

For example, in Oracle Database 12c, Release 1 (12.1), there is a `sys.ku$_Status1210` type, and in the next Oracle Database release, there could be a `sys.ku$_Status1310` type defined. Both types could be used with the `GET_STATUS` procedure.

Public synonyms have been defined for each of the types used with the `GET_STATUS` procedure. This makes it easier to use the types and means that you do not have to be concerned with changes to the actual type names or schemas where they reside. Oracle recommends that you use these synonyms whenever possible.

For each of the types, there is a version-specific synonym and a generic synonym. For example, the version-specific synonym `ku$_Status1210` is defined for the `sys.ku$_Status1210` type.

The generic synonym always describes the latest version of that type. For example, in Oracle Database 12c, Release 1 (12.1), the generic synonym `ku$_Status` is defined as `ku$_Status1210`. In a future release, there might be a `ku$_Status1310` synonym for `sys.ku$_Status1310`. Because the `ku$_Status` generic synonym always points to the latest definition, it would then point to `ku$_Status1310` rather than to `ku$_Status1210`.

The choice of whether to use version-specific synonyms or generic synonyms makes a significant difference in how you work. Using version-specific names protects your code from changes in future releases of Oracle Database because those types will continue to exist and be supported. However, access to new information will require code changes to use new synonym names for each of the types. Using the generic names implies that you always want the latest definition of the types and are prepared to deal with changes in different releases of Oracle Database.

When the version of Oracle Database that you are using changes, any C code that accesses types through generic synonym names will need to be recompiled.

 **Note:**

Languages other than PL/SQL must ensure that their type definitions are properly aligned with the version-specific definitions.

 **See Also:**

[GET_STATUS Procedure](#) for additional information about how types are used

Data Structures — Object Types

The `DBMS_DATAPUMP` package defines the following kinds of `OBJECT` types:

- Worker Status Types
- Log Entry and Error Types
- Job Status Types
- Job Description Types
- Status Types

Worker Status Types

The worker status types describe what each worker process in a job is doing. The schema, object name, and object type of an object being processed will be provided. For workers processing user data, the partition name for a partitioned table (if any), the number of bytes processed in the partition, and the number of rows processed in the partition are also returned. Workers processing metadata provide status on the last object that was processed. No status for idle threads is returned.

The `percent_done` refers to the amount completed for the current data item being processed. It is not updated for metadata objects.

The worker status types are defined as follows:

```
CREATE TYPE sys.ku$_WorkerStatus1010 AS OBJECT
(
    worker_number    NUMBER,           -- Worker process identifier
    process_name     VARCHAR2(30),    -- Worker process name
    state            VARCHAR2(30),    -- Worker process state
    schema           VARCHAR2(30),    -- Schema name
    name             VARCHAR2(4000),  -- Object name
    object_type      VARCHAR2(200),  -- Object type
    partition        VARCHAR2(30),    -- Partition name
    completed_objects NUMBER,         -- Completed number of objects
    total_objects    NUMBER,         -- Total number of objects
    completed_rows   NUMBER,         -- Number of rows completed
    completed_bytes  NUMBER,         -- Number of bytes completed
    percent_done     NUMBER          -- Percent done current object
)

CREATE OR REPLACE PUBLIC SYNONYM ku$_WorkerStatus1010

```

Log Entry and Error Types

These types provide informational and error text to attached clients and the log stream. The `ku$LogLine.errorNumber` type is set to `NULL` for informational messages but is specified for error messages. Each log entry may contain several lines of text messages.

The log entry and error types are defined as follows:

```

CREATE TYPE sys.ku$_LogLine1010 AS OBJECT (
    logLineNumber    NUMBER,
    errorNumber      NUMBER,
    LogText          VARCHAR2(2000))

CREATE OR REPLACE PUBLIC SYNONYM ku$_LogLine1010 FOR sys.ku$_LogLine1010;
CREATE OR REPLACE PUBLIC SYNONYM ku$_LogLine1020 FOR sys.ku$_LogLine1010;
CREATE OR REPLACE PUBLIC SYNONYM ku$_LogLine FOR ku$_LogLine1010;
CREATE TYPE sys.ku$_LogEntry1010 AS TABLE OF sys.ku$_LogLine1010

CREATE OR REPLACE PUBLIC SYNONYM ku$_LogEntry1010 FOR sys.ku$_LogEntry1010;
CREATE OR REPLACE PUBLIC SYNONYM ku$_LogEntry1020 FOR sys.ku$_LogEntry1010;
CREATE OR REPLACE PUBLIC SYNONYM ku$_LogEntry FOR ku$_LogEntry1010;

```

Job Status Types

The job status type returns status about a job. Usually, the status concerns a running job, but it could also be about a stopped job when a client attaches. It is typically requested at attach time, when the client explicitly requests status from interactive mode and every *N* seconds when the client has requested status periodically.

The job status types are defined as follows (`percent_done` applies to data only):

```

CREATE TYPE sys.ku$_JobStatus1010 IS OBJECT
(
    job_name          VARCHAR2(30),          -- Name of the job
    operation         VARCHAR2(30),          -- Current operation
    job_mode          VARCHAR2(30),          -- Current mode
    bytes_processed   NUMBER,                -- Bytes so far
    total_bytes       NUMBER,                -- Total bytes for job
    percent_done      NUMBER,                -- Percent done
    degree            NUMBER,                -- Of job parallelism
    error_count       NUMBER,                -- #errors so far
    state             VARCHAR2(30),          -- Current job state
    phase             NUMBER,                -- Job phase
    restart_count     NUMBER,                -- #Job restarts
    worker_status_list ku$_WorkerStatusList1010, -- For (non-idle)

Job Description Types

The job description type holds all the environmental information about the job such as parameter settings and dump file set members. There are a couple of subordinate types required as well.

The job description types are defined as follows:

```
CREATE TYPE sys.ku$_JobDesc1010 IS OBJECT
(
    job_name          VARCHAR2(30),          -- The job name
    guid              RAW(16),              -- The job GUID
    operation          VARCHAR2(30),        -- Current operation
    job_mode           VARCHAR2(30),        -- Current mode
    remote_link        VARCHAR2(4000),      -- DB link, if any
    owner              VARCHAR2(30),        -- Job owner
    instance           VARCHAR2(16),        -- The instance name
    db_version         VARCHAR2(30),        -- Version of objects
    creator_privs      VARCHAR2(30),        -- Privs of job
    start_time         DATE,                -- This job start time
    max_degree         NUMBER,              -- Max. parallelism
    log_file           VARCHAR2(4000),      -- Log file name

Status Types

The status type is an aggregate of some the previous types defined and is the return value for the `GET_STATUS` call. The mask attribute indicates which types of information are being returned to the caller. It is created by a client's shadow process from information it retrieves off the status queue or directly from the master table.

For errors, the `ku$_LogEntry` that is returned has already had its log lines ordered for proper output. That is, the original `ku$_LogEntry` objects have been ordered from outermost context to innermost.

The status types are defined as follows:

```
CREATE TYPE sys.ku$_Status1010 IS OBJECT
(
    mask          NUMBER,          -- Status types present
    wip          ku$_LogEntry1010, -- Work in progress
    job_description ku$_JobDesc1010, -- Complete job description
    job_status    ku$_JobStatus1010, -- Detailed job status
    error        ku$_LogEntry1010 -- Multi-level context errors
)

```

```
CREATE OR REPLACE PUBLIC SYNONYM ku$_Status1010 FOR sys.ku$_Status1010;
```

```
CREATE TYPE sys.ku$_Status1020 IS OBJECT
(
    mask          NUMBER,          -- Status types present
    wip          ku$_LogEntry1010, -- Work in progress
    job_description ku$_JobDesc1020, -- Complete job description

```

```

        job_status      ku$_JobStatus1020,-- Detailed job status
        error           ku$_LogEntry1010 -- Multi-level context errors
    )

CREATE OR REPLACE PUBLIC SYNONYM ku$_Status1020 FOR sys.ku$_Status1020;

54.5 Summary of DBMS_DATAPUMP Subprograms

This table lists the DBMS_DATAPUMP subprograms in alphabetical order and briefly describes them.

Table 54-1 DBMS_DATAPUMP Package Subprograms

| Subprogram | Description |
|--|--|
| ADD_FILE Procedure | Adds dump files to the dump file set for an Export, Import, or SQL_FILE operation. In addition to dump files, other types of files can also be added by using the FILETYPE parameter provided with this procedure. |
| ATTACH Function | Used to gain access to a Data Pump job that is in the Defining, Executing, Idling, or Stopped state |
| DATA_FILTER Procedures | Specifies restrictions on the rows that are to be retrieved |

Table 54-1 (Cont.) DBMS_DATAPUMP Package Subprograms

| Subprogram | Description |
|--|---|
| DATA_REMAP Procedure | Specifies transformations to be applied to column data as it is exported from, or imported into, a database. |
| DETACH Procedure | Specifies that the user has no further interest in using the handle |
| GET_DUMPFILE_INFO Procedure | Retrieves information about a specified dump file |
| GET_STATUS Procedure | Monitors the status of a job or waits for the completion of a job or for more details on API errors |
| LOG_ENTRY Procedure | Inserts a message into the log file |
| METADATA_FILTER Procedure | Provides filters that allow you to restrict the items that are included in a job |
| METADATA_REMAP Procedure | Specifies a remapping to be applied to objects as they are processed in the specified job |
| METADATA_TRANSFORM Procedure | Specifies transformations to be applied to objects as they are processed in the specified job |
| OPEN Function | Declares a new job using the Data Pump API, the handle returned being used as a parameter for calls to all other procedures (but not to the <code>ATTACH</code> function) |
| SET_PARALLEL Procedure | Adjusts the degree of parallelism within a job |
| SET_PARAMETER Procedures | Specifies job-processing options |
| START_JOB Procedure | Begins or resumes execution of a job |
| STOP_JOB Procedure | Terminates a job, but optionally, preserves the state of the job |
| WAIT_FOR_JOB Procedure | Runs a job until it either completes normally or stops for some other reason |

54.5.1 ADD_FILE Procedure

This procedure adds files to the dump file set for an Export, Import, or `SQL_FILE` operation, or specifies the log file or the output file for a `SQL_FILE` operation.

Syntax

```
DBMS_DATAPUMP.ADD_FILE (
    handle      IN NUMBER,
    filename   IN VARCHAR2,
    directory  IN VARCHAR2,
    filesize   IN VARCHAR2 DEFAULT NULL,
    filetype   IN NUMBER DEFAULT DBMS_DATAPUMP.KU$_FILE_TYPE_DUMP_FILE,
    reusefile  IN NUMBER DEFAULT NULL);
```

Parameters

Table 54-2 ADD_FILE Procedure Parameters

| Parameter | Description |
|-----------|--|
| handle | The handle of a job. The current session must have previously attached to the handle through a call to either the <code>OPEN</code> or <code>ATTACH</code> function. |
| filename | <p>The name of the file that is being added. The <code>filename</code> parameter must be a simple filename without any directory path information. For dump files, the <code>filename</code> can include a substitution variable. For a description of available substitution variables, see the following table.</p> <p>The file can be written to or read from either the local file system or the Oracle Object Store. If you are interfacing with the local file system, the <code>filename</code> parameter must contain a filename without directory path information. If you are interfacing with the Oracle Object Store, the <code>filename</code> parameter must contain a valid URI to the location of a bucket within your compartment in the Oracle Object Store. You must also specify a valid <code>CREDENTIAL</code> in the directory parameter to access the bucket and the <code>DBMS_DATAPUMP.KU\$_FILE_TYPE_URIDUMP_FILE</code> file type in the <code>filetype</code> parameter. For examples, see <i>Using the Oracle Data Pump API</i> in <i>Oracle Database Utilities Guide</i>.</p> |
| directory | <p>If you are interfacing with the local file system, then the <code>directory</code> parameter specifies the name of a directory object within the database that is used to locate the filename. If you are interfacing with the Oracle Object Store, then the <code>directory</code> parameter must specify a valid <code>CREDENTIAL</code> to access the bucket where filename resides.</p> <p>Ensure that you specify a valid <code>directory</code> parameter.</p> |
| filesize | <p>The size of the dump file that is being added.</p> <p>It can be specified as follows:</p> <ul style="list-style-type: none"> • The number of bytes • The number of kilobytes (if followed by <code>K</code>) • The number of megabytes (if followed by <code>M</code>) • The number of gigabytes (if followed by <code>G</code>) • The number of terabytes (if followed by <code>T</code>) <p>An Export operation will write no more than the specified number of bytes to the file. When the file is full, it will be closed. If there is insufficient space on the device to write the specified number of bytes, then the Export operation will fail, but it can be restarted. If not specified, then <code>filesize</code> defaults to an unlimited size. For Import and <code>SQL_FILE</code> operations, <code>filesize</code> is ignored. The minimum value for <code>filesize</code> is ten times the default Data Pump block size, which is 4 kilobytes. A <code>filesize</code> can only be specified for dump files.</p> |
| filetype | <p>The type of the file that you want to add. The supported values are as follows:</p> <ul style="list-style-type: none"> • <code>DBMS_DATAPUMP.KU\$_FILE_TYPE_DUMP_FILE</code>—Dump file for a job • <code>DBMS_DATAPUMP.KU\$_FILE_TYPE_LOG_FILE</code>—Log file for a job • <code>DBMS_DATAPUMP.KU\$_FILE_TYPE_SQL_FILE</code>—Output for <code>SQL_FILE</code> job • <code>DBMS_DATAPUMP.KU\$_FILE_TYPE_URIDUMP_FILE</code>—Specifies a filename in the Oracle Object Store. For more information, see the <code>filename</code> and <code>directory</code> parameters described above. |

Table 54-2 (Cont.) ADD_FILE Procedure Parameters

| Parameter | Description |
|-----------|---|
| reusefile | If the value is 0, then a preexisting file will cause an error. If the value is 1, then a preexisting file will be overwritten. If the value is NULL, then the default action for the file type will be applied (that is, dump files will not be overwritten). This parameter should only be non-NULL for dump files. The reusefile parameter is restricted to export jobs. |

Substitution Variables

Table 54-3 Substitution Variables Available for the Filename Parameter on DBMS_DATAPUMP.ADD_FILE

| Substitution Variable | Description |
|-----------------------|--|
| %U | <p>The %U is expanded in the resulting file names into a two-character, fixed-width, incrementing integer starting at 01, and ending at 99. For example, the dump filename of export%U would cause export01, export02, export03, and so on, to be created depending on how many files are needed to perform the export up to export99. For filenames containing the % character, the % must be represented as %% to avoid ambiguity.</p> <p>Note: If you have more than 100 files, then Oracle recommends that you use the %L substitution variable.</p> |
| %l, %L | <p>Specifies a system-generated unique file name. The file names can contain a substitution variable (%L), which implies that multiple files may be generated. The substitution variable is expanded in the resulting file names into a 2-digit, fixed-width, incrementing integer starting at 01 and ending at 99 which is the same as (%U). In addition, the substitution variable is expanded in the resulting file names into a 3-digit to 10-digit, variable-width, incrementing integers starting at 100 and ending at 2147483646. The width field is determined by the number of digits in the integer.</p> <p>For example if the current integer was 1, exp%Laa%L.dmp would resolve to</p> <pre>exp01aa01.dmp exp02aa02.dmp</pre> <p>and so forth up until 99. Then, the next file name would have 3 digits substituted:</p> <pre>exp100aa100.dmp exp101aa101.dmp</pre> <p>and so forth up until 999 where the next file would have 4 digits substituted. The substitution will continue up to the largest number substitution allowed, which is 2147483646.</p> |
| %d, %D | <p>Specifies the current day of the month from the Gregorian calendar in format DD.</p> <p>Note: This substitution variable cannot be used in an import file name.</p> |
| %m, %M | <p>Specifies the month in the Gregorian calendar in format MM.</p> <p>Note: This substitution variable cannot be used in an import file name.</p> |

Table 54-3 (Cont.) Substitution Variables Available for the Filename Parameter on DBMS_DATAPUMP.ADD_FILE

| Substitution Variable | Description |
|-----------------------|---|
| %t, %T | Specifies the year, month, and day in the Gregorian calendar in this format: YYYYMMDD. Note: This substitution variable cannot be used in an import file name. |
| %y, %Y | Specifies the year in this format: YYYY. Note: This substitution variable cannot be used in an import file name. |

Exceptions

- `INVALID_HANDLE`. The specified handle is not attached to an Oracle Data Pump job.
- `INVALID_ARGVAL`. An invalid value was supplied for an input parameter.
- `INVALID_STATE`. The job is completing, or the job is past the defining state for an import or `SQL_FILE` job, or is past the defining state for `LOG` and `SQL` files.
- `INVALID_OPERATION`. A dump file was specified for a Network Import or `ESTIMATE_ONLY` export operation.
- `SUCCESS_WITH_INFO`. The procedure succeeded, but further information is available through the `GET_STATUS` procedure.
- `NO_SUCH_JOB`. The specified job does not exist.

Usage Notes

- This procedure adds files to an Oracle Data Pump job. You can add the following types of files to a job:
 - Log files—To record the messages associated with an operation. The Log file overwrites the previously existing files.
 - SQL files—To record the output of a `SQL_FILE` operation. The SQL file overwrites the previously existing files.
 - Dump files—To contain the data that is being moved. The Dump files do not overwrite the existing files. However, an error is generated.
- Import and `SQL_FILE` operations require that that you specify all dump files during the definition phase of the job. For Export operations, dump files can be added at any time. For example, if the user ascertains that the file space is running low during an Export, additional dump files can be added through this API. If the specified dump file already exists for an Export operation and `reusefile` is not set to 1, an error will be returned.
- For Export operations, the parallelism setting should be less than or equal to the number of dump files in the dump file set. If there are not enough dump files, then the job will not be able to maximize parallelism to the degree specified by the `SET_PARALLEL` procedure.
- For Import operations, the parallelism setting should also be less than or equal to the number of dump files in the dump file set. If there are not enough dump files,

the performance will not be optimal, as multiple threads of execution try to access the same dump file.

- If the substitution variable (%U) is included in a filename, then multiple dump files can be specified through a single call to `ADD_FILE`. For Export operations, the new dump files will be created as they are needed. Enough dump files will be created to allow all of the processes specified by the current `SET_PARALLEL` value to be active. If one of the dump files is full, then it is closed, and a new dump file (with a new generated name) is created to take its place. If multiple `ADD_FILES` with substitution variables have been specified for dump files in a job, then they will be used to generate dump files in a round-robin fashion. For example, if `expa%U`, `expb%U` and `expc%U` were all specified for a job having a parallelism of 6, then the initial dump files created would appear as follows: `expa01`, `expb01`, `expc01`, `expa02`, `expb02`, and `expc02`.
- If presented with dump file specifications, `expa%U`, `expb%U` and `expc%U`, then an Import or `SQL_FILE` operation will begin by attempting to open the dump files, `expa01`, `expb01`, and `expc01`. If the dump file containing the master table is not found in this set, then the operation will expand its search for dump files by incrementing the substitution variable and looking up the new filenames (for example, `expa02`, `expb02`, and `expc02`). The Oracle Data Pump API will keep expanding the search until it locates the dump file containing the master table. If the Oracle Data Pump API determines that the dump file does not exist, or that it is not part of the current dump set at any iteration, then the Oracle Data Pump API stops incrementing the substitution variable for the dump file specification that was in error. After the master table is found, the master table is used to ascertain when all of dump files in the dump file set have been located.

Examples

Note:

The examples in this section assume that the credentials, network ACLs, database account, and object-store information are already set up.

Example 1

The following example performs a table mode export to the Oracle Object Store.

```
CONNECT user;
Enter password: password

SET SERVEROUTPUT ON
SET ECHO ON
SET FEEDBACK 1
SET NUMWIDTH 10
SET LINESIZE 80
SET TRIMSPOOL ON
SET TAB OFF
SET PAGESIZE 100

DECLARE
    hdl          NUMBER;          -- Datapump handle
    ind          NUMBER;          -- Loop index
    le           ku$_LogEntry;    -- For WIP and error messages
    js           ku$_JobStatus;   -- The job status from get_status
```

```

jd          ku$_JobDesc;    -- The job description from get_status

54.5.2 ATTACH Function

This function provides access to a previously created job.

Syntax

```

DBMS_DATAPUMP.ATTACH (
    job_name      IN VARCHAR2 DEFAULT NULL,
    job_owner     IN VARCHAR2 DEFAULT NULL)
RETURN NUMBER;

```

Parameters

Table 54-4 ATTACH Function Parameters

| Parameter | Description |
|-----------|---|
| job_name | The name of the job. The default is the job name owned by the user who is specified in the job_owner parameter (assuming that user has only one job in the Defining, Executing, or Idling states). |
| job_owner | The user who originally started the job. If NULL, then the value defaults to the owner of the current session. To specify a job owner other than yourself, you must have either the DATAPUMP_EXP_FULL_DATABASE role (for export operations) or the DATAPUMP_IMP_FULL_DATABASE role (for import and SQL_FILE operations). Being a privileged user allows you to monitor another user's job, but you cannot restart another user's job. |

Return Values

An opaque handle for the job. This handle is used as input to the following procedures: ADD_FILE, DATA_FILTER, DETACH, GET_STATUS, LOG_ENTRY, METADATA_FILTER, METADATA_REMAP, METADATA_TRANSFORM, SET_PARALLEL, SET_PARAMETER, START_JOB, STOP_JOB, and WAIT_FOR_JOB.

Exceptions

- INVALID_ARGVAL. An invalid value was supplied for an input parameter.

- **OBJECT_NOT_FOUND.** The specified job no longer exists or the user specified a job owned by another schema, but the user did not have the `DATAPUMP_EXP_FULL_DATABASE` or `DATAPUMP_IMP_FULL_DATABASE` role.
- **SUCCESS_WITH_INFO.** The function succeeded, but further information is available through the `GET_STATUS` procedure.
- **NO_SUCH_JOB.** The specified job does not exist.

Usage Notes

- If the job was in the `Stopped` state, then the job is placed into the `Idling` state. After the `ATTACH` succeeds, you can monitor the progress of the job or control the job. The stream of `KU$ STATUS_WIP` and `KU$ STATUS_JOB_ERROR` messages returned through the `GET_STATUS` procedure will be returned to the newly attached job starting at the approximate time of the client's attachment. There will be no repeating of status and error messages that were processed before the client attached to a job.
- If you want to perform a second attach to a job, then you must do so from a different session.
- If the `ATTACH` fails, then use a null handle in a subsequent call to `GET_STATUS` for more information about the failure.

54.5.3 DATA_FILTER Procedures

This procedure specifies restrictions on the rows that are to be retrieved.

Syntax

```
DBMS_DATAPUMP.DATA_FILTER (
    handle      IN NUMBER,
    name       IN VARCHAR2,
    value      IN NUMBER,
    table_name IN VARCHAR2 DEFAULT NULL,
    schema_name IN VARCHAR2 DEFAULT NULL);
```

```
DBMS_DATAPUMP.DATA_FILTER (
    handle      IN NUMBER,
    name       IN VARCHAR2,
    value      IN VARCHAR2,
    table_name IN VARCHAR2 DEFAULT NULL,
    schema_name IN VARCHAR2 DEFAULT NULL);
```

```
DBMS_DATAPUMP.DATA_FILTER (
    handle      IN NUMBER,
    name       IN VARCHAR2,
    value      IN CLOB,
    table_name IN VARCHAR2 DEFAULT NULL,
    schema_name IN VARCHAR2 DEFAULT NULL);
```

Parameters

Table 54-5 DATA_FILTER Procedure Parameters

| Parameter | Description |
|-----------|---|
| handle | The handle that is returned from the <code>OPEN</code> function |

Table 54-5 (Cont.) DATA_FILTER Procedure Parameters

| Parameter | Description |
|-------------|---|
| name | The name of the filter |
| value | The value of the filter |
| table_name | The name of the table on which the data filter is applied. If no table name is supplied, the filter applies to all tables in the job. |
| schema_name | The name of the schema that owns the table on which the filter is applied. If no schema name is specified, the filter applies to all schemas in the job. If you supply a schema name you must also supply a table name. |

Exceptions

- **INVALID_ARGVAL.** There can be several reasons for this message:
 - A bad filter name is specified
 - The mode is `TRANSPORTABLE`, which does not support data filters
 - The specified table does not exist
 - The filter has already been set for the specified values of `schema_name` and `table_name`
- **INVALID_STATE.** The user called `DATA_FILTER` when the job was not in the Defining state.
- **INCONSISTENT_ARGS.** The `value` parameter is missing or its datatype does not match the filter name. Or a schema name was supplied, but not a table name.
- **PRIVILEGE_ERROR.** A schema name was supplied, but the user did not have the `DATAPUMP_EXP_FULL_DATABASE` or `DATAPUMP_IMP_FULL_DATABASE` role.
- **SUCCESS_WITH_INFO.** The procedure succeeded, but further information is available through the `GET_STATUS` procedure.
- **NO_SUCH_JOB.** The specified job does not exist.

Usage Notes

- Each data filter can only appear once in each table (for example, you cannot supply multiple `SUBQUERY` filters to a table) or once in each job. If different filters using the same name are applied to both a particular table and to the whole job, the filter parameter supplied for the specific table will take precedence.

With the exception of the `INCLUDE_ROWS` filter, data filters are not supported on tables having nested tables or domain indexes defined upon them. Data filters are not supported in jobs performed in Transportable Tablespace mode.

The available data filters are described in [Table 54-6](#).

Table 54-6 Data Filters

| Name | Datatype | Operations that Support Filter | Description |
|----------------|----------|--------------------------------|---|
| INCLUDE_ROWS | NUMBER | EXPORT, IMPORT | If nonzero, this filter specifies that user data for the specified table should be included in the job. The default is 1. |
| PARTITION_EXPR | TEXT | EXPORT, IMPORT | <p>Note:</p> <p>In this description, the information about partitions also applies to subpartitions.</p> |
| PARTITION_LIST | TEXT | | |
| SAMPLE | NUMBER | EXPORT, IMPORT | <p>For Export jobs, these filters specify which partitions are unloaded from the database. For Import jobs, they specify which table partitions are loaded into the database. Partition names are included in the job if their names satisfy the specified expression (for <code>PARTITION_EXPR</code>) or are included in the list (for <code>PARTITION_LIST</code>). Whereas the expression version of the filter offers more flexibility, the list version provides for full validation of the partition names.</p> <p>Double quotation marks around partition names are required only if the partition names contain special characters.</p> <p><code>PARTITION_EXPR</code> is not supported on jobs across a network link.</p> <p>Default=All partitions are processed</p> <p>For Export jobs, specifies a percentage for sampling the data blocks to be moved. This filter allows subsets of large tables to be extracted for testing purposes.</p> |
| SUBQUERY | TEXT | EXPORT, IMPORT | Specifies a subquery that is added to the end of the <code>SELECT</code> statement for the table. If you specify a <code>WHERE</code> clause in the subquery, you can restrict the rows that are selected. Specifying an <code>ORDER BY</code> clause orders the rows dumped in the export which improves performance when migrating from heap-organized tables to index-organized tables. |

54.5.4 DATA_REMAP Procedure

This procedure specifies transformations to be applied to column data as it is exported from, or imported into, a database.

Syntax

```
DBMS_DATAPUMP.DATA_REMAP (
    handle          IN NUMBER,
    name            IN VARCHAR2,
    table_name      IN VARCHAR2,
    column          IN VARCHAR2,
    remap_function  IN VARCHAR2,
    schema          IN VARCHAR2 DEFAULT NULL);
```

Parameters

Table 54-7 DATA_REMAP Procedure Parameters

| Parameter | Description |
|----------------|---|
| handle | The handle of the current job. The current session must have previously attached to the handle through a call to an <code>OPEN</code> function. |
| name | The name of the remap |
| table_name | The table containing the column to be remapped |
| column | The name of the column to be remapped |
| remap_function | The meaning of <code>remap_function</code> is dependent upon the value of <code>name</code> . See Table 54-8 for a list of possible names. |
| schema | The schema containing the column to be remapped. If <code>NULL</code> , the remapping applies to all schemas moved in the job that contain the specified table. |

Exceptions

- `INVALID_ARGVAL`. The mode is transportable (which does not support data modifications) or it has specified that no data to be included in the job. An invalid remap name was supplied.
- `INVALID_OPERATION`. Data remaps are only supported for Export and Import operations.
- `INVALID_STATE`. The `DATA_REMAP` procedure was called after the job started (that is, it was not in the defining state).
- `NO_SUCH_JOB`. The job handle is no longer valid.

Usage Notes

- The `DATA_REMAP` procedure is only supported for Export and Import operations. It allows you to manipulate user data being exported or imported. The `name` of the remap determines the remap operation to be performed.
- For export operations, you might wish to define a data remap to obscure sensitive data such as credit card numbers from a dump file, but leave the remainder of the

data so that it can be read. To accomplish this, the remapping should convert each unique source number into a distinct generated number. So that the mapping is consistent across the dump file set, the same function should be called for every column that contains the credit card number.

- For import operations, you might wish to define a data remap to reset the primary key when data is being merged into an existing table that contains colliding primary keys. A single remapping function should be provided for all columns defining or referencing the primary key to ensure that remapping is consistent.

 **Note:**

If the called function uses package state variables, then to ensure that remapping is performed consistently across all tables, the job should be run with a SET_PARALLEL value of 1 and no restart operations should be performed.

The Data Remap functions are listed in [Table 54-8](#).

Table 54-8 Names of Data Remap Functions

| Name | Meaning of remap_function | Meaning |
|-----------------|--|--|
| COLUMN_FUNCTION | String having the format: [schema.]package.function | The name parameter references a PL/SQL package function which is called to modify the data for the specified column. The function accepts a single parameter, which has the same datatype as the remapped column, and returns a value having the same datatype as the remapped column. Note that the default for the schema is the schema of the user performing the export. |

54.5.5 DETACH Procedure

This procedure specifies that the user has no further interest in using the handle.

Syntax

```
DBMS_DATAPUMP.DETACH (
    handle IN NUMBER);
```

Parameters

Table 54-9 DETACH Procedure Parameters

| Parameter | Description |
|-----------|---|
| handle | The handle of the job. The current session must have previously attached to the handle through a call to either an OPEN or ATTACH function. |

Exceptions

- `INVALID_HANDLE`. The specified handle is not attached to a Data Pump job.
- `SUCCESS_WITH_INFO`. The procedure succeeded, but further information is available through the `GET_STATUS` procedure.
- `NO_SUCH_JOB`. The specified job does not exist.

Usage Notes

- Through this call, you specify that you have no further interest in using the handle. Resources associated with a completed job cannot be reclaimed until all users are detached from the job. An implicit detach from a handle is performed when the user's session is exited or aborted. An implicit detach from a handle is also performed upon the expiration of the timeout associated with a `STOP_JOB` that was applied to the job referenced by the handle. All previously allocated `DBMS_DATAPUMP` handles are released when an instance is restarted.

54.5.6 GET_DUMPFILE_INFO Procedure

This procedure retrieves information about a specified dump file.

Syntax

```
DBMS_DATAPUMP.GET_DUMPFILE_INFO(
  filename      IN VARCHAR2,
  directory     IN VARCHAR2,
  info_table    OUT ku$_dumpfile_info,
  filetype      OUT NUMBER);
```

Parameters

Table 54-10 GET_DUMPFILE_INFO Procedure Parameters

| Parameter | Description |
|-------------------------|--|
| <code>filename</code> | A simple filename with no directory path information |
| <code>directory</code> | A directory object that specifies where the file can be found |
| <code>info_table</code> | A PL/SQL table for storing information about the dump file |
| <code>filetype</code> | The type of file (Data Pump dump file, original Export dump file, external tables dump file, or unknown) |

Exceptions

The `GET_DUMPFILE_INFO` procedure is a utility routine that operates outside the context of any Data Pump job. Exceptions are handled differently for this procedure than for procedures associated in some way with a Data Pump job. A full exception stack should be available directly, without the need to call the `GET_STATUS` procedure to retrieve the detailed information. The exception for this procedure is as follows:

- `NO_DUMPFILE_INFO`. Unable to retrieve dump file information as specified.

Usage Notes

You can use the `GET_DUMPFILE_INFO` procedure to request information about a specific file. If the file is not recognized as any type of dump file, then a filetype of 0 (zero) is returned and the dump file `info_table` remains empty.

A filetype value of 1 indicates a Data Pump dump file. A filetype value of 2 indicates an original Export dump file. A filetype value of 3 indicates an external tables dump file. In all cases, the dump file `info_table` will be populated with information retrieved from the dump file header. Rows of this table consist of item code and value pairs, where the item code indicates the type of information and the value column is a `VARCHAR2` containing the actual data (converted to a string in some cases). The table is defined as follows:

```
CREATE TYPE sys.ku$_dumpfile_item IS OBJECT (
    item_code    NUMBER,           -- Identifies header item
    value        VARCHAR2(2048)   -- Text string value)/

GRANT EXECUTE ON sys.ku$_dumpfile_item TO PUBLIC;
CREATE OR REPLACE PUBLIC SYNONYM ku$_dumpfile_item FOR sys.ku$_dumpfile_item;

CREATE TYPE sys.ku$_dumpfile_info AS TABLE OF sys.ku$_dumpfile_item/

GRANT EXECUTE ON sys.ku$_dumpfile_info TO PUBLIC;
CREATE OR REPLACE PUBLIC SYNONYM ku$_dumpfile_info FOR sys.ku$_dumpfile_info;
```

The item codes, which can easily be extended to provide more information as needed, are currently defined as shown in [Table 54-11](#) (prepended with the package name, `DBMS_DATAPUMP`). Assume the following with regard to these item codes:

- Unless otherwise stated, all item codes may be returned only for Oracle Data Pump and external tables dump files (filetypes 1 and 3).
- Unless otherwise stated, all item codes have been available since Oracle Database 10g Release 2 (10.2).

Table 54-11 Item Codes For the `DBMS_DATAPUMP.GET_DUMPFILE_INFO` Procedure

| Item Code | Description |
|--|---|
| <code>KU\$_DFHDR_FILE_VERSION</code> | The internal file version of the dump file. |
| <code>KU\$_DFHDR_MASTER_PRESENT</code> | If the Data Pump master table is present in the dump file, then the value for this item code is 1; otherwise the value is 0. Returned only for filetype 1. |
| <code>KU\$_DFHDR_GUID</code> | A unique identifier assigned to the Data Pump export job or the external tables unload job that produced the dump file. For a multifile dump set, each file in the set has the same value for this item code. |
| <code>KU\$_DFHDR_FILE_NUMBER</code> | A numeric identifier assigned to the dump file. Each dump file in a multifile dump set has its own identifier, unique only within the dump set. |
| <code>KU\$_DFHDR_CHARSET_ID</code> | A numeric code that represents the character set in use at the source system when the dump file was created. Returned for all filetypes. |
| <code>KU\$_DFHDR_CREATION_DATE</code> | The date and time that the dump file was created. |
| <code>KU\$_DFHDR_FLAGS</code> | Internal flag values. |

Table 54-11 (Cont.) Item Codes For the DBMS_DATAPUMP.GET_DUMPFILE_INFO Procedure

| Item Code | Description |
|--------------------------------|--|
| KU\$_DFHDR_JOB_NAME | The name assigned to the export job that created the dump file. Returned only for filetype 1. |
| KU\$_DFHDR_PLATFORM | The operating system name of the source system on which the dump file was created. |
| KU\$_DFHDR_INSTANCE | The instance name of the source system on which the dump file was created. |
| KU\$_DFHDR_LANGUAGE | The language name that corresponds to the character set of the source system where the export dump file was created. |
| KU\$_DFHDR_BLOCKSIZE | The blocksize, in bytes, of the dump file. |
| KU\$_DFHDR_DIRPATH | If direct path mode was used when the dump file was created, then the value for this item code is 1, otherwise the value is 0. Returned only for filetype 2. |
| KU\$_DFHDR_METADATA_COMPRESSED | If the system metadata is stored in the dump file in compressed format, then the value for this item code is 1, otherwise the value is 0. Returned only for filetype 1. |
| KU\$_DFHDR_DB_VERSION | The database job version used to create the dump file. Returned for all filetypes. |
| KU\$_DFHDR_MASTER_PIECE_COUNT | The Data Pump master table may be split into multiple pieces and written to multiple dump files in the set, one piece per file. The value returned for this item code indicates the number of dump files that contain pieces of the master table. The value for this item code is only meaningful if the Data Pump master table is present in the dump file, as indicated by the item code KU\$_DFHDR_MASTER_PRESENT. Returned only for filetype 1. Only available since Oracle Database 11g Release 1 (11.1). |
| KU\$_DFHDR_MASTER_PIECE_NUMBER | The Data Pump master table may be split into multiple pieces and written to multiple dump files in the set, one piece per file. The value returned for this item code indicates which master table piece is contained in the dump file. The value for this item code is only meaningful if the Data Pump master table is present in the dump file, as indicated by the item code KU\$_DFHDR_MASTER_PRESENT. Returned only for filetype 1. Only available since Oracle Database 11g Release 1 (11.1). |
| KU\$_DFHDR_DATA_COMPRESSED | If the table data is stored in the dump file in compressed format, then the value for this item code is 1, otherwise the value is 0. Only available since Oracle Database 11g Release 1 (11.1). |
| KU\$_DFHDR_METADATA_ENCRYPTED | If the system metadata is stored in the dump file in encrypted format, then the value for this item code is 1, otherwise the value is 0. Returned only for filetype 1. Only available since Oracle Database 11g Release 1 (11.1). |
| KU\$_DFHDR_DATA_ENCRYPTED | If the table data is stored in the dump file in encrypted format, then the value for this item code is 1, otherwise the value is 0. Only available since Oracle Database 11g Release 1 (11.1). |

Table 54-11 (Cont.) Item Codes For the DBMS_DATAPUMP.GET_DUMPFILE_INFO Procedure

| Item Code | Description |
|------------------------------|---|
| KU\$_DFHDR_COLUMNS_ENCRYPTED | <p>If encrypted column data is stored in the dump file in encrypted format, then the value for this item code is 1, otherwise the value is 0.</p> <p>Returned only for filetype 1.</p> <p>Only available since Oracle Database 11g Release 1 (11.1).</p> |
| KU\$_DFHDR_ENCRYPTION_MODE | <p>The encryption mode indicates whether a user-provided password or the Oracle Encryption Wallet was used to encrypt data written to the dump file. The possible values returned for this item code are:</p> <ul style="list-style-type: none"> • KU\$_DFHDR_ENCMODE_NONE No data was written to the dump file in encrypted format. • KU\$_DFHDR_ENCMODE_PASSWORD Data was written to the dump file in encrypted format using a provided password. • KU\$_DFHDR_ENCMODE_DUAL Data was written to the dump file in encrypted format using both a provided password as well as an Oracle Encryption Wallet. • KU\$_DFHDR_ENCMODE_TRANS Data was written to the dump file in encrypted format transparently using an Oracle Encryption Wallet. <p>Only available since Oracle Database 11g Release 1 (11.1).</p> |
| KU\$_DFHDR_COMPRESSION_ALG | <p>The compression algorithm used when writing system metadata and/or table data to the dump file in compressed format. The possible values returned for this item code are:</p> <ul style="list-style-type: none"> • KU\$_DFHDR_CMPALG_NONE No data was written to the dump file in compressed format. • KU\$_DFHDR_CMPALG_BASIC Data was written to the dump file in compressed format using an internal algorithm. This is the default algorithm used since Oracle Database 10g Release 2 (10.2). • KU\$_DFHDR_CMPALG_LOW Data was written to the dump file in compressed format using the LOW algorithm. • KU\$_DFHDR_CMPALG_MEDIUM Data was written to the dump file in compressed format using the MEDIUM algorithm. • KU\$_DFHDR_CMPALG_HIGH Data was written to the dump file in compressed format using the HIGH algorithm. <p>Only available since Oracle Database 12c Release 1 (12.1).</p> |

54.5.7 GET_STATUS Procedure

This procedure monitors the status of a job or waits for the completion of a job.

Syntax

```
DBMS_DATAPUMP.GET_STATUS (
    handle      IN NUMBER,
    mask        IN BINARY_INTEGER,
```

```

timeout  IN NUMBER DEFAULT NULL,
job_state OUT VARCHAR2,
status   OUT ku$_Status);

```

Parameters

Table 54-12 GET_STATUS Procedure Parameters

| Parameter | Description |
|-----------|--|
| handle | The handle of a job. The current session must have previously attached to the handle through a call to either the <code>OPEN</code> or <code>ATTACH</code> function. A null handle can be used to retrieve error information after <code>OPEN</code> and <code>ATTACH</code> failures. |
| mask | A bit mask that indicates which of four types of information to return: <ul style="list-style-type: none"> • <code>KU\$_STATUS_WIP</code> • <code>KU\$_STATUS_JOB_DESC</code> • <code>KU\$_STATUS_JOB_STATUS</code> • <code>KU\$_STATUS_JOB_ERROR</code> Each status has a numerical value. You can request multiple types of information by adding together different combinations of values. |
| timeout | Maximum number of seconds to wait before returning to the user. A value of 0 requests an immediate return. A value of -1 requests an infinite wait. If <code>KU\$_STATUS_WIP</code> or <code>KU\$_STATUS_JOB_ERROR</code> information is requested and becomes available during the timeout period, then the procedure returns before the timeout period is over. |
| job_state | Current state of the job. If only the job state is needed, it is much more efficient to use this parameter than to retrieve the full <code>ku\$_Status</code> structure. |
| status | A <code>ku\$_Status</code> is returned. The <code>ku\$_Status</code> mask indicates what kind of information is included. This could be none if only <code>KU\$_STATUS_WIP</code> or <code>KU\$_STATUS_JOB_ERROR</code> information is requested and the timeout period expires. |

Exceptions

- `INVALID_HANDLE`. The specified handle is not attached to a Data Pump job.
- `INVALID_VALUE`. The mask or timeout contains an illegal value.
- `SUCCESS_WITH_INFO`. The procedure succeeded, but further information is available through the `GET_STATUS` procedure.
- `NO_SUCH_JOB`. The specified job does not exist.

Usage Notes

The `GET_STATUS` procedure is used to monitor the progress of an ongoing job and to receive error notification. You can request various type of information using the mask parameter. The `KU$_STATUS_JOB_DESC` and `KU$_STATUS_JOB_STATUS` values are classified as synchronous information because the information resides in the master table. The `KU$_STATUS_WIP` and `KU$_STATUS_JOB_ERROR` values are classified as asynchronous because the messages that embody these types of information can be generated at any time by various layers in the Data Pump architecture.

- If synchronous information *only* is requested, the interface will ignore the timeout parameter and simply return the requested information.

- If asynchronous information is requested, the interface will wait a *maximum* of timeout seconds before returning to the client. If a message of the requested asynchronous information type is received, the call will complete prior to timeout seconds. If synchronous information was also requested, it will be returned whenever the procedure returns.
- If the `job_state` returned by `GET_STATUS` does not indicate a terminating job, it is possible that the job could still terminate before the next call to `GET_STATUS`. This would result in an `INVALID_HANDLE` exception. Alternatively, the job could terminate during the call to `GET_STATUS`, which would result in a `NO_SUCH_JOB` exception. Callers should be prepared to handle these cases.

Error Handling

There are two types of error scenarios that need to be handled using the `GET_STATUS` procedure:

- Errors resulting from other procedure calls: For example, the `SET_PARAMETER` procedure may produce an `INCONSISTENT_ARGS` exception. The client should immediately call `GET_STATUS` with `mask=8` (errors) and `timeout=0`. The returned `ku$_Status.error` will contain a `ku$_LogEntry` that describes the inconsistency in more detail.
- Errors resulting from events asynchronous to the client(s): An example might be `Table already exists` when trying to create a table. The `ku$_Status.error` will contain a `ku$_LogEntry` with all error lines (from all processing layers that added context about the error) properly ordered.

After a job has begun, a client's main processing loop will typically consist of a call to `GET_STATUS` with an infinite timeout (-1) "listening" for `KU$_STATUS_WIP` and `KU$_STATUS_JOB_ERROR` messages. If status was requested, then `JOB_STATUS` information will also be in the request.

When the `ku$_Status` is interpreted, the following guidelines should be used:

- `ku$_Status.ku$_JobStatus.percent_done` refers only to the amount of data that has been processed in a job. Metadata is not considered in the calculation. It is determined using the following formulas:
 - `EXPORT` or `network IMPORT`-- $(\text{bytes_processed} / \text{estimated_bytes}) * 100$
 - `IMPORT`-- $(\text{bytes_processed} / \text{total_expected_bytes}) * 100$
 - `SQL_FILE` or `estimate-only EXPORT`-- 0.00 if not done or 100.00 if done

The effects of the `QUERY` and `PARTITION_EXPR` data filters are not considered in computing `percent_done`.

It is expected that the status returned will be transformed by the caller into more user-friendly status. For example, when `percent done` is not zero, an estimate of completion time could be produced using the following formula:

$$((\text{SYSDATE} - \text{start time}) / \text{ku$_Status.ku$_JobStatus.percent_done}) * 100$$

- The caller should not use `ku$_Status.ku$_JobStatus.percent_done` for determining whether the job has completed. Instead, the caller should only rely on the state of the job as found in `job_state`.

54.5.8 LOG_ENTRY Procedure

This procedure inserts a message into the log file.

Syntax

```
DBMS_DATAPUMP.LOG_ENTRY(  
    handle          IN NUMBER,  
    message         IN VARCHAR2  
    log_file_only  IN NUMBER DEFAULT 0);
```

Parameters

Table 54-13 LOG_ENTRY Procedure Parameters

| Parameter | Description |
|---------------|---|
| handle | The handle of a job. The current session must have previously attached to the handle through a call to either the <code>OPEN</code> or <code>ATTACH</code> function. |
| message | A text line to be added to the log file |
| log_file_only | Specified text should be written only to the log file. It should not be returned in <code>GET_STATUS</code> work-in-progress (<code>KU\$_STATUS_WIP</code>) messages. |

Exceptions

- `INVALID_HANDLE`. The specified handle is not attached to a Data Pump job.
- `SUCCESS_WITH_INFO`. The procedure succeeded, but further information is available through the `GET_STATUS` procedure.
- `NO_SUCH_JOB`. The specified job does not exist.

Usage Notes

The message is added to the log file. If `log_file_only` is zero (the default), the message is also broadcast as a `KU$_STATUS_WIP` message through the `GET_STATUS` procedure to all users attached to the job.

The `LOG_ENTRY` procedure allows applications to tailor the log stream to match the abstractions provided by the application. For example, the command-line interface supports `INCLUDE` and `EXCLUDE` parameters defined by the user. Identifying these values as calls to the underlying `METADATA_FILTER` procedure would be confusing to users. Instead, the command-line interface can enter text into the log describing the settings for the `INCLUDE` and `EXCLUDE` parameters.

Lines entered in the log stream from `LOG_ENTRY` are prefixed by the string, ";;; "

54.5.9 METADATA_FILTER Procedure

This procedure provides filters that allow you to restrict the items that are included in a job.

Syntax

```
DBMS_DATAPUMP.METADATA_FILTER(
    handle      IN NUMBER,
    name        IN VARCHAR2,
    value       IN VARCHAR2,
    object_path IN VARCHAR2 DEFAULT NULL);
```

```
DBMS_DATAPUMP.METADATA_FILTER(
    handle      IN NUMBER,
    name        IN VARCHAR2,
    value       IN CLOB,
    object_path IN VARCHAR2 DEFAULT NULL);
```

Parameters

Table 54-14 METADATA_FILTER Procedure Parameters

| Parameter | Description |
|-------------|---|
| handle | The handle returned from the OPEN function |
| name | The name of the filter. See Table 54-15 for descriptions of the available filters. |
| value | The value of the filter |
| object_path | The object path to which the filter applies. If the default is used, the filter applies to all applicable objects. Lists of the object paths supported for each mode are contained in the catalog views for DATABASE_EXPORT_OBJECTS, SCHEMA_EXPORT_OBJECTS, and TABLE_EXPORT_OBJECTS. (Note that the TABLE_EXPORT_OBJECTS view is applicable to both Table and Tablespace mode because their object paths are the same.) For an import operation, object paths reference the mode used to create the dump file rather than the mode being used for the import. |

[Table 54-15](#) describes the name, the object type, and the meaning of the filters available with the METADATA_FILTER procedure. The datatype for all the filters is a text expression. All operations support all filters.

Table 54-15 Filters Provided by METADATA_FILTER Procedure

| Name | Object Type | Meaning |
|----------------------------|----------------|---|
| NAME_EXPR NAME_LIST | Named objects | Defines which object names are included in the job. You use the object type parameter to limit the filter to a particular object type. For Table mode, identifies which tables are to be processed. |
| SCHEMA_EXPR SCHEMA_LIST | Schema objects | Restricts the job to objects whose owning schema name is satisfied by the expression. For Table mode, only a single SCHEMA_EXPR filter is supported. If specified, it must only specify a single schema (for example, 'IN ('SCOTT')'). For Schema mode, identifies which users are to be processed. |

Table 54-15 (Cont.) Filters Provided by METADATA_FILTER Procedure

| Name | Object Type | Meaning |
|-----------------------|--------------------------------|--|
| TABSPACE_EX PR | TABLE, CLUSTER, | Restricts the job to objects stored in a tablespace whose name is satisfied by the expression. |
| TABSPACE_LI ST | INDEX, ROLLBACK_SEGM ENT | For Tablespace mode, identifies which tablespaces are to be processed. If a partition of an object is stored in the tablespace, the entire object is added to the job. For Transportable mode, identifies which tablespaces are to be processed. If a table has a single partition in the tablespace set, all partitions must be in the tablespace set. An index is not included within the tablespace set unless all of its partitions are in the tablespace set. A domain index is not included in the tablespace set unless all of its secondary objects are included in the tablespace set. |
| INCLUDE_PATH_ EXPR | All | Defines which object paths are included in, or excluded from, the job. You use these filters to select only certain object types from the database or dump file set. Objects of paths satisfying the condition are included (INCLUDE_PATH_*) or excluded (EXCLUDE_PATH_*) from the operation. The object_path parameter is not supported for these filters. |
| INCLUDE_PATH_ LIST | | |
| EXCLUDE_PATH_ EXPR | | |
| EXCLUDE_PATH_ LIST | | |
| EXCLUDE_TABLE S | TABLE_EXPORT | Specifies that no tables are to be exported. |
| VIEWS_AS_TABL ES | TABLE_EXPORT | A comma-separated list of views to be exported as tables: [schema_name.]view_name[:table_name] The filter can be called multiple times with multiple values and all values get added to a list. All views on the list are exported as tables. |

Exceptions

- INVALID_HANDLE. The specified handle is not attached to a Data Pump job.
- INVALID_ARGVAL. This exception can indicate any of the following conditions:
 - An object_path was specified for an INCLUDE_PATH_EXPR or EXCLUDE_PATH_EXPR filter.
 - The specified object_path is not supported for the current mode.
 - The SCHEMA_EXPR filter specified multiple schemas for a Table mode job.
- INVALID_STATE. The user called the METADATA_FILTER procedure after the job left the defining state.
- INCONSISTENT_ARGS. The filter value is of the wrong datatype or is missing.
- SUCCESS_WITH_INFO. The procedure succeeded but further information is available through the GET_STATUS procedure.
- NO_SUCH_JOB. The specified job does not exist.

Usage Notes

- Metadata filters identify a set of objects to be included or excluded from a Data Pump operation. Except for `EXCLUDE_PATH_EXPR` and `INCLUDE_PATH_EXPR`, dependent objects of an identified object will be processed along with the identified object. For example, if an index is identified for inclusion by a filter, grants upon that index will also be included by the filter. Likewise, if a table is excluded by a filter, then indexes, constraints, grants and triggers upon the table will also be excluded by the filter.
- Two versions of each filter are supported: SQL expression and List. The SQL expression version of the filters offer maximum flexibility for identifying objects (for example the use of LIKE to support use of wild cards). The names of the expression filters are as follows:

- `NAME_EXPR`
- `SCHEMA_EXPR`
- `TABLESPACE_EXPR`
- `INCLUDE_PATH_EXPR`
- `EXCLUDE_PATH_EXPR`

The list version of the filters allow maximum validation of the filter. An error will be reported if one of the elements in the filter is not found within the source database (for Export and network-based jobs) or is not found within the dump file (for file-based Import and SQLFILE jobs). The names of the list filters are as follows:

- `NAME_LIST`
- `SCHEMA_LIST`
- `TABLESPACE_LIST`
- `INCLUDE_PATH_LIST`
- `EXCLUDE_PATH_LIST`

- Filters allow a user to restrict the items that are included in a job. For example, a user could request a full export, but without Package Specifications or Package Bodies.
- If multiple filters are specified for a object type, they are implicitly 'ANDed' together (that is, objects participating in the job must pass all of the filters applied to their object types).
- The same filter name can be specified multiple times within a job. For example, specifying `NAME_EXPR` as `'!='EMP''` and `NAME_EXPR` as `'!='DEPT''` on a Table mode export would produce a file set containing all of the tables except for `EMP` and `DEPT`.

54.5.10 METADATA_REMAP Procedure

This procedure specifies a remapping to be applied to objects as they are processed in the specified job.

Syntax

```
DBMS_DATAPUMP.METADATA_REMAP (
  handle      IN NUMBER,
  name        IN VARCHAR2,
  old_value   IN VARCHAR2,
  value       IN VARCHAR2,
  object_type IN VARCHAR2 DEFAULT NULL);
```

Parameters

Table 54-16 METADATA_REMAP Procedure Parameters

| Parameter | Description |
|-------------|---|
| handle | The handle for the current job. The current session must have previously attached to the handle through a call to the <code>OPEN</code> function. |
| name | The name of the remap. See Table 54-17 for descriptions of the available remaps. |
| old_value | Specifies which value in the dump file set should be reset to <code>value</code> |
| value | The value of the parameter for the remap. This signifies the new value that <code>old_value</code> should be translated into. |
| object_type | <p>Designates the object type to which the remap applies. The list of object types supported for each mode are contained in the <code>DATABASE_EXPORT_OBJECTS</code>, <code>SCHEMA_EXPORT_OBJECTS</code>, <code>TABLE_EXPORT_OBJECTS</code>, and <code>TABLESPACE_EXPORT_OBJECTS</code> catalog views.</p> <p>By default, the remap applies to all applicable objects within the job. The <code>object_type</code> parameter allows a caller to specify different parameters for different object types within a job. Remaps that explicitly specify an object type override remaps that apply to all object types.</p> |

[Table 54-17](#) describes the remaps provided by the `METADATA_REMAP` procedure.

Table 54-17 Remaps Provided by the METADATA_REMAP Procedure

| Name | Datatype | Object Type | Meaning |
|------------------|----------|---|--|
| REMAP_SCHEMA | TEXT | Schema objects | <p>Any schema object in the job that matches the <code>object_type</code> parameter and was located in the <code>old_value</code> schema will be moved to the <code>value</code> schema.</p> <p>Privileged users can perform unrestricted schema remaps.</p> <p>Nonprivileged users can perform schema remaps only if their schema is the target schema of the remap.</p> <p>For example, SCOTT can remap his BLAKE's objects to SCOTT, but SCOTT cannot remap SCOTT's objects to BLAKE.</p> |
| REMAP_TABLESPACE | TEXT | TABLE, INDEX, ROLLBACK_SEGMENT, MATERIALIZED_VIEW, , MATERIALIZED_VIEW_LOG, TABLE_SPACE | <p>Any storage segment in the job that matches the <code>object_type</code> parameter and was located in the <code>old_value</code> tablespace will be relocated to the <code>value</code> tablespace.</p> |

Table 54-17 (Cont.) Remaps Provided by the METADATA_REMAP Procedure

| Name | Datatype | Object Type | Meaning |
|----------------|----------|--------------------------------------|---|
| REMAP_DATAFILE | TEXT | LIBRARY, TABLESPACE, DIRECTORY | If <code>old_value</code> and <code>value</code> are both full file specifications, then any data file reference in the job that matches the <code>object_type</code> parameter and that referenced the <code>old_value</code> data file will be redefined to use the <code>value</code> data file. If <code>old_value</code> and <code>value</code> are both directory paths, then any data file reference whose object path matches <code>old_value</code> will have its path substituted with <code>value</code> . |
| REMAP_TABLE | TEXT | TABLE | Any reference to a table in the job that matches the <code>old_value</code> table name will be replaced with the <code>value</code> table name. The <code>old_value</code> parameter may refer to a partition such as <code>employees.low</code> . This allows names for tables constructed the by <code>PARTITION_OPTIONS=DEPART</code> <code>ITION</code> parameter to be specified by the user. |

Exceptions

- `INVALID_HANDLE`. The specified handle is not attached to a Data Pump job.
- `INVALID_ARGVAL`. This message can indicate any of the following:
 - The job's mode does not include the specified `object_type`.
 - The remap has already been specified for the specified `old_value` and `object_type`.
- `INVALID_OPERATION`. Remaps are only supported for `SQL_FILE` and Import operations. The job's operation was Export, which does not support the use of metadata remaps.
- `INVALID_STATE`. The user called `METADATA_REMAP` after the job had started (that is, the job was not in the defining state).
- `INCONSISTENT_ARGS`. There was no `value` supplied or it was of the wrong datatype for the remap.
- `PRIVILEGE_ERROR`. A nonprivileged user attempted to do a `REMAP_SCHEMA` to a different user's schema or a `REMAP_DATAFILE`.
- `SUCCESS_WITH_INFO`. The procedure succeeded, but further information is available through the `GET_STATUS` procedure.
- `NO_SUCH_JOB`. The specified job does not exist.

Usage Notes

- The `METADATA_REMAP` procedure is only supported for Import and `SQL_FILE` operations. It enables you to apply commonly desired, predefined remappings to the definition of objects as part of the transfer. If you need remaps that are not supported within this procedure, you should do a preliminary `SQL_FILE` operation to produce a SQL script corresponding to the dump file set. By editing the DDL directly and then executing it, you can produce any remappings that you need.
- Transforms for the DataPump API are a subset of the remaps implemented by the `DBMS_METADATA.SET_TRANSFORM_PARAMETER` API. Multiple remaps can be defined for a single job. However, each remap defined must be unique according to its parameters. That is, two remaps cannot specify conflicting or redundant remaps.

54.5.11 METADATA_TRANSFORM Procedure

This procedure specifies transformations to be applied to objects as they are processed in the specified job.

Syntax

```
DBMS_DATAPUMP.METADATA_TRANSFORM (
    handle      IN NUMBER,
    name        IN VARCHAR2,
    value       IN VARCHAR2,
    object_type IN VARCHAR2 DEFAULT NULL);
```

```
DBMS_DATAPUMP.METADATA_TRANSFORM (
    handle      IN NUMBER,
    name        IN VARCHAR2,
    value       IN NUMBER,
    object_type IN VARCHAR2 DEFAULT NULL);
```

Parameters

Table 54-18 METADATA_TRANSFORM Procedure Parameters

| Parameter | Description |
|-------------|---|
| handle | The handle for the current job. The current session must have previously attached to the handle through a call to the <code>OPEN</code> function. |
| name | The name of the transformation. See Table 54-19 for descriptions of the available transforms. |
| value | The value of the parameter for the transform |
| object_type | Designates the object type to which the transform applies. The list of object types supported for each mode are contained in the <code>DATABASE_EXPORT_OBJECTS</code> , <code>SCHEMA_EXPORT_OBJECTS</code> , <code>TABLE_EXPORT_OBJECTS</code> , and <code>TABLESPACE_EXPORT_OBJECTS</code> catalog views. By default, the transform applies to all applicable objects within the job. The <code>object_type</code> parameter allows a caller to specify different transform parameters for different object types within a job. Transforms that explicitly specify an object type override transforms that apply to all object types. |

[Table 54-19](#) describes the transforms provided by the `METADATA_TRANSFORM` procedure.

Table 54-19 Transforms Provided by the METADATA_TRANSFORM Procedure

| Name | Datatype | Object Type | Meaning |
|-------------------------|----------|---|--|
| DISABLE_ARCHIVE_LOGGING | NUMBER | TABLE INDEX | <p>Specifies whether to disable archive logging for specified object types during import.</p> <p>A value of zero (<code>FALSE</code>) is the default. It specifies that archive logging will take place. This is the default behavior if this transform parameter is not specified.</p> <p>A non-zero (<code>TRUE</code>) value disables archive logging for the specified object types before data is loaded during import. If no object type is specified, then archive logging is disabled for both <code>TABLE</code> and <code>INDEX</code> object types. All other object types processed during data pump import are logged.</p> <p>Note: If the database is in <code>FORCE LOGGING</code> mode, then the <code>DISABLE_ARCHIVE_LOGGING</code> transform does not disable logging when indexes and tables are created.</p> |
| INMEMORY | NUMBER | TABLE TABLESPACE MATERIALIZED VIEWS | <p>The <code>INMEMORY</code> transform is related to the In-Memory Column Store (IM column store), an optional area in the SGA that stores whole tables, table partitions, and individual columns in a compressed columnar format.</p> <p>If a non-zero value (<code>TRUE</code>) is specified on import, then Data Pump generates an <code>IM</code> clause that preserves the IM setting those objects had at export time. This is the default.</p> <p>If a value of zero (<code>FALSE</code>) is specified on import, then Data Pump does not include an <code>IM</code> clause for any objects.</p> <p>Note: The <code>INMEMORY</code> transform is available only in Oracle Database 12c Release 1 (12.1.0.2) or higher.</p> |
| INMEMORY_CLAUSE | TEXT | TABLE TABLESPACE MATERIALIZED VIEWS | <p>The <code>INMEMORY_CLAUSE</code> transform is related to the In-Memory Column Store (IM column store), an optional area in the SGA that stores whole tables, table partitions, and individual columns in a compressed columnar format.</p> <p>When you specify this transform, Data Pump uses the contents of the string as the <code>IM</code> clause for all objects being imported that have an <code>IM</code> clause in their DDL. This transform is useful when you want to override the <code>IM</code> clause for an object in the dump file.</p> <p>Note: The <code>INMEMORY_CLAUSE</code> transform is available only in Oracle Database 12c Release (12.1.0.2) or higher.</p> |

Table 54-19 (Cont.) Transforms Provided by the METADATA_TRANSFORM Procedure

| Name | Datatype | Object Type | Meaning |
|--------------------|----------|------------------------------|---|
| LOB_STORAGE | TEXT | TABLE | <p>Specifies the storage type to use for LOB segments. The options are as follows:</p> <ul style="list-style-type: none"> • SECUREFILE - LOB storage is returned as SECUREFILE • BASICFILE - LOB storage is returned as BASICFILE • DEFAULT - The keyword (SECUREFILE or BASICFILE) is omitted in the LOB STORE AS clause. • NO_CHANGE - LOB segments are created with the same storage they had in the source database. This is the default. <p>Specifying this transform changes the LOB storage for all tables in the job, including tables that provide storage for materialized views.</p> |
| OID | NUMBER | TYPE TABLE | <p>If zero, inhibits the assignment of the exported OID during type or table creation. Instead, a new OID will be assigned.</p> <p>Use of this transform on Object Tables will cause breakage in REF columns that point to the table.</p> <p>Defaults to 1.</p> |
| PCTSPACE | NUMBER | TABLE INDEX TABLESPACE | <p>Specifies a percentage multiplier used to alter extent allocations and data file sizes. Used to shrink large tablespaces for testing purposes.</p> <p>Defaults to 100.</p> |
| SEGMENT_ATTRIBUTES | NUMBER | TABLE, INDEX | <p>If nonzero (TRUE), emit storage segment parameters.</p> <p>Defaults to 1.</p> |
| SEGMENT_CREATION | NUMBER | TABLE | <p>If nonzero (TRUE), the SQL SEGMENT CREATION clause is added to the CREATE TABLE statement. That is, the CREATE TABLE statement will explicitly say either SEGMENT CREATION DEFERRED or SEGMENT CREATION IMMEDIATE.</p> <p>If the value is FALSE, then the SEGMENT CREATION clause is omitted from the CREATE TABLE statement. Set this parameter to FALSE to use the default segment creation attributes for the table(s) being loaded.</p> <p>Defaults to nonzero (TRUE).</p> |
| STORAGE | NUMBER | TABLE | <p>If nonzero (TRUE), emit storage clause. (Ignored if SEGMENT_ATTRIBUTES is zero.)</p> <p>Defaults to nonzero (TRUE).</p> |

Table 54-19 (Cont.) Transforms Provided by the METADATA_TRANSFORM Procedure

| Name | Datatype | Object Type | Meaning |
|--------------------------|----------|-------------|--|
| TABLE_COMPRESSION_CLAUSE | TEXT | TABLE | <p>Specifies a table compression clause (for example, <code>COMPRESS BASIC</code>) to use when the table is created.</p> <p>Specify <code>NONE</code> to omit the table compression clause. The table will have the default compression for the tablespace.</p> <p>Specifying this transform changes the compression type for all tables in the job, including tables that provide storage for materialized views.</p> |

Exceptions

- `INVALID_HANDLE`. The specified handle is not attached to a Data Pump job.
- `INVALID_ARGVAL`. This message can indicate any of the following:
 - The mode is transportable, which doesn't support transforms.
 - The job's mode does not include the specified `object_type`.
 - The transform has already been specified for the specified `value` and `object_type`.
- `INVALID_OPERATION`. Transforms are only supported for `SQL_FILE` and Import operations. The job's operation was Export which does not support the use of metadata transforms.
- `INVALID_STATE`. The user called `METADATA_TRANSFORM` after the job had started (that is, the job was not in the defining state).
- `INCONSISTENT_ARGS`. There was no `value` supplied or it was of the wrong datatype for the transform.
- `PRIVILEGE_ERROR`. A nonprivileged user attempted to do a `REMAP_SCHEMA` to a different user's schema or a `REMAP_DATAFILE`.
- `SUCCESS_WITH_INFO`. The procedure succeeded, but further information is available through the `GET_STATUS` procedure.
- `NO_SUCH_JOB`. The specified job does not exist.

Usage Notes

- The `METADATA_TRANSFORM` procedure is only supported for Import and `SQL_FILE` operations. It enables you to apply commonly desired, predefined transformations to the definition of objects as part of the transfer. If you need transforms that are not supported within this procedure, you should do a preliminary `SQL_FILE` operation to produce a SQL script corresponding to the dump file set. By editing the DDL directly and then executing it, you can produce any transformations that you need.
- Transforms for the DataPump API are a subset of the transforms implemented by the `DBMS_METADATA.SET_TRANSFORM_PARAMETER` API. Multiple transforms can be defined for a single job. However, each transform defined must be unique according its parameters. That is, two transforms cannot specify conflicting or redundant transformations.

54.5.12 OPEN Function

This function is used to declare a new job using the Data Pump API.

Note:

A multitenant container database is the only supported architecture in Oracle Database 20c. While the documentation is being revised, legacy terminology may persist. In most cases, "database" and "non-CDB" refer to a CDB or PDB, depending on context. In some contexts, such as upgrades, "non-CDB" refers to a non-CDB from a previous release.

The handle that is returned is used as a parameter for calls to all other procedures (but not to the `ATTACH` function).

Syntax

```
DBMS_DATAPUMP.OPEN (
  operation      IN VARCHAR2,
  job_mode       IN VARCHAR2,
  remote_link    IN VARCHAR2 DEFAULT NULL,
  job_name       IN VARCHAR2 DEFAULT NULL,
  version        IN VARCHAR2 DEFAULT 'COMPATIBLE')
RETURN NUMBER;
```

Parameters

Table 54-20 OPEN Function Parameters

| Parameter | Meaning |
|--------------------------|---|
| <code>operation</code> | The type of operation to be performed. Table 54-21 contains descriptions of valid operation types. |
| <code>job_mode</code> | The scope of the operation to be performed. Table 54-22 contains descriptions of valid modes. Specifying <code>NULL</code> generates an error. |
| <code>remote_link</code> | If the value of this parameter is non-null, it provides the name of a database link to the remote database that will be the source of data and metadata for the current job. |
| <code>job_name</code> | <p>The name of the job. The name is limited to 128 characters; it will be truncated if more than 128 characters are used. It may consist of printable characters and spaces. It is implicitly qualified by the schema of the user executing the <code>OPEN</code> function and must be unique to that schema (that is, there cannot be other Data Pump jobs using the same name).</p> <p>The name is used to identify the job both within the API and with other database components such as identifying the job in the <code>DBA_RESUMABLE</code> view if the job becomes suspended through lack of resources. If no name is supplied, a system generated name will be provided for the job in the following format: "SYS_<OPERATION>_<MODE>_%N".</p> <p>The default job name is formed where %N expands to a two-digit incrementing integer starting at '01' (for example, "SYS_IMPORT_FULL_03"). The name supplied for the job will also be used to name the master table and other resources associated with the job.</p> |

Table 54-20 (Cont.) OPEN Function Parameters

| Parameter | Meaning |
|-----------|--|
| version | <p>The version of database objects to be extracted. This option is only valid for Export, network Import, and SQL_FILE operations. Database objects or attributes that are incompatible with the version will not be extracted. Legal values for this parameter are as follows:</p> <ul style="list-style-type: none"> COMPATIBLE - (default) the version of the metadata corresponds to the database compatibility level and the compatibility release level for feature (as given in the V\$COMPATIBILITY view). Database compatibility must be set to 9.2 or higher. LATEST - the version of the metadata corresponds to the database version. A specific database version, for example, '11.0.0'. <p>Specify a value of 12 to allow all existing database features, components, and options to be exported from Oracle Database 11g release 2 (11.2.0.3) or later into an Oracle Database 12 c Release 1 (12.1) (either a multitenant container database (CDB) or a non-CDB).</p> |

Table 54-21 describes the valid operation types for the OPEN function.

Table 54-21 Valid Operation Types for the OPEN Function

| Operation | Description |
|-----------|---|
| EXPORT | Saves data and metadata to a dump file set or obtains an estimate of the size of the data for an operation. |
| IMPORT | Restores data and metadata from a dump file set or across a database link. |
| SQL_FILE | Displays the metadata within a dump file set, or from across a network link, as a SQL script. The location of the SQL script is specified through the ADD_FILE procedure. |

Table 54-22 describes the valid modes for the OPEN function.

Table 54-22 Valid Modes for the OPEN Function

| Mode | Description |
|--------|---|
| FULL | <p>Operates on the full database or full dump file set except for Oracle Database internal schemas. (Some tables from Oracle Database internal schemas may be registered to be exported and imported in full operations in order to provide consistent metadata during import.)</p> <p>The TRANSPORTABLE parameter can be set to ALWAYS during a full database export in order to move data via transportable tablespaces rather than in the Data Pump dump file.</p> |
| SCHEMA | <p>Operates on a set of selected schemas. Defaults to the schema of the current user. All objects in the selected schemas are processed. In SCHEMA mode, you cannot specify Oracle-internal schemas (for example, SYS, XDB, ORDSYS, MDSYS, CTXSYS, ORDPLUGINS, or LBACSYS).</p> |

Table 54-22 (Cont.) Valid Modes for the OPEN Function

| Mode | Description |
|---------------|---|
| TABLE | Operates on a set of selected tables. Defaults to all of the tables in the current user's schema. Only tables and their dependent objects are processed. |
| TABLESPACE | Operates on a set of selected tablespaces. No defaulting is performed. Tables that have storage in the specified tablespaces are processed in the same manner as in Table mode. |
| TRANSPORTABLE | Operates on metadata for tables (and their dependent objects) within a set of selected tablespaces to perform a transportable tablespace export/import. |

Return Values

- An opaque handle for the job. This handle is used as input to the following procedures: `ADD_FILE`, `CREATE_JOB_VIEW`, `DATA_FILTER`, `DETACH`, `GET_STATUS`, `LOG_ENTRY`, `LOG_ERROR`, `METADATA_FILTER`, `METADATA_REMAP`, `METADATA_TRANSFORM`, `SET_PARALLEL`, `SET_PARAMETER`, `START_JOB`, `STOP_JOB`, and `WAIT_FOR_JOB`

Exceptions

- `INVALID_ARGVAL`. An invalid operation or mode was specified. A NULL or invalid value was supplied for an input parameter. The error message text identifies the parameter.
- `JOB_EXISTS`. A table already exists with the specified job name.
- `PRIVILEGE_ERROR`. The user does not have the necessary privileges or roles to use the specified mode.
- `INTERNAL_ERROR`. The job was created under the wrong schema or the master table was of the wrong format.
- `SUCCESS_WITH_INFO`. The function succeeded, but further information is available through the `GET_STATUS` procedure.
- `NO_SUCH_JOB`. The specified job does not exist.

Usage Notes

- When the job is created, a master table is created for the job under the caller's schema within the caller's default tablespace. A handle referencing the job is returned that attaches the current session to the job. Once attached, the handle remains valid until either an explicit or implicit detach occurs. The handle is only valid in the caller's session. Other handles can be attached to the same job from a different session by using the `ATTACH` function.
- If the call to the `OPEN` function fails, call the `GET_STATUS` procedure with a null handle to retrieve additional information about the failure.

54.5.13 SET_PARALLEL Procedure

This procedure adjusts the degree of parallelism within a job.

Syntax

```
DBMS_DATAPUMP.SET_PARALLEL(  
    handle      IN NUMBER,  
    degree      IN NUMBER);
```

Parameters

Table 54-23 SET_PARALLEL Procedure Parameters

| Parameter | Description |
|-----------|---|
| handle | The handle of a job. The current session must have previously attached to the handle through a call to either the OPEN or ATTACH function. |
| degree | The maximum number of worker processes that can be used for the job. You use this parameter to adjust the amount of resources used for a job. |

Exceptions

- `INVALID_HANDLE`. The specified handle is not attached to a Data Pump job.
- `INVALID_OPERATION`. The `SET_PARALLEL` procedure is only valid for export and import operations.
- `INVALID_ARGVAL`. An invalid value was supplied for an input parameter.
- `SUCCESS_WITH_INFO`. The procedure succeeded, but further information is available through the `GET_STATUS` procedure.
- `NO_SUCH_JOB`. The specified job does not exist.

Usage Notes

- The `SET_PARALLEL` procedure is only available in the Enterprise Edition of the Oracle database.
- The `SET_PARALLEL` procedure can be executed by any session attached to a job. The job must be in one of the following states: Defining, Idling, or Executing.
- The effect of decreasing the degree of parallelism may be delayed because ongoing work needs to find an orderly completion point before `SET_PARALLEL` can take effect.
- Decreasing the parallelism will not result in fewer worker processes associated with the job. It will only decrease the number of worker processes that will be executing at any given time.
- Increasing the parallelism will take effect immediately if there is work that can be performed in parallel.
- The degree of parallelism requested by a user may be decreased based upon settings in the resource manager or through limitations introduced by the `PROCESSES` or `SESSIONS` initialization parameters in the `init.ora` file.

- To parallelize an Export job to a degree of n , the user should supply n files in the dump file set or specify a substitution variable in a file specification. Otherwise, some of the worker processes will be idle while waiting for files.
- SQL_FILE operations always operate with a degree of 1. Jobs running in the Transportable mode always operate with a degree of 1.

54.5.14 SET_PARAMETER Procedures

This procedure is used to specify job-processing options.

Syntax

```
DBMS_DATAPUMP.SET_PARAMETER (
    handle      IN NUMBER,
    name        IN VARCHAR2,
    value       IN VARCHAR2);
```

```
DBMS_DATAPUMP.SET_PARAMETER (
    handle      IN NUMBER,
    name        IN VARCHAR2,
    value       IN NUMBER);
```

Parameters

Table 54-24 SET_PARAMETER Procedure Parameters

| Parameter | Description |
|-----------|---|
| handle | The handle of a job. The current session must have previously attached to the handle through a call to the OPEN function. |
| name | The name of the parameter. Table 54-25 describes the valid parameter names. |
| value | The value for the specified parameter |

[Table 54-25](#) describes the valid options for the `name` parameter of the `SET_PARAMETER` procedure.

Table 54-25 Valid Options for the name Parameter in the SET_PARAMETER Procedure

| Parameter Name | Datatype | Supported Operations | Meaning |
|----------------|----------|----------------------|---|
| CLIENT_COMMAND | TEXT | All | An opaque string used to describe the current operation from the client's perspective. The command-line procedures will use this string to store the original command used to invoke the job. |

Table 54-25 (Cont.) Valid Options for the name Parameter in the SET_PARAMETER Procedure

| Parameter Name | Datatype | Supported Operations | Meaning |
|-----------------------|----------|----------------------|---|
| COMPRESSION | TEXT | Export | <p>Allows you to trade off the size of the dump file set versus the time it takes to perform export and import operations.</p> <p>The <code>DATA_ONLY</code> option compresses only user data in the dump file set.</p> <p>The <code>METADATA_ONLY</code> option compresses only metadata in the dump file set.</p> <p>The <code>ALL</code> option compresses both user data and metadata.</p> <p>The <code>NONE</code> option stores the dump file set in an uncompressed format.</p> <p>The <code>METADATA_ONLY</code> and <code>NONE</code> options require a job version of 10.2 or later. All other options require a job version of 11.1 or later.</p> <p>Default=<code>METADATA_ONLY</code></p> |
| COMPRESSION_ALGORITHM | TEXT | Export | <p>Indicates the compression algorithm is to be used when compressing dump file data. The choices are as follows:</p> <ul style="list-style-type: none"> <code>BASIC</code>--Offers a good combination of compression ratios and speed; the algorithm used is the same as in previous versions of Oracle Data Pump. <code>LOW</code>---Least impact on backup throughput and suited for environments where CPU resources are the limiting factor. <code>MEDIUM</code>---Recommended for most environments. This option, like the <code>BASIC</code> option, provides a good combination of compression ratios and speed, but it uses a different algorithm than <code>BASIC</code>. <code>HIGH</code>--Best suited for exports over slower networks where the limiting factor is network speed. <p>To use this feature, the <code>COMPATIBLE</code> initialization parameter must be set to at least 12.0.0.</p> <p>This feature requires that the Oracle Advanced Compression option be enabled.</p> |
| DATA_ACCESS_METHOD | TEXT | Export and Import | <p>Allows you to specify an alternative method to unload data if the default method does not work for some reason. The choices are <code>AUTOMATIC</code>, <code>DIRECT_PATH</code>, or <code>EXTERNAL_TABLE</code>. Oracle recommends that you use the default option (<code>AUTOMATIC</code>) whenever possible because it allows Data Pump to automatically select the most efficient method.</p> |

Table 54-25 (Cont.) Valid Options for the name Parameter in the SET_PARAMETER Procedure

| Parameter Name | Datatype | Supported Operations | Meaning |
|----------------|----------|----------------------|--|
| DATA_OPTIONS | Number | Export and Import | <p>A bitmask to supply special options for processing the job. The possible values are as follows:</p> <ul style="list-style-type: none"> • KU\$_DATAOPT_SKIP_CONST_ERR • KU\$_DATAOPT_XMLTYPE_CLOB • KU\$_DATAOPT_DISABL_APPEND_HINT • KU\$_DATAOPT_GRP_PART_TAB • KU\$_DATAOPT_TRUST_EXIST_TB_PAR • KU\$_DATAOPT_CONT_LOAD_ON_FMT_ERR <p>Export supports the value KU\$_DATAOPT_XMLTYPE_CLOB. This option stores compressed XMLType columns in the dump file in CLOB format rather than as XML documents.</p> <p>Note: XMLType stored as CLOB is deprecated as of Oracle Database 12c Release 1 (12.1).</p> <p>Import supports the value KU\$_DATAOPT_SKIP_CONST_ERR. This option specifies that if constraint violations occur while data is being imported into user tables, the rows that cause the violations will be rejected and the load will continue. If this option is not set, a constraint error will abort the loading of the entire partition (or table for unpartitioned tables). Setting this option may affect performance, especially for pre-existing tables with unique indexes or constraints.</p> <p>Import also supports the value KU\$_DATAOPT_DISABL_APPEND_HINT. This option prevents the append hint from being applied to the data load. Disabling the APPEND hint can be useful if there is a small set of data objects to load that already exist in the database and some other application may be concurrently accessing one or more of the data objects.</p> <p>Data Pump Export supports the value KU\$_DATAOPT_GRP_PART_TAB. This option tells Data Pump to unload all table data in one operation rather than unload each table partition as a separate operation. As a result, the definition of the table will not matter at import time because Import will see one partition of data that will be loaded into the entire table.</p> <p>Data Pump Import supports the value KU\$_DATAOPT_TRUST_EXIST_TB_PAR. This option tells Data Pump to load partition data in parallel into existing tables.</p> <p>Use of the DATA_OPTIONS parameter requires that the version on the OPEN function be set to 11.1 or later.</p> <p>Default=0</p> <p>Data Pump Import supports the value KU\$_DATAOPT_CONT_LOAD_ON_FMT_ERR. This option tells Data Pump to skip forward to the start of the next granule if a stream format error is encountered while loading table data. Most stream format errors are caused by corrupt dump files. This value can be used if Data Pump encounters a stream format error and the original export database is not available to export the table data again. If Data Pump skips over data, not all data</p> |

Table 54-25 (Cont.) Valid Options for the name Parameter in the SET_PARAMETER Procedure

| Parameter Name | Datatype | Supported Operations | Meaning |
|----------------------|----------|----------------------|---|
| ENCRYPTION | TEXT | Export | <p>from the source database is imported potentially skipping hundreds or thousands of rows.</p> <p>Specifies what to encrypt in the dump file set, as follows: ALL enables encryption for all data and metadata in the export operation. DATA_ONLY specifies that only data is written to the dump file set in encrypted format. ENCRYPTED_COLUMNS_ONLY specifies that only encrypted columns are written to the dump file set in encrypted format. METADATA_ONLY specifies that only metadata is written to the dump file set in encrypted format. NONE specifies that no data is written to the dump file set in encrypted format.</p> <p>This parameter requires a job version of 11.1 or later.</p> <p>The default value depends upon the combination of encryption-related parameters that are used. To enable encryption, either ENCRYPTION or ENCRYPTION_PASSWORD or both, must be specified. If only ENCRYPTION_PASSWORD is specified, then ENCRYPTION defaults to ALL. If neither ENCRYPTION nor ENCRYPTION_PASSWORD is specified, then ENCRYPTION defaults to NONE.</p> <p>To specify ALL, DATA_ONLY, or METADATA_ONLY, the COMPATIBLE initialization parameter must be set to at least 11.1.</p> <p>NOTE: If the data being exported includes SecureFiles that you want to be encrypted, then you must specify ENCRYPTION=ALL to encrypt the entire dump file set. Encryption of the entire dump file set is the only way to achieve encryption security for SecureFiles during a Data Pump export operation.</p> |
| ENCRYPTION_ALGORITHM | TEXT | Export | <p>Identifies which cryptographic algorithm should be used to perform encryption. Possible values are AES128, AES192, and AES256.</p> <p>The ENCRYPTION_ALGORITHM parameter requires that you also specify either ENCRYPTION or ENCRYPTION_PASSWORD; otherwise an error is returned. See <i>Oracle Database Advanced Security Guide</i> for information about encryption algorithms.</p> <p>This parameter requires a job version of 11.1 or later. Default=AES128</p> |

Table 54-25 (Cont.) Valid Options for the name Parameter in the SET_PARAMETER Procedure

| Parameter Name | Datatype | Supported Operations | Meaning |
|---------------------|----------|----------------------|--|
| ENCRYPTION_MODE | TEXT | Export | <p>Identifies the types of security used for encryption and decryption. The values are as follows:</p> <p>PASSWORD requires that you provide a password when creating encrypted dump file sets. You will need to provide the same password when you import the dump file set. PASSWORD mode requires that you also specify the ENCRYPTION_PASSWORD parameter. The PASSWORD mode is best suited for cases in which the dump file set will be imported into a different or remote database, but which must remain secure in transit.</p> <p>TRANSPARENT allows an encrypted dump file set to be created without any intervention from a database administrator (DBA), provided the required Oracle Encryption Wallet is available. Therefore, the ENCRYPTION_PASSWORD parameter is not required, and will in fact, cause an error if it is used in TRANSPARENT mode. This encryption mode is best suited for cases in which the dump file set will be imported into the same database from which it was exported.</p> <p>DUAL creates a dump file set that can later be imported using either the Oracle Encryption Wallet or the password that was specified with the ENCRYPTION_PASSWORD parameter. DUAL mode is best suited for cases in which the dump file set will be imported on-site using the Oracle Encryption Wallet, but which may also need to be imported offsite where the Oracle Encryption Wallet is not available.</p> <p>When you use the ENCRYPTION_MODE parameter, you must also use either the ENCRYPTION or ENCRYPTION_PASSWORD parameter. Otherwise, an error is returned.</p> <p>To use DUAL or TRANSPARENT mode, the COMPATIBLE initialization parameter must be set to at least 11.1.</p> <p>The default mode depends on which other encryption-related parameters are used. If only ENCRYPTION is specified, then the default mode is TRANSPARENT. If ENCRYPTION_PASSWORD is specified and the Oracle Encryption Wallet is open, then the default is DUAL. If ENCRYPTION_PASSWORD is specified and the Oracle Encryption Wallet is closed, then the default is PASSWORD.</p> |
| ENCRYPTION_PASSWORD | TEXT | Export and Import | <p>For export operations, this parameter is required if ENCRYPTION_MODE is set to either PASSWORD or DUAL. It is also required for transportable export/import operations (job mode=FULL and TRANSPORTABLE=ALWAYS) when the database includes either encrypted tablespaces or tables with encrypted columns.</p> |

Table 54-25 (Cont.) Valid Options for the name Parameter in the SET_PARAMETER Procedure

| Parameter Name | Datatype | Supported Operations | Meaning |
|------------------|----------|---------------------------|---|
| ESTIMATE | TEXT | Export and Import | <p>Specifies that the estimate method for the size of the tables should be performed before starting the job.</p> <p>If <code>BLOCKS</code>, a size estimate for the user tables is calculated using the count of blocks allocated to the user tables.</p> <p>If <code>STATISTICS</code>, a size estimate for the user tables is calculated using the statistics associated with each table. If no statistics are available for a table, the size of the table is estimated using <code>BLOCKS</code>.</p> <p>The <code>ESTIMATE</code> parameter cannot be used in Transportable Tablespace mode.</p> <p>Default=<code>STATISTICS</code></p> |
| ESTIMATE_ONLY | NUMBER | Export | <p>Specifies that only the estimation portion of an export job should be performed. This option is useful for estimating the size of dump files when the size of the export is unknown.</p> |
| FLASHBACK_SCN | NUMBER | Export and network Import | <p>System change number (SCN) to serve as transactionally consistent point for reading user data. If neither <code>FLASHBACK_SCN</code> nor <code>FLASHBACK_TIME</code> is specified, there will be no transactional consistency between partitions, except for logical standby databases and Streams targets. <code>FLASHBACK_SCN</code> is not supported in Transportable mode.</p> <p>For <code>FLASHBACK_SCN</code>, Data Pump supports the new 8–byte big SCNs used in Oracle Database 12c release 2 (12.2).</p> |
| FLASHBACK_TIME | TEXT | Export and network Import | <p>Either the date and time used to determine a consistent point for reading user data or a string of the form <code>TO_TIMESTAMP (...)</code>.</p> <p>If neither <code>FLASHBACK_SCN</code> nor <code>FLASHBACK_TIME</code> is specified, there will be no transactional consistency between partitions. <code>FLASHBACK_SCN</code> and <code>FLASHBACK_TIME</code> cannot both be specified for the same job. <code>FLASHBACK_TIME</code> is not supported in Transportable mode.</p> |
| INCLUDE_METADATA | NUMBER | Export and Import | <p>If nonzero, metadata for objects will be moved in addition to user table data.</p> <p>If zero, metadata for objects will not be moved. This parameter converts an Export operation into an unload of user data and an Import operation into a load of user data.</p> <p><code>INCLUDE_METADATA</code> is not supported in Transportable mode.</p> <p>Default=1</p> |
| KEEP_MASTER | NUMBER | Export and Import | <p>Specifies whether the master table should be deleted or retained at the end of a Data Pump job that completes successfully. The master table is automatically retained for jobs that do not complete successfully.</p> <p>Default=0.</p> |

Table 54-25 (Cont.) Valid Options for the name Parameter in the SET_PARAMETER Procedure

| Parameter Name | Datatype | Supported Operations | Meaning |
|-----------------------|----------|---------------------------|---|
| LOGTIME | TEXT | Export and Import | Specifies that messages displayed during export and import operations be timestamped. Valid options are as follows: <ul style="list-style-type: none"> NONE--No timestamps on status or log file messages (this is the default) STATUS--Timestamps on status messages only LOGFILE--Timestamps on log file messages only ALL--Timestamps on both status and log file messages |
| MASTER_ONLY | NUMBER | Import | Indicates whether to import just the master table and then stop the job so that the contents of the master table can be examined. Default=0. |
| METRICS | NUMBER | Export and Import | Indicates whether additional information about the job should be reported to the Data Pump log file. Default=0. |
| PARTITION_OPTIONS | TEXT | Import | Specifies how partitioned tables should be handled during an import operation. The options are as follows: NONE means that partitioning is reproduced on the target database as it existed in the source database. DEPARTITION means that each partition or subpartition that contains storage in the job is reproduced as a separate unpartitioned table. Intermediate partitions that are subpartitioned are not re-created (although their subpartitions are converted into tables). The names of the resulting tables are system-generated from the original table names and partition names unless the name is overridden by the REMAP_TABLE metadata transform. MERGE means that each partitioned table is re-created in the target database as an unpartitioned table. The data from all of the source partitions is merged into a single storage segment. This option is not supported for transportable jobs or when the TRANSPORTABLE parameter is set to ALWAYS. This parameter requires a job version of 11.1 or later. Default=NONE |
| REUSE_DATAFILES | NUMBER | Import | Specifies whether the import job should reuse existing data files for tablespace creation. Default=0. |
| SKIP_UNUSABLE_INDEXES | NUMBER | Import | If nonzero, rows will be inserted into tables having unusable indexes. SKIP_UNUSABLE_INDEXES is not supported in Transportable mode. Default=1 |
| SOURCE_EDITION | TEXT | Export and network Import | The application edition that will be used for determining the objects that will be unloaded for export and for network import. |
| STREAMS_CONFIGURATION | NUMBER | Import | Specifies whether to import any Streams metadata that may be present in the export dump file. Default=1. |

Table 54-25 (Cont.) Valid Options for the name Parameter in the SET_PARAMETER Procedure

| Parameter Name | Datatype | Supported Operations | Meaning |
|---------------------|----------|----------------------|---|
| TABLE_EXISTS_ACTION | TEXT | Import | <p>Specifies the action to be performed when data is loaded into a preexisting table. The possible actions are: TRUNCATE, REPLACE, APPEND, and SKIP.</p> <p>If INCLUDE_METADATA=0, only TRUNCATE and APPEND are supported.</p> <p>If TRUNCATE, rows are removed from a preexisting table before inserting rows from the Import.</p> <p>Note that if TRUNCATE is specified on tables referenced by foreign key constraints, the TRUNCATE will be modified into a REPLACE.</p> <p>If REPLACE, preexisting tables are replaced with new definitions. Before creating the new table, the old table is dropped.</p> <p>If APPEND, new rows are added to the existing rows in the table.</p> <p>If SKIP, the preexisting table is left unchanged.</p> <p>TABLE_EXISTS_ACTION is not supported in Transportable mode.</p> <p>The default is SKIP if metadata is included in the import. The default is APPEND if INCLUDE_METADATA is set to 0.</p> |
| TABSPACE_DATAFILE | TEXT | Import | <p>Specifies the full file specification for a data file in the transportable tablespace set. TABSPACE_DATAFILE is only valid for transportable mode imports.</p> <p>TABSPACE_DATAFILE can be specified multiple times, but the value specified for each occurrence must be different.</p> |
| TARGET_EDITION | TEXT | Import | <p>The application edition that will be used for determining where the objects will be loaded for import and for network import.</p> |

Table 54-25 (Cont.) Valid Options for the name Parameter in the SET_PARAMETER Procedure

| Parameter Name | Datatype | Supported Operations | Meaning |
|----------------|----------|---|--|
| TRANSPORTABLE | TEXT | Export (and network import or full-mode import) | <p>This option is for export operations done in table mode, and also for full-mode imports and network imports. It allows the data to be moved using transportable tablespaces.</p> <p>In table-mode storage segments in the moved tablespaces that are not associated with the parent schemas (tables) will be reclaimed at import time. If individual partitions are selected in a table-mode job, only the tablespaces referenced by those partitions will be moved. During import, the moved partitions can only be reconstituted as tables by using the <code>PARTITION_OPTIONS=DEPARTITION</code> parameter.</p> <p>Use of the <code>TRANSPORTABLE</code> parameter prohibits the subsequent import of the dump file into a database at a lower version or using different character sets. Additionally, the data files may need to be converted if the target database is on a different platform.</p> <p>In table-mode, the <code>TRANSPORTABLE</code> parameter is not allowed if a network link is supplied on the <code>OPEN</code> call.</p> <p>The possible values for this parameter are as follows: <code>ALWAYS</code> - data is always moved by moving data files. This option is valid only for table mode and full mode. <code>NEVER</code> - data files are never used for copying user data</p> <p>This parameter requires a job version of 11.1 or later This parameter requires a job version of 12.1 or later when the job mode is <code>FULL</code>. Default=<code>NEVER</code></p> |
| TTS_FULL_CHECK | NUMBER | Export | <p>If nonzero, verifies that a transportable tablespace set has no dependencies (specifically, IN pointers) on objects outside the set, and vice versa. Only valid for Transportable mode Exports. Default=0</p> |
| USER_METADATA | NUMBER | Export and network Import | <p>For schema-mode operations, specifies that the metadata to re-create the users' schemas (for example, privilege grants to the exported schemas) should also be part of the operation if set to nonzero. Users must be privileged to explicitly set this parameter.</p> <p>The <code>USER_METADATA</code> parameter cannot be used in Table, Tablespace, or Transportable Tablespace mode. Default=1 if user has <code>DATAPUMP_EXP_FULL_DATABASE</code> role; 0 otherwise.</p> |

Exceptions

- `INVALID_HANDLE`. The specified handle is not attached to a Data Pump job.
- `INVALID_ARGVAL`. This exception could be due to any of the following causes:
 - An invalid name was supplied for an input parameter
 - The wrong datatype was used for `value`
 - A `value` was not supplied

- The supplied `value` was not allowed for the specified parameter name
- A flashback parameter had been established after a different flashback parameter had already been established
- A parameter was specified that did not support duplicate definitions
- `INVALID_OPERATION`. The operation specified is invalid in this context.
- `INVALID_STATE`. The specified job is not in the Defining state.
- `INCONSISTENT_ARGS`. Either the specified parameter is not supported for the current operation type or it is not supported for the current mode.
- `PRIVILEGE_ERROR`. The user does not have the `DATAPUMP_EXP_FULL_DATABASE` or `DATAPUMP_IMP_FULL_DATABASE` role required for the specified parameter.
- `SUCCESS_WITH_INFO`. The procedure succeeded, but further information is available through the `GET_STATUS` procedure.
- `NO_SUCH_JOB`. The specified job does not exist.

Usage Notes

- The `SET_PARAMETER` procedure is used to specify optional features for the current job. See [Table 54-25](#) for a list of supported options.

54.5.15 START_JOB Procedure

This procedure begins or resumes job execution.

Syntax

```
DBMS_DATAPUMP.START_JOB (
    handle          IN NUMBER,
    skip_current    IN NUMBER DEFAULT 0,
    abort_step      IN NUMBER DEFAULT 0,
    cluster_ok      IN NUMBER DEFAULT 1,
    service_name    IN VARCHAR2 DEFAULT NULL);
```

Parameters

Table 54-26 START_JOB Procedure Parameters

| Parameter | Description |
|---------------------------|---|
| <code>handle</code> | The handle of a job. The current session must have previously attached to the handle through a call to either the <code>OPEN</code> or <code>ATTACH</code> function. |
| <code>skip_current</code> | If nonzero, causes actions that were 'in progress' on a previous execution of the job to be skipped when the job restarts. The skip will only be honored for Import jobs. This mechanism allows the user to skip actions that trigger fatal bugs and cause the premature termination of a job. Multiple actions can be skipped on a restart. The log file will identify which actions are skipped. If a domain index was being processed, all pieces of the domain index are skipped even if the error occurred in only a subcomponent of the domain index. A description of the actions skipped is entered into the log file. <code>skip_current</code> is ignored for the initial <code>START_JOB</code> in a job. If zero, no data or metadata is lost upon a restart. |

Table 54-26 (Cont.) START_JOB Procedure Parameters

| Parameter | Description |
|---------------------------|---|
| <code>abort_step</code> | Value must be 0. Inserting values other than 0 into this argument will have unintended consequences. |
| <code>cluster_ok</code> | If = 0, all workers are started on the current instance. Otherwise, workers are started on instances usable by the job. |
| <code>service_name</code> | If specified, indicates a service name used to constrain the job to specific instances or to a specific resource group. |

Exceptions

- `INVALID_HANDLE`. The specified handle is not attached to a Data Pump job.
- `INVALID_STATE`. The causes of this exception can be any of the following:
 - No files have been defined for an Export, non-network Import, or `SQL_FILE` job
 - An `ADD_FILE` procedure has not been called to define the output for a `SQL_FILE` job
 - A `TABLESPACE_DATAFILE` parameter has not been defined for a Transportable Import job
 - A `TABLESPACE_EXPR` metadata filter has not been defined for a Transportable or Tablespace mode Export or Network job
 - The dump file set on an Import or `SQL_FILE` job was either incomplete or missing a master table specification
- `INVALID_OPERATION`. Unable to restore master table from a dump file set.
- `INTERNAL_ERROR`. An inconsistency was detected when the job was started. Additional information may be available through the `GET_STATUS` procedure.
- `SUCCESS_WITH_INFO`. The procedure succeeded, but further information is available through the `GET_STATUS` procedure.
- `NO_SUCH_JOB`. The specified job does not exist.

Usage Notes

- When this procedure is called to request that the corresponding job be started or restarted, the state of the job is changed from either the Defining or Idling state to the Executing state.
- If the `SET_PARALLEL` procedure was not called prior to the `START_JOB` procedure, the initial level of parallelism used in the job will be 1. If `SET_PARALLEL` was called prior to the job starting, the `degree` specified by the last `SET_PARALLEL` call determines the parallelism for the job. On restarts, the parallelism is determined by the previous parallel setting for the job, unless it is overridden by another `SET_PARALLEL` call.
- To restart a stopped job, an `ATTACH` function must be performed prior to executing the `START_JOB` procedure.

54.5.16 STOP_JOB Procedure

This procedure terminates a job, but optionally, preserves the state of the job.

Syntax

```
DBMS_DATAPUMP.STOP_JOB (
    handle      IN NUMBER,
    immediate   IN NUMBER DEFAULT 0,
    keep_master IN NUMBER DEFAULT NULL,
    delay       IN NUMBER DEFAULT 60);
```

Parameters

Table 54-27 STOP_JOB Procedure Parameters

| Parameter | Description |
|-------------|---|
| handle | The handle of a job. The current session must have previously attached to the handle through a call to either the <code>OPEN</code> or <code>ATTACH</code> function. At the end of the procedure, the user is detached from the handle. |
| immediate | If nonzero, the worker processes are aborted immediately. This halts the job quickly, but parts of the job will have to be rerun if the job is ever restarted. If zero, the worker processes are allowed to complete their current work item (either metadata or table data) before they are terminated. The job is placed in a Stop Pending state while the workers finish their current work. |
| keep_master | If nonzero, the master table is retained when the job is stopped. If zero, the master table is dropped when the job is stopped. If the master table is dropped, the job will not be restartable. If the master table is dropped during an export job, the created dump files are deleted. |
| delay | The number of seconds to wait until other attached sessions are forcibly detached. The delay allows other sessions attached to the job to be notified that a stop has been performed. The job keeps running until either all clients have detached or the delay has been satisfied. If no delay is specified, then the default delay is 60 seconds. If a shorter delay is used, clients might not be able to retrieve the final messages for the job through the <code>GET_STATUS</code> procedure. |

Exceptions

- `INVALID_HANDLE`. The specified handle is not attached to a Data Pump job.
- `INVALID_STATE`. The job is already in the process of being stopped or completed.
- `SUCCESS_WITH_INFO`. The procedure succeeded, but further information is available through the `GET_STATUS` procedure.
- `NO_SUCH_JOB`. The specified job does not exist.

Usage Notes

- This procedure is used to request that the corresponding job stop executing.
- The termination of a job that is in an Executing state may take several minutes to complete in an orderly fashion.
- For jobs in the Defining, Idling, or Completing states, this procedure is functionally equivalent to the `DETACH` procedure.

- Once a job is stopped, it can be restarted using the `ATTACH` function and `START_JOB` procedures, provided the master table and the dump file set are left intact.
- If the `KEEP_MASTER` parameter is not specified, and the job is in the Defining state or has a mode of Transportable, the master table is dropped. Otherwise, the master table is retained.

54.5.17 WAIT_FOR_JOB Procedure

This procedure runs a job until it either completes normally or stops for some other reason.

Syntax

```
DBMS_DATAPUMP.WAIT_FOR_JOB (  
    handle      IN  NUMBER,  
    job_state   OUT VARCHAR2);
```

Parameters

Table 54-28 WAIT_FOR_JOB Procedure Parameters

| Parameter | Description |
|-----------|---|
| handle | The handle of the job. The current session must have previously attached to the handle through a call to either the <code>OPEN</code> or <code>ATTACH</code> function. At the end of the procedure, the user is detached from the handle. |
| job_state | The state of the job when it has stopped executing; either <code>STOPPED</code> or <code>COMPLETED</code> . |

Exceptions

- `SUCCESS_WITH_INFO`. The procedure succeeded, but further information is available through the `GET_STATUS` API.
- `INVALID_HANDLE`. The job handle is no longer valid.

Usage Notes

This procedure provides the simplest mechanism for waiting for the completion of a Data Pump job. The job should be started before calling `WAIT_FOR_JOB`. When `WAIT_FOR_JOB` returns, the job will no longer be executing. If the job completed normally, the final status will be `COMPLETED`. If the job stopped executing because of a `STOP_JOB` request or an internal error, the final status will be `STOPPED`.

DBMS_DB_VERSION

The `DBMS_DB_VERSION` package specifies the Oracle version numbers and other information useful for simple conditional compilation selections based on Oracle versions.

See Also:

Oracle Database PL/SQL Language Reference regarding conditional compilation

This package contains the following topics:

- [Overview](#)
- [Constants](#)
- [Examples](#)

55.1 DBMS_DB_VERSION Overview

The `DBMS_DB_VERSION` package specifies the Oracle version numbers and other information useful for simple conditional compilation selections based on Oracle versions.

The package for the Oracle Database 21c version is shown below.

```
PACKAGE DBMS_DB_VERSION IS
  VERSION CONSTANT PLS_INTEGER := 21; -- RDBMS version number
  RELEASE CONSTANT PLS_INTEGER := 0; -- RDBMS release number
  ver_le_9_1      CONSTANT BOOLEAN := FALSE;
  ver_le_9_2      CONSTANT BOOLEAN := FALSE;
  ver_le_9        CONSTANT BOOLEAN := FALSE;
  ver_le_10_1     CONSTANT BOOLEAN := FALSE;
  ver_le_10_2     CONSTANT BOOLEAN := FALSE;
  ver_le_10       CONSTANT BOOLEAN := FALSE;
  ver_le_11_1     CONSTANT BOOLEAN := FALSE;
  ver_le_11_2     CONSTANT BOOLEAN := FALSE;
  ver_le_11       CONSTANT BOOLEAN := FALSE;
  ver_le_12_1     CONSTANT BOOLEAN := FALSE;
  ver_le_12_2     CONSTANT BOOLEAN := FALSE;
  ver_le_12       CONSTANT BOOLEAN := FALSE;
  ver_le_18       CONSTANT BOOLEAN := FALSE;
  ver_le_19       CONSTANT BOOLEAN := FALSE;
  ver_le_20       CONSTANT BOOLEAN := FALSE;
  ver_le_21       CONSTANT BOOLEAN := TRUE;
END DBMS_DB_VERSION;
```

The boolean constants follow a naming convention. Each constant gives a name for a boolean expression. For example:

- `VER_LE_9_1` represents version ≤ 9 and release ≤ 1

- VER_LE_10_2 represents version <= 10 and release <= 2
- VER_LE_10 represents version <= 10

A typical usage of these boolean constants is:

```

$IF DBMS_DB_VERSION.VER_LE_10 $THEN
    version 10 and earlier code
$ELSIF DBMS_DB_VERSION.VER_LE_11 $THEN
    version 11 code
$ELSE
    version 12 and later code
$END

```

This code structure will protect any reference to the code for version 12. It also prevents the controlling package constant `DBMS_DB_VERSION.VER_LE_11` from being referenced when the program is compiled under version 10. A similar observation applies to version 11. This scheme works even though the static constant `VER_LE_11` is not defined in version 10 database because conditional compilation protects the `$ELSIF` from evaluation if `DBMS_DB_VERSION.VER_LE_10` is `TRUE`.

55.2 DBMS_DB_VERSION Constants

The `DBMS_DB_VERSION` package contains different constants for different Oracle Database releases.

The Oracle Database 21c version of the `DBMS_DB_VERSION` package uses the constants shown in the following table.

Table 55-1 DBMS_DB_VERSION Constants

| Name | Type | Value | Description |
|-------------|-------------|-------|--------------------------------|
| VERSION | PLS_INTEGER | 21 | Current version |
| RELEASE | PLS_INTEGER | 0 | Current release |
| VER_LE_9 | BOOLEAN | FALSE | Version <= 9 |
| VER_LE_9_1 | BOOLEAN | FALSE | Version <= 9 and release <= 1 |
| VER_LE_9_2 | BOOLEAN | FALSE | Version <= 9 and release <= 2 |
| VER_LE_10 | BOOLEAN | FALSE | Version <= 10 |
| VER_LE_10_1 | BOOLEAN | FALSE | Version <= 10 and release <= 1 |
| VER_LE_10_2 | BOOLEAN | FALSE | Version <=10 and release <= 2 |
| VER_LE_11 | BOOLEAN | FALSE | Version <= 11 |
| VER_LE_11_1 | BOOLEAN | FALSE | Version <=11 and release <= 1 |
| VER_LE_11_2 | BOOLEAN | FALSE | Version <=11 and release <= 2 |
| VER_LE_12 | BOOLEAN | FALSE | Version <=12 |
| VER_LE_12_1 | BOOLEAN | FALSE | Version <=12 and release <= 1 |
| VER_LE_12_2 | BOOLEAN | FALSE | Version <=12 and release <= 2 |
| VER_LE_18 | BOOLEAN | FALSE | Version <=18 |
| VER_LE_19 | BOOLEAN | FALSE | Version <=19 |
| VER_LE_20 | BOOLEAN | FALSE | Version <=20 |

Table 55-1 (Cont.) DBMS_DB_VERSION Constants

| Name | Type | Value | Description |
|-----------|---------|-------|--------------|
| VER_LE_21 | BOOLEAN | TRUE | Version <=21 |

55.3 DBMS_DB_VERSION Examples

This example uses conditional compilation to guard new features.

```

CREATE OR REPLACE PROCEDURE whetstone IS

  -- Notice that conditional compilation constructs
  -- can interrupt a regular PL/SQL statement.
  -- You can locate a conditional compilation directive anywhere
  -- there is whitespace in the regular statement.

  SUBTYPE my_real IS
    $IF DBMS_DB_VERSION.VER_LE_9 $THEN NUMBER
    $ELSE BINARY_DOUBLE
    $END;

  t CONSTANT my_real := $IF DBMS_DB_VERSION.VER_LE_9 $THEN 0.499975
    $ELSE 0.499975d
    $END;

  t2 CONSTANT my_real := $if DBMS_DB_VERSION.VER_LE_9 $THEN 2.0
    $ELSE 2.0d
    $END;

  x CONSTANT my_real := $IF DBMS_DB_VERSION.VER_LE_9 $THEN 1.0
    $ELSE 1.0d
    $END;

  y CONSTANT my_real := $IF DBMS_DB_VERSION.VER_LE_9 $THEN 1.0
    $ELSE 1.0d
    $END;

  z MY_REAL;

  PROCEDURE P(x IN my_real, y IN my_real, z OUT NOCOPY my_real) IS
    x1 my_real;
    y1 my_real;
  BEGIN
    x1 := x;
    y1 := y;
    x1 := t * (x1 + y1);
    y1 := t * (x1 + y1);
    z := (x1 + y1)/t2;
  END P;
BEGIN
  P(x, y, z);
  DBMS_OUTPUT.PUT_LINE ('z = ' || z);
END whetstone;
/

```

DBMS_DBCOMP

The `DBMS_DBCOMP` package performs block comparison to detect lost writes or database inconsistencies between a primary database and one or more physical standby databases. It contains one procedure, `DBCMP`, which can be executed at any time. (It does not require that the `DB_LOST_WRITE_PROTECT` initialization parameter be enabled.)

This chapter contains the following sections:

- [Using DBMS_DBCOMP](#)
- [DBMS_DBCOMP Security Model](#)
- [DBCMP Procedure](#)

Related Topics

- *Oracle Data Guard Concepts and Administration*

56.1 Using DBMS_DBCOMP

The `DBMS_DBCOMP.DBCMP` procedure assumes that there is one primary database and one or more physical standby databases. The databases should be at least mounted before block comparison.

Note:

Logical standby databases, far sync instances, and cascaded standbys cannot be the target database for the `DBMS_DBCOMP.DBCMP` procedure.

While this procedure is running, you can monitor progress of the compare operation by querying the `V$SESSION_LONGOPS` view. For example:

```
SQL> SELECT target_desc, sofar, totalwork FROM V$SESSION_LONGOPS WHERE
opname = 'BlockCompare';
```

The output might look as follows:

| TARGET_DESC | SO FAR | TOTALWORK |
|-----------------|--------|-----------|
| ----- | ----- | ----- |
| Compared Blocks | 23914 | 340639 |
| Lost Writes | 0 | 0 |

The results can be interpreted as follows:

- The `Compared Blocks` value is the number of blocks that were scanned (including those that did not use compare callback functions). The number is the sum of all slaves (that is, each slave is responsible for a connection between primary and standby). For example, if

there are two slaves and each slave has compared 1000 blocks, then the value of `SO FAR` should be 2000.

- The `Lost Writes` value is the number of lost writes found at both the primary and the standby. Also, it is the sum of all slaves. For `Lost Writes`, the value of `SO FAR` should be always equal to the value of `TOTALWORK`.
- The value of `SO FAR` should be always less than or equal to the value of `TOTALWORK`.
- When the block compare slave processes finish, the value of `SO FAR` should be equal to the value of `TOTALWORK`.

56.2 DBMS_DBCOMP Security Model

The `DBMS_DBCOMP` package runs with invoker's rights and requires the `SYSDBA` or `SYSDBG` or `SYSBACKUP` privilege.

56.3 Summary of the DBMS_DBCOMP Subprogram

The `DBMS_DBCOMP` package contains one procedure, `DBCMP`.

| Subprogram | Description |
|------------------------------|---|
| <code>DBCMP</code> procedure | The <code>DBMS_DBCOMP.DBCMP</code> procedure performs block comparison to detect lost writes or database inconsistencies between a primary database and one or more physical standby databases. The <code>DBCMP</code> procedure can be executed on the primary or on the physical standby while the databases are mounted or open. |

56.3.1 DBCOMP Procedure

Use `DBCMP` procedure to compare blocks on a primary database and one or more physical standby databases.

Syntax

```
DBMS_DBCOMP.DBCMP (
  datafile IN varchar2,
  outputfile IN varchar2,
  block_dump IN boolean);
```

Parameters

| Parameter | Description |
|-----------------------|---|
| <code>datafile</code> | This can be a data file name or a data file number. Specify <code>'ALL'</code> to compare all data files. |

| Parameter | Description |
|------------|---|
| outputfile | This value is used as a prefix in the name of the output file. By default, output files are placed in the dbs/ directory, but the output file argument can contain a relative directory path or an absolute directory path. See Usage Notes for descriptions of the information contained in the output file. |
| block_dump | This is a Boolean parameter to specify whether block content should be dumped into output files if a pair of blocks of primary and standby databases is not identical. This parameter does not guarantee that all different block pairs are dumped. The default value is FALSE. |

Usage Notes

- The output file contains the following columns:
 - **ID**: The block type. For instance, type 02 is undo block type, and 06 is KTB-managed data block type.
 - **TOTAL**: The total number of blocks in the specific block type.
 - **CORR**: The number of corrupted blocks.
 - **SKIPPED**: The number of block pairs that are skipped (ignored) without comparison, such as direct loaded blocks, RMAN optimized blocks, and flashback optimized blocks
 - **DIFFV**: The number of blocks that have different version numbers between primary and standby.
 - **SAMEV**: The number of block pairs that have the same version number between primary and standby.
 - **SAMEV&C**: The number of block pairs that have the same version and the same checksum.
 - **ENCERR**: The number of block pairs that have encryption related errors (usually because the Wallet is not open).
 - **LWLOC**: The number of lost writes on the local database.
 - **LWRMT**: The number of lost writes on the remote databases.
 - **DIFFPAIR** : The number of block pairs that have the same version but different checksum, and which the block compare callback function has concluded are different.

Example 56-1 Example

The following is an example of using the `DBMS_DBCOMP.DBCOMP` procedure.

```
declare
  Datafile_Name_or_Number varchar2(1000);
  Output_File varchar2(1000);
begin
  dbms_output.enable(1000000);
```

```
Datafile_Name_or_Number:= 'all' ;  
Output_File:='BlockCompareAll_';  
sys.dbms_dbcomp.DBCOMP(Datafile_Name_or_Number, Output_File, true);  
end;
```

DBMS_DBFS_CONTENT

The `DBMS_DBFS_CONTENT` package provides an interface comprising a file system-like abstraction backed by one or more Store Providers.

This chapter contains the following topics:

- [Overview](#)
- [Security Model](#)
- [Constants](#)
- [Exceptions](#)
- [Operational Notes](#)
- [Data Structures](#)
- [Summary of DBMS_DBFS_CONTENT Subprograms](#)

57.1 DBMS_DBFS_CONTENT Overview

The `DBMS_DBFS_CONTENT` package provides an interface that connects the Oracle database to the DBFS client-side.

In the server, the `DBMS_DBFS_CONTENT` package is backed by the `DBMS_DBFS_CONTENT_SPI` package, which includes descriptions but not actual implementations of DBFS stores.

See Also:

- Oracle Database SecureFiles and Large Objects Developer's Guide for a description of `DBMS_DBFS_CONTENT` and the DBFS architecture
- Oracle Database SecureFiles and Large Objects Developer's Guide for conceptual information about the `DBMS_DBFS_CONTENT` package

57.2 DBMS_DBFS_CONTENT Security Model

The `DBMS_DBFS_CONTENT` package runs under `AUTHID CURRENT_USER`.

57.3 DBMS_DBFS_CONTENT Constants

The `DBMS_DBFS_CONTENT` package uses various types of constants.

These are shown in the following tables:

- [Table 57-1](#)
- [Table 57-2](#)
- [Table 57-3](#)
- [Table 57-4](#)
- [Table 57-5](#)
- [Table 57-6](#)
- [Table 57-7](#)
- [Table 57-8](#)
- [Table 57-9](#)
- [Table 57-10](#)

Path Name Constants and Types

The following constants are useful for declaring paths and item names. Paths are limited to 1024 characters and item names are limited to 256 characters.

Table 57-1 DBMS_DBFS_CONTENT Constants - Path Names

| Constant | Type | Value | Description |
|----------|-----------------|----------|--|
| NAME_MAX | PLS_INTEGER | 256 | Maximum length of an absolute path name visible to clients |
| NAME_T | VARCHAR2 (256) | NAME_MAX | Portable alias for string that can represent component names |
| PATH_MAX | PLS_INTEGER | 1024 | Maximum length of any individual component of an absolute path name visible to clients |
| PATH_T | VARCHAR2 (1024) | PATH_MAX | Portable alias for string that can represent path names |

ContentID Constants

Stores may expose to the user a unique identifier that represents a particular path item in the store. These identifiers are limited to 128 characters.

Table 57-2 DBMS_DBFS_CONTENT Constants - ContentID

| Constant | Type | Value | Description |
|----------------|-------------|----------------|--|
| CONTENT_ID_MAX | PLS_INTEGER | 128 | Maximum length of a store-specific provider-generated contentID that identifies a file-type content item |
| CONTENT_ID_T | RAW(128) | CONTENT_ID_MAX | Portable alias for raw buffers that can represent contentID values |

Path Properties Constants

Every path name in a store is associated with a set of properties. Each property is identified by a string "name", has a string "value" (which might be `NULL` if unset or undefined or unsupported by a specific store implementation) and a value "typecode" (a numeric discriminant for the actual type of value held in the "value" string.)

Table 57-3 DBMS_DBFS_CONTENT Constants - Properties

| Constant | Type | Value | Description |
|--------------|----------------|--------------|--|
| PROPNAME_MAX | PLS_INTEGER | 32 | Maximum length of a property name |
| PROPNAME_T | VARCHAR2(32) | PROPNAME_MAX | Portable alias for string that can represent property names |
| PROPVAL_MAX | PLS_INTEGER | 1024 | Maximum length of the string value of a property |
| PROPVAL_T | VARCHAR2(1024) | PATH_MAX | Portable alias for string that can represent property values |

Path Name Type Constants

Path items in a store have a item type associated with them. These types represent the kind of entry the item represents in the store.

Table 57-4 DBMS_DBFS_CONTENT Constants - Path Name Types

| Constant | Type | Value | Description |
|----------------|-------------|-------|--|
| TYPE_FILE | PLS_INTEGER | 1 | A regular file storing content (a logically linear sequence of bytes accessed as a BLOB) |
| TYPE_DIRECTORY | PLS_INTEGER | 2 | A container of other path name types, including file types |

Table 57-4 (Cont.) DBMS_DBFS_CONTENT Constants - Path Name Types

| Constant | Type | Value | Description |
|----------------|-------------|-------|---|
| TYPE_LINK | PLS_INTEGER | 3 | A symbolic link (that is, an uninterpreted string value associated with a path name). Since symbolic links may represent path names that fall outside the scope of any given store (or even the entire aggregation of stores managed by the DBMS_DBFS_CONTENT interface), or may not even represent path names, clients must be careful in creating symbolic links, and stores must be careful in trying to resolve these links internally. |
| TYPE_REFERENCE | PLS_INTEGER | 4 | A hard link which is always a valid path name alias to content |
| TYPE_SOCKET | PLS_INTEGER | 5 | UNIX domain socket created using socket interface defined as in <code>socket.h</code> with domain defined as <code>AF_UNIX</code> or <code>AF_LOCAL</code> . |

Store Feature Constants

The DBFS content API allows different store providers (and different stores) to describe themselves through a *feature set* (a bitmask indicating which features they support and which ones they do not).

Table 57-5 DBMS_DBFS_CONTENT Constants - Store Features

| Constant | Type | Value | Description |
|-----------------|-------------|-------|--|
| FEATURE_FOLDERS | PLS_INTEGER | 1 | Set if the store supports folders (or directories) as part of hierarchical path names |
| FEATURE_FOIAI | PLS_INTEGER | 2 | Set if implicit folder operations within the store (performed as part of a client-requested operation) runs inside autonomous transactions. In general, the use of autonomous transactions is a compromise between (a) simplicity in the implementation and client-controlled transaction scope for all operations, at the cost of greatly reduced concurrency (FEATURE_FOIAI not set), versus (b) more complex implementation and smaller client-controlled transaction scope, at the benefit of greatly increased concurrency (FEATURE_FOIAI set). |

Table 57-5 (Cont.) DBMS_DBFS_CONTENT Constants - Store Features

| Constant | Type | Value | Description |
|------------------------|-------------|-------|--|
| FEATURE_NOWAIT | PLS_INTEGER | 4 | Set if the store allows <code>nowait</code> gets of path elements. The default behavior is to wait for row locks; if <code>nowait</code> gets are implemented, the <code>get</code> operation raises an ORA-54 exception if the path element is already locked by another transaction. |
| FEATURE_ACLS | PLS_INTEGER | 8 | Set if the store supports Access Control Lists (ACLs) and internal authorization or checking based on these ACLs. ACLs are standard properties but a store may do nothing more than store and retrieve the ACLs without interpreting them in any way. |
| FEATURE_LINKS | PLS_INTEGER | 16 | Set if the store supports symbolic links, and if certain types of symbolic links (specifically non-absolute path names) can be internally resolved by the store itself |
| FEATURE_LINK_DEREF | PLS_INTEGER | 32 | Set if the store supports symbolic links, and if certain types of symbolic links (specifically non-absolute path names) can be internally resolved by the store itself |
| FEATURE_REFERENCES | PLS_INTEGER | 64 | Set if the store supports hard links |
| FEATURE_LOCKING | PLS_INTEGER | 128 | Set if the store supports user-level locks (read-only, write-only, read-write) that can be applied on various items of the store, and if the store uses these lock settings to control various types of access to the locked items. User-level locks are orthogonal to transaction locks and persist beyond the scope of any specific transaction, session, or connection — this implies that the store itself may not be able to clean up after dangling locks, and client-applications need to perform any garbage collection. |
| FEATURE_LOCK_HIERARCHY | PLS_INTEGER | 256 | Set if the store allows a user-lock to control access to the entire sub-tree under the locked path name. |
| FEATURE_LOCK_CONVERT | PLS_INTEGER | 512 | Set if the store supports upgrade or downgrade of locks from one mode to another |

Table 57-5 (Cont.) DBMS_DBFS_CONTENT Constants - Store Features

| Constant | Type | Value | Description |
|----------------------|-------------|-------|---|
| FEATURE_VERSIONING | PLS_INTEGER | 1024 | Set if the store supports at least a linear versioning and version management. Different versions of the same path name are identified by monotonic version numbers, with a version-nonqualified path name representing the latest version. |
| FEATURE_VERSION_PATH | PLS_INTEGER | 2048 | Set if the store supports a hierarchical namespace for different versions of a path name |
| FEATURE_SOFT_DELETES | PLS_INTEGER | 4096 | Set if the store supports a "soft-delete", that is, the ability to delete a path name and make it invisible to normal operations, but retain the ability to restore the path name later (as long as it has not been overwritten by a new create operation). The store also supports purging soft-deleted path names (making them truly deleted), and navigation modes that show soft-deleted items. |
| FEATURE_HASHING | PLS_INTEGER | 8192 | Set if the store automatically computes and maintains some type of a secure hash of the contents of a path name (typically a TYPE_FILE path). |
| FEATURE_HASH_LOOKUP | PLS_INTEGER | 16384 | Set if the store allows "content-based addressing", that is, the ability to locate a content item based, not on its path name, but on its content hash. |

Table 57-5 (Cont.) DBMS_DBFS_CONTENT Constants - Store Features

| Constant | Type | Value | Description |
|-------------------|-------------|--------|--|
| FEATURE_FILTERING | PLS_INTEGER | 32768 | <p>Set if the store allows clients to pass a filter function (a PL/SQL function conforming to the signature below) that returns a logical boolean indicating if a given store item satisfies a selection predicate. Stores that support filtering may be able to more efficiently perform item listing, directory navigation, and deletions by embedding the filtering logic inside their implementation. If filtering is not supported, clients can retrieve more items than necessary and perform the filtering checks themselves, albeit less efficiently.</p> <p>A filter predicate is a function with the following signature:</p> <pre>function filterFunction(path IN VARCHAR2, store_name IN VARCHAR2, opcode IN INTEGER, item_type IN INTEGER, properties IN DBMS_DBFS_CONTENT_PROPERTIES_T, content IN BLOB) RETURN INTEGER;</pre> <p>Any PL/SQL function conforming to this signature can examine the contents and properties of a store item, and determine if the item satisfies the selection criterion for the current operation. Any nonzero return value results in the DBMS_DBFS_CONTENT interface processing the item as part of the current operation; a return value that is zero or NULL results in the item being skipped from processing.</p> |
| FEATURE_SEARCHING | PLS_INTEGER | 65536 | <p>Set if the store allows clients to pass a text-search filter query to locate <code>type_file</code> path names based on their content. Stores that support searching may use indexes to accelerate such searches; otherwise, clients need to build their own indexes, or else search a potentially larger set of items to locate the ones of interest for the current search.</p> |
| FEATURE_ASOF | PLS_INTEGER | 131072 | <p>Set if the store allows clients to use a flashback timestamp in query operations (non-mutating GETPATH Procedures and LIST Function).</p> |

Table 57-5 (Cont.) DBMS_DBFS_CONTENT Constants - Store Features

| Constant | Type | Value | Description |
|------------------------|-------------|---------|---|
| FEATURE_PROVIDER_PROPS | PLS_INTEGER | 262144 | Set if the store allows per-operation properties (that control the behavior of the store with regard to the current operation, as opposed to properties associated with individual items). |
| FEATURE_SNAPSHOTS | PLS_INTEGER | 524288 | Set if the store allows the use of named, read-only snapshots of its contents. It is up to the provider to implement snapshots using any suitable means (including creating immediate copies of the content, or using copy-on-write) and managing dependencies between snapshots and its parent content view. |
| FEATURE_CLONES | PLS_INTEGER | 1048576 | Set if the store allows the use of named, writable clones of its contents. It is up to the provider to implement clones using any suitable means (including creating immediate copies of the content, or using copy-on-write) and managing dependencies between clones and its parent content view. |
| FEATURE_LOCATOR | PLS_INTEGER | 2097152 | Set if the store allows direct access to file contents through a LOB locator. Stores that internally manipulate the file contents, perhaps by shredding or reassembling them in separate pieces, performing other transformations, and so on, cannot transparently give out a LOB locator to clients. The file contents of these stores should be accessed using the buffer-based interfaces. |
| FEATURE_CONTENT_ID | PLS_INTEGER | 4194304 | Set if the store allows a "pathless", contentID-based access to files (there is no notion of a directory, link, or reference in this model) |
| FEATURE_LAZY_PATH | PLS_INTEGER | 8388608 | Set if the store allows a lazy binding of a path name to file content elements that are otherwise identified by a contentID; this feature makes sense only in conjunction with FEATURE_CONTENT_ID |

Lock Type Constants

Stores that support locking should implement 3 types of locks: `LOCK_READ_ONLY`, `LOCK_WRITE_ONLY`, and `LOCK_READ_WRITE`.

Table 57-6 DBMS_DBFS_CONTENT Constants - Lock Types

| Constant | Type | Value | Description |
|-----------------|-------------|-------|---------------------|
| LOCK_READ_ONLY | PLS_INTEGER | 1 | Locks as read-only |
| LOCK_WRITE_ONLY | PLS_INTEGER | 2 | Locks as write-only |
| LOCK_READ_WRITE | PLS_INTEGER | 3 | Locks as read-write |

Standard Property Constants

Standard properties are well-defined, mandatory properties associated with all content path names that all stores should support (in the manner described by the content interface), with some exceptions. For example, a read-only store need not implement a `modification_time` or `creation_time`.

All standard properties informally use the `STD` namespace, which clients and stores should avoid using.

Table 57-7 DBMS_DBFS_CONTENT Constants - Standard Properties

| Constant | Type | Value | Description |
|--------------------|---------------|----------------------|--|
| STD_ACCESS_TIME | VARCHAR2 (32) | 'std:access_time' | TYPECODE_TIMESTAMP in UTC: The time of last access of a path name's contents |
| STD_ACL | VARCHAR2 (32) | 'std:acl' | TYPECODE_VARCHAR2: The access control list (in standard ACL syntax) associated with the path name |
| STD_CANONICAL_PATH | VARCHAR2 (32) | 'std:canonical_path' | TYPECODE_VARCHAR2: The canonical store-specific path name of an item. |
| STD_CHANGE_TIME | VARCHAR2 (32) | 'std:change_time' | TYPECODE_TIMESTAMP in UTC: The time of last change to the metadata of a path name |
| STD_CHILDREN | VARCHAR2 (32) | 'std:children' | TYPECODE_NUMBER: The number of child directories/folders a directory/folder path has (this property should be available in providers that support the FEATURE_FOLDERS feature) |
| STD_CONTENT_TYPE | VARCHAR2 (32) | 'std:content_type' | TYPECODE_NUMBER: The client-supplied mime-type(s) (in standard RFC syntax) describing the (typically <code>type_file</code>) path name. The content type is not necessarily interpreted by the store. |
| STD_CREATION_TIME | VARCHAR2 (32) | 'std:creation_time' | TYPECODE_TIMESTAMP in UTC: The time at which the item was created (once set, this value never changes for the lifetime of the path name) |

Table 57-7 (Cont.) DBMS_DBFS_CONTENT Constants - Standard Properties

| Constant | Type | Value | Description |
|-----------------------|---------------|-------------------------|--|
| STD_DELETED | VARCHAR2 (32) | 'std:deleted' | TYPECODE_NUMBER as a BOOLEAN: Set to a nonzero number if the path name has been soft-deleted but not yet purged. |
| STD_GUID | VARCHAR2 (32) | 'std:guid' | TYPECODE_NUMBER: A store-specific unique identifier for a path name. Clients must not depend on the GUID being unique across different stores, but a given (<i>store-name, store-specific-path name</i>) has a stable and unique GUID for its lifetime. |
| STD_LENGTH | VARCHAR2 (32) | 'std:length' | TYPECODE_NUMBER: The length of the content (BLOB) of a TYPE_FILE/TYPE_REFERENCE path, or the length of the referent of a TYPE_LINK symbolic link. Directories do not have a well-defined length and stores are free to set this property to zero, NULL, or any other value. |
| STD_MODIFICATION_TIME | VARCHAR2 (32) | 'std:modification_time' | TYPECODE_TIMESTAMP in UTC: The time of last change to the data associated with a path name. Change to the content of a TYPE_FILE/TYPE_REFERENCE path, the referent of the TYPE_LINK path, and addition or deletion of immediate children in a TYPE_DIRECTORY path, all constitute data changes. |
| STD_OWNER | VARCHAR2 (32) | 'std:owner' | TYPECODE_VARCHAR2: A client-supplied (or implicit) owner name for the path name. The owner name may be used (along with the current "principal") for access checks by stores that support ACLs, locking, or both. |
| STD_PARENT_GUID | VARCHAR2 (32) | 'std:parent_guid' | TYPECODE_NUMBER: A store-specific unique identifier for the parent of a path name. Clients must not depend on the GUID being unique across different stores, but a given (<i>store-name, store-specific-path name</i>) has a stable and unique GUID for its lifetime. STD_PARENT_GUID(path name) == STD_GUID(parent(path name)) |

Table 57-7 (Cont.) DBMS_DBFS_CONTENT Constants - Standard Properties

| Constant | Type | Value | Description |
|--------------|---------------|--------------------|---|
| STD_REFERENT | VARCHAR2 (32) | 'std:refere nt' | TYPECODE_VARCHAR2: The content of the symbolic link of a TYPE_LINK path; NULL otherwise. As mentioned, the STD_REFERENT can be an arbitrary string and must not necessarily be interpreted as path name by clients (or such interpretation should be done with great care). |

Optional Property Constants

Optional properties are well-defined properties (not mandatory) associated with all content path names that all stores are free to support (but only in the manner described by the DBFS content API).

All optional properties informally use the `opt:` namespace, which clients and stores should avoid using.

Table 57-8 DBMS_DBFS_CONTENT Constants - Optional Properties

| Constant | Type | Value | Description |
|----------------|---------------|----------------------|---|
| OPT_HASH_TYPE | VARCHAR2 (32) | 'opt:hash_ type' | TYPECODE_NUMBER: The type of hash provided in the <code>opt_hash_value</code> property; see DBMS_CRYPTO for possible options. |
| OPT_HASH_VALUE | VARCHAR2 (32) | 'opt:hash_ value' | TYPECODE_NUMBER: The hash value of type <code>OPT_HASH_TYPE</code> describing the content of the path name. |
| OPT_LOCK_COUNT | VARCHAR2 (32) | 'opt:lock_ count' | TYPECODE_NUMBER: The number of (compatible) locks placed on a path name. If different principals are allowed to place compatible (read) locks on a path, the <code>opt_locker</code> must specify all lockers (with repeats so that lock counts can be correctly maintained). |
| OPT_LOCK_DATA | VARCHAR2 (32) | 'opt:lock_ data' | TYPECODE_NUMBER: The client-supplied user-data associated with a user-lock, uninterpreted by the store. |
| OPT_LOCKER | VARCHAR2 (32) | 'opt:locke r' | TYPECODE_NUMBER: One or more implicit or client-specified principals that applied a user-lock on a path name. |

Table 57-8 (Cont.) DBMS_DBFS_CONTENT Constants - Optional Properties

| Constant | Type | Value | Description |
|------------------|---------------|--------------------|---|
| OPT_LOCK_STATUS | VARCHAR2 (32) | 'opt:lock_status' | TYPECODE_NUMBER: One of the LOCK_READ_ONLY, LOCK_WRITE_ONLY, LOCK_READ_WRITE values describing the type of lock currently applied on a path name. |
| OPT_VERSION | VARCHAR2 (32) | 'opt:version' | TYPECODE_NUMBER: A sequence number for linear versioning of a path name. |
| OPT_VERSION_PATH | VARCHAR2 (32) | 'opt:version_path' | TYPECODE_NUMBER: A version-path name for hierarchical versioning of a path name. |
| OPT_CONTENT_ID | VARCHAR2 (32) | 'opt:content_id' | TYPECODE_NUMBER: A provider-generated store-specific unique contentID in the form of a string for a file content element (that may optionally not be associated with a path; see FEATURE_CONTENT_ID and FEATURE_LAZY_PATH). |

Property Access Flag Constants

Content interface methods to get or set properties can use combinations of property access flags to fetch properties from different name spaces in a single interface call.

Table 57-9 DBMS_DBFS_CONTENT Constants - Property Access Flags

| Constant | Type | Value | Description |
|-----------|-------------|-------|---|
| PROP_NONE | PLS_INTEGER | 0 | None: used when the client is not interested in any properties, and is invoking the content access method for other reasons (path name existence or lockability validation, data access, and so on) |
| PROP_STD | PLS_INTEGER | 1 | Mandatory: used when the client is interested in the standard properties; all standard properties are retrieved if this flag is specified. |
| PROP_OPT | PLS_INTEGER | 2 | Optional: used when the client is interested in the optional properties; all optional properties are retrieved if this flag is specified. |
| PROP_USR | PLS_INTEGER | 3 | User-defined: used when the client is interested in the user-defined properties; all user-defined properties are retrieved if this flag is specified. |

Table 57-9 (Cont.) DBMS_DBFS_CONTENT Constants - Property Access Flags

| Constant | Type | Value | Description |
|-----------|-------------|---------------------------------------|---|
| PROP_ALL | PLS_INTEGER | PROP_STD + PROP_OPT + PROP_USR; | All: an alias for the combination of all standard, optional, and user-defined properties |
| PROP_DATA | PLS_INTEGER | 8 | Content: used when the client is interested only in data access, and does not care about properties |
| PROP_SPC | PLS_INTEGER | 16 | Specific: used when the client is interested in a mix-and-match of different subsets of various property name spaces; the names of the specific properties to fetch are passed into the content interface method call as arguments, and only these property values are fetched and returned to the client. This is useful in cases where there are a very large number of properties potentially accessible, but the client is interested in only a small number of them (and knows the names of these "interesting" properties beforehand). PROP_SPC is applicable only to the various GETPATH operations. Other operations that specify properties ignore PROP_SPC specifications. |

Operation Code Constants

All of the operations in the DBFS content API are represented as abstract opcodes.

Clients can use these opcodes to directly and explicitly by invoking the [CHECKACCESS Function](#) to verify if a particular operation can be invoked by a given principal on a particular path name.

Table 57-10 DBMS_DBFS_CONTENT Constants - Operation Codes

| Constant | Type | Value | Description |
|-------------------|-------------|-----------|--------------------------------|
| OP_CREATE | PLS_INTEGER | 1 | Create a path item |
| OP_CREATEFILE | PLS_INTEGER | OP_CREATE | Create a file |
| OP_CREATELINK | PLS_INTEGER | OP_CREATE | Create a soft link |
| OP_CREATEREERENCE | PLS_INTEGER | OP_CREATE | Create a reference (hard link) |

Table 57-10 (Cont.) DBMS_DBFS_CONTENT Constants - Operation Codes

| Constant | Type | Value | Description |
|--------------------|-------------|-----------|--|
| OP_DELETE | PLS_INTEGER | 2 | Soft-deletion, purge, and restore operations are all represented by OP_DELETE |
| OP_DELETEFILE | PLS_INTEGER | OP_DELETE | Delete a file |
| OP_DELETEDIRECTORY | PLS_INTEGER | OP_DELETE | Delete a directory |
| OP_RESTORE | PLS_INTEGER | OP_DELETE | Restore a soft-deleted path item |
| OP_PURGE | PLS_INTEGER | OP_DELETE | Purge a soft-deleted path item |
| OP_READ | PLS_INTEGER | 3 | Read from a path item |
| OP_GET | PLS_INTEGER | OP_READ | Get a path item for either read or update operations |
| OP_WRITE | PLS_INTEGER | 4 | Write a path item |
| OP_PUT | PLS_INTEGER | OP_WRITE | Put (write) to a path item |
| OP_RENAME | PLS_INTEGER | 5 | Rename a path item |
| OP_RENAMEFROM | PLS_INTEGER | OP_RENAME | Operations performed on the source of a rename |
| OP_RENAMETO | PLS_INTEGER | OP_RENAME | Operations performed on the destination of a rename |
| OP_SETPATH | PLS_INTEGER | OP_RENAME | Set a path item name |
| OP_LIST | PLS_INTEGER | 6 | Perform a path listing |
| OP_SEARCH | PLS_INTEGER | 7 | Perform a search |
| OP_LOCK | PLS_INTEGER | 8 | Lock a path item |
| OP_UNLOCK | PLS_INTEGER | 9 | Unlock a path item |
| OP_ACL | PLS_INTEGER | 10 | An implicit operation invoked during an OP_CREATE or OP_PUT that specifies a STD_ACL property; the operation tests to see if the principal is allowed to set or change the ACL of a store item |
| OP_STORE | PLS_INTEGER | 11 | A catch-all category for miscellaneous store operations that do not fall under any of the other operational interfaces |

57.4 Exceptions

DBFS content API operations can raise any one of these top-level exceptions.

Table 57-11 DBMS_DBFS_CONTENT Exceptions

| Exception | Code | Description |
|-----------------------|-------|--|
| PATH_EXISTS | 64000 | A specified path name already exists |
| INVALID_PARENT | 64001 | Parent of a specified path name does not exist |
| INVALID_PATH | 64002 | Specified path name does not exist, or is not valid |
| UNSUPPORTED_OPERATION | 64003 | An operation unsupported by a store was invoked |
| INVALID_ARGUMENTS | 64004 | An operation was invoked with invalid arguments |
| INVALID_ACCESS | 64005 | Access control checks failed for the current operation |
| LOCK_CONFLICT | 64006 | Current operation failed lock conflict check |
| INVALID_STORE | 64007 | An invalid store name was specified |
| INVALID_MOUNT | 64008 | An invalid mount point was specified |
| INVALID_PROVIDER | 64009 | An invalid provider-package was specified |
| READONLY_PATH | 64010 | A mutating operation was invoked on a read-only mount or store |

57.5 DBMS_DBFS_CONTENT Operational Notes

This topic lists operational notes for DBMS_DBFS_CONTENT implementation, path names, and other operations.

- [Implementation](#)
- [Path Names](#)
- [Other DBMS_DBFS_CONTENT Operations](#)

Implementation

Since the interconnection of the [DBMS_DBFS_CONTENT](#) interface and the provider SPI is a 1-to-many pluggable architecture, the interface uses dynamic SQL to invoke methods in the provider SPI, this can lead to runtime errors.

There are no explicit `INIT` or `FINI` methods to indicate when the `DBMS_DBFS_CONTENT` interface plugs or unplugs a particular provider SPI. Provider SPIs must be willing to auto-initialize themselves at any SPI entry-point.

All operations performed by a store provider are "stateless" in that they are complete operations unto themselves. If state is necessary to be maintained for some reason, then the state must be maintained in data structures such as auxiliary tables that can be queried as needed.

Path Names

All path names used in the provider SPI are store-qualified in pair form (`store_name`, `pathname`) where the path name is rooted within the store namespace.

Stores and their providers that support contentID-based access (see `FEATURE_CONTENT_ID` in [Table 57-5](#)) also support a form of addressing that is not based on path names. Content items are identified by an explicit store name, a `NULL` path name, and possibly a contentID specified as a parameter or by way of the `OPT_CONTENT_ID` (see [Table 57-8](#)) property.

Not all operations are supported with contentID-based access, and applications should depend only on the simplest create or delete functionality being available.

This table lists other operations and provides links to related discussions.

Other DBMS_DBFS_CONTENT Operations

Table 57-12 Other DBMS_DBFS_CONTENT Operations

| Other Operations | See ... |
|---------------------------------|--|
| Creation | <i>Oracle Database SecureFiles and Large Objects Developer's Guide</i> for further information on creation operations |
| Deletion | <i>Oracle Database SecureFiles and Large Objects Developer's Guide</i> for further information on deletion operations |
| Get (Retrieve) and Put (Insert) | <i>Oracle Database SecureFiles and Large Objects Developer's Guide</i> for further information on Get and Put operations |
| Rename and Move | <i>Oracle Database SecureFiles and Large Objects Developer's Guide</i> for further information on Rename and Move operations |
| Directory Navigation and Search | <i>Oracle Database SecureFiles and Large Objects Developer's Guide</i> for further information on Navigation and Search operations |
| Locking | <i>Oracle Database SecureFiles and Large Objects Developer's Guide</i> for further information on Locking operations |
| Access Check | <i>Oracle Database SecureFiles and Large Objects Developer's Guide</i> for further information on Access Check operations |

57.6 DBMS_DBFS_CONTENT Data Structures

The `DBMS_DBFS_CONTENT` package defines `RECORD` types and `TABLE` types.

RECORD Types

- [FEATURE_T Record Type](#)
- [MOUNT_T Record Type](#)
- [PATH_ITEM_T Record Type](#)
- [PROP_ITEM_T Record Type](#)
- [PROPERTY_T Record Type](#)
- [STORE_T Record Type](#)

TABLE Types

- [FEATURES_T Table Type](#)
- [MOUNTS_T Table Type](#)
- [PATH_ITEMS_T Table Type](#)
- [PROP_ITEMS_T Table Type](#)
- [PROPERTIES_T Table Type](#)
- [STORES_T Table Type](#)

Usage Notes

There is an approximate correspondence between `DBMS_DBFS_CONTENT_PROPERTY_T` and `PROPERTY_T` — the former is a SQL object type that describes the full property tuple, while the latter is a PL/SQL record type that describes only the property value component.

Likewise, there is an approximate correspondence between `DBMS_DBFS_CONTENT_PROPERTIES_T` and `PROPERTIES_T` — the former is a SQL nested table type, while the latter is a PL/SQL hash table type.

Dynamic SQL calling conventions force the use of SQL types, but PL/SQL code may be implemented more conveniently in terms of the hash-table types.

The `DBMS_DBFS_CONTENT` interface provides convenient utility functions to convert between `DBMS_DBFS_CONTENT_PROPERTIES_T` and `PROPERTIES_T` (see `propertiesT2H` and `propertiesH2T`).

Clients can query the `DBMS_DBFS_CONTENT` interface for the list of available stores, determine which store is to handle access to a given path name, and determine the feature set for the store.

57.6.1 DBMS_DBFS_CONTENT FEATURE_T Record Type

This type describes a store mount point and its properties.

Syntax

```
TYPE feature_t IS RECORD (
  feature_name  VARCHAR2(32),
  feature_mask  INTEGER,
  feature_state VARCHAR2(3));
```

Fields

Table 57-13 MOUNT_T Fields

| Field | Description |
|----------------------------|--|
| <code>feature_name</code> | Name of feature |
| <code>feature_mask</code> | Value used to mask off all other bits other than this feature in the feature value |
| <code>feature_state</code> | 'YES' or 'NO' depending on whether the feature is supported on this store |

57.6.2 DBMS_DBFS_CONTENT MOUNT_T Record Type

This type describes a store mount point and its properties.

Syntax

```
TYPE mount_t IS RECORD (
  store_name  VARCHAR2(32),
  store_id    NUMBER,
  provider_name VARCHAR2(32),
  provider_pkg VARCHAR2(32),
```

```

provider_id      NUMBER,
provider_version VARCHAR2(32),
store_features   INTEGER,
store_guid       NUMBER,
store_mount      NAME_T,
mount_properties DBMS_DBFS_CONTENT_PROPERTIES_T);

```

Fields

Table 57-14 MOUNT_T Fields

| Field | Description |
|------------------|--|
| store_name | Name of store |
| store_id | ID of store |
| provider_name | Name of the content store |
| provider_pkg | PL/SQL package name for the content store |
| provider_id | Unique identifier for the content store |
| provider_version | Version number for the content store |
| respos_features | Features supported by this content store |
| store_guid | Unique ID for this instance of the store |
| store_mount | Location at which this store instance is mounted |
| mount_properties | Properties for this mount point (see DBMS_DBFS_CONTENT_PROPERTIES_T Table Type) |

57.6.3 DBMS_DBFS_CONTENT PATH_ITEM_T Record Type

A `PATH_ITEM_T` is a tuple describing a (store, mount) qualified path in a store, with all standard and optional properties associated with it.

Syntax

```

TYPE path_item_t IS RECORD (
  store           NAME_T,
  mount           NAME_T,
  pathname        PATH_T,
  pathtype        VARCHAR2(32),
  filedata        BLOB,
  std_access_time TIMESTAMP,
  std_acl          VARCHAR2(1024),
  std_change_time TIMESTAMP,
  std_children     NUMBER,
  std_content_type VARCHAR2(1024),
  std_creation_time TIMESTAMP,
  std_deleted      INTEGER,
  std_guid         INTEGER,
  std_modification_time TIMESTAMP,
  std_owner        VARCHAR2(32),
  std_parent_guid  INTEGER,
  std_referent     VARCHAR2(1024),
  opt_hash_type    VARCHAR2(32),
  opt_hash_value   VARCHAR2(128),
  opt_lock_count   INTEGER,
  opt_lock_data    VARCHAR2(128),

```

```

opt_locker          VARCHAR2(128),
opt_lock_status     INTEGER,
opt_version         INTEGER,
opt_version_path    PATH_T,
opt_content_id      CONTENT_ID_T);

```

Fields

Table 57-15 PATH_ITEM_T Fields

| Field | Description |
|-----------------------|---|
| store | Name of store |
| mount | Location at which instance of store is mounted |
| pathname | Name of path to item |
| pathtype | Type of object path (see Table 57-4) |
| filedata | BLOB locator that can be used to access data in the path item |
| std_access_time | Time of last access of a pathname's contents |
| std_acl | Access Control List (in standard ACL syntax) |
| std_change_time | Time of last change to the metadata of a path name |
| std_children | Number of child directories or folders a directory or folder path (this property should be available in providers that support the <code>feature_folders</code> feature). |
| std_content_type | One or more client-supplied mime-types (in standard RFC syntax) describing the path name which is typically of <code>type_file</code> . The content type s not necessarily interpreted by the store. |
| std_creation_time | Time at which the item was created. Once set, this value remains the same for the lifetime of the path name. |
| std_deleted | Set to a nonzero number if the path name has been soft-deleted but not yet purged (see Table 57-5) |
| std_guid | Store-specific unique identifier for a path name. Clients must not depend on the GUID being unique across different stores, but a given <i>store-name</i> , <i>store-specific-pathname</i> has a stable and unique GUID for its lifetime. |
| std_modification_time | Time of last change to the data associated with a path name. Changes to the content of a <code>type_file</code> or <code>type_reference</code> path, the referent of the <code>type_link</code> path, and addition or deletion of immediate children in a <code>type_directory</code> path, all constitute data changes. |
| std_owner | Client-supplied (or implicit) owner name for the path name |
| std_parent_guid | Store-specific unique identifier for the parent of a path name. Clients must not depend on the GUID being unique across different stores, but a given <i>store-name</i> , <i>store-specific-pathname</i> has a stable and unique GUID for its lifetime. <code>std_parent_guid(pathname) == std_guid(parent(pathname))</code> |
| std_referent | Content of the symbolic link of a <code>type_link</code> path, otherwise NULL. As mentioned before, the <code>std_referent</code> can be an arbitrary string and must not necessarily be interpreted as pathname by clients (or such interpretation should be done with great care). |

Table 57-15 (Cont.) PATH_ITEM_T Fields

| Field | Description |
|------------------|---|
| opt_hash_type | Type of hash provided in the opt_hash_value property (see DBMS_CRYPTO for possible options) |
| opt_hash_value | Hash value of type opt_hash_type describing the content of the path name |
| opt_lock_count | Number of compatible locks placed on a path name. If different principals are allowed to place compatible (read) locks on a path, the opt_locker must specify all lockers with repeats so that lock counts can be correctly maintained. |
| opt_lock_data | Client-supplied user-data associated with a user-lock, uninterpreted by the store |
| opt_locker | One or more implicit or client-specified principals that applied a user-lock on a path name |
| opt_lock_status | One of the lock_read_only, lock_write_only, lock_read_write values describing the type of lock currently applied on a path name |
| opt_version | Sequence number for linear versioning of a path name |
| opt_version_path | Version path name for hierarchical versioning of a path name |
| opt_content_id | Stringified provider-generated store-specific unique contentID for a file element (that may optionally not be associated with a path (see FEATURE_CONTENT_ID and FEATURE_LAZY_PATH in Table 57-5)) |

57.6.4 DBMS_DBFS_CONTENT PROP_ITEM_T Record Type

A `PROP_ITEM_T` is a tuple describing a (store, mount) qualified path in a store, with all user-defined properties associated with it, expanded out into individual (name, value, type) tuples.

Syntax

```
TYPE prop_item_t IS RECORD (
    store          NAME_T,
    mount         NAME_T,
    pathname      PATH_T,
    property_name  PROPNAME_T,
    property_value PROPVAL_T,
    property_type  INTEGER);
```

Fields

Table 57-16 PROP_ITEM_T Fields

| Field | Description |
|---------------|--|
| store | Name of store |
| mount | Location at which instance of store is mounted |
| pathname | Name of path to item |
| property_name | Name of the property |

Table 57-16 (Cont.) PROP_ITEM_T Fields

| Field | Description |
|----------------|--|
| property_value | Value of the property |
| property_type | PL/SQL typecode for the property value |

57.6.5 PROPERTY_T Record Type

This type describes a single (value, typecode) property value tuple; the property name is implied.

See [PROPERTIES_T Table Type](#) for more information.

Syntax

```
TYPE property_t IS RECORD (
  propvalue    PROPVAL_T,
  typecode     INTEGER);
```

Fields

Table 57-17 PROPERTY_T Fields

| Field | Description |
|-----------|-------------------|
| propvalue | Value of property |
| typecode | Typecode |

57.6.6 DBMS_DBFS_CONTENT STORE_T Record Type

This type describes a store registered with and managed by the DBMS_DBFS_CONTENT interface.

Syntax

```
TYPE store_t IS RECORD (
  store_name    VARCHAR2(32),
  store_id      NUMBER,
  provider_name VARCHAR2(32),
  provider_pkg  VARCHAR2(32),
  provider_id   NUMBER,
  provider_version VARCHAR2(32),
  store_features INTEGER,
  store_guid    NUMBER);
```

Fields

Table 57-18 STORET_T Fields

| Field | Description |
|------------|---------------|
| store_name | Name of store |

Table 57-18 (Cont.) STORET_T Fields

| Field | Description |
|------------------|---|
| store_name | ID of store |
| provider_name | Name of the content store |
| provider_pkg | PL/SQL package name for the content store |
| provider_id | Unique identifier for the content store |
| provider_version | Version number for the content store |
| respos_features | Features supported by this content store |
| store_guid | Unique ID for this instance of the store |

57.6.7 DBMS_DBFS_CONTENT FEATURES_T Table Type

A table type of FEATURE_T Record Type.

Syntax

```
TYPE features_t IS TABLE OF feature_t;
```

Related Topics

- [DBMS_DBFS_CONTENT FEATURE_T Record Type](#)
This type describes a store mount point and its properties.

57.6.8 MOUNTS_T Table Type

A table type of MOUNT_T Record Type.

Syntax

```
TYPE mounts_t IS TABLE OF mount_t;
```

Related Topics

- [DBMS_DBFS_CONTENT MOUNT_T Record Type](#)
This type describes a store mount point and its properties.

57.6.9 DBMS_DBFS_CONTENT PATH_ITEMS_T Table Type

A table type of PATH_ITEM_T Record Type

Syntax

```
TYPE path_items_t IS TABLE OF path_item_t;
```

Related Topics

- [DBMS_DBFS_CONTENT PATH_ITEM_T Record Type](#)
A PATH_ITEM_T is a tuple describing a (store, mount) qualified path in a store, with all standard and optional properties associated with it.

57.6.10 DBMS_DBFS_CONTENT PROP_ITEMS_T Table Type

A table type of PATH_ITEM_T Record Type.

Syntax

```
TYPE prop_items_t IS TABLE OF prop_item_t;
```

Related Topics

- [DBMS_DBFS_CONTENT PATH_ITEM_T Record Type](#)
A PATH_ITEM_T is a tuple describing a (store, mount) qualified path in a store, with all standard and optional properties associated with it.

57.6.11 DBMS_DBFS_CONTENT PROPERTIES_T Table Type

This is a name-indexed hash table of property tuples. The implicit hash-table association between the index and the value allows the client to build up the full DBMS_DBFS_CONTENT_PROPERTY_T tuples for a PROPERTIES_T.

Syntax

```
TYPE properties_t IS TABLE OF property_t INDEX BY propname_t;
```

57.6.12 STORES_T Table Type

This type describes a store registered with and managed by the DBMS_DBFS_CONTENT interface.

Syntax

```
TYPE stores_t IS TABLE OF store_t;
```

57.7 Summary of DBMS_DBFS_CONTENT Subprograms

This table lists and describes the subprograms used in the DBMS_DBFS_CONTENT Package.

Table 57-19 DBMS_DBFS_CONTENT Package Subprograms

| Subprogram | Description |
|---|---|
| CHECKACCESS Function | Reports if the user (principal) can perform the specified operation on the given path |
| CHECKSPI Functions and Procedures | Checks if a user-provided package implements all of the DBMS_DBFS_CONTENT_SPI subprograms with the proper signatures, and reports on the conformance. |
| CREATEDIRECTORY Procedures | Creates a directory |
| CREATEFILE Procedures | Creates a file |
| CREATELINK Procedures | Creates a new reference to the source file system element |
| CREATEREFERENCE Procedures | Creates a physical link to an already existing file system element |

Table 57-19 (Cont.) DBMS_DBFS_CONTENT Package Subprograms

| Subprogram | Description |
|---|--|
| DECODEFEATURES Function | Given a feature bit set integer value, returns a <code>FEATURES_T</code> table of the feature bits as <code>FEATURE_T</code> records |
| DELETECONTENT Procedure | Deletes the file specified by the given <code>contentID</code> |
| DELETEDIRECTORY Procedure | Deletes a directory |
| DELETEFILE Procedure | Deletes a file |
| FEATURENAME Function | Given a feature bit, returns a <code>VARCHAR2</code> of that feature's name |
| FLUSHSTATS Function | Flushes <code>DBMS_DBFS_CONTENT</code> statistics to disk |
| GETDEFAULTACL Procedure | Returns the <code>ACL</code> parameter of the default context |
| GETDEFAULTASOF Procedure | Returns the <code>asof</code> parameter of the default context |
| GETDEFAULTCONTEXT Procedure | Returns the default context |
| GETDEFAULTOWNER Procedure | Returns the <code>owner</code> parameter of the default context |
| GETDEFAULTPRINCIPAL Procedure | Returns the <code>principal</code> parameter of the default context |
| GETFEATURESBYMOUNT Function | Returns features of a store by mount point |
| GETFEATURESBYNAME Function | Returns features of a store by store name |
| GETFEATURESBYPATH Function | Returns features of a store by path |
| GETPATHBYMOUNTID Function | Returns the full absolute path name |
| GETPATH Procedures | Returns existing path items (such as files and directories) |
| GETPATHBYSTOREID Function | If the underlying <code>GUID</code> is found in the underlying store, returns the store-qualified path name |
| GETPATHNOWAIT Procedures | Implies that the operation is for an update, and, if implemented, allows providers to return an exception (<code>ORA-00054</code>) rather than wait for row locks. |
| GETSTOREBYMOUNT Function | Returns a store by way of its mount point |
| GETSTOREBYNAME Function | Returns a store by way of its name |
| GETSTOREBYPATH Function | Returns a store by way of its path |
| GETSTATS Procedure | Returns information about <code>DBMS_DBFS_CONTENT</code> statistics collection |
| GETTRACE Function | Returns whether or not <code>DBMS_DBFS_CONTENT</code> tracing is turned on |
| GETVERSION Function | Returns the version of the <code>DBMS_DBFS_CONTENT</code> interface in a standardized format associated with a store |
| LIST Function | Lists the path items in the specified path meeting the specified filter and other criteria |
| LISTALLCONTENT Function | Lists all path items in all mounts |
| LISTALLPROPERTIES Function | Returns a table of all properties for all path items in all mounts |
| LISTMOUNTS Function | Lists all available mount points, their backing stores, and the store features |
| LISTSTORES Function | Lists all available stores and their features |

Table 57-19 (Cont.) DBMS_DBFS_CONTENT Package Subprograms

| Subprogram | Description |
|---|---|
| LOCKPATH Procedure | Applies user-level locks to the given valid path name |
| MOUNTSTORE Procedure | Mounts a previously registered store and binds it to the mount point |
| NORMALIZEPATH Functions | Converts a store-specific or full-absolute path name into normalized form |
| PROPANY Functions | Provides constructors that take one of a variety of types and return a <code>PROPERTY_T</code> |
| PROPERTIESH2T Function | Converts a <code>PROPERTY_T</code> hash to a <code>DBMS_DBFS_CONTENT_PROPERTIES_T</code> table |
| PROPERTIEST2H Function | Converts a <code>DBMS_DBFS_CONTENT_PROPERTIES_T</code> table to a <code>PROPERTY_T</code> hash |
| PROPNUMBER Function | Is a constructor that takes a <code>NUMBER</code> and returns a <code>PROPERTY_T</code> |
| PROPRAW Function | Is a constructor that takes a <code>RAW</code> and returns a <code>PROPERTY_T</code> |
| PROPTIMESTAMP Function | Is a constructor that takes a <code>TIMESTAMP</code> and returns a <code>PROPERTY_T</code> |
| PROPVARCHAR2 Function | Is a constructor that takes a <code>VARCAHR2</code> and returns a <code>PROPERTY_T</code> |
| PURGEALL Procedure | Purges all soft-deleted entries matching the path and optional filter criteria |
| PURGEPATH Procedure | Purges any soft-deleted versions of the given path item |
| PUTPATH Procedures | Creates a new path item |
| REGISTERSTORE Procedure | Registers a new store |
| RENAMEPATH Procedures | Renames or moves a path |
| RESTOREALL Procedure | Restores all soft-deleted path items meeting the path and filter criteria |
| RESTOREPATH Procedure | Restores all soft-deleted path items that match the given path and filter criteria |
| SETDEFAULTACL Procedure | Sets the ACL parameter of the default context |
| SETDEFAULTASOF Procedure | Sets the "as of" parameter of the default context |
| SETDEFAULTCONTEXT Procedure | Sets the default context |
| SETDEFAULTOWNER Procedure | Sets the "owner" parameter of the default context |
| SETDEFAULTPRINCIPAL Procedure | Sets the "principal" parameter of the default context |
| SETPATH Procedures | Assigns a path name to a path item represented by contentID |
| SETSTATS Procedure | Enables and disables statistics collection |
| SETTRACE Procedure | Sets <code>DBMS_DBFS_CONTENT</code> tracing on or off |
| SPACEUSAGE Procedure | Queries file system space usage statistics |
| TRACE Procedure | Returns a <code>CLOB</code> that contains the evaluation results |
| TRACEENABLED Function | Determines if the current trace "severity" set by the SETTRACE Procedure is at least as high as the given trace level |
| UNLOCKPATH Procedure | Unlocks path items that were previously locked with the LOCKPATH Procedure |

Table 57-19 (Cont.) DBMS_DBFS_CONTENT Package Subprograms

| Subprogram | Description |
|---|-----------------------------|
| UNMOUNTSTORE Procedure | Unmounts a registered store |
| UNREGISTERSTORE Procedure | Unregisters a store |

57.7.1 CHECKACCESS Function

This function reports if the user (`principal`) can perform the specified operation on the given path. This enables verifying the validity of an operation without attempting to perform the operation. If `CHECKACCESS` returns 0, then the subprogram invoked to implement that operation should fail with an error.

Syntax

```
DBMS_DBFS_CONTENT.CHECKACCESS (
  path          IN      VARCHAR2,
  pathtype      IN      INTEGER,
  operation     IN      VARCHAR2,
  principal     IN      VARCHAR2,
  store_name    IN      VARCHAR2 DEFAULT NULL)
RETURN BOOLEAN;
```

Parameters

Table 57-20 CHECKACCESS Procedure Parameters

| Parameter | Description |
|-------------------------|---|
| <code>path</code> | Name of path to check for access |
| <code>pathtype</code> | Type of object <code>path</code> represents (see Table 57-4) |
| <code>operation</code> | Operation to be checked (see Table 57-8) |
| <code>principal</code> | File system user for whom the access check is made |
| <code>store_name</code> | Name of store |

Usage Notes

Whether or not the user invokes this function, a store that supports access control internally performs these checks to guarantee security.

57.7.2 CHECKSPI Functions and Procedures

Given the name of a putative `DBMS_DBFS_CONTENT_SPI` conforming package, this function or procedure checks whether the package implements all of the provider subprograms with the proper signatures, and reports on the conformance.

Syntax

```
DBMS_DBFS_CONTENT.CHECKSPI (
  package_name IN      VARCHAR2)
RETURN CLOB;
```

```
DBMS_DBFS_CONTENT.CHECKSPI (
  schema_name      IN          VARCHAR2,
  package_name     IN          VARCHAR2)
return clob;
```

```
DBMS_DBFS_CONTENT.CHECKSPI (
  package_name     IN          VARCHAR2,
  chk              IN OUT NOCOPY CLOB);
```

```
DBMS_DBFS_CONTENT.CHECKSPI (
  schema_name     in          VARCHAR2,
  package_name    in          VARCHAR2,
  chk             in out nocopy CLOB);
```

Parameters

Table 57-21 CHECKSPI Procedure Parameters

| Parameter | Description |
|--------------|---|
| package_name | Name of package |
| schema_name | Name of schema |
| chk | CLOB that contains the evaluation results |

Usage Notes

- The functional form returns a cached temporary LOB of session duration with the results of the analysis. The caller is expected to manage the lifetime of this LOB, as needed.
- The procedural form generates the results of the analysis into the `chk` LOB parameter; if the value passed in is `NULL`, the results are written to the foreground trace file provided that `DBMS_DBFS_CONTENT` interface tracing is enabled. If neither tracing is enabled nor a valid LOB passed in, the checker does not provide any useful indication of the analysis (other than raise exceptions if it encounters a serious error).
- If `schema_name` is `NULL`, standard name resolution rules (current schema, private synonym, public synonym) are used to try and locate a suitable package to analyze.

57.7.3 CREATEDIRECTORY Procedures

This procedure creates a directory.

Syntax

```
DBMS_DBFS_CONTENT.CREATEDIRECTORY (
  path           IN          VARCHAR2,
  properties     IN OUT NOCOPY DBMS_DBFS_CONTENT_PROPERTIES_T,
  prop_flags     IN          INTEGER      DEFAULT PROP_STD,
  recurse       IN          BOOLEAN     DEFAULT FALSE,
  store_name     IN          VARCHAR2   DEFAULT NULL,
  principal     IN          VARCHAR2   DEFAULT NULL);
```

```
DBMS_DBFS_CONTENT.CREATEDIRECTORY (
  path           IN          VARCHAR2,
  properties     IN OUT NOCOPY PROPERTIES_T,
  prop_flags     IN          INTEGER     DEFAULT PROP_STD,
  recurse       IN          BOOLEAN     DEFAULT FALSE,
```

```

store_name IN          VARCHAR2  DEFAULT NULL,
principal  IN          VARCHAR2  DEFAULT NULL);

```

Parameters

Table 57-22 CREATEDIRECTORY Procedure Parameters

| Parameter | Description |
|------------|---|
| path | Name of path to the directory |
| properties | One or more properties and their values to be set, returned, or both, depending on <code>prop_flags</code> (see DBMS_DBFS_CONTENT_PROPERTIES_T Table Type) |
| prop_flags | Determines which properties are set, returned, or both. Default is <code>PROP_STD</code> . Specify properties to be returned by setting <code>PROP_SPC</code> (see Table 57-9), and providing an instance of the DBMS_DBFS_CONTENT_PROPERTIES_T Table Type with properties whose values are of interest. |
| recurse | If 0, do not execute recursively; otherwise, recursively create the directories above the given directory |
| store_name | Name of store |
| principal | File system user for whom the access check is made |

57.7.4 CREATEFILE Procedures

This procedure creates a file.

Syntax

```

DBMS_DBFS_CONTENT.CREATEFILE (
  path          IN          VARCHAR2,
  properties    IN OUT NOCOPY DBMS_DBFS_CONTENT_PROPERTIES_T,
  content       IN OUT NOCOPY BLOB,
  prop_flags    IN          INTEGER      DEFAULT (PROP_STD + PROP_DATA),
  store_name    IN          VARCHAR2    DEFAULT NULL,
  principal     IN          VARCHAR2    DEFAULT NULL);

```

```

DBMS_DBFS_CONTENT.CREATEFILE (
  path          IN          VARCHAR2,
  properties    IN OUT NOCOPY PROPERTIES_T,
  content       IN OUT NOCOPY BLOB,
  prop_flags    IN          INTEGER      DEFAULT (PROP_STD + PROP_DATA),
  store_name    IN          VARCHAR2    DEFAULT NULL,
  principal     IN          VARCHAR2    DEFAULT NULL);

```

Parameters

Table 57-23 CREATEFILE Procedure Parameters

| Parameter | Description |
|------------|---|
| path | Name of path to the file |
| properties | One or more properties and their values to be set, returned, or both, depending on <code>prop_flags</code> (see DBMS_DBFS_CONTENT_PROPERTIES_T Table Type) |

Table 57-23 (Cont.) CREATEFILE Procedure Parameters

| Parameter | Description |
|------------|---|
| content | BLOB holding data with which to populate the file (optional) |
| prop_flags | Determines which properties are set, returned, or both. Default is PROP_STD. Specify properties to be returned by setting prop_spec, and providing an instance of the DBMS_DBFS_CONTENT_PROPERTIES_T Table Type with properties whose values are of interest. |
| store_name | Name of store |
| principal | File system user for whom the access check is made |

57.7.5 CREATELINK Procedures

This procedure creates a new link element `srcPath` with the value of `dstPath`. The value of `dstPath` is not validated or interpreted in any way by this procedure. This is analogous to a UNIX file system symbolic link.

Syntax

```
DBMS_DBFS_CONTENT.CREATELINK (
  srcPath      IN          VARCHAR2,
  dstPath      IN          VARCHAR2,
  properties   IN OUT NOCOPY DBMS_DBFS_CONTENT_PROPERTIES_T,
  prop_flags   IN          INTEGER      DEFAULT PROP_STD,
  store_name   IN          VARCHAR2    DEFAULT NULL,
  principal    IN          VARCHAR2    DEFAULT NULL);
```

```
DBMS_DBFS_CONTENT.CREATELINK (
  srcPath      IN          VARCHAR2,
  dstPath      IN          VARCHAR2,
  properties   IN OUT NOCOPY PROPERTIES_T,
  prop_flags   IN          INTEGER      DEFAULT PROP_STD,
  store_name   IN          VARCHAR2    DEFAULT NULL,
  principal    IN          VARCHAR2    DEFAULT NULL);
```

Parameters

Table 57-24 CREATELINK Procedure Parameters

| Parameter | Description |
|------------|---|
| srcPath | File system entry to create. |
| dstPath | Value to associate with <code>srcPath</code> . |
| properties | One or more properties and their values to be set, returned depending, or both, on <code>prop_flags</code> (see DBMS_DBFS_CONTENT_PROPERTIES_T Table Type) |
| prop_flags | Determines which properties are set, returned, or both. Default is PROP_STD. Specify properties to be returned by setting <code>prop_spec</code> , and providing an instance of the DBMS_DBFS_CONTENT_PROPERTIES_T Table Type with properties whose values are of interest. |

Table 57-24 (Cont.) CREATELINK Procedure Parameters

| Parameter | Description |
|------------|--|
| store_name | Name of store |
| principal | File system user for whom the access check is made |

57.7.6 CREATEREERENCE Procedures

This procedure creates a physical link, `srcPath`, to an already existing file system element, `dstPath` (such as file or directory). The resulting entry shares the same metadata structures as the value of the `dstPath` parameter, and so is similar to incrementing a reference count on the file system element. This is analogous to a UNIX file system hard link.

Syntax

```
DBMS_DBFS_CONTENT.CREATEREFERENCE (
    srcPath      IN          VARCHAR2,
    dstPath      IN          VARCHAR2,
    properties   IN OUT NOCOPY DBMS_DBFS_CONTENT_PROPERTIES_T,
    prop_flags   IN          INTEGER      DEFAULT PROP_STD,
    store_name   IN          VARCHAR2    DEFAULT NULL,
    principal    IN          VARCHAR2    DEFAULT NULL);
```

```
DBMS_DBFS_CONTENT.CREATEREFERENCE (
    srcPath      IN          VARCHAR2,
    dstPath      IN          VARCHAR2,
    properties   IN OUT NOCOPY PROPERTIES_T,
    prop_flags   IN          INTEGER      DEFAULT PROP_STD,
    store_name   IN          VARCHAR2    DEFAULT NULL,
    principal    IN          VARCHAR2    DEFAULT NULL);
```

Parameters

Table 57-25 CREATEREERENCE Procedure Parameters

| Parameter | Description |
|------------|--|
| srcPath | File system entry to create. |
| dstPath | Path that is the reference to <code>srcPath</code> . |
| properties | One or more properties and their values to be set, returned, or both, depending on <code>prop_flags</code> (see DBMS_DBFS_CONTENT_PROPERTIES_T Table Type) |
| prop_flags | Determines which properties are set, returned. Default is <code>PROP_STD</code> . Specify properties to be returned by setting <code>prop_spec</code> , and providing an instance of the DBMS_DBFS_CONTENT_PROPERTIES_T Table Type with properties whose values are of interest. |
| store_name | Name of store |
| principal | File system user for whom the access check is made |

57.7.7 DECODEFEATURES Function

Given a feature bit set integer value, this function returns a `FEATURES_T` table of the feature bits as `FEATURE_T` records.

Syntax

```
DBMS_DBFS_CONTENT.DECODEFEATURES (
    featureSet      IN      INTEGER)
    RETURN FEATURES_T DETERMINISTIC PIPELINED;
```

Parameters

Table 57-26 DECODEFEATURES Function Parameters

| Parameter | Description |
|------------|-------------|
| featureSet | Feature set |

Return Values

[FEATURES_T Table Type](#)

57.7.8 DELETECONTENT Procedure

This procedure deletes the file specified by the given contentID.

Syntax

```
DBMS_DBFS_CONTENT.DELETECONTENT (
    store_name      IN      VARCHAR2      DEFAULT NULL,
    contentID       IN      RAW,
    filter          IN      VARCHAR2      DEFAULT NULL,
    soft_delete     IN      BOOLEAN      DEFAULT NULL,
    principal       IN      VARCHAR2      DEFAULT NULL);
```

Parameters

Table 57-27 DELETECONTENT Procedure Parameters

| Parameter | Description |
|-------------|--|
| store_name | Name of store |
| contentID | Unique identifier for the file to be deleted |
| filter | A filter, if any, to be applied |
| soft_delete | If 0, execute a hard (permanent) delete. For any value other than 0, perform a soft delete (see <i>Oracle Database SecureFiles and Large Objects Developer's Guide</i> , Deletion Operations). |
| principal | File system user for whom the access check is made |

57.7.9 DELETEDIRECTORY Procedure

This procedure deletes a directory.

If `recurse` is nonzero, it recursively deletes all elements of the directory. A filter, if supplied, determines which elements of the directory are deleted.

Syntax

```
DBMS_DBFS_CONTENT.DELETEDIRECTORY (
  path          IN      VARCHAR2,
  filter        IN      VARCHAR2   DEFAULT NULL,
  soft_delete   IN      BOOLEAN    DEFAULT NULL,
  recurse       IN      BOOLEAN    DEFAULT FALSE,
  store_name    IN      VARCHAR2   DEFAULT NULL,
  principal     IN      VARCHAR2   DEFAULT NULL);
```

Parameters

Table 57-28 DELETEDIRECTORY Procedure Parameters

| Parameter | Description |
|--------------------------|--|
| <code>path</code> | Name of path to the directory |
| <code>filter</code> | A filter, if any, to be applied |
| <code>soft_delete</code> | If 0, execute a hard (permanent) delete. For any value other than 0, perform a soft delete see <i>Oracle Database SecureFiles and Large Objects Developer's Guide</i> , Deletion Operations. |
| <code>recurse</code> | If 0, do not execute recursively. Otherwise, recursively delete the directories and files below the given directory. |
| <code>store_name</code> | Name of store |
| <code>principal</code> | File system user for whom the access check is made |

57.7.10 DELETEFILE Procedure

This procedure deletes the specified file.

Syntax

```
DBMS_DBFS_CONTENT.DELETEFILE (
  path          IN      VARCHAR2,
  filter        IN      VARCHAR2   DEFAULT NULL,
  soft_delete   IN      BOOLEAN    DEFAULT NULL,
  store_name    IN      VARCHAR2   DEFAULT NULL,
  principal     IN      VARCHAR2   DEFAULT NULL);
```

Parameters

Table 57-29 DELETEFILE Procedure Parameters

| Parameter | Description |
|-------------------|--------------------------|
| <code>path</code> | Name of path to the file |

Table 57-29 (Cont.) DELETEFILE Procedure Parameters

| Parameter | Description |
|-------------|--|
| filter | A filter, if any, to be applied |
| soft_delete | If 0, execute a hard (permanent) delete. For any value other than 0, perform a soft delete (see <i>Oracle Database SecureFiles and Large Objects Developer's Guide</i> , Deletion Operations). |
| store_name | Name of store |
| principal | File system user for whom the access check is made |

57.7.11 FEATURENAME Function

Given a feature bit, this function returns a VARCHAR2 of that feature's name.

Syntax

```
DBMS_DBFS_CONTENT.FEATURENAME (
    featureBit          IN          INTEGER)
RETURN VARCHAR2 DETERMINISTIC;
```

Parameters

Table 57-30 FEATURENAME Function Parameters

| Parameter | Description |
|------------|---|
| featureBit | Bit representation of the feature (see Table 57-5) |

Return Values

Name of the feature

57.7.12 FLUSHSTATS Function

This procedure flushes DBMS_DBFS_CONTENT statistics to disk.

Syntax

```
DBMS_DBFS_CONTENT.FLUSHSTATS;
```

57.7.13 GETDEFAULTACL Procedure

This procedure returns the ACL parameter of the default context. This information can be inserted explicitly by way of argument into other method calls, allowing for a more fine-grained control.

Syntax

```
DBMS_DBFS_CONTENT.GETDEFAULTACL (
    acl          OUT NOCOPY          VARCHAR2);
```

Parameters

Table 57-31 GETDEFAULTACL Procedure Parameters

| Parameter | Description |
|-----------|--|
| acl | ACL for all new elements created (implicitly or explicitly) by the current operation |

57.7.14 GETDEFAULTASOF Procedure

This procedure returns the "as of" parameter of the default context. This information can be inserted explicitly by way of argument into other method calls, allowing for a more fine-grained control.

Syntax

```
DBMS_DBFS_CONTENT.GETDEFAULTASOF (
  asof      OUT NOCOPY      TIMESTAMP);
```

Parameters

Table 57-32 GETDEFAULTASOF Procedure Parameters

| Parameter | Description |
|-----------|--|
| asof | The "as of" timestamp at which the underlying read-only operation (or its read-only sub-components) executes |

57.7.15 GETDEFAULTCONTEXT Procedure

This procedure returns the default context. The information contained in the context can be inserted explicitly by way of arguments to the various method calls, allowing for fine-grained control over individual operations.

Syntax

```
DBMS_DBFS_CONTENT.GETDEFAULTCONTEXT (
  principal  OUT NOCOPY      VARCHAR2,
  owner      OUT NOCOPY      VARCHAR2,
  acl        OUT NOCOPY      VARCHAR2,
  asof       OUT NOCOPY      TIMESTAMP);
```

Parameters

Table 57-33 GETDEFAULTCONTEXT Procedure Parameters

| Parameter | Description |
|-----------|--|
| principal | Agent (principal) invoking the current operation |
| owner | Owner for new elements created (implicitly or explicitly) by the current operation |

Table 57-33 (Cont.) GETDEFAULTCONTEXT Procedure Parameters

| Parameter | Description |
|-----------|--|
| acl | ACL for all new elements created (implicitly or explicitly) by the current operation |
| asof | The "as of" timestamp at which the underlying read-only operation (or its read-only sub-components) executes |

57.7.16 GETDEFAULTOWNER Procedure

This procedure returns the "owner" parameter of the default context. This information can be inserted explicitly by way of argument into other method calls, allowing for a more fine-grained control.

Syntax

```
DBMS_DBFS_CONTENT.GETDEFAULTOWNER (
    principal IN VARCHAR2);
```

Parameters

Table 57-34 GETDEFAULTOWNER Procedure Parameters

| Parameter | Description |
|-----------|--|
| owner | Owner for new elements created (implicitly or explicitly) by the current operation |

57.7.17 GETDEFAULTPRINCIPAL Procedure

This procedure returns the "principal" parameter of the default context. This information contained can be inserted explicitly by way of argument into other method calls, allowing for a more fine-grained control.

Syntax

```
DBMS_DBFS_CONTENT.GETDEFAULTPRINCIPAL (
    principal OUT NOCOPY VARCHAR2);
```

Parameters

Table 57-35 GETDEFAULTPRINCIPAL Procedure Parameters

| Parameter | Description |
|-----------|--|
| principal | Agent (principal) invoking the current operation |

57.7.18 GETFEATURESBYMOUNT Function

This function returns features of a store by mount point.

Syntax

```
DBMS_DBFS_CONTENT.GETFEATURESBYMOUNT (  
    store_mount    IN    VARCHAR2)  
    RETURN INTEGER;
```

Parameters

Table 57-36 GETFEATURESBYMOUNT Function Parameters

| Parameter | Description |
|-------------|-------------|
| store_mount | Mount point |

Return Values

A bit mask of supported features (see [FEATURES_T Table Type](#))

57.7.19 GETFEATURESBYNAME Function

This function returns features of a store by store name.

Syntax

```
DBMS_DBFS_CONTENT.GETFEATURESBYNAME (  
    store_name    IN    VARCHAR2)  
    RETURN INTEGER;
```

Parameters

Table 57-37 GETFEATURESBYNAME Function Parameters

| Parameter | Description |
|------------|---------------|
| store_name | Name of store |

Return Values

A bit mask of supported features (see [FEATURES_T Table Type](#))

57.7.20 GETFEATURESBYPATH Function

This function returns features of a store by path.

Syntax

```
DBMS_DBFS_CONTENT.GETFEATURESBYPATH (  
    path    IN    PATH_T)  
    RETURN INTEGER;
```

Parameters

Table 57-38 GETFEATURESBYPATH Function Parameters

| Parameter | Description |
|-----------|-------------|
| path | PATH_T |

Return Values

A bit mask of supported features (see [FEATURES_T Table Type](#))

57.7.21 GETPATH Procedures

This procedure returns existing path items (such as files and directories). This includes both data and metadata (properties).

The client can request (using `prop_flags`) that specific properties be returned. File path names can be read either by specifying a BLOB locator using the `prop_data` bitmask in `prop_flags` (see [Table 57-9](#)) or by passing one or more RAW buffers.

When `forUpdate` is 0, this procedure also accepts a valid `asof` timestamp parameter as part of `ctx` that can be used by stores to implement "as of" style flashback queries. Mutating versions of the GETPATH Procedures do not support these modes of operation.

Syntax

```
DBMS_DBFS_CONTENT.GETPATH (
    path          IN          VARCHAR2,
    properties    IN OUT NOCOPY DBMS_DBFS_CONTENT_PROPERTIES_T,
    content       OUT NOCOPY  BLOB,
    item_type     OUT          INTEGER,
    prop_flags    IN          INTEGER      DEFAULT (PROP_STD +
                                                PROP_OPT +
                                                PROP_DATA),
    asof          IN          TIMESTAMP   DEFAULT NULL,
    forUpdate     IN          BOOLEAN     DEFAULT FALSE,
    deref         IN          BOOLEAN     DEFAULT FALSE,
    store_name    IN          VARCHAR2    DEFAULT NULL,
    principal     IN          VARCHAR2    DEFAULT NULL);
```

```
DBMS_DBFS_CONTENT.GETPATH (
    path          IN          VARCHAR2,
    properties    IN OUT NOCOPY PROPERTIES_T,
    content       OUT NOCOPY  BLOB,
    item_type     OUT          INTEGER,
    prop_flags    IN          INTEGER      DEFAULT (PROP_STD +
                                                PROP_OPT +
                                                PROP_DATA),
    asof          IN          TIMESTAMP   DEFAULT NULL,
    forUpdate     IN          BOOLEAN     DEFAULT FALSE,
    deref         IN          BOOLEAN     DEFAULT FALSE,
    store_name    IN          VARCHAR2    DEFAULT NULL,
    principal     IN          VARCHAR2    DEFAULT NULL);
```

```
DBMS_DBFS_CONTENT.GETPATH (
    path          IN          VARCHAR2,
```

```

properties IN OUT NOCOPY DBMS_DBFS_CONTENT_PROPERTIES_T,
amount     IN OUT        NUMBER,
offset     IN            NUMBER,
buffers    OUT NOCOPY   RAW,
prop_flags IN          INTEGER    DEFAULT (PROP_STD +
                                     PROP_OPT +
                                     PROP_DATA),

asof       IN           TIMESTAMP  DEFAULT NULL,
store_name IN          VARCHAR2    DEFAULT NULL,
principal  IN          VARCHAR2    DEFAULT NULL);

DBMS_DBFS_CONTENT.GETPATH (
  path       IN          VARCHAR2,
  properties IN OUT NOCOPY PROPERTIES_T,
  amount     IN OUT        NUMBER,
  offset     IN            NUMBER,
  buffers    OUT NOCOPY   RAW,
  prop_flags IN          INTEGER    DEFAULT (PROP_STD +
                                     PROP_OPT +
                                     PROP_DATA),

  asof       IN           TIMESTAMP  DEFAULT NULL,
  store_name IN          VARCHAR2    DEFAULT NULL,
  principal  IN          VARCHAR2    DEFAULT NULL);

DBMS_DBFS_CONTENT.GETPATH (
  path       IN          VARCHAR2,
  properties IN OUT NOCOPY DBMS_DBFS_CONTENT_PROPERTIES_T,
  amount     IN OUT        NUMBER,
  offset     IN            NUMBER,
  buffers    OUT NOCOPY   DBMS_DBFS_CONTENT_RAW_T,
  prop_flags IN          INTEGER    DEFAULT (PROP_STD +
                                     PROP_OPT +
                                     PROP_DATA),

  asof       IN           TIMESTAMP  DEFAULT NULL,
  store_name IN          VARCHAR2    DEFAULT NULL,
  principal  IN          VARCHAR2    DEFAULT NULL);

DBMS_DBFS_CONTENT.GETPATH (
  path       IN          VARCHAR2,
  properties IN OUT NOCOPY PROPERTIES_T,
  amount     IN OUT        NUMBER,
  offset     IN            NUMBER,
  buffers    OUT NOCOPY   DBMS_DBFS_CONTENT_RAW_T,
  prop_flags IN          INTEGER    DEFAULT (PROP_STD +
                                     PROP_OPT +
                                     PROP_DATA),

  asof       IN           TIMESTAMP  DEFAULT NULL,
  store_name IN          VARCHAR2    DEFAULT NULL,
  principal  IN          VARCHAR2    DEFAULT NULL);

```

Parameters

Table 57-39 GETPATH Procedure Parameters

| Parameter | Description |
|-----------|----------------------------|
| path | Name of path to path items |

Table 57-39 (Cont.) GETPATH Procedure Parameters

| Parameter | Description |
|------------|---|
| properties | One or more properties and their values to be returned depending on <code>prop_flags</code> (see DBMS_DBFS_CONTENT_PROPERTIES_T Table Type) |
| content | BLOB holding data which populates the file (optional) |
| item_type | Type of the path item specified (see Table 57-4) |
| amount | On input, number of bytes to be read. On output, number of bytes read |
| offset | Byte offset from which to begin reading |
| buffer | Buffer to which to write |
| buffers | Buffers to which to write |
| prop_flags | Determines which properties are set, returned, or both. Default is <code>PROP_STD</code> . Specify properties to be returned by setting <code>prop_spec</code> , and providing an instance of the DBMS_DBFS_CONTENT_PROPERTIES_T Table Type with properties whose values are of interest. |
| asof | The "as of" timestamp at which the underlying read-only operation (or its read-only sub-components) executes |
| forUpdate | Specifies that a lock should be taken to signify exclusive write access to the path item |
| deref | If nonzero, attempts to resolve the given path item to actual data provided it is a reference |
| store_name | Name of store |
| principal | Agent (principal) invoking the current operation |

57.7.22 GETPATHBYMOUNTID Function

If the underlying GUID is found in the underlying store, this function returns the full absolute path name.

Syntax

```
DBMS_DBFS_CONTENT.GETPATHBYMOUNTID (
    store_mount      IN      VARCHAR2,
    guid             IN      INTEGER)
RETURN VARCHAR2;
```

Parameters

Table 57-40 GETPATHBYMOUNTID Function Parameters

| Parameter | Description |
|-------------|---|
| store_mount | Mount point in which the path item with <code>guid</code> resides |
| guid | Unique ID for the path item |

Usage Notes

If the GUID is unknown, a NULL value is returned. Clients are expected to handle this as appropriate.

Return Values

Path of the path item represented by GUID in `store_mount`

57.7.23 GETPATHBYSTOREID Function

If the underlying GUID is found in the underlying store, this function returns the store-qualified path name.

Syntax

```
DBMS_DBFS_CONTENT.GETPATHBYSTOREID (
  store_name      IN      VARCHAR2,
  guid           IN      INTEGER)
RETURN VARCHAR2;
```

Parameters

Table 57-41 GETPATHBYSTOREID Function Parameters

| Parameter | Description |
|-------------------------|--|
| <code>store_name</code> | Name of store |
| <code>guid</code> | Unique ID representing the desired path item |

Usage Notes

If the GUID is unknown, a NULL value is returned. Clients are expected to handle this as appropriate.

Return Values

Store-qualified path name represented by the GUID

57.7.24 GETPATHNOWAIT Procedures

This procedure implies that the operation is for an update, and, if implemented, allows providers to return an exception (ORA-00054) rather than wait for row locks.

See `FEATURE_NOWAIT` in [Table 57-5](#) for more information.

Syntax

```
DBMS_DBFS_CONTENT.GETPATHNOWAIT (
  path           IN      VARCHAR2,
  properties    IN OUT NOCOPY DBMS_DBFS_CONTENT_PROPERTIES_T,
  content       OUT      NOCOPY BLOB,
  item_type     OUT      INTEGER,
  prop_flags    IN      INTEGER      DEFAULT (PROP_STD +
                                     PROP_OPT +
                                     PROP_DATA),
```

```

deref          IN          BOOLEAN          DEFAULT FALSE,
store_name     IN          VARCHAR2        DEFAULT NULL,
principal      IN          VARCHAR2        DEFAULT NULL);

DBMS_DBFS_CONTENT.GETPATHNOWAIT (
  path          IN          VARCHAR2,
  properties    IN OUT NOCOPY PROPERTIES_T,
  content       OUT NOCOPY BLOB,
  item_type     OUT          INTEGER,
  prop_flags    IN          INTEGER          DEFAULT (PROP_STD +
                                           PROP_OPT +
                                           PROP_DATA),
  deref         IN          BOOLEAN          DEFAULT FALSE,
  store_name    IN          VARCHAR2        DEFAULT NULL,
  principal     IN          VARCHAR2        DEFAULT NULL);

```

Parameters

Table 57-42 GETPATHNOWAIT Procedure Parameters

| Parameter | Description |
|------------|---|
| path | Name of path to path items |
| properties | One or more properties and their values to be returned depending on prop_flags (see DBMS_DBFS_CONTENT_PROPERTIES_T Table Type) |
| content | BLOB holding data which populates the file (optional) |
| item_type | Type of the path item specified (see Table 57-4) |
| prop_flags | Determines which properties are returned. Default is PROP_STD. Specify properties to be returned by setting prop_spec, and providing an instance of the DBMS_DBFS_CONTENT_PROPERTIES_T Table Type with properties whose values are of interest. |
| asof | The "as of" timestamp at which the underlying read-only operation (or its read-only sub-components) executes |
| deref | If nonzero, attempts to resolve the given path item to actual data provided it is a reference |
| store_name | Name of store |
| principal | Agent (principal) invoking the current operation |

57.7.25 GETSTOREBYMOUNT Function

This function returns a store by way of its name.

Syntax

```

DBMS_DBFS_CONTENT.GETSTOREBYMOUNT (
  store_mount   IN          VARCHAR2)
RETURN STORE_T;

```

Parameters

Table 57-43 GETSTOREBYMOUNT Function Parameters

| Parameter | Description |
|-------------|---|
| store_mount | Location at which the store instance is mounted |

Return Values

[STORE_T Record Type](#)

57.7.26 GETSTOREBYNAME Function

This function returns a store by way of its name.

Syntax

```
DBMS_DBFS_CONTENT.GETSTOREBYNAME (
    store_name    IN    VARCHAR2)
RETURN STORE_T;
```

Parameters

Table 57-44 GETSTOREBYNAME Function Parameters

| Parameter | Description |
|------------|---------------|
| store_name | Name of store |

Return Values

[STORE_T Record Type](#)

57.7.27 GETSTOREBYPATH Function

This function returns a store by way of its path.

Syntax

```
DBMS_DBFS_CONTENT.GETSTOREBYPATH (
    path    IN    PATH_T)
RETURN STORE_T;
```

Parameters

Table 57-45 GETSTOREBYPATH Function Parameters

| Parameter | Description |
|-----------|-------------|
| path | PATH_T s |

Return Values[STORE_T Record Type](#)

57.7.28 GETSTATS Procedure

This procedure returns information about DBMS_DBFS_CONTENT statistics collection.

Syntax

```
DBMS_DBFS_CONTENT.GETSTATS (
    enabled          OUT    BOOLEAN,
    flush_time      OUT    INTEGER,
    flush_count     OUT    INTEGER);
```

Parameters**Table 57-46 GETSTATS Procedure Parameters**

| Parameter | Description |
|-------------|---|
| enabled | Whether statistics collection is enabled |
| flush_time | How often to flush the statistics to disk in centiseconds |
| flush_count | Number of operations to allow between statistics flushes |

57.7.29 GETTRACE Function

This function returns whether DBMS_DBFS_CONTENT tracing is turned on or not.

Syntax

```
DBMS_DBFS_CONTENT.GETTRACE
    RETURN INTEGER.
```

Return Values

Returns zero if tracing is off, non-zero if tracing is on.

57.7.30 GETVERSION Function

This function marks each version of the DBMS_DBFS_CONTENT interface.

Syntax

```
DBMS_DBFS_CONTENT.GETVERSION (
    RETURN VARCHAR2;
```

Return Values

A string enumerating the version of the DBMS_DBFS_CONTENT interface in standard naming convention: string: *a.b.c* corresponding to *major*, *minor*, and *patch* components.

57.7.31 ISPATHLOCKED Procedure

This procedure checks if any user-level locks are applied on a given path.

Syntax

```
DBMS_DBFS_CONTENT.ISPATHLOCKED (
  path          IN      VARCHAR2,
  who           IN      VARCHAR2,
  lock_type     IN OUT  INTEGER,
  store_name    IN      VARCHAR2  DEFAULT NULL,
  principal     IN      VARCHAR2  DEFAULT NULL);
```

Parameters

Table 57-47 ISPATHLOCKED Procedure Parameters

| Parameter | Description |
|------------|---|
| path | Name of path to file items |
| who | Transaction identifier that has locked the path |
| lock_type | One of the available lock types (see Table 57-6) |
| store_name | Name of store |
| principal | Agent (principal) invoking the current operation |

57.7.32 LIST Function

This function lists the path items in the specified path meeting the specified filter and other criteria.

Syntax

```
DBMS_DBFS_CONTENT.LIST (
  path          IN      VARCHAR2,
  filter        IN      VARCHAR2  DEFAULT NULL,
  recurse      IN      INTEGER    DEFAULT 0,
  asof         IN      TIMESTAMP  DEFAULT NULL,
  store_name    IN      VARCHAR2  DEFAULT NULL,
  principal     IN      VARCHAR2  DEFAULT NULL)
RETURN DBMS_DBFS_CONTENT_LIST_ITEMS_T PIPELINED;
```

Parameters

Table 57-48 LIST Function Parameters

| Parameter | Description |
|-----------|--|
| path | Name of path to directories |
| filter | A filter, if any, to be applied |
| recurse | If 0, do not execute recursively. Otherwise, recursively list the contents of directories and files below the given directory. |

Table 57-48 (Cont.) LIST Function Parameters

| Parameter | Description |
|------------|--|
| asof | The "as of" timestamp at which the underlying read-only operation (or its read-only sub-components) executes |
| store_name | Name of repository |
| principal | Agent (principal) invoking the current operation |

Return Values

[DBMS_DBFS_CONTENT_LIST_ITEMS_T Table Type](#)

57.7.33 LISTALLPROPERTIES Function

This function returns a table of all properties for all path items in all mounts.

Syntax

```
DBMS_DBFS_CONTENT.LISTALLPROPERTIES
  RETURN PROP_ITEMS_T PIPELINED;
```

Return Values

[PROP_ITEMS_T Table Type](#)

57.7.34 LISTALLCONTENT Function

This function lists all path items in all mounts.

Syntax

```
DBMS_DBFS_CONTENT.LISTALLCONTENT
  RETURN PATH_ITEMS_T PIPELINED;
```

Return Values

[PATH_ITEMS_T Table Type](#)

57.7.35 LISTMOUNTS Function

This function lists all available mount points, their backing stores, and the store features.

Syntax

```
DBMS_DBFS_CONTENT.LISTMOUNTS
  RETURN MOUNTS_T PIPELINED;
```

Return Values

[MOUNTS_T Table Type](#)

Usage Notes

A single mount results in a single returned row, with its `store_mount` field of the returned records set to `NULL`.

57.7.36 LISTSTORES Function

This function lists all available stores and their features.

Syntax

```
DBMS_DBFS_CONTENT.LISTSTORES
  RETURN STORES_T PIPELINED;
```

Return Values

[STORES_T Table Type](#)

Usage Notes

The `store_mount` field of the returned records is set to `NULL` (since mount-points are separate from stores themselves).

57.7.37 LOCKPATH Procedure

This procedure applies user-level locks to the given valid path name (subject to store feature support), and optionally associates user-data with the lock.

Syntax

```
DBMS_DBFS_CONTENT.LOCKPATH (
  path          IN      VARCHAR2,
  who           IN      VARCHAR2,
  lock_type     IN      INTEGER,
  waitForRowLock IN    INTEGER    DEFAULT 1,
  store_name    IN      VARCHAR2  DEFAULT NULL,
  principal     IN      VARCHAR2  DEFAULT NULL);
```

Parameters

Table 57-49 LOCKPATH Procedure Parameters

| Parameter | Description |
|-----------------------------|---|
| <code>path</code> | Name of path to file items |
| <code>who</code> | Transaction identifier that has locked the path |
| <code>lock_type</code> | One of the available lock types (see Table 57-6) |
| <code>waitForRowLock</code> | Determines if a row is locked by a transaction or not |
| <code>store_name</code> | Name of store |
| <code>principal</code> | Agent (principal) invoking the current operation |

57.7.38 MOUNTSTORE Procedure

This procedure mounts a previously registered store and binds it to the mount point.

Syntax

```
DBMS_DBFS_CONTENT.MOUNTSTORE (
  store_mount  in    VARCHAR2  DEFAULT NULL,
  singleton    in    BOOLEAN    DEFAULT FALSE,
  principal    in    VARCHAR2  DEFAULT NULL,
  owner        in    VARCHAR2  DEFAULT NULL,
  acl          in    VARCHAR2  DEFAULT NULL,
  asof         in    TIMESTAMP  DEFAULT NULL,
  read_only   in    BOOLEAN    DEFAULT FALSE);
```

Parameters

Table 57-50 MOUNTSTORE Procedure Parameters

| Parameter | Description |
|-------------|--|
| store_mount | Path name to use to mount this store |
| singleton | Whether the mount is a single backend store on the system |
| principal | Agent (principal) invoking the current operation |
| owner | Owner for new elements created (implicitly or explicitly) by the current operation |
| acl | ACL for all new elements created (implicitly or explicitly) by the current operation |
| asof | The "as of" timestamp at which the underlying read-only operation (or its read-only sub-components) executes |
| read_only | Whether the mount is read-only |

Usage Notes

See Also:

Oracle Database SecureFiles and Large Objects Developer's Guide for information on mounting a registered store

57.7.39 NORMALIZEPATH Functions

This function converts a store-specific or full-absolute path name into normalized form.

It does the following:

- verifies that the path name is absolute, and so starts with "/"
- collapses multiple consecutive "/" into a single "/"
- strips trailing "/"

- breaks up a store-specific normalized path name into 2 components - parent pathname, trailing component name
- breaks up a full-absolute normalized path name into 3 components - store name, parent pathname, trailing component name

Syntax

```
DBMS_DBFS_CONTENT.NORMALIZEPATH (
    path      IN          VARCHAR2,
    parent    OUT NOCOPY  VARCHAR2,
    tpath     OUT NOCOPY  VARCHAR2)
RETURN VARCHAR2;
```

```
DBMS_DBFS_CONTENT.NORMALIZEPATH (
    path      IN          VARCHAR2,
    store_name OUT NOCOPY  VARCHAR2,
    parent    OUT NOCOPY  VARCHAR2,
    tpath     OUT NOCOPY  VARCHAR2)
RETURN VARCHAR2;
```

Parameters

Table 57-51 NORMALIZEPATH Function Parameters

| Parameter | Description |
|------------|----------------------------|
| path | Name of path to file items |
| store_name | Name of store |
| parent | Parent path name |
| tpath | Name of trailing path item |

Return Values

The completely normalized store-specific or full-absolute path name

57.7.40 PROPANY Functions

This function provides constructors that take one of a variety of types and return a PROPERTY_T.

Syntax

```
DBMS_DBFS_CONTENT.PROPANY (
    val      IN          NUMBER)
RETURN PROPERTY_T;
```

```
DBMS_DBFS_CONTENT.PROPANY (
    val      IN          VARCHAR2)
RETURN PROPERTY_T;
```

```
DBMS_DBFS_CONTENT.PROPANY (
    val      IN          TIMESTAMP)
RETURN PROPERTY_T;
```

```
DBMS_DBFS_CONTENT.PROPANY (
```

```

    val      IN      RAW)
RETURN PROPERTY_T;

```

Parameters

Table 57-52 PROPANY Function Parameters

| Parameter | Description |
|-----------|-------------|
| val | Value |

Return Values

[PROPERTY_T Record Type](#)

57.7.41 PROPERTIESH2T Function

This function converts a `PROPERTY_T` hash to a `DBMS_DBFS_CONTENT_PROPERTIES_T` table.

Syntax

```

DBMS_DBFS_CONTENT.PROPERTIESH2T (
    pprops      IN      PROPERTIES_T)
RETURN DBMS_DBFS_CONTENT_PROPERTIES_T;

```

Parameters

Table 57-53 PROPERTIESH2T Function Parameters

| Parameter | Description |
|-----------|----------------------------------|
| sprops | A <code>PROPERTIES_T</code> hash |

Return Values

[DBMS_DBFS_CONTENT_PROPERTIES_T Table Type](#)

57.7.42 PROPERTIEST2H Function

This function converts a `DBMS_DBFS_CONTENT_PROPERTIES_T` table to a `PROPERTY_T` hash.

Syntax

```

DBMS_DBFS_CONTENT.PROPERTIEST2H (
    sprops      IN      DBMS_DBFS_CONTENT_PROPERTIES_T)
RETURN properties_t;

```

Parameters

Table 57-54 PROPERTIEST2H Function Parameters

| Parameter | Description |
|-----------|---|
| sprops | A <code>DBMS_DBFS_CONTENT_PROPERTIES_T</code> table |

Return Values

[PROPERTIES_T Table Type](#)

57.7.43 PROPNUMBER Function

This function is a constructor that takes a number and returns a `PROPERTY_T`.

Syntax

```
DBMS_DBFS_CONTENT.PROPNUMBER (
    val      IN      NUMBER)
RETURN PROPERTY_T;
```

Parameters

Table 57-55 PROPNUMBER Function Parameters

| Parameter | Description |
|-----------|-------------|
| val | Value |

Return Values

[PROPERTY_T Record Type](#)

57.7.44 PROPRAW Function

This function is a constructor that takes a `RAW` and returns a `PROPERTY_T`.

Syntax

```
DBMS_DBFS_CONTENT.PROPRAW (
    val      IN      RAW)
RETURN PROPERTY_T;
```

Parameters

Table 57-56 PROPRAW Function Parameters

| Parameter | Description |
|-----------|-------------|
| val | Value |

Return Values

[PROPERTY_T Record Type](#)

57.7.45 PROPTIMESTAMP Function

This function is a constructor that takes a `TIMESTAMP` and returns a `PROPERTY_T`.

Syntax

```
DBMS_DBFS_CONTENT.PROPTIMESTAMP (
    val      IN      TIMESTAMP)
RETURN PROPERTY_T;
```

Parameters

Table 57-57 PROPTIMESTAMP Function Parameters

| Parameter | Description |
|-----------|-------------|
| val | Value |

Return Values

[PROPERTY_T Record Type](#)

57.7.46 PROPVARCHAR2 Function

This function is a constructor that takes a `VARCHAR2` and returns a `PROPERTY_T`.

Syntax

```
DBMS_DBFS_CONTENT.PROPVARCHAR2 (
    val      IN      VARCHAR2)
RETURN PROPERTY_T;
```

Parameters

Table 57-58 PROPNUMBER Function Parameters

| Parameter | Description |
|-----------|-------------|
| val | Value |

Return Values

[PROPERTY_T Record Type](#)

57.7.47 PURGEALL Procedure

This procedure purges all soft-deleted entries matching the path and optional filter criteria.

Syntax

```
DBMS_DBFS_CONTENT.PURGEALL (
    path      IN      VARCHAR2,
    filter     IN      VARCHAR2    DEFAULT NULL,
    store_name IN      VARCHAR2    DEFAULT NULL,
    principal  IN      VARCHAR2    DEFAULT NULL);
```

Parameters

Table 57-59 PURGEALL Procedure Parameters

| Parameter | Description |
|------------|---|
| path | Name of path to file items |
| filter | A filter, if any, to be applied based on specified criteria |
| store_name | Name of store |
| principal | Agent (principal) invoking the current operation |

57.7.48 PURGEPATH Procedure

This procedure purges any soft-deleted versions of the given path item.

Syntax

```
DBMS_DBFS_CONTENT.PURGEPATH (
    path          IN          VARCHAR2,
    filter        IN          VARCHAR2    DEFAULT NULL,
    store_name    IN          VARCHAR2    DEFAULT NULL,
    principal     IN          VARCHAR2    DEFAULT NULL);
```

Parameters

Table 57-60 PURGEPATH Procedure Parameters

| Parameter | Description |
|------------|--|
| path | Name of path to file items |
| filter | A filter, if any, to be applied |
| store_name | Name of store |
| principal | Agent (principal) invoking the current operation |

57.7.49 PUTPATH Procedures

This procedure creates a new path item.

Syntax

```
DBMS_DBFS_CONTENT.PUTPATH (
    path          IN          VARCHAR2,
    properties    IN OUT NOCOPY DBMS_DBFS_CONTENT_PROPERTIES_T,
    content       IN OUT NOCOPY BLOB,
    item_type     OUT          INTEGER,
    prop_flags    IN          INTEGER    DEFAULT (PROP_STD +
                                                PROP_OPT +
                                                PROP_DATA),
    store_name    IN          VARCHAR2    DEFAULT NULL,
    principal     IN          VARCHAR2    DEFAULT NULL);

DBMS_DBFS_CONTENT.PUTPATH (
    path          IN          VARCHAR2,
```

```

properties IN OUT NOCOPY PROPERTIES_T,
content    IN OUT NOCOPY BLOB,
item_type  OUT           INTEGER,
prop_flags IN           INTEGER    DEFAULT (PROP_STD +
                                PROP_OPT +
                                PROP_DATA),

store_name IN           VARCHAR2   DEFAULT NULL,
principal  IN           VARCHAR2   DEFAULT NULL);

DBMS_DBFS_CONTENT.PUTPATH (
  path      IN           VARCHAR2,
  properties IN OUT NOCOPY DBMS_DBFS_CONTENT_PROPERTIES_T,
  amount    IN           NUMBER,
  offset    IN           NUMBER,
  buffer    IN           RAW,
  prop_flags IN         INTEGER    DEFAULT (PROP_STD +
                                PROP_OPT),

  store_name IN         VARCHAR2   DEFAULT NULL,
  principal  IN         VARCHAR2   DEFAULT NULL);

DBMS_DBFS_CONTENT.PUTPATH (
  path      IN           VARCHAR2,
  properties IN OUT NOCOPY PROPERTIES_T,
  amount    IN           NUMBER,
  offset    IN           NUMBER,
  buffer    IN           RAW,
  prop_flags IN         INTEGER    DEFAULT (PROP_STD +
                                PROP_OPT),

  store_name IN         VARCHAR2   DEFAULT NULL,
  principal  IN         VARCHAR2   DEFAULT NULL);

DBMS_DBFS_CONTENT.PUTPATH (
  path      IN           VARCHAR2,
  properties IN OUT NOCOPY DBMS_DBFS_CONTENT_PROPERTIES_T,
  written   OUT          NUMBER,
  offset    IN           NUMBER,
  buffers   IN           DBMS_DBFS_CONTENT_RAW_T,
  prop_flags IN         INTEGER    DEFAULT (PROP_STD +
                                PROP_OPT),

  store_name IN         VARCHAR2   DEFAULT NULL,
  principal  IN         VARCHAR2   DEFAULT NULL);

DBMS_DBFS_CONTENT.PUTPATH (
  path      IN           VARCHAR2,
  properties IN OUT NOCOPY PROPERTIES_T,
  written   OUT          NUMBER,
  offset    IN           NUMBER,
  buffers   IN           DBMS_DBFS_CONTENT_RAW_T,
  prop_flags IN         INTEGER    DEFAULT (PROP_STD +
                                PROP_OPT),

  store_name IN         VARCHAR2   DEFAULT NULL,
  principal  IN         VARCHAR2   DEFAULT NULL);

```

Parameters

Table 57-61 PUTPATH Procedure Parameters

| Parameter | Description |
|-----------|----------------------------|
| path | Name of path to file items |

Table 57-61 (Cont.) PUTPATH Procedure Parameters

| Parameter | Description |
|------------|--|
| properties | One or more properties and their values to be set depending on <code>prop_flags</code> (see DBMS_DBFS_CONTENT_PROPERTIES_T Table Type) |
| content | BLOB holding data which populates the file (optional) |
| item_type | Type of the path item specified (see Table 57-4) |
| amount | Number of bytes to be read |
| offset | Byte offset from which to begin reading |
| buffer | Buffer to which to write |
| buffers | Buffers to which to write |
| prop_flags | Determines which properties are set. Default is <code>PROP_STD</code> . Specify properties to be returned by setting <code>prop_spec</code> , and providing an instance of the DBMS_DBFS_CONTENT_PROPERTIES_T Table Type with properties whose values are of interest. |
| store_name | Name of store |
| principal | Agent (principal) invoking the current operation |

57.7.50 REGISTERSTORE Procedure

This procedure registers a new store backed by a provider that uses a store provider (conforming to the `DBMS_DBFS_CONTENT_SPI` package signature).

This method is to be used primarily by store providers after they have created a new store.

Syntax

```
DBMS_DBFS_CONTENT.REGISTERSTORE (
    store_name      IN      VARCHAR2,
    provider_name   IN      VARCHAR2,
    provider_package IN      VARCHAR2);
```

Parameters

Table 57-62 REGISTERSTORE Procedure Parameters

| Parameter | Description |
|------------------|-------------------------------|
| store_name | Name of store, must be unique |
| provider_name | Name of provider |
| provider_package | Store provider |

57.7.51 RENAMEPATH Procedures

This procedure renames or moves a path. This operation can be performed across directory hierarchies and mount-points as long as it is within the same store.

Note:

See *Oracle Database SecureFiles and Large Objects Developer's Guide for Rename and Move operations*

Syntax

```
DBMS_DBFS_CONTENT.RENAMEPATH (
    oldPath      IN          VARCHAR2,
    newPath      IN          VARCHAR2,
    properties   IN OUT NOCOPY DBMS_DBFS_CONTENT_PROPERTIES_T,
    store_name   IN          VARCHAR2   DEFAULT NULL,
    principal    IN          VARCHAR2   DEFAULT NULL);
```

```
DBMS_DBFS_CONTENT.RENAMEPATH (
    oldPath      IN          VARCHAR2,
    newPath      IN          VARCHAR2,
    properties   IN OUT NOCOPY PROPERTIES_T,
    store_name   IN          VARCHAR2   DEFAULT NULL,
    principal    IN          VARCHAR2   DEFAULT NULL);
```

Parameters

Table 57-63 RENAMEPATH Procedure Parameters

| Parameter | Description |
|------------|--|
| oldPath | Name of path prior to renaming |
| newPath | Name of path after renaming |
| properties | One or more properties and their values to be set depending on prop_flags (see DBMS_DBFS_CONTENT_PROPERTIES_T Table Type) |
| store_name | Name of store, must be unique |
| principal | Agent (principal) invoking the current operation |

57.7.52 RESTOREALL Procedure

This procedure restores all soft-deleted path items meeting the path and optional filter criteria.

Syntax

```
DBMS_DBFS_CONTENT.RESTOREALL (
    path         IN          VARCHAR2,
    filter       IN          VARCHAR2   DEFAULT NULL,
```

```

store_name    IN      VARCHAR2    DEFAULT NULL,
principal     IN      VARCHAR2    DEFAULT NULL);

```

Parameters

Table 57-64 RESTOREALL Procedure Parameters

| Parameter | Description |
|------------|--|
| path | Name of path to file items |
| filter | A filter, if any, to be applied |
| store_name | Name of store |
| principal | Agent (principal) invoking the current operation |

57.7.53 RESTOREPATH Procedure

This procedure restores all soft-deleted path items that match the given path and optional filter criteria.

Syntax

```

DBMS_DBFS_CONTENT.RESTOREPATH (
  path          IN      VARCHAR2,
  filter        IN      VARCHAR2    DEFAULT NULL,
  store_name    IN      VARCHAR2    DEFAULT NULL,
  principal     IN      VARCHAR2    DEFAULT NULL);

```

Parameters

Table 57-65 RESTOREPATH Procedure Parameters

| Parameter | Description |
|------------|--|
| path | Name of path to file items |
| filter | A filter, if any, to be applied |
| store_name | Name of store |
| principal | Agent (principal) invoking the current operation |

57.7.54 SETDEFAULTACL Procedure

This procedure sets the ACL parameter of the default context.

This information can be inserted explicitly by way of argument into other method calls, allowing for a more fine-grained control.

Syntax

```

DBMS_DBFS_CONTENT.SETDEFAULTACL (
  acl          IN      VARCHAR2);

```

Parameters

Table 57-66 SETDEFAULTACL Procedure Parameters

| Parameter | Description |
|-----------|--|
| acl | ACL for all new elements created (implicitly or explicitly) by the current operation |

Usage Notes

- NULL by default, this parameter be can be cleared by setting it to NULL.
- The parameters, once set, remain as a default for the duration of the session, and is inherited by all operations for which the default is not explicitly overridden.

57.7.55 SETDEFAULTASOF Procedure

This procedure sets the "as of" parameter of the default context. This information can be inserted explicitly by way of argument into other method calls, allowing for a more fine-grained control.

Syntax

```
DBMS_DBFS_CONTENT.SETDEFAULTASOF (
    asof    IN    TIMESTAMP);
```

Parameters

Table 57-67 SETDEFAULTASOF Procedure Parameters

| Parameter | Description |
|-----------|--|
| asof | The "as of" timestamp at which the underlying read-only operation (or its read-only sub-components) executes |

Usage Notes

- NULL by default, this parameter be can be cleared by setting it to NULL.
- The parameters, once set, remain as a default for the duration of the session, and is inherited by all operations for which the default is not explicitly overridden.

57.7.56 SETDEFAULTCONTEXT Procedure

This procedure sets the default context. The information contained in the context can be inserted explicitly by way of arguments to the various method calls, allowing for fine-grained control over individual operations.

Syntax

```
DBMS_DBFS_CONTENT.SETDEFAULTCONTEXT (
    principal    IN    VARCHAR2,
    owner        IN    VARCHAR2,
    acl          IN    VARCHAR2,
    asof         IN    TIMESTAMP);
```

Parameters

Table 57-68 SETDEFAULTCONTEXT Procedure Parameters

| Parameter | Description |
|-----------|--|
| principal | Agent (principal) invoking the current operation |
| owner | Owner for new elements created (implicitly or explicitly) by the current operation |
| acl | ACL for all new elements created (implicitly or explicitly) by the current operation |
| asof | The "as of" timestamp at which the underlying read-only operation (or its read-only sub-components) executes |

Usage Notes

- All of the context parameters are `NULL` by default, and be can be cleared by setting them to `NULL`.
- The context parameters, once set, remain as defaults for the duration of the session, and are inherited by all operations for which the defaults are not explicitly overridden.

57.7.57 SETDEFAULTOWNER Procedure

This procedure sets the "owner" parameter of the default context. This information can be inserted explicitly by way of argument into other method calls, allowing for a more fine-grained control.

Syntax

```
DBMS_DBFS_CONTENT.SETDEFAULTOWNER (
    principal IN VARCHAR2);
```

Parameters

Table 57-69 SETDEFAULTOWNER Procedure Parameters

| Parameter | Description |
|-----------|--|
| owner | Owner for new elements created (implicitly or explicitly) by the current operation |

Usage Notes

- `NULL` by default, this parameter be can be cleared by setting it to `NULL`.
- The parameters, once set, remain as a default for the duration of the session, and is inherited by all operations for which the default is not explicitly overridden.

57.7.58 SETDEFAULTPRINCIPAL Procedure

This procedure sets the "principal" parameter of the default context. This information contained can be inserted explicitly by way of argument into other method calls, allowing for a more fine-grained control.

Syntax

```
DBMS_DBFS_CONTENT.SETDEFAULTPRINCIPAL (
    principal IN VARCHAR2);
```

Parameters

Table 57-70 SETDEFAULTPRINCIPAL Procedure Parameters

| Parameter | Description |
|-----------|--|
| principal | Agent (principal) invoking the current operation |

Usage Notes

- NULL by default, this parameter be can be cleared by setting it to NULL.
- The parameters, once set, remain as a default for the duration of the session, and is inherited by all operations for which the default is not explicitly overridden.

57.7.59 SETPATH Procedures

This procedure assigns a path name to a path item represented by contentID.

Stores and their providers that support contentID-based access and lazy path name binding also support the SETPATH Procedure that associates an existing contentID with a new path.

Note:

See *Oracle Database SecureFiles and Large Objects Developer's Guide for Rename and Move operations*

Syntax

```
DBMS_DBFS_CONTENT.SETPATH (
    store_name IN VARCHAR2,
    contentID IN RAW,
    path IN VARCHAR2,
    properties IN OUT NOCOPY DBMS_DBFS_CONTENT_PROPERTIES_T,
    principal IN VARCHAR2 DEFAULT NULL);
```

```
DBMS_DBFS_CONTENT.SETPATH (
    store_name IN VARCHAR2,
    contentID IN RAW,
    path IN VARCHAR2,
    properties IN OUT NOCOPY PROPERTIES_T,
    principal IN VARCHAR2 DEFAULT NULL);
```

Parameters

Table 57-71 SETPATH Procedure Parameters

| Parameter | Description |
|------------|--|
| store_name | Name of the store |
| contentID | Unique identifier for the item to be associated |
| path | Name of path to path item |
| properties | One or more properties and their values to be set depending on prop_flags (see DBMS_DBFS_CONTENT_PROPERTIES_T Table Type) |
| principal | Agent (principal) invoking the current operation |

57.7.60 SETSTATS Procedure

This procedure enables and disables statistics collection.

The client can optionally control the flush settings by specifying non-NULL values for the time, count or both parameters.

Syntax

```
DBMS_DBFS_CONTENT.SETSTATS (
    enable          IN    BOOLEAN,
    flush_time      IN    INTEGER,
    flush_count     IN    INTEGER);
```

Parameters

Table 57-72 SETSTATS Procedure Parameters

| Parameter | Description |
|-------------|---|
| enable | If TRUE, enable statistics collection. If FALSE, disable statistics collection. |
| flush_time | How often to flush the statistics to disk in centiseconds |
| flush_count | Number of operations to allow between statistics flushes |

Usage Notes

The SETSTATS Procedure buffers statistics in-memory for a maximum of flush_time centiseconds or a maximum of flush_count operations (whichever limit is reached first), or both, at which time the buffers are implicitly flushed to disk.

57.7.61 SETTRACE Procedure

This procedure sets the DBMS_DBFS_CONTENT tracing severity to the given level, 0 being "off".

Syntax

```
DBMS_DBFS_CONTENT.SETTRACE
    trclvl      IN      INTEGER);
```

Parameters

Table 57-73 SETTRACE Procedure Parameters

| Parameter | Description |
|-----------|---|
| trclvl | Level of the tracing, higher values implying more tracing |

57.7.62 SPACEUSAGE Procedure

This procedure queries file system space usage statistics.

Providers are expected to support this subprogram for their stores (and to make a best effort determination of space usage, especially if the store consists of multiple tables, indexes, LOBs, and so on).

Syntax

```
DBMS_DBFS_CONTENT.SPACEUSAGE (
    path          IN      VARCHAR2,
    blksize       OUT     INTEGER,
    tbytes        OUT     INTEGER,
    fbytes        OUT     INTEGER,
    nfile         OUT     INTEGER,
    ndir          OUT     INTEGER,
    nlink         OUT     INTEGER,
    nref          OUT     INTEGER,
    store_name    IN      VARCHAR2 DEFAULT NULL);
```

Parameters

Table 57-74 SPACEUSAGE Procedure Parameters

| Parameter | Description |
|-----------|---|
| path | Name of path to file items |
| blksize | Natural tablespace blocksize that holds the store. If multiple tablespaces with different blocksizes are used, any valid blocksize is acceptable. |
| tbytes | Total size of the store in bytes computed over all segments that comprise the store |
| fbytes | Free or unused size of the store in bytes computed over all segments that comprise the store |
| nfile | Number of currently available files in the store |

Table 57-74 (Cont.) SPACEUSAGE Procedure Parameters

| Parameter | Description |
|------------|--|
| ndir | Number of currently available directories in the store |
| nlink | Number of currently available links in the store |
| nref | Number of currently available references in the store |
| store_name | Name of store |

Usage Notes

- A space usage query on the top-level root directory returns a combined summary of the space usage of all available distinct stores under it (if the same store is mounted multiple times, is still counted only once).
- Since database objects are dynamically expandable, it is not easy to estimate the division between "free" space and "used" space.

57.7.63 TRACE Procedure

This procedure outputs tracing to the current foreground trace file.

Syntax

```
DBMS_DBFS_CONTENT.TRACE
  sev          IN          INTEGER,
  msg0         IN          VARCHAR2,
  msg1         IN          VARCHAR   DEFAULT '',
  msg2         IN          VARCHAR   DEFAULT '',
  msg3         IN          VARCHAR   DEFAULT '',
  msg4         IN          VARCHAR   DEFAULT '',
  msg5         IN          VARCHAR   DEFAULT '',
  msg6         IN          VARCHAR   DEFAULT '',
  msg7         IN          VARCHAR   DEFAULT '',
  msg8         IN          VARCHAR   DEFAULT '',
  msg9         IN          VARCHAR   DEFAULT '',
  msg10        IN          VARCHAR   DEFAULT '' );
```

Parameters

Table 57-75 TRACE Procedure Parameters

| Parameter | Description |
|-----------|--|
| sev | Severity at which trace message is output |
| msg* | One or more message strings to be output. If more than one message is specified, all are output. |

Usage Notes

- Trace information is written to the foreground trace file, with varying levels of detail as specified by the trace level arguments.
- The global trace level consists of 2 components: "severity" and "detail". These can be thought of as additive bitmasks.

The "severity" allows the separation of top level as compared to low-level tracing of different components, and allows the amount of tracing to be increased as needed. There are no semantics associated with different levels, and users are free to set trace at any severity they choose, although a good rule of thumb would use severity "1" for top level API entry and exit traces, "2" for internal operations, and "3" or greater for very low-level traces.

The "detail" controls how much additional information: timestamps, short-stack, etc. is dumped along with each trace record.

57.7.64 TRACEENABLED Function

This function determines if the current trace "severity" set by the SETTRACE Procedure is at least as high as the given trace level.

Syntax

```
DBMS_DBFS_CONTENT.TRACEENABLED (
    sev          IN          INTEGER)
RETURN INTEGER;
```

Parameters

Table 57-76 TRACEENABLED Procedure Parameters

| Parameter | Description |
|-----------|---|
| sev | Severity at which trace message is output |

Return Values

Returns 0 if the requested severity level is lower than the currently set trace severity level; 1 otherwise.

Related Topics

- [SETTRACE Procedure](#)
This procedure sets the DBMS_DBFS_CONTENT tracing severity to the given level, 0 being "off".

57.7.65 UNLOCKPATH Procedure

This procedure unlocks path items that were previously locked with the LOCKPATH Procedure.

Syntax

```
DBMS_DBFS_CONTENT.UNLOCKPATH (
    path          IN          VARCHAR2,
    who           IN          VARCHAR2,
    waitForRowLock IN        INTEGER    DEFAULT 1,
    store_name    IN          VARCHAR2    DEFAULT NULL,
    principal     IN          VARCHAR2    DEFAULT NULL);
```

Parameters

Table 57-77 UNLOCKPATH Procedure Parameters

| Parameter | Description |
|----------------|---|
| path | Name of path to file items |
| who | Transaction identifier that has locked the path |
| waitForRowLock | Determines if a row is locked by a transaction or not |
| store_name | Name of store |
| principal | Agent (principal) invoking the current operation |

Related Topics

- [LOCKPATH Procedure](#)
This procedure applies user-level locks to the given valid path name (subject to store feature support), and optionally associates user-data with the lock.

57.7.66 UNMOUNTSTORE Procedure

This procedure unmounts a registered store, either by name or by mount point.

Syntax

```
DBMS_DBFS_CONTENT.UNMOUNTSTORE (
  store_name      IN      VARCHAR2  DEFAULT NULL,
  store_mount     IN      VARCHAR2  DEFAULT NULL,
  ignore_unknown IN      BOOLEAN    DEFAULT FALSE);
```

Parameters

Table 57-78 UNMOUNTSTORE Procedure Parameters

| Parameter | Description |
|----------------|---|
| store_name | Name of store |
| store_mount | Location at which the store instance is mounted |
| ignore_unknown | If TRUE, attempts to unregister unknown stores will not raise an exception. |

Usage Notes

 **See Also:**

Oracle Database SecureFiles and Large Objects Developer's Guide for further information on unmounting a previously unmounted store

57.7.67 UNREGISTERSTORE Procedure

This procedure unregisters a previously registered store (invalidating all mount points associated with it).

Syntax

```
DBMS_DBFS_CONTENT.UNREGISTERSTORE (  
    store_name          IN      VARCHAR2,  
    ignore_unknown     IN      BOOLEAN DEFAULT FALSE);
```

Parameters

Table 57-79 UNREGISTERSTORE Procedure Parameters

| Parameter | Description |
|----------------|---|
| store_name | Name of store |
| ignore_unknown | If TRUE, attempts to unregister unknown stores will not raise an exception. |

Usage Notes

- Once unregistered all access to the store (and its mount points) are not guaranteed to work
- If the `ignore_unknown` argument is TRUE, attempts to unregister unknown stores do not raise an exception.

DBMS_DBFS_CONTENT_SPI

The `DBMS_DBFS_CONTENT_SPI` package is a specification for `DBMS_DBFS_CONTENT` store providers, which must be implemented. Application designers can create PL/SQL packages conforming to this specification to extend `DBMS_DBFS_CONTENT` to use custom store providers.

This chapter contains the following topics:

- [Overview](#)
- [Security Model](#)
- [Operational Notes](#)
- [Summary of DBMS_DBFS_CONTENT_SPI Subprograms](#)

Related Topics

- [DBMS_DBFS_CONTENT](#)
The `DBMS_DBFS_CONTENT` package provides an interface comprising a file system-like abstraction backed by one or more Store Providers.

See Also:

- *Oracle Database SecureFiles and Large Objects Developer's Guide*

58.1 ODBMS_DBFS_CONTENT_SPI Overview

The `DBMS_DBFS_CONTENT_SPI` package describes an internal contract between the implementation of the `DBMS_DBFS_CONTENT` interface and individual store providers, and whichever package contains their code.

Since PL/SQL does not allow a compile-time, declarative type-conformation between package signatures, store providers should informally conform to the SPI, which is to say, they should implement the SPI by means of a package that contains all of the methods specified in package `DBMS_DBFS_CONTENT_SPI`, with the same method signatures and semantics.

Obviously, these provider packages can implement other methods and expose other interfaces, however, these interfaces are not to be used by the `DBMS_DBFS_CONTENT` interface itself.

Since the provider SPI is merely a contract specification, there is no package body for `DBMS_DBFS_CONTENT_SPI`, and it is not possible to actually invoke any methods using this package.

The SPI references various elements (constants, types, exceptions) defined by the `DBMS_DBFS_CONTENT` interface.

Additionally, there is an almost one-to-one correspondence between the client API exported by the `DBMS_DBFS_CONTENT` interface and the provider interface that the `DBMS_DBFS_CONTENT` interface itself expects to work against.

The main distinction in the method naming conventions is that all path name references are always store-qualified. That is, the notion of mount-points and full-absolute path names have been normalized and converted to store-qualified path names by the `DBMS_DBFS_CONTENT` interface before it invokes any of the provider SPI methods.

Since the interconnection of the `DBMS_DBFS_CONTENT` interface and the provider SPI is a 1-to-many pluggable architecture, and the interface uses dynamic SQL to invoke methods in the provider SPI, this can lead to runtime errors.

Related Topics

- [DBMS_DBFS_CONTENT](#)
The `DBMS_DBFS_CONTENT` package provides an interface comprising a file system-like abstraction backed by one or more Store Providers.

58.2 DBMS_DBFS_CONTENT_SPI Security Model

Implementations of the `DBMS_DBFS_CONTENT_SPI` package should be created as `AUTHID CURRENT_USER`.

58.3 DBMS_DBFS_CONTENT_SPI Operational Notes

This topic lists operational notes for `DBMS_DBFS_CONTENT_SPI` implementation, path names, and other operations.

- [Implementation](#)
- [Path Names](#)
- [Other DBMS_DBFS_CONTENT Operations](#)

Implementation

Since the interconnection of the `DBMS_DBFS_CONTENT` interface and the provider SPI is a 1-to-many pluggable architecture, the interface uses dynamic SQL to invoke methods in the provider SPI, this can lead to runtime errors.

There are no explicit `INIT` or `FINI` methods to indicate when the `DBMS_DBFS_CONTENT` interface plugs or unplugs a particular provider SPI. Provider SPIs must be willing to auto-initialize themselves at any SPI entry-point.

All operations performed by a store provider are "stateless" in that they are complete operations unto themselves. If state is necessary to be maintained for some reason, then the state must be maintained in data structures such as auxiliary tables that can be queried as needed.

Path Names

All path names used in the provider SPI are store-qualified in pair form (`store_name`, `pathname`) where the path name is rooted within the store namespace.

Stores and their providers that support contentID-based access (see `FEATURE_CONTENT_ID` in [Table 57-5](#)) also support a form of addressing that is not based on path names. Content items are identified by an explicit store name, a `NULL` path name, and possibly a contentID specified as a parameter or by way of the `OPT_CONTENT_ID` (see [Table 57-8](#)) property.

Not all operations are supported with contentID-based access, and applications should depend only on the simplest create or delete functionality being available.

Other DBMS_DBFS_CONTENT Operations

This table lists other operations and provides links to related discussions.

Table 58-1 Other DBMS_DBFS_CONTENT Operations

| Other Operations | See ... |
|---------------------------------|--|
| Creation | <i>Oracle Database SecureFiles and Large Objects Developer's Guide</i> for further information on creation operations |
| Deletion | <i>Oracle Database SecureFiles and Large Objects Developer's Guide</i> for further information on deletion operations |
| Get (Retrieve) and Put (Insert) | <i>Oracle Database SecureFiles and Large Objects Developer's Guide</i> for further information on Get and Put operations |
| Rename and Move | <i>Oracle Database SecureFiles and Large Objects Developer's Guide</i> for further information on Rename and Move operations |
| Directory Navigation and Search | <i>Oracle Database SecureFiles and Large Objects Developer's Guide</i> for further information on Navigation and Search operations |
| Locking | <i>Oracle Database SecureFiles and Large Objects Developer's Guide</i> for further information on Locking operations |
| Access Check | <i>Oracle Database SecureFiles and Large Objects Developer's Guide</i> for further information on Access Check operations |

58.4 Summary of DBMS_DBFS_CONTENT_SPI Subprograms

This table lists and describes the subprograms used in the `DBMS_DBFS_CONTENT_SPI` Package.

Table 58-2 DBMS_DBFS_CONTENT_SPI Package Subprograms

| Subprogram | Description |
|---|---|
| CHECKACCESS Function | Reports if the user (principal) can perform the specified operation on the given path |
| CREATEDIRECTORY Procedure | Creates a directory |
| CREATEFILE Procedure | Creates a file |
| CREATELINK Procedure | Creates a physical link to an already existing file system element |
| CREATEREFERENCE Procedure | Creates a new reference to the source file system element |
| DELETECONTENT Procedure | Deletes the file specified by the given contentID |
| DELETEDIRECTORY Procedure | Deletes a directory |
| DELETEFILE Procedure | Deletes a file |
| GETFEATURES Function | Returns the features of a store |
| GETPATH Procedures | Returns existing path items (such as files and directories) |

Table 58-2 (Cont.) DBMS_DBFS_CONTENT_SPI Package Subprograms

| Subprogram | Description |
|---|---|
| GETPATHBYSTOREID Function | If the underlying GUID is found in the underlying store, returns the store-qualified path name |
| GETPATHNOWAIT Procedure | Implies that the operation is for an update, and, if implemented, allows providers to return an exception (ORA-00054) rather than wait for row locks. |
| GETSTOREID Function | Returns the ID of a store |
| GETVERSION Function | Returns the version associated with a store |
| LIST Function | Lists the contents of a directory path name |
| LOCKPATH Procedure | Applies user-level locks to the given valid path name |
| PURGEALL Procedure | Purges all soft-deleted entries matching the path and optional filter criteria |
| PURGEPATH Procedure | Purges any soft-deleted versions of the given path item |
| PUTPATH Procedures | Creates a new path item |
| RENAMEPATH Procedure | Renames or moves a path |
| RESTOREALL Procedure | Restores all soft-deleted path items meeting the path and filter criteria |
| RESTOREPATH Procedure | Restores all soft-deleted path items that match the given path and filter criteria |
| SEARCH Function | Searches for path items matching the given path and filter criteria |
| SETPATH Procedure | Assigns a path name to a path item represented by contentID |
| SPACEUSAGE Procedure | Queries file system space usage statistics |
| UNLOCKPATH Procedure | Unlocks path items that were previously locked with the LOCKPATH Procedure |

58.4.1 CHECKACCESS Function

This function reports if the user (*principal*) can perform the specified operation on the given path. This enables verifying the validity of an operation without attempting to perform the operation. If `CHECKACCESS` returns 0, then the subprogram invoked to implement that operation should fail with an error.

Syntax

```
DBMS_DBFS_CONTENT_SPI.CHECKACCESS (
  store_name      IN      VARCHAR2  DEFAULT NULL,
  path            IN      VARCHAR2,
  pathtype       IN      INTEGER,
  operation       IN      VARCHAR2,
  principal       IN      VARCHAR2)
RETURN INTEGER;
```

Parameters

Table 58-3 CHECKACCESS Procedure Parameters

| Parameter | Description |
|------------|--|
| store_name | Name of store |
| path | Name of path to check for access |
| pathtype | Type of object path represents (see Table 57-4) |
| operation | Operation to be checked (see Table 57-8) |
| principal | File system user for whom the access check is made |

Usage Notes

Whether or not the user invokes this function, a store that supports access control internally performs these checks to guarantee security.

58.4.2 CREATEDIRECTORY Procedure

This procedure creates a directory.

Syntax

```
DBMS_DBFS_CONTENT_SPI.CREATEDIRECTORY (
  store_name IN          VARCHAR2,
  path       IN          VARCHAR2,
  properties IN OUT NOCOPY DBMS_DBFS_CONTENT_PROPERTIES_T,
  prop_flags IN          INTEGER,
  recurse    IN          INTEGER,
  ctx       IN          DBMS_DBFS_CONTENT_CONTEXT_T);
```

Parameters

Table 58-4 CREATEDIRECTORY Procedure Parameters

| Parameter | Description |
|------------|---|
| store_name | Name of store |
| path | Name of path to the directory |
| properties | One or more properties and their values to be set, returned, or both, depending on <code>prop_flags</code> (see DBMS_DBFS_CONTENT_PROPERTIES_T Table Type) |
| prop_flags | Determines which properties are set, returned, or both. Default is <code>PROP_STD</code> . Specify properties to be returned by setting <code>PROP_SPC</code> (see Table 57-9), and providing an instance of the DBMS_DBFS_CONTENT_PROPERTIES_T Table Type with properties whose values are of interest. |
| recurse | If 0, do not execute recursively; otherwise, recursively create the directories above the given directory |
| ctx | Context with which to create the directory (see DBMS_DBFS_CONTENT_CONTEXT_T Object Type) |

58.4.3 CREATEFILE Procedure

This procedure creates a file.

Syntax

```
DBMS_DBFS_CONTENT_SPI.CREATEFILE (
  store_name  IN          VARCHAR2,
  path        IN          VARCHAR2,
  properties  IN OUT NOCOPY DBMS_DBFS_CONTENT_PROPERTIES_T,
  content     IN OUT NOCOPY BLOB,
  prop_flags  IN          INTEGER,
  ctx         IN          DBMS_DBFS_CONTENT_CONTEXT_T);
```

Parameters

Table 58-5 CREATEFILE Procedure Parameters

| Parameter | Description |
|------------|---|
| store_name | Name of store |
| path | Name of path to the file |
| properties | One or more properties and their values to be set, returned or both depending, or both on <code>prop_flags</code> (see DBMS_DBFS_CONTENT_PROPERTIES_T Table Type) |
| content | BLOB holding data with which to populate the file (optional) |
| prop_flags | Determines which properties are set, returned, or both. Default is <code>PROP_STD</code> . Specify properties to be returned by setting <code>prop_spec</code> , and providing an instance of the DBMS_DBFS_CONTENT_PROPERTIES_T Table Type with properties whose values are of interest. |
| ctx | Context with which to create the file (see DBMS_DBFS_CONTENT_CONTEXT_T Object Type) |

58.4.4 CREATELINK Procedure

This procedure creates a physical link to an already existing file system element (such as file or directory). The resulting entry shares the same metadata structures as the value of the `srcPath` parameter, and so is similar to incrementing a reference count on the file system element. This is analogous to a UNIX file system hard link.

Syntax

```
DBMS_DBFS_CONTENT_SPI.CREATELINK (
  store_name  IN          VARCHAR2,
  srcPath     IN          VARCHAR2,
  dstPath     IN          VARCHAR2,
  properties  IN OUT NOCOPY DBMS_DBFS_CONTENT_PROPERTIES_T,
  prop_flags  IN          INTEGER,
  ctx         IN          DBMS_DBFS_CONTENT_CONTEXT_T);
```

Parameters

Table 58-6 CREATELINK Procedure Parameters

| Parameter | Description |
|------------|---|
| store_name | Name of store |
| srcPath | File system entry with which to link |
| dstPath | Path of the new link element to be created |
| properties | One or more properties and their values to be set, returned, or both, depending on prop_flags (see DBMS_DBFS_CONTENT_PROPERTIES_T Table Type) |
| prop_flags | Determines which properties are set, returned, or both. Default is PROP_STD. Specify properties to be returned by setting prop_spec, and providing an instance of the DBMS_DBFS_CONTENT_PROPERTIES_T Table Type with properties whose values are of interest. |
| ctx | Context with which to create the link (see DBMS_DBFS_CONTENT_CONTEXT_T Object Type) |

58.4.5 CREATEREERENCE Procedure

This procedure creates a new reference to the source file system element (such as a file, or directory). The resulting reference points to the source element but does not directly share metadata with the source element. This is analogous to a UNIX file system symbolic link.

Syntax

```
DBMS_DBFS_CONTENT_SPI.CREATEREERENCE (
  srcPath      IN          VARCHAR2,
  dstPath      IN          VARCHAR2,
  properties   IN OUT NOCOPY DBMS_DBFS_CONTENT_PROPERTIES_T,
  prop_flags   IN          INTEGER,
  store_name   IN          VARCHAR2,
  ctx          IN          DBMS_DBFS_CONTENT_CONTEXT_T);
```

Parameters

Table 58-7 CREATEREERENCE Procedure Parameters

| Parameter | Description |
|------------|--|
| store_name | Name of store |
| srcPath | File system entry with which to link |
| dstPath | Path of the new link element to be created |
| properties | One or more properties and their values to be set, returned, or both, depending on prop_flags (see DBMS_DBFS_CONTENT_PROPERTIES_T Table Type) |

Table 58-7 (Cont.) CREATEREERENCE Procedure Parameters

| Parameter | Description |
|------------|---|
| prop_flags | Determines which properties are set, returned, or both. Default is PROP_STD. Specify properties to be returned by setting prop_spec, and providing an instance of the DBMS_DBFS_CONTENT_PROPERTIES_T Table Type with properties whose values are of interest. |
| ctx | Context with which to create the reference (see DBMS_DBFS_CONTENT_CONTEXT_T Object Type) |

58.4.6 DELETECONTENT Procedure

This procedure deletes the file specified by the given contentID.

Syntax

```
DBMS_DBFS_CONTENT_SPI.DELETECONTENT (
  store_name      IN      VARCHAR2,
  contentID       IN      RAW,
  filter          IN      VARCHAR2,
  soft_delete     IN      INTEGER,
  ctx             IN      DBMS_DBFS_CONTENT_CONTEXT_T);
```

Parameters

Table 58-8 DELETECONTENT Procedure Parameters

| Parameter | Description |
|-------------|---|
| store_name | Name of store |
| contentID | Unique identifier for the file to be deleted |
| filter | A filter, if any, to be applied |
| soft_delete | If 0, execute a hard (permanent) delete. For any value other than 0, perform a soft delete see <i>Oracle Database SecureFiles and Large Objects Developer's Guide</i> , Deletion Operations). |
| ctx | Context with which to delete the file (see DBMS_DBFS_CONTENT_CONTEXT_T Object Type) |

58.4.7 DELETEDIRECTORY Procedure

This procedure deletes a directory.

If `recurse` is nonzero, it recursively deletes all elements of the directory. A filter, if supplied, determines which elements of the directory are deleted.

Syntax

```
DBMS_DBFS_CONTENT_SPI.DELETEDIRECTORY (
  store_name      IN      VARCHAR2,
  path           IN      VARCHAR2,
  filter         IN      VARCHAR2,
  soft_delete     IN      INTEGER,
```

```

recurse      IN      INTEGER,
ctx          IN      DBMS_DBFS_CONTENT_CONTEXT_T);

```

Parameters

Table 58-9 DELETEDIRECTORY Procedure Parameters

| Parameter | Description |
|-------------|---|
| store_name | Name of store |
| path | Name of path to the directory |
| filter | A filter, if any, to be applied |
| soft_delete | If 0, execute a hard (permanent) delete. For any value other than 0, perform a soft delete see <i>Oracle Database SecureFiles and Large Objects Developer's Guide</i> , Deletion Operations). |
| recurse | If 0, do not execute recursively. Otherwise, recursively delete the directories and files below the given directory. |
| ctx | Context with which to delete the directory (see DBMS_DBFS_CONTENT_CONTEXT_T Object Type) |

58.4.8 DELETEFILE Procedure

This procedure deletes the specified file.

Syntax

```

DBMS_DBFS_CONTENT_SPI.DELETEFILE (
  store_name  IN   VARCHAR2,
  path        IN   VARCHAR2,
  filter      IN   VARCHAR2,
  soft_delete IN   BOOLEAN,
  ctx         IN   DBMS_DBFS_CONTENT_CONTEXT_T);

```

Parameters

Table 58-10 DELETEFILE Procedure Parameters

| Parameter | Description |
|-------------|---|
| store_name | Name of store |
| path | Name of path to the file |
| filter | A filter, if any, to be applied |
| soft_delete | If 0, execute a hard (permanent) delete. For any value other than 0, perform a soft delete see <i>Oracle Database SecureFiles and Large Objects Developer's Guide</i> , Deletion Operations). |
| ctx | Context with which to delete the file (see DBMS_DBFS_CONTENT_CONTEXT_T Object Type) |

58.4.9 GETFEATURES Function

This function returns the features of a store.

Syntax

```
DBMS_DBFS_CONTENT_SPI.GETFEATURES (
    store_name      IN      VARCHAR2)
RETURN INTEGER;
```

Parameters

Table 58-11 GETFEATURES Function Parameters

| Parameter | Description |
|------------|---------------|
| store_name | Name of store |

Return Values

DBMS_DBFS_CONTENT.FEATURE_* features supported by the Store Provider

58.4.10 GETPATH Procedures

This procedure returns existing path items (such as files and directories). This includes both data and metadata (properties).

The client can request (using `prop_flags`) that specific properties be returned. File path names can be read either by specifying a BLOB locator using the `prop_data` bitmask in `prop_flags` (see [Table 57-9](#)) or by passing one or more RAW buffers.

When `forUpdate` is 0, this procedure also accepts a valid "as of" timestamp parameter as part of `ctx` that can be used by stores to implement "as of" style flashback queries. Mutating versions of the GETPATH Procedures do not support these modes of operation.

Syntax

```
DBMS_DBFS_CONTENT_SPI.GETPATH (
    store_name  IN          VARCHAR2,
    path        IN          VARCHAR2,
    properties  IN OUT NOCOPY DBMS_DBFS_CONTENT_PROPERTIES_T,
    content     OUT         NOCOPY BLOB,
    item_type   OUT         INTEGER,
    prop_flags  IN          INTEGER,
    forUpdate   IN          INTEGER,
    deref       IN          INTEGER,
    ctx         IN          DBMS_DBFS_CONTENT_CONTEXT_T);

DBMS_DBFS_CONTENT_SPI.GETPATH (
    store_name  IN          VARCHAR2,
    path        IN          VARCHAR2,
    properties  IN OUT NOCOPY DBMS_DBFS_CONTENT_PROPERTIES_T,
    amount     IN OUT      NUMBER,
    offset      IN          NUMBER,
    buffer      OUT         NOCOPY RAW,
```

```

prop_flags IN          INTEGER,
ctx        IN          DBMS_DBFS_CONTENT_CONTEXT_T);

DBMS_DBFS_CONTENT_SPI.GETPATH (
  store_name IN          VARCHAR2,
  path       IN          VARCHAR2,
  properties IN OUT NOCOPY DBMS_DBFS_CONTENT_PROPERTIES_T,
  amount     IN OUT      NUMBER,
  offset     IN          NUMBER,
  buffers    OUT NOCOPY  DBMS_DBFS_CONTENT_RAW_T,
  prop_flags IN          INTEGER,
  ctx        IN          DBMS_DBFS_CONTENT_CONTEXT_T);

```

Parameters

Table 58-12 GETPATH Procedure Parameters

| Parameter | Description |
|------------|---|
| store_name | Name of store |
| path | Name of path to path items |
| properties | One or more properties and their values to be returned depending on prop_flags (see DBMS_DBFS_CONTENT_PROPERTIES_T Table Type) |
| content | BLOB holding data which populates the file (optional) |
| item_type | Type of the path item specified (see Table 57-4) |
| amount | On input, number of bytes to be read. On output, number of bytes read |
| offset | Byte offset from which to begin reading |
| buffer | Buffer to which to write |
| buffers | Buffers to which to write |
| prop_flags | Determines which properties are set, returned, or both. Default is PROP_STD. Specify properties to be returned by setting prop_spec, and providing an instance of the DBMS_DBFS_CONTENT_PROPERTIES_T Table Type with properties whose values are of interest. |
| forUpdate | Specifies that a lock should be taken to signify exclusive write access to the path item |
| deref | If nonzero, attempts to resolve the given path item to actual data provided it is a reference (symbolic link) |
| ctx | Context with which to access the path items (see DBMS_DBFS_CONTENT_CONTEXT_T Object Type) |

58.4.11 GETPATHBYSTOREID Function

If the underlying GUID is found in the underlying store, this function returns the store-qualified path name.

Syntax

```

DBMS_DBFS_CONTENT_SPI.GETPATHBYSTOREID (
  store_name IN          VARCHAR2,
  guid       IN          INTEGER)
RETURN VARCHAR2;

```

Parameters

Table 58-13 GETPATHBYSTOREID Function Parameters

| Parameter | Description |
|------------|--|
| store_name | Name of store |
| guid | Unique ID representing the desired path item |

Return Values

Store-qualified path name represented by the GUID

Usage Notes

If the `STD_GUID` is unknown, a `NULL` value is returned. Clients are expected to handle this as appropriate.

58.4.12 GETPATHNOWAIT Procedure

This procedure implies that the operation is for an update, and, if implemented, allows providers to return an exception (ORA-00054) rather than wait for row locks.

See `FEATURE_NOWAIT` in [Table 57-5](#) for more information.

Syntax

```
DBMS_DBFS_CONTENT_SPI.GETPATHNOWAIT (
  store_name  IN          VARCHAR2,
  path        IN          VARCHAR2,
  properties  IN OUT NOCOPY DBMS_DBFS_CONTENT_PROPERTIES_T,
  content     OUT NOCOPY  BLOB,
  item_type   OUT          INTEGER,
  prop_flags  IN          INTEGER,
  deref       IN          INTEGER,
  ctx         IN          DBMS_DBFS_CONTENT_CONTEXT_T);
```

Parameters

Table 58-14 GETPATHNOWAIT Procedure Parameters

| Parameter | Description |
|------------|--|
| store_name | Name of store |
| path | Name of path to path items |
| properties | One or more properties and their values to be returned depending on <code>prop_flags</code> (see DBMS_DBFS_CONTENT_PROPERTIES_T Table Type) |
| content | BLOB holding data which populates the file (optional) |
| item_type | Type of the path item specified (see Table 57-4) |

Table 58-14 (Cont.) GETPATHNOWAIT Procedure Parameters

| Parameter | Description |
|------------|---|
| prop_flags | Determines which properties are returned. Default is PROP_STD. Specify properties to be returned by setting prop_spec, and providing an instance of the DBMS_DBFS_CONTENT_PROPERTIES_T Table Type with properties whose values are of interest. |
| deref | If nonzero, attempts to resolve the given path item to actual data provided it is a reference (symbolic link) |
| ctx | Context with which to access the path items (see DBMS_DBFS_CONTENT_CONTEXT_T Object Type) |

58.4.13 GETSTOREID Function

This function returns the ID of a store.

Syntax

```
DBMS_DBFS_CONTENT_SPI.GETSTOREID (
    store_name          IN          VARCHAR2)
RETURN NUMBER;
```

Parameters

Table 58-15 GETSTOREID Function Parameters

| Parameter | Description |
|------------|---------------|
| store_name | Name of store |

Return Values

ID of the Store

Usage Notes

A store ID identifies a provider-specific store, across registrations and mounts, but independent of changes to the store contents. For this reason, changes to the store table or tables should be reflected in the store ID, but re-initialization of the same store table or tables should preserve the store ID.

58.4.14 GETVERSION Function

This function returns the version associated with a store.

Syntax

```
DBMS_DBFS_CONTENT_SPI.GETVERSION (
    store_name          IN          VARCHAR2)
RETURN VARCHAR2;
```

Parameters

Table 58-16 GETVERSION Function Parameters

| Parameter | Description |
|------------|---------------|
| store_name | Name of store |

Return Values

A "version" (either specific to a provider package, or to an individual store) based on a standard *a.b.c* naming convention (for *major*, *minor*, and *patch* components)

58.4.15 ISPATHLOCKED Procedure

This procedure checks if any user-level locks are applied on a given path.

Syntax

```
DBMS_DBFS_CONTENT.ISPATHLOCKED (
  store_name  IN   VARCHAR2,
  path        IN   VARCHAR2,
  who         IN   VARCHAR2,
  lock_type   IN OUT INTEGER,
  ctx         IN   DBMS_DBFS_CONTENT_CONTEXT_T);
```

Parameters

Table 58-17 ISPATHLOCKED Procedure Parameters

| Parameter | Description |
|------------|--|
| store_name | Name of store |
| path | Path name of items to be locked |
| who | Transaction identifier that has locked the path |
| lock_type | One of the available lock types (see Table 57-6) |
| ctx | Context with which to access the path items (see DBMS_DBFS_CONTENT_CONTEXT_T Object Type) |

58.4.16 LIST Function

This function lists the contents of a directory path name.

The invoker of the subprogram has the option to investigate recursively into sub-directories, to make soft-deleted items visible, to use a flashback "as of" a specified timestamp, and to filter items within the store based on list predicates.

Syntax

```
DBMS_DBFS_CONTENT_SPI.LIST (
  store_name  IN   VARCHAR2,
  path        IN   VARCHAR2,
  filter      IN   VARCHAR2,
  recurse     IN   INTEGER,
```

```

    ctx          IN      DBMS_DBFS_CONTENT_CONTEXT_T)
RETURN  DBMS_DBFS_CONTENT_LIST_ITEMS_T PIPELINED;

```

Parameters

Table 58-18 LIST Function Parameters

| Parameter | Description |
|------------|--|
| store_name | Name of repository |
| path | Name of path to directories |
| filter | A filter, if any, to be applied |
| recurse | If 0, do not execute recursively. Otherwise, recursively list the contents of directories and files below the given directory. |
| ctx | Context with which to access the path items (see DBMS_DBFS_CONTENT_CONTEXT_T Object Type) |

Return Values

Path items found that match the path, filter and criteria for executing recursively (see [DBMS_DBFS_CONTENT_LIST_ITEMS_T Table Type](#))

Usage Notes

This function returns only list items; the client is expected to explicitly use one of the [GETPATH Procedures](#) to access the properties or content associated with an item.

58.4.17 LOCKPATH Procedure

This procedure applies user-level locks to the given valid path name (subject to store feature support), and optionally associates user-data with the lock.

Syntax

```

DBMS_DBFS_CONTENT_SPI.LOCKPATH (
    store_name    IN      VARCHAR2,
    path          IN      VARCHAR2,
    who           IN      VARCHAR2,
    lock_type     IN      INTEGER,
    waitForRowLock IN    INTEGER,
    ctx           IN      DBMS_DBFS_CONTENT_CONTEXT_T);

```

Parameters

Table 58-19 LOCKPATH Procedure Parameters

| Parameter | Description |
|----------------|---|
| store_name | Name of store |
| path | Path name of items to be locked |
| who | Transaction identifier that has locked the path |
| lock_type | One of the available lock types (see Table 57-6) |
| waitForRowLock | Determines if a row is locked by a transaction or not |

Table 58-19 (Cont.) LOCKPATH Procedure Parameters

| Parameter | Description |
|-----------|--|
| ctx | Context with which to access the path items (see DBMS_DBFS_CONTENT_CONTEXT_T Object Type) |

Usage Notes

- It is the responsibility of the store and its providers (assuming it supports user-defined lock checking) to ensure that lock and unlock operations are performed in a consistent manner.
- The status of locked items is available by means of various optional properties (see `OPT_LOCK*` in [Table 57-8](#)).

58.4.18 PURGEALL Procedure

This procedure purges all soft-deleted entries matching the path and optional filter criteria.

Syntax

```
DBMS_DBFS_CONTENT_SPI.PURGEALL (
    store_name    IN    VARCHAR2,
    path          IN    VARCHAR2,
    filter        IN    VARCHAR2,
    ctx           IN    DBMS_DBFS_CONTENT_CONTEXT_T);
```

Parameters

Table 58-20 PURGEALL Procedure Parameters

| Parameter | Description |
|------------|--|
| store_name | Name of store |
| path | Name of path to file items |
| filter | A filter, if any, to be applied based on specified criteria |
| ctx | Context with which to access the path items (see DBMS_DBFS_CONTENT_CONTEXT_T Object Type) |

58.4.19 PURGEPATH Procedure

This procedure purges any soft-deleted versions of the given path item.

Syntax

```
DBMS_DBFS_CONTENT_SPI.PURGEPATH (
    path          IN    VARCHAR2,
    filter        IN    VARCHAR2,
    store_name    IN    VARCHAR2,
    ctx           IN    DBMS_DBFS_CONTENT_CONTEXT_T);
```

Parameters

Table 58-21 PURGEPATH Procedure Parameters

| Parameter | Description |
|------------|--|
| store_name | Name of store |
| path | Name of path to file items |
| filter | A filter, if any, to be applied |
| ctx | Context with which to access the path items (see DBMS_DBFS_CONTENT_CONTEXT_T Object Type) |

58.4.20 PUTPATH Procedures

This procedure creates a new path item.

Syntax

```

DBMS_DBFS_CONTENT_SPI.PUTPATH (
  store_name  IN          VARCHAR2,
  path        IN          VARCHAR2,
  properties  IN OUT NOCOPY DBMS_DBFS_CONTENT_PROPERTIES_T,
  content     IN OUT NOCOPY BLOB,
  item_type   OUT         INTEGER,
  prop_flags  IN          INTEGER,
  ctx         IN          DBMS_DBFS_CONTENT_CONTEXT_T);

DBMS_DBFS_CONTENT_SPI.PUTPATH (
  store_name  IN          VARCHAR2,
  path        IN          VARCHAR2,
  properties  IN OUT NOCOPY DBMS_DBFS_CONTENT_PROPERTIES_T,
  amount     IN          NUMBER,
  offset     IN          NUMBER,
  buffer     IN          RAW,
  prop_flags  IN          INTEGER,
  ctx         IN          DBMS_DBFS_CONTENT_CONTEXT_T);

DBMS_DBFS_CONTENT_SPI.PUTPATH (
  store_name  IN          VARCHAR2,
  path        IN          VARCHAR2,
  properties  IN OUT NOCOPY DBMS_DBFS_CONTENT_PROPERTIES_T,
  written     OUT         NUMBER,
  offset     IN          NUMBER,
  buffers     IN          DBMS_DBFS_CONTENT_RAW_T,
  prop_flags  IN          INTEGER,
  ctx         IN          DBMS_DBFS_CONTENT_CONTEXT_T);

```

Parameters

Table 58-22 PUTPATH Procedure Parameters

| Parameter | Description |
|------------|-----------------------------|
| store_name | Name of store |
| path | Path name of item to be put |

Table 58-22 (Cont.) PUTPATH Procedure Parameters

| Parameter | Description |
|------------|--|
| properties | One or more properties and their values to be set depending on <code>prop_flags</code> (see DBMS_DBFS_CONTENT_PROPERTIES_T Table Type) |
| content | BLOB holding data which populates the file (optional) |
| item_type | Type of the path item specified (see Table 57-4) |
| amount | Number of bytes to be read |
| written | Number of bytes written |
| offset | Byte offset from which to begin reading |
| buffer | Buffer to which to write |
| buffers | Buffers to which to write |
| prop_flags | Determines which properties are set. Default is <code>PROP_STD</code> . Specify properties to be returned by setting <code>prop_spec</code> , and providing an instance of the DBMS_DBFS_CONTENT_PROPERTIES_T Table Type with properties whose values are of interest. |
| ctx | Context with which to access the path items (see DBMS_DBFS_CONTENT_CONTEXT_T Object Type) |

Usage Notes

- All path names allow their metadata (properties) to be read and modified. On completion of the call, the client can access specific properties using `prop_flags` (see [Table 57-9](#)).
- On completion of the call, the client can request a new BLOB locator that can be used to continue data access using the `prop_data` bitmask in `prop_flags` (see [Table 57-9](#)).
- Files can also be written without using BLOB locators, by explicitly specifying logical offsets or buffer-amounts, and a suitably sized buffer.

58.4.21 RENAMEPATH Procedure

This procedure renames or moves a path. This operation can be performed across directory hierarchies and mount-points as long as it is within the same store.

Note:

See *Oracle Database SecureFiles and Large Objects Developer's Guide* for further information on Rename and Move operations

Syntax

```
DBMS_DBFS_CONTENT_SPI.RENAMEPATH (
  store_name    IN          VARCHAR2,
  oldPath       IN          VARCHAR2,
  newPath       IN          VARCHAR2,
```

```

properties  IN OUT NOCOPY  DBMS_DBFS_CONTENT_PROPERTIES_T,
ctx        IN          DBMS_DBFS_CONTENT_CONTEXT_T);

```

Parameters

Table 58-23 RENAMEPATH Procedure Parameters

| Parameter | Description |
|------------|--|
| store_name | Name of store, must be unique |
| oldPath | Name of path prior to renaming |
| newPath | Name of path after renaming |
| properties | One or more properties and their values to be set depending on prop_flags (see DBMS_DBFS_CONTENT_PROPERTIES_T Table Type) |
| ctx | Context with which to access the path items (see DBMS_DBFS_CONTENT_CONTEXT_T Object Type) |

58.4.22 RESTOREALL Procedure

This procedure restores all soft-deleted path items meeting the path and optional filter criteria.

Syntax

```

DBMS_DBFS_CONTENT_SPI.RESTOREALL (
  store_name  IN      VARCHAR2,
  path        IN      VARCHAR2,
  filter      IN      VARCHAR2,
  ctx        IN      DBMS_DBFS_CONTENT_CONTEXT_T);

```

Parameters

Table 58-24 RESTOREALL Procedure Parameters

| Parameter | Description |
|------------|--|
| store_name | Name of store |
| path | Name of path to path items |
| filter | A filter, if any, to be applied |
| ctx | Context with which to access the path items (see DBMS_DBFS_CONTENT_CONTEXT_T Object Type) |

58.4.23 RESTOREPATH Procedure

This procedure restores all soft-deleted path items that match the given path and optional filter criteria.

Syntax

```

DBMS_DBFS_CONTENT_SPI.RESTOREPATH (
  store_name  IN      VARCHAR2,
  path        IN      VARCHAR2,

```

```

filter      IN      VARCHAR2,
ctx         IN      DBMS_DBFS_CONTENT_CONTEXT_T);

```

Parameters

Table 58-25 RESTOREPATH Procedure Parameters

| Parameter | Description |
|------------|--|
| store_name | Name of store |
| path | Name of path to path items |
| filter | A filter, if any, to be applied |
| ctx | Context with which to access the path items (see DBMS_DBFS_CONTENT_CONTEXT_T Object Type) |

58.4.24 SEARCH Function

This function searches for path items matching the given path and filter criteria.

Syntax

```

DBMS_DBFS_CONTENT_SPI.SEARCH (
  store_name  IN      VARCHAR2,
  path        IN      VARCHAR2,
  filter      IN      VARCHAR2,
  recurse     IN      INTEGER,
  ctx         IN      DBMS_DBFS_CONTENT_CONTEXT_T)
RETURN DBMS_DBFS_CONTENT_LIST_ITEMS_T PIPELINED;

```

Parameters

Table 58-26 LIST Function Parameters

| Parameter | Description |
|------------|--|
| store_name | Name of store |
| path | Name of path to the path items |
| filter | A filter, if any, to be applied |
| recurse | If 0, do not execute recursively. Otherwise, recursively search the contents of directories and files below the given directory. |
| ctx | Context with which to access the path items (see DBMS_DBFS_CONTENT_CONTEXT_T Object Type) |

Return Values

Path items matching the given path and filter criteria (see [DBMS_DBFS_CONTENT_LIST_ITEMS_T Table Type](#))

58.4.25 SETPATH Procedure

This procedure assigns a path name to a path item represented by contentID.

Stores and their providers that support contentID-based access and lazy path name binding also support the SETPATH Procedure that associates an existing contentID with a new path.

Note:

See *Oracle Database SecureFiles and Large Objects Developer's Guide* for further information on Rename and Move operations

Syntax

```
DBMS_DBFS_CONTENT_SPI.SETPATH (
  store_name      IN          VARCHAR2,
  contentID      IN          RAW,
  path           IN          VARCHAR2,
  properties     IN OUT NOCOPY DBMS_DBFS_CONTENT_PROPERTIES_T,
  ctx            IN          DBMS_DBFS_CONTENT_CONTEXT_T);
```

Parameters

Table 58-27 SETPATH Procedure Parameters

| Parameter | Description |
|------------|--|
| store_name | Name of the store |
| contentID | Unique identifier for the item to be associated |
| path | Name of path to path item |
| properties | One or more properties and their values to be set depending on prop_flags (see DBMS_DBFS_CONTENT_PROPERTIES_T Table Type) |
| ctx | Context with which to access the path items (see DBMS_DBFS_CONTENT_CONTEXT_T Object Type) |

58.4.26 SPACEUSAGE Procedure

This procedure queries file system space usage statistics.

Providers are expected to support this subprogram for their stores and to make a best effort determination of space usage, especially if the store consists of multiple tables, indexes, LOBs, and so on.

Syntax

```
DBMS_DBFS_CONTENT_SPI.SPACEUSAGE (
  store_name      IN          VARCHAR2,
  blksize        OUT         INTEGER,
  tbytes         OUT         INTEGER,
  fbytes         OUT         INTEGER,
```

```
nfile      OUT      INTEGER,
ndir       OUT      INTEGER,
nlink      OUT      INTEGER,
nref       OUT      INTEGER);
```

Parameters

Table 58-28 SPACEUSAGE Procedure Parameters

| Parameter | Description |
|------------|---|
| store_name | Name of store |
| blksize | Natural tablespace blocksize that holds the store. If multiple tablespaces with different blocksizes are used, any valid blocksize is acceptable. |
| tbytes | Total size of the store in bytes computed over all segments that comprise the store |
| fbytes | Free or unused size of the store in bytes computed over all segments that comprise the store |
| nfile | Number of currently available files in the store |
| ndir | Number of currently available directories in the store |
| nlink | Number of currently available links in the store |
| nref | Number of currently available references in the store |

Usage Notes

- A space usage query on the top-level root directory returns a combined summary of the space usage of all available distinct stores under it (if the same store is mounted multiple times, it is still counted only once).
- Since database objects are dynamically expandable, it is not easy to estimate the division between "free" space and "used" space.

58.4.27 UNLOCKPATH Procedure

This procedure unlocks path items that were previously locked with the LOCKPATH Procedure.

Syntax

```
DBMS_DBFS_CONTENT_SPI.UNLOCKPATH (
  store_name  IN    VARCHAR2,
  path        IN    VARCHAR2,
  who         IN    VARCHAR2,
  waitForRowLock IN  INTEGER,
  ctx         IN    DBMS_DBFS_CONTENT_CONTEXT_T);
```

Parameters

Table 58-29 UNLOCKPATH Procedure Parameters

| Parameter | Description |
|------------|---------------|
| store_name | Name of store |

Table 58-29 (Cont.) UNLOCKPATH Procedure Parameters

| Parameter | Description |
|----------------|--|
| path | Name of path to the path items |
| who | Transaction identifier that has locked the path |
| waitForRowLock | Determines if a row is locked by a transaction or not |
| ctx | Context with which to access the path items (see DBMS_DBFS_CONTENT_CONTEXT_T Object Type) |

Related Topics

- [LOCKPATH Procedure](#)
This procedure applies user-level locks to the given valid path name (subject to store feature support), and optionally associates user-data with the lock.

DBMS_DBFS_HS

The Oracle Database File System Hierarchical Store is implemented in the `DBMS_DBFS_HS` package. This package provides users the ability to use tape or Amazon S3 Web service as a storage tier when doing Information Lifecycle Management for their database tables.

This chapter contains the following topics:

- [Overview](#)
- [Security Model](#)
- [Constants](#)
- [Operational Notes](#)
- [Summary of DBMS_DBFS_HS Subprograms](#)

See Also:

- *Oracle Database SecureFiles and Large Objects Developer's Guide*

59.1 DBMS_DBFS_HS Overview

The `DBMS_DBFS_HS` package is a service provider underneath the `DBMS_DBFS_CONTENT` package that enables use of tape or Amazon S3 Web service as storage for data.

The data on tape or Amazon S3 Web service is part of the Oracle Database and can be accessed through all standard interfaces, but only through the database. The package allows users to use tape or Amazon S3 Web service as a storage tier when doing Information Lifecycle Management of their content.

The package initially stores all content files in level-1 cache. As the level-1 cache fills up, content files are moved to level-2 cache and then to an external storage device using bulk writes.

59.2 DBMS_DBFS_HS Security Model

The `DBMS_DBFS_HS` package runs with invoker's rights.

59.3 DBMS_DBFS_HS Constants

The `DBMS_DBFS_HS` package uses the constants shown in the tables in this topic.

Table 59-1 DBMS_DBFS_HS Constants - Used by the CREATESTORE Procedure

| Constant | Type | Value | Description |
|--------------------|--------------|-----------|---|
| STORETYPE_TAPE | VARCHAR2(50) | 'HS_TAPE' | Use tape as a storage tier |
| STORETYPE_AMAZONS3 | VARCHAR2(50) | 'HS_S3' | Use Amazon S3 Web service as a storage tier |

Table 59-2 DBMS_DBFS_HS Constants - Used by the SETSTOREPROPERTY Procedure and the GETSTOREPROPERTY Function

| Constant | Type | Value | Description |
|----------------------------|--------------|---------------------|--|
| PROPNAME_BUCKET | VARCHAR2(50) | 'BUCKET' | <p>Specifies the AWS bucket to be used as a storage tier by the Hierarchical Store.</p> <p>Restrictions on bucket name are:</p> <ol style="list-style-type: none"> 1) Bucket names can only contain lowercase letters, numbers, periods (.) and dashes(-). Note that underscores (_) are invalid. 2) Bucket names must start with a number or letter. 3) Bucket names cannot be in an IP address style (192.168.5.4). 4) Bucket names must be between 3 and 63 characters long. 5) Bucket names should not end with a dash. 6) Dashes cannot appear next to periods. For example, my-.bucket.com is invalid. |
| PROPNAME_CACHE_SIZE | VARCHAR2(50) | 'CACHE_SIZE' | <p>Specifies the cumulative cache size used for the Hierarchical Store. This property is set by the CREATESTORE Procedure and can be modified by the RECONFIGCACHE Procedure. It cannot be modified by the SETSTOREPROPERTY Procedure, though its value can be queried by the GETSTOREPROPERTY Function.</p> |
| PROPNAME_COMPRESSION_LEVEL | VARCHAR2(50) | 'COMPRESSION_LEVEL' | <p>Use to enable compression of files stored in the DBFS hierarchical store. It specifies the compression level to be used for compressing the files</p> |

Table 59-2 (Cont.) DBMS_DBFS_HS Constants - Used by the SETSTOREPROPERTY Procedure and the GETSTOREPROPERTY Function

| Constant | Type | Value | Description |
|------------------------------------|---------------|--------------------------------|---|
| PROPNAME_ENABLE CLEANUPONDELETE | VARCHAR2 (50) | 'ENABLE_CLEAN UP_ON_DELETE' | If this property is set to 'TRUE', whenever the user invokes the DELETEFILE Procedure in the DBMS_DBFS_CONTENT interface on a file residing in the DBMS_DBFS_HS store, the DBMS_DBFS_HS removes the file on the external storage that contains this user file, provided that the file has no other useful data. By default, the property is set to 'TRUE' for STORETYPE_AMAZONS3 and 'FALSE' for STORETYPE_TAPE . |
| PROPNAME_HTTPPR OXY | VARCHAR2 (50) | 'HTTP_PROXY' | Specifies the DNS name of the HTTP proxy, if any, that is needed to access the Amazon S3 storage service |
| PROPNAME_LICENS EID | VARCHAR2 (50) | 'LICENSE_ID' | Specifies the license ID associated with the library <code>libosbws11.so</code> . |
| PROPNAME_LOBCAC HE_QUOTA | VARCHAR2 (50) | 'LOBCACHE_QUO TA' | Specifies fraction of the <code>cache_size</code> which is allocated for level 1 cache. The default value of this parameter is <code>NULL</code> which means that 0.8 (= 80%) of the <code>cache_size</code> is used for level 1 cache. This property cannot be modified by the SETSTOREPROPERTY Procedure though its value can be queried by the GETSTOREPROPERTY Function . Its value is set by CREATESTORE Procedure and can be modified by the RECONFIGCACHE Procedure . |
| PROPNAME_MEDIAP OOL | VARCHAR2 (50) | 'MEDIA_POOL' | Specifies the media pool number to use for storing the content |
| PROPVAL_COMPLVL _NONE | VARCHAR2 (50) | 'NONE' | Indicates no compression |
| PROPVAL_COMPLVL _LOW | VARCHAR2 (50) | 'LOW' | Use to set the compression level to <code>LOW</code> . This is expected to have the best performance while still providing a good compression ratio. |
| PROPVAL_COMPLVL _MEDIUM | VARCHAR2 (50) | 'MEDIUM' | Use to set the compression level to <code>MEDIUM</code> . This compression level is expected to provide better compression ratio than <code>LOW</code> but the time required for compression will be higher than compression level <code>LOW</code> . |

Table 59-2 (Cont.) DBMS_DBFS_HS Constants - Used by the SETSTOREPROPERTY Procedure and the GETSTOREPROPERTY Function

| Constant | Type | Value | Description |
|-------------------------|--------------|------------------------|---|
| PROPVAL_COMPLVL_HIGH | VARCHAR2(50) | 'HIGH' | Use to set the compression level to HIGH. This compression level is expected to provide the best compression ratio but compression time will in general be highest among the 3 compression levels. |
| PROPNAME_OPTTARBALLSIZE | VARCHAR2(50) | 'OPTIMAL_TARBALL_SIZE' | Specifies <code>optimal_tarball_size</code> as the maximum possible size of an archive file. Multiple content files are bundled together into one archive file and then the archive file is transferred to tape or Amazon S3. This is because creating one file on tape or Amazon S3 for every content file in the store is a prohibitively expensive operation. This property cannot be modified by the SETSTOREPROPERTY Procedure though its value can be queried by the GETSTOREPROPERTY Function . Its value is set by CREATESTORE Procedure and can be modified by the RECONFIGCACHE Procedure . |
| PROPNAME_READCHUNKSIZE | VARCHAR2(50) | 'READ_CHUNK_SIZE' | Specifies the size used by the SBT protocol to transfer data from tape or S3. This chunk is allocated in memory per transaction for retrieval of content files from an archive store, so the value of this property should be conservative. The default size of 1MB is typically good for most users. |
| PROPNAME_S3HOST | VARCHAR2(50) | 'S3_HOST' | Specifies the <code>HOST</code> name of the Amazon S3 storage service. It must be <code>s3.amazonaws.com</code> . |
| PROPNAME_SBT_LIBRARY | VARCHAR2(50) | 'SBT_LIBRARY' | Specifies the path of the shared library used by RMAN to communicate with Amazon S3. It is named <code>libosbws11.so</code> and is available in <code>rdbms/lib</code> directory. |
| PROPNAME_STREAMABLE | VARCHAR2(50) | 'STREAMABLE' | Indicates whether buffer-based <code>PUT</code> or <code>GET</code> should be done on this store. Valid values for are <code>TRUE</code> and <code>FALSE</code> . The default value of this property is <code>TRUE</code> . |

Table 59-2 (Cont.) DBMS_DBFS_HS Constants - Used by the SETSTOREPROPERTY Procedure and the GETSTOREPROPERTY Function

| Constant | Type | Value | Description |
|----------------------------|--------------|--------------------|--|
| PROPNAME_WALLET | VARCHAR2(50) | 'WALLET' | <p>The value of this property should be of the form:</p> <pre>LOCATION=file:filename CREDENTIAL_ALIAS=access/secret_alias PROXY_AUTH_ALIAS=proxyusername/password alias</pre> <p>Defines the Oracle Wallet which contains the credentials of the Amazon S3 account associated with the store under consideration.</p> <p>LOCATION: The directory path that contains the Oracle wallet. The format is <code>file:directory-path</code></p> <p>The format of <code>wallet_path</code> in Windows is, for example:</p> <pre>file:c:\WINNT\Profiles\username\WALLETS</pre> <p>In UNIX or Linux it is, for example:</p> <pre>file:/home/username/wallets</pre> <p>When the package is executed in the Oracle database server, the wallet is accessed from the database server.</p> <p>PASSWORD: Defines the wallet password. If auto-login is enabled in wallet (this can be changed using the OWM utility), this parameter does not have to be specified. By default, the <code>mkstore</code> utility enables auto-login.</p> <p>CREDENTIAL_ALIAS: Defines the credential alias for <code>ACCESS_KEY</code> and <code>SECRET_KEY</code></p> |
| PROPNAME_WRITEC HUNKSIZ | VARCHAR2(50) | 'WRITE_CHUNK_SIZE' | <p>Specifies the size used by the SBT protocol to transfer data to tape or S3.</p> <p>This chunk is allocated in memory per transaction for <code>PUT</code> of Content Files to an archive store so the value should be conservative.</p> <p>The default size of 1MB is typically good for most users.</p> |

Table 59-3 DBMS_DBFS_HS Constants - Used by the REGISTERSTORECOMMAND Function

| Constant | Type | Value | Description |
|------------|--------|-------|---|
| BEFORE_PUT | NUMBER | '1' | Specified operation must be performed before writing a <code>SECUREFILE</code> to the remote store |
| BEFORE_GET | NUMBER | '2' | Specified operation must be performed before a retrieval operation such as reading a <code>SECUREFILE</code> from the remote device |

Table 59-4 DBMS_DBFS_HS Constants - Failure/Success/Error

| Constant | Type | Value | Description |
|----------|--------|-------|--|
| FAIL | NUMBER | '0' | Procedure or function did not execute successfully |
| SUCCESS | NUMBER | '1' | Procedure or function completed successfully |
| ERROR | NUMBER | '2' | Procedure or function returned an error |

59.4 DBMS_DBFS_HS Operational Notes

When the `DBMS_DBFS_HS` package is executed in the Oracle database server, the wallet is accessed from the database server.

59.5 Summary of DBMS_DBFS_HS Subprograms

This table lists and describes the subprograms in the `DBMS_DBFS_HS` package.

Table 59-5 DBMS_DBFS_HS Package Subprograms

| Subprogram | Description |
|--|---|
| CLEANUPUNUSEDBACKUPFILES Procedure | Removes files created on the external storage device that hold no currently used data |
| CREATEBUCKET Procedure | Creates an AWS bucket, associated with a store of type <code>STORETYPE_AMAZONS3</code> into which the Hierarchical Store can then move data |
| CREATESTORE Procedure | Creates a new hierarchical store |
| DEREGSTORECOMMAND Function | Removes a command that had been previously associated with a store through the RECONFIGCACHE Procedure |
| DROPSTORE Procedure | Deletes a previously created hierarchical store |
| FLUSHCACHE Procedure | Flushes (writes out) dirty contents from the level-1 cache. |
| GETSTOREPROPERTY Function | Retrieves the values of a property of a store |

Table 59-5 (Cont.) DBMS_DBFS_HS Package Subprograms

| Subprogram | Description |
|--|--|
| RECONFIGCACHE Procedure | Reconfigures the parameters of the database cache used by the store |
| REGISTERSTORECOMMAND Procedure | Registers commands for a store with the Hierarchical Store to be sent to the Media Manager for the external storage device associated with the store |
| SENDCOMMAND Procedures | Sends a command to be executed on the external storage device's Media Manager |
| SETSTOREPROPERTY Procedure | Stores properties of a store in the database |
| STOREPUSH Procedure | Pushes locally staged data to the remote storage |

59.5.1 CLEANUPUNUSEDBACKUPFILES Procedure

This procedure removes files created on the external storage device that hold no currently used data in them.

Syntax

```
DBMS_DBFS_HS.CLEANUPUNUSEDBACKUPFILES (
    store_name    IN    VARCHAR2);
```

Parameters

Table 59-6 CLEANUPUNUSEDBACKUPFILES Procedure Parameters

| Parameter | Description |
|------------|---------------|
| store_name | Name of store |

Usage Notes

- The action of removing files from external storage device can not be rolled back.
- This method can be executed periodically to clear space on the external storage device. Asynchronously deleting content from the external storage device is useful because it has minimal impact on the OLTP performance. The periodic scheduling can be accomplished using the DBMS_SCHEDULER package.

59.5.2 CREATEBUCKET Procedure

This procedure creates an AWS bucket, associated with a store of type STORETYPE_AMAZONS3 into which the Hierarchical Store can then move data.

Syntax

```
DBMS_DBFS_HS.CREATEBUCKET (
    store_name    IN    VARCHAR2);
```

Parameters

Table 59-7 CREATEBUCKET Procedure Parameters

| Parameter | Description |
|------------|---------------|
| store_name | Name of store |

Usage Notes

- The PROPNAME_BUCKET property of the store should be set before this subprogram is called.
- Once this procedure has successfully created a bucket in Amazon S3, the bucket can only be deleted using out-of-band methods, such as logging-in to S3 and deleting data (directories, files, and other items) for the bucket.

59.5.3 CREATESTORE Procedure

This procedure creates a new hierarchical store `store_name` of type `STORE_TYPE` (`STORETYPE_TAPE` or `STORETYPE_AMAZONS3`) in schema `schema_name` (defaulting to the current schema) under the ownership of the invoking session user.

Syntax

```
DBMS_DBFS_HS.CREATESTORE (
    store_name          IN    VARCHAR2,
    store_type         IN    VARCHAR2,
    tbl_name           IN    VARCHAR2,
    tbs_name           IN    VARCHAR2,
    cache_size         IN    NUMBER,
    lob_cache_quota   IN    NUMBER DEFAULT NULL,
    optimal_tarball_size IN  NUMBER DEFAULT NULL,
    schema_name        IN    VARCHAR2 DEFAULT NULL);
```

Parameters

Table 59-8 CREATESTORE Procedure Parameters

| Parameter | Description |
|-----------------|--|
| store_name | Name of store |
| store_type | STORETYPE_TAPE or STORETYPE_AMAZONS3 |
| tbl_name | Table for store entries |
| tbs_name | Tablespace for the store |
| cache_size | Amount of space used by the store to cache content in given tablespace |
| lob_cache_quota | Fraction of the cache_size which is allocated for level 1 cache. The default value of this parameter is NULL which means that 0.8 (= 80%) of the cache_size is used for level 1 cache. |

Table 59-8 (Cont.) CREATESTORE Procedure Parameters

| Parameter | Description |
|-----------------------------------|--|
| <code>optimal_tarball_size</code> | Maximum possible size of the archive file. Multiple content files are bundled together into one archive file, and then the archive file is transferred to tape or Amazon S3. This is because creating one file on tape or Amazon S3 for every content file in the store is a prohibitively expensive operation. The value of is set by default to 10GB for tape and to 100MB for Amazon S3. |
| <code>schema_name</code> | Schema for the store |

Usage Notes

`CREATESTORE ()` sets certain properties of the store to default values. The user can use the methods `SETSTOREPROPERTY ()` and `RECONFIGCACHE ()` to appropriately change the property values and to set other properties of the store.

- Store names must be unique for an owner. The same store names can be used for different stores owned by different owners.
- Once a table space has been specified to store the store's content in a database, it cannot be changed later.
- This subprogram will execute like a DDL statement, performing an automatic `COMMIT` before and after execution.
- Stores using `DBMS_DBFS_HS` must not use singleton mount. This means that the singleton parameter should be `FALSE` and the `store_mount` parameter should have a non-NULL value in a call to the `DBMS_DBFS_CONTENT.MOUNTSTORE` procedure.

59.5.4 DEREGSTORECOMMAND Function

This procedure removes a command that had been previously associated with a store through the `REGISTERSTORECOMMAND` Procedure.

Syntax

```
DBMS_DBFS_HS.DEREGSTORECOMMAND (
    store_name    IN    VARCHAR2,
    message      IN    VARCHAR2);
```

Parameters

Table 59-9 DEREGSTORECOMMAND Procedure Parameters

| Parameter | Description |
|-------------------------|----------------------------|
| <code>store_name</code> | Name of store |
| <code>message</code> | Message to be deregistered |

Usage Notes

If this subprogram successfully executes, its actions cannot be rolled back by the user. If the user wants to restore the previous state, the user must call the [REGISTERSTORECOMMAND Procedure](#).

Related Topics

- [REGISTERSTORECOMMAND Procedure](#)
This procedure registers commands for a store with the Hierarchical Store. These commands are sent to the Media Manager for the external storage device associated with the store.

59.5.5 DROPSTORE Procedure

This procedure deletes a previously created hierarchical store specified by name and owned by the invoking session user.

Syntax

```
DBMS_DBFS_HS.DROPSTORE (
    store_name IN VARCHAR2,
    opt_flags IN INTEGER DEFAULT 0);
```

Parameters

Table 59-10 DROPSTORE Procedure Parameters

| Parameter | Description |
|------------|---|
| store_name | Name of store owned by the invoking session user |
| opt_flags | User can specify optional flags. If <code>DISABLE_CLEANUPBACKUPFILES</code> is specified as one of the optional flags, the call to the CLEANUPUNUSEDBACKUPFILES Procedure is not issued. By default, when this flag is not set, the procedure implicitly cleans-up all unused backup files. |

Usage Notes

- The procedure executes like a DDL in that it auto-commits before and after its execution.
- If `CLEANUPBACKUPFILES` is disabled during the procedure, the user must resort to out-of-band techniques to cleanup unused backup files. No further invocations of `CLEANUPBACKFILES` for a dropped store are possible through hierarchical store.
- This subprogram will un-register the store from `DBMS_DBFS_CONTENT` package. All files in the given store are deleted from the store (Tape or Amazon S3 Web service). The database table holding the store's entries in the database, is also dropped by this subprogram.

59.5.6 FLUSHCACHE Procedure

This procedure flushes out dirty contents from level-1 cache, which can be locked, to level-2 cache, thereby freeing-up space in level 1 cache.

Syntax

```
DBMS_DBFS_HS.FLUSHCACHE (
    store_name    IN    VARCHAR2);
```

Parameters

Table 59-11 FLUSHCACHE Procedure Parameters

| Parameter | Description |
|------------|---------------|
| store_name | Name of store |

59.5.7 GETSTOREPROPERTY Function

This function retrieves the values of a property.

Syntax

```
DBMS_DBFS_HS.GETSTOREPROPERTY (
    store_name    IN    VARCHAR2,
    property_name IN    VARCHAR2,
    noexcp       IN    BOOLEAN DEFAULT FALSE) RETURN VARCHAR2;
```

Parameters

Table 59-12 GETSTOREPROPERTY Function Parameters

| Parameter | Description |
|---------------|---|
| store_name | Name of store |
| property_name | Name of property |
| noexcp | If set to <code>FALSE</code> , raises an exception if the property does not exist in the database. If <code>noexcp</code> is set to <code>TRUE</code> , returns <code>NULL</code> if the property does not exist. |

Return Values

The values of a property.

Usage Notes

The specified store must already have been created.

59.5.8 RECONFIGCACHE Procedure

This procedure reconfigures the parameters of the database cache being used by the store.

Syntax

```
DBMS_DBFS_HS.RECONFIGCACHE (
  store_name          IN  VARCHAR2,
  cache_size         IN  NUMBER DEFAULT NULL,
  lobcache_quota     IN  NUMBER DEFAULT NULL,
  optimal_tarball_size IN NUMBER DEFAULT NULL);
```

Parameters

Table 59-13 RECONFIGCACHE Procedure Parameters

| Parameter | Description |
|----------------------|--|
| store_name | Name of store |
| cache_size | Cumulative cache size used for the Hierarchical Store |
| lobcache_quota | Fraction of the cache size that are assigned to level 1 cache |
| optimal_tarball_size | Maximum possible size of an archive file. Since creating one file for every content file in the store is a prohibitively expensive operation, multiple content files are bundled together into one archive file for transfer to tape or Amazon S3. |

Usage Notes

- The specified store must already have been created before reconfiguration.
- The Hierarchical Store uses a level 1 cache and a level 2 cache. The level 1 cache subsumes most of the working set and the level 2 cache is used to perform bulk writes to the backend device.
- If any of the last 3 parameters is `NULL`, its value specified during store creation is used. If the parameter was `NULL` when the call to the [CREATESTORE Procedure](#) was issued, the `DBMS_DBFS_HS` package assigns a default value.

The `DBMS_DBFS_HS` package optimistically tries to allocate more than 1 tarball's worth of size for level 2 cache to facilitate concurrency, though a minimum of 1 tarball size is necessary for level 2 cache.

The values for cumulative cache size and LOB cache quota decide allocation of space for the two caches. If values are not provided, a user might see an `INSUFFICIENT_CACHE` exception. In that case, it is better to revise the cache parameters in order to have a working store.

- If this subprogram successfully executes, its actions cannot be rolled back by the user. In that case, the user should call `RECONFIGCACHE` again with new or modified parameters.

59.5.9 REGISTERSTORECOMMAND Procedure

This procedure registers commands for a store with the Hierarchical Store. These commands are sent to the Media Manager for the external storage device associated with the store.

Syntax

```
DBMS_DBFS_HS.REGISTERSTORECOMMAND (
    store_name    IN    VARCHAR2,
    message       IN    VARCHAR2,
    flags         IN    NUMBER);
```

Parameters

Table 59-14 REGISTERSTORECOMMAND Procedure Parameters

| Parameter | Description |
|------------|--|
| store_name | Name of store |
| message | Message to be sent to the Media Manager of the external store |
| flags | Valid values: <ul style="list-style-type: none"> • BEFORE_PUT CONSTANT NUMBER := 1; • BEFORE_GET CONSTANT NUMBER := 2; |

Usage Notes

- These commands are sent before the next read or write of content. When the Hierarchical Store wants to push (or get) data to (or from) the storage device, it begins a session (to communicate with the device). After beginning the session, it sends all registered commands for the to the relevant device before writing (or getting) any data.
- If this method successfully executes, its actions cannot be rolled back by the user. To restore the previous state the user must call the [DEREGSTORECOMMAND Function](#).

59.5.10 SENDCOMMAND Procedure

This procedure sends a command to be executed on the external storage device's Media Manager.

Syntax

```
DBMS_DBFS_HS.SENDCOMMAND (
    store_name    IN    VARCHAR2,
    message       IN    VARCHAR2);
```

Parameters

Table 59-15 SENDCOMMAND Procedure Parameters

| Parameter | Description |
|------------|-------------------------------|
| store_name | Name of store |
| message | Message string to be executed |

59.5.11 SETSTOREPROPERTY Procedure

This procedure stores properties of a store in the database as name-value pairs.

Syntax

```
DBMS_DBFS_HS.SETSTOREPROPERTY (
    store_name      IN      VARCHAR2,
    property_name   IN      VARCHAR2,
    property_value  IN      VARCHAR2);
```

Parameters

Table 59-16 SETSTOREPROPERTY Procedure Parameters

| Parameter | Description |
|----------------|---|
| store_name | Name of store |
| property_name | For a store using Tape device, there are three properties whose values must be set by the user, and four properties that have default values. Stores of type STORETYPE_AMAZONS3 have properties with default values. The various options for both types of stores are detailed under property_value. |
| property_value | <p>Stores using a Tape Device</p> <p>The values for the following properties must be set by the user:</p> <ul style="list-style-type: none"> PROPNAME_SBTLIBRARY - This should point to the shared library used by RMAN to communicate with the external tape device. It is usually named libobk.so. PROPNAME_MEDIAPool - Media pool number for storing content PROPNAME_CACHE_SIZE - Amount of space, in bytes, used for the cache of this store <p>The following properties, which have default values assigned to them when a store is created, benefit from tuning:</p> <ul style="list-style-type: none"> PROPNAME_READCHUNKSIZE and PROPNAME_WRITECHUNKSIZE - These are the sizes used by the SBT protocol to transfer data to and from the tapes. These chunks are allocated in memory per transaction, so the values should be conservative. The default size is 1MB. PROPNAME_STREAMABLE - Indicates whether DBFS_LINKS can perform read operations (for example SELECT or DBMS_LOB.READ) directly from the store, or if the data must be copied back into the database before it can be read PROPNAME_ENABLECLEANUPONDELETE - Indicates if DBMS_DBFS_HS should delete unused files on the external storage. Valid values for this property are 'FALSE' for STORETYPE_TAPE. PROPNAME_COMPRESSLEVEL - Describes how files written to Tape should be compressed. It can be set to PROPVAL_COMPLVL_NONE, PROPVAL_COMPLVL_LOW, PROPVAL_COMPLVL_MEDIUM or PROPVAL_COMPLVL_HIGH. By default it is set to PROPVAL_COMPLVL_NONE. |

Table 59-16 (Cont.) SETSTOREPROPERTY Procedure Parameters

| Parameter | Description |
|------------------------------------|--|
| (cont) <code>property_value</code> | <p>Stores of type STORETYPE_AMAZONS3</p> <p>It is mandatory that the following properties have assigned values, and default values are provided:</p> <ul style="list-style-type: none"> • <code>PROPNAME_SBTLIBRARY</code> - Specifies the path of the shared library used by RMAN to communicate with Amazon S3. It is named <code>libosbws11.so</code> and is available in <code>rdbms/lib</code> directory. • <code>PROPNAME_S3HOST</code> - Defines the HOST name of the Amazon S3 storage service. It must be <code>s3.amazonaws.com</code>. • <code>PROPNAME_BUCKET</code> - Defines the AWS bucket used as a storage tier by the Hierarchical Store. Restrictions on bucket names are: <ul style="list-style-type: none"> -- Bucket names can only contain lowercase letters, numbers, periods (.) and dashes (-). Use of an underscore () is invalid. -- Bucket names must start with a number or letter -- Bucket names cannot be in an IP address style ("192.168.5.4") -- Bucket names must be between 3 and 63 characters in length -- Bucket names should not end with a dash -- Dashes cannot appear next to periods. For example, "my-.bucket.com" is invalid. • <code>PROPNAME_LICENSEID</code> - Specifies the license ID associated with the library <code>libosbws11.so</code>. • <code>PROPNAME_WALLET</code> - Has the form: <pre>'LOCATION=file:<filename> CREDENTIAL_ALIAS=<access/secret_alias> PROXY_AUTH_ALIAS=<proxyusername/password alias>'</pre> <ul style="list-style-type: none"> -- <code>LOCATION</code> - Directory path that contains the Oracle wallet. The format is <code>file:directory-path</code>. See Examples for variations in format. -- <code>PASSWORD</code> - Defines the wallet password. If <code>auto-login</code> is enabled in the wallet (this can be changed using the user's own utility), and does not have to be specified. By default, the <code>mkstore</code> utility enables <code>auto-login</code>. -- <code>CREDENTIAL_ALIAS</code> - Defines the credential alias for <code>ACCESS_KEY</code> and <code>SECRET_KEY</code> -- <code>PROXY_AUTH_ALIAS</code> - Defines authentication credentials for the proxy server, if applicable. |

Table 59-16 (Cont.) SETSTOREPROPERTY Procedure Parameters

| Parameter | Description |
|---------------------------|--|
| (property_value (contd.)) | <p>The following properties are optional:</p> <ul style="list-style-type: none"> PROPNAME_HTTPPROXY - Defines the DNS name of the HTTP proxy, if any, that is needed to access the Amazon S3 storage service. PROPNAME_STREAMABLE – Indicates whether buffer-based PUT or GET operation should be done on this store. Valid values for this property are TRUE (default) and FALSE. PROPNAME_ENABLECLEANUPONDELETE - Indicates if DBMS_DBFS_HS should delete unused files on the external storage device. Default values for this property are FALSE for STORETYPE_TAPE and TRUE for STORETYPE_AMAZONS3. PROPNAME_COMPRESSLEVEL - Describes how files written to tape should be compressed. It can be set to PROPVAL_COMPLVL_NONE, PROPVAL_COMPLVL_LOW, PROPVAL_COMPLVL_MEDIUM or PROPVAL_COMPLVL_HIGH. By default it is set to PROPVAL_COMPLVL_NONE. |

Usage Notes

- The specified store must already have been created.
- If this subprogram successfully executes, its actions cannot be rolled back by the user.
- The same property can be set multiple times to the same or different values using this subprogram
- Regarding PROPNAME_ENABLECLEANUPONDELETE behavior, a job is created for each store by the DBMS_DBFS_HS to remove the unused files from the external storage. By default, the job is enabled for STORETYPE_AMAZONS3 and is disabled for STORETYPE_TAPE. If the ENABLECLEANUPONDELETE property is set to TRUE, the job is enabled; if the property is set to FALSE, the job is disabled. If enabled, the job runs at an interval of one hour by default. The DBMS_SCHEDULER package can be used to modify the schedule. The name of the job can be obtained by querying USER_DBFS_HS_FIXED_PROPERTIES for prop_name = 'DELJOB_NAME'.

Examples

Format

The format of wallet_path in Windows is, for example:

```
file:c:\WINNT\Profiles\\WALLETS
```

The format of wallet_path in UNIX or Linux is, for example:

```
file:/home/username/wallets
```

59.5.12 STOREPUSH Procedure

This procedure pushes locally staged data to the remote storage.

Syntax

```
DBMS_DBFS_HS.STOREPUSH (
    store_name IN VARCHAR2,
    path       IN VARCHAR2 DEFAULT NULL);
```

Parameters

Table 59-17 STOREPUSH Procedure Parameters

| Parameter | Description |
|------------|--|
| store_name | Name of store whose content the client writes from local cache to the external store |
| path | A non-mount qualified (without mount point) path within the store. By default, its value is <code>NULL</code> which corresponds to the root path of the store. |

Usage Notes

- The Hierarchical Store caches the content files locally in database tables. When enough content is amassed in the cache to make it efficient to write to the external storage device (or the cache is completely filled), the Hierarchical Store creates a tarball out of the local content and writes these tarballs as files on the external device. The size of the tarball created by the Hierarchical Store is controlled by the store property `PROPNAME_OPTTARBALLSIZE`.
- When the amount of free space in the cache is such that the caching of a content file will push the space used above `cache_size`, the Hierarchical Store will internally call `STOREPUSH`. The `STOREPUSH` Procedure creates tarball(s) out of the existing dirty or modified content files in the cache and writes them out to the external device. A `STOREPUSH` call is not guaranteed to write all the dirty content from local cache to the external storage, since some files may be locked by other sessions.
- `STOREPUSH` has a built-in ability feature allowing it to automatically resume operation. If a `STOREPUSH` call is interrupted (say by a network outage) after it has transferred some tarballs to the external device, it can be restarted after the outage and will then resume transferring data from the point it was interrupted. In other words, work done before the outage is not lost. `STOREPUSH` can safely be restarted and the effect is such as if the outage never occurred.
- If this method successfully executes, its actions cannot be rolled back by the user.
- By default, when `path` is `NULL`, all files in the store are candidates for `STOREPUSH`. If `path` has a valid input value, all files which are under the namespace of given path are written from the local cache to the external store. If a given path is an existing file, it is pushed out again to the remote store.

DBMS_DBFS_SFS

The `DBMS_DBFS_SFS` package provides an interface to operate a SecureFile-based store (SFS) for the content interface described in the `DBMS_DBFS_CONTENT` package.

This chapter contains the following topics:

- [Overview](#)
- [Security Model](#)
- [Constants](#)
- [Summary of DBMS_DBFS_SFS Subprograms](#)

See Also:

Oracle Database SecureFiles and Large Objects Developer's Guide

60.1 DBMS_DBFS_SFS Overview

The `DBMS_DBFS_SFS` package is a sample implementation of a package that implements and extends the `DBMS_DBFS_CONTENT_SFI` interface. It provides a POSIX-compliant file system stored in the RDBMS.

60.2 DBMS_DBFS_SFS Security Model

The `DBMS_DBFS_SFS` package runs with `AUTHID CURRENT_USER`.

60.3 DBMS_DBFS_SFS Constants

The `DBMS_DBFS_SFS` package uses the constants shown in the following tables.

Note:

Oracle has deprecated the older encryptions and hashing algorithms. The deprecated algorithms for `DBMS_CRYPTO` and native network encryption include MD4, MD5, DES, 3DES, and RC4-related algorithms as well as 3DES for Transparent Data Encryption (TDE). Removing older, less secure cryptography algorithms prevents accidental use of these algorithms. To meet your security requirements, Oracle recommends that you use more modern cryptography algorithms, such as the Advanced Encryption Standard (AES).

- [Table 60-1](#)

- [Table 60-2](#)
- [Table 60-3](#)
- [Table 60-4](#)

Table 60-1 DBMS_DBFS_SFS Constants - Compression Levels

| Constant | Type | Value | Description |
|---------------------|---------------|----------|--|
| COMPRESSION_DEFAULT | VARCHAR2 (32) | ' ' | Use the default SecureFile compression level |
| COMPRESSION_LOW | VARCHAR2 (32) | 'LOW' | Use compression level 'LOW' |
| COMPRESSION_MEDIUM | VARCHAR2 (32) | 'MEDIUM' | Use compression level 'MEDIUM' |
| COMPRESSION_HIGH | VARCHAR2 (32) | 'HIGH' | Use compression level 'HIGH' |

Table 60-2 DBMS_DBFS_SFS Constants - Used by the encryption Parameter

| Constant | Type | Value | Description |
|--------------------|---------------|----------|---|
| ENCRYPTION_DEFAULT | VARCHAR2 (32) | ' ' | Use the default SecureFile encryption algorithm |
| ENCRYPTION_AES128 | VARCHAR2 (32) | 'AES128' | Use encryption AES 128 bit |
| ENCRYPTION_AES192 | VARCHAR2 (32) | 'AES192' | Use encryption AES 192 bit |
| ENCRYPTION_AES256 | VARCHAR2 (32) | 'AES256' | Use encryption AES 256 bit |

Table 60-3 DBMS_DBFS_SFS Constants - Used by the npartitions Parameter

| Constant | Type | Value | Description |
|--------------------|---------|-------|--------------------------|
| DEFAULT_PARTITIONS | INTEGER | 16 | Default to 16 partitions |

Table 60-4 DBMS_DBFS_SFS Constants - Used by the partition_key Parameter

| Constant | Type | Value | Description |
|-------------------|---------|-------|---|
| PARTITION_BY_ITEM | INTEGER | 1 | Use a hash of the item name for the partition key |
| PARTITION_BY_PATH | INTEGER | 2 | Use a hash of the path name for the partition key |
| PARTITION_BY_GUID | INTEGER | 3 | Use a hash of the GUID as the partition key |

60.4 Summary of DBMS_DBFS_SFS Subprograms

This table lists and describes the DBMS_DBFS_SFS Package subprograms.

Table 60-5 DBMS_DBFS_SFS Package Subprograms

| Subprogram | Description |
|--|---------------------------------------|
| CREATEFILESYSTEM Procedure | Creates a file system store |
| CREATESTORE Procedure | Creates a new DBFS SFS store |
| DROPFILERYSTEM Procedures | Drops the DBFS SFS store |
| INITFS Procedure | Initializes a POSIX file system store |

60.4.1 CREATEFILESYSTEM Procedure

This procedure creates a file system store.

Syntax

```
DBMS_DBFS_SFS.CREATEFILESYSTEM (
  store_name          IN      VARCHAR2,
  schema_name        IN      VARCHAR2  DEFAULT NULL,
  tbl_name           IN      VARCHAR2  DEFAULT NULL,
  tbl_tbs            IN      VARCHAR2  DEFAULT NULL,
  lob_tbs            IN      VARCHAR2  DEFAULT NULL,
  use_bf             IN      BOOLEAN   DEFAULT FALSE,
  properties         IN      DBMS_DBFS_CONTENT_PROPERTIES_T DEFAULT NULL,
  create_only        IN      BOOLEAN   FALSE,
  use_objects        IN      BOOLEAN   DEFAULT FALSE,
  with_grants        IN      BOOLEAN   DEFAULT FALSE,
  do_dedup           IN      BOOLEAN   DEFAULT FALSE,
  do_compress        IN      BOOLEAN   DEFAULT FALSE,
  compression        IN      VARCHAR2  DEFAULT COMPRESSION_DEFAULT,
  do_encrypt         IN      BOOLEAN   DEFAULT FALSE,
  encryption         IN      VARCHAR2  DEFAULT ENCRYPTION_DEFAULT,
  do_partition       IN      BOOLEAN   DEFAULT FALSE,
  npartitions        IN      NUMBER    DEFAULTDEFAULT_PARTITIONS,
  partition_key      IN      NUMBER    DEFAULT PARTITION_BY_ITEM,
  partition_guidi    IN      BOOLEAN   DEFAULT FALSE,
  partition_pathi    IN      BOOLEAN   DEFAULT FALSE,
  partition_prop     IN      BOOLEAN   DEFAULT TRUE);
```

Parameters

Table 60-6 CREATEFILESYSTEM Procedure Parameters

| Parameter | Description |
|-------------|--|
| store_name | Name of store |
| schema_name | Schema for the store, defaulting to the current schema |
| tbl_name | Table for store entries. If not specified, an internally generated name is used. |
| tbl_tb | Tablespace for the store, defaulting to the schema's default tablespace |
| lob_tbs | Tablespace in which to create the LOB segment. It defaults to the user's default tablespace. |
| use_bf | If TRUE, a BasicFile LOB is used; otherwise a SecureFile LOB is used. |

Table 60-6 (Cont.) CREATEFILESYSTEM Procedure Parameters

| Parameter | Description |
|-----------------|--|
| properties | Table of (name, value, typecode) tuples used to configure the store properties. Currently no such properties are defined or used. |
| create_only | If TRUE, the file system is created, but not registered with the current user |
| use_objects | If TRUE, a single base-table with an object-type column (using a nested table) is created to backup the new file system. Otherwise, a pair of (parent, child) tables is used to backup the file system. In both cases, the object type nested table or the child table is used only for user-defined properties. |
| with_grants | If TRUE, DML and query access permissions are granted to the DBFS_ROLE as part of creating the file system. Otherwise, explicit grants (or existing permissions) are required to access the file system. |
| do_dedup | If TRUE, do deduplication the underlying SecureFile column |
| do_compress | If TRUE, do compression the underlying SecureFile column |
| compression | Compression algorithm to use (see Table 60-1) |
| do_encrypt | If TRUE, encrypt the underlying SecureFile column |
| encryption | encryption algorithm to use (see Table 60-2) |
| do_partition | If TRUE, partition the table used for storage |
| npartitions | Number of partitions to create for the table (see Table 60-3). |
| partition_key | How to partition the table: by item name, by path name, or by GUID (see Table 60-4). |
| partition_guidi | If TRUE, build an index on GUID |
| partition_pathi | If TRUE, build an index on path name |
| partition_prop | If TRUE, partition the properties table |

Usage Notes

The procedure executes like a DDL in that it auto-commits before and after its execution.

60.4.2 CREATESTORE Procedure

This procedure creates a new DBFS SFS store owned by the invoking session user.

Syntax

```
DBMS_DBFS_SFS.CREATESTORE (
    store_name      IN      VARCHAR2,
    tbl_name       IN      VARCHAR2  DEFAULT NULL,
    tbs_name       in      VARCHAR2  DEFAULT NULL,
    use_bf         in      BOOLEAN   DEFAULT FALSE,
    stgopts        in      VARCHAR2  DEFAULT '');
```

Parameters

Table 60-7 CREATESTORE Procedure Parameters

| Parameter | Description |
|------------|---|
| store_name | Name of store |
| store_type | STORETYPE_TAPE or STORETYPE_AMAZONS3 |
| tbl_name | Placeholder for the store content cached in database |
| tbs_name | Named tablespace |
| use_bf | If TRUE, a BasicFile LOB is used; otherwise a SecureFile LOB is used. |
| stgopts | Currently non-operational, reserved for future use |

60.4.3 DROPFILESYSTEM Procedures

This procedure drops the DBFS SFS store, purging all dictionary information associated with the store, and dropping the underlying file system table.

Syntax

```
DBMS_DBFS_SFS.DROPFILESYSTEM (
  schema_name  IN      VARCHAR2 DEFAULT NULL,
  tbl_name     IN      INTEGER);

DBMS_DBFS_SFS.DROPFILESYSTEM (
  store_name   IN      VARCHAR2);
```

Parameters

Table 60-8 DROPFILESYSTEM Procedure Parameters

| Parameter | Description |
|-------------|--------------------|
| schema_name | Name of schema |
| tbl_name | Name of tablespace |
| store_name | Name of store path |

Usage Notes

- If the specified store table is registered by the current user, it will be unregistered from the content interface described in the `DBMS_DBFS_CONTENT` package and the POSIX metadata tables.
- Subsequent to unregistration, an attempt will be made to store table(s). This operation may fail if other users are currently using this store table.
- The user attempting a drop of the tables underlying the store must actually have the privileges to complete the drop operation (either as the owner of the tables, or as a sufficiently privileged user for cross-schema operations).
- The procedure executes like a DDL in that it auto-commits before and after its execution.

60.4.4 INITFS Procedure

This procedure initialize a POSIX file system store. The table associated with the POSIX file system store `store_name` is truncated and reinitialized with a single "root" directory entry.

Syntax

```
DBMS_DBFS_SFS.INITFS (  
    store_name      IN      VARCHAR2);
```

Parameters

Table 60-9 INITFS Procedure Parameters

| Parameter | Description |
|-------------------------|---------------|
| <code>store_name</code> | Name of store |

Usage Notes

The procedure executes like a DDL in that it auto-commits before and after its execution.

61

DBMS_DDL

This package provides access to some SQL data definition language (DDL) statements from stored procedures. It also provides special administration operations that are not available as Data Definition Language statements (DDLs).

This chapter contains the following topics:

- [Deprecated Subprograms](#)
- [Security Model](#)
- [Operational Notes](#)
- [Summary of DBMS_DDL Subprograms](#)

61.1 DBMS_DDL Deprecated Subprograms

Oracle recommends that you do not use deprecated subprograms in new applications. Support for deprecated features is for backward compatibility only.

The following subprograms are deprecated with release Oracle Database 10g:

- [ALTER_COMPILE Procedure](#)

61.2 DBMS_DDL Security Model

This package runs with the privileges of the calling user, rather than the package owner `SYS`.

61.3 DBMS_DDL Operational Notes

The `ALTER_COMPILE` procedure commits the current transaction, performs the operation, and then commits again.

61.4 Summary of DBMS_DDL Subprograms

This table lists the `DBMS_DDL` subprograms in alphabetical order and briefly describes them.

Table 61-1 *DBMS_DDL Package Subprograms*

| Subprogram | Description |
|---|----------------------------|
| ALTER_COMPILE Procedure | Compiles the PL/SQL object |
| ALTER_TABLE_NOT_REFERENCEABLE Procedure | Reorganizes object tables |
| ALTER_TABLE_REFERENCEABLE Procedure | Reorganizes object tables |

Table 61-1 (Cont.) DBMS_DDL Package Subprograms

| Subprogram | Description |
|--|--|
| CREATE_WRAPPED Procedures | Takes as input a single CREATE OR REPLACE statement that specifies creation of a PL/SQL package specification, package body, function, procedure, type specification or type body, generates a CREATE OR REPLACE statement with the PL/SQL source text obfuscated and executes the generated statement |
| IS_TRIGGER_FIRE_ONCE Function | Returns TRUE if the specified DML or DDL trigger is set to fire once. Otherwise, returns FALSE |
| SET_TRIGGER_FIRING_PROPERTY Procedures | Sets the specified DML or DDL trigger's firing property |
| WRAP Functions | Takes as input a CREATE OR REPLACE statement that specifies creation of a PL/SQL package specification, package body, function, procedure, type specification or type body and returns a CREATE OR REPLACE statement where the text of the PL/SQL unit has been obfuscated |

61.4.1 ALTER_COMPILE Procedure

This procedure is equivalent to the SQL statement: ALTER PROCEDURE|FUNCTION|PACKAGE [<schema>.] <name> COMPILE [BODY]

Note:

This procedure is deprecated in Oracle Database 10g Release 2 (10.2). While the procedure remains available in the package for reasons of backward compatibility, Oracle recommends using the DDL equivalent in a dynamic SQL statement.

Syntax

```
DBMS_DDL.ALTER_COMPILE (
    type          VARCHAR2,
    schema        VARCHAR2,
    name          VARCHAR2
    reuse_settings BOOLEAN := FALSE);
```

Parameters

Table 61-2 ALTER_COMPILE Procedure Parameters

| Parameter | Description |
|-----------|--|
| type | Must be either PROCEDURE, FUNCTION, PACKAGE, PACKAGE BODY or TRIGGER |
| schema | Schema name If NULL, then use current schema (case-sensitive) |

Table 61-2 (Cont.) ALTER_COMPILE Procedure Parameters

| Parameter | Description |
|----------------|---|
| name | Name of the object (case-sensitive) |
| reuse_settings | Indicates whether the session settings in the objects should be reused, or whether the current session settings should be adopted instead |

Exceptions**Table 61-3 ALTER_COMPILE Procedure Exceptions**

| Exception | Description |
|------------|--|
| ORA-20000: | Insufficient privileges or object does not exist |
| ORA-20001: | Remote object, cannot compile |
| ORA-20002: | Bad value for object type: should be either PACKAGE, PACKAGE BODY, PROCEDURE, FUNCTION, or TRIGGER |

61.4.2 ALTER_TABLE_NOT_REFERENCEABLE Procedure

This procedure alters the given object table `table_schema.table_name` so it becomes not the default referenceable table for the schema `affected_schema`.

This is equivalent to SQL:

```
ALTER TABLE [<table_schema>.<table_name>] NOT REFERENCEABLE FOR <affected_schema>
```

which is currently not supported or available as a DDL statement.

Syntax

```
DBMS_DDL.ALTER_TABLE_NOT_REFERENCEABLE (
    table_name      IN          VARCHAR2,
    table_schema    IN DEFAULT  NULL,
    affected_schema IN DEFAULT  NULL);
```

Parameters**Table 61-4 ALTER_TABLE_NOT_REFERENCEABLE Procedure Parameters**

| Parameter | Description |
|-----------------|---|
| table_name | Name of the table to be altered. Cannot be a synonym. Must not be NULL. Case sensitive. |
| table_schema | Name of the schema owning the table to be altered. If NULL then the current schema is used. Case sensitive. |
| affected_schema | Name of the schema affected by this alteration. If NULL then the current schema is used. Case sensitive. |

Usage Notes

This procedure simply reverts for the affected schema to the default table referenceable for PUBLIC; that is., it simply undoes the previous ALTER_TABLE_REFERENCEABLE call for this specific schema. The affected schema must a particular schema (cannot be PUBLIC).

The user that executes this procedure must own the table (that is, the schema is the same as the user), and the affected schema must be the same as the user.

If the user executing this procedure has ALTER ANY TABLE and SELECT ANY TABLE and DROP ANY TABLE privileges, the user doesn't have to own the table and the affected schema can be any valid schema.

61.4.3 ALTER_TABLE_REFERENCEABLE Procedure

This procedure alters the given object table table_schema.table_name so it becomes the referenceable table for the given schema affected_schema.

This is equivalent to SQL:

```
ALTER TABLE [<table_schema>.<table_name>] REFERENCEABLE FOR <affected_schema>
```

which is currently not supported or available as a DDL statement.

Syntax

```
DBMS_DDL.ALTER_TABLE_REFERENCEABLE
    table_name      IN  VARCHAR2,
    table_schema    IN  DEFAULT NULL,
    affected_schema IN  DEFAULT NULL);
```

Parameters

Table 61-5 ALTER_TABLE_REFERENCEABLE Procedure Parameters

| Parameter | Description |
|-----------------|---|
| table_name | Name of the table to be altered. Cannot be a synonym. Must not be NULL. Case sensitive. |
| table_schema | Name of the schema owning the table to be altered. If NULL then the current schema is used. Case sensitive. |
| affected_schema | Name of the schema affected by this alteration. If NULL then the current schema is used. Case sensitive. |

Usage Notes

When you create an object table, it automatically becomes referenceable, unless you use the OID AS clause when creating the table. The OID AS clause makes it possible for you to create an object table and to assign to the new table the same EOID as another object table of the same type. After you create a new table using the OID AS clause, you end up with two object table with the same EOID; the new table is not referenceable, the original one is. All references that used to point to the objects in the original table still reference the same objects in the same original table.

If you execute this procedure on the new table, it makes the new table the referenceable table replacing the original one; thus, those references now point to the objects in the new table instead of the original table.

61.4.4 CREATE_WRAPPED Procedures

The procedure takes as input a single `CREATE OR REPLACE` statement that specifies creation of a PL/SQL package specification, package body, function, procedure, type specification or type body. It then generates a `CREATE OR REPLACE` statement with the PL/SQL source text obfuscated and executes the generated statement. In effect, this procedure bundles together the operations of wrapping the text and creating the PL/SQL unit.

See Also:

[WRAP Functions](#)

This procedure has 3 overloads. Each of the three functions provides better performance than using a combination of individual [WRAP Functions](#) and `DBMS_SQL.PARSE` (or `EXECUTE IMMEDIATE`) calls. The different functionality of each form of syntax is presented with the definition.

Syntax

Is a shortcut for `EXECUTE IMMEDIATE SYS.DBMS_DDL.WRAP(ddl)`:

```
DBMS_DDL.CREATE_WRAPPED (
    ddl    VARCHAR2);
```

Is a shortcut for `DBMS_SQL.PARSE(cursor, SYS.DBMS_DDL.WRAP (input, lb, ub))`:

```
DBMS_DDL.CREATE_WRAPPED (
    ddl    DBMS_SQL.VARCHAR2A,
    lb     PLS_INTEGER,
    ub     PLS_INTEGER);
```

Is a shortcut for `DBMS_SQL.PARSE(cursor, SYS.DBMS_DDL.WRAP (input, lb, ub))`:

```
DBMS_DDL.CREATE_WRAPPED (
    ddl    DBMS_SQL.VARCHAR2S,
    lb     PLS_INTEGER,
    ub     PLS_INTEGER);
```

Parameters

Table 61-6 CREATE_WRAPPED Procedure Parameters

| Parameter | Description |
|-----------|--|
| ddl | A <code>CREATE OR REPLACE</code> statement that specifies creation of a PL/SQL package specification, package body, function, procedure, type specification or type body |
| lb | Lower bound for indices in the string table that specify the <code>CREATE OR REPLACE</code> statement |

Table 61-6 (Cont.) CREATE_WRAPPED Procedure Parameters

| Parameter | Description |
|-----------|---|
| ub | Upper bound for indices in the string table that specify the CREATE OR REPLACE statement. |

Usage Notes

- The CREATE OR REPLACE statement is executed with the privileges of the user invoking DBMS_DDL.CREATE_WRAPPED.
- Any PL/SQL code that attempts to call these interfaces should use the fully qualified package name SYS.DBMS_DDL to avoid the possibility that the name DBMS_DDL is captured by a locally-defined unit or by redefining the DBMS_DDL public synonym.
- Each invocation of any accepts only a single PL/SQL unit. By contrast, the PL/SQL wrap utility accepts a entire SQL*Plus file and obfuscates the PL/SQL units within the file leaving all other text as-is. These interfaces are intended to be used in conjunction with or as a replacement for PL/SQL's dynamic SQL interfaces (EXECUTE IMMEDIATE and DBMS_SQL.PARSE). Since these dynamic SQL interfaces only accept a single unit at a time (and do not understand the SQL*Plus "/" termination character), both the CREATE_WRAPPED Procedures and the WRAP Functions require input to be a single unit.

Exceptions

ORA-24230: If the input is not a CREATE OR REPLACE statement specifying a PL/SQL unit, exception DBMS_DDL.MALFORMED_WRAP_INPUT is raised.

Examples

```
DECLARE
    ddl VARCHAR2(32767);
BEGIN
    ddl := GENERATE_PACKAGE(...);
    SYS.DBMS_DDL.CREATE_WRAPPED(ddl); -- Instead of EXECUTE IMMEDIATE ddl
END;
```

61.4.5 IS_TRIGGER_FIRE_ONCE Function

This function returns TRUE if the specified DML or DDL trigger is set to fire once. Otherwise, it returns FALSE.

A fire once trigger fires in a user session but does not fire in the following cases:

- For changes made by a Streams apply process
- For changes made by executing one or more Streams apply errors using the EXECUTE_ERROR or EXECUTE_ALL_ERRORS procedure in the DBMS_APPLY_ADM package
- For changes made by a Logical Standby apply process

Note:

Only DML and DDL triggers can be fire once. All other types of triggers always fire.

See Also:

"SET_TRIGGER_FIRING_PROPERTY Procedures"

Syntax

```
DBMS_DDL.IS_TRIGGER_FIRE_ONCE
    trig_owner      IN VARCHAR2,
    trig_name       IN VARCHAR2)
RETURN BOOLEAN;
```

Parameters

Table 61-7 IS_TRIGGER_FIRE_ONCE Function Parameters

| Parameter | Description |
|------------|-------------------|
| trig_owner | Schema of trigger |
| trig_name | Name of trigger |

61.4.6 SET_TRIGGER_FIRING_PROPERTY Procedures

This procedure sets the specified DML or DDL trigger's firing property whether or not the property is set for the trigger.

Use this procedure to control a DML or DDL trigger's firing property for changes:

- Applied by a Streams apply process
- Made by executing one or more Streams apply errors using the EXECUTE_ERROR or EXECUTE_ALL_ERRORS procedure in the DBMS_APPLY_ADM package.
- Applied by a Logical Standby apply process

Syntax

```
DBMS_DDL.SET_TRIGGER_FIRING_PROPERTY (
    trig_owner      IN VARCHAR2,
    trig_name       IN VARCHAR2,
    fire_once       IN BOOLEAN);

DBMS_DDL.SET_TRIGGER_FIRING_PROPERTY (
    trig_owner      IN VARCHAR2,
    trig_name       IN VARCHAR2,
    property        IN INTEGER,
    setting         IN BOOLEAN);
```

Parameters

Table 61-8 SET_TRIGGER_FIRING_PROPERTY Procedure Parameters

| Parameter | Description |
|------------|--|
| trig_owner | Schema of the trigger to set |
| trig_name | Name of the trigger to set |
| fire_once | <ul style="list-style-type: none"> If <code>TRUE</code>, the trigger is set to fire once. By default, the <code>fire_once</code> parameter is set to <code>TRUE</code> for DML and DDL triggers. If <code>FALSE</code>, the trigger is set to always fire unless <code>apply_server_only</code> property is set to <code>TRUE</code>, which overrides <code>fire_once</code> property setting. |
| property | <ul style="list-style-type: none"> <code>DBMS_DDL.fire_once</code> to set the <code>fire_once</code> property of the trigger <code>DBMS_DDL.apply_server_only</code> to indicate whether trigger fires only in the context of SQL apply processes maintaining a logical standby database or Streams apply processes |
| setting | Value of property being set |

Usage Notes

DML triggers created on a table have their fire-once property set to `TRUE`. In this case, the triggers only fire when the table is modified by an user process, and they are automatically disabled inside Oracle processes maintaining either a logical standby database (SQL Apply) or Oracle processes doing replication (Streams Apply) processes, and thus do not fire when a SQL Apply or a Streams Apply process modifies the table. There are two ways for a user to fire a trigger as a result of SQL Apply or a Streams Apply process making a change to a maintained table: (a) setting the fire-once property of a trigger to `FALSE`, which allows it fire both in the context of a user process or a SQL or Streams Apply process, or (b) by setting the apply-server-only property to `TRUE` and thus making the trigger fire only in the context of a SQL Apply or a Streams Apply process and not in the context of a user process.

- `FIRE_ONCE=TRUE, APPLY_SERVER_ONLY=FALSE`

This is the default property setting for a DML trigger. The trigger only fires when user process modifies the base table.

- `FIRE_ONCE=TRUE or FALSE, APPLY_SERVER_ONLY=TRUE`

The trigger only fires when SQL Apply or Streams Apply process modifies the base table. The trigger does not fire when a user process modifies the base table. Thus the apply-server-only property overrides the fire-once property of a trigger.

 **Note:**

- If you dequeue an error transaction from the error queue and execute it without using the `DBMS_APPLY_ADM` package, then relevant changes resulting from this execution cause a trigger to fire, regardless of the trigger firing property.
- Only DML and DDL triggers can be fire once. All other types of triggers always fire.

61.4.7 WRAP Functions

This function takes as input a single `CREATE OR REPLACE` statement that specifies creation of a PL/SQL package specification, package body, function, procedure, type specification or type body and returns a `CREATE OR REPLACE` statement where the text of the PL/SQL unit has been obfuscated.

The function has 3 overloads to allow for the different ways in which DDL statements can be generated dynamically and presented to `DBMS_SQL` or `EXECUTE IMMEDIATE`. The different functionality of each form of syntax is presented with the definition.

 **See Also:**

[CREATE_WRAPPED Procedures](#)

Syntax

Provides basic functionality:

```
DBMS_DDL.WRAP (
    ddl      VARCHAR2)
RETURN VARCHAR2;
```

Provides the same functionality as the first form, but allows for larger inputs. This function is intended to be used with the [PARSE Procedures](#) in the `DBMS_SQL` package and its argument list follows the convention of `DBMS_SQL.PARSE`:

```
DBMS_DDL.WRAP (
    ddl      DBMS_SQL.VARCHAR2S,
    lb       PLS_INTEGER,
    ub       PLS_INTEGER)
RETURN DBMS_SQL.VARCHAR2S;
```

Provides the same functionality as the second form and is provided for compatibility with multiple forms of the [PARSE Procedures](#) in the `DBMS_SQL` package:

```
DBMS_DDL.WRAP (
    ddl      DBMS_SQL.VARCHAR2A,
    lb       PLS_INTEGER,
    ub       PLS_INTEGER)
RETURN DBMS_SQL.VARCHAR2A;
```

Parameters

Table 61-9 WRAP Function Parameters

| Parameter | Description |
|-----------|---|
| ddl | A CREATE OR REPLACE statement that specifies creation of a PL/SQL package specification, package body, function, procedure, type specification or type body |
| lb | Lower bound for indices in the string table that specify the CREATE OR REPLACE statement |
| ub | Upper bound for indices in the string table that specify the CREATE OR REPLACE statement. |

Return Values

A CREATE OR REPLACE statement with the text obfuscated. In the case of the second and third form, the return value is a table of strings that need to be concatenated in order to construct the CREATE OR REPLACE string containing obfuscated source text.

Usage Notes

- Any PL/SQL code that attempts to call these interfaces should use the fully qualified package name `SYS.DBMS_DDL` to avoid the possibility that the name `DBMS_DDL` is captured by a locally-defined unit or by redefining the `DBMS_DDL` public synonym.
- Each invocation of any accepts only a single PL/SQL unit. By contrast, the PL/SQL `wrap` utility accepts a full SQL file and obfuscates the PL/SQL units within the file leaving all other text as-is. These interfaces are intended to be used in conjunction with or as a replacement for PL/SQL's dynamic SQL interfaces (`EXECUTE IMMEDIATE` and `DBMS_SQL.PARSE`). Since these dynamic SQL interfaces only accept a single unit at a time (and do not understand the SQL*Plus `"/` termination character), both the [CREATE_WRAPPED Procedures](#) and the [WRAP Functions](#) require input to be a single unit.

Exceptions

ORA-24230: If the input is not a CREATE OR REPLACE statement specifying a PL/SQL unit, exception `DBMS_DDL.MALFORMED_WRAP_INPUT` is raised.

Examples

```
DECLARE
    ddl VARCHAR2(32767);
BEGIN
    ddl := GENERATE_PACKAGE(...);
EXECUTE IMMEDIATE SYS.DBMS_DDL.WRAP(ddl); -- Instead of EXECUTE IMMEDIATE ddl
END;
```

DBMS_DEBUG

`DBMS_DEBUG` is deprecated. Use `DBMS_DEBUG_JDWP` instead.

See [DBMS_DEBUG_JDWP](#) for more information.

`DBMS_DEBUG` is a PL/SQL interface to the PL/SQL debugger layer, Probe, in the Oracle server.

This package is primarily intended to implement server-side debuggers and it provides a way to debug server-side PL/SQL program units.

Note:

The term *program unit* refers to a PL/SQL program of any type (procedure, function, package, package body, trigger, anonymous block, object type, or object type body).

This chapter contains the following topics:

- [Overview](#)
- [Constants](#)
- [Variables](#)
- [Exceptions](#)
- [Operational Notes](#)
- [Data Structures](#)
- [Summary of DBMS_DEBUG Subprograms](#)

62.1 DBMS_DEBUG Overview

To debug server-side code, you must have two database sessions: one session to run the code in debug mode (the target session), and a second session to supervise the target session (the debug session).

The target session becomes available for debugging by making initializing calls with `DBMS_DEBUG`. This marks the session so that the PL/SQL interpreter runs in debug mode and generates debug events. As debug events are generated, they are posted from the session. In most cases, debug events require return notification: the interpreter pauses awaiting a reply.

Meanwhile, the debug session must also initialize itself using `DBMS_DEBUG`: This tells it which target session to supervise. The debug session may then call entry points in `DBMS_DEBUG` to read events that were posted from the target session and to communicate with the target session.

The following subprograms are run in the target session (the session that is to be debugged):

- [SYNCHRONIZE Function](#)
- [DEBUG_ON Procedure](#)
- [DEBUG_OFF Procedure](#)

DBMS_DEBUG does not provide an interface to the PL/SQL compiler, but it does depend on debug information optionally generated by the compiler. Without debug information, it is not possible to examine or modify the values of parameters or variables.

62.2 DBMS_DEBUG Constants

A breakpoint status may have the following value: `breakpoint_status_unused`—breakpoint is not in use.

Otherwise, the status is a mask of the following values:

- `breakpoint_status_active`—a line breakpoint
- `breakpoint_status_disabled`—breakpoint is currently disabled
- `breakpoint_status_remote`—a shadow breakpoint (a local representation of a remote breakpoint)

62.3 DBMS_DEBUG Variables

The DBMS_DEBUG uses the variables shown in the following table.

Table 62-1 DBMS_DEBUG Variables

| Variable | Description |
|------------------------------|---|
| <code>default_timeout</code> | The timeout value (used by both sessions). The smallest possible timeout is 1 second. If this value is set to 0, then a large value (3600) is used. |

62.4 DBMS_DEBUG Exceptions

These values are returned by the various functions called in the debug session (`SYNCHRONIZE`, `CONTINUE`, `SET_BREAKPOINT`, and so on). If PL/SQL exceptions worked across client/server and server/server boundaries, then these would all be exceptions rather than error codes.

Table 62-2 DBMS_DEBUG Exceptions

| Status | Description |
|----------------------|--------------------|
| <code>success</code> | Normal termination |

Statuses returned by `GET_VALUE` and `SET_VALUE`:

Table 62-3 DBMS_DEBUG Exceptions Returned by GET_VALUE and SET_VALUE

| Status | Description |
|----------------------|---|
| error_bogus_frame | No such entrypoint on the stack |
| error_no_debug_info | Program was compiled without debug symbols |
| error_no_such_object | No such variable or parameter |
| error_unknown_type | Debug information is unreadable |
| error_indexed_table | Returned by GET_VALUE if the object is a table, but no index was provided |
| error_illegal_index | No such element exists in the collection |
| error_nullcollection | Table is atomically NULL |
| error_nullvalue | Value is NULL |

Statuses returned by SET_VALUE:

Table 62-4 DBMS_DEBUG Exceptions Returned by SET_VALUE

| Status | Description |
|-----------------------|------------------------------------|
| error_illegal_value | Constraint violation |
| error_illegal_null | Constraint violation |
| error_value_malformed | Unable to decipher the given value |
| error_other | Some other error |
| error_name_incomplete | Name did not resolve to a scalar |

Statuses returned by the breakpoint functions:

Table 62-5 Statuses Returned by the Breakpoint Functions

| Status | Description |
|-----------------------|---|
| error_no_such_breakpt | No such breakpoint |
| error_idle_breakpt | Cannot enable or disable an unused breakpoint |
| error_bad_handle | Unable to set breakpoint in given program (nonexistent or security violation) |

General error codes (returned by many of the DBMS_DEBUG subprograms):

Table 62-6 DBMS_DEBUG Subprograms Error Codes

| Status | Description |
|---------------------|---|
| error_unimplemented | Functionality is not yet implemented |
| error_deferred | No program running; operation deferred |
| error_exception | An exception was raised in the DBMS_DEBUG or Probe packages on the server |

Table 62-6 (Cont.) DBMS_DEBUG Subprograms Error Codes

| Status | Description |
|---------------------|--|
| error_communication | Some error other than a timeout occurred |
| error_timeout | Timeout occurred |

Table 62-7 illegal_init Exceptions

| Exception | Description |
|--------------|---|
| illegal_init | DEBUG_ON was called prior to INITIALIZE |

The following exceptions are raised by procedure `SELF_CHECK`:

Table 62-8 SELF_CHECK Procedure Exceptions

| Exception | Description |
|------------------------|-----------------------------------|
| pipe_creation_failure | Could not create a pipe |
| pipe_send_failure | Could not write data to the pipe |
| pipe_receive_failure | Could not read data from the pipe |
| pipe_datatype_mismatch | Datatype in the pipe was wrong |
| pipe_data_error | Data got garbled in the pipe |

62.5 DBMS_DEBUG Operational Notes

There are two ways to ensure that debug information is generated: through a session switch, or through individual recompilation.

To set the session switch, enter the following statement:

```
ALTER SESSION SET PLSQL_DEBUG = true;
```

This instructs the compiler to generate debug information for the remainder of the session. It does not recompile any existing PL/SQL.

To generate debug information for existing PL/SQL code, use one of the following statements (the second recompiles a package or type body):

```
ALTER [PROCEDURE | FUNCTION | PACKAGE | TRIGGER | TYPE] <name> COMPILE DEBUG;
ALTER [PACKAGE | TYPE] <name> COMPILE DEBUG BODY;
```

[Figure 62-1](#) and [Figure 62-2](#) illustrate the flow of operations in the session to be debugged and in the debugging session.

 see arpls004
date: 1/30/01
platform: pc

Figure 62-3 Debug Session (Cont.)

Control of the Interpreter

The interpreter pauses execution at the following times:

1. At startup of the interpreter so any deferred breakpoints may be installed prior to execution.
2. At any line containing an enabled breakpoint.
3. At any line where an *interesting* event occurs. The set of interesting events is specified by the flags passed to `DBMS_DEBUG.CONTINUE` in the `breakflags` parameter.

illustration: arpls004
release: 9
caption: Target Session
see arpls003
date: 1/30/01
platform: pc

Session Termination

There is no event for session termination. Therefore, it is the responsibility of the debug session to check and make sure that the target session has not ended. A call to `DBMS_DEBUG.SYNCHRONIZE` after the target session has ended causes the debug session to hang until it times out.

Deferred Operations

The diagram suggests that it is possible to set breakpoints prior to having a target session. This is true. In this case, Probe caches the breakpoint request and transmits it to the target session at first synchronization. However, if a breakpoint request is deferred in this fashion, then:

- `SET_BREAKPOINT` does not set the breakpoint number (it can be obtained later from `SHOW_BREAKPOINTS` if necessary).
- `SET_BREAKPOINT` does not validate the breakpoint request. If the requested source line does not exist, then an error silently occurs at synchronization, and no breakpoint is set.

Diagnostic Output

To debug Probe, there are *diagnostics* parameters to some of the calls in `DBMS_DEBUG`. These parameters specify whether to place diagnostic output in the RDBMS tracefile. If output to the RDBMS tracefile is disabled, these parameters have no effect.

Common Debug Session Sections

- Common Section
- Target Session
- Debug Session Section

Common Section

The following subprograms may be called in either the target or the debug session:

- [PROBE_VERSION Procedure](#)
- [SELF_CHECK Procedure](#)
- [SET_TIMEOUT Function](#)

Target Session

The following subprograms may be called only in the target session:

- [INITIALIZE Function](#)
- [DEBUG_ON Procedure](#)
- [SET_TIMEOUT_BEHAVIOUR Procedure](#)
- [GET_TIMEOUT_BEHAVIOUR Function](#)

Debug Session Section

The following subprograms should be run in the debug session only:

- [ATTACH_SESSION Procedure](#)

- SYNCHRONIZE Function
- SHOW_FRAME_SOURCE Procedure
- SHOW_SOURCE Procedures
- GET_MORE_SOURCE Procedure
- PRINT_BACKTRACE Procedure
- CONTINUE Function
- SET_BREAKPOINT Function
- DELETE_BREAKPOINT Function
- SET_OER_BREAKPOINT Function
- DELETE_OER_BREAKPOINT Function
- ENABLE_BREAKPOINT Function
- DISABLE_BREAKPOINT Function
- SHOW_BREAKPOINTS Procedures
- SET_VALUE Functionn
- GET_VALUE Function
- TARGET_PROGRAM_RUNNING Procedure
- DETACH_SESSION Procedure
- GET_RUNTIME_INFO Function
- PRINT_INSTANTIATIONS Procedure
- PING Procedure
- GET_LINE_MAP Function
- GET_RUNTIME_INFO Function
- GET_INDEXES Function
- EXECUTE Procedure

OER Breakpoints

Exceptions that are declared in PL/SQL programs are known as user-defined exceptions. In addition, there are Oracle Errors (OERs) that are returned from the Oracle kernel. To tie the two mechanisms together, PL/SQL provides the `exception_init` pragma that turns a user-defined exception into an OER, so that a PL/SQL handler may be used for it, and so that the PL/SQL engine can return OERs to the Oracle kernel. As of the current release, the only information available about an OER is its number. If two user-defined exceptions are `exception_init`'d to the same OER, they are indistinguishable.

Namespaces

Program units on the server reside in different namespaces. When setting a breakpoint, specify the desired namespace.

1. `Namespace_cursor` contains cursors (anonymous blocks).
2. `Namespace_pgkspec_or_toplevel` contains:
 - Package specifications.

- Procedures and functions that are not nested inside other packages, procedures, or functions.
 - Object types.
3. `Namespace_pkg_body` contains package bodies and type bodies.
 4. `Namespace_trigger` contains triggers.

Libunit Types

These values are used to disambiguate among objects in a given namespace. These constants are used in `PROGRAM_INFO` when Probe is giving a stack backtrace.

- `LibunitType_cursor`
- `LibunitType_procedure`
- `LibunitType_function`
- `LibunitType_package`
- `LibunitType_package_body`
- `LibunitType_trigger`
- `LibunitType_Unknown`

Breakflags

These are values to use for the `breakflags` parameter to `CONTINUE`, in order to tell Probe what events are of interest to the client. These flags may be combined.

| Value | Description |
|-------------------------------|--|
| <code>break_next_line</code> | Break at next source line (step over calls) |
| <code>break_any_call</code> | Break at next source line (step into calls) |
| <code>break_any_return</code> | Break after returning from current entrypoint (skip over any entrypoints called from the current routine) |
| <code>break_return</code> | Break the next time an entrypoint gets ready to return. (This includes entrypoints called from the current one. If interpreter is running <code>Proc1</code> , which calls <code>Proc2</code> , then <code>break_return</code> stops at the end of <code>Proc2</code> .) |
| <code>break_exception</code> | Break when an exception is raised |
| <code>break_handler</code> | Break when an exception handler is executed |
| <code>abort_execution</code> | Stop execution and force an 'exit' event as soon as <code>DBMS_DEBUG.CONTINUE</code> is called. |

Information Flags

These are flags which may be passed as the `info_requested` parameter to `SYNCHRONIZE`, `CONTINUE`, and `GET_RUNTIME_INFO`.

| Flag | Description |
|---------------------------------|------------------------------------|
| <code>info_getStackDepth</code> | Get the current depth of the stack |
| <code>info_getBreakpoint</code> | Get the breakpoint number |

| Flag | Description |
|------------------|------------------------------|
| info_getLineinfo | Get program unit information |

Reasons for Suspension

After `CONTINUE` is run, the program either runs to completion or breaks on some line.

| Reason | Description |
|-----------------------------|-----------------------------------|
| reason_none | - |
| reason_interpreter_starting | Interpreter is starting |
| reason_breakpoint | Hit a breakpoint |
| reason_enter | Procedure entry |
| reason_return | Procedure is about to return |
| reason_finish | Procedure is finished |
| reason_line | Reached a new line |
| reason_interrupt | An interrupt occurred |
| reason_exception | An exception was raised |
| reason_exit | Interpreter is exiting (old form) |
| reason_knl_exit | Kernel is exiting |
| reason_handler | Start exception-handler |
| reason_timeout | A timeout occurred |
| reason_instantiate | Instantiation block |
| reason_abort | Interpreter is aborting |

62.6 DBMS_DEBUG Data Structures

The `DBMS_DEBUG` package defines `RECORD` types and `TABLE` types.

RECORD Types

- [BREAKPOINT_INFO Record Type](#)
- [PROGRAM_INFO Record Type](#)
- [RUNTIME_INFO Record Type](#)

TABLE Types

- [BACKTRACE_TABLE Table Type](#)
- [BREAKPOINT_TABLE Table Type](#)
- [INDEX_TABLE Table Type](#)
- [VC2_TABLE Table Type](#)

62.6.1 BREAKPOINT_INFO Record Type

This type gives information about a breakpoint, such as its current status and the program unit in which it was placed.

Syntax

```
TYPE breakpoint_info IS RECORD (
  name          VARCHAR2(30),
  owner         VARCHAR2(30),
  dblink        VARCHAR2(30),
  line#         BINARY_INTEGER,
  libunittype   BINARY_INTEGER,
  status        BINARY_INTEGER);
```

Fields

Table 62-9 BREAKPOINT_INFO Fields

| Field | Description |
|-------------|---|
| name | Name of the program unit |
| owner | Owner of the program unit |
| dblink | Database link, if remote |
| line# | Line number |
| libunittype | NULL, unless this is a nested procedure or function |
| status | See Constants for values of breakpoint_status_* |

62.6.2 PROGRAM_INFO Record Type

The PROGRAM_INFO record type of the DBMS_DEBUG package specifies a program location. It is a line number in a program unit.

This is used for stack backtraces and for setting and examining breakpoints. The read-only fields are currently ignored by Probe for breakpoint operations. They are set by Probe only for stack backtraces.

Syntax

```
TYPE program_info IS RECORD(
  -- The following fields are used when setting a breakpoint
  namespace     BINARY_INTEGER,
  name          VARCHAR2(30),
  owner         VARCHAR2(30),
  dblink        VARCHAR2(30),
  line#         BINARY_INTEGER,
  -- Read-only fields (set by Probe when doing a stack backtrace)
  libunittype   BINARY_INTEGER,
  entrypointname VARCHAR2(30));
```

Fields

Table 62-10 PROGRAM_INFO Fields

| Field | Description |
|----------------|---|
| namespace | See DBMS_DEBUG Operational Notes for more information about namespaces. |
| name | Name of the program unit |
| owner | Owner of the program unit |
| dblink | Database link, if remote |
| line# | Line number |
| libunittype | A read-only field, NULL, unless this is a nested procedure or function |
| entrypointname | A read-only field, to disambiguate among objects that share the same namespace (for example, procedure and package specifications). See DBMS_DEBUG Operational Notes for more information about the libunit types. |

62.6.3 RUNTIME_INFO Record Type

This type gives context information about the running program.

Syntax

```
TYPE runtime_info IS RECORD(
  line#           BINARY_INTEGER,
  terminated      binary_integer,
  breakpoint      binary_integer,
  stackdepth     BINARY_INTEGER,
  interpreterdepth BINARY_INTEGER,
  reason         BINARY_INTEGER,
  program        program_info);
```

Fields

Table 62-11 RUNTIME_INFO Fields

| Field | Description |
|------------------|---|
| line# | Duplicate of <code>program.line#</code> |
| terminated | Whether the program has terminated |
| breakpoint | Breakpoint number |
| stackdepth | Number of frames on the stack |
| interpreterdepth | [A reserved field] |
| reason | Reason for suspension |
| program | Source location |

62.6.4 BACKTRACE_TABLE Table Type

This type is used by PRINT_BACKTRACE.

Syntax

```
TYPE backtrace_table IS TABLE OF program_info INDEX BY BINARY_INTEGER;
```

62.6.5 BREAKPOINT_TABLE Table Type

This type is used by SHOW_BREAKPOINTS.

Syntax

```
TYPE breakpoint_table IS TABLE OF breakpoint_info INDEX BY BINARY_INTEGER;
```

62.6.6 INDEX_TABLE Table Type

This type is used by GET_INDEXES to return the available indexes for an indexed table.

Syntax

```
TYPE index_table IS table of BINARY_INTEGER INDEX BY BINARY_INTEGER;
```

62.6.7 VC2_TABLE Table Type

This type is used by SHOW_SOURCE.

Syntax

```
TYPE vc2_table IS TABLE OF VARCHAR2(90) INDEX BY BINARY_INTEGER;
```

62.7 Summary of DBMS_DEBUG Subprograms

This table lists the DBMS_DEBUG subprograms in alphabetical order and briefly describes them.

Table 62-12 DBMS_DEBUG Package Subprograms

| Subprogram | Description |
|--|---|
| ATTACH_SESSION Procedure | Notifies the debug session about the target debugID |
| CONTINUE Function | Continues execution of the target program |
| DEBUG_OFF Procedure | Turns debug-mode off |
| DEBUG_ON Procedure | Turns debug-mode on |
| DELETE_BREAKPOINT Function | Deletes a breakpoint |
| DELETE_OER_BREAKPOINT Function | Deletes an OER breakpoint |

Table 62-12 (Cont.) DBMS_DEBUG Package Subprograms

| Subprogram | Description |
|----------------------------------|---|
| DETACH_SESSION Procedure | Stops debugging the target program |
| DISABLE_BREAKPOINT Function | Disables a breakpoint |
| ENABLE_BREAKPOINT Function | Activates an existing breakpoint |
| EXECUTE Procedure | Executes SQL or PL/SQL in the target session |
| GET_INDEXES Function | Returns the set of indexes for an indexed table |
| GET_MORE_SOURCE Procedure | Provides additional source in the event of buffer overflow when using SHOW_SOURCE |
| GET_LINE_MAP Function | Returns information about line numbers in a program unit |
| GET_RUNTIME_INFO Function | Returns information about the current program |
| GET_TIMEOUT_BEHAVIOUR Function | Returns the current timeout behavior |
| GET_VALUE Function | Gets a value from the currently-running program |
| INITIALIZE Function | Sets debugID in target session |
| PING Procedure | Pings the target session to prevent it from timing out |
| PRINT_BACKTRACE Procedure | Prints a stack backtrace |
| PRINT_INSTANTIATIONS Procedure | Prints a stack backtrace |
| PROBE_VERSION Procedure | Returns the version number of DBMS_DEBUG on the server |
| SELF_CHECK Procedure | Performs an internal consistency check |
| SET_BREAKPOINT Function | Sets a breakpoint in a program unit |
| SET_OER_BREAKPOINT Function | Sets an OER breakpoint |
| SET_TIMEOUT Function | Sets the timeout value |
| SET_TIMEOUT_BEHAVIOUR Procedure | Tells Probe what to do with the target session when a timeout occurs |
| SET_VALUE Function | Sets a value in the currently-running program |
| SHOW_BREAKPOINTS Procedures | Returns a listing of the current breakpoints |
| SHOW_FRAME_SOURCE Procedure | Fetches the frame source |
| SHOW_SOURCE Procedures | Fetches program source |
| SYNCHRONIZE Function | Waits for program to start running |
| TARGET_PROGRAM_RUNNING Procedure | Returns TRUE if the target session is currently executing a stored procedure, or FALSE if it is not |

62.7.1 ATTACH_SESSION Procedure

This procedure notifies the debug session about the target program.

Syntax

```
DBMS_DEBUG.ATTACH_SESSION (
    debug_session_id IN VARCHAR2,
    diagnostics      IN BINARY_INTEGER := 0);
```

Parameters

Table 62-13 ATTACH_SESSION Procedure Parameters

| Parameter | Description |
|------------------|--|
| debug_session_id | Debug ID from a call to INITIALIZE in target session |
| diagnostics | Generate diagnostic output if nonzero |

62.7.2 CONTINUE Function

This function passes the given breakflags (a mask of the events that are of interest) to Probe in the target process. It tells Probe to continue execution of the target process, and it waits until the target process runs to completion or signals an event.

If `info_requested` is not NULL, then calls `GET_RUNTIME_INFO`.

Syntax

```
DBMS_DEBUG.CONTINUE (
    run_info      IN OUT runtime_info,
    breakflags    IN      BINARY_INTEGER,
    info_requested IN      BINARY_INTEGER := NULL)
RETURN BINARY_INTEGER;
```

Parameters

Table 62-14 CONTINUE Function Parameters

| Parameter | Description |
|----------------|--|
| run_info | Information about the state of the program |
| breakflags | Mask of events that are of interest (see the discussion about break flags under DBMS_DEBUG Operational Notes) |
| info_requested | Which information should be returned in <code>run_info</code> when the program stops (see the discussion of information flags under DBMS_DEBUG Operational Notes) |

Return Values

Table 62-15 CONTINUE Function Return Values

| Return | Description |
|---------------------|--|
| success | |
| error_timeout | Timed out before the program started running |
| error_communication | Other communication error |

62.7.3 DEBUG_OFF Procedure

This procedure notifies the target session that debugging should no longer take place in that session. It is not necessary to call this function before ending the session.

⚠ WARNING:

There must be a debug session waiting if immediate is `TRUE`.

Syntax

```
DBMS_DEBUG.DEBUG_OFF;
```

Usage Notes

The server does not handle this entrypoint specially. Therefore, it attempts to debug this entrypoint.

62.7.4 DEBUG_ON Procedure

This procedure marks the target session so that all PL/SQL is run in debug mode. This must be done before any debugging can take place.

Syntax

```
DBMS_DEBUG.DEBUG_ON (
    no_client_side_plsql_engine BOOLEAN := TRUE,
    immediate                   BOOLEAN := FALSE);
```

Parameters

Table 62-16 DEBUG_ON Procedure Parameters

| Parameter | Description |
|-----------------------------|--|
| no_client_side_plsql_engine | Should be left to its default value unless the debugging session is taking place from a client-side PL/SQL engine |
| immediate | If this is <code>TRUE</code> , then the interpreter immediately switches itself into debug-mode, instead of continuing in regular mode for the duration of the call. |

62.7.5 DELETE_BREAKPOINT Function

This function deletes a breakpoint.

Syntax

```
DBMS_DEBUG.DELETE_BREAKPOINT (
    breakpoint IN BINARY_INTEGER)
RETURN BINARY_INTEGER;
```

Parameters

Table 62-17 DELETE_BREAKPOINT Function Parameters

| Parameter | Description |
|------------|--|
| breakpoint | Breakpoint number from a previous call to SET_BREAKPOINT |

Return Values

Table 62-18 DELETE_BREAKPOINT Function Return Values

| Return | Description |
|--------------------------|---|
| success | |
| error_no_such_breakpoint | No such breakpoint exists |
| error_idle_breakpoint | Cannot delete an unused breakpoint |
| error_stale_breakpoint | The program unit was redefined since the breakpoint was set |

62.7.6 DELETE_OER_BREAKPOINT Function

This function deletes an OER breakpoint.

Syntax

```
DBMS_DEBUG.DELETE_OER_BREAKPOINT (
    oer IN PLS_INTEGER)
RETURN PLS_INTEGER;
```

Parameters

Table 62-19 DELETE_OER_BREAKPOINT Function Parameters

| Parameter | Description |
|-----------|--|
| oer | The OER (positive 4-byte number) to delete |

62.7.7 DETACH_SESSION Procedure

This procedure stops debugging the target program.

This procedure may be called at any time, but it does not notify the target session that the debug session is detaching itself, and it does not terminate execution of the target session. Therefore, care should be taken to ensure that the target session does not hang itself.

Syntax

```
DBMS_DEBUG.DETACH_SESSION;
```

62.7.8 DISABLE_BREAKPOINT Function

This function makes an existing breakpoint inactive but leaves it in place.

Syntax

```
DBMS_DEBUG.DISABLE_BREAKPOINT (
    breakpoint IN BINARY_INTEGER)
RETURN BINARY_INTEGER;
```

Parameters

Table 62-20 DISABLE_BREAKPOINT Function Parameters

| Parameter | Description |
|------------|--|
| breakpoint | Breakpoint number from a previous call to SET_BREAKPOINT |

Return Values

Table 62-21 DISABLE_BREAKPOINT Function Return Values

| Returns | Description |
|-----------------------|-------------------------------------|
| success | |
| error_no_such_breakpt | No such breakpoint exists |
| error_idle_breakpt | Cannot disable an unused breakpoint |

62.7.9 ENABLE_BREAKPOINT Function

This function is the reverse of disabling. This enables a previously disabled breakpoint.

Syntax

```
DBMS_DEBUG.ENABLE_BREAKPOINT (
    breakpoint IN BINARY_INTEGER)
RETURN BINARY_INTEGER;
```

Parameters

Table 62-22 ENABLE_BREAKPOINT Function Parameters

| Parameter | Description |
|------------|--|
| breakpoint | Breakpoint number from a previous call to SET_BREAKPOINT |

Return Values

Table 62-23 ENABLE_BREAKPOINT Function Return Values

| Return | Description |
|-----------------------|------------------------------------|
| success | Success |
| error_no_such_breakpt | No such breakpoint exists |
| error_idle_breakpt | Cannot enable an unused breakpoint |

62.7.10 EXECUTE Procedure

This procedure executes SQL or PL/SQL code in the target session. The target session is assumed to be waiting at a breakpoint (or other event). The call to DBMS_DEBUG.EXECUTE occurs in the debug session, which then asks the target session to execute the code.

Syntax

```
DBMS_DEBUG.EXECUTE (
  what          IN VARCHAR2,
  frame#        IN BINARY_INTEGER,
  bind_results  IN BINARY_INTEGER,
  results       IN OUT NOCOPY dbms_debug_vc2coll,
  errm          IN OUT NOCOPY VARCHAR2);
```

Parameters

Table 62-24 EXECUTE Procedure Parameters

| Parameter | Description |
|--------------|---|
| what | SQL or PL/SQL source to execute |
| frame# | The context in which to execute the code. Only -1 (global context) is supported at this time. |
| bind_results | Whether the source wants to bind to results in order to return values from the target session: 0 = No 1 = Yes |
| results | Collection in which to place results, if bind_results is not 0 |
| errm | Error message, if an error occurred; otherwise, NULL |

Examples

Example 1

This example executes a SQL statement. It returns no results.

```

DECLARE
    coll sys.dbms_debug_vc2coll; -- results (unused)
    errm VARCHAR2(100);
BEGIN
    dbms_debug.execute('insert into emp(ename,empno,deptno) ' ||
                      'values(''LJE'', 1, 1)',
                      -1, 0, coll, errm);
END;

```

Example 2

This example executes a PL/SQL block, and it returns no results. The block is an autonomous transaction, which means that the value inserted into the table becomes visible in the debug session.

```

DECLARE
    coll sys.dbms_debug_vc2coll;
    errm VARCHAR2(100);
BEGIN
    dbms_debug.execute(
        'DECLARE PRAGMA autonomous_transaction; ' ||
        'BEGIN ' ||
        '  insert into emp(ename, empno, deptno) ' ||
        '  values(''LJE'', 1, 1); ' ||
        ' COMMIT; ' ||
        'END;',
        -1, 0, coll, errm);
END;

```

Example 3

This example executes a PL/SQL block, and it returns some results.

```

DECLARE
    coll sys.dbms_debug_vc2coll;
    errm VARCHAR2(100);
BEGIN
    dbms_debug.execute(
        'DECLARE ' ||
        '  pp SYS.dbms_debug_vc2coll := SYS.dbms_debug_vc2coll(); ' ||
        '  x PLS_INTEGER; ' ||
        '  i PLS_INTEGER := 1; ' ||
        'BEGIN ' ||
        '  SELECT COUNT(*) INTO x FROM emp; ' ||
        '  pp.EXTEND(x * 6); ' ||
        '  FOR c IN (SELECT * FROM emp) LOOP ' ||
        '    pp(i) := ''Ename: '' || c.ename; i := i+1; ' ||
        '    pp(i) := ''Empno: '' || c.empno; i := i+1; ' ||
        '    pp(i) := ''Job:   '' || c.job;   i := i+1; ' ||
        '    pp(i) := ''Mgr:   '' || c.mgr;   i := i+1; ' ||
        '    pp(i) := ''Sal:   '' || c.sal;   i := i+1; ' ||
        '    pp(i) := null;      i := i+1; ' ||
        '  END LOOP; ' ||
        '  :1 := pp; ' ||
        'END;',

```

```

        -1, 1, coll, errm);
    each := coll.FIRST;
    WHILE (each IS NOT NULL) LOOP
        dosomething(coll(each));
        each := coll.NEXT(each);
    END LOOP;
END;
```

62.7.11 GET_INDEXES Function

Given a name of a variable or parameter, this function returns the set of its indexes, if it is an indexed table. An error is returned if it is not an indexed table.

Syntax

```

DBMS_DEBUG.GET_INDEXES (
    varname   IN  VARCHAR2,
    frame#    IN  BINARY_INTEGER,
    handle    IN  program_info,
    entries   OUT index_table)
RETURN BINARY_INTEGER;
```

Parameters

Table 62-25 GET_INDEXES Function Parameters

| Parameter | Description |
|-----------|--|
| varname | Name of the variable to get index information about |
| frame# | Number of frame in which the variable or parameter resides; NULL for a package variable |
| handle | Package description, if object is a package variable |
| entries | 1-based table of the indexes: if non-NULL, then entries(1) contains the first index of the table, entries(2) contains the second index, and so on. |

Return Values

Table 62-26 GET_INDEXES Function Return Values

| Return | Description |
|----------------------|---|
| error_no_such_object | One of the following: <ul style="list-style-type: none"> - The package does not exist - The package is not instantiated - The user does not have privileges to debug the package - The object does not exist in the package |

62.7.12 GET_MORE_SOURCE Procedure

When the source does not fit in the buffer provided by the SHOW_SOURCE Procedure version which produced a formatted buffer, this procedure provides additional source.

Syntax

```
DBMS_DEBUG.GET_MORE_SOURCE (  
    buffer          IN OUT VARCHAR2,  
    buflen         IN BINARY_INTEGER,  
    piece#         IN BINARY_INTEGER);
```

Parameters

Table 62-27 GET_MORE_SOURCE Procedure Parameters

| Parameter | Description |
|-----------|--|
| buffer | The buffer |
| buflen | The length of the buffer |
| piece# | A value between 2 and the value returned in the parameter pieces from the call to the relevant version of the SHOW_SOURCE Procedures |

Usage Notes

This procedure should be called only after the version of SHOW_SOURCE that returns a formatted buffer.

Related Topics

- [SHOW_SOURCE Procedures](#)
The procedure gets the source code. There are two overloaded SHOW_SOURCE procedures.

62.7.13 GET_LINE_MAP Function

This function finds line and entypoint information about a program so that a debugger can determine the source lines at which it is possible to place breakpoints.

Syntax

```
DBMS_DEBUG.GET_LINE_MAP (  
    program          IN  program_info,  
    maxline         OUT BINARY_INTEGER,  
    number_of_entry_points OUT BINARY_INTEGER,  
    linemap         OUT  RAW)  
RETURN BINARY_INTEGER;
```

Parameters

Table 62-28 GET_LINE_MAP Function Parameters

| Parameter | Description |
|------------------------|--|
| program | A top-level program unit (procedure / package / function / package body, and so on). Its <code>Namespace</code> , <code>Name</code> , and <code>Owner</code> fields must be initialized, the remaining fields are ignored. |
| maxline | The largest source code line number in 'program' |
| number_of_entry_points | The number of subprograms in 'program' |
| linemap | A bitmap representing the executable lines of 'program'. If line number <code>N</code> is executable, bit number <code>N MOD 8</code> will be set to 1 at <code>linemap</code> position <code>N / 8</code> . The length of returned <code>linemap</code> is either <code>maxline</code> divided by 8 (plus one if <code>maxline MOD 8</code> is not zero) or 32767 in the unlikely case of <code>maxline</code> being larger than <code>32767 * 8</code> . |

Return Values

Table 62-29 GET_LINE_MAP Function Return Values

| Return | Description |
|---------------------|--|
| success | A successful completion |
| error_no_debug_info | The program unit exists, but has no debug info |
| error_bad_handle | No such program unit exists |

62.7.14 GET_RUNTIME_INFO Function

This function returns information about the current program. It is only needed if the `info_requested` parameter to `SYNCHRONIZE` or `CONTINUE` was set to 0.

**Note:**

This is currently only used by client-side PL/SQL.

Syntax

```
DBMS_DEBUG.GET_RUNTIME_INFO (
  info_requested IN BINARY_INTEGER,
  run_info      OUT runtime_info)
RETURN BINARY_INTEGER;
```

Parameters

Table 62-30 GET_RUNTIME_INFO Function Parameters

| Parameter | Description |
|-----------------------------|---|
| <code>info_requested</code> | Which information should be returned in <code>run_info</code> when the program stops (see DBMS_DEBUG Operational Notes for information about information flags) |
| <code>run_info</code> | Information about the state of the program |

62.7.15 GET_TIMEOUT_BEHAVIOUR Function

This procedure returns the current timeout behavior. This call is made in the target session.

Syntax

```
DBMS_DEBUG.GET_TIMEOUT_BEHAVIOUR
RETURN BINARY_INTEGER;
```

Parameters

Table 62-31 GET_TIMEOUT_BEHAVIOUR Function Parameters

| Parameter | Description |
|------------------|------------------------------------|
| <code>oer</code> | The OER (a 4-byte positive number) |

Return Values

Table 62-32 GET_TIMEOUT_BEHAVIOUR Function Return Values

| Return | Description |
|----------------------|-------------------------|
| <code>success</code> | A successful completion |

Information Flags

```
info_getOerInfo CONSTANT PLS_INTEGER:= 32;
```

Usage Notes

Less functionality is supported on OER breakpoints than on code breakpoints. In particular, note that:

- No "breakpoint number" is returned - the number of the OER is used instead. Thus it is impossible to set duplicate breakpoints on a given OER (it is a no-op).
- It is not possible to disable an OER breakpoint (although clients are free to simulate this by deleting it).
- OER breakpoints are deleted using `delete_oer_breakpoint`.

62.7.16 GET_VALUE Function

This function gets a value from the currently-running program. There are two overloaded `GET_VALUE` functions.

Syntax

```
DBMS_DEBUG.GET_VALUE (
  variable_name IN VARCHAR2,
  frame#        IN BINARY_INTEGER,
  scalar_value  OUT VARCHAR2,
  format       IN VARCHAR2 := NULL)
RETURN BINARY_INTEGER;
```

Parameters

Table 62-33 GET_VALUE Function Parameters

| Parameter | Description |
|----------------------------|--|
| <code>variable_name</code> | Name of the variable or parameter |
| <code>frame#</code> | Frame in which it lives; 0 means the current procedure |
| <code>scalar_value</code> | Value |
| <code>format</code> | Optional date format to use, if meaningful |

Return Values

Table 62-34 GET_VALUE Function Return Values

| Return | Description |
|-----------------------------------|--|
| <code>success</code> | A successful completion |
| <code>error_bogus_frame</code> | Frame does not exist |
| <code>error_no_debug_info</code> | Entrypoint has no debug information |
| <code>error_no_such_object</code> | <code>variable_name</code> does not exist in <code>frame#</code> |
| <code>error_unknown_type</code> | The type information in the debug information is illegible |
| <code>error_nullvalue</code> | Value is NULL |
| <code>error_indexed_table</code> | The object is a table, but no index was provided |

This form of `GET_VALUE` is for fetching package variables. Instead of a `frame#`, it takes a handle, which describes the package containing the variable.

Syntax

```
DBMS_DEBUG.GET_VALUE (
  variable_name IN VARCHAR2,
  handle        IN program_info,
  scalar_value  OUT VARCHAR2,
  format       IN VARCHAR2 := NULL)
RETURN BINARY_INTEGER;
```

Parameters

Table 62-35 GET_VALUE Function Parameters

| Parameter | Description |
|---------------|--|
| variable_name | Name of the variable or parameter |
| handle | Description of the package containing the variable |
| scalar_value | Value |
| format | Optional date format to use, if meaningful |

Return Values

Table 62-36 GET_VALUE Function Return Values

| Return | Description |
|----------------------|---|
| error_no_such_object | One of the following: <ul style="list-style-type: none"> - Package does not exist - Package is not instantiated - User does not have privileges to debug the package - Object does not exist in the package |
| error_indexed_table | The object is a table, but no index was provided |

Examples

This example illustrates how to get the value with a given package `PACK` in schema `SCOTT`, containing variable `VAR`:

```
DECLARE
  handle    dbms_debug.program_info;
  resultbuf VARCHAR2(500);
  retval    BINARY_INTEGER;
BEGIN
  handle.Owner      := 'SCOTT';
  handle.Name       := 'PACK';
  handle.namespace := dbms_debug.namespace_pkgspec_or_toplevel;
  retval           := dbms_debug.get_value('VAR', handle, resultbuf, NULL);
END;
```

62.7.17 INITIALIZE Function

This function initializes the target session for debugging.

Syntax

```
DBMS_DEBUG.INITIALIZE (
  debug_session_id IN VARCHAR2      := NULL,
  diagnostics      IN BINARY_INTEGER := 0)
RETURN VARCHAR2;
```

Parameters

Table 62-37 INITIALIZE Function Parameters

| Parameter | Description |
|-------------------------------|--|
| <code>debug_session_id</code> | Name of session ID. If NULL, then a unique ID is generated. |
| <code>diagnostics</code> | Indicates whether to dump diagnostic output to the tracefile: 0 = (default) no diagnostics 1 = print diagnostics |

Return Values

The newly-registered debug session ID (`debugID`)

Usage Notes

You cannot use `DBMS_DEBUG` and the JDWP-based debugging interface simultaneously. This call will either fail with an ORA-30677 error if the session is currently being debugged with the JDWP-based debugging interface or, if the call succeeds, any further use of the JDWP-based interface to debug this session will be disallowed.

Calls to `DBMS_DEBUG` will succeed only if either the caller or the specified debug role carries the `DEBUG CONNECT SESSION` privilege. Failing that, an ORA-1031 error will be raised. Other exceptions are also possible if a debug role is specified but the password does not match, or if the calling user has not been granted the role, or the role is application-enabled and this call does not originate from within the role-enabling package.

The `CREATE ANY PROCEDURE` privilege does not affect the visibility of routines through the debugger. A privilege `DEBUG` for each object has been introduced with a corresponding `DEBUG ANY PROCEDURE` variant. These are required in order to see routines owned by users other than the session's login user.

Authentication of the debug role and the check for `DEBUG CONNECT SESSION` privilege will be done in the context of the caller to this routine. If the caller is a definer's rights routine or has been called from one, only privileges granted to the defining user, the debug role, or `PUBLIC` will be used to check for `DEBUG CONNECT SESSION`. If this call is from within a definer's rights routine, the debug role, if specified, must be one that has been granted to that definer, but it need not also have been granted to the session login user or be enabled in the calling session at the time the call is made.

The checks made by the debugger after this call is made looking for the `DEBUG` privilege on individual procedures will be done in the context of the session's login user, the roles that were enabled at session level at the moment this call was made (even if those roles were not available within a definer's rights environment of the call), and the debug role.

62.7.18 PING Procedure

This procedure pings the target session to prevent it from timing out. Use this procedure when execution is suspended in the target session, for example at a breakpoint.

If the `timeout_behaviour` is set to `retry_on_timeout` then this procedure is not necessary.

Syntax

```
DBMS_DEBUG.PING;
```

Exceptions

Oracle will display the `no_target_program` exception if there is no target program or if the target session is not currently waiting for input from the debug session.

Usage Notes

Timeout options for the target session are registered with the target session by calling `set_timeout_behaviour`:

- `retry_on_timeout` - Retry. Timeout has no effect. This is like setting the timeout to an infinitely large value.
- `continue_on_timeout` - Continue execution, using same event flags.
- `nodebug_on_timeout` - Turn debug-mode OFF (in other words, call `debug_off`) and then continue execution. No more events will be generated by this target session unless it is re-initialized by calling `debug_on`.
- `abort_on_timeout` - Continue execution, using the `abort_execution` flag, which should cause the program to terminate immediately. The session remains in debug-mode.

```
retry_on_timeout CONSTANT BINARY_INTEGER:= 0;
```

```
continue_on_timeout CONSTANT BINARY_INTEGER:= 1;
```

```
nodebug_on_timeout CONSTANT BINARY_INTEGER:= 2;
```

```
abort_on_timeout CONSTANT BINARY_INTEGER:= 3;
```

62.7.19 PRINT_BACKTRACE Procedure

This procedure prints a backtrace listing of the current execution stack. This should only be called if a program is currently running.

There are two overloaded `PRINT_BACKTRACE` procedures.

Syntax

```
DBMS_DEBUG.PRINT_BACKTRACE (  
    listing IN OUT VARCHAR2);
```

```
DBMS_DEBUG.PRINT_BACKTRACE (  
    backtrace OUT backtrace_table);
```

Parameters

Table 62-38 PRINT_BACKTRACE Procedure Parameters

| Parameter | Description |
|-----------|--|
| listing | A formatted character buffer with embedded newlines |
| backtrace | 1-based indexed table of backtrace entries. The currently-running procedure is the last entry in the table (that is, the frame numbering is the same as that used by GET_VALUE). Entry 1 is the oldest procedure on the stack. |

62.7.20 PRINT_INSTANTIATIONS Procedure

This procedure returns a list of the packages that have been instantiated in the current session.

Syntax

```
DBMS_DEBUG.PRINT_INSTANTIATIONS (
    pkgs   IN OUT NOCOPY backtrace_table,
    flags  IN BINARY_INTEGER);
```

Parameters

Table 62-39 PRINT_INSTANTIATIONS Procedure Parameters

| Parameter | Description |
|-----------|--|
| pkgs | The instantiated packages |
| flags | Bitmask of options: <ul style="list-style-type: none"> • 1 - show specs • 2 - show bodies • 4 - show local instantiations • 8 - show remote instantiations (NYI) • 16 - do a fast job. The routine does not test whether debug information exists or whether the libunit is shrink-wrapped. |

Exceptions

no_target_program - target session is not currently executing

Usage Notes

On return, `pkgs` contains a `program_info` for each instantiation. The valid fields are: Namespace, Name, Owner, and LibunitType.

In addition, `Line#` contains a bitmask of:

- 1 - the libunit contains debug info
- 2 - the libunit is shrink-wrapped

62.7.21 PROBE_VERSION Procedure

This procedure returns the version number of DBMS_DEBUG on the server.

Syntax

```
DBMS_DEBUG.PROBE_VERSION (
    major out BINARY_INTEGER,
    minor out BINARY_INTEGER);
```

Parameters

Table 62-40 PROBE_VERSION Procedure Parameters

| Parameter | Description |
|-----------|--|
| major | Major version number |
| minor | Minor version number: increments as functionality is added |

62.7.22 SELF_CHECK Procedure

This procedure performs an internal consistency check. SELF_CHECK also runs a communications test to ensure that the Probe processes are able to communicate.

If SELF_CHECK does not return successfully, then an incorrect version of DBMS_DEBUG was probably installed on this server. The solution is to install the correct version (pblog.sql loads DBMS_DEBUG and the other relevant packages).

Syntax

```
DBMS_DEBUG.SELF_CHECK (
    timeout IN binary_integer := 60);
```

Parameters

Table 62-41 SELF_CHECK Procedure Parameters

| Parameter | Description |
|-----------|---|
| timeout | The timeout to use for the communication test. Default is 60 seconds. |

Exceptions

Table 62-42 SELF_CHECK Procedure Exceptions

| Exception | Description |
|-----------------------|-----------------------------------|
| OER-6516 | Probe version is inconsistent |
| pipe_creation_failure | Could not create a pipe |
| pipe_send_failure | Could not write data to the pipe |
| pipe_receive_failure | Could not read data from the pipe |

Table 62-42 (Cont.) SELF_CHECK Procedure Exceptions

| Exception | Description |
|------------------------|--------------------------------|
| pipe_datatype_mismatch | Datatype in the pipe was wrong |
| pipe_data_error | Data got garbled in the pipe |

All of these exceptions are fatal. They indicate a serious problem with Probe that prevents it from working correctly.

62.7.23 SET_BREAKPOINT Function

This function sets a breakpoint in a program unit, which persists for the current session.

Execution pauses if the target program reaches the breakpoint.

Syntax

```
DBMS_DEBUG.SET_BREAKPOINT (
  program      IN program_info,
  line#        IN BINARY_INTEGER,
  breakpoint#  OUT BINARY_INTEGER,
  fuzzy        IN BINARY_INTEGER := 0,
  iterations  IN BINARY_INTEGER := 0)
RETURN BINARY_INTEGER;
```

Parameters

Table 62-43 SET_BREAKPOINT Function Parameters

| Parameter | Description |
|-------------|---|
| program | Information about the program unit in which the breakpoint is to be set. (In version 2.1 and later, the namespace, name, owner, and dblink may be set to NULL, in which case the breakpoint is placed in the currently-running program unit.) |
| line# | Line at which the breakpoint is to be set |
| breakpoint# | On successful completion, contains the unique breakpoint number by which to refer to the breakpoint |
| fuzzy | Only applicable if there is no executable code at the specified line: 0 means return <code>error_illegal_line</code> 1 means search forward for an adjacent line at which to place the breakpoint -1 means search backward for an adjacent line at which to place the breakpoint |
| iterations | Number of times to wait before signalling this breakpoint |

Return Values

Note:

The `fuzzy` and `iterations` parameters are not yet implemented

Table 62-44 SET_BREAKPOINT Function Return Values

| Return | Description |
|--------------------|--------------------------------------|
| success | A successful completion |
| error_illegal_line | Cannot set a breakpoint at that line |
| error_bad_handle | No such program unit exists |

62.7.24 SET_OER_BREAKPOINT Function

This function sets an OER breakpoint.

Syntax

```
DBMS_DEBUG.SET_OER_BREAKPOINT (
    oer IN PLS_INTEGER)
RETURN PLS_INTEGER;
```

Parameters

Table 62-45 SET_OER_BREAKPOINT Function Parameters

| Parameter | Description |
|-----------|---|
| oer | The OER (positive 4-byte number) to set |

Return Values

Table 62-46 SET_OER_BREAKPOINT Function Return Values

| Return | Description |
|-----------------------|-------------------------------|
| success | A successful completion |
| error_no_such_breakpt | No such OER breakpoint exists |

62.7.25 SET_TIMEOUT Function

This function sets the timeout value and returns the new timeout value.

Syntax

```
DBMS_DEBUG.SET_TIMEOUT (
    timeout BINARY_INTEGER)
RETURN BINARY_INTEGER;
```

Parameters

Table 62-47 SET_TIMEOUT Function Parameters

| Parameter | Description |
|-----------|--|
| timeout | The timeout to use for communication between the target and debug sessions |

62.7.26 SET_TIMEOUT_BEHAVIOUR Procedure

This procedure tells Probe what to do with the target session when a timeout occurs. This call is made in the target session.

Syntax

```
DBMS_DEBUG.SET_TIMEOUT_BEHAVIOUR (
    behaviour IN PLS_INTEGER);
```

Parameters

Table 62-48 SET_TIMEOUT_BEHAVIOUR Procedure Parameters

| Parameter | Description |
|-----------------------------------|---|
| behaviour - One of the following: | |
| retry_on_timeout | Retry. Timeout has no effect. This is like setting the timeout to an infinitely large value. |
| continue_on_timeout | Continue execution, using same event flags |
| nodebug_on_timeout | Turn debug-mode OFF (in other words, call <code>debug_off</code>) and continue execution. No more events will be generated by this target session unless it is re-initialized by calling <code>debug_on</code> . |
| abort_on_timeout | Continue execution, using the <code>abort_execution</code> flag, which should cause the program to terminate immediately. The session remains in debug-mode. |

Exceptions

unimplemented - the requested behavior is not recognized

Usage Notes

The default behavior (if this procedure is not called) is `continue_on_timeout`, since it allows a debugger client to reestablish control (at the next event) but does not cause the target session to hang indefinitely.

62.7.27 SET_VALUE Function

This function sets a value in the currently-running program. There are two overloaded SET_VALUE functions.

Syntax

```
DBMS_DEBUG.SET_VALUE (
    frame#           IN binary_integer,
    assignment_statement IN varchar2)
RETURN BINARY_INTEGER;
```

```
DBMS_DEBUG.SET_VALUE (
    handle           IN program_info,
    assignment_statement IN VARCHAR2)
RETURN BINARY_INTEGER;
```

Parameters

Table 62-49 SET_VALUE Function Parameters

| Parameter | Description |
|----------------------|---|
| frame# | Frame in which the value is to be set; 0 means the currently executing frame. |
| handle | Description of the package containing the variable |
| assignment_statement | An assignment statement (which must be legal PL/SQL) to run in order to set the value. For example, 'x := 3'; Only scalar values are supported in this release. The right side of the assignment statement must be a scalar. |

Return Values

Table 62-50 SET_VALUE Function Return Values

| Return | Description |
|-----------------------|---|
| success | - |
| error_illegal_value | Not possible to set it to that value |
| error_illegal_null | Cannot set to NULL because object type specifies it as 'not NULL' |
| error_value_malformed | Value is not a scalar |
| error_name_incomplete | The assignment statement does not resolve to a scalar. For example, 'x := 3;', if x is a record. |
| error_no_such_object | One of the following: <ul style="list-style-type: none"> - Package does not exist - Package is not instantiated - User does not have privileges to debug the package - Object does not exist in the package |

Usage Notes

In some cases, the PL/SQL compiler uses temporaries to access package variables, and does not guarantee to update such temporaries. It is possible, although unlikely, that modification to a package variable using `SET_VALUE` might not take effect for a line or two.

Examples

To set the value of `SCOTT.PACK.var` to 6:

```
DECLARE
    handle dbms_debug.program_info;
    retval BINARY_INTEGER;
BEGIN
    handle.Owner      := 'SCOTT';
    handle.Name       := 'PACK';
    handle.namespace := dbms_debug.namespace_pkgspec_or_toplevel;
    retval            := dbms_debug.set_value(handle, 'var := 6;');
END;
```

62.7.28 SHOW_BREAKPOINTS Procedures

There are two overloaded procedures that return a listing of the current breakpoints. There are three overloaded `SHOW_BREAKPOINTS` procedures.

Syntax

```
DBMS_DEBUG.SHOW_BREAKPOINTS (
    listing IN OUT VARCHAR2);

DBMS_DEBUG.SHOW_BREAKPOINTS (
    listing OUT breakpoint_table);

DBMS_DEBUG.SHOW_BREAKPOINTS (
    code_breakpoints OUT breakpoint_table,
    oer_breakpoints  OUT oer_table);
```

Parameters

Table 62-51 SHOW_BREAKPOINTS Procedure Parameters

| Parameter | Description |
|-------------------------------|---|
| <code>listing</code> | A formatted buffer (including newlines) of the breakpoints. |
| <code>code_breakpoints</code> | Indexed table of breakpoint entries. The breakpoint number is indicated by the index into the table. Breakpoint numbers start at 1 and are reused when deleted. |
| <code>oer_breakpoints</code> | The indexed table of OER breakpoints, indexed by OER |

62.7.29 SHOW_FRAME_SOURCE Procedure

The procedure gets the source code. There are two overloaded `SHOW_SOURCE` procedures.

Syntax

```
DBMS_DEBUG.SHOW_FRAME_SOURCE (
  first_line IN          BINARY_INTEGER,
  last_line  IN          BINARY_INTEGER,
  source     IN OUT NOCOPY vc2_table,
  frame_num IN          BINARY_INTEGER);
```

Parameters

Table 62-52 SHOW_FRAME_SOURCE Procedure Parameters

| Parameter | Description |
|-------------------------|---|
| <code>first_line</code> | Line number of first line to fetch (PL/SQL programs always start at line 1 and have no holes) |
| <code>last_line</code> | Line number of last line to fetch. No lines are fetched past the end of the program. |
| <code>source</code> | The resulting table, which may be indexed by line# |
| <code>frame_num</code> | 1-based frame number |

Usage Notes

- You use this function only when backtrace shows an anonymous unit is executing at a given frame position and you need to view the source in order to set a breakpoint.
- If frame number is top of the stack and it's an anonymous block then `SHOW_SOURCE` can also be used.
- If it's a stored PL/SQL package/function/procedure then use SQL as described in the [Usage Notes](#) to [SHOW_SOURCE Procedures](#).

62.7.30 SHOW_SOURCE Procedures

The procedure gets the source code. There are two overloaded `SHOW_SOURCE` procedures.

Syntax

```
DBMS_DEBUG.SHOW_SOURCE (
  first_line IN  BINARY_INTEGER,
  last_line  IN  BINARY_INTEGER,
  source     OUT vc2_table);

DBMS_DEBUG.SHOW_SOURCE (
  first_line IN  BINARY_INTEGER,
  last_line  IN  BINARY_INTEGER,
  window     IN  BINARY_INTEGER,
  print_arrow IN  BINARY_INTEGER,
  buffer     IN OUT VARCHAR2,
  buflen     IN  BINARY_INTEGER,
  pieces     OUT  BINARY_INTEGER);
```

Parameters

Table 62-53 SHOW_SOURCE Procedure Parameters

| Parameter | Description |
|--------------------------|---|
| <code>first_line</code> | Line number of first line to fetch (PL/SQL programs always start at line 1 and have no holes) |
| <code>last_line</code> | Line number of last line to fetch. No lines are fetched past the end of the program. |
| <code>source</code> | The resulting table, which may be indexed by line# |
| <code>window</code> | 'Window' of lines (the number of lines around the current source line) |
| <code>print_arrow</code> | Nonzero means to print an arrow before the current line |
| <code>buffer</code> | Buffer in which to place the source listing |
| <code>buflen</code> | Length of buffer |
| <code>pieces</code> | Set to nonzero if not all the source could be placed into the given buffer |

Return Values

An indexed table of source-lines. The source lines are stored starting at `first_line`. If any error occurs, then the table is empty.

Usage Notes

The best way to get the source code (for a program that is being run) is to use SQL. For example:

```
DECLARE
    info DBMS_DEBUG.runtime_info;
BEGIN
    -- call DBMS_DEBUG.SYNCHRONIZE, CONTINUE,
    -- or GET_RUNTIME_INFO to fill in 'info'
    SELECT text INTO <buffer> FROM all_source
    WHERE owner = info.Program.Owner
        AND name = info.Program.Name
        AND line = info.Line#;
END;
```

However, this does not work for nonpersistent programs (for example, anonymous blocks and trigger invocation blocks). For nonpersistent programs, call `SHOW_SOURCE`. There are two flavors: one returns an indexed table of source lines, and the other returns a packed (and formatted) buffer.

The second overloading of `SHOW_SOURCE` returns the source in a formatted buffer, complete with line-numbers. It is faster than the indexed table version, but it does not guarantee to fetch all the source.

If the source does not fit in `bufferlength` (`buflen`), then additional pieces can be retrieved using the `GET_MORE_SOURCE` procedure (`pieces` returns the number of additional pieces that need to be retrieved).

62.7.31 SYNCHRONIZE Function

This function waits until the target program signals an event. If `info_requested` is not `NULL`, then it calls `GET_RUNTIME_INFO`.

Syntax

```
DBMS_DEBUG.SYNCHRONIZE (
    run_info      OUT runtime_info,
    info_requested IN  BINARY_INTEGER := NULL)
RETURN BINARY_INTEGER;
```

Parameters

Table 62-54 SYNCHRONIZE Function Parameters

| Parameter | Description |
|-----------------------------|--|
| <code>run_info</code> | Structure in which to write information about the program. By default, this includes information about what program is running and at which line execution has paused. |
| <code>info_requested</code> | Optional bit-field in which to request information other than the default (which is <code>info_getStackDepth + info_getLineInfo</code>). 0 means that no information is requested at all (see DBMS_DEBUG Operational Notes for more about information flags). |

Return Values

Table 62-55 SYNCHRONIZE Function Return Values

| Return | Description |
|----------------------------------|--|
| <code>success</code> | A successful completion |
| <code>error_timeout</code> | Timed out before the program started execution |
| <code>error_communication</code> | Other communication error |

62.7.32 TARGET_PROGRAM_RUNNING Procedure

This procedure returns `TRUE` if the target session is currently executing a stored procedure, or `FALSE` if it is not.

Syntax

```
DBMS_DEBUG.TARGET_PROGRAM_RUNNING
RETURN BOOLEAN;
```

DBMS_DEBUG_JDWP

The `DBMS_DEBUG_JDWP` provides the interface to initiate and control the debugging of PL/SQL stored procedures and Java stored procedures over Java Debug Wire Protocol (JDWP).

This chapter contains the following topics:

- [DBMS_DEBUG_JDWP Overview](#)
- [DBMS_DEBUG_JDWP Security Model](#)
- [Summary of DBMS_DEBUG_JDWP Subprograms](#)

63.1 DBMS_DEBUG_JDWP Overview

Oracle supports the debugging of PL/SQL stored procedures and Java stored procedures over JDWP. Using the `DBMS_DEBUG_JDWP` package, you can:

- Retrieve the session ID of the current session and serial number
- Connect a database session to a debugger over JDWP
- Set the NLS parameters to change the formats in which PL/SQL program values are represented over JDWP

63.2 DBMS_DEBUG_JDWP Security Model

The debugging user invoking a `DBMS_DEBUG_JDWP` subprogram requires a privilege to connect the target database session to the debugger.

Table 63-1 System Privileges

| System Privilege | Description |
|-----------------------|--|
| DEBUG CONNECT SESSION | Allows a user to connect his current session to a debugger |
| DEBUG CONNECT ANY | Allows a user to connect a session by any logon user to a debugger |

In addition, the user can also be granted the following user privilege to debug another user's session.

Table 63-2 User Privileges

| User Privilege | Description |
|------------------------------|--|
| DEBUG CONNECT ON USER <user> | Allows a user to connect any of the specified user's logon sessions to a debugger to debug another user's session or his own |

63.3 Summary DBMS_DEBUG_JDWP Subprograms

This table lists the DBMS_DEBUG_JDWP subprograms and briefly describes them.

Table 63-3 DBMS_DEBUG_JDWP Package Subprograms

| Subprogram | Description |
|--|--|
| CONNECT_TCP Procedure | Connects the specified session to the debugger waiting at <code>host:port</code> |
| CURRENT_SESSION_ID Function | Gets the current session's session ID |
| CURRENT_SESSION_SERIAL Function | Gets the current session's session serial number |
| DISCONNECT Procedure | Disconnects the specified session from any debugger with which it is connected |
| GET-NLS_PARAMETER Function | Gets the value of the specified NLS parameter affecting the format in which NUMBER, DATE, TIME (WITH TIME ZONE) and TIMESTAMP (WITH TIME ZONE) runtime values of PL/SQL programs are converted to strings as they are presented through JDWP |
| PROCESS_CONNECT_STRING Procedure | Connects a session to a debugger without having to directly modify an application's code |
| SET-NLS_PARAMETER Procedure | Sets the value of the specified NLS parameter affecting the format in which NUMBER, DATE, TIME (WITH TIME ZONE) and TIMESTAMP (WITH TIME ZONE) runtime values of PL/SQL programs are converted to strings as they are presented through JDWP |

63.3.1 CONNECT_TCP Procedure

This procedure connects the specified session to the debugger waiting at `host:port`.

Syntax

```
DBMS_DEBUG_JDWP.CONNECT_TCP (
  host           IN VARCHAR2,
  port           IN VARCHAR2,
  session_id     IN PLS_INTEGER := NULL,
  session_serial IN PLS_INTEGER := NULL,
  debug_role     IN VARCHAR2 := NULL,
  debug_role_pwd IN VARCHAR2 := NULL,
  option_flags   IN PLS_INTEGER := 0,
  extensions_cmd_set IN PLS_INTEGER := 128);
```

Parameters

Table 63-4 CONNECT_TCP Parameters

| Parameter | Description |
|--------------------|--|
| host | The host name the debugger is waiting at |
| port | The port number the debugger is waiting at |
| session_id | Session ID |
| session_serial | Session number |
| debug_role | Debug role |
| debug_role_pwd | Debug password |
| option_flags | Values: <ul style="list-style-type: none"> 1 : Does not suspend the program until the next client/server request begins. This can be used to hide the startup sequence from end users, who may only want to see their own code 2 : Forces the connection even if the session appears to be connected to a debugger. This should best only be specified after some human-interaction confirmation step has occurred; i.e., if an attempt without this option raised ORA-30677, then if the user confirms, retry with this bit set. These may be added together to select multiple option choices. |
| extensions_cmd_set | The ID of the Oracle JDWP extension command set |

Exceptions

Table 63-5 CONNECT_TCP Exceptions

| Exception | Description |
|-----------|---|
| ORA-00022 | Invalid session ID |
| ORA-01031 | Insufficient privilege |
| ORA-30677 | Session is already connected to a debugger |
| ORA-30681 | Improper value for argument EXTENSIONS_CMD_SET |
| ORA-30682 | Improper value for argument OPTION_FLAGS |
| ORA-30683 | Failure establishing connection to debugger |

Usage Notes

- To connect the current session to a debugger, you can pass `NULL` to both the `session_id` and `session_serial` parameters.

- To connect a different session, you need to find out its ID and serial. These are available in the `v$sql_debuggable_sessions` view. The Instance Manager option of Oracle Enterprise Manager is one example of a user interface that displays these values to users. You can also find the values of these for your own session using the [CURRENT_SESSION_ID Function](#) and [CURRENT_SESSION_SERIAL Function](#).
- The `debug_role` and `debug_role_pwd` arguments allow the user to name any role as the "debug role", which will be available to privilege checking when checking for permissions to connect the session and when checking permissions available on objects within the debugged session. Both the role and its password are passed here as strings and not as identifiers, so double quotes should not be used but case matters. If the original role name wasn't double-quoted, it should be specified here in upper case.
- An `ORA-30677` indicates that the requested session is already being debugged. It is suggested in this case that the user be asked to confirm that (s)he desires to steal the session from the existing connection, and then either an explicit disconnect call or the use of the `connect_force_connect` option bit can be used to allow the connection to succeed on a second attempt. Note that using the `connect_force_connect` bit will avoid the session being allowed to run freely if it is currently suspended through the debugger - in other words, this bit lets you steal a session from one debugger to another without actually disturbing the state of the session.

63.3.2 CURRENT_SESSION_ID Function

This function gets the current session's session ID

Syntax

```
DBMS_DEBUG_JDWP.CURRENT_SESSION_ID  
RETURN PLS_INTEGER;
```

63.3.3 CURRENT_SESSION_SERIAL Function

This function gets the current session's session number.

Syntax

```
DBMS_DEBUG_JDWP.CURRENT_SESSION_SERIAL  
RETURN PLS_INTEGER;
```

63.3.4 DISCONNECT Procedure

This procedure disconnects the specified session from any debugger with which it is connected.

Syntax

```
DBMS_DEBUG_JDWP.DISCONNECT(  
    session_id      IN PLS_INTEGER := NULL,  
    session_serial  IN PLS_INTEGER := NULL);
```

Parameters

Table 63-6 DISCONNECT Procedure Parameters

| Parameter | Description |
|----------------|----------------|
| session_id | Session ID |
| session_serial | Session number |

Usage Notes

- If the session to disconnect is the current session, the session will be allowed to run freely after disconnecting the debugger. Otherwise, the session will be terminated.
- The same rights are required for this call as for connect, except when disconnecting the current session and the effective user at the time of the call is the same as the login user of the session where no privilege is required.

63.3.5 GET_NLS_PARAMETER Function

This function gets the value of the specified NLS parameter affecting the format in which the NUMBER, DATE, TIME (WITH TIME ZONE) and TIMESTAMP (WITH TIME ZONE) runtime values of PL/SQL programs are converted to strings, as they are presented through JDWP.

These values are private to the current session, but further are private to the debugger mechanisms, separate from the values used to convert values within the debugged program itself.

Syntax

```
DBMS_DEBUG_JDWP.GET_NLS_PARAMETER(
    name    IN  VARCHAR2)
RETURN VARCHAR2;
```

Parameters

Table 63-7 GET_NLS_PARAMETER Function Parameters

| Parameter | Description |
|-----------|-------------------------|
| name | Specified NLS parameter |

Usage Notes

- When any variable value is read or assigned through JDWP, or when either GET_NLS_PARAMETER Function or SET_NLS_PARAMETER Procedure is first invoked in a session, the debugger mechanisms make a private copy of the then-current NLS_LANGUAGE, NLS_TERRITORY, NLS_CALENDAR, NLS_DATE_LANGUAGE, NLS_NUMERIC_CHARACTERS, NLS_TIMESTAMP_FORMAT, NLS_TIMESTAMP_TZ_FORMAT, NLS_TIME_FOMAT and NLS_TIME_TZ_FORMAT values. These private copies may be read using this GET_NLS_PARAMETER Functioncall and changed using the following call to the [SET_NLS_PARAMETER Procedure](#).
- Once the debugger's private copy of the NLS parameters is established, changes made to the NLS parameters in the current session using the ALTER SESSION statement will

have no effect on the formatting of values as seen through JDWP. To modify the NLS parameters used for JDWP, one must use the `SET_NLS_PARAMETER Procedure`. By the same token, changes made to the debugger's private copy of the NLS parameters using `SET_NLS_PARAMETER Procedure` will have no effect on the debugged program itself.

- Date values are always formatted for JDWP use using the `NLS_TIMESTAMP_FORMAT`. The default format for `DATE (NLS_DATE_FORMAT)` used in a session most often does not show the time information that is in fact present in the value, and for debugging purposes it seems beneficial to always display that information.

63.3.6 PROCESS_CONNECT_STRING Procedure

This procedure connects a session to a debugger in two ways, so that you do not have to directly modify the application code.

The two ways are:

- Using the `ORA_DEBUG_JDWP` environment variable, when running an OCI program
- Setting a web browser cookie called `OWA_DEBUG_<dad>`, when running an application through the PL/SQL Web Gateway

Syntax

```
DBMS_DEBUG_JDWP.PROCESS_CONNECT_STRING (
    connect_string      IN VARCHAR2,
    connect_string_type IN PLS_INTEGER);
```

Parameters

Table 63-8 PROCESS_CONNECT_STRING Procedure Parameters

| Parameter | Description |
|----------------------------------|--|
| <code>connect_string</code> | The <code>ORA_DEBUG_JDWP</code> environment variable or <code>OWA_DEBUG_<dad></code> cookie value that contains the JDWP connection information such as the host and port number of the debugger to connect to |
| <code>connect_string_type</code> | Can have the following two values: <ul style="list-style-type: none"> • 1 if the connect string value is retrieved from the <code>ORA_DEBUG_JDWP</code> environment • 2 if the value is from the <code>OWA_DEBUG_<dad></code> cookie |

Exceptions

Table 63-9 PROCESS_CONNECT_STRING Procedure Exceptions

| Exception | Description |
|-----------|--|
| ORA-00022 | Invalid session ID |
| ORA-01031 | Insufficient privilege |
| ORA-30677 | Session is already connected to a debugger |

Table 63-9 (Cont.) PROCESS_CONNECT_STRING Procedure Exceptions

| Exception | Description |
|-----------|---|
| ORA-30681 | Improper value for argument EXTENSIONS_CMD_SET |
| ORA-30682 | Improper value for argument OPTION_FLAGS |
| ORA-30683 | Failure establishing connection to debugger |
| ORA-30689 | Improper value for environment variable ORA_DEBUG_JDWP |

63.3.7 SET_NLS_PARAMETER Procedure

This function sets the value of the specified NLS parameter affecting the format in which NUMBER, DATE, TIME (WITH TIME ZONE) and TIMESTAMP (WITH TIME ZONE) runtime values of PL/SQL programs are converted to strings as they are presented through JDWP.

These values are private to the current session, but further are private to the debugger mechanisms, separate from the values used to convert values within the debugged program itself.

Syntax

```
DBMS_DEBUG_JDWP.SET_NLS_PARAMETER(
    name      IN  VARCHAR2,
    value     IN  VARCHAR2);
```

Parameters

Table 63-10 SET_NLS_PARAMETER Procedure Parameters

| Parameter | Description |
|-----------|----------------------------------|
| name | Specified NLS parameter |
| value | Value of specified NLS parameter |

Usage Notes

- When any variable value is read or assigned through JDWP, or when either [GET_NLS_PARAMETER Function](#) or [SET_NLS_PARAMETER Procedure](#) is first invoked in a session, the debugger mechanisms make a private copy of the then-current NLS_LANGUAGE, NLS_TERRITORY, NLS_CALENDAR, NLS_DATE_LANGUAGE, NLS_NUMERIC_CHARACTERS, NLS_TIMESTAMP_FORMAT, NLS_TIMESTAMP_TZ_FORMAT, NLS_TIME_FOMAT and NLS_TIME_TZ_FORMAT values. These private copies may be read by calling the [GET_NLS_PARAMETER Function](#) and changed using the following call to the [SET_NLS_PARAMETER Procedure](#).
- Once the debugger's private copy of the NLS parameters is established, changes made to the NLS parameters in the current session using the ALTER SESSION statement will have no effect on the formatting of values as seen through JDWP. To modify the NLS parameters used for JDWP, one must use the [SET_NLS_PARAMETER Procedure](#). By the same token, changes made to the debugger's private copy of the NLS parameters using [SET_NLS_PARAMETER Procedure](#) will have no effect on the debugged program itself.

- Date values are always formatted for JDWP use using the `NLS_TIMESTAMP_FORMAT`. The default format for `DATE` (`NLS_DATE_FORMAT`) used in a session most often does not show the time information that is in fact present in the value, and for debugging purposes it seems beneficial to always display that information.

DBMS_DEBUG_JDWP_CUSTOM

The `DBMS_DEBUG_JDWP_CUSTOM` package provides database users a means to perform custom handling of a debug connection request of a database session to a debugger using the Java Debug Wire Protocol (JDWP).

This chapter contains the following topics:

- [DBMS_DEBUG_JDWP_CUSTOM Overview](#)
- [DBMS_DEBUG_JDWP_CUSTOM Security Model](#)
- [Summary of DBMS_DEBUG_JDWP_CUSTOM Subprograms](#)

64.1 DBMS_DEBUG_JDWP_CUSTOM Overview

The `DBMS_DEBUG_JDWP_CUSTOM` package is invoked when you attempt to connect your database session to a debugger, using the Java Debug Wire Protocol (JDWP). Before connecting to the database, you must set the `ORA_DEBUG_JDWP` environment variable in your client-side OCI application. Defining this package in your schema enables you to perform custom actions before connecting your database session to the debugger.

64.2 DBMS_DEBUG_JDWP_CUSTOM Security Model

This default implementation of the `DBMS_DEBUG_JDWP_CUSTOM` package does not perform any additional security checks and only invokes the `DBMS_DEBUG_JDWP` package for making the debug connection. When the `DBMS_DEBUG_JDWP` package is invoked, it checks for the necessary `DEBUG CONNECT` system or user privilege before making the connection.

A database user who wants to perform additional custom security checks, must perform the following steps to override this default implementation:

- Define the `DBMS_DEBUG_JDWP_CUSTOM` package in the user's own schema.
- Implement the check before invoking the `DBMS_DEBUG_JDWP` package in the user's local copy of the package.

64.3 Summary DBMS_DEBUG_JDWP_CUSTOM Subprograms

This table summarizes the `DBMS_DEBUG_JDWP_CUSTOM` subprograms.

Table 64-1 DBMS_DEBUG_JDWP_CUSTOM Subprograms

| Subprogram | Description |
|--|---|
| CONNECT_DEBUGGER Procedure | This procedure is invoked to handle the debug connection request of the current database session to the debugger. |

64.3.1 CONNECT_DEBUGGER Procedure

This procedure is invoked to handle the debug connection request of the current database session to the debugger.

Syntax

```
PROCEDURE CONNECT_DEBUGGER
(
    HOST            VARCHAR2,
    PORT            VARCHAR2,
    DEBUG_ROLE      VARCHAR2 := NULL,
    DEBUG_ROLE_PWD  VARCHAR2 := NULL,
    OPTION_FLAGS    PLS_INTEGER := 0,
    EXTENSIONS_CMD_SET PLS_INTEGER := 128
)
```

Parameters

The preceding parameters are for the default implementation of the procedure for handling the debug connection request. A user, who wants to customize the handling of the request, must override this default implementation of the `DBMS_DEBUG_JDWP_CUSTOM` package procedure by defining the package (specification and body) with a procedure of the same name in the user's own schema. The user may customize the number and names of the arguments, but must have the same name for the package and the procedure, namely, `DBMS_DEBUG_JDWP_CUSTOM` and `CONNECT_DEBUGGER` respectively. The user's customized version of the package may contain overloaded versions of the `CONNECT_DEBUGGER` procedure with different arguments. All of the arguments to the custom package procedure must either be of `VARCHAR2` type or of types that PL/SQL can implicitly convert from `VARCHAR2`.

For example, if a user wants to disallow debugging outside business hours, while applying optional NLS settings to the program values displayed during debugging, then the user can define a custom implementation of the package in the user's schema in the following way:

```
CREATE OR REPLACE PACKAGE DBMS_DEBUG_JDWP_CUSTOM AUTHID CURRENT_USER IS
    PROCEDURE CONNECT_DEBUGGER(HOST VARCHAR2,
                               PORT VARCHAR2,
                               NLS_LANGUAGE VARCHAR2 DEFAULT NULL,
                               NLS_TERRITORY VARCHAR2 DEFAULT NULL);
END;
/

CREATE OR REPLACE PACKAGE BODY DBMS_DEBUG_JDWP_CUSTOM IS

    PROCEDURE CONNECT_DEBUGGER(HOST VARCHAR2,
                               PORT VARCHAR2,
                               NLS_LANGUAGE VARCHAR2 DEFAULT NULL,
                               NLS_TERRITORY VARCHAR2 DEFAULT NULL) IS
    BEGIN
        SELECT EXTRACT(HOUR FROM LOCALTIMESTAMP) INTO HOUR FROM DUAL;
```

```
IF (HOUR < 9 OR HOUR > 5) THEN
  RAISE_APPLICATION_ERROR(-20000,
    'Debug connection disallowed outside business hours');
ELSE
  IF (NLS_LANGUAGE IS NOT NULL) THEN
    DBMS_DEBUG_JDWP.SET-NLS_PARAMETER('NLS_LANGUAGE', NLS_LANGUAGE);
  END IF;
  IF (NLS_TERRITORY IS NOT NULL) THEN
    DBMS_DEBUG_JDWP.SET-NLS_PARAMETER('NLS_TERRITORY', NLS_TERRITORY);
  END IF;
  DBMS_DEBUG_JDWP.CONNECT_TCP(HOST, PORT);
END IF;
END;

END;
/
```

Before executing the client application for passing arguments to the procedure parameters, the user must set the `ORA_DEBUG_JDWP` environment variable as follows :

```
> setenv ORA_DEBUG_JDWP "host=123.45.67.89;port=4000;nls_language=american"
> myapp -user HR/<password>
...
```

DBMS_DESCRIBE

You can use the `DBMS_DESCRIBE` package to get information about a PL/SQL object. When you specify an object name, `DBMS_DESCRIBE` returns a set of indexed tables with the results. Full name translation is performed and security checking is also checked on the final object.

This chapter contains the following topics:

- [Overview](#)
- [Security Model](#)
- [Types](#)
- [Exceptions](#)
- [Examples](#)
- [Summary of DBMS_DESCRIBE Subprograms](#)

65.1 DBMS_DESCRIBE Overview

This package provides the same functionality as the Oracle Call Interface `OCIDescribeAny` call.

See Also:

Oracle Call Interface Developer's Guide

65.2 DBMS_DESCRIBE Security Model

This package is available to `PUBLIC` and performs its own security checking based on the schema object being described.

65.3 DBMS_DESCRIBE Types

The `DBMS_DESCRIBE` package declares two PL/SQL table types, which are used to hold data returned by `DESCRIBE_PROCEDURE` in its `OUT` parameters.

The types are:

```
TYPE VARCHAR2_TABLE IS TABLE OF VARCHAR2(30)
INDEX BY BINARY_INTEGER;
```

```
TYPE NUMBER_TABLE IS TABLE OF NUMBER
INDEX BY BINARY_INTEGER;
```

65.4 DBMS_DESCRIBE Exceptions

DBMS_DESCRIBE can raise application errors in the range -20000 to -20004.

Table 65-1 DBMS_DESCRIBE Errors

| Error | Description |
|-----------|---|
| ORA-20000 | ORU 10035: cannot describe a package ('X') only a procedure within a package. |
| ORA-20001 | ORU-10032: procedure 'X' within package 'Y' does not exist. |
| ORA-20002 | ORU-10033: object 'X' is remote, cannot describe; expanded name 'Y'. |
| ORA-20003 | ORU-10036: object 'X' is invalid and cannot be described. |
| ORA-20004 | Syntax error attempting to parse 'X'. |

65.5 DBMS_DESCRIBE Examples

One use of the DESCRIBE_PROCEDURE procedure is as an external service interface.

For example, consider a client that provides an OBJECT_NAME of SCOTT.ACCOUNT_UPDATE, where ACCOUNT_UPDATE is an overloaded function with specification:

```
TABLE account (acct_no NUMBER, person_id NUMBER,
               balance NUMBER(7,2))
TABLE person (person_id number(4), person_nm varchar2(10))

CREATE OR REPLACE PACKAGE ACCOUNT_PKG IS
  FUNCTION ACCOUNT_UPDATE (acct_no
    NUMBER,
                           person
                           person%rowtype,
                           amounts
                           DBMS_DESCRIBE.NUMBER_TABLE,
                           trans_date
                           DATE)
    return
    account.balance%type;

  FUNCTION ACCOUNT_UPDATE (acct_no
    NUMBER,
                           person
                           person%rowtype,
                           amounts
                           DBMS_DESCRIBE.NUMBER_TABLE,
                           trans_no
                           NUMBER)
    return
    account.balance%type;
END;
```

This procedure might look similar to the following output:

```
overload position argument level datatype length prec scale rad
-----
1          0          0          2      22      7      2  10
1          1  ACCNT_NO  0          2       0      0      0  0
1          2  PERSON    0        250      0      0      0  0
1          1  PERSON_ID  1          2      22      4      0  10
1          2  PERSON_NM  1          1      10      0      0  0
1          3  AMOUNTS   0        251      0      0      0  0
1          1          1          2      22      0      0  0
1          4  TRANS_DATE 0         12       0      0      0  0
2          0          0          2      22      7      2  10
```

| | | | | | | | | |
|---|---|----------|---|-----|----|---|---|----|
| 2 | 1 | ACCNT_NO | 0 | 2 | 22 | 0 | 0 | 0 |
| 2 | 2 | PERSON | 0 | 2 | 22 | 4 | 0 | 10 |
| 2 | 3 | AMOUNTS | 0 | 251 | 22 | 4 | 0 | 10 |
| 2 | 1 | | 1 | 2 | 0 | 0 | 0 | 0 |
| 2 | 4 | TRANS_NO | 0 | 2 | 0 | 0 | 0 | 0 |

The following PL/SQL procedure has as its parameters all of the PL/SQL datatypes:

```
CREATE OR REPLACE PROCEDURE p1 (
  pvc2   IN   VARCHAR2,
  pvc    OUT  VARCHAR,
  pstr   IN OUT STRING,
  plong  IN   LONG,
  prowid IN   ROWID,
  pchara IN   CHARACTER,
  pchar  IN   CHAR,
  praw  IN   RAW,
  plraw  IN   LONG RAW,
  pbinint IN BINARY_INTEGER,
  pplsint IN PLS_INTEGER,
  pbool  IN   BOOLEAN,
  pnat   IN   NATURAL,
  ppos   IN   POSITIVE,
  pposn  IN   POSITIVEN,
  pnatn  IN   NATURALN,
  pnum   IN   NUMBER,
  pintgr IN   INTEGER,
  pint   IN   INT,
  psmall IN   SMALLINT,
  pdec   IN   DECIMAL,
  preal  IN   REAL,
  pfloat IN   FLOAT,
  pnumer IN   NUMERIC,
  pdp    IN   DOUBLE PRECISION,
  pdate  IN   DATE,
  pmls   IN   MLSLABEL) AS

BEGIN
  NULL;
END;
```

If you describe this procedure using the following:

```
CREATE OR REPLACE PACKAGE describe_it AS

  PROCEDURE desc_proc (name VARCHAR2);

END describe_it;

CREATE OR REPLACE PACKAGE BODY describe_it AS

  PROCEDURE prt_value(val VARCHAR2, isize INTEGER) IS
    n INTEGER;
  BEGIN
    n := isize - LENGTHB(val);
    IF n < 0 THEN
      n := 0;
    END IF;
    DBMS_OUTPUT.PUT(val);
    FOR i in 1..n LOOP
      DBMS_OUTPUT.PUT(' ');
    END LOOP;
  END;
```

```

        END LOOP;
    END prt_value;

    PROCEDURE desc_proc (name VARCHAR2) IS

        overload      DBMS_DESCRIBE.NUMBER_TABLE;
        position       DBMS_DESCRIBE.NUMBER_TABLE;
        c_level        DBMS_DESCRIBE.NUMBER_TABLE;
        arg_name       DBMS_DESCRIBE.VARCHAR2_TABLE;
        dtty           DBMS_DESCRIBE.NUMBER_TABLE;
        def_val        DBMS_DESCRIBE.NUMBER_TABLE;
        p_mode         DBMS_DESCRIBE.NUMBER_TABLE;
        length         DBMS_DESCRIBE.NUMBER_TABLE;
        precision      DBMS_DESCRIBE.NUMBER_TABLE;
        scale          DBMS_DESCRIBE.NUMBER_TABLE;
        radix          DBMS_DESCRIBE.NUMBER_TABLE;
        spare          DBMS_DESCRIBE.NUMBER_TABLE;
        idx            INTEGER := 0;

    BEGIN
        DBMS_DESCRIBE.DESCRIBE_PROCEDURE(
            name,
            null,
            null,
            overload,
            position,
            c_level,
            arg_name,
            dtty,
            def_val,
            p_mode,
            length,
            precision,
            scale,
            radix,
            spare);

        DBMS_OUTPUT.PUT_LINE('Position      Name          DTY  Mode');
        LOOP
            idx := idx + 1;
            prt_value(TO_CHAR(position(idx)), 12);
            prt_value(arg_name(idx), 12);
            prt_value(TO_CHAR(dtty(idx)), 5);
            prt_value(TO_CHAR(p_mode(idx)), 5);
            DBMS_OUTPUT.NEW_LINE;
        END LOOP;
    EXCEPTION
        WHEN NO_DATA_FOUND THEN
            DBMS_OUTPUT.NEW_LINE;
            DBMS_OUTPUT.NEW_LINE;

    END desc_proc;
END describe_it;

```

Then the results list all the numeric codes for the PL/SQL datatypes:

| Position | Name | Datatype_Code | Mode |
|----------|-------|---------------|------|
| 1 | PVC2 | 1 | 0 |
| 2 | PVC | 1 | 1 |
| 3 | PSTR | 1 | 2 |
| 4 | PLONG | 8 | 0 |

| | | | |
|----|---------|-----|---|
| 5 | PROWID | 11 | 0 |
| 6 | PCHARA | 96 | 0 |
| 7 | PCHAR | 96 | 0 |
| 8 | PRAW | 23 | 0 |
| 9 | PLRAW | 24 | 0 |
| 10 | PBININT | 3 | 0 |
| 11 | PPLSINT | 3 | 0 |
| 12 | PBOOL | 252 | 0 |
| 13 | PNAT | 3 | 0 |
| 14 | PPOS | 3 | 0 |
| 15 | PPOSN | 3 | 0 |
| 16 | PNATN | 3 | 0 |
| 17 | PNUM | 2 | 0 |
| 18 | PINTGR | 2 | 0 |
| 19 | PINT | 2 | 0 |
| 20 | PSMALL | 2 | 0 |
| 21 | PDEC | 2 | 0 |
| 22 | PREAL | 2 | 0 |
| 23 | PFLOAT | 2 | 0 |
| 24 | PNUMBER | 2 | 0 |
| 25 | PDP | 2 | 0 |
| 26 | PDATE | 12 | 0 |
| 27 | PMLS | 106 | 0 |

65.6 Summary of DBMS_DESCRIBE Subprograms

The DBMS_DESCRIBE package includes the DESCRIBE_PROCEDURE procedure.

Table 65-2 DBMS_DESCRIBE Package Subprograms

| Subprogram | Description |
|--|---|
| DESCRIBE_PROCEDURE Procedure | Provides a brief description of a PL/SQL stored procedure |

65.6.1 DESCRIBE_PROCEDURE Procedure

The procedure DESCRIBE_PROCEDURE provides a brief description of a PL/SQL stored procedure.

It takes the name of a stored procedure and returns information about each parameter of that procedure.

Syntax

```
DBMS_DESCRIBE.DESCRIBE_PROCEDURE (
    object_name          IN  VARCHAR2,
    reserved1            IN  VARCHAR2,
    reserved2            IN  VARCHAR2,
    overload             OUT NUMBER_TABLE,
    position             OUT NUMBER_TABLE,
    level                OUT NUMBER_TABLE,
    argument_name        OUT VARCHAR2_TABLE,
    datatype             OUT NUMBER_TABLE,
    default_value        OUT NUMBER_TABLE,
    in_out               OUT NUMBER_TABLE,
    length               OUT NUMBER_TABLE,
    precision            OUT NUMBER_TABLE,
```

```

scale                OUT NUMBER_TABLE,
radix                OUT NUMBER_TABLE,
spare                OUT NUMBER_TABLE
include_string_constraints  OUT BOOLEAN DEFAULT FALSE);

```

Parameters

Table 65-3 DBMS_DESCRIBE.DESCRIBE_PROCEDURE Parameters

| Parameter | Description |
|------------------------|---|
| object_name | <p>Name of the procedure being described.</p> <p>The syntax for this parameter follows the rules used for identifiers in SQL. The name can be a synonym. This parameter is required and may not be null. The total length of the name cannot exceed 197 bytes. An incorrectly specified OBJECT_NAME can result in one of the following exceptions:</p> <p>ORA-20000 - A package was specified. You can only specify a stored procedure, stored function, packaged procedure, or packaged function.</p> <p>ORA-20001 - The procedure or function that you specified does not exist within the given package.</p> <p>ORA-20002 - The object that you specified is a remote object. This procedure cannot currently describe remote objects.</p> <p>ORA-20003 - The object that you specified is invalid and cannot be described.</p> <p>ORA-20004 - The object was specified with a syntax error.</p> |
| reserved1 reserved2 | Reserved for future use -- must be set to NULL or the empty string. |
| overload | <p>A unique number assigned to the procedure's signature.</p> <p>If a procedure is overloaded, then this field holds a different value for each version of the procedure.</p> |
| position | <p>Position of the argument in the parameter list.</p> <p>Position 0 returns the values for the return type of a function.</p> |
| level | If the argument is a composite type, such as record, then this parameter returns the level of the datatype. See the <i>Oracle Call Interface Developer's Guide</i> for a description of the ODESSP call for an example. |
| argument_name | Name of the argument associated with the procedure that you are describing. |

Table 65-3 (Cont.) DBMS_DESCRIBE.DESCRIBE_PROCEDURE Parameters

| Parameter | Description |
|----------------------------|--|
| datatype | <p>Oracle datatype of the argument being described. The datatypes and their numeric type codes are:</p> <pre> 0 placeholder for procedures with no arguments 1 VARCHAR, VARCHAR, STRING 2 NUMBER, INTEGER, SMALLINT, REAL, FLOAT, DECIMAL 3 BINARY_INTEGER, PLS_INTEGER, POSITIVE, NATURAL 8 LONG 11 ROWID 12 DATE 23 RAW 24 LONG RAW 58 OPAQUE TYPE 96 CHAR (ANSI FIXED CHAR), CHARACTER 106 MLSLABEL 121 OBJECT 122 NESTED TABLE 123 VARRAY 178 TIME 179 TIME WITH TIME ZONE 180 TIMESTAMP 181 TIMESTAMP WITH TIME ZONE 231 TIMESTAMP WITH LOCAL TIME ZONE 250 PL/SQL RECORD 251 PL/SQL TABLE 252 PL/SQL BOOLEAN </pre> |
| default_value | 1 if the argument being described has a default value; otherwise, the value is 0. |
| in_out | <p>Describes the mode of the parameter:</p> <pre> 0 IN 1 OUT 2 IN OUT </pre> |
| length | For %rowtype formal arguments, the length constraint is returned, otherwise 0 is returned. If the include_string_constraints parameter is set to TRUE, the argument's formal length constraint is passed back if it is of the appropriate type. Those are the string types: 1;8;23;24;96 |
| precision | If the argument being described is of datatype 2 (NUMBER), then this parameter is the precision of that number. |
| scale | If the argument being described is of datatype 2 (NUMBER), then this parameter is the scale of that number. |
| radix | If the argument being described is of datatype 2 (NUMBER), then this parameter is the radix of that number. |
| spare | Reserved for future functionality. |
| include_string_constraints | The default is FALSE. If the parameter is set to TRUE, the arguments' formal type constraints is passed back if it is of the appropriate type. Those are the string types: 1;8;23;24;96 |

Return Values

All values from `DESCRIBE_PROCEDURE` are returned in its `OUT` parameters. The datatypes for these are PL/SQL tables, to accommodate a variable number of parameters.

DBMS_DG

The `DBMS_DG` package allows applications to notify the primary database or the fast-start failover target database in an Oracle Data Guard broker environment to initiate a fast-start failover when the application encounters a condition that warrants a failover.

 **Note:**

A multitenant container database is the only supported architecture in Oracle Database 20c. While the documentation is being revised, legacy terminology may persist. In most cases, "database" and "non-CDB" refer to a CDB or PDB, depending on context. In some contexts, such as upgrades, "non-CDB" refers to a non-CDB from a previous release.

This chapter contains the following topics:

- [Using DBMS_DG](#)
- [Security Model](#)
- [Summary of the DBMS_DG Subprogram](#)

 **See Also:**

Oracle Data Guard Broker

66.1 Using DBMS_DG

There are conditions detectable by applications running outside of the Oracle database that may warrant the Oracle Data Guard broker to perform a fast-start failover. Because the range of possible conditions is virtually unlimited, it is left to the applications to determine which conditions warrant a fast-start failover.

When such conditions occur, the application calls the `DBMS_DG.INITIATE_FS_FAILOVER` procedure to alert either the primary or fast-start failover target standby database that the application wants a fast-start failover to occur immediately. The database on which the procedure was called then notifies the observer, which immediately initiates a fast-start failover as long as the standby database is in a valid fast-start failover state ("observed" and either "synchronized" or "within lag") to accept a failover. If the configuration is not in a valid fast-start failover state, the `INITIATE_FS_FAILOVER` subprogram returns an ORA error message (it will not signal an exception) to inform the calling application that a fast-start failover could not be performed.

 **Note:**

If you are working in a multitenant container database (CDB), then functions within `DBMS_DG` are only executed at the root level. Ensure you are connected at the root level, not at the individual pluggable database (PDB) level.

66.2 DBMS_DG Security Model

The `DBMS_DG` package runs with invoker's rights and requires the `SYSDBA` privilege.

66.3 Summary of the DBMS_DG Subprogram

The `DBMS_DG` package contains one subprogram, the `INITIATE_FS_FAILOVER` procedure.

Table 66-1 DBMS_DG Package Subprogram

| Subprogram | Description |
|--|---|
| INITIATE_FS_FAILOVER Procedure | Enables an application to notify either the primary or fast-start failover target standby database that a fast-start failover is necessary when the application encounters conditions that warrant a failover. This procedure can only be called while connected to a primary database or a fast-start failover standby database. |

66.3.1 INITIATE_FS_FAILOVER Procedure

Use this procedure to specify a condition string that, when encountered by an application, allows the application to request that a fast-start failover be invoked.

Syntax

```
DBMS_DG.INITIATE_FS_FAILOVER (
    condstr          IN VARCHAR2)
RETURN BINARY_INTEGER;
```

Parameters

Table 66-2 INITIATE_FS_FAILOVER Procedure Parameters

| Parameter | Description |
|----------------------|--|
| <code>condstr</code> | Specifies the condition string for which a fast-start failover should be requested. If no condition string argument is supplied, the default string of "Application Failover Requested" will be logged in the broker log file and in the database alert log of the database on which the procedure was called. |

Usage Notes

- This procedure returns a binary integer.

- Query the `V$FS_FAILOVER_STATS` view to see the time of the last fast-start failover and the reason it was performed.
- This procedure can only be called while connected to a primary database or a fast-start failover standby database.

Errors

Table 66-3 INITIATE_FS_FAILOVER Procedure Errors

| Error | Description |
|---|---|
| ORA-00000: normal, successful completion | The request to initiate a fast-start failover has been posted to the observer. |
| ORA-16646: fast-start failover is disabled | Either a broker configuration does not exist or fast-start failover has not been enabled. |
| ORA-16666: unable to initiate fast-start failover on a bystander standby database | DBMS_DG.INITIATE_FS_FAILOVER was invoked on a bystander standby database. That is, it was not invoked on the primary or on the fast-start failover target standby database. |
| ORA-16817: unsynchronized fast-start failover configuration | DBMS_DG.INITIATE_FS_FAILOVER was invoked in a maximum available fast-start failover configuration when the configuration was not synchronized. |
| ORA-16819: fast-start failover observer not started | DBMS_DG.INITIATE_FS_FAILOVER was invoked but an observer had not yet been started. |
| ORA-16820: fast-start failover observer is no longer observing this database | DBMS_DG.INITIATE_FS_FAILOVER was invoked but the configuration detects that the observer may not be running. |
| ORA-16829: lagging fast-start failover configuration | DBMS_DG.INITIATE_FS_FAILOVER was invoked in a maximum performance fast-start failover configuration when the configuration was not in the user-specified redo lag limit. |

Example

In this example, the program attempts to initiate a fast-start failover when fast-start failover is disabled. To use this example, connect as user `SYS` with `SYDDBA` privileges.

```
set serveroutput on

declare
status integer;

begin
status := dbms_dg.initiate_fs_failover('Failover Requested');

dbms_output.put_line('Fast-Start Failover is disabled: Expected status = ORA-16646');
dbms_output.put_line('                Actual Status = ORA-' || status);

end;
/
exit;
```

DBMS_DIMENSION

DBMS_DIMENSION enables you to verify dimension relationships and provides an alternative to the Enterprise Manager Dimension Wizard for displaying a dimension definition.

See Also:

Oracle Database Data Warehousing Guide for detailed conceptual and usage information about the DBMS_DIMENSION package

This chapter contains the following topics:

- [Security Model](#)
- [Summary of DBMS_DIMENSION Subprograms](#)

67.1 DBMS_DIMENSION Security Model

Security on this package can be controlled by granting EXECUTE to selected users or roles.

A user can validate or describe all the dimensions in his own schema. To validate or describe a dimension in another schema, you must have either an object privilege on the dimension or one of the following system privileges: CREATE ANY DIMENSION, ALTER ANY DIMENSION, and DROP ANY DIMENSION.

67.2 Summary of DBMS_DIMENSION Subprograms

This table lists the DBMS_DIMENSION subprograms and briefly describes them.

Table 67-1 DBMS_DIMENSION Package Subprograms

| Subprogram | Description |
|--|---|
| DESCRIBE_DIMENSION Procedure | Prints out the definition of the input dimension, including dimension owner and name, levels, hierarchies, and attributes |
| VALIDATE_DIMENSION Procedure | Verifies that the relationships specified in a dimension are correct |

67.2.1 DESCRIBE_DIMENSION Procedure

This procedure displays the definition of the dimension, including dimension name, levels, hierarchies, and attributes. It displays the output using the `DBMS_OUTPUT` package.

Syntax

```
DBMS_DIMENSION.DESCRIBE_DIMENSION (
    dimension IN VARCHAR2);
```

Parameters

Table 67-2 DESCRIBE_DIMENSION Procedure Parameter

| Parameter | Description |
|------------------------|--|
| <code>dimension</code> | The owner and name of the dimension in the format of <code>owner.name</code> . |

67.2.2 VALIDATE_DIMENSION Procedure

This procedure verifies that the relationships specified in a dimension are valid. The `rowid` for any row that is found to be invalid will be stored in the table `DIMENSION_EXCEPTIONS` in the user's schema.

Syntax

```
DBMS_DIMENSION.VALIDATE_DIMENSION (
    dimension          IN VARCHAR2,
    incremental        IN BOOLEAN := TRUE,
    check_nulls        IN BOOLEAN := FALSE,
    statement_id       IN VARCHAR2 := NULL );
```

Parameters

Table 67-3 VALIDATE_DIMENSION Procedure Parameters

| Parameter | Description |
|---------------------------|--|
| <code>dimension</code> | The owner and name of the dimension in the format of <code>owner.name</code> . |
| <code>incremental</code> | If <code>TRUE</code> , check only the new rows for tables of this dimension. If <code>FALSE</code> , check all the rows. |
| <code>check_nulls</code> | If <code>TRUE</code> , then all level columns are verified to be non-null. If <code>FALSE</code> , this check is omitted. Specify <code>FALSE</code> when non-NULLness is guaranteed by other means, such as <code>NOT NULL</code> constraints. |
| <code>statement_id</code> | A client-supplied unique identifier to associate output rows with specific invocations of the procedure. |

DBMS_DISTRIBUTED_TRUST_ADMIN

DBMS_DISTRIBUTED_TRUST_ADMIN procedures maintain the Trusted Servers List. Use these procedures to define whether a server is trusted. If a database is not trusted, Oracle refuses current user database links from the database.

This chapter contains the following topics:

- [Overview](#)
- [Security Model](#)
- [Examples](#)
- [Summary of DBMS_DISTRIBUTED_TRUST_ADMIN Subprograms](#)

68.1 DBMS_DISTRIBUTED_TRUST_ADMIN Overview

Oracle uses local Trusted Servers Lists, along with enterprise domain membership lists stored in the enterprise LDAP directory service, to determine if another database is trusted. The LDAP directory service entries are managed with the Enterprise Security Manager Tool in Oracle Enterprise Manager.

Oracle considers another database to be "trusted" if it meets the following criteria:

1. It is in the same enterprise domain in the directory service as the local database.
2. The enterprise domain is marked as trusted in the directory service.
3. It is not listed as untrusted in the local Trusted Servers List. Current user database links will only be accepted from another database if both databases involved trust each other.

You can list a database server locally in the Trusted Servers List regardless of what is listed in the directory service. However, if you list a database that is not in the same domain as the local database, or if that domain is untrusted, the entry will have no effect.

This functionality is part of the Enterprise User Security feature of the Oracle Advanced Security Option.

68.2 DBMS_DISTRIBUTED_TRUST_ADMIN Security Model

To execute DBMS_DISTRIBUTED_TRUST_ADMIN, the EXECUTE_CATALOG_ROLE role must be granted to the DBA. To select from the view TRUSTED_SERVERS, the SELECT_CATALOG_ROLE role must be granted to the DBA.

It is important to know whether all servers are trusted or not trusted. Trusting a particular server with the ALLOW_SERVER procedure does not have any effect if the database already trusts all databases, or if that database is already trusted. Similarly, denying a particular server with the DENY_SERVER procedure does not have any effect if the database already does not trust any database or if that database is already untrusted.

The procedures `DENY_ALL` and `ALLOW_ALL` delete all entries (in other words, server names) that are explicitly allowed or denied using the `ALLOW_SERVER` procedure or `DENY_SERVER` procedure respectively.

68.3 DBMS_DISTRIBUTED_TRUST_ADMIN Examples

If you have not yet used the package `DBMS_DISTRIBUTED_TRUST_ADMIN` to change the trust listing, by default you trust all databases in the same enterprise domain if that domain is listed as trusted in the directory service:

```
SELECT * FROM TRUSTED_SERVERS;
TRUST
NAME
-----
Trusted
All
```

Because all servers are currently trusted, you can execute the [DENY_SERVER Procedure](#) and specify that a particular server is not trusted:

```
EXECUTE DBMS_DISTRIBUTED_TRUST_ADMIN.DENY_SERVER
        ('SALES.US.AMERICAS.ACME_AUTO.COM');
PL/SQL procedure successfully completed.
```

```
SELECT * FROM TRUSTED_SERVERS;
TRUST
NAME
-----
Untrusted SALES.US.AMERICAS.ACME_AUTO.COM
```

By executing the [DENY_ALL Procedure](#), you can choose to not trust any database server:

```
EXECUTE DBMS_DISTRIBUTED_TRUST_ADMIN.DENY_ALL;
```

```
PL/SQL procedure successfully completed.
```

```
SELECT * FROM TRUSTED_SERVERS;

TRUST
NAME
-----
Untrusted
All
```

The [ALLOW_SERVER Procedure](#) can be used to specify that one particular database is to be trusted:

```
EXECUTE DBMS_DISTRIBUTED_TRUST_ADMIN.ALLOW_SERVER
        ('SALES.US.AMERICAS.ACME_AUTO.COM');
PL/SQL procedure successfully completed.
```

```
SELECT * FROM TRUSTED_SERVERS;
TRUST
NAME
-----
Trusted  SALES.US.AMERICAS.ACME_AUTO.COM
```

68.4 Summary of DBMS_DISTRIBUTED_TRUST_ADMIN Subprograms

This table lists and briefly describes the DBMS_DISTRIBUTED_TRUST_ADMIN subprograms.

Table 68-1 DBMS_DISTRIBUTED_TRUST_ADMIN Package Subprograms

| Subprogram | Description |
|--|--|
| ALLOW_ALL Procedure | Empties the list and inserts a row indicating that all servers should be trusted |
| ALLOW_SERVER Procedure | Enables a specific server to be allowed access even though deny all is indicated in the list |
| DENY_ALL Procedure | Empties the list and inserts a row indicating that all servers should be untrusted |
| DENY_SERVER Procedure | Enables a specific server to be denied access even though allow all is indicated in the list |

68.4.1 ALLOW_ALL Procedure

This procedure empties the Trusted Servers List and specifies that all servers that are members of a trusted domain in an enterprise directory service and that are in the same domain are allowed access.

The view TRUSTED_SERVERS will show "TRUSTED ALL" indicating that the database trusts all servers that are currently trusted by the enterprise directory service.

Syntax

```
DBMS_DISTRIBUTED_TRUST_ADMIN.ALLOW_ALL;
```

Usage Notes

ALLOW_ALL only applies to servers listed as trusted in the enterprise directory service and in the same enterprise domain.

68.4.2 ALLOW_SERVER Procedure

This procedure ensures that the specified server is considered trusted (even if you have previously specified "deny all").

Syntax

```
DBMS_DISTRIBUTED_TRUST_ADMIN.ALLOW_SERVER (
    server IN VARCHAR2);
```

Parameters

Table 68-2 ALLOW_SERVER Procedure Parameters

| Parameter | Description |
|-----------|---|
| server | Unique, fully-qualified name of the server to be trusted. |

Usage Notes

If the Trusted Servers List contains the entry "deny all", then this procedure adds a specification indicating that a specific database (for example, DBx) is to be trusted.

If the Trusted Servers List contains the entry "allow all", and if there is no "deny DBx" entry in the list, then executing this procedure causes no change.

If the Trusted Servers List contains the entry "allow all", and if there is a "deny DBx" entry in the list, then that entry is deleted.

68.4.3 DENY_ALL Procedure

This procedure empties the Trusted Servers List and specifies that all servers are denied access.

The view TRUSTED_SERVERS will show "UNTRUSTED ALL" indicating that no servers are currently trusted.

Syntax

```
DBMS_DISTRIBUTED_TRUST_ADMIN.DENY_ALL;
```

68.4.4 DENY_SERVER Procedure

This procedure ensures that the specified server is considered untrusted (even if you have previously specified allow all).

Syntax

```
DBMS_DISTRIBUTED_TRUST_ADMIN.DENY_SERVER (
    server IN VARCHAR2);
```

Parameters

Table 68-3 DENY_SERVER Procedure Parameters

| Parameter | Description |
|-----------|---|
| server | Unique, fully-qualified name of the server to be untrusted. |

Usage Notes

If the Trusted Servers List contains the entry allow all, then this procedure adds an entry indicating that the specified database (for example, DBx) is not to be trusted.

If the Trusted Servers List contains the entry "deny all", and if there is no "allow DBx" entry in the list, then this procedure causes no change.

If the Trusted Servers List contains the entry "deny all", and if there is an "allow DBx" entry, then this procedure causes that entry to be deleted.

DBMS_DNFS

The `DBMS_DNFS` package provides an interface to assists in creating a database using files in the backup set.

This chapter contains the following topics:

- [Security Model](#)
- [Summary of DBMS_DNFS Subprograms](#)

See Also:

Oracle Database Administrator's Guide

69.1 DBMS_DNFS Security Model

This package has to be executed by users with `SYSDBA` privileges.

69.2 Summary of DBMS_DNFS Subprograms

The `DBMS_DNFS` package includes the `CLONEDB_RENAMEFILE`, `RESTORE_DATAFILE_PERMISSIONS`, and `UNMOUNTVOLUME` procedures.

Table 69-1 DBMS_DNFS Package Subprograms

| Subprogram | Description |
|--|--|
| CLONEDB_RENAMEFILE Procedure | Renames datafiles that were pointing to the backup set to the actual file name in cloned database. |
| RESTORE_DATAFILE_PERMISSIONS Procedure | This procedure will restore the file permissions for the data files belonging to the PDB to read write. PDB data files are converted to read only when one or more clones are created using this source PDB. |
| UNMOUNTVOLUME Procedure | This procedure cleans up the cached Direct NFS file handles in SGA. |

69.2.1 CLONEDB_RENAMEFILE Procedure

This procedure is used to rename datafiles that were pointing to the backup set to the actual file name in cloned database.

The `srcfile` is the file name that represents the data file in the backup image copy or a read-only storage snapshot. The `destfile` destination file path must point to a NFS volume where clonedDB datafiles will be created. When the procedure is run successfully, the control file record is updated with the new datafile name.

Syntax

```
DBMS_DNFS.CLONEDB_RENAMEFILE (
    srcfile      IN      VARCHAR2,
    destfile     IN      VARCHAR2);
```

Parameters**Table 69-2** *CLONEDB_RENAMEFILE Procedure Parameters*

| Parameter | Description |
|-----------|--|
| srcfile | Source datafile name in the control file |
| destfile | New datafile name |

69.2.2 RESTORE_DATAFILE_PERMISSIONS Procedure

This procedure restores the file permissions for the data files belonging to the PDB to `read write`. PDB data files are converted to `read only` when one or more clones are created using this source PDB. This procedure must be invoked after the last clone is dropped to restore the data file permissions for the source PDB files.

Syntax

```
DBMS_DNFS.RESTORE_DATAFILE_PERMISSIONS (
    pdb_name     IN      VARCHAR2 DEFAULT NULL);
```

Parameters**Table 69-3** *RESTORE_DATAFILE_PERMISSIONS Procedure Parameters*

| Parameter | Description |
|-----------|--|
| pdb_name | Name of pluggable database whose file permissions need to be restored. |

69.2.3 UNMOUNTVOLUME Procedure

This procedure cleans up the cached Direct NFS file handles in SGA. This procedure must be used when any NFS mount changes are being made via the operating system and the OS unmount and mount commands are invoked.

The server is the host name or IP address of the NFS server. The volume is the exported path from the NFS server. This procedure will fail if the database has any open files in the volume that is being unmounted.

Syntax

```
DBMS_DNFS.UNMOUNTVOLUME (
    server      IN      VARCHAR2,
    volume     IN      VARCHAR2);
```

Parameters

Table 69-4 *UNMOUNTVOLUME Procedure Parameters*

| Parameter | Description |
|------------------|-------------------------------------|
| server | NFS server host name or IP address. |
| volume | Exported path from the NFS server. |

DBMS_DST

The DBMS_DST package provides an interface to apply the Daylight Saving Time (DST) patch to the Timestamp with Time Zone datatype.

This chapter contains the following topics:

- [Overview](#)
- [Security Model](#)
- [Views](#)
- [Summary of DBMS_DST Subprograms](#)

See Also:

- *Oracle Database Globalization Support Guide*
- *Oracle Database Reference*

70.1 DBMS_DST Overview

The transition period during which Daylight Saving Time comes into effect, or stops being in effect, has the potential for problems, such as data loss, when handling timestamps with time zone data. The DBMS_DST package enables working with these transitions in the context of a set of rules.

70.2 DBMS_DST Security Model

The DBMS_DST package is an invoker's rights package.

See Also:

Oracle Database PL/SQL Language Reference for more information about using Invoker Rights or Definer Rights

The execute privilege on the package is granted to the EXECUTE_CATALOG_ROLE role. This role is normally granted to selected users to allow EXECUTE privileges for packages and procedures in the data dictionary.

The user that invokes the package must have the following privileges:

- CREATE ANY TABLE
- ALTER ANY TABLE

- DROP ANY TABLE
- SELECT ANY TABLE
- LOCK ANY TABLE
- ALTER ANY INDEX
- ALTER ANY TRIGGER
- UPDATE ANY TABLE
- EXECUTE ANY TYPE

70.3 DBMS_DST Views

The `DBMS_DST` package uses views to display table information.

These views are shown in the following table. They are further described in the *Oracle Database Reference*:

Table 70-1 Views used by DBMS_DST

| View | Description |
|-------------------------------|---|
| <code>DBA_TSTZ_TABLES</code> | Displays information about all tables in the database, which have columns defined on <code>TIMESTAMP WITH TIME ZONE</code> datatypes or object types containing attributes of <code>TIMESTAMP WITH TIME ZONE</code> datatypes. Its columns are the same as those in <code>ALL_TSTZ_TABLES</code> . |
| <code>USER_TSTZ_TABLES</code> | Displays information about the tables owned by the current user, which have columns defined on <code>TIMESTAMP WITH TIME ZONE</code> datatypes or object types containing attributes of <code>TIMESTAMP WITH TIME ZONE</code> datatypes. Its columns (except for <code>OWNER</code>) are the same as those in <code>ALL_TSTZ_TABLES</code> . |
| <code>ALL_TSTZ_TABLES</code> | Displays information about the tables accessible to the current user, which have columns defined on <code>TIMESTAMP WITH TIME ZONE</code> datatypes or object types containing attributes of <code>TIMESTAMP WITH TIME ZONE</code> datatypes. |

70.4 Summary of DBMS_DST Subprograms

This table lists and describes the `DBMS_DST` package subprograms.

Table 70-2 DBMS_DST Package Subprograms

| Subprogram | Description |
|---|--|
| BEGIN_PREPARE Procedure | Starts a prepare window |
| BEGIN_UPGRADE Procedure | Starts an upgrade window |
| CREATE_AFFECTED_TABLE Procedure | Creates a table that has the schema shown in the comments for the FIND_AFFECTED_TABLES Procedure |

Table 70-2 (Cont.) DBMS_DST Package Subprograms

| Subprogram | Description |
|--|---|
| CREATE_ERROR_TABLE Procedure | Creates a log error table |
| CREATE_TRIGGER_TABLE Procedure | Creates a table that is used to record active triggers disabled before performing upgrade on the table, having not been enabled due to fatal failure during the upgrading process |
| END_PREPARE Procedure | Ends a prepare window |
| END_UPGRADE Procedure | Ends an upgrade window |
| FIND_AFFECTED_TABLES Procedure | Finds all the tables that have affected TSTZ data due to the new timezone version |
| UPGRADE_DATABASE Procedure | Upgrades all tables in the database that have one or more columns defined on the TSTZ type, or an ADT containing the TSTZ type |
| UPGRADE_SCHEMA Procedure | Upgrades tables in a specified list of schemas that has one or more columns defined on the TSTZ type, or an ADT containing the TSTZ type |
| UPGRADE_TABLE Procedure | Upgrades a specified list of tables that has one or more columns defined on the TSTZ type or an ADT containing the TSTZ type |

70.4.1 BEGIN_PREPARE Procedure

This procedure starts a prepare window. Once a prepare window is started successfully, the database property 'DST_UPGRADE_STATE' is set to 'PREPARE', and the database property 'SECONDARY_TT_VERSION' is set to a new timezone version.

The prepare window lets a DBA investigate data affected by the upgrade, and so judge when it is optimal to perform the upgrade. The prepare window can overlap normal database operation.

Syntax

```
DBMS_DST.BEGIN_PREPARE (
    new_version          IN BINARY_INTEGER);
```

Parameters

Table 70-3 BEGIN_PREPARE Procedure Parameters

| Parameter | Description |
|-------------|---|
| new_version | New timezone version to which the database is to be prepared to upgrade |

70.4.2 BEGIN_UPGRADE Procedure

This procedure starts an upgrade window.

Syntax

```
DBMS_DST.BEGIN_UPGRADE (
    new_version           IN BINARY_INTEGER,
    error_on_overlap_time IN BOOLEAN := FALSE,
    error_on_nonexisting_time IN BOOLEAN := FALSE);
```

Parameters

Table 70-4 BEGIN_UPGRADE Procedure Parameters

| Parameter | Description |
|--|--|
| <code>new_version</code> | New timezone version to which the database is to be upgraded |
| <code>error_on_overlap_time</code> | Boolean flag indicating whether to report errors on the 'overlap' time semantic conversion error. The default is <code>FALSE</code> . For more information about boundary cases, see <i>Oracle Database SQL Language Reference</i> . |
| <code>error_on_nonexisting_time</code> | Boolean flag indicating whether to report errors on the 'non-existing' time semantic conversion error. The default value is <code>FALSE</code> . |

70.4.3 CREATE_AFFECTED_TABLE Procedure

This procedure creates a table that has the schema shown in the comments for the `FIND_AFFECTED_TABLES` Procedure.

Syntax

```
DBMS_DST.CREATE_AFFECTED_TABLE (
    table_name IN VARCHAR2);
```

Parameters

Table 70-5 CREATE_AFFECTED_TABLE Procedure Parameters

| Parameter | Description |
|-------------------------|---------------------------|
| <code>table_name</code> | Name of the table created |

Usage Notes

This procedure takes a `table_name` without schema qualification, creating a table within the current user schema.

Related Topics

- [FIND_AFFECTED_TABLES Procedure](#)
This procedure finds all the tables which have affected TSTZ data due to the new timezone version.

70.4.4 CREATE_ERROR_TABLE Procedure

This procedure creates a log error table.

The table has the following schema:

```
CREATE TABLE dst$error_table(  
  table_owner  VARCHAR2(30),  
  table_name   VARCHAR2(30),  
  column_name  VARCHAR2(4000),  
  rid         ROWID,  
  error_number NUMBER)
```

Syntax

```
DBMS_DST.CREATE_ERROR_TABLE (  
  table_name      IN  VARCHAR2);
```

Parameters

Table 70-6 CREATE_ERROR_TABLE Procedure Parameters

| Parameter | Description |
|------------|---------------------------|
| table_name | Name of the table created |

Usage Notes

- This procedure takes a `table_name` without schema qualification, creating a table within the current user schema.
- The error number is found when upgrading time zone file and timestamp with time zone data. For more information about error handling when upgrading time zone file and timestamp with time zone data, see Oracle Database Globalization Support Guide

70.4.5 CREATE_TRIGGER_TABLE Procedure

This procedure creates a table to record active triggers that are disabled before performing upgrade on the table, having not been enabled due to fatal failure during the upgrading process.

The table that has the following schema.

```
CREATE TABLE dst_trigger_table (  
  trigger_owner VARCHAR2(30),  
  trigger_name  VARCHAR2(30));
```

Syntax

```
DBMS_DST.CREATE_TRIGGER_TABLE (  
  table_name      IN  VARCHAR2);
```

Parameters

Table 70-7 CREATE_TRIGGER_TABLE Procedure Parameters

| Parameter | Description |
|------------|-----------------------------|
| table_name | Name of table to be created |

Usage Notes

This procedure takes a `table_name` without schema qualification, creating a table within the current user schema.

70.4.6 END_PREPARE Procedure

This procedure ends a prepare window.

Syntax

```
DBMS_DST.BEGIN_PREPARE;
```

70.4.7 END_UPGRADE Procedure

This procedure ends an upgrade window. An upgraded window is ended if all the affected user tables have been upgraded. Otherwise, the `OUT` parameter `num_of_failures` indicates how many tables have not been converted.

Syntax

```
DBMS_DST.END_UPGRADE (
    num_of_failures OUT BINARY_INTEGER);
```

Parameters

Table 70-8 END_UPGRADE Procedure Parameters

| Parameter | Description |
|-----------------|--|
| num_of_failures | Number of tables that fail to complete |

70.4.8 FIND_AFFECTED_TABLES Procedure

This procedure finds all the tables which have affected TSTZ data due to the new timezone version.

This procedure can only be invoked during a prepare window. The tables which have affected TSTZ data are recorded into a table indicated by parameter `affected_tables`. If semantic errors must be logged, they are recorded into a table indicated by parameter `log_errors_table`.

Syntax

```
DBMS_DST.FIND_AFFECTED_TABLES (
    affected_tables          IN VARCHAR2 =: 'sys.dst$affected_tables',
```

```

log_errors          IN  BOOLEAN := FALSE,
log_errors_table    IN  VARCHAR2 := 'sys.dst$error_table',
parallel            IN  BOOLEAN := FALSE);

```

Parameters

Table 70-9 FIND_AFFECTED_TABLES Procedure Parameters

| Parameter | Description |
|------------------|--|
| affected_tables | <p>Name of table with the following schema:</p> <pre> CREATE TABLE dst\$affected_tables (table_owner VARCHAR2(30), table_name VARCHAR2(30), column_name VARCHAR2(4000), row_count NUMBER, error_count NUMBER) </pre> <p>The table can be created with the CREATE_AFFECTED_TABLE Procedure.</p> |
| log_errors | <p>Boolean flag indicating whether to log errors during upgrade. If FALSE, no error is logged into the log_errors_table after aborting conversion of the current table. If TRUE, the error is logged to the log_errors_table.</p> <p>The default is FALSE.</p> |
| log_errors_table | <p>Table name with the following schema:</p> <pre> CREATE TABLE dst\$error_table (table_owner VARCHAR2(30), table_name VARCHAR2(30), column_name VARCHAR2(4000), rid ROWID, error_number NUMBER) </pre> <p>The table can be created with the CREATE_ERROR_TABLE Procedure. The rid column records the rowids of the offending rows, and the error_number column records the corresponding error number.</p> |
| parallel | <p>Boolean flag indicating whether to find the affected tables using parallel queries or serial queries. The default is FALSE.</p> |

70.4.9 UPGRADE_DATABASE Procedure

This procedure upgrades all tables in the database, which have one or more columns defined on the TSTZ type or an ADT containing the TSTZ type.

This procedure can only be invoked after an upgrade window has been started. Each table is upgraded in an atomic transaction. Note that, a base table and its materialized view log table are upgraded in an atomic transaction.

Syntax

```

DBMS_DST.UPGRADE_DATABASE (
  num_of_failures OUT BINARY_INTEGER,
  upgrade_data    IN  BOOLEAN := TRUE,
  parallel        IN  BOOLEAN := FALSE,

```

```

continue_after_errors      IN  BOOLEAN := TRUE,
log_errors                 IN  BOOLEAN := FALSE,
log_errors_table           IN  VARCHAR2 := 'sys.dst$error_table' ,
error_on_overlap_time      IN  BOOLEAN := FALSE,
error_on_nonexisting_time  IN  BOOLEAN := FALSE,
log_triggers_table        IN  VARCHAR2 := 'sys.dst$trigger_table';

```

Parameters

Table 70-10 UPGRADE_DATABASE Procedure Parameters

| Parameter | Description |
|---------------------------|---|
| num_of_failures | Number of tables that fail to complete |
| upgrade_data | Boolean flag indicating whether to convert TSTZ data using the new Time Zone patch File (TRUE), or to leave it unconverted (FALSE).The default is TRUE. |
| parallel | Boolean flag indicating whether to convert tables using PDML (Parallel DML) or Serial DML.The default is FALSE. |
| continue_after_errors | Boolean flag indicating whether to continue after upgrade fails on the current table. The default is TRUE. |
| log_errors | Boolean flag indicating whether to log errors during upgrade. If FALSE, no error is logged into the log_errors_table after aborting conversion of the current table. If TRUE, errors are logged to the log_errors_table. The default is FALSE. |
| log_errors_table | Table name with the following schema: <pre> CREATE TABLE dst\$error_table (table_owner VARCHAR2(30), table_name VARCHAR2(30), column_name VARCHAR2(4000), rid ROWID, error_number NUMBER) </pre> The table can be created with the CREATE_ERROR_TABLE Procedure . The rid column records the rowids of the offending rows, and the error_number column records the corresponding error number. |
| error_on_overlap_time | Boolean flag indicating whether to report errors on the 'overlap' time semantic conversion error. The default is TRUE. |
| error_on_nonexisting_time | Boolean flag indicating whether to report errors on the 'non-existing' time semantic conversion error. The default is TRUE. |
| log_triggers_table | Table to log triggers which are disabled before upgrade, having not been enabled due to a fatal failure when performing an upgrade |

70.4.10 UPGRADE_SCHEMA Procedure

This procedure upgrades tables in a specified list of schemas that have one or more columns defined on the TSTZ type, or an ADT containing the TSTZ type.

This procedure can be invoked only after an upgrade window has been started. Each table is upgraded in an atomic transaction. Note that a base table and its materialized view log table are upgraded in an atomic transaction.

Syntax

```
DBMS_DST.UPGRADE_SCHEMA (
    num_of_failures          OUT BINARY_INTEGER,
    schema_list              IN  VARCHAR2,
    upgrade_data             IN  BOOLEAN := TRUE,
    parallel                 IN  BOOLEAN := FALSE,
    continue_after_errors   IN  BOOLEAN := TRUE,
    log_errors               IN  BOOLEAN := FALSE,
    log_errors_table        IN  VARCHAR2 =: 'sys.dst$error_table' ,
    error_on_overlap_time   IN  BOOLEAN := FALSE,
    error_on_nonexisting_time IN  BOOLEAN := FALSE,
    log_triggers_table      IN  VARCHAR2 :=: 'sys.dst$trigger_table');
```

Parameters

Table 70-11 UPGRADE_SCHEMA Procedure Parameters

| Parameter | Description |
|-----------------------|---|
| num_of_failures | Number of tables that fail to complete |
| schema_list | Schema name list (comma separated strings) |
| upgrade_data | Boolean flag indicating whether to convert TSTZ data using the new Time Zone patch File (TRUE) or to leave unconverted (FALSE).The default is TRUE. |
| parallel | Boolean flag indicating whether to convert tables using PDML (Parallel DML) or Serial DML.The default is FALSE. |
| continue_after_errors | Boolean flag indicating whether to continue after upgrade fails on the current table.The default is TRUE. |
| log_errors | Boolean flag indicating whether to log errors during upgrade. If FALSE, no error is logged into the log_errors_table after aborting conversion of the current table. If TRUE, the error is logged to the log_errors_table. The default is FALSE. |

Table 70-11 (Cont.) UPGRADE_SCHEMA Procedure Parameters

| Parameter | Description |
|---------------------------|--|
| log_errors_table | <p>Table name with the following schema:</p> <pre>CREATE TABLE dst\$error_table (table_owner VARCHAR2(30), table_name VARCHAR2(30), column_name VARCHAR2(4000), rid ROWID, error_number NUMBER)</pre> <p>The table can be created with the CREATE_ERROR_TABLE Procedure. The <code>rid</code> column records the rowids of the offending rows, and the <code>error_number</code> column records the corresponding error number.</p> |
| error_on_overlap_time | <p>Boolean flag indicating whether to report errors on the 'overlap' time semantic conversion error.</p> <p>The default is TRUE.</p> |
| error_on_nonexisting_time | <p>Boolean flag indicating whether to report errors on the 'non-existing' time semantic conversion error.</p> <p>The default is TRUE.</p> |
| log_triggers_table | <p>Table to log triggers that are disabled before upgrade, having not been enabled due to a fatal failure when performing an upgrade</p> |

70.4.11 UPGRADE_TABLE Procedure

This procedure upgrades a specified list of tables that have one or more columns defined on the TSTZ type, or an ADT containing the TSTZ type.

Syntax

```
DBMS_DST.UPGRADE_TABLE (
  num_of_failures      OUT BINARY_INTEGER,
  table_list           IN  VARCHAR2,
  upgrade_data         IN  BOOLEAN := TRUE,
  parallel             IN  BOOLEAN := FALSE,
  continue_after_errors IN  BOOLEAN := TRUE,
  log_errors           IN  BOOLEAN := FALSE,
  log_errors_table     IN  VARCHAR2 := 'sys.dst$error_table' ,
  error_on_overlap_time IN  BOOLEAN := FALSE,
  error_on_nonexisting_time IN  BOOLEAN := FALSE,
  log_triggers_table   IN  VARCHAR2 := 'sys.dst$trigger_table',
  atomic_upgrade       IN  BOOLEAN := FALSE);
```

Parameters

Table 70-12 UPGRADE_TABLE Procedure Parameters

| Parameter | Description |
|-----------------|---|
| num_of_failures | Number of tables that fail to complete |
| table_list | Table name list (comma separated strings) |

Table 70-12 (Cont.) UPGRADE_TABLE Procedure Parameters

| Parameter | Description |
|---------------------------|---|
| upgrade_data | Boolean flag indicating whether to convert TSTZ data using the new Time Zone patch File (TRUE), or to leave unconverted (FALSE). The default is TRUE. |
| parallel | Boolean flag indicating whether to convert tables using PDML (Parallel DML), or Serial DML. The default is FALSE. |
| continue_after_errors | Boolean flag indicating whether to continue after upgrade fails on the current table. The default is TRUE. |
| log_errors | Boolean flag indicating whether to log errors during upgrade. If FALSE, no error is logged into the log_errors_table after aborting conversion of the current table. If TRUE, the error is logged to the log_errors_table. The default is FALSE. |
| log_errors_table | Table name with the following schema: <pre>CREATE TABLE dst\$error_table (table_owner VARCHAR2(30), table_name VARCHAR2(30), column_name VARCHAR2(4000), rid ROWID, error_number NUMBER)</pre> The table can be created with the CREATE_ERROR_TABLE Procedure . The rid parameter records the rowids of the offending rows and the corresponding error number. |
| error_on_overlap_time | Boolean flag indicating whether to report errors on the 'overlap' time semantic conversion error. The default is TRUE. |
| error_on_nonexisting_time | Boolean flag indicating whether to report errors on the 'non-existing' time semantic conversion error. The default is TRUE. |
| log_triggers_table | Table to log triggers that are disabled before upgrade, having not been enabled due to a fatal failure when performing an upgrade |
| atomic_upgrade | Boolean flag indicating whether to convert the listed tables atomically (in a single transaction). If FALSE, each table is converted in its own transaction. The default is FALSE. |

Usage Notes

This procedure can only be invoked after an upgrade window has been started. The table list has to satisfy the following partial ordering:

1. If a base table has a materialized view log table, the log table must be the next item in the list.

2. If the container table for a materialized view appears in the list, the materialized view's 'non-upgraded' base tables and log tables must appear in the table list and before the container table.

A base table and its materialized view log table need to be upgraded in an atomic transaction by specifying `atomic_upgrade` to `TRUE`.

71

DBMS_EDITIONS_UTILITIES

The `DBMS_EDITIONS_UTILITIES` package provides helper functions for edition-related operations.

The chapter contains the following topics:

- [Overview](#)
- [Security Model](#)
- [Exceptions](#)
- [Summary of DBMS_EDITIONS_UTILITIES Subprograms](#)

71.1 DBMS_EDITIONS_UTILITIES Overview

The `DBMS_EDITIONS_UTILITIES` package implements an interface which provides helper functions for edition-related operations.

71.2 DBMS_EDITIONS_UTILITIES Security Model

This package is owned by `SYS` with execute access granted to `PUBLIC`. It runs with invoker's rights, that is, with the security profile of the caller.

71.3 DBMS_EDITIONS_UTILITIES Exceptions

The table in this topic lists exception messages created by `DBMS_EDITIONS_UTILITIES`.

Table 71-1 DBMS_EDITIONS_UTILITIES Error Messages

| Error | Description |
|-----------|-------------------------|
| ORA-38817 | Insufficient privileges |
| ORA-942 | Missing table |

71.4 Summary of DBMS_EDITIONS_UTILITIES Subprograms

This table lists and describes the `DBMS_EDITIONS_UTILITIES` package subprograms.

Table 71-2 DBMS_EDITIONS_UTILITIES Package Subprograms

| Subprogram | Description |
|---|--|
| CLEAN_UNUSABLE_EDITIONS Procedure | Drops covered objects in unusable editions, and drops empty unusable editions if possible. |

Table 71-2 (Cont.) DBMS_EDITIONS_UTILITIES Package Subprograms

| Subprogram | Description |
|--|---|
| SET_EDITIONING_VIEWS_READ_ONLY Procedure | Given the schema name and table name, this procedure sets the corresponding editioning views in all editions to READ ONLY or READ/WRITE |
| SET_NULL_COLUMN_VALUES_TO_EXPR Procedure | For use only during an edition-based redefinition (EBR) exercise |

71.4.1 CLEAN_UNUSABLE_EDITIONS Procedure

Drops all covered objects in any unusable editions and drops empty unusable editions.

The `CLEAN_UNUSABLE_EDITIONS` procedure executes immediately and in its entirety.

Syntax

```
DBMS_EDITIONS_UTILITIES.CLEAN_UNUSABLE_EDITIONS ( );
```

Usage Notes

The `COMPATIBLE` parameter must be set to 12.2.0 or higher for this procedure to execute.

See Also:

- *Oracle Database SQL Language Reference* for information about `DROP EDITION`
- *Oracle Database Development Guide* for more information about using edition-based redefinition

71.4.2 SET_EDITIONING_VIEWS_READ_ONLY Procedure

Given the schema name and table name, this procedure sets the corresponding editioning views in all editions to `READ ONLY` or `READ/WRITE`.

Syntax

```
DBMS_EDITIONS_UTILITIES.SET_EDITIONING_VIEWS_READ_ONLY (
  table_name IN VARCHAR2,
  owner      IN VARCHAR2 DEFAULT NULL,
  read_only  IN BOOLEAN  DEFAULT TRUE);
```

Parameters

Table 71-3 SET_EDITIONING_VIEWS_READ_ONLY Procedure Parameters

| Parameter | Description |
|------------|--|
| table_name | Base table of the editioning views |
| owner | Base table schema. The default (or NULL) is the current schema. |
| read_only | TRUE to set the views to read-only; FALSE (or NULL) sets the views to READ/WRITE. Default is TRUE. |

Usage Notes

The user must have the following privileges:

- Owner of the table, or have the ALTER ANY TABLE system privileges
- USE object privilege on all the editions for which the views are defined

71.4.3 SET_NULL_COLUMN_VALUES_TO_EXPR Procedure

This procedure replaces NULL values in a replacement column with the value of an expression.

The expression evaluation cost is deferred to future updates and queries. The procedure is intended for use only during an edition-based redefinition (EBR) exercise.

See Also:

- *Oracle Database Development Guide* regarding transforming pre- to post-upgrade representation

Syntax

```
DBMS_EDITIONS_UTILITIES.SET_NULL_COLUMN_VALUES_TO_EXPR(
  table_name    IN VARCHAR2,
  column_name   IN VARCHAR2,
  expression    IN VARCHAR2);
```

Parameters

Table 71-4 SET_NULL_COLUMN_VALUES_TO_EXPR Procedure Parameters

| Parameter | Description |
|-------------|---|
| table_name | A potentially schema-qualified table name |
| column_name | Name of the column to be updated |
| expression | An expression composed of columns in the same table, constants, and SQL functions |

DBMS_EPG

The `DBMS_EPG` package implements the embedded PL/SQL gateway that enables a Web browser to invoke a PL/SQL stored procedure through an HTTP listener.

This chapter contains the following topics:

- [Overview](#)
- [Security Model](#)
- [Exceptions](#)
- [Data Structures](#)
 - [VARCHAR2_TABLE Table Type](#)
- [Subprogram Groups](#)
- [Summary of DBMS_EPG Subprograms](#)

72.1 DBMS_EPG Overview

The `DBMS_EPG` package is a platform on which PL/SQL users develop and deploy PL/SQL Web applications. The embedded PL/SQL gateway is an embedded version of the gateway that runs in the XML database HTTP server in the Oracle database. It provides the core features of `mod_plsql` in the database but does not require the Oracle HTTP server powered by Apache.

In order to make a PL/SQL application accessible from a browser by way of HTTP, a Database Access Descriptor (DAD) must be created and mapped to a virtual path. A DAD is a set of configuration values used for database access and the virtual path mapping makes the application accessible under a virtual path of the XML DB HTTP Server. A DAD is represented as a servlet in XML DB HTTP Server.

72.2 DBMS_EPG Security Model

The `XDBADMIN` role is required to invoke the configuration interface. It may be invoked by the database user "XDB".

The authorization interface can be invoked by any user.

72.3 DBMS_EPG Exceptions

The table in this topic lists the exceptions raised by the `DBMS_EPG` package.

Table 72-1 DBMS_EPG Exceptions

| Exception | Error Code | Description |
|---------------|------------|---|
| DAD_NOT_FOUND | 20000 | Database Access Descriptor (DAD) %s not found. Ensure that the name of the DAD is correct and that it exists. |

72.4 DBMS_EPG Data Structures

The DBMS_EPG package defines a TABLE type.

VARCHAR2_TABLE Table Type

This type is used by the procedures GET_ALL_GLOBAL_ATTRIBUTES, GET_ALL_DAD_ATTRIBUTES, GET_ALL_DAD_MAPPINGS, and GET_DAD_LIST to return lists of attribute names, attribute values, virtual paths, and database access descriptors (DAD).

```
TYPE VARCHAR2_TABLE IS TABLE OF VARCHAR2(4000) INDEX BY BINARY_INTEGER;
```

72.5 DBMS_EPG Subprogram Groups

The DBMS_EPG consists of two interfaces: configuration subprograms and authorization subprograms.

- [Configuration Subprograms](#)
- [Authorization Subprograms](#)

72.5.1 DBMS_EPG Configuration Subprograms

The Configuration subprogram group contain the subprogram interfaces to examine and modify the global and database access descriptor (DAD) specific settings of the embedded PL/SQL gateway.

Table 72-2 Configuration Subprogram Group

| Subprogram | Description |
|---|---|
| CREATE_DAD Procedure | Creates a new DAD |
| DELETE_DAD_ATTRIBUTE Procedure | Deletes a DAD attribute |
| DELETE_GLOBAL_ATTRIBUTE Procedure | Deletes a global attribute |
| DROP_DAD Procedure | Drops a DAD |
| GET_ALL_DAD_ATTRIBUTES Procedure | Retrieves all the attributes of a DAD. |
| GET_ALL_DAD_MAPPINGS Procedure | Retrieves all virtual paths to which the specified DAD is mapped. |
| GET_ALL_GLOBAL_ATTRIBUTES Procedure | Retrieves all global attributes and values |
| GET_DAD_ATTRIBUTE Function | Retrieves the value of a DAD attribute |

Table 72-2 (Cont.) Configuration Subprogram Group

| Subprogram | Description |
|--|--|
| GET_DAD_LIST Procedure | Retrieves a list of all DADs for an Embedded Gateway instance. |
| GET_GLOBAL_ATTRIBUTE Function | Retrieves the value of a global attribute |
| MAP_DAD Procedure | Maps a DAD to the specified virtual path. |
| SET_DAD_ATTRIBUTE Procedure | Sets the value for a DAD |
| SET_GLOBAL_ATTRIBUTE Procedure | Sets the value of a global attribute |
| UNMAP_DAD Procedure | Unmaps a DAD from the specified virtual path |

72.5.2 DBMS_EPG Authorization Subprograms

The Authorization subprogram group contains the subprogram interfaces to authorize and deauthorize the use of a database user's privileges by the embedded PL/SQL gateway through a specific database access descriptor (DAD)

Table 72-3 Authorization Subprogram Group

| Subprogram | Description |
|---|---|
| AUTHORIZE_DAD Procedure | Authorizes a DAD to invoke procedures and access document tables with a database user's privileges |
| DEAUTHORIZE_DAD Procedure | Deauthorizes a DAD with regard to invoking procedures and accessing document tables with a database user's privileges |

72.6 Summary of DBMS_EPG Subprograms

This table lists the DBMS_ALERT subprograms and briefly describes them.

Table 72-4 DBMS_EPG Package Subprograms

| Subprogram | Description |
|---|---|
| AUTHORIZE_DAD Procedure | authorizes a DAD to invoke procedures and access document tables with a database user's privileges |
| CREATE_DAD Procedure | Creates a new DAD |
| DEAUTHORIZE_DAD Procedure | Deauthorizes a DAD with regard to invoking procedures and accessing document tables with a database user's privileges |
| DELETE_DAD_ATTRIBUTE Procedure | Deletes a DAD attribute |
| DELETE_GLOBAL_ATTRIBUTE Procedure | Deletes a global attribute |
| DROP_DAD Procedure | Drops a DAD |
| GET_ALL_DAD_ATTRIBUTES Procedure | Retrieves all the attributes of a DAD. |
| GET_ALL_DAD_MAPPINGS Procedure | Retrieves all virtual paths to which the specified DAD is mapped. |

Table 72-4 (Cont.) DBMS_EPG Package Subprograms

| Subprogram | Description |
|---|--|
| GET_ALL_GLOBAL_ATTRIBUTES Procedure | Retrieves all global attributes and values |
| GET_DAD_ATTRIBUTE Function | Retrieves the value of a DAD attribute |
| GET_DAD_LIST Procedure | Retrieves a list of all DADs for an Embedded Gateway instance. |
| GET_GLOBAL_ATTRIBUTE Function | Retrieves the value of a global attribute |
| MAP_DAD Procedure | Maps a DAD to the specified virtual path. |
| SET_DAD_ATTRIBUTE Procedure | Sets the value for a DAD |
| SET_GLOBAL_ATTRIBUTE Procedure | Sets the value of a global attribute |
| UNMAP_DAD Procedure | Unmaps a DAD from the specified virtual path |

72.6.1 AUTHORIZE_DAD Procedure

This procedure authorizes a DAD to invoke procedures and access document tables with a database user's privileges. The invoker can always authorize the use of her/his own privileges.

See Also:

[Authorization Subprograms](#) for other subprograms in this group

Syntax

```
DBMS_EPG.AUTHORIZE_DAD (
    dad_name IN VARCHAR2,
    path     IN VARCHAR2 DEFAULT NULL);
```

Parameters

Table 72-5 AUTHORIZE_DAD Procedure Parameters

| Parameter | Description |
|-----------|---|
| dad_name | The name of the DAD to create |
| user | The user whose privileges to deauthorize. If use, the invoker is assumed. |

Usage Notes

- To authorize the use of another user's privileges, the invoker must have the ALTER USER system privilege.
- The DAD must exist but its "database-username" DAD attribute does not have to be set to user to authorize.
- Multiple users can authorize the same DAD and it is up to the DAD's "database-username" setting to decide which user's privileges to use.

Exceptions

Raises an error if the DAD or user does not exist, or the invoker does not have the needed system privilege.

Examples

```
DBMS_EPG.AUTHORIZE_DAD('HR');
```

72.6.2 CREATE_DAD Procedure

This procedure creates a new DAD.

See Also:

[Configuration Subprograms](#) for other subprograms in this group

Syntax

```
DBMS_EPG.CREATE_DAD (  
    dad_name IN VARCHAR2,  
    path     IN VARCHAR2 DEFAULT NULL);
```

Parameters

Table 72-6 CREATE_DAD Procedure Parameters

| Parameter | Description |
|-----------|--|
| dad_name | The name of the DAD to create |
| path | The virtual path to which to map the DAD |

72.6.3 DEAUTHORIZE_DAD Procedure

This procedure deauthorizes a DAD with regard to invoking procedures and accessing document tables with a database user's privileges. The invoker can always deauthorize the use of his own privileges.

See Also:

[Authorization Subprograms](#) for other subprograms in this group

Syntax

```
DBMS_EPG.DEAUTHORIZE_DAD (  
    dad_name IN VARCHAR2,  
    path     IN VARCHAR2 DEFAULT NULL);
```

Parameters

Table 72-7 DEAUTHORIZE_DAD Procedure Parameters

| Parameter | Description |
|-----------|---|
| dad_name | The name of the DAD for which to deauthorize use |
| user | The user whose privileges to deauthorize. If use, the invoker is assumed. |

Usage Notes

To deauthorize the use of another user's privileges, the invoker must have the `ALTER USER` system privilege.

Exceptions

Raises an error if the DAD or user does not exist, or the invoker does not have the needed system privilege.

Examples

```
DBMS_EPG.DEAUTHORIZE_DAD('HR');
```

72.6.4 DELETE_DAD_ATTRIBUTE Procedure

This procedure deletes a DAD attribute.

See Also:

[Configuration Subprograms](#) for other subprograms in this group

Syntax

```
DBMS_EPG.DELETE_DAD_ATTRIBUTE (
  dad_name      IN  VARCHAR2,
  attr_name     IN  VARCHAR2);
```

Parameters

Table 72-8 DELETE_DAD_ATTRIBUTE Procedure Parameters

| Parameter | Description |
|-----------|---|
| dad_name | The name of the DAD for which to delete a DAD attribute |
| attr_name | The name of the DAD attribute to delete |

Exceptions

Raises an error if DAD does not exist

72.6.5 DELETE_GLOBAL_ATTRIBUTE Procedure

This procedure deletes a global attribute.

See Also:

[Configuration Subprograms](#) for other subprograms in this group

Syntax

```
DBMS_EPG.DELETE_GLOBAL_ATTRIBUTE (  
    attr_name    IN VARCHAR2);
```

Parameters

Table 72-9 DELETE_GLOBAL_ATTRIBUTE Procedure Parameters

| Parameter | Description |
|-----------|--------------------------------|
| attr_name | The global attribute to delete |

72.6.6 DROP_DAD Procedure

This procedure drops a DAD. All the virtual-path mappings of the DAD will be dropped also.

See Also:

[Configuration Subprograms](#) for other subprograms in this group

Syntax

```
DBMS_EPG.DROP_DAD (  
    dadname    IN VARCHAR2);
```

Parameters

Table 72-10 DROP_DAD Procedure Parameters

| Parameter | Description |
|-----------|-----------------|
| dad_name | The DAD to drop |

Exceptions

Raises an error if the DAD does not exist.

72.6.7 GET_ALL_DAD_ATTRIBUTES Procedure

This procedure retrieves all the attributes of a DAD. The outputs are 2 correlated index-by tables of the name/value pairs.

See Also:

[Configuration Subprograms](#) for other subprograms in this group

Syntax

```
DBMS_EPG.GET_ALL_DAD_ATTRIBUTES (
  dad_name      IN          VARCHAR2,
  attr_names    OUT NOCOPY VARCHAR2_TABLE,
  attr_values   OUT NOCOPY VARCHAR2_TABLE);
```

Parameters

Table 72-11 GET_ALL_DAD_ATTRIBUTES Procedure Parameters

| Parameter | Description |
|-------------|----------------------|
| dad_names | The name of the DAD |
| attr_names | The attribute names |
| attr_values | The attribute values |

Exceptions

Raises an error if DAD does not exist.

Usage Notes

If the DAD has no attributes set, then `attr_names` and `attr_values` will be set to empty arrays.

72.6.8 GET_ALL_DAD_MAPPINGS Procedure

This procedure retrieves all the virtual paths to which the specified DAD is mapped.

See Also:

[Configuration Subprograms](#) for other subprograms in this group

Syntax

```
DBMS_EPG.GET_ALL_DAD_MAPPINGS (
  dad_name      IN          VARCHAR2,
  paths         OUT NOCOPY VARCHAR2_TABLE);
```

Parameters

Table 72-12 GET_ALL_DAD_MAPPINGS Procedure Parameters

| Parameter | Description |
|-----------|--|
| dad_names | The name of the DAD |
| paths | The virtual paths to which h the DAD is mapped |

Exceptions

Raises an error if DAD does not exist.

Usage Notes

If the DAD is not mapped to any virtual path, `paths` will be set to empty arrays.

72.6.9 GET_ALL_GLOBAL_ATTRIBUTES Procedure

This procedure retrieves all global attributes and values. The outputs are 2 correlated index-by tables of the name/value pairs.

See Also:

[Configuration Subprograms](#) for other subprograms in this group

Syntax

```
DBMS_EPG.GET_ALL_GLOBAL_ATTRIBUTES (
  attr_names      OUT  NOCOPY  VARCHAR2_TABLE,
  attr_values     OUT  NOCOPY  VARCHAR2_TABLE);
```

Parameters

Table 72-13 GET_ALL_GLOBAL_ATTRIBUTES Procedure Parameters

| Parameter | Description |
|-------------|-------------------------------------|
| attr_names | The global attribute names |
| attr_values | The values of the global attributes |

Usage Notes

If the gateway instance has no global attributes set, then `attr_names` and `attr_values` will be set to empty arrays.

72.6.10 GET_DAD_ATTRIBUTE Function

This procedure retrieves the value of a DAD attribute.

See Also:

[Configuration Subprograms](#) for other subprograms in this group

Syntax

```
DBMS_EPG.GET_DAD_ATTRIBUTE (  
    dad_name      IN  VARCHAR2,  
    attr_name     IN  VARCHAR2)  
RETURN VARCHAR2;
```

Parameters

Table 72-14 GET_DAD_ATTRIBUTE Function Parameters

| Parameter | Description |
|-----------|--|
| dad_name | The name of the DAD for which to delete an attribute |
| attr_name | The name of the attribute to delete |

Return values

Returns the DAD attribute value. Returns `NULL` if attribute is unknown or has not been set.

Exceptions

Raises an error if DAD does not exist.

72.6.11 GET_DAD_LIST Procedure

This procedure retrieves a list of all DADs for an Embedded Gateway instance.

See Also:

[Configuration Subprograms](#) for other subprograms in this group

Syntax

```
DBMS_EPG.GET_DAD_LIST (  
    dad_names     OUT NOCOPY  VARCHAR2_TABLE);
```

Parameters

Table 72-15 GET_DAD_LIST Procedure Parameters

| Parameter | Description |
|-----------|----------------------|
| dad_names | The list of all DADs |

Usage Notes

If no DADs exist then `dad_names` will be set to an empty array.

72.6.12 GET_GLOBAL_ATTRIBUTE Function

This function retrieves the value of a global attribute.

See Also:

[Configuration Subprograms](#) for other subprograms in this group

Syntax

```
DBMS_EPG.GET_GLOBAL_ATTRIBUTE (
    attr_name IN VARCHAR2)
RETURN VARCHAR2;
```

Parameters

Table 72-16 GET_GLOBAL_ATTRIBUTE Procedure Parameters

| Parameter | Description |
|-----------|----------------------------------|
| attr_name | The global attribute to retrieve |

Return Values

Returns the global attribute value. Returns `NULL` if attribute has not been set or is not a valid attribute.

72.6.13 MAP_DAD Procedure

This procedure maps a DAD to the specified virtual path. If the virtual path exists already, the old virtual-path mapping will be overridden.

See Also:

[Configuration Subprograms](#) for other subprograms in this group

Syntax

```
DBMS_EPG.MAP_DAD (
  dad_name IN VARCHAR2,
  path     IN VARCHAR2);
```

Parameters**Table 72-17 MAP_DAD Procedure Parameters**

| Parameter | Description |
|-----------|----------------------------|
| dad_name | The name of the DAD to map |
| path | The virtual path to map |

Exceptions

Raises an error if the DAD does not exist.

72.6.14 SET_DAD_ATTRIBUTE Procedure

This procedure sets the value for a DAD.

**See Also:**

[Configuration Subprograms](#) for other subprograms in this group

Syntax

```
DBMS_EPG.SET_DAD_ATTRIBUTE (
  dad_name IN VARCHAR2,
  attr_name IN VARCHAR2, attr_value IN VARCHAR2);
```

Parameters**Table 72-18 SET_DAD_ATTRIBUTE Procedure Parameters**

| Parameter | Description |
|------------|--|
| dad_name | The name of the DAD for which to set the attribute |
| attr_name | The name of the attribute to set |
| attr_value | The attribute value to set |

Table 72-19 Mapping Between mod_plsql and Embedded PL/SQL Gateway DAD Attributes

| mod_plsql DAD Attribute | Embedded PL/SQL Gateway DAD Attribute | Allows Multiple Occurrences | Legal Values |
|--------------------------------|--|------------------------------------|---|
| PlsqlAfterProcedure | after-procedure | No | String |
| PlsqlAlwaysDescribeProcedure | always-describe-procedure | No | Enumeration of On, Off |
| PlsqlAuthenticationMode | authentication-mode | No | Enumeration of Basic, SingleSignOn, GlobalOwa, CustomOwa, PerPackageOwa |
| PlsqlBeforeProcedure | before-procedure | No | String |
| PlsqlBindBucketLengths | bind-bucket-lengths | Yes | Unsigned integer |
| PlsqlBindBucketWidths | bind-bucket-widths | Yes | Unsigned integer |
| PlsqlCGIEnvironmentList | cgi-environment-list | Yes | String |
| PlsqlCompatibilityMode | compatibility-mode | No | Unsigned integer |
| PlsqlDatabaseUsername | database-username | No | String |
| PlsqlDefaultPage | default-page | No | String |
| PlsqlDocumentPath | document-path | No | String |
| PlsqlDocumentProcedure | document-procedure | No | String |
| PlsqlDocumentTablename | document-table-name | No | String |
| PlsqlErrorStyle | error-style | No | Enumeration of ApacheStyle, ModplsqlStyle, DebugStyle |
| PlsqlExclusionList | exclusion-list | Yes | String |
| PlsqlFetchBufferSize | fetch-buffer-size | No | Unsigned integer |
| PlsqlInfoLogging | info-logging | No | Enumeration of InfoDebug |
| PlsqlOWADebugEnable | owa-debug-enable | No | Enumeration of On, Off |
| PlsqlMaxRequestsPerSession | max-requests-per-session | No | Unsigned integer |
| PlsqlNLSLanguage | nlslanguage | No | String |
| PlsqlPathAlias | path-alias | No | String |
| PlsqlPathAliasProcedure | path-alias-procedure | No | String |
| PlsqlRequestValidationFunction | request-validation-function | No | String |
| PlsqlSessionCookieName | session-cookie-name | No | String |

Table 72-19 (Cont.) Mapping Between mod_plsql and Embedded PL/SQL Gateway DAD Attributes

| mod_plsql DAD Attribute | Embedded PL/SQL Gateway DAD Attribute | Allows Multiple Occurrences | Legal Values |
|-----------------------------|---------------------------------------|-----------------------------|--|
| PlsqlSessionStateManagement | session-state-management | No | Enumeration of StatelessWithResetPackageState, StatelessWithFastResetPackageState, StatelessWithPreservePackageState |
| PlsqlTransferMode | transfer-mode | No | Enumeration of Char, Raw |
| PlsqlUploadAsLongRaw | upload-as-long-raw | No | String |

Exceptions

Raises an error if DAD does not exist or the attribute is unknown.

Usage Notes

- If `attr_name` attribute has been set before, then the old value will be overwritten with the new `attr_value` argument.
- The embedded gateway assumes default values when the attributes are not set. The default values of the DAD attributes should be sufficient for most users of the embedded gateway. `mod_plsql` users should note the following
 - The `PlsqlDatabasePassword` attribute is not needed.
 - The `PlsqlDatabaseConnectionString` attribute is not needed because the embedded gateway does not support logon to external databases.

Examples

```
DBMS_EPG.SET_DAD_ATTRIBUTE('HR', 'default-page', 'HRApp.home');
```

72.6.15 SET_GLOBAL_ATTRIBUTE Procedure

This procedure sets the value of a global attribute.

See Also:

[Configuration Subprograms](#) for other subprograms in this group

Syntax

```
DBMS_EPG.SET_GLOBAL_ATTRIBUTE (
    attr_name    IN VARCHAR2,
    attr_value   IN VARCHAR2);
```

Parameters

Table 72-20 SET_GLOBAL_ATTRIBUTE Procedure Parameters

| Parameter | Description |
|------------|-----------------------------|
| attr_name | The global attribute to set |
| attr_value | The attribute value to set |

Table 72-21 Mapping Between mod_plsql and Embedded PL/SQL Gateway Global Attributes

| mod_plsql Global Attribute | Embedded PL/SQL Gateway Global Attribute | Allows Multiple Occurrences | Legal Values |
|----------------------------|--|-----------------------------|------------------|
| PlsqlLogLevel | log-level | No | Unsigned integer |
| PlsqlMaxParameters | max-parameters | No | Unsigned integer |

Usage Notes

- The attribute name is case sensitive. The value may or may not be case-sensitive depending on the attribute.
- If `attr_name` attribute has been set before, then the old value will be overwritten with the new `attr_value` argument.

Exceptions

Raises an error if the attribute is unknown.

Examples

```
dbms_epg.set_global_attribute('max-parameters', '100');
```

72.6.16 UNMAP_DAD Procedure

This procedure unmaps a DAD from the specified virtual path. If path is `NULL`, the procedure removes all virtual-path mappings for the DAD but keeps the DAD.

See Also:

[Configuration Subprograms](#) for other subprograms in this group

Syntax

```
DBMS_EPG.UNMAP_DAD (  
    dad_name IN VARCHAR2,  
    path     IN VARCHAR2 DEFAULT NULL);
```

Parameters

Table 72-22 UNMAP_DAD Procedure Parameters

| Parameter | Description |
|-----------|------------------------------|
| dad_name | The name of the DAD to unmap |
| path | The virtual path to unmap |

Usage Notes

Raises an error if the DAD does not exist.

DBMS_ERRLOG

The `DBMS_ERRLOG` package provides a procedure that enables you to create an error logging table so that DML operations can continue after encountering errors rather than abort and roll back. This enables you to save time and system resources.

This chapter contains the following topics:

- [Security Model](#)
- [Summary of DBMS_ERRLOG Subprograms](#)

See Also:

Oracle Database Data Warehousing Guide for more information regarding how to use `DBMS_ERRLOG` and *Oracle Database SQL Language Reference* for `error_logging_clause` syntax

73.1 DBMS_ERRLOG Security Model

Security on this package can be controlled by granting `EXECUTE` on this package to selected users or roles. The `EXECUTE` privilege is granted publicly. However, to create an error logging table, you need `SELECT` access on the base table or view, the `CREATE TABLE` privilege, as well as tablespace quota for the target tablespace.

73.2 Summary of DBMS_ERRLOG Subprograms

The `DBMS_ERRLOG` package includes the `CREATE_ERROR_LOG` procedure subprogram.

Table 73-1 DBMS_ERRLOG Package Subprograms

| Subprogram | Description |
|--|---|
| CREATE_ERROR_LOG Procedure | Creates the error logging table used in DML error logging |

73.2.1 CREATE_ERROR_LOG Procedure

This procedure creates the error logging table needed to use the DML error logging capability.

`LONG`, `CLOB`, `BLOB`, `BFILE`, and `ADT` datatypes are not supported in the columns.

Syntax

```
DBMS_ERRLOG.CREATE_ERROR_LOG (
    dml_table_name      IN VARCHAR2,
    err_log_table_name  IN VARCHAR2 := NULL,
    err_log_table_owner IN VARCHAR2 := NULL,
    err_log_table_space IN VARCHAR2 := NULL,
    skip_unsupported    IN BOOLEAN := FALSE);
```

Parameters

Table 73-2 CREATE_ERROR_LOG Procedure Parameters

| Parameter | Description |
|---------------------|--|
| dml_table_name | The name of the DML table to base the error logging table on. The name can be fully qualified (for example, emp, scott.emp, "EMP", "SCOTT"."EMP"). If a name component is enclosed in double quotes, it will not be upper cased. |
| err_log_table_name | The name of the error logging table you will create. The default is the first 25 characters in the name of the DML table prefixed with 'ERR\$'. Examples are the following: dml_table_name: 'EMP', err_log_table_name: 'ERR\$_EMP' dml_table_name: '"Emp2"', err_log_table_name: 'ERR\$_Emp2' |
| err_log_table_owner | The name of the owner of the error logging table. You can specify the owner in dml_table_name. Otherwise, the schema of the current connected user is used. |
| err_log_table_space | The tablespace the error logging table will be created in. If not specified, the default tablespace for the user owning the DML error logging table will be used. |
| skip_unsupported | When set to TRUE, column types that are not supported by error logging will be skipped over and not added to the error logging table. When set to FALSE, an unsupported column type will cause the procedure to terminate. The default is FALSE. |

Examples

First, create an error log table for the channels table in the SH schema, using the default name generation.

Then, see all columns of the table channels:

```
SQL> DESC channels
Name                                Null?      Type
-----
CHANNEL_ID                          NOT NULL   CHAR(1)
CHANNEL_DESC                         NOT NULL   VARCHAR2(20)
CHANNEL_CLASS                        NOT NULL   VARCHAR2(20)
```

Finally, see all columns of the generated error log table. Note the mandatory control columns that are created by the package:

```
SQL> DESC ERR$_CHANNELS
Name                               Null?      Type
-----
ORA_ERR_NUMBER$                    NUMBER
ORA_ERR_MSG$                        VARCHAR2(2000)
ORA_ERR_ROWID$                      ROWID
ORA_ERR_OPTYP$                     VARCHAR2(2)
ORA_ERR_TAG$                        VARCHAR2(2000)
CHANNEL_ID                          VARCHAR2(4000)
CHANNEL_DESC                        VARCHAR2(4000)
CHANNEL_CLASS                       VARCHAR2(4000)
```

See *Oracle Database Administrator's Guide* for more information regarding control columns.

DBMS_FGA

The `DBMS_FGA` package provides fine-grained security functions.

This chapter contains the following topics:

- [Security Model](#)
- [Operational Notes](#)
- [Summary of DBMS_FGA Subprograms](#)

74.1 DBMS_FGA Security Model

You must have the `AUDIT_ADMIN` role or the `EXECUTE` privilege on the `DBMS_FGA` package to create audit policies. `DBMS_FGA` is an invoker rights package.

To analyze and audit data, you must have the `AUDIT_VIEWER` role. Because the audit function can potentially capture all user environment and application context values, policy administration should be executable by privileged users only. The policy event handler module is executed with the module owner's privilege.

74.2 DBMS_FGA Operational Notes

This package is available for only cost-based optimization. The rule-based optimizer may generate unnecessary audit records since audit monitoring can occur before row filtering.

For both the rule-based optimizer and the cost-based optimizer, you can query the `SQL_TEXT` and `SQL_BINDS` columns of the `UNIFIED_AUDIT_TRAIL` view to analyze the SQL text and corresponding bind variables that are issued.

74.3 Summary of DBMS_FGA Subprograms

This table lists the `DBMS_FGA` subprograms and briefly describes them.

Table 74-1 *DBMS_FGA Package Subprograms*

| Subprogram | Description |
|--|---|
| ADD_POLICY Procedure | Creates an audit policy using the supplied predicate as the audit condition |
| DISABLE_POLICY Procedure | Disables an audit policy |
| DROP_POLICY Procedure | Drops an audit policy |
| ENABLE_POLICY Procedure | Enables an audit policy |

74.3.1 ADD_POLICY Procedure

This procedure creates an audit policy using the supplied predicate as the audit condition.

Syntax

```
DBMS_FGA.ADD_POLICY(
  object_schema      IN VARCHAR2 DEFAULT NULL,
  object_name        IN VARCHAR2,
  policy_name        IN VARCHAR2,
  audit_condition    IN VARCHAR2 DEFAULT NULL,
  audit_column       IN VARCHAR2 DEFAULT NULL,
  handler_schema     IN VARCHAR2 DEFAULT NULL,
  handler_module     IN VARCHAR2 DEFAULT NULL,
  enable             IN BOOLEAN DEFAULT TRUE,
  statement_types    IN VARCHAR2 DEFAULT SELECT,
  audit_trail        IN BINARY_INTEGER DEFAULT NULL,
  audit_column_opts  IN BINARY_INTEGER DEFAULT ANY_COLUMNS,
  policy_owner       IN VARCHAR2 DEFAULT NULL);
```

Parameters

Table 74-2 ADD_POLICY Procedure Parameters

| Parameter | Description |
|-----------------|---|
| object_schema | Schema of the object to be audited. If <code>NULL</code> , the current schema is assumed. |
| object_name | Name of the object to be audited |
| policy_name | Unique name of the policy. Do not enter special characters such as spaces or commas. If you want to use special characters for the policy name, then enclose the name in quotation marks. |
| audit_condition | A condition in a row that indicates a monitoring condition. <code>NULL</code> is allowed and acts as <code>TRUE</code> . |
| audit_column | Columns to be checked for access. These can include OLS hidden columns or object type columns. The default, <code>NULL</code> , causes audit if any column is accessed or affected. |
| handler_schema | Schema that contains the event handler. The default, <code>NULL</code> , causes the current schema to be used. |
| handler_module | Function name of the event handler; includes the package name if necessary. This function is invoked only after the first row that matches the audit condition in the query is processed. If the procedure fails with an exception, the user SQL statement will fail as well. |
| enable | Enables the policy if <code>TRUE</code> , which is the default |
| statement_types | SQL statement types to which this policy is applicable: <code>INSERT</code> , <code>UPDATE</code> , <code>DELETE</code> , or <code>SELECT</code> only |
| audit_trail | In an environment that has not yet migrated to unified auditing, the destination (DB or XML) of fine-grained audit records. Also specifies whether to populate the <code>LSQLTEXT</code> and <code>LSQLBIND</code> columns in the <code>FGA_LOG\$</code> system table. |

Table 74-2 (Cont.) ADD_POLICY Procedure Parameters

| Parameter | Description |
|--------------------------------|--|
| <code>audit_column_opts</code> | Establishes whether a statement is audited when the query references <i>any</i> column specified in the <code>audit_column</code> parameter or only when <i>all</i> such columns are referenced |
| <code>policy_owner</code> | User who owns the fine-grained auditing policy. However, this setting is not a user-supplied argument. The Oracle Data Pump client uses this setting internally to recreate the fine-grained audit policies appropriately. |

Usage Notes

- A table or view can have a maximum of 256 fine-grained audit policies applied to it.
- If `object_schema` is not specified, the current schema is assumed.
- An FGA policy should not be applied to out-of-line columns such as LOB columns.
- Each audit policy is applied to the query individually. However, at most one audit record may be generated for each policy, no matter how many rows being returned satisfy that policy's `audit_condition`. In other words, whenever any number of rows being returned satisfy an audit condition defined on the table, a single audit record will be generated for each such policy.
- If a table with an FGA policy defined on it receives a Fast Path insert or a vectored update, the hint is automatically disabled before any such operations. Disabling the hint allows auditing to occur according to the policy's terms. (One example of a Fast Path insert is the statement `INSERT-WITH-APPEND-hint`.)
- The `audit_condition` must be a boolean expression that can be evaluated using the values in the row being inserted, updated, or deleted. The expression can also use functions, such as the `USER` or `SYS_CONTEXT` functions.

The expression must not combine conditions using operators such as `AND` and `OR`. `audit_condition` can be `NULL` (or omitted), which is interpreted as `TRUE`, but it cannot contain the following elements:

- Subqueries or sequences
- The following attributes of the `USERENV` namespace when accessed using the `SYS_CONTEXT` function:
 - * `CURRENT_SQL`
 - * `CURRENT_SQL_LENGTH`
 - * `CURRENT_BIND`
- Any use of the pseudo columns `LEVEL`, `PRIOR`, or `ROWNUM`.

Specifying an audit condition of "1=1" to force auditing of all specified statements ("statement_types") affecting the specified column ("audit_column") is no longer needed to achieve this purpose. A `NULL` value for `audit_condition` causes audit to happen even if no rows are processed, so that all actions on a table with this policy are audited.

- The `audit_condition` is evaluated using the privileges of the user who creates the policy.
- For the `audit_condition` setting, do not include functions, which execute the `auditable` statement on the same base table, in the `audit_condition` setting. For example,

suppose you create a function that executes an `INSERT` statement on the `HR.EMPLOYEES` table. The policy `audit_condition` contains this function and it is for `INSERT` statements (as set by the `statement_types` parameter). When the policy is used, the function executes recursively until the system has run out of memory. This can raise the error `ORA-1000: maximum open cursors exceeded` or `ORA-00036: maximum number of recursive SQL levels (50) exceeded`.

- Do not issue the `DBMS_FGA.ENABLE_POLICY` or `DBMS_FGA.DISABLE_POLICY` statement from a policy function in a condition.
- The audit function (`handler_module`) is an alerting mechanism for the administrator. The required interface for such a function is as follows:

```
PROCEDURE fname ( object_schema VARCHAR2, object_name VARCHAR2, policy_name
VARCHAR2 ) AS ...
```

where `fname` is the name of the procedure, `object_schema` is the name of the schema of the table audited, `object_name` is the name of the table to be audited, and `policy_name` is the name of the policy being enforced. The audit function will be executed with the function owner's privilege.

- If you have migrated to unified auditing, then omit the `audit_trail` parameter because the audit records will automatically be written to the unified audit trail.
- Be aware that sensitive data, such as credit card information, can be recorded in clear text.
- The `audit_trail` parameter, if used, specifies both where the fine-grained audit trail will be written and whether it is to include the query's SQL Text and SQL Bind variable information (typically in columns named `LSQLTEXT` and `LSQLBIND`):
 - If `audit_trail` includes `XML`, then fine-grained audit records are written to XML-format operating system files stored in the directory specified by an `AUDIT_FILE_DEST` statement in SQL. (The default `AUDIT_FILE_DEST` is `$ORACLE_BASE/admin/$DB_UNIQUE_NAME/adump` on Unix-based systems, and `$ORACLE_BASE\admin\%DB_UNIQUE_NAME\adump` on Windows systems.)
 - If `audit_trail` includes `DB` instead, then the audit records are written to the `SYS.FGA_LOG$` table in the database. However, for read-only databases, Oracle Database writes the fine-grained audit records to XML files, regardless of the `audit_trail` settings.
 - If `audit_trail` includes `EXTENDED`, then the query's SQL Text and SQL Bind variable information are included in the audit trail.
 - For example:
 - * Setting `audit_trail` to `DBMS_FGA.DB` sends the audit trail to the `SYS.FGA_LOG$` table in the database and omits SQL Text and SQL Bind.
 - * Setting `audit_trail` to `DBMS_FGA.DB + DBMS_FGA.EXTENDED` sends the audit trail to the `SYS.FGA_LOG$` table in the database and includes SQL Text and SQL Bind.
 - * Setting `audit_trail` to `DBMS_FGA.XML` writes the audit trail in XML files sent to the operating system and omits SQL Text and SQL Bind.
 - * Setting `audit_trail` to `DBMS_FGA.XML + DBMS_FGA.EXTENDED` writes the audit trail in XML files sent to the operating system and includes SQL Text and SQL Bind.

The `audit_trail` parameter appears in the `ALL_AUDIT_POLICIES` view.

- You can change the operating system destination using the following command:

```
ALTER SYSTEM SET AUDIT_FILE_DEST = New Directory DEFERRED
```

- On many platforms, XML audit files are named `process_name_processId.xml`, for example, `ora_2111.xml`. Alternatively, on Windows, the XML audit files are named `process_name_ThreadId.xml` (or `process_name_ProcessId.xml` if the process is not running as a thread).
- The `audit_column_opts` parameter establishes whether a statement is audited
 - when the query references *any* column specified in the `audit_column` parameter (`audit_column_opts = DBMS_FGA.ANY_COLUMNS`), or
 - only when *all* such columns are referenced (`audit_column_opts = DBMS_FGA.ALL_COLUMNS`).

The default is `DBMS_FGA.ANY_COLUMNS`.

The `ALL_AUDIT_POLICIES` view also shows `audit_column_opts`.

- When `audit_column_opts` is set to `DBMS_FGA.ALL_COLUMNS`, a SQL statement is audited only when all the columns mentioned in `audit_column` have been explicitly referenced in the statement. And these columns must be referenced in the same SQL-statement or in the sub-select.

All these columns must refer to a single table/view or alias.

If a SQL statement selects the columns from different table aliases, the statement will not be audited.

- Every XML audit record contains the elements `AUDIT_TYPE` and `EXTENDED_TIMESTAMP`, with the latter printed in UTC zone (with no timezone information). Values retrieved using `V$XML_AUDIT_TRAIL` view are converted to session timezone and printed.
- For `SQL_TEXT` and `SQL_BIND` element values (CLOB type columns), the dynamic view shows only the first 4000 characters. The underlying XML file may have more than 4000 characters for such `SQL_TEXT` and `SQL_BIND` values.
- For large numbers of XML audit files, querying `V$XML_AUDIT_TRAIL` is faster when they are loaded into a database table using `SQL*Loader` or a similar tool. XML audit files are larger than the equivalent written to OS files when `AUDIT_TRAIL=OS`.
- Error handling is the same as when `AUDIT_TRAIL=OS`. If any error occurs in writing an audit record to disk, including the directory identified by `AUDIT_FILE_DEST` being full, the auditing operation fails. An alert message is logged.
- The policy event handler module will be executed with the module owner's privilege.
- Do not create recursive fine-grained audit handlers. For example, suppose you create a handler that executes an `INSERT` statement on the `HR.EMPLOYEES` table. The policy that is associated with this handler is for `INSERT` statements (as set by the `statement_types` parameter). When the policy is used, the handler executes recursively until the system has run out of memory. This can raise the error `ORA-1000: maximum open cursors exceeded` or `ORA-00036: maximum number of recursive SQL levels (50) exceeded`. See also *Oracle Database Security Guide* with regard to `Creating a Fine-Grained Audit Policy`.
- The fine-grained audit handler module should not have explicit `COMMIT`, `ROLLBACK`, and `DDL` statements mentioned in it.

- The values for the `audit_trail` parameter (`XML` and `XML+EXTENDED`) cause fine-grained auditing records to be written to operating system files in XML format. A dynamic view, `V$XML_AUDIT_TRAIL`, makes such audit records from XML files available to DBAs through SQL query, providing enhanced usability. Querying this view causes all XML files (all files with an `.xml` extension) in the `AUDIT_FILE_DEST` directory to be parsed and presented in relational table format.

Audit records stored in operating system files can be more secure than database-stored audit records because access can require file permissions that DBAs do not have. Operating system storage for audit records also offers higher availability, since such records remain available even if the database is temporarily inaccessible.

The `DBA_COMMON_AUDIT_TRAIL` view includes the contents of the `V$XML_AUDIT_TRAIL` dynamic view for standard and fine-grained audit records.

Note that the `V$XML_AUDIT_TRAIL` view is populated only if unified auditing is not enabled. If you have enabled unified auditing, then you can query the `UNIFIED_AUDIT_TRAIL` data dictionary view for the audit trail records.

See Also:

Oracle Database Security Guide for an example of creating an email alert handler for a fine-grained audit policy

Examples

```
DBMS_FGA.ADD_POLICY (
  object_schema   => 'scott',
  object_name     => 'emp',
  policy_name     => 'mypolicy1',
  audit_condition => 'sal < 100',
  audit_column   => 'comm,sal',
  handler_schema  => NULL,
  handler_module  => NULL,
  enable         => TRUE,
  statement_types => 'INSERT, UPDATE',
  audit_column_opts => DBMS_FGA.ANY_COLUMNS,
  policy_owner   => 'sec_admin');
```

74.3.2 DISABLE_POLICY Procedure

This procedure disables an audit policy.

Syntax

```
DBMS_FGA.DISABLE_POLICY(
  object_schema IN VARCHAR2,
  object_name   IN VARCHAR2,
  policy_name   IN VARCHAR2);
```

Parameters

Table 74-3 DISABLE_POLICY Procedure Parameters

| Parameter | Description |
|---------------|---|
| object_schema | Schema of the object to be audited. If NULL, the current schema is assumed. |
| object_name | Name of the object to be audited |
| policy_name | Unique name of the policy |

The default value for object_schema is NULL. If NULL, the current schema is assumed.

Examples

```
DBMS_FGA.DISABLE_POLICY (
object_schema => 'scott',
object_name   => 'emp',
policy_name   => 'mypolicy1');
```

74.3.3 DROP_POLICY Procedure

This procedure drops an audit policy.

Syntax

```
DBMS_FGA.DROP_POLICY(
  object_schema IN VARCHAR2,
  object_name   IN VARCHAR2,
  policy_name   IN VARCHAR2);
```

Parameters

Table 74-4 DROP_POLICY Procedure Parameters

| Parameter | Description |
|---------------|---|
| object_schema | Schema of the object to be audited. If NULL, the current schema is assumed. |
| object_name | Name of the object to be audited |
| policy_name | Unique name of the policy |

Usage Notes

The DBMS_FGA procedures cause current DML transactions, if any, to commit before the operation unless they are inside a DDL event trigger. With DDL transactions, the DBMS_FGA procedures are part of the DDL transaction. The default value for object_schema is NULL. If NULL, the current schema is assumed.

**Note:**

Oracle Database automatically drops the audit policy if you remove the object specified in the `object_name` parameter of the `DBMS_FGA.ADD_POLICY` procedure, or if you drop the user who created the audit policy.

Examples

```
DBMS_FGA.DROP_POLICY (
object_schema => 'scott',
object_name   => 'emp',
policy_name   => 'mypolicy1');
```

74.3.4 ENABLE_POLICY Procedure

This procedure enables an audit policy.

Syntax

```
DBMS_FGA.ENABLE_POLICY(
  object_schema IN VARCHAR2,
  object_name   IN VARCHAR2,
  policy_name   IN VARCHAR2,
  enable       IN BOOLEAN);
```

Parameters**Table 74-5 ENABLE_POLICY Procedure Parameters**

| Parameter | Description |
|----------------------------|---|
| <code>object_schema</code> | Schema of the object to be audited. If <code>NULL</code> , the current schema is assumed. |
| <code>object_name</code> | Name of the object to be audited |
| <code>policy_name</code> | Unique name of the policy |
| <code>enable</code> | Defaults to <code>TRUE</code> to enable the policy |

Examples

```
DBMS_FGA.ENABLE_POLICY (
object_schema => 'scott',
object_name   => 'emp',
policy_name   => 'mypolicy1',
enable       => TRUE);
```

DBMS_FILE_GROUP

The `DBMS_FILE_GROUP` package, one of a set of Oracle Streams packages, provides administrative interfaces for managing file groups, file group versions, and files. A file group repository is a collection of all of the file groups in a database and can contain multiple versions of a particular file group. You can use this package to create and manage file group repositories.

This chapter contains the following topics:

- [Overview](#)
- [Security Model](#)
- [Constants](#)
- [Summary of DBMS_FILE_GROUP Subprograms](#)

75.1 DBMS_FILE_GROUP Overview

It is helpful to understand terminology before using the `DBMS_FILE_GROUP` package.

The following terms pertain to the `DBMS_FILE_GROUP` package:

File

A **file** is a reference to a file stored on hard disk. A file is composed of a file name, a directory object, and a file type. The directory object references the directory in which the file is stored on hard disk. For example, a file might have the following components:

- The file name is `expdat.dmp`.
- The directory object that contains the file is `db_files`.
- The file type is `DBMS_FILE_GROUP.EXPORT_DUMP_FILE`.

Version

A **version** is a collection of related files. For example, a version might consist of a set of data files and a Data Pump export dump file generated by a Data Pump transportable tablespace export. Only one Data Pump export dump file is allowed in a version.

File Group

A **file group** is a collection of versions. A file group can logically group a set of versions. For example, a file group named `financial_quarters` can keep track of quarterly financial data by logically grouping versions of files related to a tablespace set. The tablespaces containing the data can be exported at the end of each quarter and versioned under names such as `Q1FY04`, `Q2FY04`, and so on.

75.2 DBMS_FILE_GROUP Security Model

There are two ways to define control on the DBMS_FILE_GROUP package.

- Granting EXECUTE on this package to selected users or roles.
- Granting EXECUTE_CATALOG_ROLE to selected users or roles.

If subprograms in the package are run from within a stored procedure, then the user who runs the subprograms must be granted EXECUTE privilege on the package directly. It cannot be granted through a role.

75.3 DBMS_FILE_GROUP Constants

The DBMS_FILE_GROUP package defines several enumerated constants for specifying parameter values. Enumerated constants must be prefixed with the package name. For example, DBMS_FILE_GROUP.EXPORT_DUMP_FILE.

The following table lists the parameters and enumerated constants.

Table 75-1 DBMS_FILE_GROUP Parameters with Enumerated Constants

| Parameter | Option | Type | Description |
|--------------------------------|---------------------|---------------|--|
| file_type | • DATAFILE | VARCHAR2 (30) | DATAFILE is a datafile for a database. This constant can be specified as 'DATAFILE'. |
| new_file_type | • EXPORT_DUMP_FILE | | EXPORT_DUMP_FILE is a Data Pump export dump file. This constant can be specified as 'DUMPSET'. |
| | • DATAPUMP_LOG_FILE | | DATAPUMP_LOG_FILE is a Data Pump export log file. This constant can be specified as 'DATAPUMLOG'. |
| max_versions retention_days | • INFINITE | NUMBER | INFINITE specifies no limit. The max_versions or retention_days can increase without reaching a limit. |

Table 75-1 (Cont.) DBMS_FILE_GROUP Parameters with Enumerated Constants

| Parameter | Option | Type | Description |
|-----------|--|----------------|--|
| privilege | <p>System privilege specified in the GRANT_SYSTEM_PRIVILEGE procedure:</p> <ul style="list-style-type: none"> • READ_ANY_FILE_GROUP • MANAGE_ANY_FILE_GROUP • MANAGE_FILE_GROUP <p>Object privilege specified in the GRANT_OBJECT_PRIVILEGE procedure:</p> <ul style="list-style-type: none"> • READ_ON_FILE_GROUP • MANAGE_ON_FILE_GROUP | BINARY_INTEGER | <p>READ_ANY_FILE_GROUP grants the privilege to view information about any file group in any schema in the data dictionary.</p> <p>MANAGE_ANY_FILE_GROUP grants the privilege to create, manage, and drop any file group in any schema.</p> <p>MANAGE_FILE_GROUP grants the privilege to create, manage, and drop file groups in the user's schema.</p> <p>READ_ON_FILE_GROUP grants the privilege to view information about a specific file group in the data dictionary.</p> <p>MANAGE_ON_FILE_GROUP grants the privilege to manage a specific file group in a schema other than the user's schema.</p> |

75.4 Summary of DBMS_FILE_GROUP Subprograms

This table lists the DBMS_FILE_GROUP subprograms and briefly describes them.

Table 75-2 DBMS_FILE_GROUP Package Subprograms

| Subprogram | Description |
|---|---|
| ADD_FILE Procedure | Adds a file to a version of a file group |
| ALTER_FILE Procedure | Alters a file in a version of a file group |
| ALTER_FILE_GROUP Procedure | Alters a file group |
| ALTER_VERSION Procedure | Alters a version of a file group |
| CREATE_FILE_GROUP Procedure | Creates a file group |
| CREATE_VERSION Procedure | Creates a version of a file group |
| DROP_FILE_GROUP Procedure | Drops a file group |
| DROP_VERSION Procedure | Drops a version of a file group |
| GRANT_OBJECT_PRIVILEGE Procedure | Grants object privileges on a file group to a user |
| GRANT_SYSTEM_PRIVILEGE Procedure | Grants system privileges for file group operations to a user |
| PURGE_FILE_GROUP Procedure | Purges a file group using the file group's retention policy |
| REMOVE_FILE Procedure | Removes a file from a version of a file group |
| REVOKE_OBJECT_PRIVILEGE Procedure | Revokes object privileges on a file group from a user |
| REVOKE_SYSTEM_PRIVILEGE Procedure | Revokes system privileges for file group operations from a user |

**Note:**

All subprograms commit unless specified otherwise.

75.4.1 ADD_FILE Procedure

This procedure adds a file to a version of a file group.

Syntax

```
DBMS_FILE_GROUP.ADD_FILE(
  file_group_name IN VARCHAR2,
  file_name       IN VARCHAR2,
  file_type       IN VARCHAR2 DEFAULT NULL,
  file_directory IN VARCHAR2 DEFAULT NULL,
  version_name    IN VARCHAR2 DEFAULT NULL,
  comments        IN VARCHAR2 DEFAULT NULL);
```

Parameters

Table 75-3 ADD_FILE Procedure Parameters

| Parameter | Description |
|-----------------|---|
| file_group_name | The name of the file group that contains the version, specified as <i>[schema_name.]file_group_name</i> . For example, if the schema is <code>hq_dba</code> and the file group name is <code>sales_tbs</code> , then specify <code>hq_dba.sales_tbs</code> . If the schema is not specified, then the current user is the default. |
| file_name | The name of the file being added to the version. Each file name in a version must be unique. |
| file_type | The file type. The following are reserved file types: <ul style="list-style-type: none"> If the file is a datafile, then enter the following: <pre>'DATAFILE'</pre> If the file is a Data Pump export dump file, then enter the following: <pre>'DUMPSET'</pre> <p>Data Pump metadata is populated when a Data Pump export dump file is imported.</p> If the file is a Data Pump export log file, then enter the following: <pre>'DATAPUMPLOG'</pre> <p>If the file type is not one of the reserved file types, then either enter a text description of the file type, or specify <code>NULL</code> to omit a file type description.</p> <p>See "Constants" for more information about the reserved file types.</p> |

Table 75-3 (Cont.) ADD_FILE Procedure Parameters

| Parameter | Description |
|----------------|--|
| file_directory | The name of the directory object that corresponds to the directory containing the file. If NULL, then the procedure uses the default directory object for the version. If NULL and no default directory object exists for the version, then the procedure uses the default directory object for the file group. If NULL and no default directory object exists for the version or file group, then the procedure raises an error. |
| version_name | The name of the version to which the file is added. If a positive integer is specified as a VARCHAR2 value, then the integer is interpreted as a version number. For example, if '1' is specified, then the file is added to version 1 of the file group. If NULL, then the procedure uses the version with the latest creation time for the file group. |
| comments | Comments about the file being added |

Usage Notes

To run this procedure with either `DBMS_FILE_GROUP.EXPORT_DUMP_FILE` or 'DUMPSET' specified for the `file_type` parameter, a user must meet the following requirements:

- Have the appropriate privileges to import the Data Pump export dump file
- Have `READ` privilege on the directory object that contains the Data Pump export dump file

See Also:

Oracle Database Utilities for more information about Data Pump privileges

75.4.2 ALTER_FILE Procedure

This procedure alters a file in a version of a file group.

Syntax

```
DBMS_FILE_GROUP.ALTER_FILE(
  file_group_name      IN  VARCHAR2,
  file_name            IN  VARCHAR2,
  version_name         IN  VARCHAR2 DEFAULT NULL,
  new_file_name        IN  VARCHAR2 DEFAULT NULL,
  new_file_directory   IN  VARCHAR2 DEFAULT NULL,
  new_file_type        IN  VARCHAR2 DEFAULT NULL,
  remove_file_type    IN  VARCHAR2 DEFAULT 'N',
  new_comments        IN  VARCHAR2 DEFAULT NULL,
  remove_comments     IN  VARCHAR2 DEFAULT 'N');
```

Parameters

Table 75-4 ALTER_FILE Procedure Parameters

| Parameter | Description |
|---------------------------------|---|
| <code>file_group_name</code> | The name of the file group that contains the version, specified as <code>[schema_name.]file_group_name</code> . For example, if the schema is <code>hq_dba</code> and the file group name is <code>sales_tbs</code> , then specify <code>hq_dba.sales_tbs</code> . If the schema is not specified, then the current user is the default. |
| <code>file_name</code> | The name of the file being altered in the version |
| <code>version_name</code> | The name of the version that contains the file being altered. If a positive integer is specified as a <code>VARCHAR2</code> value, then the integer is interpreted as a version number. For example, if '1' is specified, then the file in version 1 of the file group is altered. If <code>NULL</code> , then the procedure uses the version with the latest creation time for the file group. |
| <code>new_file_name</code> | The new name of the file if the file name is being changed. Each file name in a version must be unique. If <code>NULL</code> , then the procedure does not change the file name. Note: When a non- <code>NULL</code> new file name is specified, this procedure changes the metadata for the file name in the data dictionary, but it does not change the file name on the hard disk. |
| <code>new_file_directory</code> | The new name of the directory object that corresponds to the directory containing the file, if the directory object is being changed. If <code>NULL</code> , then the procedure does not change the directory object name. Note: When a non- <code>NULL</code> new file directory is specified, this procedure changes the metadata for the file directory in the data dictionary, but it does not change the file directory on the hard disk. |
| <code>new_file_type</code> | The file type. The following are reserved file types: <ul style="list-style-type: none"> • If the file is a datafile, then enter the following: <code>'DATAFILE'</code> • If the file is a Data Pump export dump file, then enter the following: <code>'DUMPSET'</code> • If the file is a Data Pump export log file, then enter the following: <code>'DATAPUMPLOG'</code> If the file type is not one of the reserved file types, then enter a text description of the file type. If <code>NULL</code> , then the procedure does not change the file type. See Also: "Constants" for more information about the reserved file types. |
| <code>remove_file_type</code> | If <code>Y</code> , then the procedure removes the file type. If <code>Y</code> and the <code>new_file_type</code> parameter is non- <code>NULL</code> , then the procedure raises an error. If <code>N</code> , then the procedure does not remove the file type. |

Table 75-4 (Cont.) ALTER_FILE Procedure Parameters

| Parameter | Description |
|------------------------------|--|
| <code>new_comments</code> | New comments about the file being altered. If non-NULL, then the procedure replaces the existing comments with the specified comments. If NULL, then the procedure does not change the existing comments. |
| <code>remove_comments</code> | If Y, then the procedure removes the comments for the file. If Y and the <code>new_comments</code> parameter is non-NULL, then the procedure raises an error. If N, then the procedure does not change the existing comments. |

Usage Notes

If the file type is changed to `DBMS_FILE_GROUP.EXPORT_DUMP_FILE` or 'DUMPSET', then Data Pump metadata for the file is populated. If the file type is changed from `DBMS_FILE_GROUP.EXPORT_DUMP_FILE` or 'DUMPSET', then Data Pump metadata for the file is purged.

To run this procedure with `DBMS_FILE_GROUP.EXPORT_DUMP_FILE` or 'DUMPSET' specified for the `new_file_type` parameter, a user must meet the following requirements:

- Have the appropriate privileges to import the Data Pump export dump file
- Have READ privilege on the directory object that contains the Data Pump export dump file

**See Also:**

Oracle Database Utilities for more information about Data Pump privileges

75.4.3 ALTER_FILE_GROUP Procedure

This procedure alters a file group.

Syntax

```
DBMS_FILE_GROUP.ALTER_FILE_GROUP (
  file_group_name      IN  VARCHAR2,
  keep_files           IN  VARCHAR2  DEFAULT NULL,
  min_versions         IN  NUMBER    DEFAULT NULL,
  max_versions         IN  NUMBER    DEFAULT NULL,
  retention_days       IN  NUMBER    DEFAULT NULL,
  new_default_directory IN  VARCHAR2  DEFAULT NULL,
  remove_default_directory IN VARCHAR2  DEFAULT 'N',
  new_comments         IN  VARCHAR2  DEFAULT NULL,
  remove_comments     IN  VARCHAR2  DEFAULT 'N');
```

Parameters

Table 75-5 ALTER_FILE_GROUP Procedure Parameters

| Parameter | Description |
|------------------------------------|--|
| <code>file_group_name</code> | The name of the file group being altered, specified as <code>[schema_name.]file_group_name</code> . For example, if the schema is <code>hq_dba</code> and the file group name is <code>sales_tbs</code> , then specify <code>hq_dba.sales_tbs</code> . If the schema is not specified, then the current user is the default. |
| <code>keep_files</code> | <p>If Y, then the files in the file group are retained on hard disk if the file group or a version of the file group is dropped or purged.</p> <p>If N, then the files in the file group are deleted from hard disk if the file group or a version of the file group is dropped or purged.</p> <p>If NULL, then this parameter is not changed.</p> <p>Note: If the file group is dropped because of a <code>DROP USER CASCADE</code> statement, then the setting of this parameter determines whether the files are dropped from the hard disk.</p> |
| <code>min_versions</code> | <p>The minimum number of versions to retain. The specified value must be greater than or equal to 1.</p> <p>If NULL, then the procedure does not change the <code>min_versions</code> setting for the file group.</p> |
| <code>max_versions</code> | <p>The maximum number of versions to retain. The specified value must be greater than or equal to the value specified for <code>min_versions</code>. When the number of versions exceeds the specified <code>max_versions</code>, the oldest version is purged.</p> <p>Specify <code>DBMS_FILE_GROUP.INFINITE</code> for no limit to the number of versions.</p> <p>If NULL, then the procedure does not change the <code>max_versions</code> setting for the file group.</p> |
| <code>retention_days</code> | <p>The maximum number of days to retain a version. The specified value must be greater than or equal to 0 (zero). When the age of a version exceeds the specified <code>retention_days</code> and there are more versions than the number specified in <code>min_versions</code>, the version is purged. The age of a version is calculated by subtracting the creation time from the current time.</p> <p>A decimal value can specify a fraction of a day. For example, 1.25 specifies one day and six hours.</p> <p>Specify <code>DBMS_FILE_GROUP.INFINITE</code> for no limit to the number of days a version can exist.</p> <p>If NULL, then the procedure does not change the <code>retention_days</code> setting for the file group.</p> |
| <code>new_default_directory</code> | <p>The default directory object used when files are added to a file group if no directory is specified when the files are added, and no default directory object is specified for the version.</p> <p>If NULL, then the procedure does not change the default directory.</p> |

Table 75-5 (Cont.) ALTER_FILE_GROUP Procedure Parameters

| Parameter | Description |
|---------------------------------------|--|
| <code>remove_default_directory</code> | If Y, then the procedure removes the default directory for the file group. If Y and the <code>new_default_directory</code> parameter is set to a non-NULL value, then the procedure raises an error. If N, then the procedure does not remove the default directory for the file group. |
| <code>new_comments</code> | Comments about the file group. If non-NULL, then the new comments replace the existing comments for the file group. If NULL, then the procedure does not change the existing comments. |
| <code>remove_comments</code> | If Y, then the comments for the file group are removed. If Y and the <code>new_comments</code> parameter is set to a non-NULL value, then the procedure raises an error. If N, then the procedure does not change the comments for the file group. |

Usage Notes

If `min_versions` is set to 1, then the only version of the file group can be purged when a new version is added. If the addition of the new version is not complete when the existing version is purged, then there can be a period of time when no version of the file group is available. Therefore, set `min_versions` to at least 2 if a version of the file group must be available at all times.

75.4.4 ALTER_VERSION Procedure

This procedure alters a version of a file group.

Syntax

```
DBMS_FILE_GROUP.ALTER_VERSION(
    file_group_name      IN  VARCHAR2,
    version_name         IN  VARCHAR2  DEFAULT NULL,
    new_version_name     IN  VARCHAR2  DEFAULT NULL,
    remove_version_name  IN  VARCHAR2  DEFAULT 'N',
    new_default_directory IN  VARCHAR2  DEFAULT NULL,
    remove_default_directory IN VARCHAR2  DEFAULT 'N',
    new_comments         IN  VARCHAR2  DEFAULT NULL,
    remove_comments     IN  VARCHAR2  DEFAULT 'N');
```

Parameters

Table 75-6 ALTER_VERSION Procedure Parameters

| Parameter | Description |
|---------------------------------------|--|
| <code>file_group_name</code> | The name of the file group that contains the version, specified as <code>[schema_name.]file_group_name</code> . For example, if the schema is <code>hq_dba</code> and the file group name is <code>sales_tbs</code> , then specify <code>hq_dba.sales_tbs</code> . If the schema is not specified, then the current user is the default. |
| <code>version_name</code> | The name of the version being altered. If a positive integer is specified as a <code>VARCHAR2</code> value, then the integer is interpreted as a version number. For example, if '1' is specified, then version 1 of the file group is altered. If '*' is specified, then the procedure alters all versions, and the <code>new_version_name</code> parameter must be <code>NULL</code> . If <code>NULL</code> , then the procedure uses the version with the latest creation time for the file group. |
| <code>new_version_name</code> | The new name of the version. Do not specify a schema. The specified version name cannot be a positive integer or an asterisk ('*'). If <code>NULL</code> , then the procedure does not change the version name. |
| <code>remove_version_name</code> | If <code>Y</code> , then the procedure removes the version name. If the version name is removed, then the version number must be used to manage the version. If <code>Y</code> and the <code>new_version_name</code> parameter is set to a non- <code>NULL</code> value, then the procedure raises an error. If <code>N</code> , then the procedure does not remove the version name. |
| <code>new_default_directory</code> | The default directory object used when files are added to a version if no directory is specified when the files are added. If <code>NULL</code> , then the procedure does not change the default directory. |
| <code>remove_default_directory</code> | If <code>Y</code> , then the procedure removes the default directory. If <code>Y</code> and the <code>new_default_directory</code> parameter is set to a non- <code>NULL</code> value, then the procedure raises an error. If <code>N</code> , then the procedure does not remove the default directory. |
| <code>new_comments</code> | Comments about the version. If non- <code>NULL</code> , then the new comments replace the existing comments for the version. If <code>NULL</code> , then the procedure does not change the comments. |
| <code>remove_comments</code> | If <code>Y</code> , then the procedure removes the comments for the version. If <code>Y</code> and the <code>new_comments</code> parameter is set to a non- <code>NULL</code> value, then the procedure raises an error. If <code>N</code> , then the procedure does not remove the comments for the version. |

75.4.5 CREATE_FILE_GROUP Procedure

This procedure creates a file group.

Syntax

```
DBMS_FILE_GROUP.CREATE_FILE_GROUP(
  file_group_name  IN  VARCHAR2,
  keep_files       IN  VARCHAR2  DEFAULT 'Y',
  min_versions     IN  NUMBER     DEFAULT 2,
  max_versions     IN  NUMBER     DEFAULT DBMS_FILE_GROUP.INFINITE,
  retention_days   IN  NUMBER     DEFAULT DBMS_FILE_GROUP.INFINITE,
  default_directory IN  VARCHAR2  DEFAULT NULL,
  comments         IN  VARCHAR2  DEFAULT NULL);
```

Parameters

Table 75-7 CREATE_FILE_GROUP Procedure Parameters

| Parameter | Description |
|-----------------|---|
| file_group_name | The name of the file group, specified as <i>[schema_name.]file_group_name</i> . For example, if the schema is <i>hq_dba</i> and the file group name is <i>sales_tbs</i> , then specify <i>hq_dba.sales_tbs</i> . If the schema is not specified, then the current user is the default. |
| keep_files | If Y , then the files in the file group are retained on hard disk if the file group or a version of the file group is dropped or purged. If N , then the files in the file group are deleted from hard disk if the file group or a version of the file group is dropped or purged. Note: If the file group is dropped because of a DROP USER CASCADE statement, then the setting of this parameter determines whether the files are dropped from the hard disk. |
| min_versions | The minimum number of versions to retain. The specified value must be greater than or equal to 1. |
| max_versions | The maximum number of versions to retain. The specified value must be greater than or equal to the value specified for <i>min_versions</i> . When the number of versions exceeds the specified <i>max_versions</i> , the oldest version is purged. Specify DBMS_FILE_GROUP.INFINITE for no limit to the number of versions. |
| retention_days | The maximum number of days to retain a version. The specified value must be greater than or equal to 0 (zero). When the age of a version exceeds the specified <i>retention_days</i> and there are more versions than the number specified in <i>min_versions</i> , the version is purged. The age of a version is calculated by subtracting the creation time from the current time. A decimal value can specify a fraction of a day. For example, 1.25 specifies one day and six hours. Specify DBMS_FILE_GROUP.INFINITE for no limit to the number of days a version can exist. |

Table 75-7 (Cont.) CREATE_FILE_GROUP Procedure Parameters

| Parameter | Description |
|-------------------|---|
| default_directory | The default directory object used when files are added to a file group if no directory is specified when the files are added, and no default directory object is specified for the version. |
| comments | Comments about the file group being created. |

Usage Notes

If `min_versions` is set to 1, then the only version of the file group can be purged when a new version is added. If the addition of the new version is not complete when the existing version is purged, then there can be a period of time when no version of the file group is available. Therefore, set `min_versions` to at least 2 if a version of the file group must be available at all times.

75.4.6 CREATE_VERSION Procedure

This procedure creates a version of a file group.

This procedure automatically runs the `PURGE_FILE_GROUP` procedure. Therefore, versions can be purged based on the file group's retention policy.

This procedure is overloaded. One version of the procedure contains the `OUT` parameter `version_out`, and the other does not.

Syntax

```
DBMS_FILE_GROUP.CREATE_VERSION(
  file_group_name  IN  VARCHAR2,
  version_name     IN  VARCHAR2 DEFAULT NULL,
  default_directory IN VARCHAR2 DEFAULT NULL,
  comments         IN  VARCHAR2 DEFAULT NULL);
```

```
DBMS_FILE_GROUP.CREATE_VERSION(
  file_group_name  IN  VARCHAR2,
  version_name     IN  VARCHAR2 DEFAULT NULL,
  default_directory IN VARCHAR2 DEFAULT NULL,
  comments         IN  VARCHAR2 DEFAULT NULL,
  version_out      OUT VARCHAR2);
```

Parameters

Table 75-8 CREATE_VERSION Procedure Parameters

| Parameter | Description |
|-----------------|--|
| file_group_name | The name of the file group to which the new version is added, specified as <code>[schema_name.]file_group_name</code> . For example, if the schema is <code>hq_dba</code> and the file group name is <code>sales_tbs</code> , then specify <code>hq_dba.sales_tbs</code> . If the schema is not specified, then the current user is the default. |

Table 75-8 (Cont.) CREATE_VERSION Procedure Parameters

| Parameter | Description |
|-------------------|--|
| version_name | The name of the version being created. Do not specify a schema. The specified version name cannot be a positive integer because, when a version is created, a version number is generated automatically. The specified version name cannot be an asterisk ('*'). |
| default_directory | The default directory object used when files are added to a version if no directory is specified when the files are added. |
| comments | Comments about the version being created |
| version_out | If the version_name parameter is set to a non-NULL value, then this parameter contains the specified version name. If the version_name parameter is set to NULL, then this parameter contains the generated version number. |

See Also:

[PURGE_FILE_GROUP Procedure](#)

75.4.7 DROP_FILE_GROUP Procedure

This procedure drops a file group.

Syntax

```
DBMS_FILE_GROUP.DROP_FILE_GROUP (
    file_group_name IN VARCHAR2,
    keep_files      IN VARCHAR2 DEFAULT NULL);
```

Parameters

Table 75-9 DROP_FILE_GROUP Procedure Parameters

| Parameter | Description |
|-----------------|--|
| file_group_name | The name of the file group being dropped, specified as <i>[schema_name.]file_group_name</i> . For example, if the schema is <i>hq_dba</i> and the file group name is <i>sales_tbs</i> , then specify <i>hq_dba.sales_tbs</i> . If the schema is not specified, then the current user is the default. |
| keep_files | If <i>Y</i> , then the procedure retains the files in the file group on hard disk. If <i>N</i> , then the procedure deletes the files in the file group from hard disk. If <i>NULL</i> , then the procedure uses the default keep files property of the file group. |

Usage Notes

If this procedure deletes files on hard disk, then the user who runs the procedure must have **WRITE** privilege on the directory object that contains the files.

75.4.8 DROP_VERSION Procedure

This procedure drops a version of a file group.

Syntax

```
DBMS_FILE_GROUP.DROP_VERSION(
  file_group_name IN VARCHAR2,
  version_name    IN VARCHAR2 DEFAULT NULL,
  keep_files      IN VARCHAR2 DEFAULT NULL);
```

Parameters

Table 75-10 DROP_VERSION Procedure Parameters

| Parameter | Description |
|-----------------|--|
| file_group_name | The name of the file group that contains the version, specified as <i>[schema_name.]file_group_name</i> . For example, if the schema is <code>hq_dba</code> and the file group name is <code>sales_tbs</code> , then specify <code>hq_dba.sales_tbs</code> . If the schema is not specified, then the current user is the default. |
| version_name | The name of the version being dropped. If a positive integer is specified as a <code>VARCHAR2</code> value, then the integer is interpreted as a version number. For example, if '1' is specified, then version 1 of the file group is dropped. If <code>NULL</code> , then the procedure uses the version with the oldest creation time for the file group. If '*', then the procedure drops all versions. |
| keep_files | If <code>Y</code> , then the procedure retains the files in the version on hard disk. If <code>N</code> , then the procedure deletes the files in the version from hard disk. If <code>NULL</code> , then the procedure uses the default keep files property of the file group. |

Usage Notes

If this procedure deletes files on hard disk, then the user who runs the procedure must have `WRITE` privilege on the directory object that contains the files.

75.4.9 GRANT_OBJECT_PRIVILEGE Procedure

This procedure grants object privileges on a file group to a user.

Syntax

```
DBMS_FILE_GROUP.GRANT_OBJECT_PRIVILEGE(
  object_name IN VARCHAR2,
  privilege   IN BINARY_INTEGER,
  grantee     IN VARCHAR2,
  grant_option IN BOOLEAN DEFAULT FALSE);
```

Parameters

Table 75-11 GRANT_OBJECT_PRIVILEGE Procedure Parameters

| Parameter | Description |
|--------------|--|
| object_name | The name of the file group on which the privilege is granted, specified as <i>[schema_name.]file_group_name</i> . For example, if the schema is <code>hq_dba</code> and the file group name is <code>sales_tbs</code> , then specify <code>hq_dba.sales_tbs</code> . If the schema is not specified, then the current user is the default. |
| privilege | The constant that specifies the privilege. See "Constants" for valid privileges. |
| grantee | The name of the user or role for which the privilege is granted. The specified user cannot be the owner of the object. |
| grant_option | If <code>TRUE</code> , then the specified user granted the specified privilege can grant this privilege to others. If <code>FALSE</code> , then the specified user granted the specified privilege cannot grant this privilege to others. |

Usage Notes

To run this procedure, a user must meet at least one of the following requirements:

- Be the owner of the object on which the privilege is granted
- Have the same privilege as the privilege being granted with the grant option

75.4.10 GRANT_SYSTEM_PRIVILEGE Procedure

This procedure grants system privileges for file group operations to a user.

Syntax

```
DBMS_FILE_GROUP.GRANT_SYSTEM_PRIVILEGE(
  privilege      IN  BINARY_INTEGER,
  grantee        IN  VARCHAR2,
  grant_option   IN  BOOLEAN  DEFAULT FALSE);
```

Parameters

Table 75-12 GRANT_SYSTEM_PRIVILEGE Procedure Parameters

| Parameter | Description |
|--------------|--|
| privilege | The constant that specifies the privilege. See "Constants" for valid privileges. |
| grantee | The name of the user or role for which the privilege is granted. The user who runs the procedure cannot be specified. |
| grant_option | If <code>TRUE</code> , then the specified user granted the specified privilege can grant this privilege to others. If <code>FALSE</code> , then the specified user granted the specified privilege cannot grant this privilege to others. |

75.4.11 PURGE_FILE_GROUP Procedure

This procedure purges a file group using the file group's retention policy.

A file group's retention policy is determined by its settings for the `max_versions`, `min_versions`, and `retention_days` parameters. The following versions of a file group are removed when a file group is purged:

- All versions greater than the `max_versions` setting for the file group when versions are ordered in descending order by creation time. Therefore, the older versions are purged before the newer versions.
- All versions older than the `retention_days` setting for the file group unless purging a version would cause the number of versions to drop below the `min_versions` setting for the file group.

A job named `SYS.FGR$AUTOPURGE_JOB` automatically purges all file groups in a database periodically according to the job's schedule. You can adjust this job's schedule using the `DBMS_SCHEDULER` package. Alternatively, you can create a job that runs the `PURGE_FILE_GROUP` procedure periodically.

Syntax

```
DBMS_FILE_GROUP.PURGE_FILE_GROUP(
    file_group_name IN VARCHAR2);
```

Parameter

Table 75-13 PURGE_FILE_GROUP Procedure Parameter

| Parameter | Description |
|------------------------------|---|
| <code>file_group_name</code> | The name of the file group, specified as <code>[schema_name.]file_group_name</code> . For example, if the schema is <code>hq_dba</code> and the file group name is <code>sales_tbs</code> , then specify <code>hq_dba.sales_tbs</code> . If the schema is not specified, then the current user is the default. If <code>NULL</code> and this procedure is run by <code>SYS</code> user, then the procedure purges all file groups. |

Usage Notes

If this procedure deletes files on hard disk, then the user who runs the procedure must have `WRITE` privilege on the directory object that contains the files. Files are deleted when a version is purged and the `keep_files` parameter is set to `N` for the version's file group.

75.4.12 REMOVE_FILE Procedure

This procedure removes a file from a version of a file group.

Syntax

```
DBMS_FILE_GROUP.REMOVE_FILE(
    file_group_name IN VARCHAR2,
    file_name       IN VARCHAR2,
```

```
version_name    IN VARCHAR2 DEFAULT NULL,
keep_file      IN VARCHAR2 DEFAULT NULL);
```

Parameters

Table 75-14 REMOVE_FILE Procedure Parameters

| Parameter | Description |
|-----------------|---|
| file_group_name | The name of the file group that contains the version, specified as <i>[schema_name.]file_group_name</i> . For example, if the schema is <code>hq_dba</code> and the file group name is <code>sales_tbs</code> , then specify <code>hq_dba.sales_tbs</code> . If the schema is not specified, then the current user is the default. |
| file_name | The name of the file being removed from the version |
| version_name | The name of the version from which the file is removed. If a positive integer is specified as a <code>VARCHAR2</code> value, then the integer is interpreted as a version number. For example, if '1' is specified, then the file is removed from version 1 of the file group. If <code>NULL</code> , then the procedure uses the version with the latest creation time for the file group. If '*', then the procedure removes the file from all versions. |
| keep_file | If <code>Y</code> , then the procedure retains the file on hard disk. If <code>N</code> , then the procedure deletes the file from hard disk. If <code>NULL</code> , then the procedure uses the default keep files property of the file group. |

Usage Notes

If this procedure deletes files on hard disk, then the user who runs the procedure must have `WRITE` privilege on the directory object that contains the files.

75.4.13 REVOKE_OBJECT_PRIVILEGE Procedure

This procedure revokes object privileges on a file group from a user.

Syntax

```
DBMS_FILE_GROUP.REVOKE_OBJECT_PRIVILEGE (
  object_name IN VARCHAR2,
  privilege   IN BINARY_INTEGER,
  revokee     IN VARCHAR2);
```

Parameters

Table 75-15 REVOKE_OBJECT_PRIVILEGE Procedure Parameters

| Parameter | Description |
|-------------|--|
| object_name | The name of the file group on which the privilege is revoked, specified as <i>[schema_name.]file_group_name</i> . For example, if the schema is <code>hq_dba</code> and the file group name is <code>sales_tbs</code> , then specify <code>hq_dba.sales_tbs</code> . If the schema is not specified, then the current user is the default. |
| privilege | The constant that specifies the privilege. See " Constants " for valid privileges. |

Table 75-15 (Cont.) REVOKE_OBJECT_PRIVILEGE Procedure Parameters

| Parameter | Description |
|-----------|---|
| revokee | The name of the user or role from which the privilege is revoked. The user who owns the object cannot be specified. |

75.4.14 REVOKE_SYSTEM_PRIVILEGE Procedure

This procedure revokes system privileges for file group operations from a user.

Syntax

```
DBMS_FILE_GROUP.REVOKE_SYSTEM_PRIVILEGE (
  privilege IN BINARY_INTEGER,
  revokee   IN VARCHAR2);
```

Parameters

Table 75-16 REVOKE_SYSTEM_PRIVILEGE Procedure Parameters

| Parameter | Description |
|-----------|--|
| privilege | The constant that specifies the privilege. See " Constants " for valid privileges. |
| revokee | The name of the user or role from which the privilege is revoked. The user who runs the procedure cannot be specified. |

DBMS_FILE_TRANSFER

The `DBMS_FILE_TRANSFER` package provides procedures to copy a binary file within a database or to transfer a binary file between databases.

This chapter contains the following topics:

- [Overview](#)
- [Security Model](#)
- [Operating Notes](#)
- [Summary of DBMS_FILE_TRANSFER Subprograms](#)

See Also:

Oracle Database Administrator's Guide for instructions about using file transfer

76.1 DBMS_FILE_TRANSFER Overview

The `DBMS_FILE_TRANSFER` package provides procedures to copy a binary file within a database or to transfer a binary file between databases.

The destination database converts each block when it receives a file from a platform with different endianness. Datafiles can be imported after they are moved to the destination database as part of a transportable operation without RMAN conversion. Both `GET` and `PUT` operations will converted the file across platform difference at the destination. However, `COPY` is a local operation and therefore no conversion is required.

76.2 DBMS_FILE_TRANSFER Security Model

The `DBMS_FILE_TRANSFER` package must be created under `SYS` (`CONNECT INTERNAL`). Operations provided by this package are performed under the current calling user, not the package owner (`SYS`).

To use this interface the following users must have the following privileges:

- The current user at the local database must have `READ` privilege on the directory object specified in the `source_directory_object` parameter.
- The connected user at the destination database must have `WRITE` privilege to the directory object specified in the `destination_directory_object` parameter.

76.3 DBMS_FILE_TRANSFER Operational Notes

`DBMS_FILE_TRANSFER` supports online backup. You should therefore be careful in copying or transferring a file that is being modified by the database because this can result in an

inconsistent file, and require recovery. To guarantee consistency, bring files offline when the database is in use.

If you want to use `DBMS_FILE_TRANSFER` for performing backups, note that you are implementing self-managed backups, and should therefore put the files in hot backup mode.

76.4 Summary of DBMS_FILE_TRANSFER Subprograms

This table lists the `DBMS_FILE_TRANSFER` subprograms and briefly describes them.

Table 76-1 DBMS_FILE_TRANSFER Package Subprograms

| Subprogram | Description |
|-------------------------------------|---|
| COPY_FILE Procedure | Reads a file from a source directory and creates a copy of it in a destination directory. The source and destination directories can both be in a local file system, or both be in an Automatic Storage Management (ASM) disk group, or between local file system and ASM with copying in either direction. |
| GET_FILE Procedure | Contacts a remote database to read a remote file and then creates a copy of the file in the local file system or ASM |
| PUT_FILE Procedure | Reads a local file or ASM and contacts a remote database to create a copy of the file in the remote file system |

76.4.1 COPY_FILE Procedure

This procedure reads a file from a source directory and creates a copy of it in a destination directory. The source and destination directories can both be in a local file system, or both be in an Automatic Storage Management (ASM) disk group, or between local file system and ASM with copying in either direction.

You can copy any type of file to and from a local file system. However, you can copy only database files (such as datafiles, tempfiles, controlfiles, and so on) to and from an ASM disk group.

The destination file is not closed until the procedure completes successfully.

Syntax

```
DBMS_FILE_TRANSFER.COPY_FILE(
    source_directory_object    IN  VARCHAR2,
    source_file_name           IN  VARCHAR2,
    destination_directory_object IN VARCHAR2,
    destination_file_name      IN  VARCHAR2);
```

Parameters

Table 76-2 COPY_FILE Procedure Parameters

| Parameter | Description |
|---|--|
| <code>source_directory_object</code> | The directory object that designates the source directory. The directory object must already exist. (You create directory objects with the <code>CREATE DIRECTORY</code> command). |
| <code>source_file_name</code> | The name of the file to copy. This file must exist in the source directory. |
| <code>destination_directory_object</code> | The directory object that designates the destination directory. The directory object must already exist. If the destination is ASM, the directory object must designate either a disk group name (for example, <code>+diskgroup1</code>) or a directory created for alias names. In the case of a directory, the full path to the directory must be specified (for example: <code>+diskgroup1/dbs/control</code>). |
| <code>destination_file_name</code> | <p>The name to assign to the file in the destination directory. A file with the same name must not exist in the destination directory. If the destination is ASM:</p> <ul style="list-style-type: none"> The file is given a fully qualified ASM filename and created in the appropriate directory (depending on the database name and file type) The file type tag assigned to the file is <code>COPY_FILE</code> The value of the <code>destination_file_name</code> argument becomes the file's alias name in the designated destination directory <p>The file name can be followed by an ASM template name in parentheses. The file is then given the attributes specified by the template.</p> |

Usage Notes

To run this procedure successfully, the current user must have the following privileges:

- `READ` privilege on the directory object specified in the `source_directory_object` parameter
- `WRITE` privilege on directory object specified in the `destination_directory_object` parameter

This procedure converts directory object parameters to uppercase unless they are surrounded by double quotation marks, but this procedure does not convert file names to uppercase.

Also, the copied file must meet the following requirements:

- The size of the copied file must be a multiple of 512 bytes.
- The size of the copied file must be less than or equal to two terabytes.

The `source_file_name` parameter must specify a file that is in the directory specified by the `source_directory_object` parameter before running the procedure, and the `destination_file_name` parameter must specify the new name of the file in the new location specified in the `destination_directory_object` parameter. Relative paths and symbolic

links are not allowed in the directory objects for the `source_directory_object` and `destination_directory_object` parameters.

Transferring the file is not transactional. To monitor the progress of a long file copy, query the `V$SESSION_LONGOPS` dynamic performance view.

See Also:

Oracle Automatic Storage Management Administrator's Guide for instructions about using file transfer

Examples

```
SQL> create directory DGROUP as '+diskgroup1/dbs/backup';
```

Directory created.

```
SQL> BEGIN
  2   DBMS_FILE_TRANSFER.COPY_FILE('SOURCEDIR','t_xdbtmp.f', 'DGROUP',
                                't_xdbtmp.f');
  3 END;
  4 /
```

PL/SQL procedure successfully completed.

```
SQL> EXIT
$ASMCMD
ASMCMD> ls
DISKGROUP1/
ASMCMD> cd diskgroup1/dbs/backup
ASMCMD> ls
t_xdbtmp.f => +DISKGROUP1/ORCL/TEMPFILE/COPY_FILE.267.546546525
```

76.4.2 GET_FILE Procedure

This procedure contacts a remote database to read a remote file and then creates a copy of the file in the local file system or ASM. The file that is copied is the source file, and the new file that results from the copy is the destination file. The destination file is not closed until the procedure completes successfully.

Syntax

```
DBMS_FILE_TRANSFER.GET_FILE
  source_directory_object    IN  VARCHAR2,
  source_file_name           IN  VARCHAR2,
  source_database            IN  VARCHAR2,
  destination_directory_object IN VARCHAR2,
  destination_file_name      IN  VARCHAR2);
```

Parameters

Table 76-3 GET_FILE Procedure Parameters

| Parameter | Description |
|------------------------------|---|
| source_directory_object | The directory object from which the file is copied at the source site. This directory object must exist at the source site. |
| source_file_name | The name of the file that is copied in the remote file system. This file must exist in the remote file system in the directory associated with the source directory object. |
| source_database | The name of a database link to the remote database where the file is located. |
| destination_directory_object | The directory object into which the file is placed at the destination site. This directory object must exist in the local file system. |
| destination_file_name | The name of the file copied to the local file system. A file with the same name must not exist in the destination directory in the local file system. |

Usage Notes

To run this procedure successfully, the following users must have the following privileges:

- The connected user at the source database must have read privilege on the directory object specified in the `source_directory_object` parameter.
- The current user at the local database must have write privilege on the directory object specified in the `destination_directory_object` parameter.

This procedure converts directory object parameters to uppercase unless they are surrounded by double quotation marks, but this procedure does not convert file names to uppercase.

Also, the copied file must meet the following requirements:

- The size of the copied file must be a multiple of 512 bytes.
- The size of the copied file must be less than or equal to two terabytes.

Transferring the file is not transactional. To monitor the progress of a long file transfer, query the `V$SESSION_LONGOPS` dynamic performance view.

Examples

```
CREATE OR REPLACE DIRECTORY df AS '+datafile' ;
GRANT WRITE ON DIRECTORY df TO "user";
CREATE DIRECTORY DSK_FILES AS '^t_work^';
GRANT WRITE ON DIRECTORY dsk_files TO "user";

-- assumes that dbs2 link has been created and we are connected to the instance.
-- dbs2 could be a loopback or point to another instance.

BEGIN
-- asm file to an os file
-- get an asm file from dbs1.asm/a1 to dbs2.^t_work^/oa5.dat
  DBMS_FILE_TRANSFER.GET_FILE ( 'df' , 'a1' , 'dbs1', 'dsk_files' , 'oa5.dat' );
END;
```

```

-- os file to an os file
-- get an os file from dbs1.^t_work^/a2.dat to dbs2.^t_work^/a2back.dat
  DBMS_FILE_TRANSFER.GET_FILE ( 'dsk_files' , 'a2.dat' , 'dbs1', 'dsk_files' ,
    'a2back.dat' );

END ;
/

```

76.4.3 PUT_FILE Procedure

This procedure reads a local file or ASM and contacts a remote database to create a copy of the file in the remote file system.

The file that is copied is the source file, and the new file that results from the copy is the destination file. The destination file is not closed until the procedure completes successfully.

Syntax

```

DBMS_FILE_TRANSFER.PUT_FILE(
  source_directory_object      IN  VARCHAR2,
  source_file_name             IN  VARCHAR2,
  destination_directory_object IN  VARCHAR2,
  destination_file_name        IN  VARCHAR2,
  destination_database         IN  VARCHAR2);

```

Parameters

Table 76-4 PUT_FILE Procedure Parameters

| Parameter | Description |
|------------------------------|---|
| source_directory_object | The directory object from which the file is copied at the local source site. This directory object must exist at the source site. |
| source_file_name | The name of the file that is copied from the local file system. This file must exist in the local file system in the directory associated with the source directory object. |
| destination_directory_object | The directory object into which the file is placed at the destination site. This directory object must exist in the remote file system. |
| destination_file_name | The name of the file placed in the remote file system. A file with the same name must not exist in the destination directory in the remote file system. |
| destination_database | The name of a database link to the remote database to which the file is copied. |

Usage Notes

To run this procedure successfully, the following users must have the following privileges:

- The current user at the local database must have read privilege on the directory object specified in the `source_directory_object` parameter.

- The connected user at the destination database must have write privilege to the directory object specified in the `destination_directory_object` parameter.

This procedure converts directory object parameters to uppercase unless they are surrounded by double quotation marks, but this procedure does not convert file names to uppercase.

Also, the copied file must meet the following requirements:

- The size of the copied file must be a multiple of 512 bytes.
- The size of the copied file must be less than or equal to two terabytes.

Transferring the file is not transactional. To monitor the progress of a long file transfer, query the `V$SESSION_LONGOPS` dynamic performance view.

Examples

```
CREATE OR REPLACE DIRECTORY df AS '+datafile' ;
GRANT WRITE ON DIRECTORY df TO "user";
CREATE OR REPLACE DIRECTORY ft1 AS '+datafile/ft1' ;
GRANT READ,WRITE ON DIRECTORY ft1 TO "user";
CREATE OR REPLACE DIRECTORY ft1_1 AS '+datafile/ft1/ft1_1' ;

CONNECT user;
Enter password: password

-- - put a1.dat to a4.dat (using dbs2 dblink)
-- - level 2 sub dir to parent dir
-- - user has read privs on ft1_1 at dbs1 and write on df in dbs2
BEGIN
  DBMS_FILE_TRANSFER.PUT_FILE ( 'ft1_1' , 'a2.dat' , 'df' , 'a4.dat' ,
                                'dbs2' ) ;
END ;
```

DBMS_FLASHBACK

Using `DBMS_FLASHBACK`, you can flash back to a version of the database at a specified time or a specified system change number (SCN).

This chapter contains the following topics:

- [Overview](#)
- [Security Model](#)
- [Types](#)
- [Exceptions](#)
- [Operational Notes](#)
- [Examples](#)
- [Summary of DBMS_FLASHBACK Subprograms](#)

See Also:

For detailed information about `DBMS_FLASHBACK`:

- *Oracle Database Development Guide*
- *Oracle Database SQL Language Reference*.

77.1 DBMS_FLASHBACK Overview

`DBMS_FLASHBACK` provides an interface for the user to view the database at a particular time in the past, with the additional capacity provided by transaction back out features that allow for selective removal of the effects of individual transactions. This is different from a flashback database which moves the database back in time.

When `DBMS_FLASHBACK` is enabled, the user session uses the Flashback version of the database, and applications can execute against the Flashback version of the database.

You may want to use `DBMS_FLASHBACK` for the following reasons:

- **Self-service repair:** If you accidentally delete rows from a table, you can recover the deleted rows.
- **Packaged applications such as email and voicemail:** You can use Flashback to restore deleted email by re-inserting the deleted message into the current message box.
- **Decision support system (DSS) and online analytical processing (OLAP) applications:** You can perform data analysis or data modeling to track seasonal demand.

77.2 DBMS_FLASHBACK Security Model

To use the `DBMS_FLASHBACK` package, you must have the `EXECUTE` privilege on it.

77.3 DBMS_FLASHBACK Types

The following table describes the types used by `DBMS_FLASHBACK`.

Table 77-1 DBMS_FLASHBACK

| Type | Description |
|---------------------------|---|
| <code>TXNAME_ARRAY</code> | Creates a <code>VARRAY</code> for holding Transaction Names or Identifiers (XIDs) |

77.4 DBMS_FLASHBACK Exceptions

`DBMS_FLASHBACK` creates the following error messages.

Table 77-2 DBMS_FLASHBACK Error Messages

| Error | Description |
|------------------------|--|
| <code>ORA-08180</code> | Time specified is too old |
| <code>ORA-08181</code> | Invalid system change number specified |
| <code>ORA-08182</code> | User cannot begin read-only or serializable transactions in Flashback mode |
| <code>ORA-08183</code> | User cannot enable Flashback within an uncommitted transaction |
| <code>ORA-08184</code> | User cannot enable Flashback within another Flashback session |
| <code>ORA-08185</code> | <code>SYS</code> cannot enable Flashback mode |

77.5 DBMS_FLASHBACK Operational Notes

`DBMS_FLASHBACK` is automatically turned off when the session ends, either by disconnection or by starting another connection.

PL/SQL cursors opened in Flashback mode return rows as of the flashback time or SCN. Different concurrent sessions (connections) in the database can perform Flashback to different wall-clock times or SCNs. DML and DDL operations and distributed operations are not allowed while a session is running in Flashback mode. You can use PL/SQL cursors opened before disabling Flashback to perform DML.

Under Automatic Undo Management (AUM) mode, you can use retention control to control how far back in time to go for the version of the database you need. If you need to perform a Flashback over a 24-hour period, the DBA must set the `undo_retention` parameter to 24 hours. This way, the system retains enough undo information to regenerate the older versions of the data.

You can set the `RETENTION GUARANTEE` clause for the undo tablespace to ensure that unexpired undo is not discarded. `UNDO_RETENTION` is not in itself a guarantee because, if the system is under space pressure, unexpired undo may be overwritten with freshly generated undo. In such cases, `RETENTION GUARANTEE` prevents this. For more information, see the *Oracle Database Administrator's Guide*.

In a Flashback-enabled session, `SYSDATE` is not affected; it continues to provide the current time.

`DBMS_FLASHBACK` can be used within logon triggers to enable Flashback without changing the application code.

See Also:

Oracle Database Administrator's Guide for information on setting the minimum undo retention period.

77.6 DBMS_FLASHBACK Examples

The following example illustrates how Flashback can be used when the deletion of a senior employee triggers the deletion of all the personnel reporting to him. Using the Flashback feature, you can recover and re-insert the missing employees.

```
DROP TABLE employee;
DROP TABLE keep_scn;

REM -- Keep_scn is a temporary table to store scns that we are interested in

CREATE TABLE keep_scn (scn number);
SET ECHO ON
CREATE TABLE employee (
  employee_no  number(5) PRIMARY KEY,
  employee_name varchar2(20),
  employee_mgr  number(5)
  CONSTRAINT mgr_fkey REFERENCES EMPLOYEE ON DELETE CASCADE,
  salary       number,
  hiredate     date
);

REM -- Populate the company with employees
INSERT INTO employee VALUES (1, 'John Doe', null, 1000000, '5-jul-81');
INSERT INTO employee VALUES (10, 'Joe Johnson', 1, 500000, '12-aug-84');
INSERT INTO employee VALUES (20, 'Susie Tiger', 10, 250000, '13-dec-90');
INSERT INTO employee VALUES (100, 'Scott Tiger', 20, 200000, '3-feb-86');
INSERT INTO employee VALUES (200, 'Charles Smith', 100, 150000, '22-mar-88');
INSERT INTO employee VALUES (210, 'Jane Johnson', 100, 100000, '11-apr-87');
INSERT INTO employee VALUES (220, 'Nancy Doe', 100, 100000, '18-sep-93');
INSERT INTO employee VALUES (300, 'Gary Smith', 210, 75000, '4-nov-96');
INSERT INTO employee VALUES (310, 'Bob Smith', 210, 65000, '3-may-95');
COMMIT;

REM -- Show the entire org
SELECT lpad(' ', 2*(level-1)) || employee_name Name
FROM employee
CONNECT BY PRIOR employee_no = employee_mgr
START WITH employee_no = 1
```

```
ORDER BY LEVEL;

REM -- Sleep for a short time (approximately 10 to 20 seconds) to avoid
REM -- querying close to table creation

EXECUTE DBMS_LOCK.SLEEP(10);

REM -- Store this snapshot for later access through Flashback
DECLARE
I NUMBER;
BEGIN
I := DBMS_FLASHBACK.GET_SYSTEM_CHANGE_NUMBER;
INSERT INTO keep_scn VALUES (I);
COMMIT;
END;
/

REM -- Scott decides to retire but the transaction is done incorrectly
DELETE FROM EMPLOYEE WHERE employee_name = 'Scott Tiger';
COMMIT;

REM -- notice that all of scott's employees are gone
SELECT lpad(' ', 2*(level-1)) || employee_name Name
FROM EMPLOYEE
CONNECT BY PRIOR employee_no = employee_mgr
START WITH employee_no = 1
ORDER BY LEVEL;

REM -- Flashback to see Scott's organization
DECLARE
restore_scn number;
BEGIN
SELECT scn INTO restore_scn FROM keep_scn;
DBMS_FLASHBACK.ENABLE_AT_SYSTEM_CHANGE_NUMBER (restore_scn);
END;
/

REM -- Show Scott's org.
SELECT lpad(' ', 2*(level-1)) || employee_name Name
FROM employee
CONNECT BY PRIOR employee_no = employee_mgr
START WITH employee_no =
(SELECT employee_no FROM employee WHERE employee_name = 'Scott Tiger')
ORDER BY LEVEL;

REM -- Restore scott's organization.
DECLARE
scotts_emp NUMBER;
scotts_mgr NUMBER;
CURSOR c1 IS
SELECT employee_no, employee_name, employee_mgr, salary, hiredate
FROM employee
CONNECT BY PRIOR employee_no = employee_mgr
START WITH employee_no =
(SELECT employee_no FROM employee WHERE employee_name = 'Scott Tiger');
c1_rec c1 % ROWTYPE;
BEGIN
SELECT employee_no, employee_mgr INTO scotts_emp, scotts_mgr FROM employee
WHERE employee_name = 'Scott Tiger';
/* Open c1 in flashback mode */
OPEN c1;
```

```

/* Disable Flashback */
DBMS_FLASHBACK.DISABLE;
LOOP
  FETCH c1 INTO c1_rec;
  EXIT WHEN c1%NOTFOUND;
  /*
   Note that all the DML operations inside the loop are performed
   with Flashback disabled
  */
  IF (c1_rec.employee_mgr = scotts_emp) then
    INSERT INTO employee VALUES (c1_rec.employee_no,
      c1_rec.employee_name,
      scotts_mgr,
      c1_rec.salary,
      c1_rec.hiredate);
  ELSE
    IF (c1_rec.employee_no != scotts_emp) THEN
      INSERT INTO employee VALUES (c1_rec.employee_no,
        c1_rec.employee_name,
        c1_rec.employee_mgr,
        c1_rec.salary,
        c1_rec.hiredate);
    END IF;
  END IF;
END LOOP;
END;
/

REM -- Show the restored organization.
select lpad(' ', 2*(level-1)) || employee_name Name
FROM employee
CONNECT BY PRIOR employee_no = employee_mgr
START WITH employee_no = 1
ORDER BY LEVEL;

```

77.7 Summary of DBMS_FLASHBACK Subprograms

This table lists the DBMS_FLASHBACK subprograms and briefly describes them.

Table 77-3 DBMS_FLASHBACK Package Subprograms

| Subprogram | Description |
|--|--|
| DISABLE Procedure | Disables the Flashback mode for the entire session |
| ENABLE_AT_SYSTEM_CHANGE_NUMBER Procedure | Enables Flashback for the entire session. Takes an SCN as an Oracle number and sets the session snapshot to the specified number. Inside the Flashback mode, all queries return data consistent as of the specified wall-clock time or SCN |
| ENABLE_AT_TIME Procedure | Enables Flashback for the entire session. The snapshot time is set to the SCN that most closely matches the time specified in <code>query_time</code> |
| GET_SYSTEM_CHANGE_NUMBER Function | Returns the current SCN as an Oracle number. You can use the SCN to store specific snapshots |
| TRANSACTION_BACKOUT Procedures | Provides the mechanism to back out a transaction |

77.7.1 DISABLE Procedure

This procedure disables the Flashback mode for the entire session.

Syntax

```
DBMS_FLASHBACK.DISABLE;
```

Examples

The following example queries the salary of an employee, Joe, on August 30, 2000:

```
EXECUTE dbms_flashback.enable_at_time('30-AUG-2000');
SELECT salary FROM emp where name = 'Joe'
EXECUTE dbms_flashback.disable;
```

77.7.2 ENABLE_AT_SYSTEM_CHANGE_NUMBER Procedure

This procedure takes an SCN as an input parameter and sets the session snapshot to the specified number.

In the Flashback mode, all queries return data consistent as of the specified wall-clock time or SCN. It enables Flashback for the entire session.

Syntax

```
DBMS_FLASHBACK.ENABLE_AT_SYSTEM_CHANGE_NUMBER (
    query_scn IN NUMBER);
```

Parameters

Table 77-4 ENABLE_AT_SYSTEM_CHANGE_NUMBER Procedure Parameters

| Parameter | Description |
|-----------|--|
| query_scn | The system change number (SCN), a version number for the database that is incremented on every transaction commit. |

77.7.3 ENABLE_AT_TIME Procedure

This procedure enables Flashback for the entire session.

The snapshot time is set to the SCN that most closely matches the time specified in query_time. It enables Flashback for the entire session.

Syntax

```
DBMS_FLASHBACK.ENABLE_AT_TIME (
    query_time IN TIMESTAMP);
```

Parameters

Table 77-5 ENABLE_AT_TIME Procedure Parameters

| Parameter | Description |
|------------|--|
| query_time | <p>This is an input parameter of type <code>TIMESTAMP</code>. A time stamp can be specified in the following ways:</p> <ul style="list-style-type: none"> Using the <code>TIMESTAMP</code> constructor <pre>EXECUTE DBMS_FLASHBACK.ENABLE_AT_TIME(TIMESTAMP '2001-01-09 12:31:00');</pre> <p>Use the Globalization Support (NLS) format and supply a string. The format depends on the Globalization Support settings.</p> Using the <code>TO_TIMESTAMP</code> function: <pre>EXECUTE DBMS_FLASHBACK.ENABLE_AT_TIME(TO_TIMESTAMP('12-02-2001 14:35:00', 'DD-MM-YYYY HH24:MI:SS'))</pre> <p>You provide the format you want to use. This example shows the <code>TO_TIMESTAMP</code> function for February 12, 2001, 2:35 PM.</p> <ul style="list-style-type: none"> If the time is omitted from query time, it defaults to the beginning of the day, that is, 12:00 A.M. Note that if the query time contains a time zone, the time zone information is truncated. |

77.7.4 GET_SYSTEM_CHANGE_NUMBER Function

This function returns the current SCN as an Oracle number datatype. You can obtain the current change number and store it for later use. This helps you retain specific snapshots.

Syntax

```
DBMS_FLASHBACK.GET_SYSTEM_CHANGE_NUMBER
RETURN NUMBER;
```

77.7.5 TRANSACTION_BACKOUT Procedures

This procedure provides a mechanism to back out a set of transactions. The user can call these procedures with either transaction names or transaction identifiers (`XIDS`).

The procedure analyzes the transactional dependencies, perform DMLs and generates an extensive report on the operation performed by the subprogram. This procedure does not commit the DMLs performed as part of transaction back out. However it holds all the required locks on rows and tables in the right form, so that no other dependencies can enter the system. To make the changes permanent you must explicitly commit the transaction.

A report is generated in the system tables `DBA_FLASHBACK_TRANSACTION_STATE` and `DBA_FLASHBACK_TRANSACTION_REPORT`.

Syntax

```
DBMS_FLASHBACK.TRANSACTION_BACKOUT
numtxns          NUMBER,
```

```

xids          XID_ARRAY,
options       NUMBER default NOCASCADE,
timeHint     TIMESTAMP default MINTIME);

DBMS_FLASHBACK.TRANSACTION_BACKOUT
numtxns      NUMBER,
xids         XID_ARRAY,
options      NUMBER default NOCASCADE,
scnHint     TIMESTAMP default 0 );

DBMS_FLASHBACK.TRANSACTION_BACKOUT
numtxns      NUMBER,
txnnames     TXNAME_ARRAY,
options      NUMBER default NOCASCADE,
timehint     TIMESTAMP MINTIME );

DBMS_FLASHBACK.TRANSACTION_BACKOUT
numtxns      NUMBER,
txnNames     TXNAME_ARRAY,
options      NUMBER default NOCASCADE,
scnHint     NUMBER 0);

```

Parameters

Table 77-6 TRANSACTION_BACKOUT Procedure Parameters

| Parameter | Description |
|-----------|--|
| numtxns | Number of transactions passed as input |
| xids | List of transaction IDs in the form of an array |
| txnnames | List of transaction names in the form of an array |
| options | Back out dependent transactions: <ul style="list-style-type: none"> • NOCASCADE - No dependency is expected. If a dependency is found, this raises an error, with the first dependent transaction provided in the report. • NOCASCADE_FORCE - The user forcibly backs out the given transactions without considering the dependent transactions. The RDBMS executes the UNDO SQL for the given transactions in reverse order of their commit times. If no constraints break, and the result is satisfactory, the user can either COMMIT the changes or else ROLL BACK. • NONCONFLICT_ONLY - This option lets the user back out the changes to the nonconflicting rows of the given transactions. Note that a transaction dependency can happen due to a row conflict through either WAW or primary/unique key constraints. If the user chooses to back out only the nonconflicting rows, this does not cause any problem with database consistency, although transaction atomicity is lost. As this is a recovery operation, the user can correct the data. • CASCADE - This completely removes the given transactions including their dependents in a post order fashion (reverse order of commit times). |
| timehint | Time hint on the start of the transaction |
| scnhint | SCN hint on the start of the transaction |

Usage Notes

Note:

For information about restrictions in using `TRANSACTION_BACKOUT`, see "Using Flashback Transaction" in the *Oracle Database Development Guide*.

- If transaction name is used, a time hint must be provided. The time hint should be a time before the start of all the given transactions to back out.
- If the SCN hint is provided, it must be before the start of the earliest transaction in the specified input set, or this raises an error and terminates. If it is not provided and the transaction has committed within undo retention, the database system is able to determine the start time.

DBMS_FLASHBACK_ARCHIVE

The `DBMS_FLASHBACK_ARCHIVE` package contains procedures for performing various flashback archive tasks.

These include:

- Disassociation and reassociation of a Flashback Archive enabled table from/with its underlying Flashback Time Travel
- Tamper-proofing the tables of an application
- Importing of user history

 **Caution:**

Importing user-generated history can lead to inaccurate, or unreliable results. This procedure should only be used after consulting with Oracle Support.

- Enabling and disabling of session-level support for valid-time

 **See Also:**

Oracle Database Development Guide for more information about Using Flashback Time Travel

This chapter contains the following topics:

- [Overview](#)
- [Security Model](#)
- [Constants](#)
- [Summary of DBMS_FLASHBACK_ARCHIVE Subprograms](#)

78.1 DBMS_FLASHBACK_ARCHIVE Overview

Flashback Time Travel provides strict protection on the internal history tables that it creates and maintains for users.

▲ Caution:

The `DBMS_FLASHBACK_ARCHIVE` package does not support migration between databases. It allows you to move Flashback Time Travel history within the same database only, and not outside it. This package does not allow you to move Flashback Time Travel table data. It allows you to import customer history only and not Flashback Time Travel history.

The read-only semantics prohibit users, including a DBA, from doing updates, deletes, and inserts on the Flashback Time Travel internal history tables. Users are also prevented from issuing any DDL statements on these tables. This strict security enforcement helps meet the requirements of applications in regulatory / compliance environments. Flashback Time Travel supports most common DDL statements, including those that alter the table definition or incur data movement. However, some DDL statements are not supported on Flashback Archive enabled tables. Since most application schemas are modified during application software upgrades, the ability to perform DDL operations on tracked tables is critical.

To support schema evolution during application upgrades and other table maintenance tasks that require use of DDL statements not supported by Flashback Time Travel, the `DBMS_FLASHBACK_ARCHIVE` package provides a set of simple-to-use PL/SQL procedures:

- To disassociate a Flashback Archive enabled base table from the underlying Flashback Time Travel
- To reassociate a temporarily disassociated base table with its underlying Flashback Time Travel

After a user has disassociated the base table from its Flashback Archive, it's possible to issue any DDL statements on the base table or the history tables in the Flashback Archive. Having finished with the schema changes, the user can then reassociate the base table with its Flashback Archive so that Flashback Time Travel protection is in operation and automatic tracking and archiving is resumed.

78.2 DBMS_FLASHBACK_ARCHIVE Security Model

Users need the `FLASHBACK_ARCHIVE_ADMINISTER` privilege to import user-generated history, to set context level, and to tamper-proof tables. After a table is disassociated, users can perform DDL and DML statements on the table if they have the necessary privileges. Enabling and disabling session-level Valid Time Temporal flashback needs no additional privileges.

78.3 DBMS_FLASHBACK_ARCHIVE Constants

The `DBMS_FLASHBACK_ARCHIVE` package uses the constants shown in the following table.

Table 78-1 DBMS_FLASHBACK_ARCHIVE Constants

| Constant | Type | Value | Description |
|-----------------------|-----------------------------|-------|-------------------------------------|
| <code>NODROP</code> | <code>BINARY_INTEGER</code> | 1 | Do not drop temporary history table |
| <code>NOCOMMIT</code> | <code>BINARY_INTEGER</code> | 2 | Do not commit transaction |
| <code>NODELETE</code> | <code>BINARY_INTEGER</code> | 4 | Do not delete data in history table |

78.4 Summary of DBMS_FLASHBACK_ARCHIVE Subprograms

This table lists the `DBMS_FLASHBACK_ARCHIVE` subprograms and briefly describes them.

Table 78-2 DBMS_FLASHBACK_ARCHIVE Package Subprograms

| Subprogram | Description |
|---|--|
| ADD_TABLE_TO_APPLICATION Procedure | Takes an application name and adds a table to the application as a security table |
| CREATE_TEMP_HISTORY_TABLE Procedure | Creates a table called <code>TEMP_HISTORY</code> with the correct definition in schema |
| DISABLE_APPLICATION Procedure | Takes an application name and marks a table in it as a security table |
| DISABLE_ASOF_VALID_TIME Procedure | Disables session level valid-time flashback |
| DISASSOCIATE_FBA Procedure | Disassociates the given table from the Flashback Time Travel |
| DROP_APPLICATION Procedure | Takes an application name and removes it from the list of applications |
| ENABLE_APPLICATION Procedure | Takes an application name and enables Flashback Time Travel on all the security tables for this application |
| ENABLE_AT_VALID_TIME Procedure | Enables session level valid time flashback |
| EXTEND_MAPPINGS Procedure | Extends time mappings to times in the past |
| GET_SYS_CONTEXT Function | Gets the context previously selected by the SET_CONTEXT_LEVEL Procedure |
| IMPORT_HISTORY Procedure | Imports history from a table called <code>TEMP_HISTORY</code> in the given schema. |
| LOCK_DOWN_APPLICATION Procedure | Takes an application name and makes all the security tables read-only. The group called <code>SYSTEM</code> cannot be locked |
| PURGE_CONTEXT Procedure | Purges the context to be saved selected by the SET_CONTEXT_LEVEL Procedure |
| REASSOCIATE_FBA Procedure | Reassociates the given table with the Flashback Time Travel |

Table 78-2 (Cont.) DBMS_FLASHBACK_ARCHIVE Package Subprograms

| Subprogram | Description |
|---|---|
| REGISTER_APPLICATION Procedure | Takes an application name and optionally a Time Travel, and registers an application for database hardening |
| REMOVE_TABLE_FROM_APPLICATION Procedure | Takes an application name and marks a table in it as no longer being a security table |
| SET_CONTEXT_LEVEL Procedure | Defines how much of the user context is to be saved |

78.4.1 ADD_TABLE_TO_APPLICATION Procedure

This procedure takes an application name and adds a table to the application as a security table. If the application is enabled for Flashback Time Travel, then this table will also be enabled for Flashback Time Travel.

Syntax

```
DBMS_FLASHBACK_ARCHIVE.ADD_TABLE_TO_APPLICATION (
  application_name      IN   VARCHAR2,
  table_name            IN   VARCHAR2,
  schema_name          IN   VARCHAR2 := NULL);
```

Parameters

Table 78-3 ADD_TABLE_TO_APPLICATION Procedure Parameters

| Parameter | Description |
|------------------|--|
| application_name | Name of the application for which a table has been added as a security table |
| table_name | Name of the table to add as a security table for the given application |
| schema_name | Name of the schema containing the desired table. If no schema name is specified, the current schema is used. |

78.4.2 CREATE_TEMP_HISTORY_TABLE Procedure

This procedure creates a table called `TEMP_HISTORY` with the correct definition in schema.

Syntax

```
DBMS_FLASHBACK_ARCHIVE.CREATE_TEMP_HISTORY_TABLE (
  owner_name1          IN   VARCHAR2,
  table_name1          IN   VARCHAR2);
```

Parameters

Table 78-4 CREATE_TEMP_HISTORY_TABLE Procedure Parameters

| Parameter | Description |
|-------------|---|
| owner_name1 | Schema of the Flashback Time Travel-enabled table |
| table_name1 | Name of the Flashback Time Travel-enabled table |

78.4.3 DISABLE_APPLICATION Procedure

This procedure takes an application name and disables Flashback Time Travel on all of its security tables.

Syntax

```
DBMS_FLASHBACK_ARCHIVE.DISABLE_APPLICATION (
    application_name          IN  VARCHAR2);
```

Parameters

Table 78-5 DISABLE_APPLICATION Procedure Parameters

| Parameter | Description |
|------------------|--|
| application_name | Name of the application whose security tables will be disabled for Flashback Time Travel |

78.4.4 DISABLE_ASOF_VALID_TIME Procedure

This procedure disables session level valid-time flashback.

Syntax

```
DBMS_FLASHBACK_ARCHIVE.DISABLE_ASOF_VALID_TIME;
```

78.4.5 DISASSOCIATE_FBA Procedure

This procedure disassociates the given table from the Flashback Time Travel.

Syntax

```
DBMS_FLASHBACK_ARCHIVE.DISASSOCIATE_FBA (
    owner_name      IN  VARCHAR2,
    table_name      IN  VARCHAR2);
```

Parameters

Table 78-6 DISASSOCIATE_FBA Procedure Parameters

| Parameter | Description |
|------------|--|
| owner_name | Schema of the Flashback Time Travel enabled base table |

Table 78-6 (Cont.) DISASSOCIATE_FBA Procedure Parameters

| Parameter | Description |
|------------|--|
| table_name | Name of the Flashback Time Travel enabled base table |

Exceptions

Table 78-7 DISASSOCIATE_FBA Procedure Exceptions

| Exception | Description |
|-----------|---|
| ORA-55602 | User table is not enabled for Flashback Time Travel |
| ORA-55634 | Cannot acquire the lock on the table for disassociation |

78.4.6 DROP_APPLICATION Procedure

This procedure takes an application name and removes it from the list of applications. As part of this procedure, Flashback Time Travel will be disabled on all security-enabled tables and all history data will be lost. The group called `SYSTEM` cannot be dropped.

Syntax

```
DBMS_FLASHBACK_ARCHIVE.DROP_APPLICATION (
    application_name          IN  VARCHAR2);
```

Parameters

Table 78-8 DROP_APPLICATION Procedure Parameters

| Parameter | Description |
|------------------|--|
| application_name | Name of the application for which a table has been added as a security table |

78.4.7 ENABLE_APPLICATION Procedure

This procedure takes an application name and enables Flashback Time Travel on all the security tables for this application. Once an application is enabled, every change to an Flashback Time Travel enabled table will be tracked.

Syntax

```
DBMS_FLASHBACK_ARCHIVE.ENABLE_APPLICATION (
    application_name          IN  VARCHAR2);
```

Parameters

Table 78-9 ENABLE_APPLICATION Procedure Parameters

| Parameter | Description |
|------------------|--|
| application_name | Name of the application for which to enable Flashback Time Travel on all its security tables |

78.4.8 ENABLE_AT_VALID_TIME Procedure

This procedure enables session level valid time flashback.

Syntax

```
DBMS_FLASHBACK_ARCHIVE.ENABLE_AT_VALID_TIME (
    level          IN    VARCHAR2,
    query_time     IN    TIMESTAMP DEFAULT SYSTIMESTAMP);
```

Parameters

Table 78-10 ENABLE_AT_VALID_TIME Procedure Parameters

| Parameter | Description |
|------------|---|
| level | Options: <ul style="list-style-type: none"> All - Sets the visibility of temporal data to the full table, which is the default temporal table visibility CURRENT - Sets the visibility of temporal data to currently valid data within the valid time period at the session level ASOF - Sets the visibility of temporal data to data valid as of the given time as defined by the timestamp |
| query_time | Used only if level is ASOF. Data which is valid at this query_time will only be shown. |

78.4.9 EXTEND_MAPPINGS Procedure

This procedure extends time mappings to times in the past.

Syntax

```
DBMS_FLASHBACK_ARCHIVE.EXTEND_MAPPINGS;
```

78.4.10 GET_SYS_CONTEXT Function

This function gets the context previously selected by the SET_CONTEXT_LEVEL Procedure.

Syntax

```
DBMS_FLASHBACK_ARCHIVE.GET_SYS_CONTEXT (
    xid          IN    RAW,
    namespace    IN    VARCHAR2,
    parameter    IN    VARCHAR2)
RETURN VARCHAR2;
```

Parameters

Table 78-11 GET_SYS_CONTEXT Function Parameters

| Parameter | Description |
|-----------|--|
| xid | Transaction identifier is an opaque handle to a transaction obtained from the versions query |
| namespace | Namespace |
| parameter | If undefined, the subprogram returns NULL |

Related Topics

- [SET_CONTEXT_LEVEL Procedure](#)
This procedure defines how much of the user context is to be saved.

78.4.11 IMPORT_HISTORY Procedure

This procedure is called after invoking the CREATE_TEMP_HISTORY_TABLE procedure, and after the TEMP_HISTORY table is populated with user-generated history data

▲ Caution:

Importing user-generated history can lead to inaccurate, or unreliable results. This procedure should only be used after consulting with Oracle Support.

The DBMS_FLASHBACK_ARCHIVE package does not support migration between databases. It allows you to move Flashback Time Travel history within the same database only, and not outside it. This package does not allow you to move Flashback Time Travel table data. It allows you to import customer history only and not Flashback Time Travel history.

Syntax

```
DBMS_FLASHBACK_ARCHIVE.IMPORT_HISTORY (
  owner_name1      IN   VARCHAR2,
  table_name1      IN   VARCHAR2
  temp_history_name IN   VARCHAR2 DEFAULT 'TEMP_HISTORY',
  options          IN   BINARY_INTEGER DEFAULT 0);
```

Parameters

Table 78-12 IMPORT_HISTORY Procedure Parameters

| Parameter | Description |
|-------------------|--|
| owner_name1 | Schema of the Flashback Time Travel-enabled table |
| table_name1 | Name of the Flashback Time Travel-enabled table |
| temp_history_name | Optional temporary history table from which we import history data |

Table 78-12 (Cont.) IMPORT_HISTORY Procedure Parameters

| Parameter | Description |
|-----------|--|
| options | One (or a combination) of constants (NODROP, NOCOMMIT, and NODELETE) to specify if we want to drop, commit changes of, or truncate the temporary history table |

Usage Notes

The database function `TIMESTAMP_TO_SCN` can be used to convert times to SCN when populating the temporary history table.

Related Topics

- [CREATE_TEMP_HISTORY_TABLE Procedure](#)
This procedure creates a table called `TEMP_HISTORY` with the correct definition in schema.

78.4.12 LOCK_DOWN_APPLICATION Procedure

This procedure takes an application name and makes all the security tables read-only. The group called `SYSTEM` cannot be locked.

Syntax

```
DBMS_FLASHBACK_ARCHIVE.LOCK_DOWN_APPLICATION (
    application_name          IN  VARCHAR2);
```

Parameters**Table 78-13 LOCK_DOWN_APPLICATION Procedure Parameters**

| Parameter | Description |
|------------------|--|
| application_name | Name of the application for which a table has been added as a security table |

78.4.13 PURGE_CONTEXT Procedure

This procedure purges the context to be saved selected by the `SET_CONTEXT_LEVEL` Procedure.

Syntax

```
DBMS_FLASHBACK_ARCHIVE.PURGE_CONTEXT;
```

Related Topics

- [SET_CONTEXT_LEVEL Procedure](#)
This procedure defines how much of the user context is to be saved.

78.4.14 REASSOCIATE_FBA Procedure

This procedure reassociates the given table with the Flashback Time Travel.

Syntax

```
DBMS_FLASHBACK_ARCHIVE.REASSOCIATE_FBA (
  owner_name      VARCHAR2,
  table_name      VARCHAR2);
```

Parameters

Table 78-14 REASSOCIATE_FBA Procedure Parameters

| Parameter | Description |
|------------|--|
| owner_name | Schema of the Flashback Time Travel enabled base table |
| table_name | Name of the Flashback Time Travel enabled base table |

Exceptions

Table 78-15 REASSOCIATE_FBA Procedure Exceptions

| Parameter | Description |
|-----------|---|
| ORA-55602 | User table is not enabled for Flashback Time Travel |
| ORA-55636 | Table definition validation failed |

Usage Notes

- The procedure will signal an error if the base table and the history table do not have identical data definitions. For example, when columns are added or table is split, the resulting base table and history table need to have the same schema.
- The Flashback Time Travel internal history table schema has some row versions metadata columns. The procedure will signal an error if any metadata column is dropped by users.

78.4.15 REGISTER_APPLICATION Procedure

This procedure takes an application name and optionally a Flashback Archive, and registers an application for database hardening.

When database hardening is enabled, then all the security tables for that application are enabled for Flashback Archive using the given Flashback Archive. If no Flashback Archive is specified, the default Flashback Archive is used.

See Also:

Using Flashback Time Travel in *Oracle Database Development Guide* regarding database hardening

Syntax

```
DBMS_FLASHBACK_ARCHIVE.REGISTER_APPLICATION (
    application_name          IN   VARCHAR2,
    flashback_archive_name    IN   VARCHAR2 := NULL);
```

Parameters**Table 78-16 REGISTER_APPLICATION Procedure Parameters**

| Parameter | Description |
|------------------------|--|
| application_name | Name of the application which is being registered. The application SYSTEM is already registered when the package is created and is populated with list of tables needed for database hardening. |
| flashback_archive_name | Name of the Flashback Archive in which the historical data for the security tables for given application is stored. If no Flashback Archive is specified, the default Flashback Archive is used. |

78.4.16 REMOVE_TABLE_FROM_APPLICATION Procedure

This procedure takes an application name and marks a table in it as no longer being a security table.

If the application is already enabled for Flashback Archive, Flashback Archive will be disabled for this table.

Syntax

```
DBMS_FLASHBACK_ARCHIVE.REMOVE_TABLE_TO_APPLICATION (
    application_name          IN   VARCHAR2,
    table_name                IN   VARCHAR2,
    schema_name               IN   VARCHAR2 := NULL);
```

Parameters**Table 78-17 REMOVE_TABLE_FROM_APPLICATION Procedure Parameters**

| Parameter | Description |
|------------------|--|
| application_name | Name of the application for which a table is being removed from the list of security tables |
| table_name | Name of the table to mark as being no longer a security table for the given application |
| schema_name | Name of the schema containing the desired table. If no schema name is specified, the current schema is used. |

78.4.17 SET_CONTEXT_LEVEL Procedure

This procedure defines how much of the user context is to be saved.

Syntax

```
DBMS_FLASHBACK_ARCHIVE.SET_CONTEXT_LEVEL (
    level          VARCHAR2);
```

Parameters

Table 78-18 SET_CONTEXT_LEVEL Procedure Parameters

| Parameter | Description |
|-----------|---|
| level | Depending on how much of the user context needs to be saved: <ul style="list-style-type: none">• ALL - the entire SYS_CONTEXT• TYPICAL - the user ID, global user ID and the hostname• NONE - nothing |

DBMS_FLASHBACK_ARCHIVE_MIGRATE

Using the `DBMS_FLASHBACK_ARCHIVE_MIGRATE` package, you can export and import the Flashback Archive base tables along with their history to another database using the Transportable Tablespaces.

Restrictions

You can use this migration package only on a non-CDB environment.

This chapter contains the following topics:

- [DBMS_FLASHBACK_ARCHIVE_MIGRATE Overview](#)
- [DBMS_FLASHBACK_ARCHIVE_MIGRATE Security Model](#)
- [DBMS_FLASHBACK_ARCHIVE_MIGRATE Operational Notes](#)
- [DBMS_FLASHBACK_ARCHIVE_MIGRATE Examples](#)
- [Summary of DBMS_FLASHBACK Subprograms](#)

See Also:

For detailed information about `DBMS_FLASHBACK_ARCHIVE_MIGRATE`:

- *Oracle Database Development Guide*
- *Oracle Database SQL Language Reference*.

79.1 DBMS_FLASHBACK_ARCHIVE_MIGRATE Overview

Using this package one can export and import the Flashback Archive base tables along with their history to another database using the Transportable Tablespaces.

79.2 DBMS_FLASHBACK_ARCHIVE_MIGRATE Security Model

The `DBMS_FLASHBACK_ARCHIVE_MIGRATE` package must be compiled on both the source and target databases as `SYS`. The source file is located at `?/rdbms/admin/crefbamig.sql`, using which the package can be created or compiled.

The export and import procedures must be executed as `SYS`. Since the package uses `DBMS_DATAPUMP`, `DBMS_LOCK`, `DBMS_SYSTEM`, `DBMS_SQL`, and `DBMS_SCHEDULER` PL/SQL packages, their Security Models are also applicable. Along with the user's FDA tables that are being exported the export function also exports the following `SYS` tables' data:

- `SMON_SCN_TIME`
- `SYS_FBA_FA`
- `SYS_FBA_TSFA`

- SYS_FBA_TRACKEDTABLES
- SYS_FBA_PARTITIONS
- SYS_FBA_USERS

79.3 DBMS_FLASHBACK_ARCHIVE_MIGRATE Operational Notes

This section describes how to use the `DBMS_FLASHBACK_ARCHIVE_MIGRATE` package.

Prerequisites

Database version \geq 11.2

If database version is 11.2, following conditions should be met:

- `shared_pool_size` \geq 500M
- `streams_pool_size` \geq 40M

or

- `sga_target` \geq 2G

Constants

None

1. On the source database run `flashback_archive.export` to export the given Flashback Archive enabled tables, their history tables and other relevant metadata information using the transportable tablespaces.
2. Copy the transportable tablespace export dump and relevant datafiles from the source to the target database.
3. On the target database run `flashback_archive.import` to finish the import of the exported Flashback Archive enabled table and their history.

Extraneous objects

The tablespaces which host the Flashback Archive enabled tables and Flashback archive itself may have totally unrelated objects. During the export all those objects are also exported as the process uses the transportable tablespaces feature. Such extraneous objects are listed in the table `SYS_FBA_EXTRANEUSOBS`.

Upon successful import, the extraneous objects are left as is. DBA should drop the extraneous objects.

Self Containment of Tablespaces

Since transportable tablespaces feature is used for export and import, all the objects in those tablespaces must be self contained. Otherwise, the function aborts.

Reduction in History Granularity

After the import, it is possible to see the reduction in the granularity of the history.

For example, The multiple history generated on the source database in a small duration of time may be coalesced into one history.

Logs

Export and import logs are available in the OS directory given as the input `data_pump_dir` argument.

The format of export logs is `fda_mig_exdpd_YYYY_MMDD_HH24MI.log`

The format of import logs is `fda_mig_impdp_YYYY_MMDD_HH24MI.log`

Operational Notes

- After export, involved tablespaces are kept in `READONLY` mode so that the DBA can copy the involved datafiles.
- Keeping the involved tablespaces in `READONLY` mode also ensures the exported tables are in immutable state during exporting and copying of the datafiles.
- The procedures provided cannot be used for exporting and importing to change the table blocksizes. Because, internally these procedures use transportable tablespace export and import functionalities.
- After successful import, the tablespaces are again kept in `READONLY` mode. After the DBA verify the imported data, tablespaces can be made `READ-WRITE`.
- After successful import, the small tablespace that was given as input to the export operation can be dropped.

79.4 DBMS_FLASHBACK_ARCHIVE_MIGRATE Examples

This section illustrates exporting and importing Flashback Archive tables along with their history.

Step 1: Export the Flashback Archive enabled tables along with their history

In the example, three Flashback Archive enabled tables `USR1_TAB1`, `USR1_TAB2`, and `USR1_TAB3` are exported. These tables are spread across the `FA1_TBSP`, `FA1_TBSP_1`, `USR1_TBSP`, and `USR1_TBSP_1` tablespaces.

The `TTS_TBSP` is a small tablespace that holds export related metadata.

`/some/dir/with/enough/disk/space` is the OS directory where data pump files and logs are created.

```

set serveroutput on;
declare
  l_fda_tabs dbms_sql.varchar2_table;
begin
  l_fda_tabs(1) := upper('usr1_tab1');
  l_fda_tabs(2) := upper('usr1_tab2');
  l_fda_tabs(3) := upper('usr1_tab3');
  flashback_archive_migrate.export
  ( schema_owner => 'USR1'
  , fda_tables   => l_fda_tabs
  , tts         => 'TTS_TBSP'
  , data_pump_dir => '/some/dir/with/enough/disk/space'
  );

```

```
end;
/
```

On completion, the export output lists the datapump dump file and the datafiles that are to be copied to the target database to complete the import.

Step 2: Copy the datapump dump file and datafiles listed in the Step 1 to the target database.

Step 3: Import the Flashback Archive tables along with their history

In the example, three Flashback Archive enabled tables `USR1_TAB1`, `USR1_TAB2`, and `USR1_TAB3` are imported from `FA1_TBSP`, `FA1_TBSP_1`, `USR1_TBSP`, and `USR1_TBSP_1` tablespaces spread over the data files.

For the example given, following are the data files captured in the export (Step 1) log file:

- `/u01/app/oracle/oradata/TGT_DB/tts_tbsp.dbf`
- `/u01/app/oracle/oradata/TGT_DB/usr1_tbsp.dbf`
- `/u01/app/oracle/oradata/TGT_DB/usr1_tbsp1.dbf`
- `/u01/app/oracle/oradata/TGT_DB/FA1_tbsp.dbf`
- `/u01/app/oracle/oradata/TGT_DB/FA1_tbsp_1.dbf`

The `TTS_TBSP` is a small tablespace that holds the export related metadata whose datafile is `/ade/nkedlaya_fda2/rdbms/dbs/tts_tbsp.dbf`.

`/some/dir/with/enough/disk/space` is the OS directory where data pump files are created.

```
set serveroutput on;
declare
  l_data_files dbms_sql.varchar2_table;
begin
  l_data_files(1) := '/u01/app/oracle/oradata/TGT_DB/tts_tbsp.dbf';
  l_data_files(2) := '/u01/app/oracle/oradata/TGT_DB/usr1_tbsp.dbf';
  l_data_files(3) := '/u01/app/oracle/oradata/TGT_DB/usr1_tbsp1.dbf';
  l_data_files(4) := '/u01/app/oracle/oradata/TGT_DB/FA1_tbsp.dbf';
  l_data_files(5) := '/u01/app/oracle/oradata/TGT_DB/FA1_tbsp_1.dbf';

  flashback_archive_migrate.import
  ( schema_owner   => 'USR1'
    , tts          => 'TTS_TBSP'
    , data_pump_dir => '/data/pump/dir/where/export/dump/file/resides'
    , tts_data_files => l_data_files
  );
end;
/
```

Upon successful completion of the import, Flashback Archive is enabled on the imported tables and the prior history is available along with the new history that will be generated.

79.5 Summary of DBMS_FLASHBACK Subprograms

This table lists the DBMS_FLASHBACK_ARCHIVE_MIGRATE subprograms and briefly describes them.

Table 79-1 DBMS_FLASHBACK_ARCHIVE_MIGRATE Package Subprograms

| Subprogram | Description |
|--|---|
| EXPORT Procedure | This procedure exports the given Flashback Archive enabled base tables, their history, and related tablespaces. |
| EXPORT_ANALYZE Procedure | This procedure analyzes the given Flashback Archive enabled base tables, their history, and related tablespaces for self containment using transportable tablespace checks. |
| IMPORT Procedure | This procedure imports the Flashback Archive enabled base tables that were exported, their history, and related tablespaces. |

79.5.1 EXPORT Procedure

This procedure exports the given Flashback Archive enabled base tables, their history, and related tablespaces.

Syntax

```
DBMS_FLASHBACK_ARCHIVE_MIGRATE.EXPORT (
  schema_owner      IN   VARCHAR2,
  fda_tables        IN   DBMS_SQL.VARCHAR2,
  tts               IN   VARCHAR2,
  data_pump_dir     IN   VARCHAR2,
  ignore_errors     IN   BOOLEAN DEFAULT FALSE);
```

Parameters

Table 79-2 EXPORT Procedure Parameters

| Parameter | Description |
|---------------|--|
| schema_owner | Flashback Archive enabled tables' owner |
| fda_tables | Array of Flashback Archive enabled tables |
| tts | A small tablespace that can be used to hold the export related metadata |
| data_pump_dir | The directory path in the operating system where the export dump is placed |
| ignore_errors | Ignore any transportable tablespaces errors. The default value is FALSE. |

79.5.2 EXPORT_ANALYZE Procedure

This procedure analyzes the given Flashback Archive enabled base tables, their history, and related tablespaces for self containment using Transportable tablespace checks.

Syntax

```
DBMS_FLASHBACK_ARCHIVE_MIGRATE.EXPORT_ANALYZE (
  schema_owner      IN  VARCHAR2,
  fda_tables        IN  DBMS_SQL.VARCHAR2,
  tts               IN  VARCHAR2);
```

Parameters

Table 79-3 EXPORT_ANALYZE Procedure Parameters

| Parameter | Description |
|--------------|---|
| schema_owner | Flashback Archive enabled tables' owner |
| fda_tables | Array of Flashback Archive enabled tables |
| tts | A small tablespace that can be used to hold the export related metadata |

79.5.3 IMPORT Procedure

This procedure Imports the Flashback Archive enabled base tables that were exported, their history, and related tablespaces.

Syntax

```
DBMS_FLASHBACK_ARCHIVE_MIGRATE.IMPORT (
  schema_owner      IN  VARCHAR2,
  tts               IN  VARCHAR2,
  data_pump_dir     IN  VARCHAR2,
  tts_data_files    IN  DBMS_SQL.VARCHAR2_TABLE);
```

Parameters

Table 79-4 IMPORT Procedure Parameters

| Parameter | Description |
|----------------|--|
| schema_owner | Flashback Archive enabled tables' owner |
| tts | A small tablespace that can be used to hold the export related metadata |
| data_pump_dir | The directory path in the operating system where the export dump is placed |
| tts_data_files | The data files list of TTS exported tablespaces. |

DBMS_FREQUENT_ITEMSET

The DBMS_FREQUENT_ITEMSET package enables frequent itemset counting. The two functions are identical except in the input cursor format difference.

This chapter contains the following topics:

- [Summary of DBMS_FREQUENT_ITEMSET Subprograms](#)

80.1 Summary of DBMS_FREQUENT_ITEMSET Subprograms

The DBMS_FREQUENT_ITEMSET package includes the FI_HORIZONTAL function and FI_TRANSACTIONAL function subprograms.

Table 80-1 DBMS_FREQUENT_ITEMSET Package Subprograms

| Subprogram | Description |
|---|--|
| FI_HORIZONTAL Function | Counts all frequent itemsets given a cursor for input data which is in 'HORIZONTAL' row format, support threshold, minimum itemset length, maximum itemset length, items to be included, items to be excluded |
| FI_TRANSACTIONAL Function | Counts all frequent itemsets given a cursor for input data which is in 'TRANSACTIONAL' row format, support threshold, minimum itemset length, maximum itemset length, items to be included, items to be excluded |

80.1.1 FI_HORIZONTAL Function

The purpose of this table function is to count all frequent itemsets given a cursor for input data which is in 'HORIZONTAL' row format, support threshold, minimum itemset length, maximum itemset length, items to be included, items to be excluded. The result will be a table of rows in form of itemset, support, length, total transactions counted.

In 'HORIZONTAL' row format, each row contains all of the item ids for a single transaction. Since all of the items come together, no transaction id is necessary.

The benefit of this table function is that if an application already has data in horizontal format, the database can skip the step of transforming rows that are in transactional format into horizontal format.

Syntax

```
DBMS_FREQUENT_ITEMSET.FI_HORIZONTAL(
  tranx_cursor      IN      SYSREFCURSOR,
  support_threshold IN      NUMBER,
  itemset_length_min IN     NUMBER,
  itemset_length_max IN     NUMBER,
  including_items   IN      SYS_REFCURSOR DEFAULT NULL,
  excluding_items   IN      SYS_REFCURSOR DEFAULT NULL)
```

```

RETURN TABLE OF ROW (
    itemset [Nested Table of Item Type DERIVED FROM tranx_cursor],
    support      NUMBER,
    length       NUMBER,
    total_tranx  NUMBER);

```

Parameters

Table 80-2 FI_HORIZONTAL Function Parameters

| Parameter | Description |
|--------------------|---|
| tranx_cursor | The cursor parameter that the user will supply when calling the function. There is no limits on the number of returning columns. Each column of cursor represents an item. All columns of the cursor must be of the same datatype. The item id must be number or character type (for example, VARCHAR2(n)). |
| support_threshold | A fraction number of total transaction count. An itemset is termed "frequent" if [the number of transactions it occurs in] divided by [the total number of transactions] exceed the fraction. The parameter must be a NUMBER. |
| itemset_length_min | The minimum length for interested frequent itemset. The parameter must be a NUMBER between 1 and 20, inclusive. |
| itemset_length_max | The maximum length for interested frequent itemset. This parameter must be a NUMBER between 1 and 20, inclusive, and must not be less than itemset_length_min. |
| including_items | A cursor from which a list of items can be fetched. At least one item from the list must appear in frequent itemsets that are returned. The default is NULL. |
| excluding_items | A cursor from which a list of items can be fetched. No item from the list can appear in frequent itemsets that are returned. The default is NULL. |

Return Values

Table 80-3 FI_HORIZONTAL Return Values

| Parameter | Description |
|-------------|--|
| support | The number of transactions in which a frequent itemset occurs. This will be returned as a NUMBER. |
| itemset | A collection of items which is computed as frequent itemset. This will be returned as a nested table of item type which is the item column type of the input cursor. |
| length | Number of items in a frequent itemset. This will be returned as a NUMBER. |
| total_tranx | The total transaction count. This will be returned as a NUMBER. |

Example

Suppose you have a table `horiz_table_in`.

```
horiz_table_in(iid1 VARCHAR2(30), iid2 VARCHAR2(30), iid3 VARCHAR2(30), iid4
VARCHAR2(30), iid5 VARCHAR2(30));
```

and the data in `horiz_table_in` looks as follows:

```
('apple', 'banana', NULL, NULL, NULL)
('apple', 'milk', 'banana', NULL, NULL)
('orange', NULL, NULL, NULL, NULL)
```

Suppose you want to find out what combinations of items is frequent with a given support threshold of 30%, requiring itemset containing at least one of ('apple','banana','orange'), but excluding any of ('milk') in any itemset. You use the following query:

```
CREATE TYPE fi_varchar_nt AS TABLE OF VARCHAR2(30);
SELECT CAST(itemset as FI_VARCHAR_NT)itemset, support, length, total_tranx
  FROM table(DBMS_FREQUENT_ITEMSET.FI_HORIZONTAL(
    CURSOR(SELECT iid1, iid2, iid3, iid4, iid5
      FROM horiz_table_in),
    0.3,
    2,
    5,
    CURSOR(SELECT * FROM table(FI_VARCHAR_NT
      ('apple','banana','orange'))),
    CURSOR(SELECT * FROM table(FI_VARCHAR_NT('milk'))));
```

80.1.2 FI_TRANSACTIONAL Function

This procedure counts all frequent itemsets given a cursor for input data which is in 'TRANSACTIONAL' row format, support threshold, minimum itemset length, maximum itemset length, items to be included, items to be excluded. The result will be a table of rows in form of itemset, support, length, total number of transactions.

In 'TRANSACTIONAL' row format, each transaction is spread across multiple rows. All the rows of a given transaction have the same transaction id, and each row has a different item id. Combining all of the item ids which share a given transaction id results in a single transaction.

Syntax

```
DBMS_FREQUENT_ITEMSET.FI_TRANSACTIONAL (
  tranx_cursor      IN      SYSREFCURSOR,
  support_threshold IN      NUMBER,
  itemset_length_min IN     NUMBER,
  itemset_length_max IN     NUMBER,
  including_items   IN      SYS_REFCURSOR DEFAULT NULL,
  excluding_items   IN      SYS_REFCURSOR DEFAULT NULL)
RETURN TABLE OF ROW (
  itemset [Nested Table of Item Type DERIVED FROM tranx_cursor],
  support      NUMBER,
  length       NUMBER,
  total_tranx  NUMBER);
```

Parameters

Table 80-4 *FI_TRANSACTIONAL Function Parameters*

| Parameter | Description |
|---------------------------------|---|
| <code>tranx_cursor</code> | The cursor parameter that the user will supply when calling the function. It should return two columns in its returning row, the first column being the transaction id, the second column being the item id. The item id must be number or character type (for example, <code>VARCHAR2(n)</code>). |
| <code>support_threshold</code> | A fraction number of total transaction count. An itemset is termed "frequent" if [the number of transactions it occurs in] divided by [the total number of transactions] exceed the fraction. The parameter must be a <code>NUMBER</code> . |
| <code>itemset_length_min</code> | The minimum length for interested frequent itemset. The parameter must be a <code>NUMBER</code> between 1 and 20, inclusive. |
| <code>itemset_length_max</code> | The maximum length for interested frequent itemset. This parameter must be a <code>NUMBER</code> between 1 and 20, inclusive, and must not be less than <code>itemset_length_min</code> . |
| <code>including_items</code> | A cursor from which a list of items can be fetched. At least one item from the list must appear in frequent itemsets that will be returned. The default is <code>NULL</code> . |
| <code>excluding_items</code> | A cursor from which a list of items can be fetched. No item from the list can appear in frequent itemsets that will returned. The default is <code>NULL</code> . |

Return Values

Table 80-5 *FI_TRANSACTIONAL Return Values*

| Parameter | Description |
|--------------------------|--|
| <code>support</code> | The number of transactions in which a frequent itemset occurs. This will be returned as a <code>NUMBER</code> . |
| <code>itemset</code> | A collection of items which is computed as frequent itemset. This will be returned as a nested table of item type which is the item column type of the input cursor. |
| <code>length</code> | Number of items in a frequent itemset. This will be returned as a <code>NUMBER</code> . |
| <code>total_tranx</code> | The total transaction count. This will be returned as a <code>NUMBER</code> , and will be the same for all returned rows, similar to a reporting aggregate. |

Usage Notes

Applications must predefine a nested table type of the input item type and cast the output itemset into this predefined nested table type before further processing, such as loading into a table.

Examples

Suppose that the input table `tranx_table_in` looks as follows:

```
(1, 'apple')
(1, 'banana')
(2, 'apple')
(2, 'milk')
(2, 'banana')
(3, 'orange')
```

and the user is trying to find itemsets that satisfy a support-threshold of 60% and have the itemset-length greater than 1 (namely, (apple, banana)).

The output of this function would contain the following output row:

```
itemset=('apple','banana'), support=2, length=2, total_tranx=3
```

You need to create a nested table of item type before you submit a query to perform the frequent itemset counting. In this example, since item is of VARCHAR2(30), you must create a nested table of VARCHAR2(30):

```
CREATE TYPE fi_varchar_nt AS TABLE OF VARCHAR2(30);
SELECT CAST(itemset as FI_VARCHAR_NT) itemset, support, length, total_tranx
FROM table(DBMS_FREQUENT_ITEMSET.FI_TRANSACTIONAL(
    cursor(SELECT tid, iid FROM tranx_table_in),
    0.6,
    2,
    5,
    NULL,
    NULL));
```

Here is another example to illustrate how to include certain items and exclude certain items in the counting.

```
SELECT CAST(itemset as FI_VARCHAR_NT) itemset, support, length, total_tranx
FROM table(DBMS_FREQUENT_ITEMSET.FI_TRANSACTIONAL(
    CURSOR(SELECT tid, iid FROM tranx_table_in),
    0.6,
    2,
    5,
    CURSOR(SELECT * FROM table(FI_VARCHAR_NT
        ('apple','banana','orange'))),
    CURSOR(SELECT * FROM table(FI_VARCHAR_NT('milk'))));
```

Using the including/excluding items parameter, you are able to further optimize the execution by ignoring itemsets that are not expected by application.

You can also use transactional output through collection unnesting:

```
SELECT
    bt.setid, nt.*
FROM
    (SELECT cast(Itemset as FI_VARCHAR_NT) itemset, rownum setid
    FROM table(
        DBMS_FREQUENT_ITEMSET.FI_TRANSACTIONAL(
            CURSOR(SELECT tid, iid FROM tranx_table_in), 0.6, 2, 5,
            NULL, NULL)) bt,
    table(bt.itemset) nt;
```

If you want to use an insert statement to load frequent itemsets into a nested table, it is better to use the NESTED_TABLE_FAST_INSERT hint for performance:

```

CREATE TABLE fq_nt (coll FI_VARCHAR_NT) NESTED TABLE coll STORE AS
  coll_nest;
INSERT /*+ NESTED_TABLE_FAST_INSERT */ INTO fq_nt
  SELECT cast(itemset as FI_VARCHAR_NT)
  FROM table(DBMS_FREQUENT_ITEMSET.FI_TRANSACTIONAL(
    cursor(SELECT tid, iid FROM tranx_table_in), 0.6, 2, 5,
    NULL, NULL));

```

Note that if you want to use the package inside a PL/SQL cursor, you must cast the return type of the table function:

```

CREATE TYPE fi_res AS OBJECT (
  itemset      FI_VARCHAR_NT,
  support      NUMBER,
  length       NUMBER,
  total_tranx  NUMBER
);
/
CREATE TYPE fi_coll AS TABLE OF fi_res;
/

DECLARE
  cursor freqC is
    SELECT Itemset
    FROM table(
      CAST(DBMS_FREQUENT_ITEMSET.FI_TRANSACTIONAL(
        cursor(SELECT tid, iid FROM tranx_table_in), 0.6, 2, 5,
        NULL, NULL) AS fi_coll));
  coll_nt  FI_VARCHAR_NT;
  num_rows int;
  num_itms int;
BEGIN
  num_rows := 0;
  num_itms := 0;
  OPEN freqC;
  LOOP
    FETCH freqC INTO coll_nt;
    EXIT WHEN freqC%NOTFOUND;
    num_rows := num_rows + 1;
    num_itms := num_itms + coll_nt.count;
  END LOOP;
  CLOSE freqC;
  DBMS_OUTPUT.PUT_LINE('Totally ' || num_rows || ' rows ' || num_itms || '
items were produced.');
```

81

DBMS_FS

The `DBMS_FS` package for performing operations on an Oracle file system (make, mount, unmount and destroy operations) in an Oracle database.

This chapter contains the following topics:

- [DBMS_FS Overview](#)
- [DBMS_FS Security Model](#)
- [Summary of DBMS_FS Subprograms](#)

81.1 DBMS_FS Overview

The `DBMS_FS` package contains Oracle file system (OFS) procedures that you can use to create, mount, unmount, and destroy an Oracle file system.

Starting 19c release, the file systems are supported by PDB. Oracle Database supports maximum 5 file systems per PDB and 1000 file systems in total.

The `DBMS_FS` package enables applications to access database objects from a universal client such as an NFS server. This feature interfaces with Oracle SecureFiles to provide the file system access.

See Also:

Oracle Database SecureFiles and Large Objects Developer's Guide for a detailed description of managing an NFS server in Oracle Database

81.2 DBMS_FS Security Model

You must have the `SYSDBA` administrative privilege to use the `DBMS_FS` package.

The operations that you perform using the `DBMS_FS` package are equivalent to the file system operations that are performed in an operating system by the root user. Access to the individual file system that is created and mounted by this package is enforced using Access Control Lists (ACLs) and the permissions on the mounted directories to the operating system user.

81.3 Summary of DBMS_FS Subprograms

This table lists the `DBMS_FS` subprograms and briefly describes them.

Table 81-1 DBMS_FS Subprograms

| Subprogram | Description |
|---|--|
| DESTROY_ORACLE_FS Procedure | Destroys an Oracle file system, using the <code>fstype</code> and of name <code>fsname</code> |
| MAKE_ORACLE_FS Procedure | Creates a file system of type specified by <code>fstype</code> and of name <code>fsname</code> |
| MOUNT_ORACLE_FS Procedure | Mounts an Oracle file system on the specified mount point |
| UNMOUNT_ORACLE_FS Procedure | Unmounts an Oracle file system on the specified mount point |

81.3.1 DESTROY_ORACLE_FS Procedure

This procedure destroys an Oracle file system and then frees the resources that were associated with it. Run the `dbms_fs.destroy_oracle_fs()` procedure to destroy file systems that are no longer in use.

Syntax

```
DBMS_FS.DESTROY_ORACLE_FS (
    fstype      IN VARCHAR2,
    fsname      IN VARCHAR2);
```

Parameters

Table 81-2 DBMS_FS Parameters

| Parameter | Description |
|---------------------|---|
| <code>fstype</code> | File system type. Oracle File System (OFS) and Database File System (DBFS) are supported. |
| <code>fsname</code> | Name of the file system |

Usage Notes

- You can find information about the currently mounted file systems by querying the `V$OFSMOUNT` dynamic view.
- For more information about the file system types, see the `fstype` description in [MAKE_ORACLE_FS Procedure](#).
- Before you run the `DBMS_FS.DESTROY_ORACLE_FS` procedure, you must unmount the file system by using the `DBMS_FS.UNMOUNT_ORACLE_FS` procedure. If you run this procedure on a file system that is still in use, it results in an error.
- After you run `DBMS_FS.DESTROY_ORACLE_FS`, Oracle Database destroys the file system and frees the associated resources.

Example

The following sample code shows how to destroy a DBFS file system, `dbfs_fs1`.

```

BEGIN
  DBMS_FS.DESTROY_ORACLE_FS (
    fstype      => 'dbfs',
    fsname      => 'dbfs_fs1');
END;
/

```

81.3.2 MAKE_ORACLE_FS Procedure

This procedure creates a new file system of type `DBFS` or `OFS`, on top of an existing Oracle tablespace or other database object.

Syntax

```

DBMS_FS.MAKE_ORACLE_FS (
  fstype      IN VARCHAR2,
  fsname      IN VARCHAR2,
  fsoptions   IN VARCHAR2);

```

Parameters

Table 81-3 DBMS_FS Parameters

| Parameter | Description |
|------------------------|---|
| <code>fstype</code> | File system type. Enter one of the following values: <ul style="list-style-type: none"> <code>ofs</code>—to create an Oracle File System <code>dbfs</code>—to create a Database File System |
| <code>fsname</code> | Name of the file system. Enter a string no longer than 256 characters, using alphanumeric characters. |
| <code>fsoptions</code> | Specify an existing tablespace to use for the Oracle file system, using the following format: <p>"tablespace=tablespace_name"</p> |

Usage Notes

- If you want to create a database file system (DBFS), then you must run the `dbfs_create_filesystem.sql` script, which in turn calls the `dbfs_create_filesystem_advanced.sql` script. By default, this script is in the `$ORACLE_HOME/rdbms/admin` directory. When you run this script, provide the name of an existing tablespace and a name for the file system that will be stored in the database. The size of the file system will be the same as the table size. For example, to create a file system in the `dbfs_ts` tablespace, in the file system `dbfs_tab`:

```
@/$ORACLE_HOME/rdbms/admin/dbfs_create_filesystem.sql dbfs_ts dbfs_tab
```

After you run this script, you can use the other procedures in the `DBMS_FS` package to mount, unmount, and destroy the file system.

 **Note:**

Starting Oracle Database 19.3.1.0 release, the `DBMS_FS.MAKE_ORACLE_FS` is used to create a DBFS filesystem; hence no auxiliary SQL script is needed to create a DBFS filesystem.

- Running the `DBMS_FS.MAKE_ORACLE_FS` procedure on the database instance is equivalent to running the `mkfs` command by root in an operating system.
- The tablespace that you specified in the `fsoptions` parameter must already exist before you execute the `DBMS_FS.MAKE_ORACLE_FS` procedure. To find existing tablespaces, query the `DBA_TABLESPACES` data dictionary view.
- The size of the file system is the same size as this tablespace.

Example

The following example shows how to create a DBFS file system named `dbfs_fs1` in the tablespace `dbfs_fs1_tbsp`.

```
BEGIN
  DBMS_FS.MAKE_ORACLE_FS (
    fstype      => 'dbfs',
    fsname     => 'dbfs_fs1',
    fsoptions  => 'TABLESPACE=dbfs_fs1_tbsp');
END;
/
```

81.3.3 MOUNT_ORACLE_FS Procedure

Use the `dbms_fs.mount_oracle_fs()` procedure to mount an Oracle file system or OFS managed file system on the specified mount point.

Before you begin, complete the following checks to ensure that:

- You have created the file system using the `dbms_fs.make_oracle_fs()` procedure.
- The mount point that you specify exists in the local node.
- The Oracle user has access permissions.
- The mount path is empty, which means that the directory specified by the mount point does not have any files.

Oracle supports an extensive list of mount options that you can use to have better control on resources and achieve good performance. The file system is mounted and is visible through a mounted path on the compute node. In case of RAC, mount the file system in each RAC cluster node independently.

Since OFSD is a non-fatal background process, it gets automatically restarted after the death of a process. File systems that are mounted at the time of the death of the OFSD process are automatically remounted after starting a new OFSD process. This ensures continuous availability of the mounted file systems even in the case of an error.

To improve the throughput, OFSD has its own local cache for writes and reads. The write cache uses 8 (1 MB) buffers per file connection, and it can use up to 256 MB per file system. You can modify this value through the mount option, `wcache_size`. A read-

ahead algorithm is implemented for read operation and it uses 2 (1 MB) per file connection and it can use up to 256 MB per file system. Use the mount option, `rcache_size`, to modify this value.

The read-write cache is maintained per node, so this provides local cache consistency. In an RAC environment, consistency is guaranteed only after the `flush()` or `close()` operation is performed on the file. When two different processes on two different RAC nodes modify a single file and write to the same offset, then the first process that performs the `close()` operation on the file will have its data written into the file.

Syntax

```
DBMS_FS.MOUNT_ORACLE_FS (
  fstype          IN VARCHAR2,
  fsname         IN VARCHAR2,
  mount_point    IN VARCHAR2,
  mount_options  IN VARCHAR2);
```

Parameters

Table 81-4 MOUNT_ORACLE_FS Procedure Parameters

| Parameter | Description |
|----------------------------|--|
| <code>fstype</code> | File system type. Oracle File System (OFS) and Database File System (DBFS) are supported. |
| <code>fsname</code> | Name of the file system. Enter a string no longer than 256 characters, using alpha numeric characters. |
| <code>mount_point</code> | Local directory where the file system should be mounted. This directory must already exist. Enter an absolute path. The maximum number of mount points that you can create is 5 mount points per PDB and 1000 mount points per instance. |
| <code>mount_options</code> | Comma-separated mount options, listed in Table 81-5 . |

Usage Notes

Table 81-5 Supported Mount Options for the MOUNT_ORACLE_FS procedure

| Mount Option | Usage Description |
|----------------------------------|---|
| <code>default_permissions</code> | Enables permission check and restrict access based on file mode. This option is useful with the <code>allow_other</code> mount option. |
| <code>allow_other</code> | Allows other users apart from the operating system user that did the mount can access the files. This will be used in conjunction with permission checks in determining the file access. This option requires setting the <code>user_allow_other</code> parameter in the <code>/etc/fuse.conf</code> configuration file on Linux. |
| <code>max_read</code> | Maximum size of the read operation. No maximum size is set by default. |
| <code>max_write</code> | Maximum write size in a single request. The default is 128K. |
| <code>direct_io</code> | Indicates to the operating system kernel not use file system cache. |
| <code>ro</code> | Mounts the file system in read-only mode. Files cannot be modified. |
| <code>rw</code> | Mounts the file system as read-write. This is the default. |
| <code>nosuid</code> | Specifies that the file system cannot contain set userid files. |

Table 81-5 (Cont.) Supported Mount Options for the MOUNT_ORACLE_FS procedure

| Mount Option | Usage Description |
|--------------------------|--|
| suid | Specifies that the file system can contain set userid files. This is the default. |
| exec | Allows executing a file under the mount path. This option is enabled by default. |
| noexec | Prohibits executing a file under the mount path. Use this option to disallow any file to be executed in the file system. |
| atime | Maintains information about the time when the file was accessed. This option is enabled by default. |
| noatime | Does not maintain information about the time when the was file accessed. When you enable this option, it increases throughput as the access time is not updated for every read operation. |
| max_readahead=N | Sets the maximum size for the read-ahead operations to the specified bytes. The default value depends on the versions of the kernel and FUSE in your operating system. |
| sync_read | Permits only synchronous reads. If you use this option, it disables read-ahead caching for OFS. |
| async_read | Permits asynchronous reads. All read and write operations in the file system as performed asynchronously. This is the default option for FUSE versions 7.6 or later. |
| dirsync | Makes all directory operations synchronous. FUSE utilizes this option. |
| big_writes | Permits writes larger than 4KB. This is the default option for FUSE versions 7.6 or later. |
| no_big_writes | Does not allow writes larger than 4KB. This is not a recommended option for OFS. |
| xattr_enabled | Enables the use of extended attributes. Specify this option only if you want to use extended attributes. |
| kernel_cache_mode | Makes the Linux kernel cache behave like a writeback cache when you enter <code>writeback</code> as the value for this option. A writeback cache provides better performance when there are many small input-output requirements. FUSE utilizes this option. Permitted values are: <code>writeback</code> and <code>write-through</code> . The default value is <code>write-through</code> . |
| kernel_cache_attr_time=N | Sets the Linux kernel attribute cache timeout to N seconds. The default value is infinity. Oracle recommends that you set low values for RAC setup. |
| wcache_size=N | Sets the OFS write cache size to N bytes. The default value is 256 MB. |
| rcache_size=N | Sets the OFS read cache size to N bytes. The default value is 256 MB. |
| posix_locks | Implements the POSIX file locks in OFS. This is not supported by OFS. If you want to use the file-locking mechanism, use the <code>noposix_locks</code> option. |
| noposix_locks | Implements POSIX file locks in Linux kernel. This is the default option. |

 **Note:**

The following options are exclusive options and cannot be used together:

- `ro/rw`
- `nosuid/suid`
- `exec/noexec`
- `atime/noatime`
- `big_writes/no_big_writes`
- `sync_read/async_read`
- `posix_locks/noposix_locks`

Usage Notes

- This procedure makes the files system visible in the local database instance.
- For more information about the file system types, see the `fstype` description in [MAKE_ORACLE_FS Procedure](#).
- You can find information about currently mounted file systems by querying the `V$OFSMOUNT` dynamic view.
- Run the `DBMS_FS.MOUNT_ORACLE_FS` procedure on a file system that has already been created with `DBMS_FS.MAKE_ORACLE_FS` in the local computer node where the Oracle database instance is running. You cannot run this procedure on file systems that were created outside of Oracle Database.
- You cannot update the mount options after mounting the file system. If you want to change the mount options later, you'll have to unmount the file system, and then remount it.

Example: Mounts a DBFS file system

Mounts a DBFS file system at `/oracle/dbfs/testfs`.

```
BEGIN
  DBMS_FS.MOUNT_ORACLE_FS (
    fstype      => 'dbfs',
    fsname     => 'dbfs_fs1',
    mount_point => '/oracle/dbfs/testfs',
    mount_options => 'default_permissions, allow_other');
END;
```

81.3.4 UNMOUNT_ORACLE_FS Procedure

This procedure unmounts an Oracle file system on the specified mount point.

File systems that are mounted in a PDB are automatically unmounted when the PDB is closed. You can also use `dbms_fs.unmount_oracle_fs()` to explicitly unmount an Oracle file system that you have mounted through OFS.

Syntax

```
DBMS_FS.UNMOUNT_ORACLE_FS (
  fsname           IN VARCHAR2,
  mount_point      IN VARCHAR2,
  unmount_options  IN VARCHAR2);
```

Table 81-6 UNMOUNT_ORACLE_FS Procedure Parameters

| Parameter | Description |
|------------------------------|--|
| <code>fsname</code> | Name of the file system. |
| <code>mount_point</code> | Local directory where the file system had been mounted. Enter an absolute path. |
| <code>unmount_options</code> | Optionally, enter <code>force</code> to unmount the file system forcibly. This setting prevents new requests from being sent to the file system. All pending requests on the file system are either completed or cancelled. If you omit this setting, then attempts to unmount a busy file system cause an <code>EBUSY</code> error. |

Usage Notes

- Before you unmount the file system, ensure that all applications that use this file system are shut down. Also ensure that no processes reference the mounting file system.
- You can find information about the currently mounted file systems by querying the `V$OFSMOUNT` dynamic view.
- For more information about the file system types, see the `fstype` description in [MAKE_ORACLE_FS Procedure](#).
- When an Oracle instance is shut down in normal immediate mode, then all the mounted file systems are automatically unmounted.
- If a file system is mounted with the `MOUNT_ORACLE_FS` procedure with the `persist` option, it will be automatically mounted again when the database instance starts or the PDB is plugged. If this file system is unmounted by executing `DBMS_FS.UNMOUNT_ORACLE_FS`, it will remain unmounted even if the `persist` option was used to mount it.
- If you perform a `SHUTDOWN ABORT`, then the file system may still show as mounted but it may not be accessible. In this case, you can unmount the system manually by calling the `unmount` command at the operating system level or the `fusermount` procedure on Linux systems.
- Do not use `fusermount -u` to unmount a running file system as it causes inconsistency in Oracle views, such as `v$ofsmount`.
- You can export the local mount point of an Oracle file system to point to the remote system, and then NFS mount the file system from the remote system by using the operating system `mount` command. The `DBMS_FS.MOUNT_ORACLE_FS` procedure is similar to `mount` commands that are used for other local file systems.
- For better security, Oracle recommends that you use access control lists (ACLs) and Kerberos to control access to sensitive data.

- Do not attempt to unmount the file system from the operating system level. Doing so can leave the Oracle Database-created file system internal tables in an inconsistent state.

Example

The following sample code unmounts a DBFS mounted file system at `/oracle/dbfs/testfs`.

```
BEGIN
  DBMS_FS.UNMOUNT_ORACLE_FS (
    fsname          => 'dbfs_fsl',
    mount_point     => '/oracle/dbfs/testfs',
    mount_options   => 'force');
END;
```

DBMS_GOLDENGATE_ADM

The `DBMS_GOLDENGATE_ADM` package provides subprograms to configure and manage Oracle GoldenGate conflict detection and resolution.

This chapter contains the following topics:

- [Using DBMS_GOLDENGATE_ADM](#)
- [Summary of DBMS_GOLDENGATE_ADM Subprograms](#)

82.1 Using DBMS_GOLDENGATE_ADM

This section contains topics which relate to using the `DBMS_GOLDENGATE_ADM` package.

- [DBMS_GOLDENGATE_ADM Overview](#)
- [DBMS_GOLDENGATE_ADM Security Model](#)

82.1.1 DBMS_GOLDENGATE_ADM Overview

The `DBMS_GOLDENGATE_ADM` package provides interfaces to configure automatic conflict detection and resolution in an Oracle GoldenGate configuration that replicates tables between Oracle databases.

When more than one replica of a table allows changes to the table, a conflict can occur when a change is made to the same row in two different databases at nearly the same time. Oracle GoldenGate replicates changes using row logical change records (LCRs). It detects a conflict by comparing the old values in the row LCR with the current values of the corresponding table row identified by the key columns. If any column value does not match, then there is a conflict. After a conflict is detected, Oracle GoldenGate can resolve the conflict by overwriting values in the row with some values from the row LCR, ignoring the values in the row LCR, or computing a delta to update the row values.

XStream inbound servers and outbound servers can be used in an XStream configuration in a multitenant container database (CDB). A CDB is an Oracle database that includes zero, one, or many user-created pluggable databases (PDBs).

**Note:**

Using XStream requires purchasing a license for the Oracle GoldenGate product.

 **See Also:**

- *Oracle Database XStream Guide*
- *Oracle Database Concepts* for more information about CDBs and PDBs

82.1.2 DBMS_GOLDENGATE_ADM Security Model

Security on this package can be controlled either by granting `EXECUTE` on this package to selected users or roles or by granting `EXECUTE_CATALOG_ROLE` to selected users or roles.

If subprograms in the package are run from within a stored procedure, then the user who runs the subprograms must be granted `EXECUTE` privilege on the package directly. It cannot be granted through a role.

An Oracle GoldenGate administrator must be configured at each Oracle database in the table's replication environment, and Oracle GoldenGate must be configured to replicate the table at each Oracle database. You can configure an Oracle GoldenGate administrator using the `GRANT_ADMIN_PRIVILEGE` procedure in the `DBMS_GOLDENGATE_ADM` package.

 **See Also:**

The Oracle GoldenGate documentation for more information about Oracle GoldenGate replication and configuring an Oracle GoldenGate administrator

82.2 Summary of DBMS_GOLDENGATE_ADM Subprograms

Table 82-1 DBMS_GOLDENGATE_ADM Package Subprograms

| Subprogram | Description |
|---|---|
| ADD_AUTO_CDR Procedure | Configures Oracle GoldenGate automatic conflict detection and resolution for a table |
| ADD_AUTO_CDR_COLUMN_GROUP Procedure | Adds a column group and configures Oracle GoldenGate automatic conflict detection and resolution for the column group |
| ADD_AUTO_CDR_DELTA_RES Procedure | Configures Oracle GoldenGate automatic conflict detection and delta resolution for the column |
| ALTER_AUTO_CDR Procedure | Alters the Oracle GoldenGate automatic conflict detection and resolution for a table |
| ALTER_AUTO_CDR_COLUMN_GROUP Procedure | Alters a column group for Oracle GoldenGate automatic conflict detection and resolution |

Table 82-1 (Cont.) DBMS_GOLDENGATE_ADM Package Subprograms

| Subprogram | Description |
|--|--|
| DELETE_PROCREP_EXCLUSION_OBJ Procedure | Deletes a database object from the exclusion list for Oracle GoldenGate procedural replication |
| GG_PROCEDURE_REPLICATION_ON Function | Returns 1 if Oracle GoldenGate procedural replication is enabled and returns 0 if it is disabled |
| INSERT_PROCREP_EXCLUSION_OBJ Procedure | Inserts a database object into the exclusion list for Oracle GoldenGate procedural replication |
| PURGE_TOMBSTONES Procedure | Purges rows that were deleted before the specified timestamp from the tombstone table |
| REMOVE_AUTO_CDR Procedure | Removes Oracle GoldenGate automatic conflict detection and resolution for a table |
| REMOVE_AUTO_CDR_COLUMN_GROUP Procedure | Removes a column group that was configured for Oracle GoldenGate automatic conflict detection and resolution |
| REMOVE_AUTO_CDR_DELTA_RES Procedure | Removes Oracle GoldenGate automatic conflict detection and delta resolution for the column |

**Note:**

All procedures commit unless specified otherwise.

82.2.1 ADD_AUTO_CDR Procedure

This procedure configures Oracle GoldenGate automatic conflict detection and resolution for a table.

The conflict detection and resolution configured by this procedure is based on the timestamp of the changes. The procedure adds one or more hidden columns of `TIMESTAMP` type to the table, and each hidden column is counted against the limit of 1,000 columns for each table.

The procedure automatically places the columns in the table into a default column group and into an unconditional supplemental log group, excluding nonscalar columns. To create column groups that include a subset of the columns in the table, use the `ADD_AUTO_CDR_COLUMN_GROUP` procedure in this package.

This procedure is overloaded. One version of this procedure contains the `additional_options` parameter, and the other does not.

Syntax

```
DBMS_GOLDENGATE_ADM.ADD_AUTO_CDR(
  schema_name          IN VARCHAR2,
  table_name           IN VARCHAR2,
  resolution_granularity IN VARCHAR2 DEFAULT 'ROW',
  existing_data_timestamp IN TIMESTAMP WITH TIME ZONE DEFAULT
'SYSTIMESTAMP',
  tombstone_deletes    IN BOOLEAN DEFAULT TRUE,
```

```

fetchcols           IN BOOLEAN DEFAULT TRUE,
record_conflicts   IN BOOLEAN DEFAULT TRUE,
use_custom_handlers IN BINARY_INTEGER DEFAULT 0);

```

```

DBMS_GOLDENGATE_ADM.ADD_AUTO_CDR(
  schema_name      IN VARCHAR2,
  table_name       IN VARCHAR2,
  resolution_granularity IN VARCHAR2 DEFAULT 'ROW',
  existing_data_timestamp IN TIMESTAMP WITH TIME ZONE DEFAULT
'SYSTIMESTAMP',
  tombstone_deletes IN BOOLEAN DEFAULT TRUE,
  fetchcols        IN BOOLEAN DEFAULT TRUE,
  record_conflicts IN BOOLEAN DEFAULT TRUE,
  use_custom_handlers IN BINARY_INTEGER DEFAULT 0,
  additional_options IN BINARY_INTEGER);

```

Parameters

Table 82-2 ADD_AUTO_CDR Procedure Parameters

| Parameter | Description |
|-------------------------|--|
| schema_name | The name of the table's schema. |
| table_name | The name of the table. |
| resolution_granularity | ROW, the default, adds one hidden <code>TIMESTAMP</code> column for the row and one hidden <code>TIMESTAMP</code> column for each LOB column. COLUMN adds one hidden <code>TIMESTAMP</code> column for each column in the table. |
| existing_data_timestamp | Timestamp to assign to existing rows. If <code>NULL</code> , then the current system timestamp is used. If a time is specified, and the operating system time zone is not a valid Oracle time zone, then Oracle uses UTC as the default value. |
| tombstone_deletes | <code>TRUE</code> , the default, tracks deleted rows in a tombstone table. Tracking deleted rows might be required to detect and resolve some conflicts, but tracking deleted rows requires additional database resources. <code>FALSE</code> does not track deleted rows in a tombstone table. |
| fetchcols | <code>TRUE</code> , the default, fetches the value of LOBs during conflict detection and resolution. Fetching LOBs can be an expensive operation. <code>FALSE</code> does not fetch the value of LOBs during conflict detection and resolution. |
| record_conflicts | <code>TRUE</code> , the default, records the conflict in the <code>DBA_APPLY_ERROR</code> and <code>DBA_APPLY_ERROR_MESSAGES</code> views. <code>FALSE</code> does not record the conflict. |

Table 82-2 (Cont.) ADD_AUTO_CDR Procedure Parameters

| Parameter | Description |
|---------------------|--|
| use_custom_handlers | <p>0, the default, indicates that automatic conflict handlers are used.</p> <p>1 indicates that automatic conflict handlers are not used and that a custom error handler must be specified using the SET_DML_HANDLER procedure in the DBMS_APPLY_ADM package.</p> |
| additional_options | <p>0 indicates NONE. You can also use the DBMS_GOLDENGATE_ADM.DBMS_GOLDENGATE_ADM.ADDITIONAL_OPTIONS_NONE constant.</p> <p>1 indicates EARLIEST_TIMESTAMP_RESOLUTION. In earliest timestamp resolution, the earliest timestamp is used for conflict resolution instead of the latest timestamp. You can also use the DBMS_GOLDENGATE_ADM.ADDITIONAL_OPTIONS_EARLIEST_TIMESTAMP constant.</p> <p>2 indicates DELETE_ALWAYS_WINS. In delete always wins, when there is a conflict between a delete operation and another operation, the delete operation succeeds and the other operation is discarded. You can also use the DBMS_GOLDENGATE_ADM.ADDITIONAL_OPTIONS_DELETE_ALWAYS_WINS constant.</p> <p>4 indicates IGNORE_GLOBAL_SITE_PRIORITY. In ignore global site priority, the locally defined resolution is used for the table even if global site priority is set in the Oracle GoldenGate replicat file. You can also use the DBMS_GOLDENGATE_ADM.ADDITIONAL_OPTIONS_IGNORE_GLOBAL_SITE_PRIORITY constant.</p> <p>8 indicates ADD_KEY_VERSION. Use this option to add a version number with TIMESTAMP data type to handle delete conflicts. You can also use the DBMS_GOLDENGATE_ADM.ADDITIONAL_OPTIONS_ADD_KEY_VERSION constant.</p> <p>Add the options together to use more than one option. For example, to use earliest timestamp resolution and delete always wins, use 3.</p> |

Example

The following example illustrates how to use bitmask:

```
SQL> EXECUTE dbms_goldengate_adm.add_auto_cdr('scott','table1',
additional_options =>
dbms_goldengate_adm.additional_options_delete_always_wins +
dbms_goldengate_adm.additional_options_add_key_version,
record_conflicts => TRUE);
```

82.2.2 ADD_AUTO_CDR_COLUMN_GROUP Procedure

This procedure adds a column group to a table that is configured for Oracle GoldenGate automatic conflict detection and resolution.

For a table that has been configured for timestamp conflict detection and resolution, this procedure adds a column group that includes a specified subset of columns in the table. Any columns in the table that are not part of a column group remain in the default column group for the table.

When you add a column group to a table, conflict detection and resolution is performed on the columns in the column group separately from the other columns in the table. Column groups enable different databases to update different columns in the same row at nearly the same time without causing a conflict.

For example, a replicated table that contains employee information might have a salary column and a bonus column as well as other columns that identify the employee and a location column for the employees office number. Assume that one department in the company updates its database to change the employee's salary while another department updates its database to change the employee's location. If the salary and bonus columns are in a column group, these changes are applied to the replicated table in each database without requiring conflict resolution.

The procedure automatically places the columns in the column group into an unconditional supplemental log group, excluding nonscalar columns.

Before this procedure can be run on a table, the `DBMS_GOLDENGATE_ADM.ADD_AUTO_CDR` procedure must be run in the table with `ROW` specified for the `resolution_granularity` parameter.

Syntax

```
DBMS_GOLDENGATE_ADM.ADD_AUTO_CDR_COLUMN_GROUP (
  schema_name          IN VARCHAR2,
  table_name           IN VARCHAR2,
  column_list          IN VARCHAR2,
  column_group_name    IN VARCHAR2 DEFAULT NULL,
  existing_data_timestamp IN TIMESTAMP WITH TIME ZONE DEFAULT NULL);
```

Parameters

Table 82-3 ADD_AUTO_CDR_COLUMN_GROUP Procedure Parameters

| Parameter | Description |
|--------------------------|--|
| <code>schema_name</code> | The name of the table's schema. |
| <code>table_name</code> | The name of the table. |
| <code>column_list</code> | Group of columns for which the conflict detection and resolution is configured. Specify the columns in a comma-separated list. The same column cannot be in more than one column group. Also, the same column cannot be in a column group and specified in a delta resolution. |

Table 82-3 (Cont.) ADD_AUTO_CDR_COLUMN_GROUP Procedure Parameters

| Parameter | Description |
|-------------------------|--|
| column_group_name | The name of the column group. If NULL, the column group name is system generated. |
| existing_data_timestamp | The time value for the added <code>TIMESTAMP</code> columns for existing table data. |

82.2.3 ADD_AUTO_CDR_DELTA_RES Procedure

This procedure configures Oracle GoldenGate automatic conflict detection and delta resolution for the column.

The resolution method does not depend on a timestamp or an extra resolution column. With delta conflict resolution, the conflict is resolved by adding the difference between the new and old values in the LCR to the value in the table. For example, if a bank balance is updated at two sites concurrently, then the converged value accounts for all debits and credits. This resolution method is generally used for financial data such as an account balance.

The procedure automatically places the column into an unconditional supplemental log group.

Before this procedure can be run on a table, the `DBMS_GOLDENGATE_ADM.ADD_AUTO_CDR` procedure must be run in the table with `ROW` specified for the `resolution_granularity` parameter.

Syntax

```
DBMS_GOLDENGATE_ADM.ADD_AUTO_CDR_DELTA_RES (
    schema_name IN VARCHAR2,
    table_name  IN VARCHAR2,
    column_name IN VARCHAR2);
```

Parameters

Table 82-4 ADD_AUTO_CDR_DELTA_RES Procedure Parameters

| Parameter | Description |
|-------------|---|
| schema_name | The name of the table's schema. |
| table_name | The name of the table. |
| column_name | The name of the column. The specified column must be a <code>NUMBER</code> or <code>FLOAT</code> data type column. The same column cannot be in a column group. |

82.2.4 ALTER_AUTO_CDR Procedure

This procedure alters the Oracle GoldenGate automatic conflict detection and resolution for a table.

This procedure is overloaded. One version of this procedure contains the `additional_options` parameter, and the other does not.

Syntax

```
DBMS_GOLDENGATE_ADM.ALTER_AUTO_CDR(
  schema_name          IN VARCHAR2,
  table_name           IN VARCHAR2,
  tombstone_deletes    IN BOOLEAN DEFAULT TRUE,
  fetchcols            IN BOOLEAN DEFAULT TRUE,
  record_conflicts     IN BOOLEAN DEFAULT TRUE,
  use_custom_handlers  IN BINARY_INTEGER DEFAULT 0);
```

```
DBMS_GOLDENGATE_ADM.ALTER_AUTO_CDR(
  schema_name          IN VARCHAR2,
  table_name           IN VARCHAR2,
  tombstone_deletes    IN BOOLEAN DEFAULT TRUE,
  fetchcols            IN BOOLEAN DEFAULT TRUE,
  record_conflicts     IN BOOLEAN DEFAULT TRUE,
  use_custom_handlers  IN BINARY_INTEGER DEFAULT 0,
  additional_options   IN BINARY_INTEGER);
```

Parameters

Table 82-5 ALTER_AUTO_CDR Procedure Parameters

| Parameter | Description |
|---------------------|---|
| schema_name | The name of the table's schema. |
| table_name | The name of the table. |
| tombstone_deletes | TRUE tracks deleted rows in a tombstone table. Tracking deleted rows might be required to detect and resolve some conflicts, but tracking deleted rows requires additional database resources. FALSE does not track deleted rows in a tombstone table. NULL retains the current setting for the parameter. |
| fetchcols | TRUE fetches the value of nonscalar columns during conflict detection and resolution. FALSE does not fetch the value of nonscalar columns during conflict detection and resolution. NULL retains the current setting for the parameter. |
| record_conflicts | TRUE records the conflict. FALSE does not record the conflict. NULL retains the current setting for the parameter. |
| use_custom_handlers | 0, default, indicates that automatic conflict handlers are used. 1 indicates that automatic conflict handlers are not used and that a custom error handler must be specified using the SET_DML_HANDLER procedure in the DBMS_APPLY_ADM package. NULL, the default, retains the current setting for the parameter. |

Table 82-5 (Cont.) ALTER_AUTO_CDR Procedure Parameters

| Parameter | Description |
|---------------------------------|--|
| <code>additional_options</code> | <p>A bit mask that indicates which of six types of actions to follow:</p> <ul style="list-style-type: none"> • 0 - no changes are made from any previous settings. You can also use the <code>DBMS_GOLDENGATE_ADM.ADDITIONAL_OPTIONS_NONE</code> constant. • 1 - sets earliest timestamp, but clears all other options/bits. You can also use the <code>DBMS_GOLDENGATE_ADM.EARLIEST_TIMESTAMP_RESOLUTION</code> constant. • 2 - sets delete always wins, but clears all other options/bits. You can also use the <code>DBMS_GOLDENGATE_ADM.ADDITIONAL_OPTIONS_DELETE_ALWAYS_WINS</code> constant. • 4 - indicates <code>IGNORE_GLOBAL_SITE_PRIORITY</code>. When you specify this option, then use local site resolution configuration for the table, even if the global site priority is set in the Oracle GoldenGate replicat file. You can also use the <code>DBMS_GOLDENGATE_ADM.ADDITIONAL_OPTIONS_IGNORE_GLOBAL_SITE_PRIORITY</code> constant. • 8 - indicates <code>ADD_KEY_VERSION</code>. Use this option to add a version number with <code>TIMESTAMP</code> data type to handle delete conflicts. You can also use the <code>DBMS_GOLDENGATE_ADM.ADDITIONAL_OPTIONS_ADD_KEY_VERSION</code> constant. • 16 - clears all. You can also use the <code>DBMS_GOLDENGATE_ADM.ADDITIONAL_OPTIONS_CLEAR_OPTIONS</code> constant. |

 **Note:**

- Any combination of 1,2, 4, and 8 are possible.
- Any combination that include 1 or 2 will implicitly set 8.

You can add the options together to use more than one option.

For example:

If the previously used option was `DELETE_ALWAYS_WINS`, then when you specify a value of 1 for `additional_options`, `EARLIEST_TIMESTAMP_RESOLUTION` and 16 means clear all options. As a result, there are no additional options set.

82.2.5 ALTER_AUTO_CDR_COLUMN_GROUP Procedure

This procedure alters a column group for Oracle GoldenGate automatic conflict detection and resolution.

Syntax

```
DBMS_GOLDENGATE_ADM.ALTER_AUTO_CDR_COLUMN_GROUP (
    schema_name          IN VARCHAR2,
    table_name           IN VARCHAR2,
    column_group_name    IN VARCHAR2,
    add_column_list      IN VARCHAR2,
    remove_column_list   IN VARCHAR2);
```

Parameters

Table 82-6 ALTER_AUTO_CDR_COLUMN_GROUP Procedure Parameters

| Parameter | Description |
|--------------------|--|
| schema_name | The name of the table's schema. |
| table_name | The name of the table. |
| column_group_name | The name of the column group. |
| add_column_list | A comma-separated list of columns to add to the column group. |
| remove_column_list | A comma-separated list of columns to remove from the column group. |

82.2.6 DELETE_PROCREP_EXCLUSION_OBJ Procedure

This procedure deletes a database object from the exclusion list for Oracle GoldenGate procedural replication.

When a database object is on the exclusion list for Oracle GoldenGate procedural replication, execution of subprogram in the package is not replicated if the subprogram operates on the excluded object. For example, if `hr.employees` is an excluded database object for the `DBMS_REDEFINITION` package, then an execution of the `DBMS_REDEFINITION.START_REDEF_TABLE` procedure on the `hr.employees` table is not replicated.

▲ Caution:

Run the `DELETE_PROCREP_EXCLUSION_OBJ` procedure only under the direction of Oracle Support.

Syntax

```
DBMS_GOLDENGATE_ADM.DELETE_PROCREP_EXCLUSION_OBJ (
    package_owner        IN VARCHAR2 DEFAULT NULL,
    package_name         IN VARCHAR2 DEFAULT NULL,
```

```
object_owner      IN VARCHAR2 DEFAULT NULL,
object_name       IN VARCHAR2 DEFAULT NULL);
```

Parameters

Table 82-7 DELETE_PROCREP_EXCLUSION_OBJ Procedure Parameters

| Parameter | Description |
|---------------|---------------------------|
| package_owner | The owner of the package. |
| package_name | The name of the package. |
| object_owner | The owner of the object. |
| object_name | The name of the object. |

82.2.7 GG_PROCEDURE_REPLICATION_ON Function

This function returns 1 if Oracle GoldenGate procedural replication is enabled and returns 0 if it is disabled.

Syntax

```
DBMS_GOLDENGATE_ADM.GG_PROCEDURE_REPLICATION_ON
RETURN NUMBER;
```

82.2.8 INSERT_PROCREP_EXCLUSION_OBJ Procedure

This procedure inserts a database object into the exclusion list for Oracle GoldenGate procedural replication.

When a database object is on the exclusion list for Oracle GoldenGate procedural replication, execution of subprogram in the package is not replicated if the subprogram operates on the excluded object. For example, if `hr.employees` is an excluded database object for the `DBMS_REDEFINITION` package, then an execution of the `DBMS_REDEFINITION.START_REDEF_TABLE` procedure on the `hr.employees` table is not replicated.

Caution:

Run the `INSERT_PROCREP_EXCLUSION_OBJ` procedure only under the direction of Oracle Support.

Syntax

```
DBMS_GOLDENGATE_ADM.INSERT_PROCREP_EXCLUSION_OBJ(
package_owner      IN VARCHAR2 DEFAULT NULL,
package_name       IN VARCHAR2 DEFAULT NULL,
object_owner       IN VARCHAR2 DEFAULT NULL,
object_name        IN VARCHAR2 DEFAULT NULL);
```

Parameters

Table 82-8 INSERT_PROCREP_EXCLUSION_OBJ Procedure Parameters

| Parameter | Description |
|---------------|---------------------------|
| package_owner | The owner of the package. |
| package_name | The name of the package. |
| object_owner | The owner of the object. |
| object_name | The name of the object. |

82.2.9 PURGE_TOMBSTONES Procedure

This procedure purges rows that were deleted before the specified timestamp from the tombstone table.

Syntax

```
DBMS_GOLDENGATE_ADM.PURGE_TOMBSTONES(
    purge_timestamp IN TIMESTAMP WITH TIME ZONE);
```

Parameters

Table 82-9 PURGE_TOMBSTONES Procedure Parameters

| Parameter | Description |
|-----------------|--|
| purge_timestamp | The timestamp before which records are purged. |

82.2.10 REMOVE_AUTO_CDR Procedure

This procedure removes Oracle GoldenGate automatic conflict detection and resolution for a table.

Syntax

```
DBMS_GOLDENGATE_ADM.REMOVE_AUTO_CDR(
    schema_name      IN VARCHAR2,
    table_name       IN VARCHAR2);
```

Parameters

Table 82-10 REMOVE_AUTO_CDR Procedure Parameters

| Parameter | Description |
|-------------|---------------------------------|
| schema_name | The name of the table's schema. |
| table_name | The name of the table. |

82.2.11 REMOVE_AUTO_CDR_COLUMN_GROUP Procedure

This procedure removes a column group that was configured for Oracle GoldenGate automatic conflict detection and resolution.

Syntax

```
DBMS_GOLDENGATE_ADM.REMOVE_AUTO_CDR_COLUMN_GROUP(  
    schema_name          IN VARCHAR2,  
    table_name           IN VARCHAR2,  
    column_group_name    IN VARCHAR2);
```

Parameters

Table 82-11 REMOVE_AUTO_CDR_COLUMN_GROUP Procedure Parameters

| Parameter | Description |
|-------------------|---------------------------------|
| schema_name | The name of the table's schema. |
| table_name | The name of the table. |
| column_group_name | The name of the column group. |

82.2.12 REMOVE_AUTO_CDR_DELTA_RES Procedure

This procedure removes Oracle GoldenGate automatic conflict detection and delta resolution for the column.

Syntax

```
DBMS_GOLDENGATE_ADM.REMOVE_AUTO_CDR_DELTA_RES(  
    schema_name IN VARCHAR2,  
    table_name  IN VARCHAR2,  
    column_name IN VARCHAR2);
```

Parameters

Table 82-12 REMOVE_AUTO_CDR_DELTA_RES Procedure Parameters

| Parameter | Description |
|-------------|---------------------------------|
| schema_name | The name of the table's schema. |
| table_name | The name of the table. |
| column_name | The name of the column. |

DBMS_GOLDENGATE_AUTH

The `DBMS_GOLDENGATE_AUTH` package provides subprograms for granting privileges to and revoking privileges from GoldenGate administrators.

This chapter contains the following topics:

- [Overview](#)
- [Security Model](#)
- [Summary of DBMS_GOLDENGATE_AUTH Subprograms](#)

See Also:

[GRANT_ADMIN_PRIVILEGE Procedure](#) in the `DBMS_XSTREAM_AUTH` package

83.1 DBMS_GOLDENGATE_AUTH Overview

This package provides subprograms for granting privileges to GoldenGate administrators and revoking privileges from GoldenGate administrators. A GoldenGate administrator manages an integrated GoldenGate and XStream Out configuration.

GoldenGate administrators can be used in a multitenant container database (CDB). A CDB is an Oracle database that includes zero, one, or many user-created pluggable databases (PDBs).

See Also:

- [GRANT_ADMIN_PRIVILEGE Procedure](#) in the `DBMS_XSTREAM_AUTH` package
- *Oracle Database XStream Guide*
- *Oracle Database Concepts* for more information about CDBs and PDBs

83.2 DBMS_GOLDENGATE_AUTH Security Model

Security on this package can be controlled by granting `EXECUTE` on this package to selected users or roles, or by granting `EXECUTE_CATALOG_ROLE` to selected users or roles.

The user executing the subprograms in the `DBMS_GOLDENGATE_AUTH` package must have `SYSDBA` administrative privilege, and the user must exercise the privilege using `AS SYSDBA` at connect time.

If subprograms in the package are run from within a stored procedure, then the user who runs the subprograms must be granted `EXECUTE` privilege on the package directly. It cannot be granted through a role.

To ensure that the user who runs the subprograms in this package has the necessary privileges, connect as an administrative user who can create users, grant privileges, and create tablespaces when using this package.

83.3 Summary of DBMS_GOLDENGATE_AUTH Subprograms

The `DBMS_XSTREAM_AUTH` package includes the `GRANT_ADMIN_PRIVILEGE` procedure and `REVOKE_ADMIN_PRIVILEGE` procedure subprograms.

Table 83-1 DBMS_GOLDENGATE_AUTH Package Subprograms

| Subprogram | Description |
|--|---|
| GRANT_ADMIN_PRIVILEGE Procedure | Either grants the privileges needed by a user to be a GoldenGate administrator directly, or generates a script that grants these privileges |
| REVOKE_ADMIN_PRIVILEGE Procedure | Either revokes GoldenGate administrator privileges from a user directly, or generates a script that revokes these privileges |

Note:

All subprograms commit unless specified otherwise.

83.3.1 GRANT_ADMIN_PRIVILEGE Procedure

This procedure grants the privileges needed by a user to be a GoldenGate administrator.

See Also:

[GRANT_ADMIN_PRIVILEGE Procedure](#) in the `DBMS_XSTREAM_AUTH` package

Syntax

```
DBMS_GOLDENGATE_AUTH.GRANT_ADMIN_PRIVILEGE (
  grantee           IN VARCHAR2,
  privilege_type    IN VARCHAR2 DEFAULT '*',
  grant_select_privileges IN BOOLEAN DEFAULT TRUE,
  do_grants         IN BOOLEAN DEFAULT TRUE,
  file_name         IN VARCHAR2 DEFAULT NULL,
  directory_name    IN VARCHAR2 DEFAULT NULL)
```

```
grant_optional_privileges IN VARCHAR2 DEFAULT NULL,
container                 IN VARCHAR2 DEFAULT 'CURRENT');
```

Parameters

Table 83-2 GRANT_ADMIN_PRIVILEGE Procedure Parameters

| Parameter | Description |
|-------------------------|--|
| grantee | The user to whom privileges are granted |
| privilege_type | Specify one of the following values: <ul style="list-style-type: none"> CAPTURE Specifying CAPTURE grants the minimum privileges required by the user to administer Oracle GoldenGate integrated extract. APPLY Specifying APPLY grants the minimum privileges required by the user to administer Oracle GoldenGate integrated replicat. * Specifying * grants the minimum privileges required by the user to administer Oracle GoldenGate integrated extract and Oracle GoldenGate integrated replicat. |
| grant_select_privileges | If TRUE, then the procedure grants a set of privileges, including SELECT_CATALOG_ROLE, to the user. This setting is recommended for GoldenGate administrators. If FALSE, then the procedure does not grant the set of privileges to the user. SELECT_CATALOG_ROLE enables the user to select from the data dictionary. |
| do_grants | If TRUE, then the procedure grants the privileges to the specified grantee directly, and adds the grantee to the DBA_GOLDENGATE_PRIVILEGES data dictionary view. If the user already has an entry in this data dictionary view, then the procedure does not make another entry, and no error is raised. If TRUE and any of the grant statements fails, then the procedure raises an error. If FALSE, then the procedure does not grant the privileges to the specified grantee directly, and does not add the grantee to the DBA_GOLDENGATE_PRIVILEGES data dictionary view. You specify FALSE when the procedure is generating a file that you will run later. If you specify FALSE and either the file_name or directory_name parameter is NULL, then the procedure raises an error. Note: It is recommended that do_grants be set to TRUE because many APIs check for the presence of a user in the DBA_GOLDENGATE_PRIVILEGES view, which will not be populated if do_grants is set to FALSE. |
| file_name | The name of the file generated by the procedure. The file contains all of the statements that grant the privileges. If a file with the specified file name exists in the specified directory name, then the grant statements are appended to the existing file. If NULL, then the procedure does not generate a file. |

Table 83-2 (Cont.) GRANT_ADMIN_PRIVILEGE Procedure Parameters

| Parameter | Description |
|---------------------------|---|
| directory_name | <p>The directory into which the generated file is placed. The specified directory must be a directory object created using the SQL statement <code>CREATE DIRECTORY</code>. If you specify a directory, then the user who invokes the procedure must have the <code>WRITE</code> privilege on the directory object.</p> <p>If the <code>file_name</code> parameter is <code>NULL</code>, then this parameter is ignored, and the procedure does not generate a file.</p> <p>If <code>NULL</code> and the <code>file_name</code> parameter is non-<code>NULL</code>, then the procedure raises an error.</p> |
| grant_optional_privileges | <p>A comma-separated list of optional privileges to grant to the grantee. You can specify the following roles and privileges:</p> <ul style="list-style-type: none"> • <code>XDBADMIN</code> • <code>DV_XSTREAM_ADMIN</code> • <code>DV_GOLDENGATE_ADMIN</code> • <code>EXEMPT_ACCESS_POLICY</code> • <code>EXEMPT_REDACTION_POLICY</code> |
| container | <p>If <code>CURRENT</code>, then grants privileges to the grantee only in the container where the procedure is invoked. <code>CURRENT</code> can be specified while connected to the root or to a PDB.</p> <p>If <code>ALL</code>, then grants privileges to the grantee in all containers in the CDB and all PDBs created after the procedure is invoked. To specify <code>ALL</code>, the procedure must be invoked in the root by a common user.</p> <p>If a container name, then grants privileges to the grantee only in the specified container. To specify root, use <code>CDB\$ROOT</code> while connected to the root. To specify a PDB, the procedure must be invoked in the root.</p> <p>Note: This parameter only applies to CDBs.</p> |

Usage Notes

The user who runs the procedure must be an administrative user who can grant privileges to other users.

Specifically, the procedure grants the following privileges to the specified user:

- The `RESTRICTED SESSION` system privilege
- `EXECUTE` on the following packages:
 - `DBMS_APPLY_ADM`
 - `DBMS_AQ`
 - `DBMS_AQADM`
 - `DBMS_AQIN`
 - `DBMS_AQELM`
 - `DBMS_CAPTURE_ADM`
 - `DBMS_FLASHBACK`
 - `DBMS_LOCK`
 - `DBMS_PROPAGATION_ADM`

- DBMS_RULE_ADM
- DBMS_TRANSFORM
- DBMS_XSTREAM_ADM
- Privileges to enqueue messages into and dequeue messages from any queue
- Privileges to manage any queue
- Privileges to create, alter, and execute any of the following types of objects in the user's own schema and in other schemas:
 - Evaluation contexts
 - Rule sets
 - Rules

In addition, the grantee can grant these privileges to other users.

- SELECT_CATALOG_ROLE
- SELECT or READ privilege on data dictionary views related to GoldenGate and Oracle Replication
- The ability to allow a remote GoldenGate administrator to perform administrative actions through a database link by connecting to the grantee

This ability is enabled by running the `GRANT_REMOTE_ADMIN_ACCESS` procedure in this package.

Note:

This procedure grants only the privileges necessary to configure and administer a GoldenGate environment. You can grant additional privileges to the grantee if necessary.

See Also:

[GRANT_ADMIN_PRIVILEGE Procedure](#) in the `DBMS_XSTREAM_AUTH` package

83.3.2 REVOKE_ADMIN_PRIVILEGE Procedure

This procedure revokes GoldenGate administrator privileges from a user.

Syntax

```
DBMS_GOLDENGATE_AUTH.REVOKE_ADMIN_PRIVILEGE (
  grantee           IN  VARCHAR2,
  privilege_type    IN  VARCHAR2  DEFAULT '*',
  revoke_select_privileges IN  BOOLEAN  DEFAULT FALSE,
  do_revokes        IN  BOOLEAN  DEFAULT TRUE,
  file_name         IN  VARCHAR2  DEFAULT NULL,
  directory_name    IN  VARCHAR2  DEFAULT NULL
```

```

revoke_optional_privileges IN VARCHAR2 DEFAULT NULL,
container                   IN VARCHAR2 DEFAULT 'CURRENT');

```

Parameters

Table 83-3 REVOKE_ADMIN_PRIVILEGE Procedure Parameters

| Parameter | Description |
|--------------------------|---|
| grantee | The user from whom privileges are revoked |
| privilege_type | Specify one of the following values: <ul style="list-style-type: none"> CAPTURE Specifying CAPTURE revokes the minimum privileges required by the user to administer Oracle GoldenGate integrated extract. APPLY Specifying APPLY revokes the minimum privileges required by the user to administer Oracle GoldenGate integrated replicat. * Specifying * revokes the minimum privileges required by the user to administer Oracle GoldenGate integrated extract and Oracle GoldenGate integrated replicat. |
| revoke_select_privileges | If TRUE, then the procedure revokes SELECT_CATALOG_ROLE from the user. If FALSE, then the procedure does not revoke SELECT_CATALOG_ROLE to the user. SELECT_CATALOG_ROLE enables the user to select from the data dictionary. |
| do_revokes | If TRUE, then the procedure revokes the privileges from the specified user directly, and removes the user from the DBA_XSTREAM_ADMINISTRATOR data dictionary view. If the user does not have a record in this data dictionary view, then the procedure does not remove a record from the view, and no error is raised. If TRUE and any of the revoke statements fails, then the procedure raises an error. A revoke statement fails if the user is not granted the privilege that is being revoked. If FALSE, then the procedure does not revoke the privileges from the specified user directly, and does not remove the user from the DBA_XSTREAM_ADMINISTRATOR data dictionary view. You specify FALSE when the procedure is generating a file that you will run later. If you specify FALSE and either the file_name or directory_name parameter is NULL, then the procedure does not raise an error. |
| file_name | The name of the file generated by this procedure. The file contains all of the statements that revoke the privileges. If a file with the specified file name exists in the specified directory name, then the revoke statements are appended to the existing file. If NULL, then the procedure does not generate a file. |

Table 83-3 (Cont.) REVOKE_ADMIN_PRIVILEGE Procedure Parameters

| Parameter | Description |
|----------------------------|---|
| directory_name | <p>The directory into which the generated file is placed. The specified directory must be a directory object created using the SQL statement <code>CREATE DIRECTORY</code>. If you specify a directory, then the user who invokes the procedure must have the <code>WRITE</code> privilege on the directory object.</p> <p>If the <code>file_name</code> parameter is <code>NULL</code>, then this parameter is ignored, and the procedure does not generate a file.</p> <p>If <code>NULL</code> and the <code>file_name</code> parameter is non-<code>NULL</code>, then the procedure raises an error.</p> |
| revoke_optional_privileges | <p>A comma-separated list of optional privileges to revoke from the grantee, such as the <code>DV_XSTREAM_ADMIN</code> and <code>DV_GOLDENGATE_ADMIN</code> privileges</p> |
| container | <p>If <code>CURRENT</code>, then revokes privileges from the grantee only in the container where the procedure is invoked. <code>CURRENT</code> can be specified while connected to the root or to a PDB.</p> <p>If <code>ALL</code>, then revokes privileges from the grantee in all containers in the CDB. To specify <code>ALL</code>, the procedure must be invoked in the root.</p> <p>If a container name, then revokes privileges from the grantee only in the specified container. To specify root, use <code>CDB\$ROOT</code> while connected to the root. To specify a PDB, the procedure must be invoked in the root.</p> <p>Note: This parameter only applies to CDBs.</p> |

Usage Notes

The user who runs this procedure must be an administrative user who can revoke privileges from other users. Specifically, this procedure revokes the privileges granted by running the `GRANT_ADMIN_PRIVILEGE` procedure in this package.

See Also:

"[GRANT_ADMIN_PRIVILEGE Procedure](#)"

DBMS_HADOOP

The `DBMS_HADOOP` package provides a PL/SQL procedure called `CREATE_EXTDDL_FOR_HIVE()`, that creates an Oracle external table for a given hive table.

Big Data SQL needs to be correctly set up for `DBMS_HADOOP` to work.

This chapter contains the following topics:

- [DBMS_HADOOP Overview](#)
- [DBMS_HADOOP Security Model](#)
- [Summary of DBMS_HADOOP Subprograms](#)

84.1 DBMS_HADOOP Overview

The `DBMS_HADOOP` package provides two procedures for creating an Oracle external table and for synchronizing the Oracle external table partitions.

These procedures are:

- `CREATE_EXTDDL_FOR_HIVE()` — creates an Oracle external table for a given hive table
- `SYNCHRONIZE_PARTITIONS_FOR_HIVE()` — helps to synchronize the Oracle external table partitions with those in the corresponding hive table

84.2 DBMS_HADOOP Security Model

Users must have `ALTER` privileges on the table for modifying external table parameters. In addition the `ALTER` privileges, users must have `READ` privileges for the directory object that contains the external data source and `WRITE` privileges for the directory objects containing bad, log, and discard files.

Similar privileges are applicable to the partitioned external tables.

84.3 Summary of DBMS_HADOOP Subprograms

`DBMS_HADOOP` includes the `CREATE_EXTDDL_FOR_HIVE` procedure and `SYNC_PARTITIONS_FOR_HIVE` procedure subprograms.

Table 84-1 DBMS_HADOOP Subprograms

| Subprogram | Description |
|--|---|
| CREATE_EXTDDL_FOR_HIVE Procedure | Given a hive table name, creates a text of DDL that can be executed to create an external table corresponding to the hive table |

Table 84-1 (Cont.) DBMS_HADOOP Subprograms

| Subprogram | Description |
|---|--|
| CREATE_HYBRID_PARTNED_TABLE Procedure | Merges a given partitioned Hive table with an Oracle partitioned table, and replaces it with the merged table. |
| SYNCHRONIZE_PARTITIONS_FOR_HIVE Procedure | Synchronizes the existing partitioning definition of a hive table in Oracle catalog |

84.3.1 CREATE_EXTDDL_FOR_HIVE Procedure

This procedure creates an Oracle external table for a given hive table.

Syntax

```
DBMS_HADOOP.CREATE_EXTDDL_FOR_HIVE (
  cluster_id      IN  VARCHAR2,
  db_name         IN  VARCHAR2 := NULL,
  hive_table_name IN  VARCHAR2,
  hive_partition  IN  BOOLEAN,
  table_name      IN  VARCHAR2 := NULL,
  perform_DDL     IN  BOOLEAN := FALSE,
  text_of_DDL     OUT CLOB);
```

Parameters

Table 84-2 CREATE_EXTDDL_FOR_HIVE Procedure Parameters

| Parameter | Description |
|-----------------|---|
| cluster_id | Hadoop cluster ID |
| hive_db_name | Database where the hive table is located |
| hive_table_name | Name of the hive table |
| hive_partition | If this argument is <code>TRUE</code> and if the original hive table is partitioned, the corresponding Oracle external table will also be partitioned using the same partition key(s). If the original hive table is not partitioned, <code>hive_partition=TRUE</code> has no effect. If <code>hive_partition=FALSE</code> , the corresponding Oracle external table will not be partitioned even if the original hive table is partitioned. |
| table_name | Name of the Oracle external table |
| perform_DDL | If this argument is <code>TRUE</code> , the external table will be automatically created. Otherwise, only the textual representation of the DDL statement will be generated and returned in <code>text_of_DDL</code> . |
| text_of_DDL | If the argument <code>perform_DDL</code> is <code>FALSE</code> , only the textual representation of the DDL statement will be generated and returned in <code>text_of_DDL</code> . |

84.3.2 CREATE_HYBRID_PARTNED_TABLE Procedure

This procedure merges the partitioned Hive table with an Oracle partitioned table, and replace it with the merged table.

Syntax

```
DBMS_HADOOP.CREATE_HYBRID_PARTNED_TABLE (
  cluster_id          IN      VARCHAR2,
  db_name             IN      VARCHAR2,
  hive_table_name     IN      VARCHAR2,
  table_name          IN      VARCHAR2,
  table_owner         IN      VARCHAR2,
  perform_ddl         IN      BOOLEAN := TRUE,
  text_of_ddl        OUT     CLOB);
```

Parameters

Table 84-3 CREATE_HYBRID_PARTNED_TABLE Procedure Parameters

| Parameter | Description |
|-----------------|---|
| cluster_id | Hadoop cluster ID |
| db_name | Database where the partitioned Hive table is located |
| hive_table_name | Name of the partitioned Hive table |
| table_name | Name of the partitioned Oracle table |
| table_owner | The owner of the partitioned Oracle table |
| perform_DDL | If the value of this parameter is <code>TRUE</code> , the external table is automatically created. If the value of this parameter is <code>FALSE</code> , only the textual representation of the DDL statement is generated and returned in <code>text_of_DDL</code> . |
| text_of_DDL | If the argument <code>perform_DDL</code> is <code>FALSE</code> , only the textual representation of the DDL statement is generated and returned in <code>text_of_DDL</code> . |

84.3.3 SYNCHRONIZE_PARTITIONS_FOR_HIVE Procedure

This procedure synchronizes the Oracle external table partitions with those in the corresponding hive table.

Syntax

```
DBMS_HADOOP.SYNCHRONIZE_PARTITIONS_FOR_HIVE (
  table_name      IN  VARCHAR2,
  table_owner     IN  VARCHAR2);
```

Parameters

Table 84-4 SYNCHRONIZE_PARTITIONS_FOR_HIVE Procedure Parameters

| Parameter | Description |
|------------------|-----------------------|
| table_name | Oracle external table |
| table_owner | Schema name |

DBMS_HANG_MANAGER

The DBMS_HANG_MANAGER package provides a method of changing some Hang Manager configuration parameters.

This chapter contains the following topics:

- [DBMS_HANG_MANAGER Overview](#)
- [DBMS_HANG_MANAGER Security Model](#)
- [DBMS_HANG_MANAGER Constants](#)
- [DBMS_HANG_MANAGER Exceptions](#)
- [Summary of DBMS_HANG_MANAGER Subprograms](#)

85.1 DBMS_HANG_MANAGER Overview

The DBMS_HANG_MANAGER package provides a method of changing some Hang Manager configuration parameters.

Hang Manager is always enabled on all databases, Automatic Storage Management (ASM) disk groups, and single instance systems (when not using Oracle RAC). Hang resolution is enabled on all instances by default except for single instance systems (when not using Oracle RAC) where it is disabled and cannot be enabled at this time.

Note:

The DBMS_HANG_MANAGER package is intended for use by database administrators (DBA) only. It is not intended for use by application developers.

85.2 DBMS_HANG_MANAGER Security Model

DBMS_HANG_MANAGER can only be run as the SYS user.

85.3 DBMS_HANG_MANAGER Constants

The table in this topic lists DBMS_HANG_MANAGER package constants.

Table 85-1 DBMS_HANG_MANAGER Constants

| Name | Type | Value | Description |
|------------------|----------|------------------|---------------------------------|
| RESOLUTION_SCOPE | VARCHAR2 | resolution scope | Resolution scope parameter name |

Table 85-1 (Cont.) DBMS_HANG_MANAGER Constants

| Name | Type | Value | Description |
|---------------------------|----------|--------------------------------------|--|
| SENSITIVITY | VARCHAR2 | sensitivity | Sensitivity parameter name |
| BASE_FILE_SIZE_LIMIT | VARCHAR2 | base file size limit | Base file size limit parameter name. The default value of this parameter is 100 MB. |
| BASE_FILE_SET_COUNT | VARCHAR2 | base file set count | Base file set count parameter name. The default value is 5 trace files in the circular trace file set. |
| LWS_FILE_SIZE_LIMIT | VARCHAR2 | long waiting session file size limit | Long waiting session file size limit parameter name. The default value of this parameter is 100 MB. |
| LWS_FILE_SET_COUNT | VARCHAR2 | long waiting session set count | Long waiting session set count parameter name. The default value is 5 trace files in the circular trace file set. |
| RESOLUTION_SCOPE_PROCESS | VARCHAR2 | PROCESS | Enables only session and/or process termination |
| RESOLUTION_SCOPE_INSTANCE | VARCHAR2 | INSTANCE | Enables session, process, and instance termination. The latter is used in specific scenarios. The default value is INSTANCE. |
| SENSITIVITY_NORMAL | VARCHAR2 | NORMAL | Sets various Hang Manager intervals to their default values. The default value is NORMAL. |
| SENSITIVITY_HIGH | VARCHAR2 | HIGH | Sets the various Hang Manager intervals to half of their default values |

85.4 DBMS_HANG_MANAGER Exceptions

The table in this topic lists the exceptions raised by the DBMS_HANG_MANAGER package.

Table 85-2 DBMS_HANG_MANAGER Package Exceptions

| Exception | Error Code | Description |
|--------------------------|------------|---|
| ERRNUM_INPUT_ERROR | -32706 | Invalid user input |
| ERRNUM_INTERNAL_ERROR | -32707 | Database experienced an error setting a parameter |
| ERRNUM_UNSUPPORTED_ERROR | -32708 | Operation is not supported on this instance type |

85.5 Summary of DBMS_HANG_MANAGER Subprograms

The DBMS_HANG_MANAGER package includes the SET procedure subprogram.

Table 85-3 DBMS_HANG_MANAGER Package Subprograms

| Subprogram | Description |
|-------------------------------|---|
| SET Procedure | Sets the specified parameter to the specified value |

85.5.1 SET Procedure

This procedure sets the specified parameters to specified values.

Syntax

```
DBMS_HANG_MANAGER.SET (
    pname IN VARCHAR2,
    pvalue IN VARCHAR2);
```

Parameters

Table 85-4 SET Procedure Parameters

| Parameter | Description |
|-----------|--|
| pname | Contains the parameter name that needs to be modified |
| pvalue | Contains the new value for the parameter name specified in pname |

DBMS_HEAT_MAP

The `DBMS_HEAT_MAP` package provides an interface to externalize heatmaps at various levels of storage including block, extent, segment, object and tablespace. A second set of subprograms externalize the heatmaps materialized by the background for top N tablespaces.

This chapter contains the following topics:

- [Overview](#)
- [Security Model](#)
- [Summary of DBMS_HEAT_MAP Subprograms](#)

See Also:

- [Heat Map in Oracle Database VLDB and Partitioning Guide](#)
- [DBMS_ILM](#)
- [DBMS_ILM_ADMIN](#)

86.1 DBMS_HEAT_MAP Overview

To implement your ILM strategy, you can use Heat Map in Oracle Database to track data access and modification. You can also use Automatic Data Optimization (ADO) to automate the compression and movement of data between different tiers of storage within the database.

The Heat Map tracks modification times at the block level, and multiple access statistics at the segment level. Objects in the `SYSTEM` and `SYSAUX` tablespaces are not tracked.

`DBMS_HEAT_MAP` gives you access to the Heat Map statistics at various levels - block, extent, segment, object, and tablespace.

86.2 DBMS_HEAT_MAP Security Model

The execution privilege is granted to `PUBLIC`. Procedures in this package run under the caller security. The user must have `ANALYZE` privilege on the object.

86.3 Summary of DBMS_HEAT_MAP Subprograms

This table lists and briefly describes the `DBMS_HEAT_MAP` package subprograms.

Table 86-1 DBMS_HEAT_MAP Package Subprograms

| Subprogram | Description |
|--|--|
| BLOCK_HEAT_MAP Function | Returns last modification time for each block in a table segment |
| EXTENT_HEAT_MAP Function | Returns the extent level Heat Map statistics for a table segment |
| OBJECT_HEAT_MAP Function | Returns the minimum, maximum and average access times for all the segments belonging to the object |
| SEGMENT_HEAT_MAP Procedure | Returns the heatmap attributes for the given segment |
| TABLESPACE_HEAT_MAP Function | Returns the minimum, maximum and average access times for all the segments in the tablespace |

86.3.1 BLOCK_HEAT_MAP Function

This table function returns the last modification time for each block in a table segment. It returns no information for segment types that are not data.

Syntax

```
DBMS_HEAT_MAP.BLOCK_HEAT_MAP (
    owner          IN VARCHAR2,
    segment_name   IN VARCHAR2,
    partition_name IN VARCHAR2 DEFAULT NULL,
    sort_columnid  IN NUMBER DEFAULT NULL,
    sort_order     IN VARCHAR2 DEFAULT NULL)
RETURN hm_bls_row PIPELINED;
```

Parameters

Table 86-2 BLOCK_HEAT_MAP Function Parameters

| Parameter | Description |
|----------------|---|
| owner | Owner of the segment |
| segment_name | Table name of a non-partitioned table or (sub)partition of partitioned table. Returns no rows when table name is specified for a partitioned table. |
| partition_name | Defaults to NULL. For a partitioned table, specify the partition or subpartition segment name. |
| sort_columnid | ID of the column on which to sort the output. Valid values 1..9. Invalid values are ignored. |
| sort_order | Defaults to NULL. Possible values: ASC, DESC |

Return Values

Table 86-3 *BLOCK_HEAT_MAP Function Return Values (Output Parameters)*

| Parameter | Description |
|-----------------|--|
| owner | Owner of the segment |
| segment_name | Segment name of the non-partitioned table |
| partition_name | Partition or subpartition name |
| tablespace_name | Tablespace containing the segment |
| file_id | Absolute file number of the block in the segment |
| relative_fno | Relative file number of the block in the segment |
| block_id | Block number of the block |
| write time | Last modification time of the block |

86.3.2 EXTENT_HEAT_MAP Function

This table function returns the extent level Heat Map statistics for a table segment. It returns no information for segment types that are not data. Aggregates at extent level, including minimum modification time and maximum modification time, are included.

Syntax

```
DBMS_HEAT_MAP.EXTENT_HEAT_MAP (
  owner          IN VARCHAR2,
  segment_name   IN VARCHAR2,
  partition_name IN VARCHAR2 DEFAULT NULL,
RETURN hm_els_row PIPELINED;
```

Parameters

Table 86-4 *EXTENT_HEAT_MAP Function Parameters*

| Parameter | Description |
|----------------|---|
| owner | Owner of the segment |
| segment_name | Table name of a non-partitioned table or (sub)partition of partitioned table. Returns no rows when table name is specified for a partitioned table. |
| partition_name | Defaults to NULL. For a partitioned table, specify the partition or subpartition segment name. |

Return Values

Table 86-5 *EXTENT_HEAT_MAP Function Return Values (Output Parameters)*

| Parameter | Description |
|--------------|---|
| owner | Owner of the segment |
| segment_name | Segment name of the non-partitioned table |

Table 86-5 (Cont.) EXTENT_HEAT_MAP Function Return Values (Output Parameters)

| Parameter | Description |
|-----------------|--|
| partition_name | Partition or subpartition name |
| tablespace_name | Tablespace containing the segment |
| file_id | Absolute file number of the block in the segment |
| relative_fno | Relative file number of the block in the segment |
| block_id | Block number of the block |
| blocks | Number of blocks in the extent |
| bytes | Number of bytes in the extent |
| min_writetime | Minimum of last modification time of the block |
| max_writetime | Maximum of last modification time of the block |
| avg_writetime | Average of last modification time of the block |

86.3.3 OBJECT_HEAT_MAP Function

This table function returns the minimum, maximum and average access times for all the segments belonging to the object.

The object must be a table. The table function raises an error if called on object tables other than table.

Syntax

```
DBMS_HEAT_MAP.OBJECT_HEAT_MAP (
    object_owner      IN VARCHAR2,
    object_name       IN VARCHAR2)
RETURN hm_object_table PIPELINED;
```

Parameters

Table 86-6 OBJECT_HEAT_MAP Function Parameters

| Parameter | Description |
|--------------|-------------------------------------|
| object_owner | Tablespace containing the segment |
| object_name | Segment header relative file number |

Return Values

Table 86-7 OBJECT_HEAT_MAP Function Return Values (Output Parameters)

| Parameter | Description |
|-----------------|---|
| segment_name | Name of the top level segment |
| partition_name | Name of the partition |
| tablespace_name | Name of the tablespace |
| segment_type | Type of segment as in DBA_SEGMENTS.SEGMENT_TYPE |

Table 86-7 (Cont.) OBJECT_HEAT_MAP Function Return Values (Output Parameters)

| Parameter | Description |
|----------------|--|
| segment_size | Segment size in bytes |
| min_writetime | Oldest write time for the segment |
| max_writetime | Latest write time for the segment |
| avg_writetime | Average write time for the segment |
| min_readtime | Oldest read time for the segment |
| max_readtime | Latest read time for the segment |
| avg_readtime | Average read time for the segment |
| min_lookuptime | Oldest index lookup time for the segment |
| max_lookuptime | Latest index lookup time for the segment |
| avg_lookuptime | Average index lookup time for the segment |
| min_ftstime | Oldest full table scan time for the segment |
| max_ftstime | Latest full table scan time for the segment |
| avg_ftstime | Average full table scan time for the segment |

86.3.4 SEGMENT_HEAT_MAP Procedure

This procedure returns the heatmap attributes for the given segment.

Syntax

```
DBMS_HEAT_MAP.SEGMENT_HEAT_MAP (
    tablespace_id      IN NUMBER,
    header_file        IN NUMBER,
    header_block       IN NUMBER,
    segment_objd       IN NUMBER,
    min_writetime      OUT DATE,
    max_writetime      OUT DATE,
    avg_writetime      OUT DATE,
    min_readtime       OUT DATE,
    max_readtime       OUT DATE,
    avg_readtime       OUT DATE,
    min_lookuptime     OUT DATE,
    max_lookuptime     OUT DATE,
    avg_lookuptime     OUT DATE,
    min_ftstime        OUT DATE,
    max_ftstime        OUT DATE,
    avg_ftstime        OUT DATE);
```

Parameters

Table 86-8 SEGMENT_HEAT_MAP Procedure Parameters

| Parameter | Description |
|---------------|-----------------------------------|
| tablespace_id | Tablespace containing the segment |

Table 86-8 (Cont.) SEGMENT_HEAT_MAP Procedure Parameters

| Parameter | Description |
|--------------|-------------------------------------|
| header_file | Segment header relative file number |
| header_block | Segment header block number |
| segment_objd | DATAOBJ of the segment |

Return Values

Table 86-9 SEGMENT_HEAT_MAP Procedure Return Values (Output Parameters)

| Parameter | Description |
|----------------|--|
| min_writetime | Oldest write time for the segment |
| max_writetime | Latest write time for the segment |
| avg_writetime | Average write time for the segment |
| min_readtime | Oldest read time for the segment |
| max_readtime | Latest read time for the segment |
| avg_writetime | Average write time for the segment |
| min_lookuptime | Oldest index lookup time for the segment |
| max_lookuptime | Latest index lookup time for the segment |
| avg_lookuptime | Average index lookup time for the segment |
| min_ftstime | Oldest full table scan time for the segment |
| max_ftstime | Latest full table scan time for the segment |
| avg_ftstime | Average full table scan time for the segment |

86.3.5 TABLESPACE_HEAT_MAP Function

This table function returns the minimum, maximum and average access times for all the segments in the tablespace.

Syntax

```
DBMS_HEAT_MAP.TABLESPACE_HEAT_MAP (
    tablespace_name    IN VARCHAR2)
RETURN hm_tablespace_table PIPELINED;
```

Parameters

Table 86-10 TABLESPACE_HEAT_MAP Procedure Parameters

| Parameter | Description |
|-----------------|------------------------|
| tablespace_name | Name of the tablespace |

Return Values

Table 86-11 *TABLESPACE_HEAT_MAP Procedure Return Values (Output Parameters)*

| Parameter | Description |
|-----------------|--|
| segment_count | Total number of segments in the tablespace |
| allocated_bytes | Space used by the segments in the tablespace |
| min_writetime | Oldest write time for the segment |
| max_writetime | Latest write time for the segment |
| avg_writetime | Average write time for the segment |
| min_readtime | Oldest read time for the segment |
| max_readtime | Latest read time for the segment |
| avg_writetime | Average write time for the segment |
| min_lookuptime | Oldest index lookup time for the segment |
| max_lookuptime | Latest index lookup time for the segment |
| avg_lookuptime | Average index lookup time for the segment |
| min_ftstime | Oldest full table scan time for the segment |
| max_ftstime | Latest full table scan time for the segment |
| avg_ftstime | Average full table scan time for the segment |

DBMS_HIERARCHY

DBMS_HIERARCHY contains subprograms for validating the data in tables used by hierarchies and analytic views.

This chapter contains the following topics:

- [DBMS_HIERARCHY Overview](#)
- [DBMS_HIERARCHY Security Model](#)
- [Summary of DBMS_HIERARCHY Subprograms](#)

87.1 DBMS_HIERARCHY Overview

The DBMS_HIERARCHY package contains functions for validating that the contents of a database table are suitable for use by an analytic view or a hierarchy, a function for verifying the success of the validation, and a procedure for creating a table for logging validation operations.

**Note:**

Names specified by parameters of the DBMS_HIERARCHY subprograms are case-sensitive.

For information about using analytic views, see *Oracle Database Data Warehousing Guide*.

87.2 DBMS_HIERARCHY Security Model

Summarizes security considerations for the validation of analytic view and hierarchy objects.

All procedures in this package validate that the current user has the necessary privileges on the specified objects and return an error if those privileges are not found.

**Note:**

To ensure that the user has enough tablespace to log validation operations, do one of the following:

- GRANT UNLIMITED TABLESPACE TO *username* ;
- ALTER USERNAME *username* QUOTA *size* ON *tablespace_name* ;

The following system privileges are required to use this package:

To validate objects in the user's own schema:

- CREATE TABLE privilege for CREATE_VALIDATE_LOG_TABLE or to have VALIDATE_ANALYTIC_VIEW or VALIDATE_HIERARCHY automatically create a table
- SELECT privilege on the tables or views used by the analytic view or hierarchy
- INSERT privilege on the tables used by the attribute dimensions of the hierarchy or the fact table used by the analytic view

To validate objects in different schemas:

- CREATE ANY TABLE privilege for CREATE_VALIDATE_LOG_TABLE or to have the VALIDATE_ANALYTIC_VIEW or VALIDATE_HIERARCHY automatically create a table
- INSERT ANY TABLE privilege on the tables used by the attribute dimensions of the hierarchy or the fact table used by the analytic view

87.3 Summary of DBMS_HIERARCHY Subprograms

This table lists the DBMS_HIERARCHY subprograms and briefly describes them.

| Subprogram | Description |
|--|--|
| CREATE_VALIDATE_LOG_TABLE Procedure | Creates a table that you can use for logging messages generated by the VALIDATE_HIERARCHY and VALIDATE_ANALYTIC_VIEW functions. |
| CREATE_VIEW_FOR_FACT_ROWS Procedure | This procedure creates a view for fact rows. |
| CREATE_VIEW_FOR_STAR_ROWS Procedure | This procedure creates a view for star rows. |
| GET_MV_SQL_FOR_AV_CACHE Function | This function either returns the SQL for a cache that is defined in the AV or the SQL for a given set of measures and levels. These measures and levels do not need to be part of a cache in the AV. |
| GET_MV_SQL_FOR_STAR_CACHE Function | This function returns the SQL in text form for the star cache. |
| UPGRADE_VALIDATE_LOG_TABLE Procedure | This procedure takes a log table and upgrades it to the newest format. Returns an error if the table cannot be upgraded due to other errors. |
| VALIDATE_ANALYTIC_VIEW Function | Validates that the data in a table is suitable for use by an analytic view. |
| VALIDATE_CHECK_SUCCESS Function | Indicates whether a prior call to VALIDATE_HIERARCHY or VALIDATE_ANALYTIC_VIEW was successful or produced validation errors. |
| VALIDATE_HIERARCHY Function | Validates that the data in a table is suitable for use by a hierarchy. |

87.3.1 CREATE_VALIDATE_LOG_TABLE Procedure

This procedure creates a table that you can use for logging messages generated by the `VALIDATE_ANALYTIC_VIEW` or `VALIDATE_HIERARCHY` function, which validate data used by an analytic view or hierarchy.

The table that this procedure creates has the following structure.

| NAME | NULL? | DATATYPE |
|---------------|----------|---------------------|
| LOG_NUMBER | NOT NULL | NUMBER |
| ACTION_ORDER | NOT NULL | NUMBER |
| OBJECT_OWNER | NOT NULL | VARCHAR2 (128 BYTE) |
| OBJECT_NAME | NOT NULL | VARCHAR2 (128 BYTE) |
| ACTION | NOT NULL | VARCHAR2 (10 BYTE) |
| TIME | NOT NULL | TIMESTAMP (6) |
| ERROR_NUMBER | | NUMBER |
| ERROR_MESSAGE | | VARCHAR2 (4000) |

Syntax

```
DBMS_HIERARCHY.CREATE_VALIDATE_LOG_TABLE (
    table_name          IN VARCHAR2,
    owner_name          IN VARCHAR2          DEFAULT NULL,
    IGNORE_IF_EXISTS   IN PL/SQL BOOLEAN   DEFAULT FALSE);
```

Parameters

| Parameter | Description |
|-------------------------------|--|
| <code>table_name</code> | The name of the table to create. |
| <code>owner_name</code> | The name of the schema in which to create the table. If <code>owner_name</code> is NULL, then the table is created in the current user's schema. |
| <code>IGNORE_IF_EXISTS</code> | A Boolean that indicates whether to create the table if a table by the same name exists. If you specify a table, it must have the same structure as the table that this procedure creates. |

Examples

Example 87-1 Creating a Validation Log Table

```
BEGIN
    DBMS_HIERARCHY.CREATE_VALIDATE_LOG_TABLE (
        'VAL_AV_HIERARCHY_LOG',
        'AV_USER',
        FALSE
    );
END;
/
```

87.3.2 CREATE_VIEW_FOR_FACT_ROWS Procedure

This procedure creates a view over the analytic view that exposes only the rows of the fact table. This allows standard SQL group functions to be used to aggregate those rows. The advantage to querying such a view rather than the fact table directly is that the analytic view may be able to perform query optimizations otherwise unavailable. When `include_meas` is `TRUE`, the `AV_AGGREGATE` group function may be used to expose measure columns defined in the analytic view.

Syntax

```
DBMS_HIERARCHY.CREATE_VIEW_FOR_FACT_ROWS (
    analytic_view_name      IN VARCHAR2,
    view_name               IN VARCHAR2,
    dim_hier_seq            IN ID2_SEQUENCE  DEFAULT NULL,
    analytic_view_owner_name IN VARCHAR2    DEFAULT
SYS_CONTEXT('USERENV', 'CURRENT_SCHEMA'),
    view_owner_name        IN VARCHAR2      DEFAULT
SYS_CONTEXT('USERENV', 'CURRENT_SCHEMA'),
    dim_qual_sep           IN VARCHAR2      DEFAULT '_',
    all_join_keys          IN BOOLEAN        DEFAULT TRUE,
    include_meas           IN BOOLEAN        DEFAULT FALSE,
    include_hier_attr      IN BOOLEAN        DEFAULT FALSE);
```

Parameters

| Parameter | Description |
|---------------------------------------|--|
| <code>analytic_view_name</code> | The name of the analytic view to be created. |
| <code>view_name</code> | The name of the view. |
| <code>dim_hier_seq</code> | A sequence of ID2 records. An ID2 record contains two VARCHAR2 (128) for the two parallel components, providing (dim, hier) name pairs. Default value is NULL which indicates that all hierarchies should be considered. |
| <code>analytic_view_owner_name</code> | The name of the analytic view owner. The default value is <code>SYS_CONTEXT('USERENV', 'CURRENT_SCHEMA')</code> . |
| <code>view_owner_name</code> | The owner of the view to be created. The default value is <code>SYS_CONTEXT('USERENV', 'CURRENT_SCHEMA')</code> . |
| <code>dim_qual_sep</code> | The separator to be used on the columns of the created view. For example, <ul style="list-style-type: none"> for fact columns - "FACT" <code>dim_qual_sep</code> {name of fact column alias} for measures - "MEASURE" <code>dim_qual_sep</code> {measure name alias} The default value is <code>_</code> . |

| Parameter | Description |
|-------------------|---|
| all_join_keys | If TRUE, adds all of the join key columns in the AV to the view. |
| include_meas | If TRUE, include all of the base measures and calculated measures defined in the AV as columns in the created view. |
| include_hier_attr | If TRUE, include all of the hierarchical attributes defined in the AV as columns in the created view. |

87.3.3 CREATE_VIEW_FOR_STAR_ROWS Procedure

This procedure creates a view over the analytic view that exposes only rows for a particular dimension star table. Such a view is intended to be used in conjunction with a corresponding fact rows view created using CREATE_VIEW_FOR_FACT_ROWS, joined using their corresponding keys as defined in the analytic view.

Syntax

```
DBMS_HIERARCHY.CREATE_VIEW_FOR_STAR_ROWS (
    analytic_view_name      IN VARCHAR2,
    dimension_alias         IN VARCHAR2,
    view_name               IN VARCHAR2,
    analytic_view_owner_name IN VARCHAR2      DEFAULT
SYS_CONTEXT('USERENV', 'CURRENT_SCHEMA'),
    view_owner_name         IN VARCHAR2      DEFAULT
SYS_CONTEXT('USERENV', 'CURRENT_SCHEMA'),
    hier_qual_sep           IN VARCHAR2      DEFAULT '_',
    include_hier_attr       IN BOOLEAN       DEFAULT FALSE);
```

Parameters

| Parameter | Description |
|--------------------------|--|
| analytic_view_name | The name of the analytic view to be created. |
| dimension_alias | The alias of the attribute dimension that you wish to create a star rows view for. |
| view_name | The name of the view. |
| analytic_view_owner_name | The name of the analytic view owner. The default value is SYS_CONTEXT('USERENV', 'CURRENT_SCHEMA'). |
| view_owner_name | The owner of the view to be created. The default value is SYS_CONTEXT('USERENV', 'CURRENT_SCHEMA'). |
| hier_qual_sep | The separator to be used. The separator is between the attribute dimension name and the built-in hierarchical attributes, such as MEMBER_NAME, LEVEL_NAME, DEPTH, and so on. The default value is _. |
| include_hier_attr | If TRUE, include all of the hierarchical attributes defined in the AV as columns in the created view. |

87.3.4 GET_MV_SQL_FOR_AV_CACHE Function

This function has two signatures. The first version of this method returns the SQL for a cache that is defined in the AV. The second version of this method returns SQL for a given set of measures and levels. These measures and levels do not need to be part of a cache in the AV.

Syntax

```
DBMS_HIERARCHY.GET_MV_SQL_FOR_AV_CACHE (
    analytic_view_name      IN
    VARCHAR2,
    cache_idx               IN    NUMBER,
    analytic_view_owner_name IN    VARCHAR2 DEFAULT
    SYS_CONTEXT('USERENV', 'CURRENT_SCHEMA'))
    RETURN CLOB;
```

```
DBMS_HIERARCHY.GET_MV_SQL_FOR_AV_CACHE (
    analytic_view_name      IN
    VARCHAR2,
    lvl_seq                 IN    ID3_SEQUENCE DEFAULT NULL,
    meas_seq                 IN    ID_SEQUENCE  DEFAULT NULL,
    analytic_view_owner_name IN    VARCHAR2 DEFAULT
    SYS_CONTEXT('USERENV', 'CURRENT_SCHEMA'))
    RETURN CLOB;
```

Parameters

Table 87-1 GET_MV_SQL_FOR_AV_CACHE Function Parameters

| Parameter | Description |
|--------------------------|---|
| analytic_view_name | The name of the analytic view to be created. |
| cache_idx | Zero-based index for the caches defined on the AV. |
| analytic_view_owner_name | The name of the analytic view owner. The default value is SYS_CONTEXT('USERENV', 'CURRENT_SCHEMA'). |
| lvl_seq | The list of levels that the cache should be based on. |
| meas_seq | The list of measures that the cache should be based on. |

87.3.5 GET_MV_SQL_FOR_STAR_CACHE Function

This function returns the SQL in text form for the star cache.

Syntax

```
DBMS_HIERARCHY.GET_MV_SQL_FOR_STAR_CACHE (
    attr_dim_name          IN    VARCHAR2,
    attr_dim_owner_name    IN    VARCHAR2 DEFAULT SYS_CONTEXT('USERENV',
    'CURRENT_SCHEMA'))
    RETURN CLOB;
```

Parameters

Table 87-2 GET_MV_SQL_FOR_STAR_CACHE Function Parameters

| Parameter | Description |
|---------------------|--|
| attr_dim_name | The name of the attribute dimension on which to create a cache. |
| attr_dim_owner_name | The schema that owns the attribute dimension. The default value is <code>SYS_CONTEXT('USERENV', 'CURRENT_SCHEMA')</code> . |

87.3.6 UPGRADE_VALIDATE_LOG_TABLE Procedure

This procedure takes a log table and upgrades it to the newest format. Returns an error if the table cannot be upgraded due to other errors.

Syntax

```
DBMS_HIERARCHY.UPGRADE_VALIDATE_LOG_TABLE (
    table_name      IN VARCHAR2,
    owner_name      IN VARCHAR2          DEFAULT NULL);
```

Parameters

| Parameter | Description |
|------------|--|
| table_name | The name of the table to upgrade. |
| owner_name | The name of the schema in which to find the table. If <code>owner_name</code> is <code>NULL</code> , then the table is created in the current user's schema. |

87.3.7 VALIDATE_ANALYTIC_VIEW Function

This function validates that the data in a table or view conforms to the logical constraints inherent in the definition of an analytic view.

Syntax

```
DBMS_HIERARCHY.VALIDATE_ANALYTIC_VIEW (
    analytic_view_name      IN VARCHAR2          DEFAULT NULL,
    analytic_view_owner_name IN VARCHAR2          DEFAULT NULL,
    log_table_name          IN VARCHAR2          DEFAULT NULL,
    log_table_owner_name    IN VARCHAR2          DEFAULT NULL)
RETURN NUMBER;
```

Parameters

| Parameter | Description |
|--------------------------|--|
| analytic_view_name | The name of the analytic view to validate. |
| analytic_view_owner_name | The name of the owner of the schema that contains the analytic view. |

| Parameter | Description |
|-----------------------------------|---|
| <code>log_table_name</code> | The name of the validation log table in which to put the results of the validation operation. |
| <code>log_table_owner_name</code> | The name of the owner of the schema in which the validation log table exists or in which to create the table. |

Returns

The number of the entry in the validation log table for the validation results.

Usage Notes

If the `log_table_name` parameter is `NULL`, then the `VALIDATE_ANALYTIC_VIEW` function creates a validation log table. The name of the table it creates is `DBMS_HIERARCHY_LOG`.

When the validation operation begins, a row is inserted into the log table with the action of `START`. When the operation completes, a row is inserted into the log table with the action of `END`. When an error is detected, a row is inserted into the log table with the action of `ERROR`, and the associated `error_number` and `error_message` columns are populated. All rows inserted into the validation log table include a log number and the time of the insert.

The `VALIDATE_ANALYTIC_VIEW` function verifies that the following conditions are true for each attribute dimension the analytic view is dimensioned by:

- The key values found in the fact table for the attribute dimension must exist in the star schema dimension table for that attribute dimension.
- The referenced attribute values for the attribute dimension must be unique across all rows of the star schema dimension table for that dimension.

Also, for every hierarchy in the analytic view, the function verifies that the following conditions are true:

- The primary key of a level determines a unique value for each attribute of the level.
- For each row of the table or view used by the attribute dimension of the hierarchy, the value for every level key column (including alternate keys) of a `NOT NULL` level is non-`NULL`.
- For each row of the table or view, either all level key columns and alternate key columns of a `SKIP WHEN NULL` level must be `NULL` or they must all be non-`NULL`. This verifies that the alternate level key is determined by the level key.
- For each group of rows that have the same alternate key column values for a level, the key column values must have the same column values. This verifies that the level key is determined by the alternate level key, which is required for an alternate key.

Examples

Example 87-2 Validating an Analytic View

```

DECLARE
  log_num NUMBER;
  obj_name VARCHAR2(8) := 'SALES_AV';
BEGIN
  log_num := DBMS_HIERARCHY.VALIDATE_ANALYTIC_VIEW(obj_name);
END;
/

```

87.3.8 VALIDATE_CHECK_SUCCESS Function

This function indicates whether a prior call to `VALIDATE_HIERARCHY` or `VALIDATE_ANALYTIC_VIEW` was successful or produced validation errors.

Syntax

```

DBMS_HIERARCHY.VALIDATE_CHECK_SUCCESS (
  TOPOBJ_NAME          IN VARCHAR2,
  TOPOBJ_OWNER         IN VARCHAR2,
  LOG_NUMBER           IN VARCHAR2,
  LOG_TABLE_NAME       IN VARCHAR2,
  LOG_TABLE_OWNER_NAME IN VARCHAR2 )
RETURN VARCHAR2;

```

Parameters

| Parameter | Description |
|----------------------|---|
| TOPOBJ_NAME | The name of the hierarchy or analytic view. |
| TOPOBJ_OWNDER | The owner of the hierarchy or analytic view. |
| LOG_NUMBER | The number of the log entry. |
| LOG_TABLE_NAME | The name of the log table. |
| LOG_TABLE_OWNER_NAME | The name of the schema in which the table exists. |

Returns

A `VARCHAR2` that is `SUCCESS` if no errors occurred or `ERROR` if errors did occur.

Examples

Example 87-3 Using VALIDATE_CHECK_SUCCESS

This example finds out whether the prior call to `VALIDATE_ANALYTIC_VIEW` encountered errors.

```

DECLARE
  log_num NUMBER;
  succ VARCHAR2(7);
  obj_name VARCHAR2(8) := 'SALES_AV';
BEGIN

```

```

log_num := dbms_hierarchy.validate_analytic_view(obj_name);
succ := dbms_hierarchy.validate_check_success(
    topobj_name => obj_name, log_number => log_num);
IF (succ != 'SUCCESS') THEN
    RAISE_APPLICATION_ERROR(
        num => -20000,
        msg => 'Validate failed!');
END IF;
END;
/

```

87.3.9 VALIDATE_HIERARCHY Function

This function validates that the data in a table or view conforms to the logical constraints inherent in the definitions of an attribute dimension that uses the table or view and a hierarchy that uses the attribute dimension.

Syntax

```

DBMS_HIERARCHY.VALIDATE_HIERARCHY (
    hier_name           IN VARCHAR2,
    hier_owner_name     IN VARCHAR2   DEFAULT NULL,
    log_table_name      IN VARCHAR2   DEFAULT NULL,
    log_table_owner_name IN VARCHAR2   DEFAULT NULL)
RETURN NUMBER;

```

Parameters

| Parameter | Description |
|----------------------|---|
| hier_name | The name of the hierarchy to validate. |
| hier_owner_name | The name of the owner of the schema that contains the hierarchy. |
| log_table_name | The name of the validation log table in which to put the results of the validation operation. |
| log_table_owner_name | The name of the owner of the schema in which the validation log table exists or in which to create the table. |

Returns

The number of the entry in the validation log table for the validation results.

Usage Notes

If the `log_table_name` parameter is NULL, then the `VALIDATE_HIERARCHY` function creates a validation log table. The name of the table it creates is `DBMS_HIERARCHY_LOG`.

When the validation operation begins, a row is inserted into the log table with the action of `START`. When the operation completes, a row is inserted into the log table with the action of `END`. When an error is detected, a row is inserted into the log table with the action of `ERROR`, and the associated `error_number` and `error_message` columns are populated. All rows inserted into the validation log table include a log number and the time of the insert.

The `VALIDATE_HIERARCHY` function verifies that the following conditions are true for the hierarchy:

- The primary key of a level determines a unique value for each attribute of the level.
- For each row of the table or view used by the attribute dimension of the hierarchy, the value for every level key column (including alternate keys) of a `NOT NULL` level is non-NULL.
- For each row of the table or view, either all level key columns and alternate key columns of a `SKIP WHEN NULL` level must be `NULL` or they must all be non-NULL. This verifies that the alternate level key is determined by the level key.
- For each group of rows that have the same alternate key column values for a level, the key column values must have the same column values. This verifies that the level key is determined by the alternate level key, which is required for an alternate key.

Examples

Example 87-4 Validating a Hierarchy and Specifying a Table Name

This example validates the `PRODUCT_HIER` hierarchy and specifies that the results be inserted in the table named `VAL_AV_HIERARCHY_LOG`. The owner of the hierarchy and of the schema that contains the table is `AV_USER`.

```
-- Create a log table.
BEGIN
  DBMS_HIERARCHY.CREATE_VALIDATE_LOG_TABLE (
    'VAL_AV_HIERARCHY_LOG',
    'AV_USER',
    FALSE
  );
END;
/

-- Validate the hierarchy.
DECLARE
  log_num NUMBER;
  obj_name VARCHAR2(12) := 'PRODUCT_HIER';
  table_name VARCHAR2(28) := 'VAL_AV_HIERARCHY_LOG';
BEGIN
  log_num := DBMS_HIERARCHY.VALIDATE_HIERARCHY(obj_name, 'AV_USER',
table_name);
END;
/
```

Query the log table.

```
SELECT LOG_NUMBER, ACTION, OBJECT_NAME, ERROR_NUMBER, ERROR_MESSAGE
FROM AV_USER.VAL_AV_HIERARCHY_LOG;
WHERE OBJECT_NAME = 'PRODUCT_HIER';
```

| LOG_NUMBER | ACTION | OBJECT_NAME | ERROR_NUMBER | ERROR_MESSAGE |
|------------|--------|--------------|--------------|---------------|
| 1 | START | PRODUCT_HIER | | |
| 1 | END | PRODUCT_HIER | | |

Example 87-5 Validating a Hierarchy Without Specifying a Table Name

This example shows that if you do not specify a validation log table, then the `VALIDATE_HIERARCHY` function creates one named `DBMS_HIERARCHY_LOG`.

```
DECLARE
  log_num NUMBER;
  obj_name VARCHAR2(12) := 'PRODUCT_HIER';
BEGIN
  log_num := DBMS_HIERARCHY.VALIDATE_HIERARCHY(obj_name);
END;
```

Query the log table.

```
SELECT LOG_NUMBER, ACTION, OBJECT_NAME, ERROR_NUMBER, ERROR_MESSAGE
       FROM DBMS_HIERARCHY_LOG
       WHERE OBJECT_NAME = 'PRODUCT_HIER';
```

| LOG_NUMBER | ACTION | OBJECT_NAME | ERROR_NUMBER | ERROR_MESSAGE |
|------------|--------|--------------|--------------|---------------|
| 1 | START | PRODUCT_HIER | | |
| 1 | END | PRODUCT_HIER | | |

DBMS_HM

This package contains constants and procedure declarations for health check management. Health Monitor provides facilities to run a check store and retrieve the reports through DBMS_HM package

This chapter contains the following topics:

- [Security Model](#)
- [Summary of DBMS_HM Subprograms](#)

See Also:

Oracle Database Administrator's Guide for more information about "Health Monitor"

88.1 DBMS_HM Security Model

Users must have EXECUTE privilege to run the procedures of DBMS_HM package.

88.2 Summary of DBMS_HM Subprograms

This table lists the DBMS_CONNECTION_POOL subprograms and briefly describes them.

Table 88-1 DBMS_HM Package Subprograms

| Subprogram | Description |
|---|---|
| GET_RUN_REPORT Function | Returns the report for the specified checker run |
| RUN_CHECK Procedure | Runs the specified checker with the given arguments |

88.2.1 GET_RUN_REPORT Function

This function returns the report for the specified checker run.

Syntax

```
DBMS_HM.GET_RUN_REPORT (
  run_name      IN VARCHAR2,
  type          IN VARCHAR2 := 'TEXT',
  level        IN VARCHAR2 := 'BASIC',)
RETURN CLOB;
```

Parameters

Table 88-2 GET_RUN_REPORT Function Parameters

| Parameter | Description |
|-----------|---|
| run_name | Name of the check's run |
| type | Report format type. Possible values are 'HTML', 'XML' and 'TEXT'. Default report type is 'TEXT'. |
| level | Details of report, possible value are 'BASIC' and 'DETAIL'. Caution: Currently only 'BASIC' level is supported. |

88.2.2 RUN_CHECK Procedure

This procedure runs the specified checker with the specified arguments.

You can specify a name for the run, the inputs needed and maximum time-out for the run. The run report will be maintained persistently in the database.

Syntax

```
DBMS_HM.RUN_CHECK (
    check_name      IN  VARCHAR2,
    run_name        IN  VARCHAR2 := NULL,
    timeout         IN  NUMBER := NULL,
    input_params    IN  VARCHAR2 := NULL);
```

Parameters

Table 88-3 RUN_CHECK Procedure Parameters

| Parameter | Description |
|------------|--|
| check_name | Name of the check to be invoked. Check names and their parameters can be accessed from the V\$HM_CHECK and V\$HM_CHECK_PARAM views. Users can run all checks which are not internal in nature: SELECT name FROM V\$HM_CHECK WHERE INTERNAL_CHECK = 'N' retrieves the list of checks that can be run manually by users. |
| run_name | Name with which external users can uniquely identify this check's run. If NULL value is passed, then HM creates a unique name and associates with this check's run. |
| timeout | Maximum amount of time (in units of seconds), this checker run is allowed to run. HM will interrupt the run, if it the specified time elapses for the run. If NULL value is passed, HM doesn't impose any timeout limits on the run. |

Table 88-3 (Cont.) RUN_CHECK Procedure Parameters

| Parameter | Description |
|--------------|--|
| input_params | <p>Input string: which consists of name, value pairs de-limited by a special character ';'. Example ('Data Block Integrity Check' invocation may take following type of input parameters. <code>'BLC_DF_NUM=1;BLC_BL_NUM=23456'</code></p> <p>Input parameters BLC_DF_NUM and BLC_BL_NUM have values '1' and '23456' respectively. Every check will have well defined set of inputs associated with it. These Input parameters, their types, default values and descriptions can be obtained using V\$HM_CHECK_PARAM view. Example: The following query gets the list of parameters, their default values and descriptions for a 'Data Block Integrity Check'</p> <pre>SELECT a.* FROM v\$hm_check_param a, v\$hm_check b WHERE a.check_id = b.id AND b.name = 'Data Block Integrity Check';</pre> |

DBMS_HPROF

The `DBMS_HPROF` package provides an interface for profiling the execution of PL/SQL applications. It provides services for collecting the hierarchical profiler data, analyzing the raw profiler output and profiling information generation.

This chapter contains the following topic:

- [Summary of DBMS_HPROF Subprograms](#)

See Also:

Oracle Database Development Guide for more information about the "PL/SQL Hierarchical Profiler"

89.1 DBMS_HPROF Security Model

You must have the following privileges to use the `DBMS_HPROF` package:

- An `EXECUTE` privilege on the `DBMS_HPROF` package.
- A `WRITE` privilege on the directory that you specify when you call the `DBMS_HPROF.START_PROFILING` procedure.

89.2 Summary of DBMS_HPROF Subprograms

This table lists and briefly describes the `DBMS_HPROF` package subprograms.

Table 89-1 DBMS_HPROF Package Subprograms

| Subprogram | Description |
|---|---|
| ANALYZE Function | Analyzes the raw profiler output and produces hierarchical profiler information in database tables. |
| CREATE_TABLES Procedure | Creates the hierarchical profiler database tables and data structures in the user's session. |
| START_PROFILING Procedure | Starts hierarchical profiler data collection in the user's session. |
| STOP_PROFILING Procedure | Stops profiler data collection in the user's session. |

89.2.1 ANALYZE Function

This function analyzes the raw profiler output and produces hierarchical profiler information in database tables or generates out-of-the-box HTML reports.

Syntax

```
DBMS_HPROF.ANALYZE (
    trace_id          IN NUMBER,
    summary_mode      IN BOOLEAN DEFAULT FALSE,
    trace             IN VARCHAR2 DEFAULT NULL,
    skip              IN PLS_INTEGER DEFAULT 0,
    collect           IN PLS_INTEGER DEFAULT NULL,
    run_comment       IN VARCHAR2 DEFAULT NULL)
RETURN NUMBER;
```

```
DBMS_HPROF.ANALYZE (
    trace_id          IN NUMBER,
    report_clob       OUT CLOB,
    trace             IN VARCHAR2 DEFAULT NULL,
    skip              IN PLS_INTEGER DEFAULT 0,
    collect           IN PLS_INTEGER DEFAULT NULL);
```

Parameters

Table 89-2 ANALYZE Function Parameters

| Parameter | Description |
|--------------|--|
| trace_id | The trace_id of the raw profiler data entry in the raw profiler data table (dbmshp_trace_data). |
| summary_mode | By default (that is, when summary_mode is FALSE), a detailed analysis is done. When summary_mode is TRUE, only top-level summary information is generated into the database table. |
| report_clob | The analyzed HTML report. |
| trace | Analyzes only the subtrees rooted at the specified trace entry. By default (when trace is NULL), the analysis/reporting is generated for the entire run. The trace entry must be specified in a special quoted qualified format. For example, "HR"."PKG"."FOO" or "'.'"__plsqli_vm". If multiple overloads exist for the specified name, all of them will be analyzed. |
| skip | Used only when trace is specified. Analyze only the subtrees rooted at the specified trace, but ignore the first skip invocations to trace. The default value for skip is 0. |
| collect | Used only when trace is specified. Analyze collect number of invocations of traces (starting from skip+1'th invocation). By default, only 1 invocation is collected. |
| run_comment | User-provided comment for this run. |

Return Values

A unique run identifier for this run of the analyzer. This can then be used to look up the results corresponding to this run from the hierarchical profiler tables.

Usage Notes

- Use the `DBMS_HPROF.CREATE_TABLES` subprogram to create the hierarchical profiler database tables and other data structures required for persistently storing the results of analyzing the raw profiler data.
- Calling the `DBMS_HPROF.CREATE_TABLES` with default value (`FALSE`) will raise error if table already exists.
- Use `DBMS_HPROF.CREATE_TABLES(TRUE)` to drop any previously created hierarchical profiler tables.
- Use the `DBMS_HPROF.CREATE_TABLES` to drop any previously created hierarchical profiler tables. By default, `force_it` is `FALSE`; therefore, to drop any previously created hierarchical profiler tables you must set the value of `force_it` to `TRUE`.
- If `trace_id` entry is `NULL`, error is raised.
- If `trace_id` entry in the raw profiler data table does not exist, error is raised.
- If raw data of the `trace_id` entry in the raw profiler data table is `NULL` or is zero size, error is raised.

Examples

The following snippet installs the hierarchical profiler tables in HR schema.

```
connect HR/<password>;
```

The following example analyzes and generates HTML CLOB report from a raw profiler data table.

```
DECLARE
    reportclob clob;
    trace_id number;
BEGIN
    -- create raw profiler data and analysis tables
    -- force_it =>TRUE will dropped the tables if table exists
    DBMS_HPROF.CREATE_TABLES(force_it =>TRUE);

    -- Start profiling
    -- Write raw profiler data in raw profiler data table
    trace_id := DBMS_HPROF.START_PROFILING;

    -- Run procedure to be profiled
    test;

    -- Stop profiling
    DBMS_HPROF.STOP_PROFILING;

    -- analyzes trace_id entry in raw profiler data table and produce
    -- analyzed HTML report in reportclob
    DBMS_HPROF.ANALYZE(trace_id , reportclob);
END;
/
```

89.2.2 CREATE_TABLES Procedure

Creates the hierarchical profiler database tables and data structures in the user's session.

Syntax

```
DBMS_HPROF.CREATE_TABLES (  
    force_it          IN BOOLEAN DEFAULT FALSE);
```

Parameters

Table 89-3 CREATE_TABLES Procedure Parameters

| Parameter | Description |
|-----------|---|
| force_it | If FALSE and DBMS_HPROF tables are present, then an HPROF error is raised. If TRUE , then the procedure creates tables. If the tables already exist, then they are dropped and new tables are created. |

Note:

Users need not use the `dbmshptab.sql` script located in the `rdbms/admin` directory to create the hierarchical profiler database tables and data structures anymore.

The `dbmshptab.sql` script is deprecated starting in Oracle Database 18c.

89.2.3 START_PROFILING Procedure

This procedure starts hierarchical profiler data collection in the user's session.

Syntax

```
DBMS_HPROF.START_PROFILING (  
    max_depth      IN PLS_INTEGER DEFAULT NULL,  
    sqlmonitor     IN BOOLEAN DEFAULT TRUE,  
    run_comment    IN VARCHAR2 DEFAULT NULL)  
RETURN NUMBER;
```

Parameters

Table 89-4 START_PROFILING Procedure Parameters

| Parameter | Description |
|--------------------------|--|
| <code>max_depth</code> | By default (that is, when <code>max_depth</code> value is <code>NULL</code>) profile information is gathered for all functions irrespective of their call depth. When a non- <code>NULL</code> value is specified for <code>max_depth</code> , the profiler collects data only for functions up to a call depth level of <code>max_depth</code> . |
| <code>sqlmonitor</code> | Generates a real-time monitoring report for a profiler run when the profiler run ends. The default value is <code>TRUE</code> . |
| <code>run_comment</code> | User provided comment for the profiler data collection run. |

Return Values

Unique run identifier for this profiler run. This can then be used to look up the results corresponding to this run from the hierarchical profiler tables.

Usage Notes

- Even though the profiler does not individually track functions at depth greater than `max_depth`, the time spent in such functions is charged to the ancestor function at depth `max_depth`.
- Raw profiler data is generated in the raw profiler data table with an unique `trace_id`.
- The unique `trace_id` is used to manage the raw profiler output stored in the raw profiler data table.

89.2.4 STOP_PROFILING Procedure

This procedure stops profiler data collection in the user's session. This subprogram also has the side effect of flushing data collected so far in the session, and it signals the end of a run. When the `STOP_PROFILING` procedure returns `CLOB`, it contains the Real-Time Monitoring report for the profiler run.

Syntax

```
DBMS_HPROF.STOP_PROFILING;
```

```
DBMS_HPROF.STOP_PROFILING
  RETURN CLOB;
```

Examples

Profiling with raw profiler data table

```
DECLARE
  analyze_runid number;
  trace_id number;
BEGIN
  -- create raw profiler data and analysis tables
```

```
-- call create_tables with force_it =>FALSE (default) when
-- raw profiler data and analysis tables do not exist already
DBMS_HPROF.CREATE_TABLES;
-- Start profiling
-- Write raw profiler data in raw profiler data table
trace_id := DBMS_HPROF.START_PROFILING;
-- Run the procedure to be profiled
test;
-- Stop profiling
DBMS_HPROF.STOP_PROFILING;
-- analyzes trace_id entry in raw profiler data table and writes
-- hierarchical profiler information in hprof's analysis tables
analyze_runid := DBMS_HPROF.ANALYZE(trace_id);
END;
/
```

DBMS_HS_PARALLEL

The `DBMS_HS_PARALLEL` PL/SQL package enables parallel processing for heterogeneous targets access. This package is designed to improve performance when retrieving data from a large foreign table.

This chapter discusses the following topics:

- [Using DBMS_HS_PARALLEL](#)
- [Summary of DBMS_HS_PARALLEL Subprograms](#)

90.1 Using the DBMS_HS_PARALLEL Subprogram

`DBMS_HS_PARALLEL` is compiled with the authorization ID of `CURRENT_USER`, which uses invoker's rights. In other words, all procedures in this package are executed with the privileges of the calling user.

90.2 Summary of DBMS_HS_PARALLEL Subprograms

This table lists the `DBMS_HS_PARALLEL` subprograms in alphabetic order and briefly describes them.

Table 90-1 DBMS_HS_PARALLEL Package Subprograms

| Subprogram | Description |
|--|--|
| CREATE_OR_REPLACE_VIEW | Creates (or replaces) a read-only view to be referenced for retrieving the data from a remote table in parallel. |
| CREATE_TABLE_TEMPLATE | Writes out a <code>CREATE TABLE</code> template based on information gathered from the remote table. You can use the information to add any optimal Oracle <code>CREATE TABLE</code> clauses. |
| DROP_VIEW | Drops the view and internal objects created by the <code>CREATE_OR_REPLACE_VIEW</code> procedure. If the view has not already been created by the <code>CREATE_OR_REPLACE_VIEW</code> procedure, an error message is returned. |
| LOAD_TABLE | Loads the data from a remote table to a local Oracle table in parallel. If the local Oracle table does not already exist, it is created automatically. |

90.2.1 CREATE_OR_REPLACE_VIEW Procedure

This procedure creates (or replaces) a read-only view to be referenced for retrieving the data from a remote table in parallel.

Syntax

```
CREATE_OR_REPLACE_VIEW (remote_table, database_link, oracle_view, parallel_degree)
```

Parameters

Table 90-2 CREATE_OR_REPLACE_VIEW Procedure Parameters

| Parameters | Description |
|-----------------|--|
| remote_table | The name of the remote database table. It is specified as [remote_schema_name.]remote_table_name. |
| database_link | The remote database link name. The call can only be applied to a heterogeneous services database link. |
| oracle_view | The name of the Oracle view. It is specified as [schema_name.]oracle_view_name. The default schema name is the current user. If the oracle_view parameter is not specified, the remote table name will be used as the view name. |
| parallel_degree | The number of parallel processes for the operation is computed based on the range-partition number if applicable, or the number of CPUs. The range of values is 2 to 16. |

Usage Notes

- The specified Oracle view is created and future reference of this view utilizes internal database objects for parallel retrieval of remote non-Oracle table data. If the Oracle view already exists, the following Oracle error message is raised:
ORA-00955: name is already used by an existing object
- This view is created as a read-only view. If you attempt to insert and update the view, the following Oracle error message is raised:
ORA-01733: virtual column not allowed here
- If the remote table or the database link does not exist, one of the following Oracle error messages is raised:
ORA-00942: table or view does not exist
or
ORA-02019: connection description for remote database not found
- You need the CREATE VIEW, CREATE TABLE, CREATE TYPE, CREATE PACKAGE, and CREATE FUNCTION privileges to execute the CREATE_OR_REPLACE_VIEW procedure.
- If you encounter either of the following Oracle error messages, increase the PROCESSES and SESSIONS parameter in the Oracle initialization parameter file:
ORA-12801: error signaled in parallel query server P003
or
ORA-00018: maximum number of session exceeded
- Because the CREATE_OR_REPLACE_VIEW procedure creates some internal objects, use the DROP_VIEW procedure to drop the view and the internal objects. The SQL DROP VIEW statement only drops the view and not the internal objects.

90.2.2 CREATE_TABLE_TEMPLATE Procedure

This procedure writes out a `CREATE TABLE` template based on information gathered from the remote table. You can use the information to add any optimal Oracle `CREATE TABLE` clauses.

Syntax

```
CREATE_TABLE_TEMPLATE (remote_table, database_link, oracle_table,  
create_table_template_string)
```

Parameters

Table 90-3 CREATE_TABLE_TEMPLATE Procedure Parameters

| Parameter | Description |
|---|---|
| <code>remote_table</code> | The name of the remote database table. It is specified as <code>[remote_schema_name.]remote_table_name</code> . |
| <code>database_link</code> | The remote database link name. The call can only be applied to a heterogeneous services database link. |
| <code>oracle_table</code> | The name of the local Oracle table the data will be loaded into. It is specified as <code>[schema_name.]oracle_table_name</code> . The default schema name is the current user. If the <code>oracle_table</code> parameter is not specified, the remote table name will be used as the local Oracle name. |
| <code>create_table_template_string</code> | Contains the Oracle <code>CREATE TABLE</code> SQL template when the procedure is returned. |

90.2.3 DROP_VIEW Procedure

This procedure drops the view and internal objects created by the `CREATE_OR_REPLACE_VIEW` procedure. If the view has not already been created by the `CREATE_OR_REPLACE_VIEW` procedure, an error message is returned.

Syntax

```
DROP_VIEW (oracle_view)
```

Parameters

Table 90-4 DROP_VIEW Procedure Parameter

| Parameter | Description |
|--------------------------|--|
| <code>oracle_view</code> | The name of the Oracle view created by the <code>CREATE_OR_REPLACE_VIEW</code> procedure. If the view has not been created by the <code>CREATE_OR_REPLACE_VIEW</code> procedure, an error is returned. |

90.2.4 LOAD_TABLE Procedure

This procedure loads the data from a remote table to a local Oracle table in parallel. If the local Oracle table does not already exist, it is created automatically.

Syntax

```
LOAD_TABLE (remote_table, database_link, oracle_table, truncate,
parallel_degree, row_count)
```

Parameters

Table 90-5 LOAD_TABLE Procedure Parameters

| Parameter | Description |
|-----------------|---|
| remote_table | The name of the remote database table. It is specified as [remote_schema_name.]remote_table_name |
| database_link | The remote database link name. The call can only be applied to a heterogeneous services database link. |
| oracle_table | The name of the local Oracle table the data will be loaded into. It is specified as [schema_name.]oracle_table_name. The default schema name is the current user. If the oracle_table parameter is not specified, the remote table name will be used as the local Oracle name. |
| truncate | Determines whether the Oracle table is truncated before the data is loaded. The value is either TRUE or FALSE. The default value is TRUE which means the Oracle table is truncated first. When set to FALSE, the Oracle table will not be truncated before the data is loaded. |
| parallel_degree | The number of parallel processes for the operation is computed based on the range-partition number if applicable, or the number of CPUs. The range of values is 2 to 16. |
| row_count | Contains the number of rows just added with the load table operation. |

Usage Notes

- This procedure only loads the remote table data into Oracle local table. It does not create a key, index, constraints or any other dependencies such as triggers. It is recommended that you create these dependencies after the table data is loaded as performance will improve greatly. You will need to decide whether to create the dependencies before or after the data is loaded based on your knowledge of the remote table data and dependencies.
- If the local table does not exist, the `LOAD_TABLE` procedure creates a simple (non-partitioned) local table based on the exact column matching of the remote table after which the data is inserted into the local table.

- If the remote table or the database link does not exist, an error message is returned.
- If the local table is incompatible with the remote table, an error message is returned.
- You need the `CREATE TABLE`, `CREATE TYPE`, `CREATE PACKAGE`, and `CREATE FUNCTION` privileges to execute the `LOAD_TABLE` procedure.
- If you encounter either of the following Oracle error messages, increase the `PROCESSES` and `SESSIONS` parameter in Oracle initialization parameter file:

```
ORA-12801: error signaled in parallel query server P003  
or  
ORA-00018: maximum number of session exceeded
```

- One of the following is required for parallel processing:
 - The remote table is range partitioned.
 - Histogram information for a numeric column is available.
 - There is a numeric index or primary key.
- To drop the local table, use the `DROP TABLE` SQL statement.

DBMS_HS_PASSTHROUGH

The `DBMS_HS_PASSTHROUGH` PL/SQL package allows you to send a statement directly to a non-Oracle system without being interpreted by the Oracle server. This can be useful if the non-Oracle system allows operations in statements for which there is no equivalent in Oracle.

This chapter discusses the following topics:

- [DBMS_HS_PASSTHROUGH Overview](#)
- [DBMS_HS_PASSTHROUGH Operational Notes](#)
- [Summary of DBMS_HS_PASSTHROUGH Subprograms](#)

 **See Also:**

Oracle Database Heterogeneous Connectivity User's Guide for more information about this package

91.1 DBMS_HS_PASSTHROUGH Overview

You can execute passthrough SQL statements directly at the non-Oracle system using the PL/SQL package `DBMS_HS_PASSTHROUGH`. Any statement executed with this package is executed in the same transaction as standard SQL statements.

 **See Also:**

Oracle Database Heterogeneous Connectivity User's Guide for information about this package

91.2 DBMS_HS_PASSTHROUGH Operational Notes

The `DBMS_HS_PASSTHROUGH` package is a virtual package. It conceptually resides at the non-Oracle system. In reality, however, calls to this package are intercepted by Heterogeneous Services and mapped to one or more Heterogeneous Services calls. The driver, in turn, maps these Heterogeneous Services calls to the API of the non-Oracle system. The client application should invoke the procedures in the package through a database link in exactly the same way as it would invoke a non-Oracle system stored procedure. The special processing done by Heterogeneous Services is transparent to the user.

91.3 Summary of DBMS_HS_PASSTHROUGH Subprograms

This table lists the `DBMS_HS_PASSTHROUGH` subprograms and briefly describes them.

Table 91-1 DBMS_HS_PASSTHROUGH Package Subprograms

| Subprogram | Description |
|---|--|
| BIND_INOUT_VARIABLE Procedure | Binds IN OUT bind variables |
| BIND_INOUT_VARIABLE_RAW Procedure | Binds IN OUT bind variables of datatype RAW |
| BIND_OUT_VARIABLE Procedure | Binds an OUT variable with a PL/SQL program variable |
| BIND_OUT_VARIABLE_RAW Procedure | Binds an OUT variable of datatype RAW with a PL/SQL program variable |
| BIND_VARIABLE Procedure | Binds an IN variable positionally with a PL/SQL program variable |
| BIND_VARIABLE_RAW Procedure | Binds IN variables of type RAW |
| CLOSE_CURSOR Procedure | Closes the cursor and releases associated memory after the SQL statement has been run at the non-Oracle system |
| EXECUTE_IMMEDIATE Procedure | Runs a (non-SELECT) SQL statement immediately, without bind variables |
| EXECUTE_NON_QUERY Function | Runs a (non-SELECT) SQL statement |
| FETCH_ROW Function | Fetches rows from a query |
| GET_VALUE Procedure | Retrieves column value from SELECT statement, or retrieves OUT bind parameters |
| GET_VALUE_RAW Procedure | Similar to GET_VALUE, but for datatype RAW |
| OPEN_CURSOR Function | Opens a cursor for running a passthrough SQL statement at the non-Oracle system |
| PARSE Procedure | Parses SQL statement at non-Oracle system |

91.3.1 BIND_INOUT_VARIABLE Procedure

This procedure binds IN OUT bind variables.

Syntax

```
DBMS_HS_PASSTHROUGH.BIND_OUT_VARIABLE (
  c      IN  BINARY_INTEGER NOT NULL,
  p      IN  BINARY_INTEGER NULL,
  v      OUT <dt>,
  n      IN  VARCHAR2);
```

<dt> is either DATE, NUMBER, or VARCHAR2.

See Also:

For binding OUT variables of datatype RAW, see [BIND_OUT_VARIABLE_RAW Procedure](#).

Pragmas

Purity level defined : WNDS, RNDS

Parameters**Table 91-2 BIND_INOUT_VARIABLE Procedure Parameters**

| Parameter | Description |
|-----------|--|
| c | Cursor associated with the passthrough SQL statement. Cursor must be opened and parsed, using the routines <code>OPEN_CURSOR</code> and <code>PARSE</code> respectively. |
| p | Position of the bind variable in the SQL statement: Starts at 1. |
| v | This value is used for two purposes: - To provide the IN value before the SQL statement is run. - To determine the size of the out value. |
| n | (Optional) Name of the bind variable. For example, in <code>SELECT * FROM emp WHERE ename=:ename</code> , the position of the bind variable <code>:ename</code> is 1, the name is <code>:ename</code> . This parameter can be used if the non-Oracle system supports "named binds" instead of positional binds. Passing the position is still required. |

Exceptions**Table 91-3 BIND_INOUT_VARIABLE Procedure Exceptions**

| Exception | Description |
|-----------|---|
| ORA-28550 | The cursor passed is invalid. |
| ORA-28552 | Procedure is not run in right order. (Did you first open the cursor and parse the SQL statement?) |
| ORA-28553 | The position of the bind variable is out of range. |
| ORA-28555 | A NULL value was passed for a NOT NULL parameter. |

91.3.2 BIND_INOUT_VARIABLE_RAW Procedure

This procedure binds IN OUT bind variables of datatype RAW.

Syntax

```
DBMS_HS_PASSTHROUGH.BIND_INOUT_VARIABLE_RAW (
  c      IN      BINARY_INTEGER NOT NULL,
  p      IN      BINARY_INTEGER NOT NULL,
  v      IN OUT  RAW,
  n      IN      VARCHAR2);
```

Pragmas

Purity level defined : WNDS, RNDS

Parameters

Table 91-4 BIND_INOUT_VARIABLE_RAW Procedure Parameters

| Parameter | Description |
|-----------|---|
| c | Cursor associated with the passthrough SQL statement. Cursor must be opened and parsed using the routines <code>OPEN_CURSOR</code> and <code>PARSE</code> respectively. |
| p | Position of the bind variable in the SQL statement: Starts at 1. |
| v | This value is used for two purposes: - To provide the IN value before the SQL statement is run. - To determine the size of the out value. |
| n | (Optional) Name the bind variable. For example, in <code>SELECT * FROM emp WHERE ename=:ename</code> , the position of the bind variable <code>:ename</code> is 1, the name is <code>:ename</code> . This parameter can be used if the non-Oracle system supports "named binds" instead of positional binds. Passing the position is still required. |

Exceptions

Table 91-5 BIND_INOUT_VARIABLE_RAW Procedure Exceptions

| Exception | Description |
|-----------|---|
| ORA-28550 | The cursor passed is invalid. |
| ORA-28552 | Procedure is not run in right order. (Did you first open the cursor and parse the SQL statement?) |
| ORA-28553 | The position of the bind variable is out of range. |
| ORA-28555 | A NULL value was passed for a NOT NULL parameter. |

91.3.3 BIND_OUT_VARIABLE Procedure

This procedure binds an `OUT` variable with a PL/SQL program variable.

Syntax

```
DBMS_HS_PASSTHROUGH.BIND_OUT_VARIABLE (
  c      IN  BINARY_INTEGER NOT NULL,
  p      IN  BINARY_INTEGER NULL,
  v      OUT <dt>,
  n      IN  VARCHAR2);
```

<dt> is either `DATE`, `NUMBER`, or `VARCHAR2`.

See Also:

For binding `OUT` variables of datatype `RAW`, see [BIND_OUT_VARIABLE_RAW Procedure](#).

Pragmas

Purity level defined : WNDS, RNDS

Parameters

Table 91-6 BIND_OUT_VARIABLE Procedure Parameters

| Parameter | Description |
|-----------|--|
| c | Cursor associated with the passthrough SQL statement. Cursor must be opened and parsed, using the routines <code>OPEN_CURSOR</code> and <code>PARSE</code> respectively. |
| p | Position of the bind variable in the SQL statement: Starts at 1. |
| v | Variable in which the <code>OUT</code> bind variable stores its value. The package remembers only the "size" of the variable. After the SQL statement is run, you can use <code>GET_VALUE</code> to retrieve the value of the <code>OUT</code> parameter. The size of the retrieved value should not exceed the size of the parameter that was passed using <code>BIND_OUT_VARIABLE</code> . |
| n | (Optional) Name of the bind variable. For example, in <code>SELECT * FROM emp WHERE ename=:ename</code> , the position of the bind variable <code>:ename</code> is 1, the name is <code>:ename</code> . This parameter can be used if the non-Oracle system supports "named binds" instead of positional binds. Passing the position is still required. |

Exceptions

Table 91-7 BIND_OUT_VARIABLE Procedure Exceptions

| Exception | Description |
|-----------|---|
| ORA-28550 | The cursor passed is invalid. |
| ORA-28552 | Procedure is not run in right order. (Did you first open the cursor and parse the SQL statement?) |
| ORA-28553 | The position of the bind variable is out of range. |
| ORA-28555 | A <code>NULL</code> value was passed for a <code>NOT NULL</code> parameter. |

91.3.4 BIND_OUT_VARIABLE_RAW Procedure

This procedure binds an `OUT` variable of datatype `RAW` with a PL/SQL program variable.

Syntax

```
DBMS_HS_PASSTHROUGH.BIND_OUT_VARIABLE_RAW (
    c      IN  BINARY_INTEGER NOT NULL,
    p      IN  BINARY_INTEGER NOT NULL,
```

```
v      OUT RAW,
n      IN  VARCHAR2);
```

Pragmas

Purity level defined : WNDS, RNDS

Parameters

Table 91-8 BIND_OUT_VARIABLE_RAW Procedure Parameters

| Parameter | Description |
|-----------|---|
| c | Cursor associated with the passthrough SQL statement. Cursor must be opened and parsed, using the routines OPEN_CURSOR and PARSE respectively. |
| p | Position of the bind variable in the SQL statement: Starts at 1. |
| v | Variable in which the OUT bind variable stores its value. The package remembers only the "size" of the variable. After the SQL statement is run, you can use GET_VALUE to retrieve the value of the OUT parameter. The size of the retrieved value should not exceed the size of the parameter that was passed using BIND_OUT_VARIABLE_RAW. |
| n | (Optional) Name of the bind variable. For example, in SELECT * FROM emp WHERE ename=:ename, the position of the bind variable :ename is 1, the name is :ename. This parameter can be used if the non-Oracle system supports "named binds" instead of positional binds. Passing the position is still required. |

Exceptions

Table 91-9 BIND_OUT_VARIABLE_RAW Procedure Exceptions

| Exception | Description |
|-----------|---|
| ORA-28550 | The cursor passed is invalid. |
| ORA-28552 | Procedure is not run in right order. (Did you first open the cursor and parse the SQL statement?) |
| ORA-28553 | The position of the bind variable is out of range. |
| ORA-28555 | A NULL value was passed for a NOT NULL parameter. |

91.3.5 BIND_VARIABLE Procedure

This procedure binds an IN variable positionally with a PL/SQL program variable.

Syntax

```
DBMS_HS_PASSTHROUGH.BIND_VARIABLE (
  c      IN BINARY_INTEGER NOT NULL,
  p      IN BINARY_INTEGER NOT NULL,
  v      IN <dt>,
  n      IN VARCHAR2);
```

<dt> is either DATE, NUMBER, or VARCHAR2.

See Also:

To bind RAW variables use [BIND_VARIABLE_RAW Procedure](#).

Pragmas

Purity level defined: WNDS, RNDS

Parameters

Table 91-10 BIND_VARIABLE Procedure Parameters

| Parameter | Description |
|-----------|---|
| c | Cursor associated with the passthrough SQL statement. Cursor must be opened and parsed using the routines OPEN_CURSOR and PARSE respectively. |
| p | Position of the bind variable in the SQL statement: Starts at 1. |
| v | Value that must be passed to the bind variable name. |
| n | (Optional) Name of the bind variable. For example, in SELECT * FROM emp WHERE ename=:ename, the position of the bind variable :ename is 1, the name is :ename. This parameter can be used if the non-Oracle system supports "named binds" instead of positional binds. Passing the position is still required. |

Exceptions

Table 91-11 BIND_VARIABLE Procedure Exceptions

| Exception | Description |
|-----------|---|
| ORA-28550 | The cursor passed is invalid. |
| ORA-28552 | Procedure is not run in right order. (Did you first open the cursor and parse the SQL statement?) |
| ORA-28553 | The position of the bind variable is out of range. |
| ORA-28555 | A NULL value was passed for a NOT NULL parameter. |

91.3.6 BIND_VARIABLE_RAW Procedure

This procedure binds IN variables of type RAW.

Syntax

```
DBMS_HS_PASSTHROUGH.BIND_VARIABLE_RAW (
  c   IN BINARY_INTEGER NOT NULL,
  p   IN BINARY_INTEGER NOT NULL,
  v   IN RAW,
  n   IN VARCHAR2);
```

Pragmas

Purity level defined : WNDS, RNDS

Parameters

Table 91-12 BIND_VARIABLE_RAW Procedure Parameters

| Parameter | Description |
|-----------|--|
| c | Cursor associated with the passthrough SQL statement. Cursor must be opened and parsed, using the routines <code>OPEN_CURSOR</code> and <code>PARSE</code> respectively. |
| p | Position of the bind variable in the SQL statement: Starts at 1. |
| v | Value that must be passed to the bind variable. |
| n | (Optional) Name of the bind variable. For example, in <code>SELECT * FROM emp WHERE ename=:ename</code> , the position of the bind variable <code>:ename</code> is 1, the name is <code>:ename</code> . This parameter can be used if the non-Oracle system supports "named binds" instead of positional binds. Passing the position is still required. |

Exceptions

Table 91-13 BIND_VARIABLE_RAW Procedure Exceptions

| Exception | Description |
|-----------|---|
| ORA-28550 | The cursor passed is invalid. |
| ORA-28552 | Procedure is not run in right order. (Did you first open the cursor and parse the SQL statement?) |
| ORA-28553 | The position of the bind variable is out of range. |
| ORA-28555 | A NULL value was passed for a NOT NULL parameter. |

91.3.7 CLOSE_CURSOR Procedure

This function closes the cursor and releases associated memory after the SQL statement has been run at the non-Oracle system. If the cursor was not open, then the operation is a "no operation".

Syntax

```
DBMS_HS_PASSTHROUGH.CLOSE_CURSOR (
    c IN BINARY_INTEGER NOT NULL);
```

Pragmas

Purity level defined : WNDS, RNDS

Parameters

Table 91-14 CLOSE_CURSOR Procedure Parameters

| Parameter | Description |
|-----------|------------------------|
| c | Cursor to be released. |

Exceptions

Table 91-15 CLOSE_CURSOR Procedure Exceptions

| Exception | Description |
|-----------|---|
| ORA-28555 | A NULL value was passed for a NOT NULL parameter. |

91.3.8 EXECUTE_IMMEDIATE Procedure

This function runs a SQL statement immediately. Any valid SQL command except `SELECT` can be run immediately.

The statement must not contain any bind variables. The statement is passed in as a `VARCHAR2` in the argument. Internally the SQL statement is run using the `PASSTHROUGH SQL` protocol sequence of `OPEN_CURSOR`, `PARSE`, `EXECUTE_NON_QUERY`, `CLOSE_CURSOR`.

Syntax

```
DBMS_HS_PASSTHROUGH.EXECUTE_IMMEDIATE (
  s IN VARCHAR2 NOT NULL)
RETURN BINARY_INTEGER;
```

Parameters

Table 91-16 EXECUTE_IMMEDIATE Procedure Parameters

| Parameter | Description |
|-----------|---|
| s | <code>VARCHAR2</code> variable with the statement to be executed immediately. |

Return Values

The number of rows affected by the execution of the SQL statement.

Exceptions

Table 91-17 EXECUTE_IMMEDIATE Procedure Exceptions

| Exception | Description |
|-----------|---|
| ORA-28551 | SQL statement is invalid. |
| ORA-28554 | Max open cursors. |
| ORA-28555 | A NULL value was passed for a NOT NULL parameter. |

91.3.9 EXECUTE_NON_QUERY Function

This function runs a SQL statement. The SQL statement cannot be a `SELECT` statement. A cursor has to be open and the SQL statement has to be parsed before the SQL statement can be run.

Syntax

```
DBMS_HS_PASSTHROUGH.EXECUTE_NON_QUERY (
    c IN BINARY_INTEGER NOT NULL)
RETURN BINARY_INTEGER;
```

Parameters

Table 91-18 EXECUTE_NON_QUERY Function Parameters

| Parameter | Description |
|-----------|--|
| c | Cursor associated with the passthrough SQL statement. Cursor must be opened and parsed, using the routines <code>OPEN_CURSOR</code> and <code>PARSE</code> respectively. |

Return Values

The number of rows affected by the SQL statement in the non-Oracle system

Exceptions

Table 91-19 EXECUTE_NON_QUERY Function Exceptions

| Exception | Description |
|-----------|---|
| ORA-28550 | The cursor passed is invalid. |
| ORA-28552 | Procedure is not run in right order. (Did you first open the cursor and parse the SQL statement?) |
| ORA-28555 | A <code>NULL</code> value was passed for a <code>NOT NULL</code> parameter. |

91.3.10 FETCH_ROW Function

This function fetches rows from a result set.

The result set is defined with a SQL `SELECT` statement. When there are no more rows to be fetched, the exception `NO_DATA_FOUND` is raised. Before the rows can be fetched, a cursor has to be opened, and the SQL statement has to be parsed.

Syntax

```
DBMS_HS_PASSTHROUGH.FETCH_ROW (
    c IN BINARY_INTEGER NOT NULL,
    f IN BOOLEAN)
RETURN BINARY_INTEGER;
```

Pragmas

Purity level defined : WNDS

Parameters

Table 91-20 FETCH_ROW Function Parameters

| Parameter | Description |
|-----------|--|
| c | Cursor associated with the passthrough SQL statement. Cursor must be opened and parsed, using the routines <code>OPEN_CURSOR</code> and <code>PARSE</code> respectively. |
| first | (Optional) Reexecutes <code>SELECT</code> statement. Possible values: - <code>TRUE</code> : reexecute <code>SELECT</code> statement. - <code>FALSE</code> : fetch the next row, or if run for the first time, then execute and fetch rows (default). |

Return Values

The returns the number of rows fetched. The function returns "0" if the last row was already fetched.

Exceptions

Table 91-21 FETCH_ROW Function Exceptions

| Exception | Description |
|-----------|---|
| ORA-28550 | The cursor passed is invalid. |
| ORA-28552 | Procedure is not run in right order. (Did you first open the cursor and parse the SQL statement?) |
| ORA-28555 | A <code>NULL</code> value was passed for a <code>NOT NULL</code> parameter. |

91.3.11 GET_VALUE Procedure

This procedure has two purposes: it retrieves the select list items of `SELECT` statements after a row has been fetched, and it retrieves the `OUT` bind values, after the SQL statement has been run.

Syntax

```
DBMS_HS_PASSTHROUGH.GET_VALUE (
  c      IN BINARY_INTEGER NOT NULL,
  p      IN BINARY_INTEGER NOT NULL,
  v      OUT <dt>);
```

<dt> is either `DATE`, `NUMBER`, or `VARCHAR2`.

See Also:

For retrieving values of datatype RAW, see [GET_VALUE_RAW Procedure](#).

Pragmas

Purity level defined : WNDS

Parameters

Table 91-22 GET_VALUE Procedure Parameters

| Parameter | Description |
|-----------|--|
| c | Cursor associated with the passthrough SQL statement. Cursor must be opened and parsed, using the routines OPEN_CURSOR and PARSE respectively. |
| p | Position of the bind variable or select list item in the SQL statement: Starts at 1. |
| v | Variable in which the OUT bind variable or select list item stores its value. |

Exceptions

Table 91-23 GET_VALUE Procedure Exceptions

| Exception | Description |
|-----------|--|
| ORA-1403 | Returns NO_DATA_FOUND exception when running the GET_VALUE after the last row was fetched (that is, FETCH_ROW returned "0"). |
| ORA-28550 | The cursor passed is invalid. |
| ORA-28552 | Procedure is not run in right order. (Did you first open the cursor and parse the SQL statement?) |
| ORA-28553 | The position of the bind variable is out of range. |
| ORA-28555 | A NULL value was passed for a NOT NULL parameter. |

91.3.12 GET_VALUE_RAW Procedure

This procedure is similar to GET_VALUE, but for datatype RAW.

Syntax

```
DBMS_HS_PASSTHROUGH.GET_VALUE_RAW (
  c   IN  BINARY_INTEGER NOT NULL,
  p   IN  BINARY_INTEGER NOT NULL,
  v   OUT RAW);
```

Pragmas

Purity level defined : WNDS

Parameters

Table 91-24 GET_VALUE_RAW Procedure Parameters

| Parameter | Description |
|-----------|--|
| c | Cursor associated with the passthrough SQL statement. Cursor must be opened and parsed, using the routines <code>OPEN_CURSOR</code> and <code>PARSE</code> respectively. |
| p | Position of the bind variable or select list item in the SQL statement: Starts at 1. |
| v | Variable in which the <code>OUT</code> bind variable or select list item stores its value. |

Exceptions

Table 91-25 GET_VALUE_RAW Procedure Exceptions

| Exception | Description |
|-----------|---|
| ORA-1403 | Returns <code>NO_DATA_FOUND</code> exception when running the <code>GET_VALUE</code> after the last row was fetched (that is, <code>FETCH_ROW</code> returned "0"). |
| ORA-28550 | The cursor passed is invalid. |
| ORA-28552 | Procedure is not run in right order. (Did you first open the cursor and parse the SQL statement?) |
| ORA-28553 | The position of the bind variable is out of range. |
| ORA-28555 | A <code>NULL</code> value was passed for a <code>NOT NULL</code> parameter. |

91.3.13 OPEN_CURSOR Function

This function opens a cursor for running a passthrough SQL statement at the non-Oracle system. This function must be called for any type of SQL statement.

The function returns a cursor, which must be used in subsequent calls. This call allocates memory. To deallocate the associated memory, call the procedure `CLOSE_CURSOR`.

Syntax

```
DBMS_HS_PASSTHROUGH.OPEN_CURSOR
RETURN BINARY_INTEGER;
```

Pragmas

Purity level defined : WNDS, RNDS

Return Values

The cursor to be used on subsequent procedure and function calls.

Exceptions

Table 91-26 OPEN_CURSOR Function Exceptions

| Exception | Description |
|-----------|--|
| ORA-28554 | Maximum number of open cursor has been exceeded. Increase Heterogeneous Services' OPEN_CURSORS initialization parameter. |

91.3.14 PARSE Procedure

This procedure parses an SQL statement at a non-Oracle system.

Syntax

```
DBMS_HS_PASSTHROUGH.PARSE (
  c      IN BINARY_INTEGER NOT NULL,
  stmt   IN VARCHAR2 NOT NULL);
```

Pragmas

Purity level defined : WNDS, RNDS

Parameters

Table 91-27 PARSE Procedure Parameters

| Parameter | Description |
|-----------|---|
| c | Cursor associated with the passthrough SQL statement. Cursor must be opened using function OPEN_CURSOR. |
| stmt | Statement to be parsed. |

Exceptions

Table 91-28 PARSE Procedure Exceptions

| Exception | Description |
|-----------|---|
| ORA-28550 | The cursor passed is invalid. |
| ORA-28551 | SQL statement is illegal. |
| ORA-28555 | A NULL value was passed for a NOT NULL parameter. |

DBMS_ILM

The `DBMS_ILM` package provides an interface for implementing Information Lifecycle Management (ILM) strategies using Automatic Data Optimization (ADO) policies.

This chapter contains the following topics:

- [Overview](#)
- [Security Model](#)
- [Constants](#)
- [Exceptions](#)
- [Summary of DBMS_ILM Subprograms](#)

See Also:

- *Oracle Database VLDB and Partitioning Guide* for information about managing Automatic Data Optimization (ADO) with this package
- [DBMS_ILM_ADMIN](#)
- [DBMS_HEAT_MAP](#)

92.1 DBMS_ILM Overview

To implement your ILM strategy, you can use Heat Map in Oracle Database to track data access and modification. You can also use Automatic Data Optimization (ADO) to automate the compression and movement of data between different tiers of storage within the database. The `DBMS_ILM` package supports immediate evaluation or execution of ADO related tasks. T

he package supports the following two ways for scheduling ADO actions.

- A database user schedules immediate ADO policy execution on a set of objects.
- A database user views the results of evaluation of ADO policies on a set of objects. The user then adds or deletes objects to this set and reviews the results of ADO policy evaluation again. The user repeats this step to determine the set of objects for ADO execution. The user can then schedule ADO actions for immediate execution on this set of objects.

The following procedures support the two usage modes. Before describing the procedures, we introduce the notion of an ADO task as an entity that helps to track a particular evaluation or (an evaluation and execution) of ADO policies. A particular ADO task could be in one of the following states.

- Inactive
- Active

- Completed

92.2 DBMS_ILM Security Model

The DBMS_ILM package runs under invoker's rights.

92.3 DBMS_ILM Constants

The table in this topic lists the constants used by the DBMS_ILM package.

Table 92-1 DBMS_ILM Constants

| Constant | Value | Type | Description |
|----------------------------|-------------------|---------------|---|
| ILM_ALL_POLICIES | 'ALL POLICIES' | VARCHAR2 (20) | Selects all ADO policies on an object |
| ILM_EXECUTION_OF FLINE | 1 | NUMBER | Specifies that the object may be offline while ADO action is performed |
| ILM_EXECUTION_ON LINE | 2 | NUMBER | Specifies that the object should be online while ADO action is performed |
| SCOPE_DATABASE | 1 | NUMBER | Selects all ADO policies in the database |
| SCOPE_SCHEMA | 2 | NUMBER | Selects all ADO policies in the current schema |
| SCHEDULE_IMMEDIA TE | 1 | NUMBER | Schedules ADO task for immediate execution |
| ARCHIVE_STATE_AC TIVE | '0' | VARCHAR2 (1) | Represents the value of the ORA_ARCHIVE_STATE column of a row-archival enabled table that would make the row active |
| ARCHIVE_STATE_AR CHIVED | '1' | VARCHAR2 (1) | Represents the value of the ORA_ARCHIVE_STATE column of a row-archival enabled table that would make the row inactive |

92.4 DBMS_ILM Exceptions

The table in this topic lists the exceptions raised by the DBMS_ILM package.

Table 92-2 DBMS_ILM Exceptions

| Exception | Error Code | Description |
|-------------------------|------------|-------------------------------|
| INVALID_ARGUMENT_VALUE | 38327 | Invalid argument value |
| INVALID_ILM_DICTIONARY | 38328 | Inconsistent dictionary state |
| INTERNAL_ILM_ERROR | 38329 | Internal error |
| INSUFFICIENT_PRIVILEGES | 38330 | Insufficient privileges |

92.5 Summary of DBMS_ILM Subprograms

This table lists and describes the DBMS_ILM package subprograms.

Table 92-3 DBMS_ILM Package Subprograms

| Subprogram | Description |
|--|---|
| ADD_TO_ILM Procedure | Adds the object specified through the argument to a particular ADO task and evaluates the ADO policies on this object |
| ARCHIVESTATENAME Function | Returns the value of the ORA_ARCHIVE_STATE column of a row-archival enabled table |
| EXECUTE_ILM Procedure | Executes an ADO task. |
| EXECUTE_ILM_TASK Procedure | Executes an ADO task that has been evaluated previously |
| PREVIEW_ILM Procedure | Evaluates all ADO policies in the scope specified by means of an argument |
| REMOVE_FROM_ILM Procedure | Removes the object specified through the argument from a particular ADO task |
| STOP_ILM Procedure | Stops ADO-related jobs created for a particular ADO task |

92.5.1 ADD_TO_ILM Procedure

This procedure adds the object specified through the argument to a particular ADO task and evaluates the ADO policies on this object.

The procedure can only be executed on an ADO task in an inactive state. The results of the ADO policy evaluation on this object can be viewed using the appropriate views depending on role and access (USER_ILMTASKS or DBA_ILMTASKS, USER_ILMEVALUATIONDETAILS or DBA_ILMEVALUATIONDETAILS, USER_ILMRESULTS or DBA_ILMRESULTS).

Syntax

```
DBMS_ILM.ADD_TO_ILM (
    task_id          IN    NUMBER,
    owner            IN    VARCHAR2,
    object_name      IN    VARCHAR2,
    subobject_name   IN    VARCHAR2 DEFAULT NULL);
```

Parameters

Table 92-4 ADD_TO_ILM Procedure Parameters

| Parameter | Description |
|----------------|--|
| task_id | Identifies a particular ADO task |
| owner | Owner of the object |
| object_name | Name of the object |
| subobject_name | Name of the subobject (partition name in the case of partitioned tables) |

92.5.2 ARCHIVESTATENAME Function

This function returns the value of the `ORA_ARCHIVE_STATE` column of a row-archival enabled table.

Syntax

```
DBMS_ILM.ARCHIVESTATENAME (
    value      IN VARCHAR2)
RETURN VARCHAR2;
```

Parameters

Table 92-5 *ARCHIVESTATENAME Function Parameters*

| Parameter | Description |
|-----------|--|
| value | Value for which the archive state name is to be returned |

Usage Notes

Returns `ARCHIVE_STATE_ACTIVE` for 0, `ARCHIVE_STATE_ARCHIVED` for others

See Also:

"Using In-Database Archiving" in *Oracle Database VLDB and Partitioning Guide*

92.5.3 EXECUTE_ILM Procedure

This procedure executes an ADO task.

There are two overloads to this procedure. The first overload executes an ADO task for a set of objects without having evaluated them previously. The second overload executes ADO policies for a specific object.

Syntax

```
DBMS_ILM.EXECUTE_ILM (
    task_id          OUT    NUMBER,
    ilm_scope        IN     NUMBER DEFAULT SCOPE_SCHEMA,
    execution_mode   IN     NUMBER DEFAULT ILM_EXECUTION_ONLINE);
```

```
DBMS_ILM.EXECUTE_ILM (
    owner            IN     VARCHAR2,
    object_name     IN     VARCHAR2,
    task_id         OUT    NUMBER,
    subobject_name  IN     VARCHAR2 DEFAULT NULL,
    policy_name     IN     VARCHAR2 DEFAULT ILM_ALL_POLICIES,
    execution_mode  IN     NUMBER DEFAULT ILM_EXECUTION_ONLINE);
```

Parameters

Table 92-6 EXECUTE_ILM Procedure Parameters

| Parameter | Description |
|----------------|--|
| task_id | Identifies a particular ADO task |
| ilm_scope | Determines the set of objects considered for ADO execution. The default is to consider only the objects in the schema. |
| execution_mode | Whether the ADO task be executed online (ILM_EXECUTION_ONLINE) or offline (ILM_EXECUTION_OFFLINE) |
| owner | Owner of the object |
| object_name | Name of the object |
| subobject_name | Name of the subobject (partition name in the case of partitioned tables) |
| policy_name | Name of the ADO policy to be evaluated on the object. The package constant ILM_ALL_POLICIES should be used if all ADO policies on an object should be evaluated. |

Usage Notes

- The EXECUTE_ILM procedure can be used by users who want more control of when ADO is performed, and who do not want to wait until the next maintenance window.
- The procedure executes like a DDL in that it auto commits before and after the ADO task and related jobs are created.

92.5.4 EXECUTE_ILM_TASK Procedure

This procedure executes an ADO task that has been evaluated previously and moves it to an active state.

Syntax

```
DBMS_ILM.EXECUTE_ILM_TASK (
    task_id          IN      NUMBER,
    execution_mode   IN      NUMBER DEFAULT ILM_EXECUTION_ONLINE);
    execution_schedule IN    NUMBER DEFAULT SCHEDULE_IMMEDIATE);
```

Parameters

Table 92-7 EXECUTE_ILM_TASK Procedure Parameters

| Parameter | Description |
|--------------------|---|
| task_id | Identifies a particular ADO task |
| execution_mode | Whether the ADO task be executed online (ILM_EXECUTION_ONLINE) or offline (ILM_EXECUTION_OFFLINE) |
| execution_schedule | Identifies when the ADO task should be executed. Currently, the only choice available is immediate scheduling of ADO jobs |

92.5.5 PREVIEW_ILM Procedure

This procedure evaluates the ADO policies on the objects specified using the `ILM_SCOPE` argument.

It returns a number as `task_id` which identifies a particular ADO task. This can be used to view the results of the policy evaluation in the appropriate views depending on role and access (`USER_ILMTASKS` or `DBA_ILMTASKS`, `USER_ILMEVALUATIONDETAILS` or `DBA_ILMEVALUATIONDETAILS`, `USER_ILMRESULTS` or `DBA_ILMRESULTS`).

The `PREVIEW_ILM` procedure leaves the ADO task in an inactive state. Once you have previewed the results, you can add or delete objects to this task.

Syntax

```
DBMS_ILM.PREVIEW_ILM (
    task_id          OUT    NUMBER,
    ilm_scope        IN     NUMBER DEFAULT SCOPE_SCHEMA);
```

Parameters

Table 92-8 *PREVIEW_ILM Procedure Parameters*

| Parameter | Description |
|------------------------|--|
| <code>task_id</code> | Identifies a particular ADO task |
| <code>ilm_scope</code> | Identifies the scope of execution. Should be either <code>SCOPE_DATABASE</code> or <code>SCOPE_SCHEMA</code> as described in Constants |

92.5.6 REMOVE_FROM_ILM Procedure

This procedure removes the object specified through the argument from a particular ADO task.

The procedure can only be executed on an ADO task in an inactive state.

Syntax

```
DBMS_ILM.REMOVE_FROM_ILM (
    task_id          IN     NUMBER,
    owner            IN     VARCHAR2,
    object_name      IN     VARCHAR2,
    subobject_name   IN     VARCHAR2 DEFAULT NULL);
```

Parameters

Table 92-9 *REMOVE_FROM_ILM Procedure Parameters*

| Parameter | Description |
|--------------------------|----------------------------------|
| <code>task_id</code> | Identifies a particular ADO task |
| <code>owner</code> | Owner of the object |
| <code>object_name</code> | Name of the object |

Table 92-9 (Cont.) REMOVE_FROM_ILM Procedure Parameters

| Parameter | Description |
|----------------|--|
| subobject_name | Name of the subobject (partition name in the case of partitioned tables) |

92.5.7 STOP_ILM Procedure

This procedure terminates ILM ADO jobs associated to a particular task Id or job name.

Syntax

```
DBMS_ILM.STOP_ILM (
    task_id          IN          NUMBER,
    p_drop_running_jobs IN      BOOLEAN DEFAULT FALSE),
    p_jobname       IN          VARCHAR2 DEFAULT NULL);
```

Parameters

Table 92-10 STOP_ILM Procedure Parameters

| Parameter | Description |
|---------------------|---|
| task_id | Number that uniquely identifies a particular ADO task |
| p_drop_running_jobs | Determines whether running jobs are dropped |
| p_jobname | Name of job to be terminated |

DBMS_ILM_ADMIN

The `DBMS_ILM_ADMIN` package provides an interface to customize Automatic Data Optimization (ADO) policy execution. In combination with partitioning and compression, ADO policies can be used to help implement an Information Lifecycle Management (ILM) strategy.

This chapter contains the following topics:

- [Overview](#)
- [Security Model](#)
- [Constants](#)
- [Summary of DBMS_ILM_ADMIN Subprograms](#)

See Also:

- *Oracle Database VLDB and Partitioning Guide* for information about managing Automatic Data Optimization (ADO) with this package
- [DBMS_ILM](#)
- [DBMS_HEAT_MAP](#)

93.1 DBMS_ILM_ADMIN Overview

To implement your ILM strategy, you can use Heat Map in Oracle Database to track data access and modification. You can also use Automatic Data Optimization (ADO) to automate the compression and movement of data between different tiers of storage within the database.

93.2 DBMS_ILM_ADMIN Security Model

This package runs under definer's rights. The user requires DBA privileges.

93.3 DBMS_ILM_ADMIN Constants

The table in this topic describes constants used by the `DBMS_ILM_ADMIN` package.

The value column refers to the numeric or character value that the constants resolve to.

Table 93-1 DBMS_ILM_ADMIN Constants

| Constant | Value | Type | Description |
|---------------------|-------|--------|--|
| ABS_JOBLIMIT | 12 | NUMBER | Specifies the absolute number of concurrent ILM ADO jobs. |
| EXECUTION_INTERVAL | 1 | NUMBER | Determines the frequency with which ADO background evaluation occurs. Specified in minutes. |
| RETENTION_TIME | 2 | NUMBER | Controls the amount of time ADO history should be maintained. Specified in days. |
| EXECUTION_MODE | 4 | NUMBER | Controls whether ADO execution is online, offline. The value for this parameter should either be DBMS_ILM_ADMIN.ILM_EXECUTION_OFFLINE or DBMS_ILM_ADMIN.ILM_EXECUTION_ONLINE. |
| JOBLIMIT | 5 | NUMBER | Controls the upper limit on number of ILM ADO jobs at any time. The maximum number of concurrent ADO jobs is JOBLIMIT*(number of instances)*(number of CPUs per instance). |
| JOB_SIZELIMIT | 13 | NUMBER | Specifies the size (in megabytes) of the data that is processed by a single ILM ADO row level compression job. |
| ENABLED | 7 | NUMBER | Provides a way to turn background ADO off or on |
| TBS_PERCENT_USED | 8 | NUMBER | Decides when a tablespace is considered full. Specified as a percentage of tablespace quota. |
| TBS_PERCENT_FREE | 9 | NUMBER | Decides the targeted tablespace storage through ADO actions as a percentage of tablespace quota. |
| DEG_PARALLEL | 10 | NUMBER | Decides the degree of parallelism to be used for ADO jobs |
| POLICY_TIME | 11 | NUMBER | Decides if ADO policies are treated as though they are specified in seconds rather than days. Can take value ILM_POLICY_IN_SECONDS (treat policy time in seconds) or ILM_POLICY_IN_DAYS (treat policy time in days - default). |
| HEAT_MAP_SEG_READ | 1 | NUMBER | Segment read done |
| HEAT_MAP_SEG_WRITE | 2 | NUMBER | Segment write done |
| HEAT_MAP_SEG_SCAN | 4 | NUMBER | Full table scan done |
| HEAT_MAP_SEG_LOOKUP | 8 | NUMBER | Index scan done |

The DBMS_ILM_ADMIN package uses the constants as parameter values shown in [Table 93-2](#).

Table 93-2 DBMS_ILM_ADMIN Constants Used as Parameter Values

| Constant | Value | Type | Description |
|-----------------------|-------|--------|--|
| ILM_EXECUTION_OFFLINE | 1 | NUMBER | Specifies that the object may be offline while ADO action is performed. |
| ILM_EXECUTION_ONLINE | 2 | NUMBER | Specifies that the object should be online while ADO action is performed |
| ILM_ENABLED | 1 | NUMBER | Indicates automatic ADO policy evaluation and execution is enabled |
| ILM_DISABLED | 2 | NUMBER | Indicates automatic ADO policy evaluation and execution is disabled |
| ILM_POLICY_IN_DAYS | 0 | NUMBER | Indicates policy is specified in days. This is the default. |

Table 93-2 (Cont.) DBMS_ILM_ADMIN Constants Used as Parameter Values

| Constant | Value | Type | Description |
|-----------------------|-------|--------|---|
| ILM_POLICY_IN_SECONDS | 1 | NUMBER | Indicates policy unit is changed from days to seconds. This could be used to test ADO policy evaluation quickly instead of waiting for the policy duration. |

 **Note:**

- Setting ILM_POLICY_IN_SECONDS does not compress the blocks within the specified seconds.
- Setting ILM_POLICY_IN_SECONDS is for test ADO and should not be set in the production environment.

93.4 Summary of DBMS_ILM_ADMIN Subprograms

This table lists and briefly describes the DBMS_ILM_ADMIN package subprograms.

Table 93-3 DBMS_ILM_ADMIN Package Subprograms

| Subprogram | Description |
|--|--|
| CLEAR_HEAT_MAP_ALL Procedure | Deletes all rows except the dummy row |
| CLEAR_HEAT_MAP_TABLE Procedure | Clears all or some statistics for the heat map table, deleting rows for a given table or segment which match a given pattern, or all such rows |
| CUSTOMIZE_ILM Procedure | Customizes environment for ILM execution by specifying the values for ILM execution related parameters |
| DISABLE_ILM Procedure | Turns off all background ILM scheduling |
| ENABLE_ILM Procedure | Turns on all background ILM scheduling |
| SET_HEAT_MAP_ALL Procedure | Updates or inserts heat map rows for all tables |
| SET_HEAT_MAP_START Procedure | Sets the start date for collecting heat map data |
| SET_HEAT_MAP_TABLE Procedure | Updates or inserts a row for the specified table or segment |

93.4.1 CLEAR_HEAT_MAP_ALL Procedure

This procedure deletes all rows in HEAT_MAP_STAT\$ except the dummy row.

Syntax

```
DBMS_ILM_ADMIN.CLEAR_HEAT_MAP_ALL;
```

93.4.2 CLEAR_HEAT_MAP_TABLE Procedure

This procedure clears all or some statistics for the heat map table, deleting rows for a given table or segment which match a given pattern, or all such rows.

Syntax

```
DBMS_ILM_ADMIN.CLEAR_HEAT_MAP_TABLE (
  owner          IN VARCHAR2,
  tablename      IN VARCHAR2,
  partition      IN VARCHAR2 default '',
  access_date    IN DATE DEFAULT NULL,
  segment_access_summary IN NUMBER DEFAULT NULL);
```

Parameters

Table 93-4 CLEAR_HEAT_MAP_TABLE Procedure Parameters

| Parameter | Description |
|-----------|-------------|
| owner | Table owner |

Table 93-4 (Cont.) CLEAR_HEAT_MAP_TABLE Procedure Parameters

| Parameter | Description |
|------------------------|---|
| tablename | Table name |
| partition | Name of the subobject, defaults to NULL |
| access_date | Date for the entry in HEAT_MAP_STAT\$ to be removed |
| segment_access_summary | Summary of segment access constants indicating access operations performed on the segment |

93.4.3 CUSTOMIZE_ILM Procedure

This procedure customizes environment for ILM execution by specifying the values for ILM execution related parameters. These values take effect for the next background scheduling.

Syntax

```
DBMS_ILM_ADMIN.CUSTOMIZE_ILM (
  parameter      IN      NUMBER,
  value          IN      NUMBER);
```

Parameters

Table 93-5 CUSTOMIZE_ILM Procedure Parameters

| Parameter | Description |
|-----------|--|
| parameter | One of the parameter constants defined in DBMS_ILM_ADMIN package |
| value | Value of parameter |

93.4.4 DISABLE_ILM Procedure

This procedure turns off all background ILM scheduling.

Syntax

```
DBMS_ILM_ADMIN.DISABLE_ILM;
```

93.4.5 ENABLE_ILM Procedure

This procedure turns on all background ILM scheduling.

Syntax

```
DBMS_ILM_ADMIN.ENABLE_ILM;
```

93.4.6 SET_HEAT_MAP_ALL Procedure

This procedure sets an HTTP request header. The request header is sent to the Web server as soon as it is set.

Syntax

```
DBMS_ILM_ADMIN.SET_HEAT_MAP_ALL (
    access_date          IN DATE,
    segment_access_summary IN NUMBER);
```

Parameters

Table 93-6 SET_HEAT_MAP_ALL Procedure Parameters

| Parameter | Description |
|------------------------|---|
| access_date | Date for the entry in HEAT_MAP_STAT\$ to be added |
| segment_access_summary | Summary of segment access constants indicating access operations performed on the segment |

93.4.7 SET_HEAT_MAP_START Procedure

This procedure sets the start date for collecting heat map data.

Syntax

```
DBMS_ILM_ADMIN.SET_HEAT_MAP_START (
    start_date IN DATE);
```

Parameters

Table 93-7 SET_HEAT_MAP_START Procedure Parameters

| Parameter | Description |
|------------|--|
| start_date | Indicates the new date from which all statistics are valid |

93.4.8 SET_HEAT_MAP_TABLE Procedure

This procedure updates or inserts a row for the specified table or segment.

Syntax

```
DBMS_ILM_ADMIN.SET_HEAT_MAP_TABLE (
    owner          IN VARCHAR2,
    tablename      IN VARCHAR2,
    partition      IN VARCHAR2 DEFAULT '',
    access_date    IN DATE DEFAULT NULL,
    segment_access_summary IN NUMBER DEFAULT NULL);
```

Parameters**Table 93-8** *SET_HEAT_MAP_TABLE Procedure Parameters*

| Parameter | Description |
|------------------------|---|
| owner | Table owner |
| tablename | Table name |
| partition | Name of the subobject, defaults to NULL |
| access_date | Date for the entry in HEAT_MAP_STAT\$ to be added |
| segment_access_summary | Summary of segment access constants indicating access operations performed on the segment |

DBMS_IMMUTABLE_TABLE

Immutable tables are read-only tables that protect data against unauthorized modification. They also prevent against accidental data modifications that may be caused by human errors. The `DBMS_IMMUTABLE_TABLE` package allows you to delete the expired rows in an immutable table.

This chapter contains the following topics:

- [DBMS_IMMUTABLE_TABLE Overview](#)
- [DBMS_IMMUTABLE_TABLE Security Model](#)
- [Summary of DBMS_IMMUTABLE_TABLE Subprograms](#)

See Also:

- *Oracle Database Administrator's Guide*
- *Oracle Database SQL Language Reference*
- *Oracle Database Reference*

94.1 DBMS_IMMUTABLE_TABLE Overview

Immutable tables are `read-only` tables that protect data against unauthorized modification. Immutable tables also prevent against accidental data modifications that may be caused by human errors. You must specify a retention period for the immutable table and for rows within the immutable table. An immutable table can be dropped if it contains no rows or if the specified retention period for the table has lapsed. Rows can be deleted from an immutable table only after the specified retention period for rows in the table has elapsed. Except for increasing the retention periods, you cannot modify the definition of an immutable table.

94.2 DBMS_IMMUTABLE_TABLE Security Model

The `DBMS_IMMUTABLE_TABLE` package is owned by `SYS` and is installed as part of database installation. The routines in the package are run with invoker's rights and hence run with the privileges of the current user.

94.3 Summary of DBMS_IMMUTABLE_TABLE Subprograms

This table lists the `DBMS_IMMUTABLE_TABLE` subprograms in alphabetical order and briefly describes them.

Table 94-1 DBMS_IMMUTABLE_TABLE Package Subprograms

| Subprogram | Description |
|---|--|
| DELETE_EXPIRED_ROWS Procedure | This procedure deletes the expired rows. |

94.3.1 DELETE_EXPIRED_ROWS Procedure

This procedure deletes some or all of the expired rows from the immutable table. This procedure does not commit.

Syntax

```
DBMS_IMMUTABLE_TABLE.DELETE_EXPIRED_ROWS (
  schema_name          IN VARCHAR2,
  table_name           IN VARCHAR2,
  before_timestamp     IN TIMESTAMP WITH TIME ZONE DEFAULT NULL,
  number_of_rows_deleted OUT NUMBER);
```

Parameters

Table 94-2 DELETE_EXPIRED_ROWS Procedure Parameters

| Parameter | Description |
|------------------------|--|
| schema_name | The name of the schema. |
| table_name | The name of the immutable table. |
| before_timestamp | If the parameter is <code>NULL</code> , all expired rows in the table are deleted. If the parameter is not <code>NULL</code> and older than the timestamp calculated based on current time and row retention time, rows with timestamps less than the parameter value are deleted. If the parameter is younger than the timestamp calculated based on the current time and row retention time, the calculated timestamp is used, and all expired rows are deleted. The default value is <code>NULL</code> . |
| number_of_rows_deleted | The number of rows deleted. |

DBMS_INMEMORY

The `DBMS_INMEMORY` package provides an interface for In-Memory Column Store (IM column store) functionality.

This chapter contains the following topics:

- [DBMS_INMEMORY Overview](#)
- [DBMS_INMEMORY Security Model](#)
- [Summary of DBMS_INMEMORY Subprograms](#)

95.1 DBMS_INMEMORY Overview

This package contains procedures for populating and repopulating the IM column store, and for dropping IM expressions from a specified table.

IM Population and Repopulation

In-Memory population (population) occurs when the database reads existing row-format data from disk, transforms it into columnar format, and then stores it in the IM column store. Only objects with the `INMEMORY` attribute are eligible for population.

Population, which transforms existing data on disk into columnar format, is different from repopulation, which loads new data into the IM column store. Repopulation occurs automatically after their columnar data undergo significant DML activity.

When an object has the `INMEMORY` attribute and a priority other than `NONE`, the database gradually populates the object in the IM column store according to an internal priority queue. Objects with priority of `NONE` are populated only when they undergo a full scan.

The `DBMS_INMEMORY.POPULATE` procedure forces immediate population of an object. The `DBMS_INMEMORY.REPOPULATE` procedure forces immediate repopulation of an object.

See Also:

Oracle Database In-Memory Guide to learn more about IM population

IM Expressions

IM expressions populate frequently evaluated query expressions in the IM column store for subsequent reuse. An IM expression is materialized as a hidden virtual column, prefixed with the string `SYS_IME`, and is accessed in the same way as a non-virtual column.

When you use `DBMS_INMEMORY_ADMIN.IME_CAPTURE_EXPRESSIONS`, the database adds the 20 hottest expressions to their respective tables as `SYS_IME` columns and applies the default `INMEMORY` column compression clause. If any `SYS_IME` columns that were added during a

previous invocation are no longer in the latest expression list, then the database changes their attribute to `NO INMEMORY`.

The maximum number of `SYS_IME` columns for a table, regardless of whether the attribute is `INMEMORY` or `NO INMEMORY`, is 50. After the 50 expression limit is reached for a table, the database will not add new `SYS_IME` columns. To make space for new expressions, you must manually drop `SYS_IME` columns with the `DBMS_INMEMORY.IME_DROP_EXPRESSIONS` or `DBMS_INMEMORY_ADMIN.IME_DROP_ALL_EXPRESSIONS` procedures.

See Also:

Oracle Database In-Memory Guide to learn more about IM expressions

95.2 DBMS_INMEMORY Security Model

The `DBMS_INMEMORY` package subprograms execute with invoker's rights.

The `POPULATE` and `REPOPULATE` procedures require the invoking user to have `SELECT` privileges on the specified object. For `IME_DROP_EXPRESSIONS`, the invoking user must have `ALTER TABLE` privileges on the specified table.

95.3 Summary of DBMS_INMEMORY Subprograms

This table lists and briefly describes the `DBMS_INMEMORY` package subprograms.

Table 95-1 DBMS_INMEMORY Package Subprograms

| Subprogram | Description |
|---|--|
| IME_DROP_EXPRESSIONS Procedure | Drops a specified set of <code>SYS_IME</code> virtual columns from a table |
| POPULATE Procedure | Forces population of the specified table |
| REPOPULATE Procedure | Forces repopulation of the specified table |
| SEGMENT_DEALLOCATE_VERSIONS Procedure | Deallocates non-current IMCUs in the IM column store |

95.3.1 IME_DROP_EXPRESSIONS Procedure

This procedure drops a specified set of `SYS_IME` virtual columns from a table.

Syntax

```
DBMS_INMEMORY.IME_DROP_EXPRESSIONS (
  schema_name  IN  VARCHAR2,
  table_name   IN  VARCHAR2,
  column_name  IN  VARCHAR2 DEFAULT NULL);
```

Parameters

Table 95-2 IME_DROP_EXPRESSIONS Procedure Parameters

| Parameter | Description |
|-------------|---|
| schema_name | The name of the schema that contains the In-Memory table |
| table_name | The name of the In-Memory table that contains the SYS_IME columns |
| column_name | The name of the SYS_IME column. By default this value is null, which specifies all SYS_IME columns in this table. |

Usage Notes

Typical reasons for dropping SYS_IME columns are space and performance. The maximum number of SYS_IME columns for a table, regardless of whether the attribute is INMEMORY or NO INMEMORY, is 50. After the 50-expression limit is reached for a table, the database will not add new SYS_IME columns. To make space for new expressions, you must manually drop SYS_IME columns with the DBMS_INMEMORY.IME_DROP_EXPRESSIONS or DBMS_INMEMORY_ADMIN.IME_DROP_ALL_EXPRESSIONS procedures.

To drop a specified SYS_IME column or all SYS_IME columns in the requested table, use DBMS_INMEMORY.IME_DROP_EXPRESSIONS . To populate these segments again, either invoke the DBMS_INMEMORY.POPULATE procedure, or perform a full table scan.

95.3.2 POPULATE Procedure

This procedure forces population of the specified table, partition, or subpartition into the IM column store.

Syntax

```
DBMS_INMEMORY.POPULATE (
  schema_name      IN   VARCHAR2,
  table_name       IN   VARCHAR2,
  subobject_name   IN   VARCHAR2 DEFAULT NULL);
```

Parameters

Table 95-3 POPULATE Procedure Parameters

| Parameter | Description |
|----------------|---------------------------|
| schema_name | Name of schema |
| table_name | Name of table |
| subobject_name | Partition or subpartition |

95.3.3 REPOPULATE Procedure

This procedure forces repopulation of a table, partition, or subpartition that is currently populated in the IM column store.

Syntax

```
DBMS_INMEMORY.REPOPULATE (
  schema_name      IN   VARCHAR2,
  table_name       IN   VARCHAR2,
  subobject_name   IN   VARCHAR2 DEFAULT NULL,
  force            IN   BOOLEAN DEFAULT FALSE);
```

Parameters

Table 95-4 REPOPULATE Procedure Parameters

| Parameter | Description |
|----------------|---|
| schema_name | Name of the schema that owns the object. |
| table_name | Name of the table requiring repopulation. |
| subobject_name | Name of the partition or subpartition. If null, then repopulate the entire table. |
| force | Whether to repopulate all IMCUs in the segment, just as in initial population. The following values are possible for the <i>force</i> parameter: <ul style="list-style-type: none"> FALSE — The database repopulates only IMCUs containing modified rows. This is the default. TRUE — The database drops the segment, and then rebuilds it. The database increments the statistics and performs all other tasks related to initial population. For example, IMCU 1 contains rows 1 to 500,000, and IMCU 2 contains rows 500,001 to 1,000,000. A statement modifies row 600,000. When <i>force</i> is FALSE , the database only repopulates IMCU 2. When <i>force</i> is TRUE , the database repopulates both IMCUs. Consider further that the <code>INMEMORY_VIRTUAL_COLUMNS</code> initialization parameter is set to <code>ENABLE</code> , and an application creates a new virtual column. When <i>force</i> is FALSE , the database only repopulates IMCU 2 with the new column. When <i>force</i> is TRUE , the database repopulates both IMCUs with the new column. |

95.3.4 SEGMENT_DEALLOCATE_VERSIONS Procedure

This procedure deallocates non-current IMCUs in the IM column store.

Syntax

```
DBMS_INMEMORY.SEGMENT_DEALLOCATE_VERSIONS (
  SCHEMA_NAME      IN   VARCHAR2,
```

```
TABLE_NAME      IN  VARCHAR2,
PARTITION_NAME  IN  VARCHAR2 DEFAULT NULL,
SPCPRESSURE     IN  BOOLEAN DEFAULT FALSE);
```

Parameters

Table 95-5 SEGMENT_DEALLOCATE_VERSIONS Procedure Parameters

| Parameter | Description |
|----------------|--|
| schema_name | Name of the schema that owns the object. |
| table_name | Name of the table requiring repopulation. |
| partition_name | Name of the partition or subpartition. If null, then repopulate the entire table. |
| spcpressure | Whether to force deallocation of non-current IMCUs (<code>TRUE</code>), or wait for the database to deallocate them automatically. By default, the database deallocates non-current IMCUs every two minutes. |

Usage Notes

During repopulation, the IM column store maintains both the current IMCU and non-current IMCU. This mechanism, which is called *double buffering*, ensures that queries do not decrease performance because an IMCU is unavailable during repopulation. After repopulation completes, the IM column store retains the non-current IMCU for a short time (2 minutes by default) to optimize queries with older SCNs. Typically, the default behavior is sufficient. However, you can force deallocation of non-current IMCUs by using the `SEGMENT_DEALLOCATE_VERSIONS` procedure.

Example

The following program forces deallocation of non-current IMCUs for the `products` table:

```
BEGIN
  DBMS_INMEMORY.SEGMENT_DEALLOCATE_VERSIONS (
    schema_name => 'SH'
  , table_name  => 'PRODUCTS'
  , spcpressure => TRUE );
END;
```

DBMS_INMEMORY_ADMIN

DBMS_INMEMORY_ADMIN provides interfaces for managing an In-Memory FastStart (IM FastStart) area and In-Memory Expressions (IM expressions).

This chapter contains the following topics:

- [DBMS_INMEMORY_ADMIN Overview](#)
- [DBMS_INMEMORY_ADMIN Security Model](#)
- [DBMS_INMEMORY_ADMIN Operational Notes](#)
- [Summary of DBMS_INMEMORY_ADMIN Subprograms](#)

See Also:

Oracle Database In-Memory Guide to learn more about Oracle Database In-Memory features

96.1 DBMS_INMEMORY_ADMIN Overview

This package provides interfaces for managing In-Memory Expressions (IM expressions) and the In-Memory FastStart (IM FastStart) area.

IM Expressions

Analytic queries often contain complex expressions or calculations that consume significant CPU and memory during execution. Use `IME_CAPTURE_EXPRESSIONS` to identify these frequently used (“hot”) expressions and `IME_POPULATE_EXPRESSIONS` to populate them in the IM column store. By using IM expressions, the database avoids repeated computations and improves performance.

The database represents IM expressions as system-generated virtual columns. The name of an IM virtual column begins with `SYS_IME`. You can also use `DBMS_INMEMORY_ADMIN.IME_DROP_ALL_EXPRESSIONS` and `DBMS_INMEMORY.IME_DROP_EXPRESSIONS` to remove existing `SYS_IME` columns.

The `DBA_IM_EXPRESSIONS` view shows the `SYS_IME` columns that have the `INMEMORY` attribute. After using the `IME_CAPTURE_EXPRESSIONS` procedure, you can query this view to see the hot expressions added to different tables in the database.

See Also:

Oracle Database In-Memory Guide to learn more about IM expressions

IM FastStart Area

The IM FastStart area stores data that optimizes the population of the IM column store when the database restarts. Because the database reads columnar data directly from persistent storage without needing to compress or format it, population is faster when a database instance restarts.

When you enable IM FastStart for the IM column store, you must specify an ASSM tablespace for the IM FastStart area. The tablespace stores the data in a SecureFiles LOB named `SYSDBIMFS_LOGSEG$`. The `SYSAUX` tablespace stores the metadata. When data is populated or repopulated in the IM column store, the database automatically writes the data to the IM FastStart area. You cannot manually force a write. If you specify an object as `NO INMEMORY`, then the database removes it from the IM FastStart area.

When the IM FastStart area is under space pressure, the database automatically drops the oldest 15% of segments and continues saving columnar data. If space is unavailable, then the database stops writing to the IM FastStart area.

See Also:

Oracle Database In-Memory Guide to learn more about IM expressions

Automatic In-Memory

Automatic In-Memory uses access tracking and column statistics to manage objects in the IM column store. If the IM column store is full, and if other more frequently accessed segments would benefit from population in the IM column store, then the IM column store evicts inactive segments. If the IM column store is configured to hold all `INMEMORY` segments, however, then Automatic In-Memory takes no action.

By default, Automatic In-Memory checks usage statistics for the past 31 days. You can change the current setting by supplying the `AIM_STATWINDOW_DAYS` parameter to `DBMS_INMEMORY_ADMIN.AIM_SET_PARAMETER`.

See Also:

Oracle Database In-Memory Guide to learn more about Automatic In-Memory

Database In-Memory Wait on Populate

The `POPULATE_WAIT` function initiates population of all `INMEMORY` objects that have a priority greater than or equal to the specified priority, and then returns a status value for the population. A user-specified interval specifies the maximum time that the function waits before returning the value to the caller.

**See Also:**

Oracle Database In-Memory Guide to learn more about the wait on populate feature

96.2 DBMS_INMEMORY_ADMIN Security Model

This package requires administrator privileges. Package subprograms execute with invoker's rights.

96.3 DBMS_INMEMORY_ADMIN Operational Notes

It is possible for a DBMS_INMEMORY_ADMIN FastStart operation to fail or be interrupted.

In a failure or interruption scenario, the following rules determine which subprograms you can use:

- If FASTSTART_ENABLE does not succeed, then the only permitted operation is re-executing FASTSTART_ENABLE.
- If FASTSTART_MIGRATE_STORAGE does not succeed, then the only permitted operation is re-executing FASTSTART_MIGRATE_STORAGE.
- If FASTSTART_DISABLE does not succeed, then all DBMS_INMEMORY_ADMIN operations are permitted.

96.4 Summary of DBMS_INMEMORY_ADMIN Subprograms

This table lists the DBMS_INMEMORY_ADMIN subprograms and briefly describes them.

Table 96-1 DBMS_INMEMORY_ADMIN Package Subprograms

| Subprogram | Description |
|---|---|
| AIM_GET_PARAMETER Procedure | This procedure obtains the current values for parameters that control Automatic In-Memory. |
| AIM_SET_PARAMETER Procedure | The procedure customizes the execution environment of Automatic In-Memory |
| FASTSTART_DISABLE Procedure | This procedure disables the In-Memory FastStart (IM FastStart) feature. |
| FASTSTART_ENABLE Procedure | This procedure enables IM FastStart and assigns a tablespace. |
| FASTSTART_MIGRATE_STORAGE Procedure | This procedure moves all IM FastStart data and metadata from the existing tablespace to the specified new tablespace. |
| GET_FASTSTART_TABLESPACE Function | This function returns the name of the tablespace that is currently designated for IM FastStart. |
| IME_CAPTURE_EXPRESSIONS Procedure | This procedure captures the 20 most frequently accessed ("hottest") expressions in the database in the specified time interval. |

Table 96-1 (Cont.) DBMS_INMEMORY_ADMIN Package Subprograms

| Subprogram | Description |
|--|---|
| IME_CLOSE_CAPTURE_WINDOW Procedure | This procedure signals the end of the current expression capture window. |
| IME_DROP_ALL_EXPRESSIONS Procedure | This procedure drops all SYS_IME expression virtual columns in the database. |
| IME_GET_CAPTURE_STATE Procedure | This procedure returns the current capture state of the expression capture window and the timestamp of the most recent modification. |
| IME_OPEN_CAPTURE_WINDOW Procedure | This procedure signals the beginning of an expression capture window. |
| IME_POPULATE_EXPRESSIONS Procedure | This procedure forces the population of expressions captured in the latest invocation of <code>DBMS_INMEMORY_ADMIN.IME_CAPTURE_EXPRESSIONS</code> . |
| POPULATE_WAIT Function | Initiates population of all INMEMORY objects that have a priority greater than or equal to the specified priority, and sets a timeout interval within which population must occur |

96.4.1 AIM_GET_PARAMETER Procedure

This procedure obtains the current values for parameters that control Automatic In-Memory.

Syntax

```
DBMS_INMEMORY_ADMIN.AIM_GET_PARAMETER (
    parameter IN NUMBER,
    value     OUT NUMBER);
```

Parameters

| Parameter | Description |
|-----------|--|
| parameter | Specifies a predefined constant that controls Automatic In-Memory. The only valid constant is <code>AIM_STATWINDOW_DAYS</code> , which specifies the number of days in the sliding statistics window. Automatic In-Memory uses this duration to filter statistics for INMEMORY objects as part of its algorithms. For example, if the duration is set to 7 days, then Automatic In-Memory considers only statistics of the past 7 days for its algorithms. The default is 1. |
| value | Specifies the value assigned to <code>AIM_STATWINDOW_DAYS</code> . |

Example 96-1 Getting the Number of Days in the Statistics Window

The following code prints the number of days in the statistics window to the screen:

```
VARIABLE b_statwin NUMBER

BEGIN

DBMS_INMEMORY_ADMIN.AIM_GET_PARAMETER(DBMS_INMEMORY_ADMIN.AIM_STATWINDOW_DAYS
, :b_statwin);
END;
/

PRINT b_statwin
```

Sample output appears below:

```
B_STATWIN
-----
          14
```

See Also:

Oracle Database In-Memory Guide to learn how to use AIM_GET_PARAMETER

96.4.2 AIM_SET_PARAMETER Procedure

The procedure customizes the execution environment of Automatic In-Memory.

Syntax

```
DBMS_INMEMORY_ADMIN.AIM_SET_PARAMETER(
  parameter IN NUMBER,
  value     IN NUMBER);
```

Parameters

| Parameter | Description |
|-----------|---|
| parameter | Specifies a predefined constant that controls Automatic In-Memory. The only valid constant is AIM_STATWINDOW_DAYS, which specifies the number of days in the sliding statistics window. The default is 1. |
| value | Assigns the value assigned to AIM_STATWINDOW_DAYS. |

Example 96-2 Setting the Number of Days in the Statistics Window

The following example gets the current number of days in the window, sets it to 14, and then prints the value to the screen:

```
VARIABLE b_statwin NUMBER

BEGIN

DBMS_INMEMORY_ADMIN.AIM_GET_PARAMETER(DBMS_INMEMORY_ADMIN.AIM_STATWINDO
W_DAYS, :b_statwin);
END;
/

PRINT b_statwin

BEGIN

DBMS_INMEMORY_ADMIN.AIM_SET_PARAMETER(DBMS_INMEMORY_ADMIN.AIM_STATWINDO
W_DAYS, 14);
END;
/

BEGIN

DBMS_INMEMORY_ADMIN.AIM_GET_PARAMETER(DBMS_INMEMORY_ADMIN.AIM_STATWINDO
W_DAYS, :b_statwin);
END;
/

PRINT b_statwin
```

Sample output appears below:

```
B_STATWIN
-----
          1

B_STATWIN
-----
          14
```

**See Also:**

Oracle Database In-Memory Guide to learn how to use AIM_GET_PARAMETER

96.4.3 FASTSTART_DISABLE Procedure

This procedure disables the In-Memory FastStart (IM FastStart) feature.

Syntax

```
DBMS_INMEMORY_ADMIN.FASTSTART_DISABLE();
```

Security Model

Administrator privileges are required to execute this procedure.

Usage Notes

When you execute the procedure, the database executes the following actions:

1. Waits until all IM FastStart operations complete
2. Disables the IM FastStart feature, and performs the following operations:
 - Cleans the IM FastStart area
 - Deletes IM FastStart metadata stored in the `SYSAUX` tablespace
 - Releases the IM FastStart tablespace (but does not delete it)

This procedure does not interrupt or affect any concurrent IM column store operations.

Examples

The following PL/SQL program disables the IM FastStart feature:

```
EXEC DBMS_INMEMORY_ADMIN.FASTSTART_DISABLE;
```

The following query shows that the LOB for the IM FastStart tablespace has been deleted (sample output included):

```
COL OWNER FORMAT a5
COL SEGMENT_NAME FORMAT a20
SELECT  l.OWNER, l.SEGMENT_NAME, SUM(s.BYTES)/1024/1024 MB
FROM    DBA_LOBS l, DBA_SEGMENTS s
WHERE   l.SEGMENT_NAME = s.SEGMENT_NAME
AND     l.TABLESPACE_NAME = 'FS_TBS'
GROUP BY l.OWNER, l.SEGMENT_NAME;
```

```
no rows selected
```

96.4.4 FASTSTART_ENABLE Procedure

This procedure enables In-Memory FastStart (IM FastStart), and designates a tablespace for the IM FastStart (FastStart) area.

Note:

A multitenant container database is the only supported architecture in Oracle Database 20c. While the documentation is being revised, legacy terminology may persist. In most cases, "database" and "non-CDB" refer to a CDB or PDB, depending on context. In some contexts, such as upgrades, "non-CDB" refers to a non-CDB from a previous release.

Syntax

```
DBMS_INMEMORY_ADMIN.FASTSTART_ENABLE (
  tbs_name      IN      VARCHAR2,
  nologging    IN      BOOLEAN DEFAULT TRUE);
```

Parameters

Table 96-2 FASTSTART_ENABLE Procedure Parameters

| Parameter | Description |
|-----------|--|
| tbs_name | The name of the ASSM tablespace for the FastStart area. |
| nologging | The logging mode of the LOB created for the FastStart area. If the <code>nologging</code> parameter is set to <code>FALSE</code> , then the database creates the FastStart LOB with the <code>LOGGING</code> option. If set to <code>TRUE</code> (default), then the database creates the LOB with the <code>NOLOGGING</code> option. |

Security Model

Administrator privileges are required to execute this procedure.

Usage Notes

To enable IM FastStart, the ASSM tablespace specified in `FASTSTART_ENABLE` must exist, and the `SYSAUX` tablespace must be online. Only one FastStart tablespace can exist for every PDB or non-CDB. The specified tablespace must have enough space to store data for the IM column store, and it must not contain any other data before it is designated for the FastStart area. Oracle recommends sizing the tablespace at least twice of the size of the `INMEMORY_SIZE` initialization parameter.

The database does not create the FastStart area on disk until the IM column store is populated. After population, the data periodically saves the columnar data (but not metadata such as the transaction journal) to the FastStart area, which is represented on disk as the `SYSDBIMFS_LOBSEG$` segment. The database stores the FastStart metadata in the `SYSAUX` tablespace. In an Oracle Real Application Clusters (Oracle RAC) environment, IM FastStart data is shared across all nodes.

**Note:**

IM FastStart is not supported in a standby database instance.

Whereas the initial loading of IMCUs into memory is expensive and CPU-bound, an IM FastStart tablespace requires intermittent I/O. The database periodically writes columnar data to the IM FastStart area. If a database instance must restart, then Oracle Database reads the columnar data directly from the IM FastStart area rather than reconstructing the IMCUs from scratch. No compression or formatting of the columnar data is required.

Examples

This example creates `fs_tbs` as an ASSM tablespace, and then uses `FASTSTART_ENABLE` to specify this tablespace as the IM FastStart area:

```
CREATE TABLESPACE fs_tbs
  DATAFILE 'fs_tbs.dbf' SIZE 500M
  EXTENT MANAGEMENT LOCAL
  SEGMENT SPACE MANAGEMENT AUTO;

EXEC DBMS_INMEMORY_ADMIN.FASTSTART_ENABLE('fs_tbs');
```

The following query shows that the IM FastStart LOB was created (sample output included):

```
COL OWNER FORMAT a5
COL SEGMENT_NAME FORMAT a20
SELECT  l.OWNER, l.SEGMENT_NAME, SUM(s.BYTES)/1024/1024 MB
FROM    DBA_LOBS l, DBA_SEGMENTS s
WHERE   l.SEGMENT_NAME = s.SEGMENT_NAME
AND     l.TABLESPACE_NAME = 'FS_TBS'
GROUP BY l.OWNER, l.SEGMENT_NAME;
```

| OWNER | SEGMENT_NAME | MB |
|-------|--------------------|------|
| SYS | SYSDBIMFS_LOBSEG\$ | .125 |

96.4.5 FASTSTART_MIGRATE_STORAGE Procedure

This procedure moves the In-Memory FastStart (IM FastStart) data and catalogs from the current tablespace to a new tablespace.

Syntax

```
DBMS_INMEMORY_ADMIN.FASTSTART_MIGRATE_STORAGE (
  tbs_name      IN      VARCHAR2 );
```

Parameters

Table 96-3 FASTSTART_MIGRATE_STORAGE Procedure Parameters

| Parameter | Description |
|-----------|--|
| tbs_name | The name of the new ASSM tablespace for the IM FastStart area. |

Security Model

DBA privileges are required to execute this procedure.

Usage Notes

When you execute the procedure, the database executes the following actions:

1. Waits until all IM FastStart operations complete
2. Disables the IM FastStart feature
3. Copies IM FastStart data and metadata to the new tablespace, leaving the old tablespace intact
4. Re-enables IM FastStart the feature

Examples

The following program obtains the name of the IM FastStart tablespace, if one exists, and prints the result (sample output included):

```
VARIABLE b_fstbs VARCHAR2(20)
BEGIN
    :b_fstbs := DBMS_INMEMORY_ADMIN.GET_FASTSTART_TABLESPACE;
END;
/
PRINT b_fstbs

B_FSTBS
-----
FS_TBS
```

The following statements create a new tablespace named `fs_tbs2`, and then migrate the IM FastStart area to this tablespace:

```
CREATE TABLESPACE fs_tbs2
    DATAFILE 'fs_tbs2.dbf' SIZE 500M
    EXTENT MANAGEMENT LOCAL
    SEGMENT SPACE MANAGEMENT AUTO;

EXEC DBMS_INMEMORY_ADMIN.FASTSTART_MIGRATE_STORAGE('fs_tbs2');
```

The following program prints the name of the current IM FastStart tablespace (sample output included):

```
BEGIN
  :b_fstbs := DBMS_INMEMORY_ADMIN.GET_FASTSTART_TABLESPACE;
END;
/
PRINT b_fstbs

B_FSTBS
-----
FS_TBS2
```

96.4.6 GET_FASTSTART_TABLESPACE Function

This function returns the tablespace assigned to In-Memory FastStart (IM FastStart). If the feature is disabled, then the function returns `NOT ENABLED`.

Syntax

```
DBMS_INMEMORY_ADMIN.GET_FASTSTART_TABLESPACE ();
```

Security Model

DBA privileges are required to execute this function.

Examples

This program obtains the name of the IM FastStart tablespace, if one exists, and prints the result:

```
VARIABLE b_fstbs VARCHAR2(20)
BEGIN
  :b_fstbs := DBMS_INMEMORY_ADMIN.GET_FASTSTART_TABLESPACE;
END;
/
PRINT b_fstbs

B_FSTBS
-----
NOT ENABLED
```

96.4.7 IME_CAPTURE_EXPRESSIONS Procedure

This procedure captures the 20 most frequently accessed (“hottest”) expressions in the database in the specified time interval.

Syntax

```
DBMS_INMEMORY_ADMIN.IME_CAPTURE_EXPRESSIONS (
  snapshot IN VARCHAR2);
```

Parameters

Table 96-4 IME_CAPTURE_EXPRESSIONS Procedure Parameters

| Parameter | Description |
|-----------|---|
| snapshot | <p>Specifies a snapshot that defines the time interval in which expression statistics are considered.</p> <p>You can specify any of the following values:</p> <ul style="list-style-type: none"> • CUMULATIVE The database considers all expression statistics since the creation of the database. • CURRENT The database considers only expression statistics from the past 24 hours. • WINDOW The database considers statistics for expressions tracked in the most recent expression capture window. The database adds hidden virtual columns for expressions tracked in the most recent window. If the capture window is currently open, then the database considers all expressions tracked in the current window up until this point, and then materializes the hottest expressions. To list the expressions that have been tracked in the current window, query <code>DBA_EXPRESSION_STATISTICS</code> with <code>SNAPSHOT='WINDOW'</code>. |

Usage Notes

When you invoke this procedure, the database queries the Expression Statistics Store (ESS), and considers only expressions on tables that are at least partially populated in the IM column store. The database adds the 20 hottest expressions to their respective tables as hidden virtual columns, prefixed with the string `SYS_IME`, and applies the default `INMEMORY` column compression clause. If any `SYS_IME` columns added during a previous invocation are no longer in the latest top 20 list, then the database marks them as `NO INMEMORY`.

**Note:**

Executing the `IME_CAPTURE_EXPRESSIONS` procedure on a standby database has no effect.

The maximum number of `SYS_IME` columns for a table, regardless of whether the attribute is `INMEMORY` or `NO INMEMORY`, is 50. After the limit is reached for a table, the database will not add new `SYS_IME` columns. To make space for new expressions, you must manually drop `SYS_IME` columns with the [IME_DROP_ALL_EXPRESSIONS Procedure](#) or [IME_DROP_EXPRESSIONS Procedure](#).

The 50-expression limit for each table, which includes both `INMEMORY` and `NO INMEMORY` expressions, is different from the 20-expression limit for the database, which includes only `INMEMORY` expressions. For example, if 20 tables are populated in the IM column store, then each table might each have 1 `SYS_IME` column with the `INMEMORY` attribute, and 49 `SYS_IME` columns with the `NO INMEMORY` attribute.

IM expressions and virtual columns are stored in In-Memory structured called In-Memory Expression Units (IMEUs). Every IMEU is linked to a parent In-Memory Compression Unit (IMCU) from which it inherits compression characteristics.

ESS information is stored in the data dictionary and exposed in the `DBA_EXPRESSION_STATISTICS` view. This view shows the metadata that the optimizer has collected in the ESS. IM expressions are exposed as system-generated virtual columns, prefixed by the string `SYS_IME`, in the `DBA_IM_EXPRESSIONS` view.

Example 96-3 Capturing Expressions in a User-Defined Window

This example demonstrates use of the `WINDOW` capture mode. Your goal is to open and close an expression capture window, and then capture all expressions that the database tracked during this window. You perform the following steps:

1. Open an expression capture window, generate expressions, and then close the window:

```
EXEC DBMS_INMEMORY_ADMIN.IME_OPEN_CAPTURE_WINDOW();
-- Generate expressions for the database to track
EXEC DBMS_INMEMORY_ADMIN.IME_CLOSE_CAPTURE_WINDOW();
```

2. Query `DBA_EXPRESSION_STATISTICS` (sample output included):

```
COL OWNER FORMAT A6
COL TABLE_NAME FORMAT A9
COL COUNT FORMAT 99999
COL CREATED FORMAT A10
COL EXPRESSION_TEXT FORMAT A29

SELECT OWNER, TABLE_NAME, EVALUATION_COUNT AS COUNT,
       CREATED, EXPRESSION_TEXT
FROM   DBA_EXPRESSION_STATISTICS
WHERE  SNAPSHOT = 'WINDOW'
AND    OWNER = 'SH';
```

| OWNER | TABLE_NAME | COUNT | CREATED | EXPRESSION_TEXT |
|-------|------------|-------|-----------|-------------------------------|
| SH | SALES | 4702 | 09-OCT-17 | "QUANTITY_SOLD" |
| SH | SALES | 4702 | 09-OCT-17 | "QUANTITY_SOLD"*"AMOUNT_SOLD" |
| SH | SALES | 4702 | 09-OCT-17 | "PROD_ID" |
| SH | SALES | 4702 | 09-OCT-17 | "CUST_ID" |
| SH | SALES | 4702 | 09-OCT-17 | "CHANNEL_ID" |
| SH | SALES | 4702 | 09-OCT-17 | "AMOUNT_SOLD" |

The preceding query shows both the columns tracked in the ESS and the expressions captured during the window for queries in the `sh` schema. During the most recent window, the database captured one expression: `QUANTITY_SOLD*AMOUNT_SOLD`.

3. Use `IME_CAPTURE_EXPRESSIONS` to make the database consider all expressions in the current window for materialization:

```
EXEC DBMS_INMEMORY_ADMIN.IME_CAPTURE_EXPRESSIONS('WINDOW');
```

4. Query DBA_IM_EXPRESSIONS (sample output included):

```

COL OWNER FORMAT a6
COL TABLE_NAME FORMAT a9
COL COLUMN_NAME FORMAT a25
SET LONG 50
SET LINESIZE 150

SELECT OWNER, TABLE_NAME, COLUMN_NAME, SQL_EXPRESSION
FROM   DBA_IM_EXPRESSIONS;

OWNER  TABLE_NAM COLUMN_NAME          SQL_EXPRESSION
-----
SH      SALES      SYS_IME000100000025201B
"QUANTITY_SOLD"*"AMOUNT_SOLD"

```

The preceding output shows all virtual columns that were added to the table and marked `INMEMORY` as part of the latest `IME_CAPTURE_EXPRESSIONS` invocation. The database gradually populates the captured expressions into the IM column store when it repopulates different IMCUs of the table.

5. Execute the following procedure to explicitly force a population of all captured IM expressions:

```
EXEC DBMS_INMEMORY_ADMIN.IME_POPULATE_EXPRESSIONS();
```

Note that you can populate IM expressions from a specific table by executing the `DBMS_INMEMORY.REPOPULATE` procedure with the `force` parameter set to `TRUE`.

Example 96-4 Capturing Expressions for the Past Day

The following program captures expressions tracked during the last 24 hours:

```
EXEC DBMS_INMEMORY_ADMIN.IME_CAPTURE_EXPRESSIONS('CURRENT');
```

96.4.8 IME_CLOSE_CAPTURE_WINDOW Procedure

This procedure signals the end of the current expression capture window.

Syntax

```
DBMS_INMEMORY_ADMIN.IME_CLOSE_CAPTURE_WINDOW();
```

Usage Notes

On invocation of this procedure, the optimizer saves all gathered statistics to disk, and essentially freezes the expressions tracked in the window. The database preserves the statistics captured in this window until a new expression capture window is opened, at which point the database purges the statistics captured in the previous window.

Example 96-5 Example

This example opens an expression capture window, and then issues `IME_CAPTURE_EXPRESSIONS('WINDOW')` so that the database considers all expressions in the current window for materialization. Finally, the example closes the window.

```
EXEC DBMS_INMEMORY_ADMIN.IME_OPEN_CAPTURE_WINDOW();
-- Generate expressions so that the database can track them
EXEC DBMS_INMEMORY_ADMIN.IME_CLOSE_CAPTURE_WINDOW();
EXEC DBMS_INMEMORY_ADMIN.IME_CAPTURE_EXPRESSIONS('WINDOW');
```

96.4.9 IME_DROP_ALL_EXPRESSIONS Procedure

This procedure drops all `SYS_IME` expression virtual columns in the database.

Syntax

```
DBMS_INMEMORY_ADMIN.IME_DROP_ALL_EXPRESSIONS();
```

Usage Notes

The `IME_DROP_ALL_EXPRESSIONS` procedure drops all `SYS_IME` columns from all tables, regardless of whether they have the `INMEMORY` attribute. In effect, the procedure acts as a database-wide reset button.

Using `IME_DROP_ALL_EXPRESSIONS` triggers a drop of all `IMEUs` and `IMCUs` for segments that have `SYS_IME` columns. For example, if 50 populated tables have one `SYS_IME` column each, then `IME_DROP_ALL_EXPRESSIONS` removes all 50 tables from the IM column store. To populate these segments again, you must use the `DBMS_INMEMORY.POPULATE` procedure or perform a full table scan.

96.4.10 IME_GET_CAPTURE_STATE Procedure

This procedure returns the current capture state of the expression capture window and the timestamp of the most recent modification.

Syntax

```
DBMS_INMEMORY_ADMIN.IME_GET_CAPTURE_STATE (
    p_capture_state OUT VARCHAR2,
    p_last_modified OUT TIMESTAMP);
```

Parameters

| Parameter | Description |
|------------------------------|---|
| <code>p_capture_state</code> | <p>Describes the current state of the expression capture window.</p> <p>The following states are possible:</p> <ul style="list-style-type: none"> <code>OPEN</code> — Indicates that the window is open. <code>CLOSED</code> — Indicates that the window is closed. <code>DEFAULT</code> — Indicates that the window has not been used. It is equivalent to the <code>CLOSED</code> state. |

| Parameter | Description |
|-----------------|--|
| p_last_modified | Indicates the timestamp of the most recent action. |

Usage Notes

This procedure is useful for avoiding conflicting calls for [IME_OPEN_CAPTURE_WINDOW Procedure](#) and [IME_CLOSE_CAPTURE_WINDOW Procedure](#). For example, if the current expression capture window state is `OPEN`, then you cannot open another window, and if the window state is `CLOSED`, then you cannot close a window.

Example 96-6 Determining the State of an Expression Capture Window

This example opens an expression capture window, and then determines its capture state.

```
EXEC DBMS_INMEMORY_ADMIN.IME_OPEN_CAPTURE_WINDOW();

VARIABLE b_state VARCHAR2(25)
VARIABLE b_time  VARCHAR2(10)
EXECUTE DBMS_INMEMORY_ADMIN.IME_GET_CAPTURE_STATE(:b_state, :b_time)
PRINT b_state b_time
```

The following sample output indicates that an expression capture window is currently open:

```
B_STATE
-----
OPEN

B_TIME
-----
09-OCT-17
```

96.4.11 IME_OPEN_CAPTURE_WINDOW Procedure

This procedure signals the beginning of an expression capture window.

Syntax

```
DBMS_INMEMORY_ADMIN.IME_OPEN_CAPTURE_WINDOW();
```

Security Model

Administrator privileges are required to execute this procedure.

Usage Notes

On invocation of this procedure, the optimizer begins a new window snapshot and starts tracking expressions that occur within this window. An expression capture window is global across all instances in an Oracle RAC database.

Conflicting actions are not permitted. For example, in an Oracle RAC database, opening expression capture window on instance 1 at time t0 and attempting to open another expression capture window on instance 2 at time t1 before closing the first window is a conflicting action. To obtain the current capture state and reduce the potential for conflicting procedure invocations, use the [IME_GET_CAPTURE_STATE Procedure](#).

Example

This following program opens an expression capture window:

```
EXEC DBMS_INMEMORY_ADMIN.IME_OPEN_CAPTURE_WINDOW();
```

96.4.12 IME_POPULATE_EXPRESSIONS Procedure

This procedure forces the population of expressions captured in the latest invocation of `DBMS_INMEMORY_ADMIN.IME_CAPTURE_EXPRESSIONS`.

Syntax

```
DBMS_INMEMORY_ADMIN.IME_POPULATE_EXPRESSIONS();
```

Usage Notes

If you do not invoke this procedure, then the database gradually repopulates `SYS_IME` columns when their parent IMCUs are repopulated. If a table is not repopulated, then any new `SYS_IME` columns captured by the `IME_CAPTURE_EXPRESSIONS` procedure are not populated. `IME_POPULATE_EXPRESSIONS` solves this problem by forcing population.

Internally, the procedure invokes `DBMS_INMEMORY.REPOPULATE` for all tables that have `SYS_IME` columns with the `INMEMORY` attribute. To populate `SYS_IME` columns in a specified subset of tables, use `DBMS_INMEMORY.REPOPULATE` instead of `IME_POPULATE_EXPRESSIONS`.

96.4.13 POPULATE_WAIT Function

This function initiates population of all `INMEMORY` objects that have a priority greater than or equal to the specified priority, and returns a status value for the population. A user-specified interval specifies the maximum time that the function waits before returning the value to the caller.

Syntax

```
DBMS_INMEMORY_ADMIN.POPULATE_WAIT (  
    priority    IN    VARCHAR2 DEFAULT 'LOW',  
    percentage  IN    NUMBER   DEFAULT 100,  
    timeout     IN    NUMBER   DEFAULT 99999999,  
    force       IN    VARCHAR2 DEFAULT FALSE)  
RETURN VARCHAR2;
```

Parameters

Table 96-5 POPULATE_WAIT Function Parameters

| Parameter | Description |
|------------|--|
| priority | Specifies that the database populate all INMEMORY objects with the specified priority setting or higher. The default priority is LOW. NONE is considered lowest priority. If you set to priority to NONE, then this function waits for all INMEMORY objects to populate. |
| percentage | Specifies the percentage of population required for the function to consider population to be complete. The default is 100. For example, if percentage is 50 and priority is NONE, and if 50% of the INMEMORY objects are populated in the IM column store, then the function returns the value 0 (population successful). |
| timeout | Specifies the number of seconds that must pass before the function returns -1, which indicates that the populate operation timed out. The default is 99999999 seconds, which is 115.74 days. Assume that timeout is 600, priority is LOW, and percentage is 100. If 10 minutes pass, but all PRIORITY LOW objects are not yet fully populated, then the function returns -1. |
| force | Specifies that the database should drop all INMEMORY segments that have a priority greater than or equal than the specified priority, and then repopulate these segments. The default is FALSE. Assume that the INMEMORY attribute applies to the sales table, which is partitioned. Only half the sales partitions are currently populated in the IM column store. If you execute POPULATE_WAIT with force set to TRUE, then the database drops all sales segments, and then repopulates them. |

Return Values

The following table describes the possible return values for POPULATE_WAIT. The function returns the values 0, 1, 2, and 3 only if the condition is met before the end of the interval specified by timeout. For example, if timeout is 600, then the function returns 1 only if an out-of-memory error occurs before 600 seconds pass. The function returns -1 only if the end of the timeout interval occurs *before* the database completes the requested operation.

Table 96-6 Return Values for POPULATE_WAIT

| Constant | Value | Description |
|------------------|-------|--|
| POPULATE_TIMEOUT | -1 | The function timed out while waiting for population to complete. Existing population jobs continue running in the background after -1 is returned. Reissuing POPULATE_TIMEOUT after -1 is returned reinitiates population; segments that are already populated are not dropped. |

Table 96-6 (Cont.) Return Values for POPULATE_WAIT

| Constant | Value | Description |
|------------------------------|-------|---|
| POPULATE_SUCCESS | 0 | All objects that met the <code>priority</code> criteria were populated to the specified percentage of completion. |
| POPULATE_OUT_OF_MEMORY | 1 | The In-Memory pool had insufficient memory to populate the objects that met the <code>priority</code> criteria to the specified percentage of completion. |
| POPULATE_NO_INMEMORY_OBJECTS | 2 | No INMEMORY objects met the specified <code>priority</code> criteria. |
| POPULATE_INMEMORY_SIZE_ZERO | 3 | The In-Memory column store is not enabled. |

Usage Notes

Sample use cases for ensuring that objects are populated include:

- When the database is closed, open the database with `STARTUP RESTRICT` so that only administrators can access the database, and then execute `POPULATE_WAIT` with the desired timeout setting. If `POPULATE_WAIT` returns `-1`, indicating a timeout, then reexecute `POPULATE_WAIT`. When the function returns `0`, disable the restricted session so that non-administrative users can query the database.
- Block database connections by using services or an application tier technique. When no analytic indexes exists, and when the application depends on the IM column store to provide reasonable performance, these techniques prevent runaway queries.

Example 96-7 Specifying a Timeout Interval for In-Memory Population

In this example, the database contains a number of In-Memory tables with a variety of priority settings. Your goal is to populate every In-Memory table to 100% completion in a restricted database session, and then disable the restricted session so that the application can be guaranteed of querying only the In-Memory representations.

Assume that the database is shut down. In SQL*Plus, you connect to an idle instance as SYSDBA, and then execute the following command (sample output included):

```
SQL> STARTUP RESTRICT
ORACLE instance started.

Total System Global Area 1157624280 bytes
Fixed Size                 8839640 bytes
Variable Size              754974720 bytes
Database Buffers           16777216 bytes
Redo Buffers                7933952 bytes
In-Memory Area             369098752 bytes
Database mounted.
Database opened.
```

The database is open, but is accessible only to administrative users. You execute the following statements in SQL*Plus (sample output shown in bold):

```
VARIABLE b_pop_status NUMBER

SELECT DBMS_INMEMORY_ADMIN.POPULATE_WAIT(
       priority => 'NONE' ,
       percentage => 100   ,
       timeout   => 300   )
       INTO b_pop_status
FROM   DUAL;

PRINT b_pop_status
-1
```

After 5 minutes, the function returns the number **-1**. This code indicates that the function timed out while waiting for population to complete. 5 minutes is not long enough to populate all INMEMORY tables. You re-execute the SELECT statement, specifying a 30-minute timeout:

```
SELECT DBMS_INMEMORY_ADMIN.POPULATE_WAIT(
       priority => 'NONE' ,
       percentage => 100   ,
       timeout   => 1800  )
       INTO b_pop_status
FROM   DUAL;

PRINT b_pop_status
0
```

After 8 minutes, the function returns the number **0**. This code indicates that all tables are completely populated. You now disable the restricted session so that the application can start query In-Memory objects with full confidence that only In-Memory representations will be accessed:

```
ALTER SYSTEM DISABLE RESTRICTED SESSION;
```

DBMS_IOT

The `DBMS_IOT` package creates a table into which references to the chained rows for an index-organized table can be placed using the `ANALYZE` command. `DBMS_IOT` can also create an exception table into which references to the rows of an index-organized table that violate a constraint can be placed during the `enable_constraint` operation.

`DBMS_IOT` is not loaded during database installation. To install `DBMS_IOT`, run `dbmsiotc.sql`, available in the `ADMIN` directory.

This chapter contains the following topics:

- [Summary of DBMS_IOT Subprograms](#)

Note:

With the introduction of logical-rowids for IOTs with Oracle Database Release 8.1, you no longer need to use the procedures contained in this package which is retained for backward compatibility only. It is however required for servers running with Oracle Database Release 8.0.

97.1 Summary of DBMS_IOT Subprograms

This table lists and briefly describes the `DBMS_IOT` subprograms.

Table 97-1 *DBMS_IOT Package Subprograms*

| Subprogram | Description |
|--|---|
| BUILD_CHAIN_ROWS_TABLE Procedure | Creates a table into which references to the chained rows for an index-organized table can be placed using the <code>ANALYZE</code> command |
| BUILD_EXCEPTIONS_TABLE Procedure | Creates an exception table into which rows of an index-organized table that violate a constraint can be placed |

97.1.1 BUILD_CHAIN_ROWS_TABLE Procedure

This procedure creates a table into which references to the chained rows for an index-organized table can be placed using the `ANALYZE` command.

Syntax

```
DBMS_IOT.BUILD_CHAIN_ROWS_TABLE (
  owner          IN VARCHAR2,
  iot_name       IN VARCHAR2,
  chainrow_table_name IN VARCHAR2 default 'IOT_CHAINED_ROWS');
```

Parameters

Table 97-2 BUILD_CHAIN_ROWS_TABLE Procedure Parameters

| Parameter | Description |
|---------------------|---|
| owner | Owner of the index-organized table. |
| iot_name | Index-organized table name. |
| chainrow_table_name | Intended name for the chained-rows table. |

Usage Notes

You should create a separate chained-rows table for each index-organized table to accommodate its primary key.

Examples

```
CREATE TABLE l(a char(16),b char(16), c char(16), d char(240),
PRIMARY KEY(a,b,c)) ORGANIZATION INDEX pctthreshold 10 overflow;
EXECUTE DBMS_IOT.BUILD_CHAIN_ROWS_TABLE('SYS','L','LC');
```

A chained-row table is created with the following columns:

| Column Name | Null? | Type |
|-------------------|-------|---------------|
| OWNER_NAME | | VARCHAR2 (30) |
| TABLE_NAME | | VARCHAR2 (30) |
| CLUSTER_NAME | | VARCHAR2 (30) |
| PARTITION_NAME | | VARCHAR2 (30) |
| SUBPARTITION_NAME | | VARCHAR2 (30) |
| HEAD_ROWID | | ROWID |
| TIMESTAMP | | DATE |
| A | | CHAR (16) |
| B | | CHAR (16) |
| C | | CHAR (16) |

97.1.2 BUILD_EXCEPTIONS_TABLE Procedure

This procedure creates an exception table.

Rows of an index-organized table that violate a constraint can be placed into this table during the execution of the following SQL statements:

- ALTER TABLE ... ENABLE CONSTRAINT ... EXCEPTIONS INTO
- ALTER TABLE ... ADD CONSTRAINT ... EXCEPTIONS INTO

Syntax

```
DBMS_IOT.BUILD_EXCEPTIONS_TABLE (
  owner          IN VARCHAR2,
  iot_name       IN VARCHAR2,
  exceptions_table_name IN VARCHAR2 default 'IOT_EXCEPTIONS');
```

Parameters

Table 97-3 BUILD_EXCEPTIONS_TABLE Procedure Parameters

| Parameter | Description |
|-----------------------|-------------------------------------|
| owner | Owner of the index-organized table. |
| iot_name | Index-organized table name. |
| exceptions_table_name | Intended name for exception-table. |

Usage Notes

You should create a separate exception table for each index-organized table to accommodate its primary key.

Examples

```
EXECUTE DBMS_IOT.BUILD_EXCEPTIONS_TABLE('SYS','L','LE');
```

An exception table for the preceding index-organized table with the following columns:

| Column Name | Null? | Type |
|-------------|-------|---------------|
| ROW_ID | | VARCHAR2 (30) |
| OWNER | | VARCHAR2 (30) |
| TABLE_NAME | | VARCHAR2 (30) |
| CONSTRAINT | | VARCHAR2 (30) |
| A | | CHAR (16) |
| B | | CHAR (16) |
| C | | CHAR (16) |

DBMS_JAVA

The DBMS_JAVA package provides a PL/SQL interface for accessing database functionality from Java.

For a complete description of this package within the context of DBMS_JAVA, see DBMS_JAVA in the *Oracle Database Java Developer's Guide*

DBMS_JOB

The `DBMS_JOB` package schedules and manages jobs in the job queue.

Note:

The `DBMS_JOB` package has been superseded by the `DBMS_SCHEDULER` package, and support for `DBMS_JOB` might be removed in future releases of Oracle Database. In particular, if you are administering jobs to manage system load, you are encouraged to disable `DBMS_JOB` by revoking the package execution privilege for users.

For more information, see [DBMS_SCHEDULER](#) and "Moving from `DBMS_JOB` to `DBMS_SCHEDULER`" in the *Oracle Database Administrator's Guide*.

This chapter contains the following topics:

- [Security Model](#)
- [Operational Notes](#)
- [Summary of DBMS_JOB Subprograms](#)

99.1 DBMS_JOB Security Model

`DBMS_JOB` uses the same security policies as `DBMS_SCHEDULER`. You must have the `CREATE JOB` privilege to use `DBMS_JOB`.

Jobs cannot be altered or deleted other than jobs owned by the user. This is true for all users including those users granted DBA privileges.

You can execute procedures that are owned by the user for which the user is explicitly granted `EXECUTE`. However, procedures for which the user is granted the execute privilege through roles cannot be executed.

Note that, once a job is started and running, there is no easy way to stop the job.

99.2 DBMS_JOB Operational Notes

These notes describe stopping a job, and working with Oracle Real Application Clusters.

Stopping a Job

Note that, once a job is started and running, there is no easy way to stop the job.

Working with Oracle Real Application Clusters

`DBMS_JOB` supports multi-instance execution of jobs. By default jobs can be executed on any instance, but only one single instance will execute the job. In addition, you can force instance

binding by binding the job to a particular instance. You implement instance binding by specifying an instance number to the instance affinity parameter. Note, however, that in Oracle Database 10g Release 1 (10.1) instance binding is not recommended. Service affinity is preferred. This concept is implemented in the [DBMS_SCHEDULER](#) package.

The following procedures can be used to create, alter or run jobs with instance affinity. Note that not specifying affinity means any instance can run the job.

- `DBMS_JOB.SUBMIT`
- `DBMS_JOB.INSTANCE`
- `DBMS_JOB.CHANGE`
- `DBMS_JOB.RUN`

DBMS_JOB.SUBMIT

To submit a job to the job queue, use the following syntax:

```
DBMS_JOB.SUBMIT(  
  job      OUT   BINARY_INTEGER,  
  what     IN    VARCHAR2,  
  next_date IN   DATE DEFAULT SYSDATE,  
  interval IN   VARCHAR2 DEFAULT 'NULL',  
  no_parse IN   BOOLEAN DEFAULT FALSE,  
  instance IN   BINARY_INTEGER DEFAULT ANY_INSTANCE,  
  force    IN   BOOLEAN DEFAULT FALSE);
```

Use the parameters `instance` and `force` to control job and instance affinity. The default value of `instance` is 0 (zero) to indicate that any instance can execute the job. To run the job on a certain instance, specify the `instance` value. Oracle displays error ORA-23319 if the `instance` value is a negative number or `NULL`.

The `force` parameter defaults to `false`. If `force` is `TRUE`, any positive integer is acceptable as the job instance. If `force` is `FALSE`, the specified instance must be running, or Oracle displays error number ORA-23428.

DBMS_JOB.INSTANCE

To assign a particular instance to execute a job, use the following syntax:

```
DBMS_JOB.INSTANCE(  JOB IN BINARY_INTEGER,  
  instance          IN BINARY_INTEGER,  
  force             IN BOOLEAN DEFAULT FALSE);
```

The `FORCE` parameter in this example defaults to `FALSE`. If the `instance` value is 0 (zero), job affinity is altered and any available instance can execute the job despite the value of `force`. If the `INSTANCE` value is positive and the `FORCE` parameter is `FALSE`, job affinity is altered only if the specified instance is running, or Oracle displays error ORA-23428.

If the `force` parameter is `TRUE`, any positive integer is acceptable as the job instance and the job affinity is altered. Oracle displays error ORA-23319 if the `instance` value is negative or `NULL`.

DBMS_JOB.CHANGE

To alter user-definable parameters associated with a job, use the following syntax:

```
DBMS_JOB.CHANGE(  JOB IN BINARY_INTEGER,
what              IN VARCHAR2 DEFAULT NULL,
next_date         IN DATE DEFAULT NULL,
interval          IN VARCHAR2 DEFAULT NULL,
instance          IN BINARY_INTEGER DEFAULT NULL,
force             IN BOOLEAN DEFAULT FALSE );
```

Two parameters, `instance` and `force`, appear in this example. The default value of `instance` is `null` indicating that job affinity will not change.

The default value of `force` is `FALSE`. Oracle displays error `ORA-23428` if the specified instance is not running and error `ORA-23319` if the `instance` number is negative.

DBMS_JOB.RUN

The `force` parameter for `DBMS_JOB.RUN` defaults to `FALSE`. If `force` is `TRUE`, instance affinity is irrelevant for running jobs in the foreground process. If `force` is `FALSE`, the job can run in the foreground only in the specified instance. Oracle displays error `ORA-23428` if `force` is `FALSE` and the connected instance is the incorrect instance.

```
DBMS_JOB.RUN(
  job      IN BINARY_INTEGER,
  force    IN BOOLEAN DEFAULT FALSE);
```

99.3 Summary of DBMS_JOB Subprograms

This table lists the `DBMS_JOB` subprograms and briefly describes them.

Table 99-1 DBMS_JOB Package Subprograms

| Subprogram | Description |
|--|--|
| BROKEN Procedure | Disables job execution |
| CHANGE Procedure | Alters any of the user-definable parameters associated with a job |
| INSTANCE Procedure | Assigns a job to be run by a instance |
| INTERVAL Procedure | Alters the interval between executions for a specified job |
| NEXT_DATE Procedure | Alters the next execution time for a specified job |
| REMOVE Procedure | Removes specified job from the job queue |
| RUN Procedure | Forces a specified job to run |
| SUBMIT Procedure | Submits a new job to the job queue |
| USER_EXPORT Procedures | Re-creates a given job for export, or re-creates a given job for export with instance affinity |
| WHAT Procedure | Alters the job description for a specified job |

99.3.1 BROKEN Procedure

This procedure sets the broken flag. Broken jobs are never run.

Syntax

```
DBMS_JOB.BROKEN (
  job      IN BINARY_INTEGER,
```

```
broken    IN  BOOLEAN,
next_date IN  DATE DEFAULT SYSDATE);
```

Parameters

Table 99-2 BROKEN Procedure Parameters

| Parameter | Description |
|-----------|---|
| job | System-assigned ID of the job being run. To find this ID, query the JOB column of the USER_JOBS or DBA_JOBS view. |
| broken | Sets the job as broken or not broken. TRUE sets it as broken; FALSE sets it as not broken. |
| next_date | Next date when the job will be run. |

Note:

If you set job as broken while it is running, Oracle resets the job's status to normal after the job completes. Therefore, only execute this procedure for jobs that are not running.

Usage Notes

- Your job will not be available for processing by the job queue in the background until it is committed.
- If a job fails 16 times in a row, Oracle automatically sets it as broken and then stops trying to run it.

99.3.2 CHANGE Procedure

This procedure changes any of the fields a user can set in a job.

Syntax

```
DBMS_JOB.CHANGE (
  job        IN  BINARY_INTEGER,
  what       IN  VARCHAR2,
  next_date  IN  DATE,
  interval   IN  VARCHAR2,
  instance   IN  BINARY_INTEGER DEFAULT NULL,
  force      IN  BOOLEAN DEFAULT FALSE);
```

Parameters

Table 99-3 CHANGE Procedure Parameters

| Parameter | Description |
|-----------|---|
| job | System-assigned ID of the job being run. To find this ID, query the JOB column of the USER_JOBS or DBA_JOBS view. |
| what | PL/SQL procedure to run. |

Table 99-3 (Cont.) CHANGE Procedure Parameters

| Parameter | Description |
|-----------|---|
| next_date | Next date when the job will be run. |
| interval | Date function; evaluated immediately before the job starts running. |
| instance | When a job is submitted, specifies which instance can run the job. This defaults to NULL, which indicates that instance affinity is not changed. |
| force | If this is FALSE, then the specified instance (to which the instance number change) must be running. Otherwise, the routine raises an exception. If this is TRUE, then any positive integer is acceptable as the job instance. |

Usage Notes

- Your job will not be available for processing by the job queue in the background until it is committed.
- The parameters `instance` and `force` are added for job queue affinity. Job queue affinity gives users the ability to indicate whether a particular instance or any instance can run a submitted job.
- If the parameters `what`, `next_date`, or `interval` are NULL, then leave that value as it is.

Example

```
BEGIN
  DBMS_JOB.CHANGE(14144, null, null, 'sysdate+3');
  COMMIT;
END;
```

99.3.3 INSTANCE Procedure

This procedure changes job instance affinity.

Syntax

```
DBMS_JOB.INSTANCE (
  job          IN BINARY_INTEGER,
  instance     IN BINARY_INTEGER,
  force        IN BOOLEAN DEFAULT FALSE);
```

Parameters

Table 99-4 INSTANCE Procedure Parameters

| Parameter | Description |
|-----------|--|
| job | System-assigned ID of the job being run. To find this ID, query the <code>JOB</code> column of the <code>USER_JOBS</code> or <code>DBA_JOBS</code> view. |
| instance | When a job is submitted, a user can specify which instance can run the job. |

Table 99-4 (Cont.) INSTANCE Procedure Parameters

| Parameter | Description |
|-----------|--|
| force | If this is <code>TRUE</code> , then any positive integer is acceptable as the job instance. If this is <code>FALSE</code> (the default), then the specified instance must be running; otherwise the routine raises an exception. |

Usage Notes

Your job will not be available for processing by the job queue in the background until it is committed.

99.3.4 INTERVAL Procedure

This procedure changes how often a job runs.

Syntax

```
DBMS_JOB.INTERVAL (
    job          IN  BINARY_INTEGER,
    interval     IN  VARCHAR2);
```

Parameters

Table 99-5 INTERVAL Procedure Parameters

| Parameter | Description |
|-----------|--|
| job | System-assigned ID of the job being run. To find this ID, query the <code>JOB</code> column of the <code>USER_JOBS</code> or <code>DBA_JOBS</code> view. |
| interval | Date function, evaluated immediately before the job starts running. |

Usage Notes

- If the job completes successfully, then this new date is placed in `next_date`. `interval` is evaluated by plugging it into the statement `select interval into next_date from dual`;
- The `interval` parameter must evaluate to a time in the future. Legal intervals include:

| Interval | Description |
|--------------------------------|-------------------------|
| 'sysdate + 7' | Run once a week. |
| 'next_day(sysdate, 'TUESDAY')' | Run once every Tuesday. |
| 'null' | Run only once. |

- If `interval` evaluates to `NULL` and if a job completes successfully, then the job is automatically deleted from the queue.
- Your job will not be available for processing by the job queue in the background until it is committed.

99.3.5 NEXT_DATE Procedure

This procedure changes when an existing job next runs.

Syntax

```
DBMS_JOB.NEXT_DATE (  
    job          IN  BINARY_INTEGER,  
    next_date IN  DATE);
```

Parameters

Table 99-6 NEXT_DATE Procedure Parameters

| Parameter | Description |
|-----------|---|
| job | System-assigned ID of the job being run. To find this ID, query the JOB column of the USER_JOBS or DBA_JOBS view. |
| next_date | Date of the next refresh: it is when the job will be automatically run, assuming there are background processes attempting to run it. |

Usage Notes

Your job will not be available for processing by the job queue in the background until it is committed.

99.3.6 REMOVE Procedure

This procedure removes an existing job from the job queue. This currently does not stop a running job.

Syntax

```
DBMS_JOB.REMOVE (  
    job          IN  BINARY_INTEGER );
```

Parameters

Table 99-7 REMOVE Procedure Parameters

| Parameter | Description |
|-----------|---|
| job | System-assigned ID of the job being run. To find this ID, query the JOB column of the USER_JOBS or DBA_JOBS view. |

Usage Notes

Your job will not be available for processing by the job queue in the background until it is committed.

Example

```
BEGIN  
    DBMS_JOB.REMOVE (14144);
```

```
COMMIT;
END;
```

99.3.7 RUN Procedure

This procedure runs job `JOB` now. It runs it even if it is broken.

Running the job recomputes `next_date`. See data dictionary view `USER_JOBS` or `DBA_JOBS`.

Syntax

```
DBMS_JOB.RUN (
  job      IN  BINARY_INTEGER,
  force    IN  BOOLEAN DEFAULT FALSE);
```

Parameters

Table 99-8 RUN Procedure Parameters

| Parameter | Description |
|--------------------|---|
| <code>job</code> | System-assigned ID of the job being run. To find this ID, query the <code>JOB</code> column of the <code>USER_JOBS</code> or <code>DBA_JOBS</code> view. |
| <code>force</code> | If this is <code>TRUE</code> , then instance affinity is irrelevant for running jobs in the foreground process. If this is <code>FALSE</code> , then the job can be run in the foreground only in the specified instance. |

Example

```
EXECUTE DBMS_JOB.RUN(14144);
```

WARNING:

This re-initializes the current session's packages.

Exceptions

An exception is raised if `force` is `FALSE`, and if the connected instance is the wrong one.

99.3.8 SUBMIT Procedure

This procedure submits a new job. It chooses the job from the sequence `sys.jobseq`.

Syntax

```
DBMS_JOB.SUBMIT (
  job      OUT BINARY_INTEGER,
  what     IN  VARCHAR2,
  next_date IN DATE DEFAULT SYSDATE,
  interval IN  VARCHAR2 DEFAULT 'null',
  no_parse IN  BOOLEAN DEFAULT FALSE,
```

```
instance IN BINARY_INTEGER DEFAULT any_instance,
force    IN BOOLEAN DEFAULT FALSE);
```

Parameters

Table 99-9 SUBMIT Procedure Parameters

| Parameter | Description |
|-----------|--|
| job | System-assigned ID of the job being run. To find this ID, query the JOB column of the USER_JOBS or DBA_JOBS view |
| what | <p>PL/SQL text o the job to be run. This must be a valid PL/SQL statement or block of code. For example, to run a stored procedure P, you could pass the string P; (with the semi-colon) to this routine. The SQL that you submit in the what parameter is wrapped in the following PL/SQL block:</p> <pre>DECLARE job BINARY_INTEGER := :job; next_date DATE := :mydate; broken BOOLEAN := FALSE; BEGIN WHAT :mydate := next_date; IF broken THEN :b := 1; ELSE :b := 0; END IF; END;</pre> <p>Ensure that you include the ; semi-colon with the statement.</p> |
| next_date | Next date when the job will be run. |
| interval | Date function that calculates the next time to run the job. The default is NULL. This must evaluate to a either a future point in time or NULL. |
| no_parse | <p>A flag. The default is FALSE. If this is set to FALSE, then Oracle parses the procedure associated with the job. If this is set to TRUE, then Oracle parses the procedure associated with the job the first time that the job is run.</p> <p>For example, if you want to submit a job before you have created the tables associated with the job, then set this to TRUE.</p> |
| instance | When a job is submitted, specifies which instance can run the job. |
| force | If this is TRUE, then any positive integer is acceptable as the job instance. If this is FALSE (the default), then the specified instance must be running; otherwise the routine raises an exception. |

Usage Notes

- Your job will not be available for processing by the job queue in the background until it is committed.
- The parameters instance and force are added for job queue affinity. Job queue affinity gives users the ability to indicate whether a particular instance or any instance can run a submitted job.

Example

This submits a new job to the job queue. The job calls the procedure DBMS_DDL.ANALYZE_OBJECT to generate optimizer statistics for the table DQUON.ACCOUNTS. The

statistics are based on a sample of half the rows of the `ACCOUNTS` table. The job is run every 24 hours:

```
VARIABLE jobno number;
BEGIN
  DBMS_JOB.SUBMIT(:jobno,
    'dbms_ddl.analyze_object(''TABLE'',
    ''DQUON'', ''ACCOUNTS'',
    ''ESTIMATE'', NULL, 50);'
    SYSDATE, 'SYSDATE + 1');
  COMMIT;
END;
/
Statement processed.
print jobno
JOBNO
-----
14144
```

99.3.9 USER_EXPORT Procedures

There are two overloaded procedures. The first produces the text of a call to re-create the given job. The second alters instance affinity (8i and after) and preserves the compatibility.

Syntax

```
DBMS_JOB.USER_EXPORT (
  job      IN      BINARY_INTEGER,
  mycall   IN OUT  VARCHAR2);

DBMS_JOB.USER_EXPORT (
  job      IN      BINARY_INTEGER,
  mycall   IN OUT  VARCHAR2,
  myinst   IN OUT  VARCHAR2);
```

Parameters

Table 99-10 USER_EXPORT Procedure Parameter

| Parameter | Description |
|-----------|--|
| job | System-assigned ID of the job being run. To find this ID, query the <code>JOB</code> column of the <code>USER_JOBS</code> or <code>DBA_JOBS</code> view. |
| mycall | Text of a call to re-create the given job. |
| myinst | Text of a call to alter instance affinity. |

99.3.10 WHAT Procedure

This procedure changes what an existing job does, and replaces its environment.

Syntax

```
DBMS_JOB.WHAT (
  job      IN  BINARY_INTEGER,
  what     IN  VARCHAR2);
```

Parameters

Table 99-11 WHAT Procedure Parameters

| Parameter | Description |
|-----------|---|
| job | System-assigned ID of the job being run. To find this ID, query the JOB column of the USER_JOBS or DBA_JOBS view. |
| what | PL/SQL procedure to run. |

Usage Notes

- Your job will not be available for processing by the job queue in the background until it is committed.
- Some legal values of `what` (assuming the routines exist) are:
 - `'myproc(''10-JAN-82'', next_date, broken);'`
 - `'scott.emppackage.give_raise(''JENKINS'', 30000.00);'`
 - `'dbms_job.remove(job);'`

100

DBMS_JSON

The `DBMS_JSON` package provides an interface for data-guide operations.

This chapter contains the following topics:

- [DBMS_JSON Overview](#)
- [DBMS_JSON Security Model](#)
- [DBMS_JSON Constants](#)
- [Summary of DBMS_JSON Subprograms](#)

100.1 DBMS_JSON Overview

Package `DBMS_JSON` provides subprograms for manipulating JavaScript Object Notation (JSON) data that is stored in Oracle Database.

100.2 DBMS_JSON Security Model

`PUBLIC` is granted the `EXECUTE` privilege on package `DBMS_JSON`. Its subprograms execute with invoker's rights privileges.

100.3 DBMS_JSON Constants

The `DBMS_JSON` package uses these constants to define the JSON schema types and data-guide formatting options.

Table 100-1 DBMS_JSON Constants Defined for JSON Data-Guide Formatting

| Name | Value | Description |
|----------------------------------|-------|--|
| <code>FORMAT_FLAT</code> | 2 | Display flat format |
| <code>FORMAT_HIERARCHICAL</code> | 1 | Display hierarchical format |
| <code>PRETTY</code> | 1 | Use appropriate indentation to improve readability |

Table 100-2 DBMS_JSON Constants for JSON Schema Types

| Name | Type | Value | Description |
|---------------------------|------------------------|-------|----------------------------------|
| <code>TYPE_ARRAY</code> | <code>NUMBER(2)</code> | 6 | A JSON array |
| <code>TYPE_BOOLEAN</code> | <code>NUMBER(2)</code> | 2 | A JSON boolean |
| <code>TYPE_GEOJSON</code> | <code>NUMBER(2)</code> | 7 | Geographic JSON data |
| <code>TYPE_NULL</code> | <code>NUMBER(2)</code> | 1 | The JSON <code>NULL</code> value |
| <code>TYPE_NUMBER</code> | <code>NUMBER(2)</code> | 3 | A JSON number |
| <code>TYPE_OBJECT</code> | <code>NUMBER(2)</code> | 5 | A JSON object |

Table 100-2 (Cont.) DBMS_JSON Constants for JSON Schema Types

| Name | Type | Value | Description |
|-----------------|-----------|-------|---|
| TYPE_STRING | NUMBER(2) | 4 | A JSON string |
| TYPE_BINARY | NUMBER(2) | 17 | Oracle extended JSON type binary |
| TYPE_DATE | NUMBER(2) | 13 | Oracle extended JSON type date |
| TYPE_DOUBLE | NUMBER(2) | 12 | Oracle extended JSON type double |
| TYPE_DSINTERVAL | NUMBER(2) | 16 | Oracle extended JSON type day-second interval |
| TYPE_FLOAT | NUMBER(2) | 11 | Oracle extended JSON type float |
| TYPE_TIMESTAMP | NUMBER(2) | 14 | Oracle extended JSON type timestamp |
| TYPE_YMINTERVAL | NUMBER(2) | 15 | Oracle extended JSON type year-month interval |

Table 100-3 DBMS_JSON Constants for mvrefreshmode Parameter

| Name | Type | Value | Description |
|-------------------------|-----------|-------|--|
| MV_REFRESH_ON_STATEMENT | NUMBER(2) | 1 | Creates the materialized view with refresh on statement. |
| MV_REFRESH_ON_COMMIT | NUMBER(2) | 2 | Creates the materialized view with refresh on commit. |
| MV_REFRESH_ON_DEMAND | NUMBER(2) | 3 | Creates the materialized view with refresh on demand. |

See Also:

JSON Developer's Guide

100.4 Summary of DBMS_JSON Subprograms

This table lists the DBMS_JSON subprograms and briefly describes them.

DBMS_JSON Package Subprograms

| Subprogram | Description |
|---|---|
| ADD_VIRTUAL_COLUMNS Procedure | Add virtual columns based on data-guide information. This has no effect when running on the shard catalog server — no virtual column is added. |
| CREATE_VIEW Procedure | Create a view with relational columns and scalar JSON fields as specified in a data guide. |

| Subprogram | Description |
|--|--|
| CREATE_VIEW_ON_PATH Procedure | Create a view based on data-guide information, with relational columns, top-level scalar types, and fully expanded sub-tree under a given path. When running on the shard catalog server this raises an error stating that the data guide is empty. |
| DROP_VIRTUAL_COLUMNS Procedure | Drop virtual columns created by procedure <code>add_virtual_columns</code> . This has no effect when running on the shard catalog server. |
| GET_INDEX_DATAGUIDE Function | Get JSON data guide from a data guide-enabled JSON search index. When running on the shard catalog server this returns a single empty row as result. |
| GET_VIEW_SQL Function | Get the data definition language (DDL) statement for creating a view without actually creating the view. |
| RENAME_COLUMN Procedure | Set the preferred name for a view column or a virtual column creating using a data guide. This has no effect when running on the shard catalog server. |

**Note:**

In the context of sharding, each individual shard maintains its own data-guide information, which is obtained from the JSON documents stored in that shard. When running on individual shard, procedures in this package that use data-guide information use only the information that is maintained for that shard.

100.4.1 ADD_VIRTUAL_COLUMNS Procedure

This procedure adds virtual columns based on the data guide.

The virtual column name is the value of `o:preferred_vc_name` in the data guide. The procedure ignores JSON objects, arrays, and fields under arrays in the data guide. Before it adds virtual columns, procedure `ADD_VIRTUAL_COLUMNS` first drops any existing virtual columns that were projected from fields in the same JSON column by a previous invocation of `ADD_VIRTUAL_COLUMNS` or by data-guide change-trigger procedure `add_vc` (in effect, it does what procedure `DBMS_JSON.DROP_VIRTUAL_COLUMNS` does).

**See Also:**

- [DROP_VIRTUAL_COLUMNS Procedure](#)
- *Oracle Database JSON Developer's Guide*

Syntax

```
DBMS_JSON.ADD_VIRTUAL_COLUMNS (
    tablename           IN  VARCHAR2,
    jcolname            IN  VARCHAR2,
    dataguide           IN  CLOB,
    resolvenameconflicts IN  BOOLEAN  DEFAULT FALSE,
    colnameprefix       IN  VARCHAR2  DEFAULT NULL,
    mixedcasecolumns    IN  BOOLEAN  DEFAULT FALSE);
```

For the following signature you must have a data guide-enabled search index on the JSON column. This is not needed for the previous signature.

```
DBMS_JSON.ADD_VIRTUAL_COLUMNS (
    tablename IN  VARCHAR2,
    jcolname  IN  VARCHAR2,
    frequency NUMBER  DEFAULT 0,
    hidden    BOOLEAN  DEFAULT FALSE);
```

Parameters

Table 100-4 ADD_VIRTUAL_COLUMNS Procedure Parameters

| Parameter | Description |
|----------------------|---|
| tablename | Name of the table containing JSON column jcolname. |
| jcolname | Name of the JSON column in table tablename that contains the data from which to create the virtual column. |
| dataguide | The data guide. When o:hidden in the data guide for a particular JSON field is set to TRUE, the corresponding virtual column is added as a hidden column. The default value of o:hidden is FALSE. |
| resolvenameconflicts | By default, if there are any conflicts among o:preferred_column_name, an error is raised. By setting this parameter to TRUE, the procedure automatically resolves the virtual column name conflicts by appending a sequence number. The default value is FALSE. |
| colnameprefix | By default, the virtual column name is the same as the JSON field name. This parameter allows you to add a prefix to the virtual column names. |
| mixedcasecolumns | By default, the virtual column names are case sensitive. If this parameter value is set to FALSE, the virtual column names become non-case-sensitive. |
| frequency | Sets the minimum frequency threshold to display JSON columns. A frequency of 0 means display all JSON columns. Also, all JSON columns are displayed if statistics have not been collected, effectively overriding any value set by this parameter. |
| hidden | TRUE means the added virtual column is hidden; FALSE means it is not. The default is FALSE. |

Usage Notes

Procedure DBMS_STATS.GATHER_STATS collects statistics in the data guide. If the frequency statistic has not been collected, frequency is NULL. Setting the frequency to a value greater than zero means do not include columns for which there are no

frequency statistics collected (statistic is NULL), unless DBMS_STATS.GATHER_STATS has never been executed. In that case, the frequency parameter is ignored and all columns are displayed in the view.

100.4.2 CREATE_VIEW Procedure

This procedure creates a view with relational columns, using scalar JSON fields as specified in the data guide. A data guide-enabled JSON search index is not required for this procedure; the data guide is passed to the procedure.

See Also:

Oracle Database JSON Developer's Guide

Syntax

```
PROCEDURE CREATE_VIEW (
    viewname          VARCHAR2,
    tablename         VARCHAR2,
    jcolname          VARCHAR2,
    dataguide         CLOB,
    resourcepath      VARCHAR2 DEFAULT NULL,
    materialize       BOOLEAN  DEFAULT FALSE,
    mvrefreshmode     NUMBER   DEFAULT MV_REFRESH_ON_STATEMENT,
    path              VARCHAR2 DEFAULT '$',
    resolvernameconflicts  BOOLEAN  DEFAULT FALSE,
    colnameprefix     VARCHAR2 DEFAULT NULL,
    mixedcasecolumns  BOOLEAN  DEFAULT FALSE);
```

Parameters

Table 100-5 DBMS_JSON.CREATE_VIEW Procedure Parameters

| Parameter | Description |
|---------------|---|
| viewname | Name of the view. |
| tablename | Name of the table containing JSON column jcolname. |
| jcolname | Name of the JSON column in table tablename that is used to create the view. |
| dataguide | The data guide. |
| resourcepath | This parameter is for internal use. Value of this parameter is always NULL. |
| materialize | The value of this parameter is boolean and indicates if the view is materialized or not. |
| mvrefreshmode | When materialize is true, this parameter specifies the materialized view refresh mode. For more information on materialized view refresh mode options, see DBMS_JSON Constants . |

Table 100-5 (Cont.) DBMS_JSON.CREATE_VIEW Procedure Parameters

| Parameter | Description |
|----------------------|---|
| path | The path of the JSON field to be expanded. It uses JSON path-expression syntax. It expands the descendants under the specified path, and creates view columns for each scalar value in the resulting sub-tree. The path \$ creates a view starting from the JSON document root. |
| resolvenameconflicts | By default, if there are any conflicts among o:preferred_column_name, an error is raised. By setting this parameter to TRUE, the procedure automatically resolves the virtual column name conflicts by appending a sequence number. The default value is FALSE. |
| colnameprefix | By default, the view column name is the same as the JSON field name. This parameter allows users to provide a prefix to prepend to the view column names. |
| mixedcasecolumns | By default, the view column names are case sensitive. You can use this parameter to change the case sensitivity behavior of the view column names. |

100.4.3 CREATE_VIEW_ON_PATH Procedure

This procedure creates a view with relational columns, using top-level scalar values and the scalar values in the expanded sub-tree under a given path. The JSON column must have a data guide-enabled search index.

See Also:

Oracle Database JSON Developer's Guide

Syntax

```
PROCEDURE CREATE_VIEW_ON_PATH(
    viewname VARCHAR2,
    tablename VARCHAR2,
    jcolname VARCHAR2,
    path VARCHAR2,
    frequency NUMBER DEFAULT 0);
```

Parameters

Table 100-6 CREATE_VIEW_ON_PATH Procedure Parameters

| Parameter | Description |
|-----------|--|
| viewname | Name of the view. |
| tablename | Name of the table containing JSON column jcolname. |
| jcolname | Name of the JSON column in table tablename that is used to create the view. The column must have a data guide-enabled JSON search index, or else an error is raised. |

Table 100-6 (Cont.) CREATE_VIEW_ON_PATH Procedure Parameters

| Parameter | Description |
|------------------------|---|
| <code>path</code> | The path of the JSON field to be expanded. It uses JSON path-expression syntax. It expands the descendants under the specified path, and creates view columns for each scalar value in the resulting sub-tree. The path <code>\$</code> creates a view starting from the JSON document root. |
| <code>frequency</code> | The minimum frequency threshold for displaying the JSON columns. A frequency of 0 means display all JSON columns. All JSON columns are also displayed if statistics have not been collected, effectively overriding any value set by this parameter. The view only displays JSON fields with frequency greater than the given <code>frequency</code> . It does not display JSON fields added after collecting statistics if the given frequency is greater than 0, if their statistic columns are <code>NULL</code> . |

100.4.4 DROP_VIRTUAL_COLUMNS Procedure

Drop all virtual columns that were added using PL/SQL procedure `DBMS_JSON.add_virtual_columns` or using data-guide change-trigger procedure `add_vc`.

See Also:

- [ADD_VIRTUAL_COLUMNS Procedure](#)
- *Oracle Database JSON Developer's Guide*

Syntax

```
PROCEDURE DROP_VIRTUAL_COLUMNS (
    tablename VARCHAR2,
    jcolname VARCHAR2);
```

Parameters

Table 100-7 DBMS_JSON.DROP_VIRTUAL_COLUMNS Procedure Parameters

| Parameter | Description |
|------------------------|--|
| <code>tablename</code> | Name of the table containing JSON column <code>jcolname</code> . |
| <code>jcolname</code> | Name of the JSON column in table <code>tablename</code> . |

100.4.5 GET_INDEX_DATAGUIDE Function

GET_INDEX_DATAGUIDE gets JSON data guide from data guide-enabled JSON search index.

See Also:

Oracle Database JSON Developer's Guide

Syntax

```
FUNCTION GET_INDEX_DATAGUIDE (  
    tablename VARCHAR2,  
    jcolname VARCHAR2,  
    format NUMBER,  
    pretty NUMBER DEFAULT 0)  
RETURN CLOB;
```

Parameters

Table 100-8 DBMS_JSON.GET_INDEX_DATAGUIDE Procedure Parameters

| Parameter | Description |
|-----------|--|
| tablename | Name of the table containing JSON column jcolname. |
| jcolname | Name of the JSON column in table tablename that has a data guide-enabled JSON search index. |
| format | The data-guide format: <ul style="list-style-type: none">• FORMAT_HIERARCHICAL — hierarchical format• FORMAT_FLAT — flat format |
| pretty | A value of DBMS_JSON.PRETTY means pretty-print the data guide, using indentation to improve readability. |

Example 100-1 Example Get Data Guide in Hierarchical Pretty Format

This example returns the data guide in hierarchical format.

```
SELECT DBMS_JSON.GET_INDEX_DATAGUIDE('T1', 'PO',  
DBMS_JSON.FORMAT_HIERARCHICAL, DBMS_JSON.PRETTY)  
FROM DUAL;
```

100.4.6 GET_VIEW_SQL Function

This function returns the creating view DDL without actually creating the view. A data guide-enabled JSON search index is not required for this function; the data guide is passed to the function.

See Also:

Oracle Database JSON Developer's Guide

Syntax

```
FUNCTION GET_VIEW_SQL (
    viewname          VARCHAR2,
    tablename         VARCHAR2,
    jcolname          VARCHAR2,
    dataguide         CLOB,
    materialize       BOOLEAN DEFAULT FALSE,
    mvrefreshmode     NUMBER  DEFAULT MV_REFRESH_ON_STATEMENT,
    path              VARCHAR2 DEFAULT '$',
    resolvenameconflicts  BOOLEAN DEFAULT FALSE,
    colnameprefix     VARCHAR2 DEFAULT NULL,
    mixedcasecolumns  BOOLEAN DEFAULT TRUE)
RETURN CLOB;
```

Parameters

Table 100-9 DBMS_JSON.GET_VIEW_SQL Function Parameters

| Parameter | Description |
|---------------|--|
| viewname | Name of the view. |
| tablename | Name of the table containing JSON column <code>jcolname</code> . |
| jcolname | Name of the JSON column in table <code>tablename</code> that is used to create the view. |
| dataguide | The data guide. |
| materialize | The value of this parameter is Boolean and indicates if the view is materialized or not. |
| mvrefreshmode | When <code>materialize</code> is true, this parameter specifies the materialized view refresh mode. For more information on materialized view refresh mode options, see DBMS_JSON Constants . |
| path | The path of the JSON field to be expanded. It uses JSON path-expression syntax. It expands the descendants under the specified path, and creates view columns for each scalar value in the resulting sub-tree. The path <code>\$</code> creates a view starting from the JSON document root. |

Table 100-9 (Cont.) DBMS_JSON.GET_VIEW_SQL Function Parameters

| Parameter | Description |
|-----------------------------------|--|
| <code>resolvenameconflicts</code> | By default, if there are any conflicts among <code>o:preferred_column_name</code> , an error is raised. By setting this parameter to <code>TRUE</code> , the function automatically resolves the virtual column name conflicts by appending a sequence number. The default value is <code>FALSE</code> . |
| <code>colnameprefix</code> | By default, the view column name is the same as the JSON field name. This parameter allows users to provide a prefix to prepend to the view column names. |
| <code>mixedcasecolumns</code> | By default, the view column names are case sensitive. You can use this parameter to change the case sensitivity behavior of the view column names. |

Usage Notes

- When `viewname` is `NULL`, the function returns only the select statement of the view DDL and it can select more than 1000 columns.
- When `viewname` is not `NULL`, the function returns create view DDL and it selects at most 1000 columns.
- As one `json_table` can only produce at most 1000 columns, the function will split paths into joins among multiple `json_tables` if the paths are more than 1000, when `viewname` is `NULL`.

100.4.7 RENAME_COLUMN Procedure

This procedure sets the preferred name for a JSON column, to be used by the create view, or add virtual columns procedure.

**See Also:**

Oracle Database JSON Developer's Guide

Syntax

```
PROCEDURE RENAME_COLUMN(
    tablename VARCHAR2,
    jcolname VARCHAR2,
    path VARCHAR2,
    type NUMBER,
    preferred_name VARCHAR2);
```

Parameters

Table 100-10 RENAME_COLUMN Procedure Parameters

| Parameter | Description |
|----------------|--|
| tablename | Name of the table containing JSON column jcolname. |
| jcolname | Name of the JSON column in table tablename. It must have a data guide-enabled JSON search index, or else an error is raised. |
| path | Path to the JSON field on which to set the preferred column name. |
| type | The type of the JSON field targeted by path. Two JSON fields can have the same path if they are of different types. Possible values: <ul style="list-style-type: none">• TYPE_NULL• TYPE_STRING• TYPE_NUMBER• TYPE_BOOLEAN• TYPE_OBJECT• TYPE_ARRAY |
| preferred_name | Preferred name for the JSON field specified by path. If there is a name conflict, a system generated name is used instead. |

Example 100-2 Example Renaming a Column

This example renames a field to item_name.

```
EXEC DBMS_JSON.RENAME_COLUMN('T1', 'PO', '$.purchaseOrder.items.name',  
DBMS_JSON.TYPE_STRING, 'item_name');
```

101

DBMS_LDAP

The DBMS_LDAP package lets you access data from LDAP servers.

For a complete description of this package within the context of Oracle Internet Directory, see `DBMS_LDAP` in the *Application Developer's Guide for Oracle Identity Management*.

DBMS_LDAP_UTL

The DBMS_LDAP_UTL package contains the Oracle Extension utility functions.

For a complete description of this package within the context of Oracle Internet Directory, see DBMS_LDAP_UTL in the [Application Developer's Guide for Oracle Identity Management](#).

DBMS_LIBCACHE

The `DBMS_LIBCACHE` package consists of one subprogram that prepares the library cache on an Oracle instance by extracting SQL and PL/SQL from a remote instance and compiling this SQL locally without execution. The value of compiling the cache of an instance is to prepare the information the application requires to execute in advance of failover or switchover.

This chapter contains the following topics:

- [Overview](#)
- [Security Model](#)
- [Summary of DBMS_LIBCACHE Subprograms](#)

103.1 DBMS_LIBCACHE Overview

Compiling a shared cursor consists of open, parse, and bind operations, plus the type-checking and execution plan functions performed at the first execution. All of these steps are executed in advance by the package `DBMS_LIBCACHE` for `SELECT` statements.

The open and parse functions are executed in advance for PL/SQL and DML. For PL/SQL, executing the parse phase has the effect of loading all library cache heaps other than the `MCODE`.

103.2 DBMS_LIBCACHE Security Model

To execute `DBMS_LIBCACHE` you must directly access the same objects as do SQL statements. You can best accomplish this by utilizing the same user id as the original system on the remote system.

When there are multiple schema users, `DBMS_LIBCACHE` should be called for each.

Alternatively, `DBMS_LIBCACHE` may be called with the generic user `PARSER`. However, this user cannot parse the SQL that uses objects with access granted through roles. This is a standard PL/SQL security limitation.

103.3 Summary of DBMS_LIBCACHE Subprograms

The `DBMS_LIBCACHE` package includes the `COMPILE_FROM_REMOTE` procedure subprogram.

Table 103-1 *DBMS_LIBCACHE Package Subprograms*

| Subprogram | Description |
|---|--|
| COMPILE_FROM_REMOTE Procedure | Extracts SQL in batch from the source instance and compiles the SQL at the target instance |

103.3.1 COMPILE_FROM_REMOTE Procedure

This procedure extracts SQL in batch from the source instance and compiles the SQL at the target instance.

Syntax

```
DBMS_LIBCACHE.COMPILE_FROM_REMOTE (
  p_db_link          IN      dbms_libcache$def.db_link%type,
  p_username         IN      VARCHAR2 default null,
  p_threshold_executions IN  NATURAL default 3,
  p_threshold_sharable_mem IN NATURAL default 1000,
  p_parallel_degree  IN      NATURAL default 1);
```

Parameters

Table 103-2 COMPILE_FROM_REMOTE Procedure Parameters

| Parameter | Description |
|------------------------|--|
| p_db_link | Database link to the source name (mandatory). The database link pointing to the instance that will be used for extracting the SQL statements. The user must have the role <code>SELECT_ON_CATALOG</code> at the source instance. For improved security, the connection may use a password file or LDAP authentication. The database link is mandatory only for releases with <code>dbms_libcache\$def.ACCESS_METHOD = DB_LINK_METHOD</code> |
| p_instance_name | (Reserved for future use). The name of the instance that will be used for extracting the SQL statements. The instance name must be unique for all instances excluding the local instance. The name is not case sensitive. |
| p_username | Source username (default is all users). The name of the username that will be used for extracting the SQL statements. The username is an optional parameter that is used to ensure the parsing user id is the same as that on the source instance. For an application where users connect as a single <code>user_id</code> , for example <code>APPS</code> , <code>APPS</code> is the parsing <code>user_id</code> that is recorded in the shared pool. To select only SQL statements parsed by <code>APPS</code> , enter the string 'APPS' in this field. To also select statements executed by batch, repeat the executing the procedure with the schema owner, for example <code>GL</code> . If the username is supplied, it must be valid. The name is not case sensitive. |
| p_threshold_executions | The lower bound for the number of executions, below which a SQL statement will not be selected for parsing. This parameter is optional. It allows the application to extract and compile statements with executions, for example, greater than 3. The default value is 1. This means SQL statements that have never executed, including invalid SQL statements, will not be extracted. |

Table 103-2 (Cont.) COMPILE_FROM_REMOTE Procedure Parameters

| Parameter | Description |
|---------------------------------------|--|
| <code>p_threshold_sharable_mem</code> | The lower bound for the size of the shared memory consumed by the cursors on the source instance. Below this value a SQL statement will not be selected for parsing. This parameter is optional. It allows the application to extract and compile statements with shared memory for example, greater than 10000 bytes. |
| <code>p_parallel_degree</code> | The number of parallel jobs that execute to complete the parse operation. These tasks are spawned as parallel jobs against a sub-range of the SQL statements selected for parsing. This parameter is reserved for parallel compile jobs which are currently not implemented. |

DBMS_LOB

The `DBMS_LOB` package provides subprograms to operate on BLOBs, CLOBs, NCLOBs, BFILEs, and temporary LOBs. You can use `DBMS_LOB` to access and manipulate specific parts of a LOB or complete LOBs.

This chapter contains the following topics:

- [Overview](#)
- [Security Model](#)
- [Constants](#)
- [Datatypes](#)
- [Operational Notes](#)
- [Rules and Limits](#)
- [Exceptions](#)
- [Summary of DBMS_LOB Subprograms](#)

See Also:

Oracle Database SecureFiles and Large Objects Developer's Guide

104.1 DBMS_LOB Overview

`DBMS_LOB` can read and modify BLOBs, CLOBs, and NCLOBs; it provides read-only operations for BFILEs. The bulk of the LOB operations are provided by this package.

104.2 DBMS_LOB Security Model

This package must be created under `SYS`. Operations provided by this package are performed under the current calling user, not under the package owner `SYS`.

Any `DBMS_LOB` subprogram called from an anonymous PL/SQL block is executed using the privileges of the current user. Any `DBMS_LOB` subprogram called from a stored procedure is executed using the privileges of the owner of the stored procedure.

When creating the procedure, users can set the `AUTHID` to indicate whether they want definer's rights or invoker's rights. For example:

```
CREATE PROCEDURE procl AUTHID DEFINER ...
```

or

```
CREATE PROCEDURE procl AUTHID CURRENT_USER ...
```

 **See Also:**

For more information on AUTHID and privileges, see *Oracle Database PL/SQL Language Reference*

You can provide secure access to BFILEs using the DIRECTORY feature discussed in BFILENAME function in the *Oracle Database SecureFiles and Large Objects Developer's Guide* and the *Oracle Database SQL Language Reference*.

For information about the security model pertaining to temporary LOBs, see [Operational Notes](#).

104.3 DBMS_LOB Constants

This topic describes the constants used by the DBMS_LOB package

These are shown in following tables:

- [Table 104-1](#)
- [Table 104-2](#)
- [Table 104-3](#)
- [Table 104-4](#)
- [Table 104-5](#)
- [Table 104-6](#)

Table 104-1 DBMS_LOB Constants - Basic

| Constant | Type | Value | Description |
|---------------|----------------|----------------------|---|
| CALL | PLS_INTEGER | 12 | Create the TEMP LOB with call duration |
| FILE_READONLY | BINARY_INTEGER | 0 | Open the specified BFILE read-only |
| LOB_READONLY | BINARY_INTEGER | 0 | Open the specified LOB read-only |
| LOB_READWRITE | BINARY_INTEGER | 1 | Open the specified LOB read-write |
| LOBMAXSIZE | INTEGER | 18446744073709551615 | Maximum size of a LOB in bytes |
| SESSION | PLS_INTEGER | 10 | Create the TEMP LOB with session duration |

Table 104-2 DBMS_LOB Constants - Option Types

| Constant | Definition | Value | Description |
|--------------|----------------|-------|--|
| OPT_COMPRESS | BINARY_INTEGER | 1 | Set/Get the SECUREFILE compress option value |

Table 104-2 (Cont.) DBMS_LOB Constants - Option Types

| Constant | Definition | Value | Description |
|-----------------|----------------|-------|---|
| OPT_DEDUPLICATE | BINARY_INTEGER | 4 | Set/Get the SECUREFILE Deduplicate option value |
| OPT_ENCRYPT | BINARY_INTEGER | 2 | Get the SECUREFILE encrypt option value |

Table 104-3 DBMS_LOB Constants - Option Values

| Constant | Definition | Value | Description |
|-----------------|----------------|-------|---|
| COMPRESS_OFF | BINARY_INTEGER | 0 | For SETOPTIONS Procedures , set compress off; for GETOPTIONS Functions , compress is off |
| COMPRESS_ON | BINARY_INTEGER | 1 | For SETOPTIONS Procedures , set compress on; for GETOPTIONS Functions , compress is on |
| DEDUPLICATE_OFF | BINARY_INTEGER | 0 | For SETOPTIONS Procedures , set deduplicate is off; for GETOPTIONS Functions , deduplicate is off |
| DEDUPLICATE_ON | BINARY_INTEGER | 4 | For SETOPTIONS Procedures , set deduplicate is on; for GETOPTIONS Functions , deduplicate is on |
| ENCRYPT_OFF | BINARY_INTEGER | 0 | For GETOPTIONS Functions , encrypt is off |
| ENCRYPT_ON | BINARY_INTEGER | 2 | For GETOPTIONS Functions , encrypt is on |

Table 104-4 DBMS_LOB Constants - DBFS State Value Types

| Constant | Definition | Value | Description |
|-----------------|-------------|-------|---|
| DBFS_LINK_NEVER | PLS_INTEGER | 0 | LOB has never been archived |
| DBFS_LINK_NO | PLS_INTEGER | 2 | LOB was archived, but as been read back in to the RDBMS |
| DBFS_LINK_YES | PLS_INTEGER | 1 | LOB is currently archived |

Table 104-5 DBMS_LOB Constants - DBFS Cache Flags

| Constant | Definition | Value | Description |
|-------------------|-------------|-------|---|
| DBFS_LINK_CACHE | PLS_INTEGER | 1 | Put the LOB data to the archive, but keep the data in the RDBMS as a cached version |
| DBFS_LINK_NOCACHE | PLS_INTEGER | 0 | Put the LOB data to the archive, and remove the data from the RDBMS. |

Table 104-6 DBMS_LOB Constants - Miscellaneous

| Constant | Definition | Value | Description |
|-------------------------|-------------|-------|--|
| CONTENTTYPE_MAX_SIZE | PLS_INTEGER | 128 | Maximum number of bytes allowed in the content type string |
| DBFS_LINK_PATH_MAX_SIZE | PLS_INTEGER | 1024 | The maximum length of DBFS pathnames |

104.4 DBMS_LOB Datatypes

The table in this topic describes the datatypes used by DBMS_LOB.

Table 104-7 Datatypes Used by DBMS_LOB

| Type | Description |
|----------|--|
| BLOB | Source or destination binary LOB. |
| RAW | Source or destination RAW buffer (used with BLOB). |
| CLOB | Source or destination character LOB (including NCLOB). |
| VARCHAR2 | Source or destination character buffer (used with CLOB and NCLOB). |
| INTEGER | Specifies the size of a buffer or LOB, the offset into a LOB, or the amount to access. |
| BFILE | Large, binary object stored outside the database. |

The DBMS_LOB package defines no special types.

An NCLOB is a CLOB for holding fixed-width and varying-width, multibyte national character sets.

The clause ANY_CS in the specification of DBMS_LOB subprograms for CLOBs enables the CLOB type to accept a CLOB or NCLOB locator variable as input.

104.5 DBMS_LOB Operational Notes

All DBMS_LOB subprograms work based on LOB locators. For the successful completion of DBMS_LOB subprograms, you must provide an input locator that represents a LOB that already exists in the database tablespaces or external file system.

See also Chapter 1 of *Oracle Database SecureFiles and Large Objects Developer's Guide*

Starting from 12.2 release, you can select a persistent LOB locator from a remote table into a local variable. The remote column can be of type BLOB, CLOB, or NCLOB. You cannot select BFILE from a remote table. The LOB variable that refers to the LOB value in a remote table is called a remote locator.

All the `DBMS_LOB` APIs other than the ones that are meant for BFILES will now accept and support operations on remote LOB locators. All the APIs that take in two locators must have both LOBs collocated at one database.

See Also:

Distributed LOBs chapter in *Oracle Database SecureFiles and Large Objects Developer's Guide*.

To use LOBs in your database, you must first use SQL data definition language (DDL) to define the tables that contain LOB columns.

- Internal LOBs
- External LOBs
- Temporary LOBs

Internal LOBs

To populate your table with internal LOBs after LOB columns are defined in a table, you use the SQL data manipulation language (DML) to initialize or populate the locators in the LOB columns.

External LOBs

For an external LOB (BFILE) to be represented by a LOB locator, you must:

- Ensure that a `DIRECTORY` object representing a valid, existing physical directory has been defined, and that physical files (the LOBs you plan to add) exist with read permission for the database. If your operating system uses case-sensitive path names, then be sure you specify the directory in the correct format.
- Pass the `DIRECTORY` object and the filename of the external LOB you are adding to the `BFILENAME` function to create a LOB locator for your external LOB.

Once you have completed these tasks, you can insert or update a row containing a LOB column using the specified LOB locator.

After the LOBs are defined and created, you can then `SELECT` from a LOB locator into a local PL/SQL LOB variable and use this variable as an input parameter to `DBMS_LOB` for access to the LOB value.

For details on the different ways to do this, See *Oracle Database SecureFiles and Large Objects Developer's Guide*

Temporary LOBs

The database supports the definition, creation, deletion, access, and update of temporary LOBs. Your temporary tablespace stores the temporary LOB data. Temporary LOBs are not permanently stored in the database. Their purpose is mainly to perform transformations on LOB data.

For temporary LOBs, you must use the OCI, PL/SQL, or another programmatic interface to create or manipulate them. Temporary LOBs can be either `BLOBs`, `CLOBs`, or `NCLOBs`.

A temporary LOB is empty when it is created. By default, all temporary LOBs are deleted at the end of the session in which they were created. If a process dies unexpectedly or if the database crashes, then temporary LOBs are deleted, and the space for temporary LOBs is freed.

There is also an interface to let you group temporary LOBs together into a logical bucket. The duration represents this logical store for temporary LOBs. Each temporary LOB can have separate storage characteristics, such as `CACHE/NOCACHE`. There is a default store for every session into which temporary LOBs are placed if you don't specify a specific duration. Additionally, you are able to perform a free operation on durations, which causes all contents in a duration to be freed.

There is no support for consistent read (CR), undo, backup, parallel processing, or transaction management for temporary LOBs. Because CR and roll backs are not supported for temporary LOBs, you must free the temporary LOB and start over again if you encounter an error.

Because CR, undo, and versions are not generated for temporary LOBs, there is potentially a performance impact if you assign multiple locators to the same temporary LOB. Semantically, each locator should have its own copy of the temporary LOB.

A copy of a temporary LOB is created if the user modifies the temporary LOB while another locator is also pointing to it. The locator on which a modification was performed now points to a new copy of the temporary LOB. Other locators no longer see the same data as the locator through which the modification was made. A deep copy was not incurred by permanent LOBs in these types of situations, because CR snapshots and version pages enable users to see their own versions of the LOB cheaply.

You can gain pseudo-REF semantics by using pointers to locators in OCI and by having multiple pointers to locators point to the same temporary LOB locator, if necessary. In PL/SQL, you must avoid using more than one locator for each temporary LOB. The temporary LOB locator can be passed by reference to other procedures.

Because temporary LOBs are not associated with any table schema, there are no meanings to the terms in-row and out-of-row temporary LOBs. Creation of a temporary LOB instance by a user causes the engine to create and return a locator to the LOB data. The PL/SQL `DBMS_LOB` package, PRO*C/C++, OCI, and other programmatic interfaces operate on temporary LOBs through these locators just as they do for permanent LOBs.

There is no support for client side temporary LOBs. All temporary LOBs reside in the server.

Temporary LOBs do not support the `EMPTY_BLOB` or `EMPTY_CLOB` functions that are supported for permanent LOBs. The `EMPTY_BLOB` function specifies the fact that the LOB is initialized, but not populated with any data.

A temporary LOB instance can only be destroyed by using OCI or the `DBMS_LOB` package by using the appropriate `FREETEMPORARY` or `OCIDurationEnd` statement.

A temporary LOB instance can be accessed and modified using appropriate OCI and `DBMS_LOB` statements, just as for regular permanent internal LOBs. To make a temporary LOB permanent, you must explicitly use the OCI or `DBMS_LOB COPY` command, and copy the temporary LOB into a permanent one.

Security is provided through the LOB locator. Only the user who created the temporary LOB is able to see it. Locators are not expected to be able to pass from one user's

session to another. Even if someone did pass a locator from one session to another, they would not access the temporary LOBs from the original session. Temporary LOB lookup is localized to each user's own session. Someone using a locator from somewhere else is only able to access LOBs within his own session that have the same LOB ID. Users should not try to do this, but if they do, they are not able to affect anyone else's data.

The database keeps track of temporary LOBs for each session in a `v$` view called `V$TEMPORARY_LOBS`, which contains information about how many temporary LOBs exist for each session. `v$` views are for DBA use. From the session, the database can determine which user owns the temporary LOBs. By using `V$TEMPORARY_LOBS` in conjunction with `DBA_SEGMENTS`, a DBA can see how much space is being used by a session for temporary LOBs. These tables can be used by DBAs to monitor and guide any emergency cleanup of temporary space used by temporary LOBs.

The following notes are specific to temporary LOBs:

1. All functions in `DBMS_LOB` return `NULL` if any of the input parameters are `NULL`. All procedures in `DBMS_LOB` raise an exception if the LOB locator is input as `NULL`.
2. Operations based on `CLOBs` do not verify if the character set IDs of the parameters (`CLOB` parameters, `VARCHAR2` buffers and patterns, and so on) match. It is the user's responsibility to ensure this.
3. Data storage resources are controlled by the DBA by creating different temporary tablespaces. DBAs can define separate temporary tablespaces for different users, if necessary.

104.6 DBMS_LOB Rules and Limits

This topic describes general `DBMS_LOB` rules and limits, rules and limits specific to external files (BFILES), and maximum LOB and buffer sizes.

General Rules and Limits

- Oracle Database does not support constraints on columns or attributes whose type is a LOB, with the following exception: `NOT NULL` constraints are supported for a LOB column or attribute.
- The following rules apply in the specification of subprograms in this package:
 - `newlen`, `offset`, and `amount` parameters for subprograms operating on `BLOBs` and `BFILEs` must be specified in terms of *bytes*.
 - `newlen`, `offset`, and `amount` parameters for subprograms operating on `CLOBs` must be specified in terms of *characters*.

In multi-byte character sets, it is not possible to interpret these offsets correctly. As a result, `SUBSTR` raises the following error: `ORA-22998: CLOB or NCLOB in multibyte character set not supported`.

- A subprogram raises an `INVALID_ARGVAL` exception if the following restrictions are not followed in specifying values for parameters (unless otherwise specified):
 1. Only positive, absolute offsets from the beginning of LOB data are permitted: Negative offsets from the tail of the LOB are not permitted.
 2. Only positive, nonzero values are permitted for the parameters that represent size and positional quantities, such as `amount`, `offset`, `newlen`, `nth`, and so on. Negative offsets and ranges observed in SQL string functions and operators are not permitted.
 3. The value of `offset`, `amount`, `newlen`, `nth` must not exceed the value `lobmaxsize 18446744073709551615 (264)` in any `DBMS_LOB` subprogram.
 4. For CLOBs consisting of fixed-width multibyte characters, the maximum value for these parameters must not exceed `(lobmaxsize/character_width_in_bytes)` characters.

For example, if the CLOB consists of 2-byte characters, such as:

```
JAI6SJISFIXED
```

Then, the maximum `amount` value should not exceed:

```
18446744073709551615/2 = 9223372036854775807
```

- PL/SQL language specifications stipulate an upper limit of 32767 bytes (not characters) for `RAW` and `VARCHAR2` parameters used in `DBMS_LOB` subprograms. For example, if you declare a variable to be:

```
charbuf VARCHAR2(3000)
```

Then, `charbuf` can hold 3000 single byte characters or 1500 2-byte fixed width characters. This has an important consequence for `DBMS_LOB` subprograms for CLOBs and NCLOBs.

- The `%CHARSET` clause indicates that the form of the parameter with `%CHARSET` must match the form of the `ANY_CS` parameter to which it refers.

For example, in `DBMS_LOB` subprograms that take a `VARCHAR2` buffer parameter, the form of the `VARCHAR2` buffer must match the form of the CLOB parameter. If the input LOB parameter is of type `NCLOB`, then the buffer must contain `NCHAR` data. Conversely, if the input LOB parameter is of type `CLOB`, then the buffer must contain `CHAR` data.

For `DBMS_LOB` subprograms that take two CLOB parameters, both CLOB parameters must have the same form; that is, they must both be `NCLOBs`, or they must both be `CLOBs`.

- If the value of `amount` plus the `offset` exceeds the maximum LOB size allowed by the database, then access exceptions are raised.

Under these input conditions, read subprograms, such as `READ`, `COMPARE`, `INSTR`, and `SUBSTR`, read until End of Lob/File is reached. For example, for a `READ` operation on a `BLOB` or `BFILE`, if the user specifies offset value of 3 GB and an amount value of 2 GB on a LOB that is 4GB in size, then `READ` returns only 1GB (4GB-3GB) bytes.

- Functions with `NULL` or invalid input values for parameters return a `NULL`. Procedures with `NULL` values for destination LOB parameters raise exceptions.

- Operations involving patterns as parameters, such as `COMPARE`, `INSTR`, and `SUBSTR` do not support regular expressions or special matching characters (such as `%` in the `LIKE` operator in SQL) in the `pattern` parameter or substrings.
- The End Of LOB condition is indicated by the `READ` procedure using a `NO_DATA_FOUND` exception. This exception is raised only upon an attempt by the user to read beyond the end of the LOB. The `READ` buffer for the last read contains 0 bytes.
- For consistent LOB updates, you must lock the row containing the destination LOB before making a call to any of the procedures (mutators) that modify LOB data.
- Unless otherwise stated, the default value for an `offset` parameter is 1, which indicates the first byte in the `BLOB` or `BFILE` data, and the first character in the `CLOB` or `NCLOB` value. No default values are specified for the `amount` parameter — you must input the values explicitly.
- You must lock the row containing the destination internal LOB before calling any subprograms that modify the LOB, such as `APPEND`, `COPY`, `ERASE`, `TRIM`, or `WRITE`. These subprograms do not implicitly lock the row containing the LOB.

Rules and Limits Specific to External Files (BFILES)

- The subprograms `COMPARE`, `INSTR`, `READ`, `SUBSTR`, `FILECLOSE`, `FILECLOSEALL` and `LOADFROMFILE` operate only on an *opened* `BFILE` locator; that is, a successful `FILEOPEN` call must precede a call to any of these subprograms.
- For the functions `FILEEXISTS`, `FILEGETNAME` and `GETLENGTH`, a file's open/close status is unimportant; however, the file must exist physically, and you must have adequate privileges on the `DIRECTORY` object and the file.
- `DBMS_LOB` does not support any concurrency control mechanism for `BFILE` operations.
- In the event of several open files in the session whose closure has not been handled properly, you can use the `FILECLOSEALL` subprogram to close all files opened in the session and resume file operations from the beginning.
- If you are the creator of a `DIRECTORY`, or if you have system privileges, then use the `CREATE OR REPLACE`, `DROP`, and `REVOKE` statements in SQL with extreme caution.

If you, or other grantees of a particular directory object, have several open files in a session, then any of the preceding commands can adversely affect file operations. In the event of such abnormal termination, your only choice is to invoke a program or anonymous block that calls `FILECLOSEALL`, reopen your files, and restart your file operations.

- All files opened during a user session are implicitly closed at the end of the session. However, Oracle strongly recommends that you close the files after *both* normal and abnormal termination of operations on the `BFILE`.

In the event of normal program termination, proper file closure ensures that the number of files that are open simultaneously in the session remains less than `SESSION_MAX_OPEN_FILES`.

In the event of abnormal program termination from a PL/SQL program, it is imperative that you provide an exception handler that ensures closure of all files opened in that PL/SQL program. This is necessary because after an exception occurs, only the exception handler has access to the `BFILE` variable in its most current state.

After the exception transfers program control outside the PL/SQL program block, all references to the open BFILEs are lost. The result is a larger open file count which may or may not exceed the SESSION_MAX_OPEN_FILES value.

For example, consider a READ operation past the end of the BFILE value, which generates a NO_DATA_FOUND exception:

```
-- This assumes a directory 'DDD' whose path is already known
DECLARE
    fil BFILE:= bfilename('DDD', 'filename.foo');
    pos INTEGER;
    amt BINARY_INTEGER;
    buf RAW(40);
BEGIN
    SELECT ad_graphic INTO fil FROM print_media WHERE product_id = 3106;
    dbms_lob.open(fil, dbms_lob.lob_readonly);
    amt := 40; pos := 1 + dbms_lob.getlength(fil); buf := '';
    dbms_lob.read(fil, amt, pos, buf);
    dbms_output.put_line('Read F1 past EOF: '||
        utl_raw.cast_to_varchar2(buf));
    dbms_lob.close(fil);
END;

ORA-01403: no data found
ORA-06512: at "SYS.DBMS_LOB", line 373
ORA-06512: at line 10
```

After the exception has occurred, the BFILE locator variable file goes out of scope, and no further operations on the file can be done using that variable. Therefore, the solution is to use an exception handler:

```
DECLARE
    fil BFILE;
    pos INTEGER;
    amt BINARY_INTEGER;
    buf RAW(40);
BEGIN
    SELECT ad_graphic INTO fil FROM print_media WHERE product_id = 3106;
    dbms_lob.open(fil, dbms_lob.lob_readonly);
    amt := 40; pos := 1 + dbms_lob.getlength(fil); buf := '';
    dbms_lob.read(fil, amt, pos, buf);
    dbms_output.put_line('Read F1 past EOF: '||
        utl_raw.cast_to_varchar2(buf));
    dbms_lob.close(fil);
exception
    WHEN no_data_found
    THEN
        BEGIN
            dbms_output.put_line('End of File reached. Closing file');
            dbms_lob.fileclose(fil);
            -- or dbms_lob.filecloseall if appropriate
        END;
END;
/

Statement processed.
End of File reached. Closing file
```

In general, you should ensure that files opened in a PL/SQL block using `DBMS_LOB` are closed before normal or abnormal termination of the block.

Maximum LOB Size

The maximum size for LOBs supported by the database is equal to the value of the blocksize of the tablespace the LOB column resides in times the value $2^{32}-1$ (4294967295). This allows for a maximum LOB size ranging from 8 terabytes to 128 terabytes.

Maximum Buffer Size

The maximum buffer size, 32767 bytes.

For `BLOBs`, where buffer size is expressed in bytes, the number of bytes cannot exceed 32767.

For `CLOBs` or `NCLOBs`, where buffer size is expressed in characters, the number of characters cannot result in a buffer larger than 32767 bytes. For example, if you are using fixed-width, two-byte characters, then specifying 20000 characters is an error ($20000*2 = 40000$, which is greater than 32767).

104.7 DBMS_LOB Exceptions

The table in the topic describes the exceptions for `DBMS_LOB`.

Table 104-8 DBMS_LOB Exceptions

| Exception | Code | Description |
|-----------------------------------|-------|--|
| <code>ACCESS_ERROR</code> | 22925 | You are trying to write too much data to the LOB: LOB size is limited to 4 gigabytes. |
| <code>CONTENTTYPE_TOOLONG</code> | 43859 | The length of the <code>contenttype</code> string exceeds the defined maximum. Modify the length of the <code>contenttype</code> string and retry the operation. |
| <code>CONTENTTYPEBUF_WRONG</code> | 43862 | The length of the <code>contenttype</code> buffer is less than defined constant. Modify the length of the <code>contenttype</code> buffer and retry the operation. |
| <code>INVALID_ARGVAL</code> | 21560 | The argument is expecting a non-NULL, valid value but the argument value passed in is NULL, invalid, or out of range. |
| <code>INVALID_DIRECTORY</code> | 22287 | The directory used for the current operation is not valid if being accessed for the first time, or if it has been modified by the DBA since the last access. |
| <code>NO_DATA_FOUND</code> | 1403 | <code>ENDOFLOB</code> indicator for looping read operations. This is not a hard error. |
| <code>NOEXIST_DIRECTORY</code> | 22285 | The directory leading to the file does not exist. |
| <code>NOPRIV_DIRECTORY</code> | 22286 | The user does not have the necessary access privileges on the directory or the file for the operation. |
| <code>OPEN_TOOMANY</code> | 22290 | The number of open files has reached the maximum limit. |
| <code>OPERATION_FAILED</code> | 22288 | The operation attempted on the file failed. |
| <code>QUERY_WRITE</code> | 14553 | Cannot perform a LOB write inside a query or PDML parallel execution server |

Table 104-8 (Cont.) DBMS_LOB Exceptions

| Exception | Code | Description |
|------------------------|-------|--|
| SECUREFILE_BADLOB | 43856 | A non-SECUREFILE LOB type was used in a SECUREFILE only call |
| SECUREFILE_BADPARAM | 43857 | An invalid argument was passed to a SECUREFILE subprogram |
| SECUREFILE_MARKERASED | 43861 | The mark provided to a FRAGMENT_* operation has been deleted |
| SECUREFILE_OUTOFBOUNDS | 43883 | Attempted to perform a FRAGMENT_* operation past the LOB end |
| UNOPENED_FILE | 22289 | The file is not open for the required operation to be performed. |
| VALUE_ERROR | 6502 | PL/SQL error for invalid values to subprogram's parameters. |

104.8 Summary of DBMS_LOB Subprograms

This table lists the DBMS_LOB subprograms and briefly describes them.

Table 104-9 DBMS_LOB Package Subprograms

| Subprogram | Description |
|---|---|
| APPEND Procedures | Appends the contents of the source LOB to the destination LOB |
| CLOB2FILE Procedure | Writes the content of a CLOB into a file. |
| CLOSE Procedure | Closes a previously opened internal or external LOB |
| COMPARE Functions | Compares two entire LOBs or parts of two LOBs |
| CONVERTTOBLOB Procedure | Reads character data from a source CLOB or NCLOB instance, converts the character data to the specified character, writes the converted data to a destination BLOB instance in binary format, and returns the new offsets |
| CONVERTTOCLOB Procedure | Takes a source BLOB instance, converts the binary data in the source instance to character data using the specified character, writes the character data to a destination CLOB or NCLOB instance, and returns the new offsets |
| COPY Procedures | Copies all, or part, of the source LOB to the destination LOB |
| COPY_DBFS_LINK Procedures | Copies the DBFS Link in the source LOB to the destination LOB |
| COPY_FROM_DBFS_LINK | Retrieves the data for the LOB from the DBFS store |
| CREATETEMPORARY Procedures | Creates a temporary BLOB or CLOB and its corresponding index in the user's default temporary tablespace |
| DBFS_LINK_GENERATE_PATH Functions | Returns a unique file path name for use in creating a DBFS Link |
| ERASE Procedures | Erases all or part of a LOB |
| FILECLOSE Procedure | Closes the file |
| FILECLOSEALL Procedure | Closes all previously opened files |

Table 104-9 (Cont.) DBMS_LOB Package Subprograms

| Subprogram | Description |
|--|--|
| FILEEXISTS Function | Checks if the file exists on the server |
| FILEGETNAME Procedure | Gets the directory object name and file name |
| FILEISOPEN Function | Checks if the file was opened using the input <code>BFILE</code> locators |
| FILEOPEN Procedure | Opens a file |
| FRAGMENT_DELETE Procedure | Deletes the data at the specified offset for the specified length from the LOB |
| FRAGMENT_INSERT Procedures | Inserts the specified data (limited to 32K) into the LOB at the specified offset |
| FRAGMENT_MOVE Procedure | Moves the amount of bytes (<code>BLOB</code>) or characters (<code>CLOB</code> / <code>NCLOB</code>) from the specified offset to the new offset specified |
| FRAGMENT_REPLACE Procedures | Replaces the data at the specified offset with the specified data (not to exceed 32k) |
| FREETEMPORARY Procedures | Frees the temporary <code>BLOB</code> or <code>CLOB</code> in the default temporary tablespace |
| GET_DBFS_LINK Functions | Returns the DBFS Link path associated with the specified SecureFile |
| GET_DBFS_LINK_STATE Procedures | Retrieves the current DBFS Link state of the specified SecureFile |
| GETCHUNKSIZE Functions | Returns the amount of space used in the LOB chunk to store the LOB value |
| GETCONTENTTYPE Functions | Returns the content ID string previously set by means of the SETCONTENTTYPE Procedure |
| GETLENGTH Functions | Gets the length of the LOB value |
| GETOPTIONS Functions | Obtains settings corresponding to the <code>option_type</code> field for a particular LOB |
| GET_STORAGE_LIMIT Function | Returns the storage limit for LOBs in your database configuration |
| INSTR Functions | Returns the matching position of the <i>n</i> th occurrence of the pattern in the LOB |
| ISOPEN Functions | Checks to see if the LOB was already opened using the input locator |
| ISREMOTE Function | Checks to see if the LOB is local to the database or if it belongs to a remote database. |
| ISSECUREFILE Function | Returns <code>TRUE</code> if the LOB locator passed to is for a SecureFiles LOB, otherwise, returns <code>FALSE</code> |
| ISTEMPORARY Functions | Checks if the locator is pointing to a temporary LOB |
| LOADBLOBFROMFILE Procedure | Loads <code>BFILE</code> data into an internal <code>BLOB</code> |
| LOADCLOBFROMFILE Procedure | Loads <code>BFILE</code> data into an internal <code>CLOB</code> |
| MOVE_TO_DBFS_LINK Procedures | Writes the specified SecureFile data to the DBFS store |
| OPEN Procedures | Opens a LOB (internal, external, or temporary) in the indicated mode |

Table 104-9 (Cont.) DBMS_LOB Package Subprograms

| Subprogram | Description |
|--|--|
| READ Procedures | Reads data from the LOB starting at the specified offset |
| SET_DBFS_LINK Procedures | Links the specified SecureFile to the specified path name. It does not copy the data to the path |
| SETCONTENTTYPE Procedure | Sets the content type string for the data in the LOB |
| SETOPTIONS Procedures | Enables CSCE features on a per-LOB basis, overriding the default LOB column settings |
| SUBSTR Functions | Returns part of the LOB value starting at the specified offset |
| TRIM Procedures | Trims the LOB value to the specified shorter length |
| WRITE Procedures | Writes data to the LOB from a specified offset |
| WRITEAPPEND Procedures | Writes a buffer to the end of a LOB |

104.8.1 APPEND Procedures

This procedure appends the contents of a source internal LOB to a destination LOB. It appends the complete source LOB.

Syntax

```
DBMS_LOB.APPEND (
    dest_lob IN OUT NOCOPY BLOB,
    src_lob IN BLOB);

DBMS_LOB.APPEND (
    dest_lob IN OUT NOCOPY CLOB CHARACTER SET ANY_CS,
    src_lob IN CLOB CHARACTER SET dest_lob%CHARSET);
```

Parameters

Table 104-10 APPEND Procedure Parameters

| Parameter | Description |
|-----------|---|
| dest_lob | Locator for the internal LOB to which the data is to be appended. |
| src_lob | Locator for the internal LOB from which the data is to be read. |

Exceptions

Table 104-11 APPEND Procedure Exceptions

| Exception | Description |
|-------------|---|
| VALUE_ERROR | Either the source or the destination LOB is NULL. |
| QUERY_WRITE | Cannot perform a LOB write inside a query or PDML parallel execution server |

Usage Notes

- It is not mandatory that you wrap the LOB operation inside the Open/Close interfaces. If you did not open the LOB before performing the operation, the functional and domain indexes on the LOB column are updated during the call. However, if you opened the LOB before performing the operation, you must close it before you commit the transaction. When an internal LOB is closed, it updates the functional and domain indexes on the LOB column.

If you do not wrap the LOB operation inside the Open/Close API, the functional and domain indexes are updated each time you write to the LOB. This can adversely affect performance. Therefore, it is recommended that you enclose write operations to the LOB within the `OPEN` or `CLOSE` statement.

- If `APPEND` is called on a LOB that has been archived, it implicitly gets the LOB before the first byte is written
- If `APPEND` is called on a SecureFiles LOB that is a DBFS Link, an exception is thrown.

See Also:

Oracle Database SecureFiles and Large Objects Developer's Guide for additional details on usage of this procedure

104.8.2 CLOB2FILE Procedure

This procedure writes the content of a `CLOB` into a `bfile`. This procedure gets called from the deprecated `dbms_xslprocessor.clob2file` internally.

Syntax

```
DBMS_LOB.CLOB2FILE(
  src_cl      IN  CLOB,
  file_loc    IN  VARCHAR2,
  file_name   IN  VARCHAR2,
  csid        IN  NUMBER := 0,
  open_mode   IN  VARCHAR2 := 'wb');
```

Parameters

Table 104-12 CLOB2FILE Procedure Parameters

| Parameter | Description |
|------------------------|--|
| <code>src_cl</code> | Source CLOB locator to write into a file |
| <code>file_loc</code> | Directory object name where the file is located |
| <code>file_name</code> | File name |
| <code>csid</code> | Character set id of the CLOB locator <ul style="list-style-type: none"> Must be a valid Oracle id; otherwise returns an error If the value is 0, then the content of the output file will be in the database character set |

Table 104-12 (Cont.) CLOB2FILE Procedure Parameters

| Parameter | Description |
|-----------|---|
| open_mode | The mode to open the output file in. <ul style="list-style-type: none"> wb — write byte mode, overwrites the file The default value is <code>wb</code> . |

104.8.3 CLOSE Procedure

This procedure closes a previously opened internal or external LOB.

Syntax

```
DBMS_LOB.CLOSE (
  lob_loc    IN OUT NOCOPY BLOB);

DBMS_LOB.CLOSE (
  lob_loc    IN OUT NOCOPY CLOB CHARACTER SET ANY_CS);

DBMS_LOB.CLOSE (
  file_loc   IN OUT NOCOPY BFILE);
```

Parameters

Table 104-13 CLOSE Procedure Parameters

| Parameter | Description |
|-----------|--|
| lob_loc | LOB locator. For more information, see Operational Notes . |

Exceptions

No error is returned if the `BFILE` exists but is not opened. An error is returned if the LOB is not open.

Usage Notes

`CLOSE` requires a round-trip to the server for both internal and external LOBs. For internal LOBs, `CLOSE` triggers other code that relies on the close call, and for external LOBs (`BFILES`), `CLOSE` actually closes the server-side operating system file.

It is not mandatory that you wrap all LOB operations inside the Open/Close interfaces. However, if you open a LOB, you must close it before you commit the transaction; an error is produced if you do not. When an internal LOB is closed, it updates the functional and domain indexes on the LOB column.

It is an error to commit the transaction before closing all opened LOBs that were opened by the transaction. When the error is returned, the openness of the open LOBs is discarded, but the transaction is successfully committed. Hence, all the changes made to the LOB and non-LOB data in the transaction are committed, but the domain and function-based indexes are not updated. If this happens, you should rebuild the functional and domain indexes on the LOB column.

**See Also:**

Oracle Database SecureFiles and Large Objects Developer's Guide for additional details on usage of this procedure

104.8.4 COMPARE Functions

This function compares two entire LOBs or parts of two LOBs.

Syntax

```
DBMS_LOB.COMPARE (
  lob_1          IN BLOB,
  lob_2          IN BLOB,
  amount         IN INTEGER := DBMS_LOB.LOBMAXSIZE,
  offset_1       IN INTEGER := 1,
  offset_2       IN INTEGER := 1)
RETURN INTEGER;

DBMS_LOB.COMPARE (
  lob_1          IN CLOB CHARACTER SET ANY_CS,
  lob_2          IN CLOB CHARACTER SET lob_1%CHARSET,
  amount         IN INTEGER := DBMS_LOB.LOBMAXSIZE,
  offset_1       IN INTEGER := 1,
  offset_2       IN INTEGER := 1)
RETURN INTEGER;

DBMS_LOB.COMPARE (
  lob_1          IN BFILE,
  lob_2          IN BFILE,
  amount         IN INTEGER,
  offset_1       IN INTEGER := 1,
  offset_2       IN INTEGER := 1)
RETURN INTEGER;
```

Pragmas

```
pragma restrict_references(COMPARE, WNDS, WNPS, RNDS, RNPS);
```

Parameters

Table 104-14 COMPARE Function Parameters

| Parameter | Description |
|-----------|---|
| lob_1 | LOB locator of first target for comparison. |
| lob_2 | LOB locator of second target for comparison. |
| amount | Number of bytes (for BLOBs) or characters (for CLOBs/NCLOBs) to compare. |
| offset_1 | Offset in bytes or characters on the first LOB (origin: 1) for the comparison. |
| offset_2 | Offset in bytes or characters on the second LOB (origin: 1) for the comparison. |

Return Values

- **INTEGER:** 0 if the comparison succeeds, nonzero if not.
- **NULL,** if any of `amount`, `offset_1` or `offset_2` is not a valid LOB offset value. A valid offset is within the range of 1 to `LOBMAXSIZE` inclusive.

Usage Notes

- You can only compare LOBs of the same datatype (LOBs of BLOB type with other BLOBs, and CLOBs with CLOBs, and BFILEs with BFILEs). For BFILEs, the file must be already opened using a successful `FILEOPEN` operation for this operation to succeed.
- `COMPARE` returns 0 if the data exactly matches over the range specified by the `offset` and `amount` parameters. `COMPARE` returns -1 if the first CLOB is less than the second, and 1 if it is greater.
- For fixed-width n -byte CLOBs, if the input `amount` for `COMPARE` is specified to be greater than $(\text{DBMS_LOB.LOBMAXSIZE}/n)$, then `COMPARE` matches characters in a range of size $(\text{DBMS_LOB.LOBMAXSIZE}/n)$, or $\text{Max}(\text{length}(\text{clob1}), \text{length}(\text{clob2}))$, whichever is lesser.
- If `COMPARE` is called on any LOB that has been archived, it implicitly gets the LOB before the compare begins.
- If `COMPARE()` is called on a SecureFiles LOB that is a DBFS Link, the linked LOB is streamed from DBFS, if possible, otherwise an exception is thrown.

Exceptions

Table 104-15 COMPARE Function Exceptions for BFILE operations

| Exception | Description |
|--------------------------------|--|
| <code>UNOPENED_FILE</code> | File was not opened using the input locator. |
| <code>NOEXIST_DIRECTORY</code> | Directory does not exist. |
| <code>NOPRIV_DIRECTORY</code> | You do not have privileges for the directory. |
| <code>INVALID_DIRECTORY</code> | Directory has been invalidated after the file was opened. |
| <code>INVALID_OPERATION</code> | File does not exist, or you do not have access privileges on the file. |

See Also:

Oracle Database SecureFiles and Large Objects Developer's Guide for additional details on usage of this procedure

104.8.5 CONVERTTOBLOB Procedure

This procedure reads character data from a source CLOB or NCLOB instance, converts the character data to the character set you specify, writes the converted data to a destination BLOB instance in binary format, and returns the new offsets.

You can use this interface with any combination of persistent or temporary LOB instances as the source or destination.

Syntax

```
DBMS_LOB.CONVERTTOBLOB(
  dest_lob      IN OUT      NOCOPY BLOB,
  src_clob      IN          CLOB CHARACTER SET ANY_CS,
  amount       IN          INTEGER,
  dest_offset   IN OUT      INTEGER,
  src_offset    IN OUT      INTEGER,
  blob_csid    IN          NUMBER,
  lang_context  IN OUT      INTEGER,
  warning      OUT          INTEGER);
```

Parameters

Table 104-16 CONVERTTOBLOB Procedure Parameters

| Parameter | Description |
|--------------|--|
| dest_lob | LOB locator of the destination LOB instance. |
| src_clob | LOB locator of the source LOB instance. |
| amount | Number of characters to convert from the source LOB. If you want to copy the entire LOB, pass the constant DBMS_LOB.LOBMAXSIZE. If you pass any other value, it must be less than or equal to the size of the LOB. |
| dest_offset | (IN) Offset in bytes in the destination LOB for the start of the write. Specify a value of 1 to start at the beginning of the LOB. (OUT) The new offset in bytes after the end of the write. |
| src_offset | (IN) Offset in characters in the source LOB for the start of the read. (OUT) Offset in characters in the source LOB right after the end of the read. |
| blob_csid | Desired character set ID of the converted data. |
| lang_context | (IN) Language context, such as shift status, for the current conversion. (OUT) The language context at the time when the current conversion is done. This information is returned so you can use it for subsequent conversions without losing or misinterpreting any source data. For the very first conversion, or if do not care, use the default value of zero. |

Table 104-16 (Cont.) CONVERTTOBLOB Procedure Parameters

| Parameter | Description |
|-----------|---|
| warning | (OUT) Warning message. This parameter indicates when something abnormal happened during the conversion. You are responsible for checking the warning message. Currently, the only possible warning is — inconvertible character. This occurs when the character in the source cannot be properly converted to a character in destination. The default replacement character (for example, '?') is used in place of the inconvertible character. The return value of this error message is defined as the constant <code>warn_inconvertible_char</code> in the <code>DBMS_LOB</code> package. |

Usage Notes

Preconditions

Before calling the `CONVERTTOBLOB` procedure, the following preconditions must be met:

- Both the source and destination LOB instances must exist.
- If the destination LOB is a persistent LOB, the row must be locked. To lock the row, select the LOB using the `FOR UPDATE` clause of the `SELECT` statement.

Constants and Defaults

All parameters are required. You must pass a variable for each `OUT` or `IN OUT` parameter. You must pass either a variable or a value for each `IN` parameter.

[Table 104-17](#) gives a summary of typical values for each parameter. The first column lists the parameter, the second column lists the typical value, and the last column describes the result of passing the value. Note that constants are used for some values. These constants are defined in the `dbmslob.sql` package specification file.

Table 104-17 DBMS_LOB.CONVERTTOBLOB Typical Values

| Parameter | Value | Description |
|--------------|---|---|
| amount | <code>LOBMAXSIZE</code> (IN) | convert the entire file |
| dest_offset | 1 (IN) | start from the beginning |
| src_offset | 1 (IN) | start from the beginning |
| blob_csid | <code>DEFAULT_CSID</code> (IN) | default CSID, use same CSID as source LOB |
| lang_context | <code>DEFAULT_LANG_CTX</code> (IN) | default language context |
| warning | <code>NO_WARNING</code> (OUT) <code>WARN_INCONVERTIBLE_CHAR</code> (OUT) | no warning message, success character in source cannot be properly converted |

General Notes

- You must specify the desired character set for the destination LOB in the `blob_csid` parameter. You can pass a zero value for `blob_csid`. When you do so, the database assumes that the desired character set is the same as the source LOB character set.

- You must specify the offsets for both the source and destination LOBs, and the number of characters to copy from the source LOB. The `amount` and `src_offset` values are in characters and the `dest_offset` is in bytes. To convert the entire LOB, you can specify `LOBMAXSIZE` for the `amount` parameter.
- `CONVERTTOBLOB` gets the source and/or destination LOBs as necessary prior to conversion and write of the data.

Exceptions

[Table 104-18](#) gives possible exceptions this procedure can throw. The first column lists the exception string and the second column describes the error conditions that can cause the exception.

Table 104-18 CONVERTTOBLOB Procedure Exceptions

| Exception | Description |
|----------------|--|
| VALUE_ERROR | Any of the input parameters are NULL or INVALID. |
| INVALID_ARGVAL | One or more of the following: <ul style="list-style-type: none"> - <code>src_offset</code> or <code>dest_offset</code> < 1. - <code>src_offset</code> or <code>dest_offset</code> > <code>LOBMAXSIZE</code>. - <code>amount</code> < 1. - <code>amount</code> > <code>LOBMAXSIZE</code>. |

See Also:

Oracle Database SecureFiles and Large Objects Developer's Guide for more information on using LOBs in application development

104.8.6 CONVERTTOCLOB Procedure

This procedure takes a source `BLOB` instance, converts the binary data in the source instance to character data using the character set you specify, writes the character data to a destination `CLOB` or `NCLOB` instance, and returns the new offsets.

You can use this interface with any combination of persistent or temporary LOB instances as the source or destination.

Syntax

```
DBMS_LOB.CONVERTTOCLOB(
  dest_lob      IN OUT NOCOPY  CLOB CHARACTER SET ANY_CS,
  src_blob      IN              BLOB,
  amount        IN              INTEGER,
  dest_offset   IN OUT         INTEGER,
  src_offset    IN OUT         INTEGER,
  blob_csid     IN              NUMBER,
  lang_context  IN OUT         INTEGER,
  warning       OUT             INTEGER);
```

Parameters

Table 104-19 CONVERTTOCLOB Procedure Parameters

| Parameter | Description |
|---------------------------|---|
| <code>dest_lob</code> | LOB locator of the destination LOB instance. |
| <code>src_blob</code> | LOB locator of the source LOB instance. |
| <code>amount</code> | Number of bytes to convert from the source LOB. If you want to copy the entire BLOB, pass the constant <code>DBMS_LOB.LOBMAXSIZE</code> . If you pass any other value, it must be less than or equal to the size of the BLOB. |
| <code>dest_offset</code> | (IN) Offset in characters in the destination LOB for the start of the write. Specify a value of 1 to start at the beginning of the LOB. (OUT) The new offset in characters after the end of the write. This offset always points to the beginning of the first complete character after the end of the write. |
| <code>src_offset</code> | (IN) Offset in bytes in the source LOB for the start of the read. (OUT) Offset in bytes in the source LOB right after the end of the read. |
| <code>blob_csid</code> | The character set ID of the source data |
| <code>lang_context</code> | (IN) Language context, such as shift status, for the current conversion. (OUT) The language context at the time when the current conversion is done. This information is returned so you can use it for subsequent conversions without losing or misinterpreting any source data. For the very first conversion, or if do not care, use the default value of zero. |
| <code>warning</code> | Warning message. This parameter indicates when something abnormal happened during the conversion. You are responsible for checking the warning message. Currently, the only possible warning is — inconvertible character. This occurs when the character in the source cannot be properly converted to a character in destination. The default replacement character (for example, '?') is used in place of the inconvertible character. The return value of this error message is defined as the constant <code>warn_inconvertible_char</code> in the <code>DBMS_LOB</code> package. |

Usage Notes

Preconditions

Before calling the `CONVERTTOCLOB` procedure, the following preconditions must be met:

- Both the source and destination LOB instances must exist.
- If the destination LOB is a persistent LOB, the row must be locked before calling the `CONVERTTOCLOB` procedure. To lock the row, select the LOB using the `FOR UPDATE` clause of the `SELECT` statement.

Constants and Defaults

All parameters are required. You must pass a variable for each `OUT` or `IN OUT` parameter. You must pass either a variable or a value for each `IN` parameter.

Table 104-20 gives a summary of typical values for each parameter. The first column lists the parameter, the second column lists the typical value, and the last column describes the result of passing the value. Note that constants are used for some values. These constants are defined in the `dbmslob.sql` package specification file.

Table 104-20 DBMS_LOB.CONVERTTOCLOB Typical Values

| Parameter | Value | Description |
|---------------------------|---|---|
| <code>amount</code> | <code>LOBMAXSIZE (IN)</code> | convert the entire file |
| <code>dest_offset</code> | <code>1 (IN)</code> | start from the beginning |
| <code>src_offset</code> | <code>1 (IN)</code> | start from the beginning |
| <code>csid</code> | <code>DEFAULT_CSID (IN)</code> | default CSID, use destination CSID |
| <code>lang_context</code> | <code>DEFAULT_LANG_CTX (IN)</code> | default language context |
| <code>warning</code> | <code>NO_WARNING (OUT)</code> <code>WARN_INCONVERTIBLE_CHAR (OUT)</code> | no warning message, success character in source cannot be properly converted |

General Notes

- You must specify the desired character set for the source LOB in the `blob_csid` parameter. You can pass a zero value for `blob_csid`. When you do so, the database assumes that the desired character set is the same as the destination LOB character set.
- You must specify the offsets for both the source and destination LOBs, and the number of characters to copy from the source LOB. The `amount` and `src_offset` values are in bytes and the `dest_offset` is in characters. To convert the entire LOB, you can specify `LOBMAXSIZE` for the `amount` parameter.
- `CONVERTTOCLOB` gets the source and/or destination LOBs as necessary prior to conversion and write of the data.

Exceptions

Table 104-21 CONVERTTOCLOB Procedure Exceptions

| Exception | Description |
|-----------------------------|--|
| <code>VALUE_ERROR</code> | Any of the input parameters are <code>NULL</code> or <code>INVALID</code> . |
| <code>INVALID_ARGVAL</code> | One or more of the following: <ul style="list-style-type: none"> <code>src_offset</code> or <code>dest_offset</code> < 1. <code>src_offset</code> or <code>dest_offset</code> > <code>LOBMAXSIZE</code>. <code>amount</code> < 1. <code>amount</code> > <code>LOBMAXSIZE</code>. |

 **See Also:**

Oracle Database SecureFiles and Large Objects Developer's Guide for more information on using LOBs in application development

104.8.7 COPY Procedures

This procedure copies all, or a part of, a source internal LOB to a destination internal LOB. You can specify the offsets for both the source and destination LOBs, and the number of bytes or characters to copy.

Syntax

```
DBMS_LOB.COPY (
  dest_lob   IN OUT NOCOPY BLOB,
  src_lob    IN           BLOB,
  amount     IN           INTEGER,
  dest_offset IN           INTEGER := 1,
  src_offset  IN           INTEGER := 1);

DBMS_LOB.COPY (
  dest_lob   IN OUT NOCOPY CLOB CHARACTER SET ANY_CS,
  src_lob    IN           CLOB CHARACTER SET dest_lob%CHARSET,
  amount     IN           INTEGER,
  dest_offset IN           INTEGER := 1,
  src_offset  IN           INTEGER := 1);
```

Parameters

Table 104-22 COPY Procedure Parameters

| Parameter | Description |
|-------------|---|
| dest_lob | LOB locator of the copy target. |
| src_lob | LOB locator of source for the copy. |
| amount | Number of bytes (for BLOBs) or characters (for CLOBs) to copy. |
| dest_offset | Offset in bytes or characters in the destination LOB (origin: 1) for the start of the copy. |
| src_offset | Offset in bytes or characters in the source LOB (origin: 1) for the start of the copy. |

Exceptions

Table 104-23 COPY Procedure Exceptions

| Exception | Description |
|-------------|--|
| VALUE_ERROR | Any of the input parameters are NULL or invalid. |

Table 104-23 (Cont.) COPY Procedure Exceptions

| Exception | Description |
|----------------|--|
| INVALID_ARGVAL | Either: <ul style="list-style-type: none"> - src_offset or dest_offset < 1 - src_offset or dest_offset > LOBMAXSIZE - amount < 1 - amount > LOBMAXSIZE |
| QUERY_WRITE | Cannot perform a LOB write inside a query or PDML parallel execution server |

Usage Notes

- If the offset you specify in the destination LOB is beyond the end of the data currently in this LOB, then zero-byte fillers or spaces are inserted in the destination BLOB or CLOB respectively. If the offset is less than the current length of the destination LOB, then existing data is overwritten.
- It is not an error to specify an amount that exceeds the length of the data in the source LOB. Thus, you can specify a large amount to copy from the source LOB, which copies data from the src_offset to the end of the source LOB.
- It is not mandatory that you wrap the LOB operation inside the Open/Close interfaces. If you did not open the LOB before performing the operation, the functional and domain indexes on the LOB column are updated during the call. However, if you opened the LOB before performing the operation, you must close it before you commit the transaction. When an internal LOB is closed, it updates the functional and domain indexes on the LOB column.
- If you do not wrap the LOB operation inside the Open/Close API, the functional and domain indexes are updated each time you write to the LOB. This can adversely affect performance. Therefore, it is recommended that you enclose write operations to the LOB within the OPEN or CLOSE statement.
- Prior to copy, the source and destination LOBs are retrieved, if they are currently archived. For a complete over-write, the destination LOB is not retrieved.
- If the source LOB is a DBFS Link, the data is streamed from DBFS, if possible, otherwise an exception is thrown. If the destination LOB is a DBFS Link, an exception is thrown.

 **See Also:**

Oracle Database SecureFiles and Large Objects Developer's Guide for additional details on usage of this procedure

104.8.8 COPY_DBFS_LINK Procedures

This procedure copies the DBFS Link in the source LOB to the destination LOB.

Syntax

```
DBMS_LOB.COPY_DBFS_LINK (
  lob_loc_dst   IN OUT BLOB,
  lob_loc_src   IN     BLOB,
  flags         IN     PLS_INTEGER DEFAULT DBFS_LINK_NOCACHE);
```

```
DBMS_LOB.COPY_DBFS_LINK (
  lob_loc_dst   IN OUT CLOB CHARACTER SET ANY_CS,
  lob_loc_src   IN     CLOB CHARACTER SET ANY_CS,
  flags         IN     PLS_INTEGER DEFAULT DBFS_LINK_NOCACHE);
```

Parameters

Table 104-24 COPY_DBFS_LINK Procedure Parameters

| Parameter | Description |
|-------------|--|
| lob_loc_dst | LOB to be made to reference the same storage data as lob_loc_src |
| lob_loc_src | LOB from which to copy the reference |
| flags | Options to COPY_DBFS_LINK: <ul style="list-style-type: none"> DBFS_LINK_NOCACHE specifies to only copy the DBFS Link DBFS_LINK_CACHE specifies to copy the DBFS Link and read the data into the database LOB specified by lob_loc_dst so that the data is cached |

Exceptions

Table 104-25 COPY_DBFS_LINK Procedure Exceptions

| Exception | Description |
|-------------------|--|
| SECUREFILE_BADLOB | Either lob_loc_src or lob_loc_dst is not a SECUREFILE |
| INVALID_ARGVAL | lob_loc_src LOB has not been archived |
| ORA-01555 | If the source LOB has been retrieved, never archived, or if the LOB has been migrated in and out (modified or not) since the locator was gotten. |

104.8.9 COPY_FROM_DBFS_LINK

This procedure retrieves the archived SecureFiles LOB data from the DBFS HSM store and to the database.

Syntax

```
DBMS_LOB.COPY_FROM_DBFS_LINK (
  lob_loc       IN OUT BLOB);
```

```
DBMS_LOB.COPY_FROM_DBFS_LINK (
  lob_loc      IN OUT CLOB CHARACTER SET ANY_CS);
```

Parameters

Table 104-26 COPY_FROM_DBFS_LINK Procedure Parameters

| Parameter | Description |
|-----------|--------------------------------------|
| lob_loc | LOB to be retrieved from the archive |

Usage Note

COPY_FROM_DBFS_LINK does not remove the underlying DBFS file.

If the LOB is successfully retrieved, COPY_FROM_DBFS_LINK silently returns success.

Exceptions

Table 104-27 COPY_FROM_DBFS_LINK Procedure Exceptions

| Exception | Description |
|-------------------|--|
| SECUREFILE_BADLOB | lob_loc is not a SECUREFILE |
| ORA-01555 | If the LOB has already been retrieved and has been modified since retrieval, if the LOB has been migrated in and out (modified or not) since the locator was retrieved |

104.8.10 CREATETEMPORARY Procedures

This procedure creates a temporary BLOB or CLOB and its corresponding index in your default temporary tablespace.

Syntax

```
DBMS_LOB.CREATETEMPORARY (
  lob_loc IN OUT NOCOPY BLOB,
  cache  IN          BOOLEAN,
  dur    IN          PLS_INTEGER := DBMS_LOB.SESSION);
```

```
DBMS_LOB.CREATETEMPORARY (
  lob_loc IN OUT NOCOPY CLOB CHARACTER SET ANY_CS,
  cache  IN          BOOLEAN,
  dur    IN          PLS_INTEGER := 10);
```

Parameters

Table 104-28 CREATETEMPORARY Procedure Parameters

| Parameter | Description |
|-----------|--|
| lob_loc | LOB locator. For more information, see Operational Notes . |
| cache | Specifies if LOB should be read into buffer cache or not. |

Table 104-28 (Cont.) CREATETEMPORARY Procedure Parameters

| Parameter | Description |
|-----------|--|
| dur | 1 of 2 predefined duration values (SESSION or CALL) which specifies a hint as to whether the temporary LOB is cleaned up at the end of the session or call. If dur is omitted, then the session duration is used. |

 **See Also:**

- *Oracle Database SecureFiles and Large Objects Developer's Guide* for additional details on usage of this procedure
- *Oracle Database PL/SQL Language Reference* for more information about NOCOPY and passing temporary lob as parameters

104.8.11 DBFS_LINK_GENERATE_PATH Functions

This subprogram returns a unique file path name for use in creating a DBFS Link.

Syntax

```
DBMS_LOB.DBFS_LINK_GENERATE_PATH (
  lob_loc      IN BLOB,
  storage_dir  IN VARCHAR2)
RETURN VARCHAR2;

DBMS_LOB.DBFS_LINK_GENERATE_PATH (
  lob_loc      IN CLOB CHARACTER SET ANY_CS,
  storage_dir  IN VARCHAR2)
RETURN VARCHAR2;
```

Pragmas

```
PRAGMA RESTRICT_REFERENCES (dbfs_link_generate_path,
  WNDS, RNDS, WNPS, RNPS);
```

Parameters

Table 104-29 DBFS_LINK_GENERATE_PATH Function Parameters

| Parameter | Description |
|-------------|--|
| lob_loc | LOB to be retrieved from DBFS |
| storage_dir | DBFS directory that will be the parent directory of the file |

Exceptions

Table 104-30 DBFS_LINK_GENERATE_PATH Function Exceptions

| Exception | Description |
|----------------------|-----------------------------|
| SECUREFILE_WRONGTYPE | lob_loc is not a SECUREFILE |

Usage Notes

Returns a globally unique file pathname that can be used for archiving. This is guaranteed to be globally unique across all calls to this function for different LOBs and versions of that LOB. It is always the same for the same LOB and version.

104.8.12 ERASE Procedures

This procedure erases an entire internal LOB or part of an internal LOB.

Syntax

```

DBMS_LOB.ERASE (
  lob_loc          IN OUT NOCOPY BLOB,
  amount          IN OUT NOCOPY INTEGER,
  offset          IN              INTEGER := 1);

DBMS_LOB.ERASE (
  lob_loc          IN OUT NOCOPY CLOB CHARACTER SET ANY_CS,
  amount          IN OUT NOCOPY INTEGER,
  offset          IN              INTEGER := 1);

```

Parameters

Table 104-31 ERASE Procedure Parameters

| Parameter | Description |
|-----------|---|
| lob_loc | Locator for the LOB to be erased. For more information, see Operational Notes . |
| amount | Number of bytes (for BLOBs or BFILES) or characters (for CLOBs or NCLOBs) to be erased. |
| offset | Absolute offset (origin: 1) from the beginning of the LOB in bytes (for BLOBs) or characters (CLOBs). |

Usage Notes

- When data is erased from the middle of a LOB, zero-byte fillers or spaces are written for BLOBs or CLOBs respectively.
- The actual number of bytes or characters erased can differ from the number you specified in the amount parameter if the end of the LOB value is reached before erasing the specified number. The actual number of characters or bytes erased is returned in the amount parameter.
- ERASE gets the LOB if it is archived, unless the erase covers the entire LOB.
- If the LOB to be erased is a DBFS Link, an exception is thrown.

 **Note:**

The length of the LOB is not decreased when a section of the LOB is erased. To decrease the length of the LOB value, see the "[TRIM Procedures](#)".

Exceptions

Table 104-32 ERASE Procedure Exceptions

| Exception | Description |
|----------------|---|
| VALUE_ERROR | Any input parameter is NULL. |
| INVALID_ARGVAL | Either: - amount < 1 or amount > LOBMAXSIZE - offset < 1 or offset > LOBMAXSIZE |
| QUERY_WRITE | Cannot perform a LOB write inside a query or PDML parallel execution server |

Usage Notes

It is not mandatory that you wrap the LOB operation inside the Open/Close interfaces. If you did not open the LOB before performing the operation, the functional and domain indexes on the LOB column are updated during the call. However, if you opened the LOB before performing the operation, you must close it before you commit the transaction. When an internal LOB is closed, it updates the functional and domain indexes on the LOB column.

If you do not wrap the LOB operation inside the Open/Close API, the functional and domain indexes are updated each time you write to the LOB. This can adversely affect performance. Therefore, it is recommended that you enclose write operations to the LOB within the `OPEN` or `CLOSE` statement.

104.8.13 FILECLOSE Procedure

This procedure closes a `BFILE` that has already been opened through the input locator.

Note:

The database has only read-only access to `BFILEs`. This means that `BFILEs` cannot be written through the database.

Syntax

```
DBMS_LOB.FILECLOSE (  
    file_loc IN OUT NOCOPY BFILE);
```

Parameters

Table 104-33 FILECLOSE Procedure Parameters

| Parameter | Description |
|-----------------------|--|
| <code>file_loc</code> | Locator for the <code>BFILE</code> to be closed. |

Exceptions

Table 104-34 FILECLOSE Procedure Exceptions

| Exception | Description |
|--------------------------------|--|
| <code>VALUE_ERROR</code> | NULL input value for <code>file_loc</code> . |
| <code>UNOPENED_FILE</code> | File was not opened with the input locator. |
| <code>NOEXIST_DIRECTORY</code> | Directory does not exist. |
| <code>NOPRIV_DIRECTORY</code> | You do not have privileges for the directory. |
| <code>INVALID_DIRECTORY</code> | Directory has been invalidated after the file was opened. |
| <code>INVALID_OPERATION</code> | File does not exist, or you do not have access privileges on the file. |

See Also:

- ["FILEOPEN Procedure"](#)
- ["FILECLOSEALL Procedure"](#)
- *Oracle Database SecureFiles and Large Objects Developer's Guide* for additional details on usage of this procedure

104.8.14 FILECLOSEALL Procedure

This procedure closes all `BFILE`s opened in the session.

Syntax

```
DBMS_LOB.FILECLOSEALL;
```

Exceptions

Table 104-35 FILECLOSEALL Procedure Exception

| Exception | Description |
|---------------|---|
| UNOPENED_FILE | No file has been opened in the session. |

See Also:

- ["FILEOPEN Procedure"](#)
- ["FILECLOSE Procedure"](#)
- *Oracle Database SecureFiles and Large Objects Developer's Guide* for additional details on usage of this procedure

104.8.15 FILEEXISTS Function

This function finds out if a specified `BFILE` locator points to a file that actually exists on the server's file system.

Syntax

```
DBMS_LOB.FILEEXISTS (
    file_loc    IN    BFILE)
RETURN INTEGER;
```

Pragmas

```
pragma restrict_references(FILEEXISTS, WNDS, RNDS, WNPS, RNPS);
```

Parameters

Table 104-36 FILEEXISTS Function Parameter

| Parameter | Description |
|-----------|--------------------------------------|
| file_loc | Locator for the <code>BFILE</code> . |

Return Values

Table 104-37 FILEEXISTS Function Return Values

| Return | Description |
|--------|-------------------------------|
| 0 | Physical file does not exist. |
| 1 | Physical file exists. |

Exceptions

Table 104-38 FILEEXISTS Function Exceptions

| Exception | Description |
|-------------------|---|
| NOEXIST_DIRECTORY | Directory does not exist. |
| NOPRIV_DIRECTORY | You do not have privileges for the directory. |
| INVALID_DIRECTORY | Directory has been invalidated after the file was opened. |

See Also:

- ["FILEISOPEN Function"](#).
- *Oracle Database SecureFiles and Large Objects Developer's Guide* for additional details on usage of this procedure

104.8.16 FILEGETNAME Procedure

This procedure determines the directory object and filename, given a BFILE locator.

This function only indicates the directory object name and filename assigned to the locator, not if the physical file or directory actually exists.

The maximum constraint values for the `dir_alias` buffer is 30, and for the entire path name, it is 2000.

Syntax

```
DBMS_LOB.FILEGETNAME (
    file_loc  IN    BFILE,
    dir_alias OUT  VARCHAR2,
    filename  OUT  VARCHAR2);
```

Parameters

Table 104-39 FILEGETNAME Procedure Parameters

| Parameter | Description |
|-----------------------|-----------------------|
| <code>file_loc</code> | Locator for the BFILE |

Table 104-39 (Cont.) FILEGETNAME Procedure Parameters

| Parameter | Description |
|-----------|-----------------------|
| dir_alias | Directory object name |
| filename | Name of the BFILE |

Exceptions

Table 104-40 FILEGETNAME Procedure Exceptions

| Exception | Description |
|----------------|--|
| VALUE_ERROR | Any of the input parameters are NULL or INVALID. |
| INVALID_ARGVAL | dir_alias or filename are NULL. |

See Also:

Oracle Database SecureFiles and Large Objects Developer's Guide for additional details on usage of this procedure

104.8.17 FILEISOPEN Function

This function finds out whether a BFILE was opened with the specified FILE locator.

Syntax

```
DBMS_LOB.FILEISOPEN (
    file_loc IN BFILE)
RETURN INTEGER;
```

Pragmas

```
PRAGMA RESTRICT_REFERENCES(fileisopen, WNDS, RNDS, WNPS, RNPS);
```

Parameters

Table 104-41 FILEISOPEN Function Parameter

| Parameter | Description |
|-----------|------------------------|
| file_loc | Locator for the BFILE. |

Return Values

INTEGER: 0 = file is not open, 1 = file is open

Usage Notes

If the input `FILE` locator was never passed to the `FILEOPEN` procedure, then the file is considered not to be opened by this locator. However, a different locator may have this file open. In other words, openness is associated with a specific locator.

Exceptions

Table 104-42 FILEISOPEN Function Exceptions

| Exception | Description |
|--------------------------------|---|
| <code>NOEXIST_DIRECTORY</code> | Directory does not exist. |
| <code>NOPRIV_DIRECTORY</code> | You do not have privileges for the directory. |
| <code>INVALID_DIRECTORY</code> | Directory has been invalidated after the file was opened. |

 **See Also:**

- ["FILEEXISTS Function"](#)
- *Oracle Database SecureFiles and Large Objects Developer's Guide* for additional details on usage of this procedure

104.8.18 FILEOPEN Procedure

This procedure opens a `BFILE` for read-only access. `BFILE` data may not be written through the database.

Syntax

```
DBMS_LOB.FILEOPEN (
    file_loc  IN OUT NOCOPY BFILE,
    open_mode IN             BINARY_INTEGER := file_readonly);
```

Parameters

Table 104-43 FILEOPEN Procedure Parameters

| Parameter | Description |
|------------------------|--------------------------------------|
| <code>file_loc</code> | Locator for the <code>BFILE</code> . |
| <code>open_mode</code> | File access is read-only. |

Exceptions

Table 104-44 FILEOPEN Procedure Exceptions

| Exception | Description |
|--------------------------|--|
| <code>VALUE_ERROR</code> | <code>file_loc</code> or <code>open_mode</code> is <code>NULL</code> . |

Table 104-44 (Cont.) FILEOPEN Procedure Exceptions

| Exception | Description |
|-------------------|--|
| INVALID_ARGVAL | open_mode is not equal to FILE_READONLY. |
| OPEN_TOOMANY | Number of open files in the session exceeds session_max_open_files. |
| NOEXIST_DIRECTORY | Directory associated with file_loc does not exist. |
| INVALID_DIRECTORY | Directory has been invalidated after the file was opened. |
| INVALID_OPERATION | File does not exist, or you do not have access privileges on the file. |

 **See Also:**

- ["FILECLOSE Procedure"](#)
- ["FILECLOSEALL Procedure"](#)
- *Oracle Database SecureFiles and Large Objects Developer's Guide* for additional details on usage of this procedure

104.8.19 FRAGMENT_DELETE Procedure

This procedure deletes the data at the specified offset for the specified length from the LOB without having to rewrite all the data in the LOB following the specified offset.

Syntax

```
DBMS_LOB.FRAGMENT_DELETE (
  lob_loc      IN OUT NOCOPY BLOB,
  amount       IN           INTEGER,
  offset       IN           INTEGER);

DBMS_LOB.FRAGMENT_DELETE (
  lob_loc      IN OUT NOCOPY CLOB CHARACTER SET ANY_CS,
  amount       IN           INTEGER,
  offset       IN           INTEGER);
```

Parameters

Table 104-45 FRAGMENT_DELETE Procedure Parameters

| Parameter | Description |
|-----------|--|
| lob_loc | LOB locator. For more information, see Operational Notes . |
| amount | Number of bytes (BLOB) or characters (CLOB/NCLOB) to be removed from the LOB |
| offset | Offset into the LOB in bytes (BLOB) or characters (CLOB/NCLOB) to begin the deletion |

Exceptions

Table 104-46 FRAGMENT_DELETE Procedure Exceptions

| Exception | Description |
|------------------------|---|
| INVALID_ARGVAL | A parameter value was invalid |
| QUERY_WRITE | Cannot perform operation during a query |
| SECUREFILE_BADLOB | A non-SECUREFILE LOB was used in a SECUREFILE LOB only call |
| SECUREFILE_OUTOFBOUNDS | Attempted to perform a FRAGMENT_* operation past LOB end |

104.8.20 FRAGMENT_INSERT Procedures

This procedure inserts the specified data (limited to 32K) into the LOB at the specified offset.

Syntax

```
DBMS_LOB.FRAGMENT_INSERT (
  lob_loc      IN OUT NOCOPY BLOB,
  amount       IN           INTEGER,
  offset       IN           INTEGER,
  buffer       IN           RAW);

DBMS_LOB.FRAGMENT_INSERT (
  lob_loc      IN OUT NOCOPY CLOB CHARACTER SET ANY_CS,
  amount       IN           INTEGER,
  offset       IN           INTEGER,
  buffer       IN           VARCHAR2 CHARACTER SET lob_loc%CHARSET);
```

Parameters

Table 104-47 FRAGMENT_INSERT Procedure Parameters

| Parameter | Description |
|-----------|---|
| lob_loc | LOB locator. For more information, see Operational Notes . |
| amount | Number of bytes (BLOB) or characters (CLOB/NCLOB) to be inserted into the LOB |
| offset | Offset into the LOB in bytes (BLOB) or characters (CLOB/NCLOB) to begin the insertion |
| buffer | Data to insert into the LOB |

Exceptions

Table 104-48 FRAGMENT_INSERT Procedure Exceptions

| Exception | Description |
|-------------------|---|
| INVALID_ARGVAL | A parameter value was invalid |
| QUERY_WRITE | Cannot perform operation during a query |
| SECUREFILE_BADLOB | A non-SECUREFILE LOB was used in a SECUREFILE LOB only call |

Table 104-48 (Cont.) FRAGMENT_INSERT Procedure Exceptions

| Exception | Description |
|------------------------|--|
| SECUREFILE_OUTOFBOUNDS | Attempted to perform a FRAGMENT_* operation past LOB end |

Usage Notes

FRAGMENT_INSERT gets the LOB, if necessary, before performing operations on the LOB.

104.8.21 FRAGMENT_MOVE Procedure

This procedure moves the amount of bytes (BLOB) or characters (CLOB/NCLOB) from the specified offset to the new offset specified.

Syntax

```
DBMS_LOB.FRAGMENT_MOVE (
  lob_loc      IN OUT NOCOPY BLOB,
  amount       IN           INTEGER,
  src_offset   IN           INTEGER,
  dest_offset  IN           INTEGER);

DBMS_LOB.FRAGMENT_MOVE (
  lob_loc      IN OUT NOCOPY CLOB CHARACTER SET ANY_CS,
  amount       IN           INTEGER,
  src_offset   IN           INTEGER,
  dest_offset  IN           INTEGER);
```

Parameters

Table 104-49 FRAGMENT_MOVE Procedure Parameters

| Parameter | Description |
|-------------|---|
| lob_loc | LOB locator. For more information, see Operational Notes . |
| amount | Number of bytes (BLOB) or characters (CLOB/NCLOB) to be moved in the LOB |
| src_offset | Beginning offset into the LOB in bytes (BLOB) or characters (CLOB/NCLOB) to put the data |
| dest_offset | Beginning offset into the LOB in bytes (BLOB) or characters (CLOB/NCLOB) to remove the data |

Exceptions

Table 104-50 FRAGMENT_MOVE Procedure Exceptions

| Exception | Description |
|----------------|---|
| INVALID_ARGVAL | A parameter value was invalid |
| QUERY_WRITE | Cannot perform operation during a query |

Table 104-50 (Cont.) FRAGMENT_MOVE Procedure Exceptions

| Exception | Description |
|------------------------|---|
| SECUREFILE_BADLOB | A non-SECUREFILE LOB was used in a SECUREFILE LOB only call |
| SECUREFILE_OUTOFBOUNDS | Attempted to perform a FRAGMENT_* operation past LOB end |

Usage Notes

- All offsets are pre-move offsets.
- Offsets of more than 1 past the end of the LOB are not permitted.
- FRAGMENT_MOVE gets the LOB, if necessary, before performing operations on the LOB.

104.8.22 FRAGMENT_REPLACE Procedures

This procedure replaces the data at the specified offset with the specified data (not to exceed 32k).

Syntax

```
DBMS_LOB.FRAGMENT_REPLACE (
  lob_loc      IN OUT NOCOPY BLOB,
  old_amount  IN          INTEGER,
  new_amount  IN          INTEGER,
  offset      IN          INTEGER,
  buffer      IN          RAW);

DBMS_LOB.FRAGMENT_REPLACE (
  lob_loc      IN OUT NOCOPY CLOB CHARACTER SET ANY_CS,  old_amount  IN
  INTEGER,
  new_amount  IN          INTEGER,
  offset      IN          INTEGER,
  buffer      IN          VARCHAR2 CHARACTER SET lob_loc%CHARSET);
```

Parameters

Table 104-51 FRAGMENT_REPLACE Function Parameters

| Parameter | Description |
|------------|--|
| lob_loc | LOB locator. For more information, see Operational Notes . |
| old_amount | Number of bytes (BLOB) or characters (CLOB/NCLOB) to be replaced in the LOB |
| new_amount | Number of bytes (BLOB) or characters (CLOB/NCLOB) to written to the LOB |
| offset | Beginning offset into the LOB in bytes (BLOB) or characters (CLOB/NCLOB) to put the data |
| buffer | Data to insert into the LOB |

Exceptions

Table 104-52 FRAGMENT_REPLACE Procedure Exceptions

| Exception | Description |
|------------------------|---|
| INVALID_ARGVAL | A parameter value was invalid |
| QUERY_WRITE | Cannot perform operation during a query |
| SECUREFILE_BADLOB | A non-SECUREFILE LOB was used in a SECUREFILE LOB only call |
| SECUREFILE_OUTOFBOUNDS | Attempted to perform a FRAGMENT_* operation past LOB end |

Usage Notes

- Invoking this procedure is equivalent to deleting the old amount of bytes/characters at offset and then inserting the new amount of bytes/characters at offset.
- FRAGMENT_REPLACE gets the LOB, if necessary, before performing operations on the LOB.

104.8.23 FREETEMPORARY Procedures

This procedure frees the temporary BLOB or CLOB in the default temporary tablespace.

Syntax

```
DBMS_LOB.FREETEMPORARY (
    lob_loc IN OUT NOCOPY BLOB);
```

```
DBMS_LOB.FREETEMPORARY (
    lob_loc IN OUT NOCOPY CLOB CHARACTER SET ANY_CS);
```

Parameters

Table 104-53 FREETEMPORARY Procedure Parameters

| Parameter | Description |
|-----------|--|
| lob_loc | LOB locator. For more information, see Operational Notes . |

Usage Notes

- When a new temporary LOB is created, and there is currently no temporary LOB in use with the same duration (session, call), a new temporary LOB segment is created. When the temporary LOB is freed, the space it consumed is released to the temporary segment. If there are no other temporary LOBs for the same duration, the temporary segment is also freed.
- After the call to FREETEMPORARY, the LOB locator that was freed is marked as invalid.
- If an invalid LOB locator is assigned to another LOB locator using OCILOBLocatorAssign in OCI or through an assignment operation in PL/SQL, then the target of the assignment is also freed and marked as invalid.

 **See Also:**

Oracle Database SecureFiles and Large Objects Developer's Guide for additional details on usage of this procedure

104.8.24 GET_DBFS_LINK Functions

This function returns the DBFS path name for the specified SecureFile LOB.

Syntax

```
DBMS_LOB.GET_DBFS_LINK (
  lob_loc          IN      BLOB,
  storage_path     OUT VARCHAR2(DBFS_LINK_PATH_MAX_SIZE),
  lob_length       OUT NUMBER);
```

```
DBMS_LOB.GET_DBFS_LINK (
  lob_loc          IN      CLOB CHARACTER SET ANY_CS,
  storage_path     OUT VARCHAR2(DBFS_LINK_PATH_MAX_SIZE),
  lob_length       OUT NUMBER);
```

Parameters

Table 104-54 GET_DBFS_LINK Function Parameters

| Parameter | Description |
|--------------|---|
| lob_loc | LOB to be retrieved from DBFS |
| storage_path | Path where the LOB is stored in DBFS |
| lob_length | LOB length at the time of write to DBFS |

Return Values

The Archive ID

Exceptions

Table 104-55 GET_DBFS_LINK Function Exceptions

| Exception | Description |
|-------------------|--|
| SECUREFILE_BADLOB | lob_loc is not a SECUREFILE |
| ORA-01555 | The LOB has already been retrieved and has been modified since retrieval or the LOB has been migrated in and out (modified or not) since the locator was retrieved |

104.8.25 GET_DBFS_LINK_STATE Procedures

GET_DBFS_LINK_STATE retrieves the current link state of the specified SecureFile.

Syntax

```
DBMS_LOB.GET_DBFS_LINK_STATE (
  lob_loc      IN BLOB,
  storage_path OUT VARCHAR2(DBFS_LINK_PATH_MAX_SIZE),
  state        OUT NUMBER,
  cached       OUT BOOLEAN);
```

```
DBMS_LOB.GET_DBFS_LINK_STATE (
  lob_loc      IN CLOB CHARACTER SET ANY_CS,
  storage_path OUT VARCHAR2(DBFS_LINK_PATH_MAX_SIZE),
  state        OUT NUMBER,
  cached       OUT BOOLEAN);
```

Parameters

Table 104-56 GET_DBFS_LINK_STATE Procedure Parameters

| Parameter | Description |
|--------------|---|
| lob_loc | LOB to be retrieved from the archive |
| storage_path | Path where the LOB is stored in the DBFS HSM store |
| state | One of DBFS_LINK_NEVER, DBFS_LINK_NO or DBFS_LINK_YES |
| cached | If the LOB is archived and the data was specified to be cached on put |

Exceptions

Table 104-57 GET_DBFS_LINK_STATE Procedure Exceptions

| Exception | Description |
|-------------------|-----------------------------|
| SECUREFILE_BADLOB | lob_loc is not a SECUREFILE |

Usage Notes

- If the LOB has never been archived, state is set to DBMS_LOB.DBFS_LINK_NEVER. If the LOB has been archived, state is set to DBMS_LOB.DBFS_LINK_YES. If the LOB has been previously retrieved from the archive, state is set to DBFS_LINK_NO.
- If the LOB was archived, but the data was left in the RDBMS, cached is set to TRUE. If the data was removed after the link was created, cached is set to FALSE, and NULL if state is DBMS_LOB.DBFS_LINK_NEVER.

104.8.26 GETCONTENTTYPE Functions

This procedure returns the content type string previously set by means of the SETCONTENTTYPE Procedure.

Syntax

```
DBMS_LOB.GETCONTENTTYPE (  
    lob_loc IN BLOB)  
    RETURN VARCHAR2;  
  
DBMS_LOB.GETCONTENTTYPE (  
    lob_loc IN CLOB CHARACTER SET ANY_CS)  
    RETURN VARCHAR2;
```

Pragmas

```
PRAGMA RESTRICT_REFERENCES(getcontenttype, WNDS, RNDS, WNPS, RNPS);
```

Parameters

Table 104-58 GETCONTENTTYPE Function Parameters

| Parameter | Description |
|-----------|---|
| lob_loc | LOB whose content type is to be retrieved |

Return Values

The returned content type.

If the SecureFiles LOB does not have a `contenttype` associated with it, `GETCONTENTTYPE()` returns `NULL`.

Exceptions

Table 104-59 GETCONTENTTYPE Function Exceptions

| Exception | Description |
|-------------------|-----------------------------|
| SECUREFILE_BADLOB | lob_loc is not a SECUREFILE |

Related Topics

- [SETCONTENTTYPE Procedure](#)
This procedure sets the content type string for the data in the LOB.

104.8.27 GET_STORAGE_LIMIT Function

This function returns the LOB storage limit for the specified LOB.

Syntax

```
DBMS_LOB.GET_STORAGE_LIMIT (  
    lob_loc IN CLOB CHARACTER SET ANY_CS)  
    RETURN INTEGER;
```

```
DBMS_LOB.GET_STORAGE_LIMIT (
    lob_loc IN BLOB)
RETURN INTEGER;
```

Pragmas

```
PRAGMA RESTRICT_REFERENCES(get_storage_limit, WNDS, RNDS, WNPS, RNPS);
```

Parameters

Table 104-60 GET_STORAGE_LIMIT Function Parameters

| Parameter | Description |
|-----------|--|
| lob_loc | LOB locator. For more information, see Operational Notes . |

Return Value

The value returned from this function is the maximum allowable size for specified LOB locator. For `BLOBS`, the return value depends on the block size of the tablespace the LOB resides in and is calculated as $(2^{32})-1$ (4294967295) times the block size of the tablespace. For `CLOBs/NCLOBs`, the value returned is the $(2^{32})-1$ (4294967295) times the block size of the tablespace divided by the character width of the `CLOB/NCLOB`.

Usage

See Also:

Oracle Database SecureFiles and Large Objects Developer's Guide for details on LOB storage limits

104.8.28 GETCHUNKSIZE Functions

When creating the table, you can specify the chunking factor, a multiple of tablespace blocks in bytes. This corresponds to the chunk size used by the LOB data layer when accessing or modifying the LOB value. Part of the chunk is used to store system-related information, and the rest stores the LOB value. This function returns the amount of space used in the LOB chunk to store the LOB value.

Syntax

```
DBMS_LOB.GETCHUNKSIZE (
    lob_loc IN BLOB)
RETURN INTEGER;
```

```
DBMS_LOB.GETCHUNKSIZE (
    lob_loc IN CLOB CHARACTER SET ANY_CS)
RETURN INTEGER;
```

Pragmas

```
PRAGMA RESTRICT_REFERENCES(getchunksize, WNDS, RNDS, WNPS, RNPS);
```

Parameters

Table 104-61 GETCHUNKSIZE Function Parameters

| Parameter | Description |
|-----------|--|
| lob_loc | LOB locator. For more information, see Operational Notes . |

Return Values

The return value is a usable chunk size in bytes.

Usage Notes

- With regard to basic LOB files, performance is improved if you enter read/write requests using a multiple of this chunk size. For writes, there is an added benefit, because LOB chunks are versioned, and if all writes are done on a chunk basis, then no extra or excess versioning is done or duplicated. You could batch up the `WRITE` until you have enough for a chunk, instead of issuing several `WRITE` calls for the same chunk.

These tactics of performance improvement do not apply to SecureFiles.
- Note that chunk size is independent of LOB type (`BLOB`, `CLOB`, `NCLOB`, Unicode or other character set).

See Also:

Oracle Database SecureFiles and Large Objects Developer's Guide for additional details on usage of this procedure

104.8.29 GETLENGTH Functions

This function gets the length of the specified LOB. The length in bytes or characters is returned.

The length returned for a `BFILE` includes the `EOF`, if it exists. Any 0-byte or space filler in the LOB caused by previous `ERASE` or `WRITE` operations is also included in the length count. The length of an empty internal LOB is 0.

Syntax

```
DBMS_LOB.GETLENGTH (  
  lob_loc    IN BLOB)  
  RETURN INTEGER;
```

```
DBMS_LOB.GETLENGTH (  
  lob_loc    IN CLOB CHARACTER SET ANY_CS)  
  RETURN INTEGER;
```

```
DBMS_LOB.GETLENGTH (  
  file_loc   IN BFILE)  
  RETURN INTEGER;
```

Pragmas

```
pragma restrict_references(GETLENGTH, WNDS, WNPS, RNDS, RNPS);
```

Parameters

Table 104-62 GETLENGTH Function Parameter

| Parameter | Description |
|-----------|--|
| file_loc | The file locator for the LOB whose length is to be returned. |

Return Values

The length of the LOB in bytes or characters as an `INTEGER`. `NULL` is returned if the input LOB is `NULL` or if the input `lob_loc` is `NULL`. An error is returned in the following cases for `BFILE`s:

- `lob_loc` does not have the necessary directory and operating system privileges
- `lob_loc` cannot be read because of an operating system read error

See Also:

Oracle Database SecureFiles and Large Objects Developer's Guide for additional details on usage of this procedure

104.8.30 GETOPTIONS Functions

This function obtains compression, deduplication, and encryption settings corresponding to the `option_type` field for a particular LOB.

Syntax

```
DBMS_LOB.GETOPTIONS (
  lob_loc          IN      BLOB,
  option_types     IN      PLS_INTEGER)
RETURN PLS_INTEGER;
```

```
DBMS_LOB.GETOPTIONS (
  lob_loc          IN      CLOB CHARACTER SET ANY_CS,
  option_types     IN      PLS_INTEGER)
RETURN PLS_INTEGER;
```

Parameters

Table 104-63 GETOPTIONS Function Parameter

| Parameter | Description |
|-------------|---|
| lob_loc | Locator for the LOB to be examined. For more information, see Operational Notes . |
| option_type | See Table 104-2 |

Return Values

The return values are a combination of `COMPRESS_ON`, `ENCRYPT_ON` and `DEDUPLICATE_ON` (see [Table 104-3](#)) depending on which option types (see [Table 104-2](#)) are passed in.

Exceptions

Table 104-64 GETOPTIONS Procedure Exceptions

| Exception | Description |
|-------------------|---|
| INVALID_ARGVAL | A parameter value was invalid |
| QUERY_WRITE | Cannot perform operation during a query |
| SECUREFILE_BADLOB | A non-SECUREFILE LOB was used in a SECUREFILE LOB only call |

Usage Notes

You cannot turn compression or deduplication on or off for a SecureFile column that does not have those features on. The `GetOptions` Functions and [SETOPTIONS Procedures](#) work on individual SecureFiles. You can turn off a feature on a particular SecureFile and turn on a feature that has already been turned off by `SetOptions`, but you cannot turn on an option that has not been given to the SecureFile when the table was created.

104.8.31 INSTR Functions

This function returns the matching position of the *n*th occurrence of the pattern in the LOB, starting from the offset you specify.

Syntax

```
DBMS_LOB.INSTR (
  lob_loc   IN   BLOB,
  pattern   IN   RAW,
  offset    IN   INTEGER := 1,
  nth       IN   INTEGER := 1)
RETURN INTEGER;
```

```
DBMS_LOB.INSTR (
  lob_loc   IN   CLOB          CHARACTER SET ANY_CS,
  pattern   IN   VARCHAR2     CHARACTER SET lob_loc%CHARSET,
  offset    IN   INTEGER := 1,
  nth       IN   INTEGER := 1)
RETURN INTEGER;
```

```
DBMS_LOB.INSTR (
  file_loc  IN   BFILE,
  pattern   IN   RAW,
  offset    IN   INTEGER := 1,
  nth       IN   INTEGER := 1)
RETURN INTEGER;
```

Pragmas

```
pragma restrict_references(INSTR, WNDS, WNPS, RNDS, RNPS);
```

Parameters

Table 104-65 INSTR Function Parameters

| Parameter | Description |
|-----------|---|
| lob_loc | Locator for the LOB to be examined. For more information, see Operational Notes . |
| file_loc | The file locator for the LOB to be examined. |
| pattern | Pattern to be tested for. The pattern is a group of RAW bytes for BLOBs, and a character string (VARCHAR2) for CLOBs. The maximum size of the pattern is 16383 bytes. |
| offset | Absolute offset in bytes (BLOBs) or characters (CLOBs) at which the pattern matching is to start. (origin: 1) |
| nth | Occurrence number, starting at 1. |

Return Values

Table 104-66 INSTR Function Return Values

| Return | Description |
|---------|---|
| INTEGER | Offset of the start of the matched pattern, in bytes or characters. It returns 0 if the pattern is not found. |
| NULL | Either: -any one or more of the IN parameters was NULL or INVALID. -offset < 1 or offset > LOBMAXSIZE. -nth < 1. -nth > LOBMAXSIZE. |

Usage Notes

The form of the VARCHAR2 buffer (the pattern parameter) must match the form of the CLOB parameter. In other words, if the input LOB parameter is of type NCLOB, then the buffer must contain NCHAR data. Conversely, if the input LOB parameter is of type CLOB, then the buffer must contain CHAR data.

For BFILEs, the file must be already opened using a successful FILEOPEN operation for this operation to succeed.

Operations that accept RAW or VARCHAR2 parameters for pattern matching, such as INSTR, do not support regular expressions or special matching characters (as in the case of SQL LIKE) in the pattern parameter or substrings.

Exceptions

Table 104-67 INSTR Function Exceptions for BFILES

| Exception | Description |
|---------------|--|
| UNOPENED_FILE | File was not opened using the input locator. |

Table 104-67 (Cont.) INSTR Function Exceptions for BFILES

| Exception | Description |
|-------------------|--|
| NOEXIST_DIRECTORY | Directory does not exist. |
| NOPRIV_DIRECTORY | You do not have privileges for the directory. |
| INVALID_DIRECTORY | Directory has been invalidated after the file was opened. |
| INVALID_OPERATION | File does not exist, or you do not have access privileges on the file. |

 **See Also:**

- ["SUBSTR Functions"](#)
- *Oracle Database SecureFiles and Large Objects Developer's Guide* for additional details on usage of this procedure

104.8.32 ISOPEN Functions

This function checks to see if the LOB was already opened using the input locator. This subprogram is for internal and external LOBs.

Syntax

```
DBMS_LOB.ISOPEN (
    lob_loc IN BLOB)
    RETURN INTEGER;

DBMS_LOB.ISOPEN (
    lob_loc IN CLOB CHARACTER SET ANY_CS)
    RETURN INTEGER;

DBMS_LOB.ISOPEN (
    file_loc IN BFILE)
    RETURN INTEGER;
```

Pragmas

```
PRAGMA RESTRICT_REFERENCES(isopen, WNDS, RNDS, WNPS, RNPS);
```

Parameters

Table 104-68 ISOPEN Function Parameters

| Parameter | Description |
|-----------|--|
| lob_loc | LOB locator. For more information, see Operational Notes . |
| file_loc | File locator. |

Return Values

The return value is 1 if the LOB is open, 0 otherwise.

Usage Notes

For `BFILES`, `openness` is associated with the locator. If the input locator was never passed to `OPEN`, the `BFILE` is not considered to be opened by this locator. However, a different locator may have opened the `BFILE`. More than one `OPEN` can be performed on the same `BFILE` using different locators.

For internal LOBs, `openness` is associated with the LOB, not with the locator. If `locator1` opened the LOB, then `locator2` also sees the LOB as open. For internal LOBs, `ISOPEN` requires a round-trip, because it checks the state on the server to see if the LOB is indeed open.

For external LOBs (`BFILES`), `ISOPEN` also requires a round-trip, because that's where the state is kept.

See Also:

Oracle Database SecureFiles and Large Objects Developer's Guide for additional details on usage of this procedure

104.8.33 ISREMOTE Function

This function checks to see if the LOB is local to the database or if it belongs to a remote database.

Syntax

```
DBMS_LOB.ISREMOTE (
    lob_loc IN BLOB)
RETURN BOOLEAN;
```

```
DBMS_LOB.ISREMOTE (
    lob_loc IN CLOB CHARACTER SET ANY_CS)
RETURN BOOLEAN;
```

Pragmas

```
PRAGMA RESTRICT_REFERENCES(isremote, WNDS, RNDS, WNPS, RNPS);
```

Parameters

Table 104-69 ISREMOTE Function Parameter

| Parameter | Description |
|----------------------|----------------------|
| <code>lob_loc</code> | Locator for the LOB. |

Return Values

`BOOLEAN`: `TRUE` for remote LOBs obtained over a database link; `FALSE` for LOBs obtained from local database

 **See Also:**

- *Distributed LOBs* chapter in Database SecureFiles and Large Objects Developer's Guide for more details on the usage of this procedure.

104.8.34 ISSECUREFILE Function

This function returns `TRUE` if the LOB locator passed to it is for a SecureFile LOB. It returns `FALSE` otherwise.

Syntax

```
DBMS_LOB ISSECUREFILE(
    lob_loc IN BLOB)
RETURN BOOLEAN;
```

Pragmas

```
PRAGMA RESTRICT_REFERENCES(issecurefile, WNDS, RNDS, WNPS, RNPS);
```

Parameters

Table 104-70 ISSECUREFILE Function Parameter

| Parameter | Description |
|----------------------|--|
| <code>lob_loc</code> | LOB locator. For more information, see Operational Notes . |

Return Values

This function returns `TRUE` if the LOB locator passed to it is for a SecureFile LOB. It returns `FALSE` otherwise.

104.8.35 ISTEMPORARY Functions

This function determines whether a LOB instance is temporary.

Syntax

```
DBMS_LOB.ISTEMPORARY (
    lob_loc IN BLOB)
RETURN INTEGER;

DBMS_LOB.ISTEMPORARY (
    lob_loc IN CLOB CHARACTER SET ANY_CS)
RETURN INTEGER;
```

Pragmas

```
PRAGMA RESTRICT_REFERENCES(istemporary, WNDS, RNDS, WNPS, RNPS);
```

Parameters

Table 104-71 ISTEMPORARY Procedure Parameters

| Parameter | Description |
|-----------|--|
| lob_loc | LOB locator. For more information, see Operational Notes . |

Return Values

The return value is 1 if the LOB is temporary and exists; 0 if the LOB is not temporary or does not exist; NULL if the given locator is NULL.

Usage Notes

When you free a Temporary LOB with `FREETEMPORARY`, the LOB locator is not set to NULL. Consequently, `ISTEMPORARY` will return 0 for a locator that has been freed but not explicitly reset to NULL.

See Also:

Oracle Database SecureFiles and Large Objects Developer's Guide for additional details on usage of this procedure

104.8.36 LOADBLOBFROMFILE Procedure

This procedure loads data from BFILE to internal BLOB. This achieves the same outcome as `LOADFROMFILE`, and returns the new offsets.

Syntax

```
DBMS_LOB.LOADBLOBFROMFILE (
  dest_lob    IN OUT NOCOPY BLOB,
  src_bfile   IN           BFILE,
  amount      IN           INTEGER,
  dest_offset IN OUT      INTEGER,
  src_offset  IN OUT      INTEGER);
```

Parameters

Table 104-72 LOADBLOBFROMFILE Procedure Parameters

| Parameter | Description |
|-----------|---|
| dest_lob | BLOB locator of the target for the load. |
| src_bfile | BFILE locator of the source for the load. |
| amount | Number of bytes to load from the BFILE. You can also use <code>DBMS_LOB.LOBMAXSIZE</code> to load until the end of the BFILE. |

Table 104-72 (Cont.) LOADBLOBFROMFILE Procedure Parameters

| Parameter | Description |
|--------------------------|--|
| <code>dest_offset</code> | (IN) Offset in bytes in the destination BLOB (origin: 1) for the start of the write. (OUT) New offset in bytes in the destination BLOB right after the end of this write, which is also where the next write should begin. |
| <code>src_offset</code> | (IN) Offset in bytes in the source BFILE (origin: 1) for the start of the read. (OUT) Offset in bytes in the source BFILE right after the end of this read, which is also where the next read should begin. |

Usage Notes

- You can specify the offsets for both the source and destination LOBs, and the number of bytes to copy from the source BFILE. The `amount` and `src_offset`, because they refer to the BFILE, are in terms of bytes, and the `dest_offset` is in bytes for BLOBs.
- If the offset you specify in the destination LOB is beyond the end of the data currently in this LOB, then zero-byte fillers or spaces are inserted in the destination BLOB. If the offset is less than the current length of the destination LOB, then existing data is overwritten.
- There is an error if the input amount plus offset exceeds the length of the data in the BFILE (unless the amount specified is `LOBMAXSIZE` which you can specify to continue loading until the end of the BFILE is reached).
- It is not mandatory that you wrap the LOB operation inside the `OPEN/CLOSE` operations. If you did not open the LOB before performing the operation, the functional and domain indexes on the LOB column are updated during the call. However, if you opened the LOB before performing the operation, you must close it before you commit the transaction. When an internal LOB is closed, it updates the functional and domain indexes on the LOB column.
- If you do not wrap the LOB operation inside the `OPEN/CLOSE`, the functional and domain indexes are updated each time you write to the LOB. This can adversely affect performance. Therefore, it is recommended that you enclose write operations to the LOB within the `OPEN` or `CLOSE` statement.
- `LOADFROMFILE` gets the destination LOB prior to the load unless the load covers the entire LOB.

Constants and Defaults

There is no easy way to omit parameters. You must either declare a variable for `IN/OUT` parameter or provide a default value for the `IN` parameter. Here is a summary of the constants and the defaults that can be used.

Table 104-73 Suggested Values of the Parameter

| Parameter | Default Value | Description |
|--------------------------|--|--------------------------|
| <code>amount</code> | <code>DBMS_LOB.LOBMAXSIZE</code> (IN) | Load the entire file |
| <code>dest_offset</code> | 1 (IN) | start from the beginning |
| <code>src_offset</code> | 1 (IN) | start from the beginning |

Constants defined in DBMSLOB.SQL

```
lobmaxsize          CONSTANT INTEGER          := DBMS_LOB.LOBMAXSIZE;
```

Exceptions

Table 104-74 LOADBLOBFROMFILE Procedure Exceptions

| Exception | Description |
|----------------|---|
| VALUE_ERROR | Any of the input parameters are NULL or INVALID. |
| INVALID_ARGVAL | Either: - src_offset or dest_offset < 1. - src_offset or dest_offset > LOBMAXSIZE. - amount < 1. - amount > LOBMAXSIZE. |

See Also:

Oracle Database SecureFiles and Large Objects Developer's Guide for additional details on usage of this procedure

104.8.37 LOADCLOBFROMFILE Procedure

This procedure loads data from a BFILE to an internal CLOB/NCLOB with necessary character set conversion and returns the new offsets.

Syntax

```
DBMS_LOB.LOADCLOBFROMFILE (
  dest_lob          IN OUT NOCOPY  NOCOPY CLOB CHARACTER SET ANY_CS,
  src_bfile         IN              BFILE,
  amount            IN              INTEGER,
  dest_offset       IN OUT          INTEGER,
  src_offset        IN OUT          INTEGER,
  bfile_csid        IN              NUMBER,
  lang_context      IN OUT          INTEGER,
  warning           OUT             INTEGER);
```

Parameters

Table 104-75 LOADCLOBFROMFILE Procedure Parameters

| Parameter | Description |
|-----------|---|
| dest_lob | CLOB/NCLOB locator of the target for the load. |
| src_bfile | BFILE locator of the source for the load. |
| amount | Number of bytes to load from the BFILE. Use DBMS_LOB.LOBMAXSIZE of load until the end of the BFILE. |

Table 104-75 (Cont.) LOADCLOBFROMFILE Procedure Parameters

| Parameter | Description |
|---------------------------|--|
| <code>dest_offset</code> | (IN) Offset in characters in the destination CLOB (origin: 1) for the start of the write. (OUT) The new offset in characters right after the end of this load, which is also where the next load should start. It always points to the beginning of the first complete character after the end of load. If the last character is not complete, offset goes back to the beginning of the partial character. |
| <code>src_offset</code> | (IN) Offset in bytes in the source BFILE (origin: 1) for the start of the read. (OUT) Offset in bytes in the source BFILE right after the end of this read, which is also where the next read should begin. |
| <code>bfile_csid</code> | Character set id of the source (BFILE) file. |
| <code>lang_context</code> | (IN) Language context, such as shift status, for the current load. (OUT) The language context at the time when the current load stopped, and what the next load should be using if continuing loading from the same source. This information is returned to the user so that they can use it for the continuous load without losing or misinterpreting any source data. For the very first load or if do not care, simply use the default 0. The details of this language context is hidden from the user. One does not need to know what it is or what's in it in order to make the call |
| <code>warning</code> | (OUT) Warning message. This indicates something abnormal happened during the loading. It may or may not be caused by the user's mistake. The loading is completed as required, and it's up to the user to check the warning message. Currently, the only possible warning is the inconvertible character. This happens when the character in the source cannot be properly converted to a character in destination, and the default replacement character (for example, '?') is used in place. The message is defined the constant value <code>DBMS_LOB.WARN_INCONVERTIBLE_CHAR</code> . |

Usage Notes

You can specify the offsets for both the source and destination LOBs, and the number of bytes to copy from the source BFILE. The `amount` and `src_offset`, because they refer to the BFILE, are in terms of bytes, and the `dest_offset` is in characters for CLOBs.

If the offset you specify in the destination LOB is beyond the end of the data currently in this LOB, then zero-byte fillers or spaces are inserted in the destination CLOB. If the offset is less than the current length of the destination LOB, then existing data is overwritten.

There is an error if the input amount plus offset exceeds the length of the data in the BFILE (unless the amount specified is `LOBMAXSIZE` which you can specify to continue loading until the end of the BFILE is reached).

Note the following requirements:

- The destination character set is always the same as the database character set in the case of CLOB and national character set in the case of NCLOB.
- `csid=0` indicates the default behavior that uses database `csid` for CLOB and national `csid` for NCLOB in the place of source `csid`. Conversion is still necessary if it is of varying width

- It is not mandatory that you wrap the LOB operation inside the `OPEN/CLOSE` operations. If you did not open the LOB before performing the operation, the functional and domain indexes on the LOB column are updated during the call. However, if you opened the LOB before performing the operation, you must close it before you commit the transaction. When an internal LOB is closed, it updates the functional and domain indexes on the LOB column.

If you do not wrap the LOB operation inside the `OPEN/CLOSE`, the functional and domain indexes are updated each time you write to the LOB. This can adversely affect performance. Therefore, it is recommended that you enclose write operations to the LOB within the `OPEN` or `CLOSE` statement.

The source `BFILE` can contain data in the Unicode character set. The Unicode standard defines many encoding schemes that provide mappings from Unicode characters to sequences of bytes. [Table 104-76](#) lists Unicode encodings schemes supported by this subprogram.

Table 104-76 Supported Unicode Encoding Schemes

| Encoding Scheme | Oracle Name | bfile_csid Value |
|-----------------|-------------|------------------|
| UTF-8 | AL32UTF8 | 873 |
| UTF-16BE | AL16UTF16 | 2000 |
| UTF-16LE | AL16UTF16LE | 2002 |
| CESU-8 | UTF8 | 871 |
| UTF-EBCDIC | UTFE | 872 |
| UTF-16 | UTF16 | 1000 |

All three `UTF-16` encoding schemes encode Unicode characters as 2-byte unsigned integers. Integers can be stored in big-endian or in little-endian byte order. The `UTF-16BE` encoding scheme defines big-endian data. The `UTF-16LE` scheme defines little-endian data. The `UTF-16` scheme requires that the source `BFILE` contains the Byte Order Mark (BOM) character in the first two bytes to define the byte order. The BOM code is `0xFEFF`. If the code is stored as `{0xFE, 0xFF}`, the data is interpreted as big-endian. If it is stored as `{0xFF, 0xFE}`, the data is interpreted as little-endian.

In `UTF-8` and in `CESU-8` encodings the Byte Order Mark is stored as `{0xEF, 0xBB, 0xBF}`. With any of the Unicode encodings, the corresponding BOM sequence at the beginning of the file is recognized and not loaded into the destination LOB.

Constants

Here is a summary of the constants and the suggested values that can be used.

Table 104-77 Suggested Values of the `LOADCLOBFROMFILE` Parameter

| Parameter | Suggested Value | Description |
|--------------------------|---------------------------------------|------------------------------------|
| <code>amount</code> | <code>DBMS_LOB.LOBMAXSIZE (IN)</code> | Load the entire file |
| <code>dest_offset</code> | <code>1 (IN)</code> | start from the beginning |
| <code>src_offset</code> | <code>1 (IN)</code> | start from the beginning |
| <code>csid</code> | <code>0 (IN)</code> | default csid, use destination csid |

Table 104-77 (Cont.) Suggested Values of the LOADCLOBFROMFILE Parameter

| Parameter | Suggested Value | Description |
|--------------|-----------------|--------------------------------------|
| lang_context | 0 (IN) | default language context |
| warning | 0 (OUT) | no warning message, everything is ok |

Constants defined in DBMSLOB.SQL

| | | |
|-------------------------|------------------|--------------------------|
| lobmaxsize | CONSTANT INTEGER | := 18446744073709551615; |
| warn_inconvertible_char | CONSTANT INTEGER | := 1; |
| default_csid | CONSTANT INTEGER | := 0; |
| default_lang_ctx | CONSTANT INTEGER | := 0; |
| no_warning | CONSTANT INTEGER | := 0; |

Exceptions

Table 104-78 LOADCLOBFROMFILE Procedure Exceptions

| Exception | Description |
|----------------|---|
| VALUE_ERROR | Any of the input parameters are NULL or INVALID. |
| INVALID_ARGVAL | Either: - src_offset or dest_offset < 1. - src_offset or dest_offset > LOBMAXSIZE. - amount < 1. - amount > LOBMAXSIZE. |

See Also:

Oracle Database SecureFiles and Large Objects Developer's Guide for additional details on usage of this procedure

104.8.38 MOVE_TO_DBFS_LINK Procedures

This procedure archives the specified LOB data (from the database) into the DBFS HSM Store.

Syntax

```
DBMS_LOB.MOVE_TO_DBFS_LINK (
  lob_loc      IN OUT BLOB,
  storage_path IN    VARCHAR2(dbfs_link_path_max_size),
  flags        IN    BINARY_INTEGER DEFAULT DBFS_LINK_NOCACHE);

DBMS_LOB.MOVE_TO_DBFS_LINK (
  lob_loc      IN OUT CLOB CHARACTER SET ANY_CS,
  storage_path IN    VARCHAR2(dbfs_link_path_max_size),
  flags        IN    BINARY_INTEGER DEFAULT DBFS_LINK_NOCACHE);
```

Parameters

Table 104-79 MOVE_TO_DBFS_LINK Procedure Parameters

| Parameter | Description |
|--------------|---|
| lob_loc | LOB to be archived |
| storage_path | Path where the LOB will be stored |
| flags | Either DBFS_LINK_CACHE or DBFS_LINK_NOCACHE. If DBFS_LINK_CACHE is specified, the LOB data continues to be stored in the RDBMS as well as being written to the DBFS store. DBFS_LINK_NOCACHE specifies that the LOB data should be deleted from the RDBMS once written to the DBFS. |

Exceptions

Table 104-80 MOVE_TO_DBFS_LINK Procedure Exceptions

| Exception | Description |
|-------------------|-----------------------------|
| SECUREFILE_BADLOB | lob_loc is not a SECUREFILE |

Usage Notes

- If the LOB is already archived, the procedure silently returns as if the put was successful. In that case, if DBFS_LINK_NOCACHE is specified, or flags is defaulted, the LOB data is removed from the RDBMS.
- Calling this procedure multiple times on the same LOB with the same flags has no effect.
- Calling the procedure on a LOB that is already archived causes the LOB to be cached (DBFS_LINK_CACHE) or removed (DBFS_LINK_NOCACHE) according to the flag setting.

104.8.39 OPEN Procedures

This procedure opens a LOB, internal or external, in the indicated mode. Valid modes include read-only, and read/write.

Syntax

```
DBMS_LOB.OPEN (
    lob_loc IN OUT NOCOPY BLOB,
    open_mode IN          BINARY_INTEGER);

DBMS_LOB.OPEN (
    lob_loc IN OUT NOCOPY CLOB CHARACTER SET ANY_CS,
    open_mode IN          BINARY_INTEGER);

DBMS_LOB.OPEN (
    file_loc IN OUT NOCOPY BFILE,
    open_mode IN          BINARY_INTEGER := file_readonly);
```

Parameters

Table 104-81 OPEN Procedure Parameters

| Parameter | Description |
|-----------|---|
| lob_loc | LOB locator. For more information, see Operational Notes . |
| open_mode | Mode in which to open. For BLOB and CLOB types, the mode can be either: LOB_READONLY or LOB_READWRITE. For BFILE types, the mode must be FILE_READONLY. |

Usage Notes

 **Note:**

If the LOB was opened in read-only mode, and if you try to write to the LOB, then an error is returned. BFILE can only be opened with read-only mode.

OPEN requires a round-trip to the server for both internal and external LOBs. For internal LOBs, OPEN triggers other code that relies on the OPEN call. For external LOBs (BFILEs), OPEN requires a round-trip because the actual operating system file on the server side is being opened.

It is not mandatory that you wrap all LOB operations inside the Open/Close interfaces. However, if you open a LOB, you must close it before you commit the transaction; an error is produced if you do not. When an internal LOB is closed, it updates the functional and domain indexes on the LOB column.

It is an error to commit the transaction before closing all opened LOBs that were opened by the transaction. When the error is returned, the openness of the open LOBs is discarded, but the transaction is successfully committed. Hence, all the changes made to the LOB and non-LOB data in the transaction are committed, but the domain and function-based indexes are not updated. If this happens, you should rebuild the functional and domain indexes on the LOB column.

 **See Also:**

Oracle Database SecureFiles and Large Objects Developer's Guide for additional details on usage of this procedure

104.8.40 READ Procedures

This procedure reads a piece of a LOB, and returns the specified amount into the `buffer` parameter, starting from an absolute offset from the beginning of the LOB.

The number of bytes or characters actually read is returned in the `amount` parameter. If the input `offset` points past the End of LOB, then `amount` is set to 0, and a `NO_DATA_FOUND` exception is raised.

Syntax

```
DBMS_LOB.READ (
  lob_loc   IN          BLOB,
  amount    IN OUT NOCOPY INTEGER,
  offset     IN          INTEGER,
  buffer     OUT         RAW);

DBMS_LOB.READ (
  lob_loc   IN          CLOB CHARACTER SET ANY_CS,
  amount    IN OUT NOCOPY INTEGER,
  offset     IN          INTEGER,
  buffer     OUT         VARCHAR2 CHARACTER SET lob_loc%CHARSET);

DBMS_LOB.READ (
  file_loc  IN          BFILE,
  amount    IN OUT NOCOPY INTEGER,
  offset     IN          INTEGER,
  buffer     OUT         RAW);
```

Parameters

Table 104-82 READ Procedure Parameters

| Parameter | Description |
|-----------------------|---|
| <code>lob_loc</code> | Locator for the LOB to be read. For more information, see Operational Notes . |
| <code>file_loc</code> | The file locator for the LOB to be examined. |
| <code>amount</code> | Number of bytes (for BLOBs) or characters (for CLOBs) to read, or number that were read. |
| <code>offset</code> | Offset in bytes (for BLOBs) or characters (for CLOBs) from the start of the LOB (origin: 1). |
| <code>buffer</code> | Output buffer for the read operation. |

Exceptions

[Table 104-83](#) lists exceptions that apply to any LOB instance. [Table 104-84](#) lists exceptions that apply only to BFILES.

Table 104-83 READ Procedure Exceptions

| Exception | Description |
|--------------------------|---|
| <code>VALUE_ERROR</code> | Any of <code>lob_loc</code> , <code>amount</code> , or <code>offset</code> parameters are NULL. |

Table 104-83 (Cont.) READ Procedure Exceptions

| Exception | Description |
|----------------|--|
| INVALID_ARGVAL | Either: <ul style="list-style-type: none"> - amount < 1 - amount > 32767 bytes (or the character equivalent) - offset < 1 - offset > LOBMAXSIZE - amount is greater, in bytes or characters, than the capacity of buffer. |
| NO_DATA_FOUND | End of the LOB is reached, and there are no more bytes or characters to read from the LOB: amount has a value of 0. |

Table 104-84 READ Procedure Exceptions for BFILES

| Exception | Description |
|-------------------|--|
| UNOPENED_FILE | File is not opened using the input locator. |
| NOEXIST_DIRECTORY | Directory does not exist. |
| NOPRIV_DIRECTORY | You do not have privileges for the directory. |
| INVALID_DIRECTORY | Directory has been invalidated after the file was opened. |
| INVALID_OPERATION | File does not exist, or you do not have access privileges on the file. |

Usage Notes

- The form of the VARCHAR2 buffer must match the form of the CLOB parameter. In other words, if the input LOB parameter is of type NCLOB, then the buffer must contain NCHAR data. Conversely, if the input LOB parameter is of type CLOB, then the buffer must contain CHAR data.
- When calling DBMS_LOB.READ from the client (for example, in a BEGIN/END block from within SQL*Plus), the returned buffer contains data in the client's character set. The database converts the LOB value from the server's character set to the client's character set before it returns the buffer to the user.
- READ gets the LOB, if necessary, before the read.
- If the LOB is a DBFS LINK, data is streamed from DBFS, if possible, otherwise an exception is thrown.

See Also:

Oracle Database SecureFiles and Large Objects Developer's Guide for additional details on usage of this procedure

104.8.41 SET_DBFS_LINK Procedures

This function links the specified SecureFile to the specified path name. It does not copy the data to the path.

Syntax

```
DBMS_LOB.SET_DBFS_LINK (
  lob_loc      IN OUT BLOB,
  archive_id   IN      RAW(1024));

DBMS_LOB.SET_DBFS_LINK(
  lob_loc_dst  IN OUT CLOB CHARACTER SET ANY_CS,
  archive_id   IN      RAW(1024));
```

Parameters

Table 104-85 SET_DBFS_LINK Procedure Parameters

| Parameter | Description |
|------------|---|
| lob_loc | LOB for which to store the reference value |
| archive_id | Archive ID as returned by calling either of the GET_DBFS_LINK Functions |

Exceptions

Table 104-86 SET_DBFS_LINK Procedure Exceptions

| Exception | Description |
|-------------------|-----------------------------|
| SECUREFILE_BADLOB | lob_loc is not a SECUREFILE |

104.8.42 SETCONTENTTYPE Procedure

This procedure sets the content type string for the data in the LOB.

Syntax

```
DBMS_LOB.SETCONTENTTYPE (
  lob_loc      IN OUT NOCOPY BLOB,
  contenttype  IN      VARCHAR2);

DBMS_LOB.SETCONTENTTYPE (
  lob_loc      IN OUT NOCOPY CLOB CHARACTER SET ANY_CS,
  contenttype  IN      VARCHAR2);
```

Parameters

Table 104-87 SETCONTENTTYPE Procedure Parameters

| Parameter | Description |
|-----------|-------------------------------------|
| lob_loc | LOB to be assigned the content type |

Table 104-87 (Cont.) SETCONTENTTYPE Procedure Parameters

| Parameter | Description |
|-------------|-----------------------|
| contenttype | String to be assigned |

Exceptions

Table 104-88 SETCONTENTTYPE Procedure Exceptions

| Exception | Description |
|-------------------|-----------------------------|
| SECUREFILE_BADLOB | lob_loc is not a SECUREFILE |

Usage Notes

To clear an existing content type associated with a SECUREFILE, invoke SETCONTENTTYPE with contenttype set to empty string.

104.8.43 SETOPTIONS Procedures

This procedure enables/disables compression and deduplication on a per-LOB basis, overriding the default LOB column settings.

Syntax

```

DBMS_LOB.SETOPTIONS (
  lob_loc          IN      BLOB,
  option_types     IN      PLS_INTEGER,
  options          IN      PLS_INTEGER);

DBMS_LOB.SETOPTIONS (
  lob_loc          IN      CLOB CHARACTER SET ANY_CS,
  option_types     IN      PLS_INTEGER,
  options          IN      PLS_INTEGER);

```

Parameters

Table 104-89 SETOPTIONS Procedure Parameter

| Parameter | Description |
|-------------|---|
| lob_loc | Locator for the LOB to be examined. For more information, see Operational Notes . |
| option_type | See Table 104-2 |
| options | See Table 104-3 |

Exceptions

Table 104-90 SETOPTIONS Procedure Exceptions

| Exception | Description |
|-------------------|---|
| SECUREFILE_BADLOB | Unsupported object type for the operation |
| INVALID_ARGVAL | A parameter value was invalid |
| QUERY_WRITE | Cannot perform operation during a query |

Usage Notes

- DBMS_LOB.SETOPTIONS cannot be used to enable or disable encryption on individual LOBs.
- You cannot turn the compression or deduplication features on or off for a SecureFile column if they were not turned when the table was created.
The [GETOPTIONS Functions](#) and SETOPTIONS Procedures work on individual SecureFiles. You can turn off compression or deduplication on a particular SecureFiles LOB and turn on them on, *if* they have already been turned off by SETOPTIONS.
- This call incurs a round-trip to the server to make the changes persistent.

104.8.44 SUBSTR Functions

This function returns `amount` bytes or characters of a LOB, starting from an absolute `offset` from the beginning of the LOB.

For fixed-width `n`-byte CLOBs, if the input `amount` for SUBSTR is greater than $(32767/n)$, then SUBSTR returns a character buffer of length $(32767/n)$, or the length of the CLOB, whichever is lesser. For CLOBs in a varying-width character set, `n` is the maximum byte-width used for characters in the CLOB.

Syntax

```
DBMS_LOB.SUBSTR (
  lob_loc      IN      BLOB,
  amount       IN      INTEGER := 32767,
  offset       IN      INTEGER := 1)
RETURN RAW;

DBMS_LOB.SUBSTR (
  lob_loc      IN      CLOB CHARACTER SET ANY_CS,
  amount       IN      INTEGER := 32767,
  offset       IN      INTEGER := 1)
RETURN VARCHAR2 CHARACTER SET lob_loc%CHARSET;

DBMS_LOB.SUBSTR (
  file_loc     IN      BFILE,
  amount       IN      INTEGER := 32767,
  offset       IN      INTEGER := 1)
RETURN RAW;
```

Pragmas

```
pragma restrict_references(SUBSTR, WNDS, WNPS, RNDS, RNPS);
```

Parameters

Table 104-91 SUBSTR Function Parameters

| Parameter | Description |
|-----------|---|
| lob_loc | Locator for the LOB to be read. For more information, see Operational Notes . |
| file_loc | The file locator for the LOB to be examined. |
| amount | Number of bytes (for BLOBs) or characters (for CLOBs) to be read. |
| offset | Offset in bytes (for BLOBs) or characters (for CLOBs) from the start of the LOB (origin: 1). |

Return Values

Table 104-92 SUBSTR Function Return Values

| Return | Description |
|----------|--|
| RAW | Function overloading that has a BLOB or BFILE in parameter. |
| VARCHAR2 | CLOB version. |
| NULL | Either: <ul style="list-style-type: none"> - any input parameter is NULL - amount < 1 - amount > 32767 - offset < 1 - offset > LOBMAXSIZE |

Exceptions

Table 104-93 SUBSTR Function Exceptions for BFILE operations

| Exception | Description |
|-------------------|--|
| UNOPENED_FILE | File is not opened using the input locator. |
| NOEXIST_DIRECTORY | Directory does not exist. |
| NOPRIV_DIRECTORY | You do not have privileges for the directory. |
| INVALID_DIRECTORY | Directory has been invalidated after the file was opened. |
| INVALID_OPERATION | File does not exist, or you do not have access privileges on the file. |

Usage Notes

- The form of the VARCHAR2 buffer must match the form of the CLOB parameter. In other words, if the input LOB parameter is of type NCLOB, then the buffer must contain NCHAR data. Conversely, if the input LOB parameter is of type CLOB, then the buffer must contain CHAR data.

- When calling `DBMS_LOB.SUBSTR` from the client (for example, in a `BEGIN/END` block from within `SQL*Plus`), the returned buffer contains data in the client's character set. The database converts the LOB value from the server's character set to the client's character set before it returns the buffer to the user.
- `DBMS_LOB.SUBSTR` will return 8191 or more characters based on the characters stored in the LOBs. If all characters are not returned as a consequence of the character byte size exceeding the available buffer, the user should either call `DBMS_LOB.SUBSTR` with a new offset to read the remaining characters, or call the subprogram on loop until all the data is extracted.
- `SUBSTR` gets the LOB, if necessary, before read.
- If the LOB is a DBFS Link, the data is streamed from DBFS, if possible, otherwise, an exception is thrown.

 **See Also:**

- ["INSTR Functions"](#)
- ["READ Procedures"](#)
- *Oracle Database SecureFiles and Large Objects Developer's Guide* for additional details on usage of this procedure

104.8.45 TRIM Procedures

This procedure trims the value of the internal LOB to the length you specify in the `newlen` parameter.

Specify the length in bytes for `BLOBs`, and specify the length in characters for `CLOBs`.

 **Note:**

The `TRIM` procedure decreases the length of the LOB to the value specified in the `newlen` parameter.

If you attempt to `TRIM` an empty LOB, then nothing occurs, and `TRIM` returns no error. If the new length that you specify in `newlen` is greater than the size of the LOB, then an exception is raised.

Syntax

```
DBMS_LOB.TRIM (
  lob_loc      IN OUT NOCOPY BLOB,
  newlen      IN          INTEGER);
```

```
DBMS_LOB.TRIM (
  lob_loc      IN OUT NOCOPY CLOB CHARACTER SET ANY_CS,
  newlen      IN          INTEGER);
```

Parameters

Table 104-94 TRIM Procedure Parameters

| Parameter | Description |
|-----------|---|
| lob_loc | Locator for the internal LOB whose length is to be trimmed. For more information, see Operational Notes . |
| newlen | New, trimmed length of the LOB value in bytes for BLOBs or characters for CLOBs. |

Exceptions

Table 104-95 TRIM Procedure Exceptions

| Exception | Description |
|----------------|---|
| VALUE_ERROR | lob_loc is NULL. |
| INVALID_ARGVAL | Either: - new_len < 0 - new_len > LOBMAXSIZE |
| QUERY_WRITE | Cannot perform a LOB write inside a query or PDML parallel execution server |

Usage Notes

- It is not mandatory that you wrap the LOB operation inside the Open/Close interfaces. If you did not open the LOB before performing the operation, the functional and domain indexes on the LOB column are updated during the call. However, if you opened the LOB before performing the operation, you must close it before you commit the transaction. When an internal LOB is closed, it updates the functional and domain indexes on the LOB column.
- If you do not wrap the LOB operation inside the Open/Close API, the functional and domain indexes are updated each time you write to the LOB. This can adversely affect performance. Therefore, it is recommended that you enclose write operations to the LOB within the OPEN or CLOSE statement.
- TRIM gets the LOB, if necessary, before altering the length of the LOB, unless the new length specified is '0'

See Also:

- ["ERASE Procedures"](#)
- ["WRITEAPPEND Procedures"](#)
- *Oracle Database SecureFiles and Large Objects Developer's Guide* for additional details on usage of this procedure

104.8.46 WRITE Procedures

This procedure writes a specified amount of data into an internal LOB, starting from an absolute offset from the beginning of the LOB. The data is written from the `buffer` parameter.

`WRITE` replaces (overwrites) any data that already exists in the LOB at the offset, for the length you specify.

Syntax

```
DBMS_LOB.WRITE (
  lob_loc IN OUT NOCOPY BLOB,
  amount  IN              INTEGER,
  offset  IN              INTEGER,
  buffer  IN              RAW);

DBMS_LOB.WRITE (
  lob_loc IN OUT NOCOPY CLOB CHARACTER SET ANY_CS,
  amount  IN              INTEGER,
  offset  IN              INTEGER,
  buffer  IN              VARCHAR2 CHARACTER SET lob_loc%CHARSET);
```

Parameters

Table 104-96 WRITE Procedure Parameters

| Parameter | Description |
|----------------------|--|
| <code>lob_loc</code> | Locator for the internal LOB to be written to. For more information, see Operational Notes |
| <code>amount</code> | Number of bytes (for BLOBs) or characters (for CLOBs) to write |
| <code>offset</code> | Offset in bytes (for BLOBs) or characters (for CLOBs) from the start of the LOB (origin: 1) for the write operation. |
| <code>buffer</code> | Input buffer for the write |

Exceptions

Table 104-97 WRITE Procedure Exceptions

| Exception | Description |
|-----------------------------|---|
| <code>VALUE_ERROR</code> | Any of <code>lob_loc</code> , <code>amount</code> , or <code>offset</code> parameters are NULL, out of range, or INVALID. |
| <code>INVALID_ARGVAL</code> | Either: <ul style="list-style-type: none"> - <code>amount < 1</code> - <code>amount > 32767</code> bytes (or the character equivalent) - <code>offset < 1</code> - <code>offset > LOBMAXSIZE</code> |

Table 104-97 (Cont.) WRITE Procedure Exceptions

| Exception | Description |
|------------------------|---|
| QUERY_WRITE | Cannot perform a LOB write inside a query or PDML parallel execution server |
| SECUREFILE_OUTOFBOUNDS | Attempted to perform a write operation past the end of a LOB having <code>FRAGMENT_*</code> on it |

Usage Notes

- There is an error if the input amount is more than the data in the buffer. If the input amount is less than the data in the buffer, then only amount bytes or characters from the buffer is written to the LOB. If the offset you specify is beyond the end of the data currently in the LOB, then zero-byte fillers or spaces are inserted in the `BLOB` or `CLOB` respectively.
- The form of the `VARCHAR2` buffer must match the form of the `CLOB` parameter. In other words, if the input LOB parameter is of type `NCLOB`, then the buffer must contain `NCHAR` data. Conversely, if the input LOB parameter is of type `CLOB`, then the buffer must contain `CHAR` data.
- When calling `DBMS_LOB.WRITE` from the client (for example, in a `BEGIN/END` block from within `SQL*Plus`), the buffer must contain data in the client's character set. The database converts the client-side buffer to the server's character set before it writes the buffer data to the LOB.
- It is not mandatory that you wrap the LOB operation inside the `Open/Close` interfaces. If you did not open the LOB before performing the operation, the functional and domain indexes on the LOB column are updated during the call. However, if you opened the LOB before performing the operation, you must close it before you commit the transaction. When an internal LOB is closed, it updates the functional and domain indexes on the LOB column.
- If you do not wrap the LOB operation inside the `Open/Close` API, the functional and domain indexes are updated each time you write to the LOB. This can adversely affect performance. Therefore, it is recommended that you enclose write operations to the LOB within the `OPEN` or `CLOSE` statement.
- `WRITE` gets the LOB, if necessary, before writing the LOB, unless the write is specified to overwrite the entire LOB.

See Also:

- ["APPEND Procedures"](#)
- ["COPY Procedures"](#)
- *Oracle Database SecureFiles and Large Objects Developer's Guide* for additional details on usage of this procedure

104.8.47 WRITEAPPEND Procedures

This procedure writes a specified amount of data to the end of an internal LOB. The data is written from the `buffer` parameter.

Syntax

```
DBMS_LOB.WRITEAPPEND (
  lob_loc IN OUT NOCOPY BLOB,
  amount IN             INTEGER,
  buffer IN             RAW);
```

```
DBMS_LOB.WRITEAPPEND (
  lob_loc IN OUT NOCOPY CLOB CHARACTER SET ANY_CS,
  amount IN             INTEGER,
  buffer IN             VARCHAR2 CHARACTER SET lob_loc%CHARSET);
```

Parameters

Table 104-98 WRITEAPPEND Procedure Parameters

| Parameter | Description |
|----------------------|--|
| <code>lob_loc</code> | Locator for the internal LOB to be written to. For more information, see Operational Notes |
| <code>amount</code> | Number of bytes (for BLOBs) or characters (for CLOBs) to write |
| <code>buffer</code> | Input buffer for the write |

Usage Notes

There is an error if the input amount is more than the data in the buffer. If the input amount is less than the data in the buffer, then only amount bytes or characters from the buffer are written to the end of the LOB.

Exceptions

Table 104-99 WRITEAPPEND Procedure Exceptions

| Exception | Description |
|-----------------------------|--|
| <code>VALUE_ERROR</code> | Any of <code>lob_loc</code> , <code>amount</code> , or <code>offset</code> parameters are <code>NULL</code> , out of range, or <code>INVALID</code> . |
| <code>INVALID_ARGVAL</code> | Either: <ul style="list-style-type: none"> - <code>amount < 1</code> - <code>amount > 32767</code> bytes (or the character equivalent) |
| <code>QUERY_WRITE</code> | Cannot perform a LOB write inside a query or PDML parallel execution server |

Usage Notes

- The form of the `VARCHAR2` buffer must match the form of the `CLOB` parameter. In other words, if the input LOB parameter is of type `NCLOB`, then the buffer must

contain `NCHAR` data. Conversely, if the input LOB parameter is of type `CLOB`, then the buffer must contain `CHAR` data.

- When calling `DBMS_LOB.WRITEAPPEND` from the client (for example, in a `BEGIN/END` block from within `SQL*Plus`), the buffer must contain data in the client's character set. The database converts the client-side buffer to the server's character set before it writes the buffer data to the LOB.
- It is not mandatory that you wrap the LOB operation inside the Open/Close interfaces. If you did not open the LOB before performing the operation, the functional and domain indexes on the LOB column are updated during the call. However, if you opened the LOB before performing the operation, you must close it before you commit the transaction. When an internal LOB is closed, it updates the functional and domain indexes on the LOB column.
- If you do not wrap the LOB operation inside the Open/Close API, the functional and domain indexes are updated each time you write to the LOB. This can adversely affect performance. Therefore, it is recommended that you enclose write operations to the LOB within the `OPEN` or `CLOSE` statement.
- `WRITEAPPEND` gets the LOB, if necessary, before appending to the LOB.

- *Oracle Database SecureFiles and Large Objects Developer's Guide* for additional details on usage of this procedure

DBMS_LOCK

The `DBMS_LOCK` package provides an interface to Oracle Lock Management services.

You can request a lock of a specific mode, give it a unique name recognizable in another procedure in the same or another instance, change the lock mode, and release it.

This chapter contains the following topics:

- [Overview](#)
- [Security Model](#)
- [Constants](#)
- [Rules and Limits](#)
- [Operational Notes](#)
- [Summary of DBMS_LOCK Subprograms](#)

See Also:

For more information, and an example of how to use the `DBMS_LOCK` package, see *Oracle Database Development Guide*.

105.1 DBMS_LOCK Overview

The `DBMS_LOCK` package has many beneficial uses.

These uses include the following:

- Providing exclusive access to a device, such as a terminal
- Providing application-level enforcement of read locks
- Detecting when a lock is released and cleanup after the application
- Synchronizing applications and enforcing sequential processing

105.2 DBMS_LOCK Security Model

There might be operating system-specific limits on the maximum number of total locks available. This *must* be considered when using locks or making this package available to other users. Consider granting the `EXECUTE` privilege only to specific users or roles.

A better alternative would be to create a cover package limiting the number of locks used and grant `EXECUTE` privilege to specific users. An example of a cover package is documented in the `DBMS_LOCK.SQL` package specification file. The abbreviations for these locks as they appear in Enterprise Manager monitors are in parentheses.

105.3 DBMS_LOCK Constants

The `DBMS_LOCK` package includes several constants to use when specifying parameter values.

These constants are shown in the following table.

Table 105-1 DBMS_LOCK Constants

| Name | Alternate Name(s) | Type | Value | OEM Abbreviation | Description |
|----------|--|---------|-------|------------------|--|
| NL_MODE | NuLl | INTEGER | 1 | - | - |
| SS_MODE | Sub Shared | INTEGER | 2 | ULRS | This can be used on an aggregate object to indicate that share locks are being acquired on subparts of the object. |
| SX_MODE | <ul style="list-style-type: none"> Sub eXclusive Row Exclusive Mode | INTEGER | 3 | ULRX | This can be used on an aggregate object to indicate that exclusive locks are being acquired on sub-parts of the object. |
| S_MODE | <ul style="list-style-type: none"> Shared Row Exclusive Mode Intended Exclusive | INTEGER | 4 | ULRSX | - |
| SSX_MODE | <ul style="list-style-type: none"> Shared Sub eXclusive Share Row Exclusive Mode | INTEGER | 5 | - | This indicates that the entire aggregate object has a share lock, but some of the sub-parts may additionally have exclusive locks. |
| X_MODE | Exclusive | INTEGER | 6 | ULX | - |

These are the various lock modes (nl -> "NuLl", ss -> "Sub Shared", sx -> "Sub eXclusive", s -> "Shared", ssx -> "Shared Sub eXclusive", x -> "eXclusive").

105.4 DBMS_LOCK. Rules and Limits

When another process holds "held", an attempt to get "get" succeeds or fails, based on the held mode and type of get.

The following table describes the results:

Table 105-2 Lock Compatibility

| HELD MODE | GET NL | GET SS | GET SX | GET S | GET SSX | GET X |
|-----------|---------|---------|---------|---------|---------|---------|
| NL | Success | Success | Success | Success | Success | Success |
| SS | Success | Success | Success | Success | Success | Fail |

Table 105-2 (Cont.) Lock Compatibility

| HELD MODE | GET NL | GET SS | GET SX | GET S | GET SSX | GET X |
|-----------|---------|---------|---------|---------|---------|-------|
| SX | Success | Success | Success | Fail | Fail | Fail |
| S | Success | Success | Fail | Success | Fail | Fail |
| SSX | Success | Success | Fail | Fail | Fail | Fail |
| X | Success | Fail | Fail | Fail | Fail | Fail |

```
maxwait constant integer := 32767;
```

The constant `maxwait` waits forever.

105.5 DBMS_LOCK Operational Notes

User locks never conflict with Oracle locks because they are identified with the prefix "UL". You can view these locks using the Enterprise Manager lock monitor screen or the appropriate fixed views.

User locks are automatically released when a session terminates. The lock identifier is a number in the range of 0 to 1073741823.

Because a reserved user lock is the same as an Oracle lock, it has all the functionality of an Oracle lock, such as deadlock detection. Be certain that any user locks used in distributed transactions are released upon `COMMIT`, or an undetected deadlock may occur.

`DBMS_LOCK` is most efficient with a limit of a few hundred locks for each session. Oracle strongly recommends that you develop a standard convention for using these locks in order to avoid conflicts among procedures trying to use the same locks. For example, include your company name as part of your lock names.

105.6 Summary of DBMS_LOCK Subprograms

This table lists the `DBMS_LOCK` subprograms and briefly describes them.

Table 105-3 DBMS_LOCK Package Subprograms

| Subprogram | Description |
|--|--|
| ALLOCATE_UNIQUE Procedure | Allocates a unique lock ID to a named lock |
| ALLOCATE_UNIQUE_AUTONOMOUS Procedure | Allocates a unique lock ID to a named lock |
| CONVERT Function | Converts a lock from one mode to another |
| RELEASE Function | Releases a lock |
| REQUEST Function | Requests a lock of a specific mode. |

105.6.1 ALLOCATE_UNIQUE Procedure

This procedure allocates a unique lock identifier (in the range of 1073741824 to 1999999999) a specified lock name. Lock identifiers are used to enable applications to coordinate their use of locks. This is provided because it may be easier for applications to coordinate their use of locks based on lock names rather than lock numbers.

Syntax

```
DBMS_LOCK.ALLOCATE_UNIQUE (
    lockname      IN VARCHAR2,
    lockhandle    OUT VARCHAR2,
    expiration_secs IN INTEGER DEFAULT 864000);
```

Parameters

Table 105-4 ALLOCATE_UNIQUE Procedure Parameters

| Parameter | Description |
|-----------------|--|
| lockname | Name of the lock for which you want to generate a unique ID. Do not use lock names beginning with ORA\$; these are reserved for products supplied by Oracle. |
| lockhandle | Returns the handle to the lock ID generated by ALLOCATE_UNIQUE. You can use this handle in subsequent calls to REQUEST, CONVERT, and RELEASE. A handle is returned instead of the actual lock ID to reduce the chance that a programming error accidentally creates an incorrect, but valid, lock ID. This provides better isolation between different applications that are using this package. LOCKHANDLE can be up to VARCHAR2 (128). All sessions using a lock handle returned by ALLOCATE_UNIQUE with the same lock name are referring to the same lock. Therefore, do not pass lock handles from one session to another. |
| expiration_secs | Number of seconds to wait after the last ALLOCATE_UNIQUE has been performed on a specified lock, before permitting that lock to be deleted from the DBMS_LOCK_ALLOCATED table. The default waiting period is 10 days. You should not delete locks from this table. Subsequent calls to ALLOCATE_UNIQUE may delete expired locks to recover space. |

Usage Notes

If you choose to identify locks by name, you can use ALLOCATE_UNIQUE to generate a unique lock identification number for these named locks.

The first session to call ALLOCATE_UNIQUE with a new lock name causes a unique lock ID to be generated and stored in the dbms_lock_allocated table. Subsequent calls (usually by other sessions) return the lock ID previously generated.

A lock name is associated with the returned lock ID for at least expiration_secs (defaults to 10 days) past the last call to ALLOCATE_UNIQUE with the specified lock

name. After this time, the row in the `dbms_lock_allocated` table for this lock name may be deleted in order to recover space. `ALLOCATE_UNIQUE` performs a commit.

⚠ WARNING:

Named user locks may be less efficient, because Oracle uses SQL to determine the lock associated with a specified name.

Exceptions

ORA-20000, ORU-10003: Unable to find or insert lock <lockname> into catalog `dbms_lock_allocated`.

105.6.2 ALLOCATE_UNIQUE_AUTONOMOUS Procedure

This procedure allocates a unique lock identifier (in the range of 1073741824 to 1999999999) a specified lock name and is an autonomous version of the `ALLOCATE_UNIQUE` procedure. This procedure works exactly same as that of `ALLOCATE_UNIQUE`, except that the procedure will run as an autonomous transaction. Therefore the commits in `ALLOCATE_UNIQUE_AUTONOMOUS` procedure will not affect the calling procedure. The `ALLOCATE_UNIQUE_AUTONOMOUS` procedure is implemented in DB 12.1 and later releases.

Syntax

```
DBMS_LOCK.ALLOCATE_UNIQUE_AUTONOMOUS (
    lockname          IN  VARCHAR2,
    lockhandle        OUT VARCHAR2,
    expiration_secs   IN  INTEGER    DEFAULT 864000);
```

Parameters

Table 105-5 ALLOCATE_UNIQUE_AUTONOMOUS Procedure Parameters

| Parameter | Description |
|------------|--|
| lockname | Name of the lock for which you want to generate a unique ID. Do not use lock names beginning with <code>ORA\$</code> ; these are reserved for products supplied by Oracle. |
| lockhandle | Returns the handle to the lock ID generated by <code>ALLOCATE_UNIQUE_AUTONOMOUS</code> . You can use this handle in subsequent calls to <code>REQUEST</code> , <code>CONVERT</code> , and <code>RELEASE</code> . A handle is returned instead of the actual lock ID to reduce the chance that a programming error accidentally creates an incorrect, but valid, lock ID. This provides better isolation between different applications that are using this package. <code>LOCKHANDLE</code> can be up to <code>VARCHAR2 (128)</code> . All sessions using a lock handle returned by <code>ALLOCATE_UNIQUE_AUTONOMOUS</code> with the same lock name are referring to the same lock. Therefore, do not pass lock handles from one session to another. |

Table 105-5 (Cont.) ALLOCATE_UNIQUE_AUTONOMOUS Procedure Parameters

| Parameter | Description |
|------------------------------|---|
| <code>expiration_secs</code> | <p>Number of seconds to wait after the last <code>ALLOCATE_UNIQUE_AUTONOMOUS</code> has been performed on a specified lock, before permitting that lock to be deleted from the <code>ALLOCATE_UNIQUE_AUTONOMOUS</code> table.</p> <p>The default waiting period is 10 days. You should not delete locks from this table. Subsequent calls to <code>ALLOCATE_UNIQUE_AUTONOMOUS</code> may delete expired locks to recover space.</p> |

Usage Notes

If you choose to identify locks by name, you can use `ALLOCATE_UNIQUE_AUTONOMOUS` to generate a unique lock identification number for these named locks.

The first session to call `ALLOCATE_UNIQUE_AUTONOMOUS` with a new lock name causes a unique lock ID to be generated and stored in the `dbms_lock_allocated` table. Subsequent calls (usually by other sessions) return the lock ID previously generated.

A lock name is associated with the returned lock ID for at least `expiration_secs` (defaults to 10 days) past the last call to `ALLOCATE_UNIQUE_AUTONOMOUS` with the specified lock name. After this time, the row in the `dbms_lock_allocated` table for this lock name may be deleted in order to recover space. `ALLOCATE_UNIQUE_AUTONOMOUS` performs a commit.

WARNING:

Named user locks may be less efficient, because Oracle uses SQL to determine the lock associated with a specified name.

Exceptions

ORA-20000, ORU-10003: Unable to find or insert lock <lockname> into catalog `dbms_lock_allocated`.

105.6.3 CONVERT Function

This function converts a lock from one mode to another. `CONVERT` is an overloaded function that accepts either a user-defined lock identifier, or the lock handle returned by the `ALLOCATE_UNIQUE` procedure.

Syntax

```
DBMS_LOCK.CONVERT(
  id          IN INTEGER ||
  lockhandle  IN VARCHAR2,
  lockmode   IN INTEGER,
  timeout     IN NUMBER DEFAULT MAXWAIT)
RETURN INTEGER;
```

Parameters

Table 105-6 CONVERT Function Parameters

| Parameter | Description |
|------------------|---|
| id or lockhandle | User assigned lock identifier, from 0 to 1073741823, or the lock handle, returned by <code>ALLOCATE_UNIQUE</code> , of the lock mode you want to change |
| lockmode | New mode that you want to assign to the specified lock. For the available modes and their associated integer identifiers, see Constants . |
| timeout | Number of seconds to continue trying to change the lock mode. If the lock cannot be converted within this time period, then the call returns a value of 1 (timeout). |

Return Values

Table 105-7 CONVERT Function Return Values

| Return Value | Description |
|--------------|--|
| 0 | Success |
| 1 | Timeout |
| 2 | Deadlock |
| 3 | Parameter error |
| 4 | Don't own lock specified by id or lockhandle |
| 5 | Illegal lock handle |

105.6.4 RELEASE Function

This function explicitly releases a lock previously acquired using the `REQUEST` function.

Locks are automatically released at the end of a session. `RELEASE` is an overloaded function that accepts either a user-defined lock identifier, or the lock handle returned by the `ALLOCATE_UNIQUE` procedure.

Syntax

```
DBMS_LOCK.RELEASE (
    id          IN INTEGER)
    RETURN INTEGER;
```

```
DBMS_LOCK.RELEASE (
    lockhandle IN VARCHAR2)
    RETURN INTEGER;
```

Parameters

Table 105-8 RELEASE Function Parameter

| Parameter | Description |
|------------------|---|
| id or lockhandle | User assigned lock identifier, from 0 to 1073741823, or the lock handle, returned by <code>ALLOCATE_UNIQUE</code> , of the lock mode you want to change |

Return Values

Table 105-9 RELEASE Function Return Values

| Return Value | Description |
|--------------|---|
| 0 | Success |
| 3 | Parameter error |
| 4 | Do not own lock specified by id or lockhandle |
| 5 | Illegal lock handle |

105.6.5 REQUEST Function

This function requests a lock with a specified mode.

`REQUEST` is an overloaded function that accepts either a user-defined lock identifier, or the lock handle returned by the `ALLOCATE_UNIQUE` procedure.

Syntax

```
DBMS_LOCK.REQUEST(
  id          IN  INTEGER ||
  lockhandle  IN  VARCHAR2,
  lockmode    IN  INTEGER DEFAULT X_MODE,
  timeout     IN  INTEGER DEFAULT MAXWAIT,
  release_on_commit IN BOOLEAN DEFAULT FALSE)
RETURN INTEGER;
```

The current default values, such as `X_MODE` and `MAXWAIT`, are defined in the `DBMS_LOCK` package specification.

Parameters

Table 105-10 REQUEST Function Parameters

| Parameter | Description |
|------------------|---|
| id or lockhandle | User assigned lock identifier, from 0 to 1073741823, or the lock handle, returned by <code>ALLOCATE_UNIQUE</code> , of the lock mode you want to change |
| lockmode | Mode that you are requesting for the lock. For the available modes and their associated integer identifiers, see Constants . |

Table 105-10 (Cont.) REQUEST Function Parameters

| Parameter | Description |
|--------------------------------|---|
| <code>timeout</code> | Number of seconds to continue trying to grant the lock. If the lock cannot be granted within this time period, then the call returns a value of 1 (<code>timeout</code>). |
| <code>release_on_commit</code> | Set this parameter to <code>TRUE</code> to release the lock on commit or roll-back. Otherwise, the lock is held until it is explicitly released or until the end of the session. |

Return Values**Table 105-11 REQUEST Function Return Values**

| Return Value | Description |
|--------------|--|
| 0 | Success |
| 1 | Timeout |
| 2 | Deadlock |
| 3 | Parameter error |
| 4 | Already own lock specified by <code>id</code> or <code>lockhandle</code> |
| 5 | Illegal lock handle |

DBMS_LOGMNR

The `DBMS_LOGMNR` package, one of a set of LogMiner packages, contains the subprograms you use to initialize the LogMiner tool and to begin and end a LogMiner session.

 **Note:**

The ability to create flat file dictionary dumps of pluggable databases (PDBs) is desupported in Oracle Database 21c.

In previous releases, using a flat file dictionary was one means of mining the redo logs for the changes associated with a specific PDB whose data dictionary was contained within the flat file. This feature is now desupported. Starting with Oracle Database 21c, Oracle recommends that you call `DBMS_LOGMNR.START_LOGMNR`, and supply the system change number (SCN) or time range that you want to mine. The SCN or time range options of `START_LOGMNR` are enhanced to support mining of individual PDBs.

The `CONTINUOUS_MINE` functionality of the LogMiner package is obsolete. It was deprecated in Oracle Database 12c release 2 (12.2). There is no replacement functionality.

This chapter contains the following topics:

- [Overview](#)
- [Security Model](#)
- [Constants](#)
- [Views](#)
- [Operational Notes](#)
- [Summary of DBMS_LOGMNR Subprograms](#)

 **See Also:**

Oracle Database Utilities for information regarding LogMiner.

106.1 DBMS_LOGMNR Overview

Oracle LogMiner, which is part of Oracle Database, enables you to query online and archived redo log files through a SQL interface. The `DBMS_LOGMNR` package provides the majority of the tools needed to start and stop LogMiner and specify the redo log files of interest.

All changes made to user data or to the database dictionary are recorded in the Oracle redo log files so that database recovery operations can be performed. You can take advantage of the data recorded in the redo log files to accomplish other tasks, such as:

- Pinpointing when a logical corruption to a database, such as errors made at the application level, may have begun
- Determining what actions you would have to take to perform fine-grained recovery at the transaction level.
- Performance tuning and capacity planning through trend analysis.
- Track any data manipulation language (DML) and data definition language (DDL) statements executed on the database, the order in which they were executed, and who executed them.

See Also:

`DBMS_LOGMNR_D` for information on the package subprograms that extract a LogMiner dictionary and re-create LogMiner tables in alternate tablespaces

106.2 DBMS_LOGMNR Security Model

You must have the `EXECUTE_CATALOG_ROLE` role to use the `DBMS_LOGMNR` package.

106.3 DBMS_LOGMNR Constants

The `DBMS_LOGMNR` package defines several enumerated constants for specifying parameter values. Enumerated constants must be prefixed with the package name, for example, `DBMS_LOGMNR.NEW`.

Note:

The `continuous_mine` option for the `dbms_logmnr.start_logmnr` package is desupported in Oracle Database 19c (19.1), and is no longer available.

The following table describes the constants for the `ADD_LOGFILE options` flag in the `DBMS_LOGMNR` package.

Table 106-1 Constants for ADD_LOGFILE Options Flag

| Constant | Description |
|----------|--|
| NEW | Implicitly calls the <code>DBMS_LOGMNR.END_LOGMNR</code> procedure to end the current LogMiner session and then creates a new session. The new session starts a new list of redo log files to be analyzed, beginning with the redo log file you specify. |
| ADDFILE | Adds the specified redo log file to the list of redo log files to be analyzed. Any attempt to add a duplicate file raises an exception (ORA-01289). This is the default if no options flag is specified. |

[Table 106-2](#) describes the constants for the `START_LOGMNR` options flag in the `DBMS_LOGMNR` package.

Table 106-2 Constants for START_LOGMNR Options Flag

| Constant | Description |
|---------------------|---|
| COMMITTED_DATA_ONLY | <p>If set, DML statements corresponding to committed transactions are returned. DML statements corresponding to a committed transaction are grouped together. Transactions are returned in their commit order. Transactions that are rolled back or in-progress are filtered out, as are internal redo records (those related to index operations, management, and so on).</p> <p>If this option is not set, all rows for all transactions (committed, rolled back, and in-progress) are returned in the order in which they are found in the redo logs (in order of SCN values).</p> |
| SKIP_CORRUPTION | Directs a select operation on the <code>V\$LOGMNR_CONTENTS</code> view to skip any corruptions in the redo log file being analyzed and continue processing. This option works only when a block in the redo log file (and not the header of the redo log file) is corrupt. You should check the <code>INFO</code> column in the <code>V\$LOGMNR_CONTENTS</code> view to determine the corrupt blocks skipped by LogMiner. When a corruption in the redo log file is skipped, the <code>OPERATION</code> column contains the value <code>CORRUPTED_BLOCKS</code> , and the <code>STATUS</code> column contains the value <code>1343</code> . |
| DDL_DICT_TRACKING | <p>If the LogMiner dictionary in use is a flat file or in the redo log files, LogMiner updates its internal dictionary if a DDL event occurs. This ensures that correct <code>SQL_REDO</code> and <code>SQL_UNDO</code> information is maintained for objects that are modified after the LogMiner internal dictionary is built. The database to which LogMiner is connected must be open.</p> <p>This option cannot be used in conjunction with the <code>DICT_FROM_ONLINE_CATALOG</code> option and cannot be used when the LogMiner dictionary being used is one that was extracted to a flat file prior to Oracle9i.</p> |

Table 106-2 (Cont.) Constants for START_LOGMNR Options Flag

| Constant | Description |
|--------------------------|---|
| DICT_FROM_ONLINE_CATALOG | <p>Directs LogMiner to use the current online database dictionary rather than a LogMiner dictionary contained in a flat file or in the redo log files being analyzed.</p> <p>This option cannot be used in conjunction with the DDL_DICT_TRACKING option. The database to which LogMiner is connected must be the same one that generated the redo log files.</p> <p>Expect to see a value of 2 in the STATUS column of the V\$LOGMNR_CONTENTS view if the table definition in the database does not match the table definition in the redo log file.</p> |
| DICT_FROM_REDO_LOGS | <p>If set, LogMiner expects to find a LogMiner dictionary in the redo log files that were specified. The redo log files are specified with the DBMS_LOGMNR.ADD_LOGFILE procedure or with the DBMS_LOGMNR.START_LOGMNR procedure.</p> |
| NO_SQL_DELIMITER | <p>If set, the SQL delimiter (a semicolon) is not placed at the end of reconstructed SQL statements. This is helpful for applications that open a cursor and then execute the reconstructed statements.</p> |
| NO_ROWID_IN_STMT | <p>If set, the ROWID clause is not included in the reconstructed SQL statements. The redo log file may already contain logically unique identifiers for modified rows if supplemental logging is enabled.</p> <p>When using this option, you must be sure that supplemental logging was enabled in the source database at the appropriate level and that no duplicate rows exist in the tables of interest. LogMiner does not make any guarantee regarding the uniqueness of logical row identifiers.</p> |
| PRINT_PRETTY_SQL | <p>If set, LogMiner formats the reconstructed SQL statements for ease of reading. These reconstructed SQL statements are not executable.</p> |
| STRING_LITERALS_IN_STMT | <p>If set, SQL_REDO and SQL_UNDO use literals for numbers and datetime and interval column types.</p> |

To specify more than one option, use a plus sign (+) between them. For example:

```
EXECUTE DBMS_LOGMNR.START_LOGMNR (OPTIONS => -
    DBMS_LOGMNR.DDL_DICT_TRACKING + DBMS_LOGMNR.DICT_FROM_REDO_LOGS);
```

106.4 DBMS_LOGMNR Views

The DBMS_LOGMNR package uses the views listed under *Accessing Logminer Operational Information In Views in Oracle Database Utilities*.

See Also:

Oracle Database Utilities

106.5 DBMS_LOGMNR Operational Notes

A **LogMiner session** begins with a call to `DBMS_LOGMNR.ADD_LOGFILE` or `DBMS_LOGMNR.START_LOGMNR` (the former if you plan to specify log files explicitly; the latter if you plan to use continuous mining). The session ends with a call to `DBMS_LOGMNR.END_LOGMNR`.

Within a LogMiner session, you can specify the redo log files to be analyzed and the SCN or time range of interest; then you can issue SQL `SELECT` statements against the `V$LOGMNR_CONTENTS` view to retrieve the data of interest.

`ADD_LOGFILE` Procedure must be invoked before `START_LOGMNR` Procedure.

Note:

You must add log files before filtering. Continuous logging is no longer supported. If logfiles have not been added that match the time or the SCN that you provide, then `DBMS_LOGMNR.START_LOGMNR` fails with the error `ORA-01291: missing logfile`.

106.6 Summary of DBMS_LOGMNR Subprograms

This table lists the `DBMS_LOGMNR` subprograms and briefly describes them.

In a multitenant container database (CDB) some subprograms must be called from the root. There may be other differences as well. See the individual subprogram descriptions for details.

Table 106-3 DBMS_LOGMNR Package Subprograms

| Subprogram | Description |
|--|--|
| ADD_LOGFILE Procedure | Adds a redo log file to the existing or newly created list of redo log files for LogMiner to process, so that if a new list is created, this marks the beginning of a LogMiner session |
| COLUMN_PRESENT Function | Call this function for any row returned from the <code>V\$LOGMNR_CONTENTS</code> view to determine if undo or redo column values exist for the column specified by the <code>column_name</code> input parameter to this function |
| END_LOGMNR Procedure | Finishes a LogMiner session |
| MINE_VALUE Function | Call this function for any row returned from the <code>V\$LOGMNR_CONTENTS</code> view to retrieve the undo or redo column value of the column specified by the <code>column_name</code> input parameter to this function |
| REMOVE_LOGFILE Procedure | Removes a redo log file from the list of redo log files for LogMiner to process |
| START_LOGMNR Procedure | Initializes the LogMiner utility and starts LogMiner (unless the session was already started with a call to <code>DBMS_LOGMNR.ADD_LOGFILE</code>) |

106.6.1 ADD_LOGFILE Procedure

This procedure adds a file to an existing or newly created list of log files for LogMiner to process.

Note:

The `continuous_mine` option for the `dbms_logmnr.start_logmnr` package is desupported in Oracle Database 19c (19.1), and is no longer available.

In a CDB, the `ADD_LOGFILE` procedure must be called from the root database. You must have the `LOGMINING` administrative privilege to use this procedure.

Syntax

```
DBMS_LOGMNR.ADD_LOGFILE (
    LogFileName      IN VARCHAR2,
    options          IN BINARY_INTEGER default ADDFILE );
```

Parameters

Table 106-4 ADD_LOGFILE Procedure Parameters

| Parameter | Description |
|-------------|--|
| LogFileName | Specifies the name of the redo log file to add to the list of redo log files to be analyzed during this session. |
| options | Does one of the following: <ul style="list-style-type: none"> Starts a new LogMiner session and a new list of redo log files for analysis (<code>DBMS_LOGMNR.NEW</code>) Adds a file to an existing list of redo log files for analysis (<code>DBMS_LOGMNR.ADDFILE</code>) See Table 106-1 . |

Exceptions

Table 106-5 ADD_LOGFILE Procedure Exceptions

| Exception | Description |
|-----------|--|
| ORA-01284 | Specified file cannot be opened. |
| ORA-01287 | Specified file is from a different database incarnation. |
| ORA-01289 | Specified file has already been added to the list. Duplicate redo log files cannot be added. |
| ORA-01290 | Specified file is not in the current list and therefore cannot be removed from the list. |
| ORA-01324 | Specified file cannot be added to the list because there is a <code>DB_ID</code> mismatch. |

Usage Notes

- The `DBMS_LOGMNR.ADD_LOGFILE` call from a PDB connection is not supported for adhoc users and returns error 65040.
- Dumping Flat File dictionary and mining using Flat File dictionary are not supported from a PDB connection.
- Before querying the `V$LOGMNR_CONTENTS` view, you must make a successful call to the `DBMS_LOGMNR.START_LOGMNR` procedure (within the current LogMiner session).
- The LogMiner session must be set up with a list of redo log files to be analyzed. Use the `ADD_LOGFILE` procedure to specify the list of redo log files to analyze.
- If you want to analyze more than one redo log file, you must call the `ADD_LOGFILE` procedure separately for each redo log file. The redo log files do not need to be registered in any particular order.
- Both archived and online redo log files can be mined.
- After you have added the first redo log file to the list, each additional redo log file that you add to the list must be associated with the same database and database `RESETLOGS SCN` as the first redo log file. (The database `RESETLOGS SCN` uniquely identifies each execution of an `ALTER DATABASE OPEN RESETLOGS` statement. When the online redo logs are reset, Oracle creates a new and unique incarnation of the database.)
- To analyze the redo log files from a different database (or a database incarnation with a different database `RESETLOGS SCN`) than that with which the current list of redo log files is associated, use the `END_LOGMNR` procedure to end the current LogMiner session, and then build a new list using the `ADD_LOGFILE` procedure.
- LogMiner matches redo log files by the log sequence number. Thus, two redo log files with different names but with the same log sequence number will return the ORA-01289 exception. For instance, the online counterpart of an archived redo log file has a different name from the archived redo log file, but attempting to register it with LogMiner after registering the archived counterpart will result in the ORA-01289 exception being returned.

106.6.2 COLUMN_PRESENT Function

This function is designed to be used in conjunction with the `MINE_VALUE` function.

If the `MINE_VALUE` function returns a `NULL` value, it can mean either:

- The specified column is not present in the redo or undo portion of the data.
- The specified column is present and has a `NULL` value.

To distinguish between these two cases, use the `COLUMN_PRESENT` function, which returns a 1 if the column is present in the redo or undo portion of the data. Otherwise, it returns a 0.

Syntax

```
DBMS_LOGMNR.COLUMN_PRESENT (
    sql_redo_undo      IN RAW,
    column_name        IN VARCHAR2 default '') RETURN NUMBER;
```

Parameters

Table 106-6 COLUMN_PRESENT Function Parameters

| Parameter | Description |
|----------------------------|--|
| <code>sql_redo_undo</code> | Specifies either the <code>REDO_VALUE</code> or the <code>UNDO_VALUE</code> column in the <code>V\$LOGMNR_CONTENTS</code> view from which to extract data values. See the Usage Notes for more information. |
| <code>column_name</code> | Specifies the fully qualified name (<code>schema.table.column</code>) of the column for which this function will return information. In a CDB, the column name is specified as follows: <code>container_name: schema.table.column</code> |

Return Values

[Table 106-7](#) describes the return values for the `COLUMN_PRESENT` function. The `COLUMN_PRESENT` function returns 1 if the self-describing record (the first parameter) contains the column specified in the second parameter. This can be used to determine the meaning of `NULL` values returned by the `DBMS_LOGMNR.MINE_VALUE` function.

Table 106-7 Return Values for COLUMN_PRESENT Function

| Return | Description |
|--------|--|
| 0 | Specified column is not present in this row of <code>V\$LOGMNR_CONTENTS</code> . |
| 1 | Column is present in this row of <code>V\$LOGMNR_CONTENTS</code> . |

Exceptions

Table 106-8 COLUMN_PRESENT Function Exceptions

| Exception | Description |
|-----------|--|
| ORA-01323 | Currently, a LogMiner dictionary is not associated with the LogMiner session. You must specify a LogMiner dictionary for the LogMiner session. |
| ORA-00904 | Value specified for the <code>column_name</code> parameter is not a fully qualified column name. |

Usage Notes

- To use the `COLUMN_PRESENT` function, you must have successfully started LogMiner.
- The `COLUMN_PRESENT` function must be invoked in the context of a select operation on the `V$LOGMNR_CONTENTS` view.
- The `COLUMN_PRESENT` function does not support `LONG`, `LOB`, `ADT`, or `COLLECTION` datatypes.
- The value for the `sql_redo_undo` parameter depends on the operation performed and the data of interest:

- If an update operation was performed and you want to know what the value was prior to the update operation, specify `UNDO_VALUE`.
- If an update operation was performed and you want to know what the value is after the update operation, specify `REDO_VALUE`.
- If an insert operation was performed, typically you would specify `REDO_VALUE` (because the value of a column prior to an insert operation will always be `NULL`).
- If a delete operation was performed, typically you would specify `UNDO_VALUE` (because the value of a column after a delete operation will always be `NULL`).

106.6.3 END_LOGMNR Procedure

This procedure finishes a LogMiner session. Because this procedure performs cleanup operations that may not otherwise be done, you must use it to properly end a LogMiner session. This procedure is called automatically when you log out of a database session or when you call `DBMS_LOGMNR.ADD_LOGFILE` and specify the `NEW` option.

Syntax

```
DBMS_LOGMNR.END_LOGMNR;
```

Exceptions

Table 106-9 END_LOGMNR Procedure Exception

| Exception | Description |
|-----------|---|
| ORA-01307 | No LogMiner session is currently active. The <code>END_LOGMNR</code> procedure was called without adding any log files or before the <code>START_LOGMNR</code> procedure was called |

106.6.4 MINE_VALUE Function

This function facilitates queries based on a column's data value.

This function takes two arguments. The first one specifies whether to mine the redo (`REDO_VALUE`) or undo (`UNDO_VALUE`) portion of the data. The second argument is a string that specifies the fully qualified name of the column to be mined. The `MINE_VALUE` function always returns a string that can be converted back to the original datatype.

Syntax

```
DBMS_LOGMNR.MINE_VALUE (
    sql_redo_undo      IN RAW,
    column_name        IN VARCHAR2 default '') RETURN VARCHAR2;
```

Parameters

Table 106-10 MINE_VALUE Function Parameters

| Parameter | Description |
|----------------------------|---|
| <code>sql_redo_undo</code> | Specifies either the <code>REDO_VALUE</code> or the <code>UNDO_VALUE</code> column in the <code>V\$LOGMNR_CONTENTS</code> view from which to extract data values. See the Usage Notes for more information. |
| <code>column_name</code> | Specifies the fully qualified name (<code>schema.table.column</code>) of the column for which this function will return information. In a CDB, the column name is specified as follows: <code>container_name:schema.table.column</code> |

Return Values

Table 106-11 Return Values for MINE_VALUE Function

| Return | Description |
|----------|--|
| NULL | The column is not contained within the self-describing record, or the column value is NULL. To distinguish between the two different null possibilities, use the <code>DBMS_LOGMNR.COLUMN_PRESENT</code> function. |
| NON-NULL | The column is contained within the self-describing record; the value is returned in string format. |

Exceptions

Table 106-12 MINE_VALUE Function Exceptions

| Exception | Description |
|-----------|---|
| ORA-01323 | Invalid state. Currently, a LogMiner dictionary is not associated with the LogMiner session. You must specify a LogMiner dictionary for the LogMiner session. |
| ORA-00904 | Invalid identifier. The value specified for the <code>column_name</code> parameter was not a fully qualified column name. |

Usage Notes

- To use the `MINE_VALUE` function, you must have successfully started LogMiner.
- The `MINE_VALUE` function must be invoked in the context of a select operation from the `V$LOGMNR_CONTENTS` view.
- The `MINE_VALUE` function does not support `LONG`, `LOB`, `ADT`, or `COLLECTION` datatypes.
- The value for the `sql_redo_undo` parameter depends on the operation performed and the data of interest:
 - If an update operation was performed and you want to know what the value was prior to the update operation, specify `UNDO_VALUE`.

- If an update operation was performed and you want to know what the value is after the update operation, specify `REDO_VALUE`.
- If an insert operation was performed, typically you would specify `REDO_VALUE` (because the value of a column prior to an insert operation will always be null).
- If a delete operation was performed, typically you would specify `UNDO_VALUE` (because the value of a column after a delete operation will always be null).
- If the `DBMS_LOGMNR.MINE_VALUE` function is used to get an `NCHAR` value that includes characters not found in the database character set, then those characters are returned as the replacement character (for example, an inverted question mark) of the database character set.

106.6.5 REMOVE_LOGFILE Procedure

This procedure removes a redo log file from an existing list of redo log files for LogMiner to process.

In a CDB, the `REMOVE_LOGFILE` procedure must be called from the root database. You must have the `LOGMINING` administrative privilege to use this procedure.

Syntax

```
DBMS_LOGMNR.REMOVE_LOGFILE (
    LogFileName      IN VARCHAR2);
```

Parameters

Table 106-13 REMOVE_LOGFILE Procedure Parameters

| Parameter | Description |
|--------------------------|---|
| <code>LogFileName</code> | Specifies the name of the redo log file to be removed from the list of redo log files to be analyzed during this session. |

Exceptions

Table 106-14 REMOVE_LOGFILE Procedure Exception

| Exception | Description |
|------------------------|---------------------------------|
| <code>ORA-01290</code> | Cannot remove unlisted log file |

Usage Notes

- Before querying the `V$LOGMNR_CONTENTS` view, you must make a successful call to the `DBMS_LOGMNR.START_LOGMNR` procedure (within the current LogMiner session).
- You can use this procedure to remove a redo log file from the list of redo log files for LogMiner to process if you know that redo log file does not contain any data of interest.
- Multiple redo log files can be removed by calling this procedure repeatedly.
- The redo log files do not need to be removed in any particular order.
- To start a new list of redo log files for analysis, use the `END_LOGMNR` procedure to end the current LogMiner session, and then build a new list using the `ADD_LOGFILE` procedure.

- Even if you remove all redo log files from the list, any subsequent calls you make to the `ADD_LOGFILE` procedure must match the database ID and `RESETLOGS SCN` of the removed redo log files. Therefore, to analyze the redo log files from a different database (or a database incarnation with a different database `RESETLOGS SCN`) than that with which the current list of redo log files is associated, use the `END_LOGMNR` procedure to end the current LogMiner session, and then build a new list using the `ADD_LOGFILE` procedure.

106.6.6 START_LOGMNR Procedure

This procedure starts LogMiner by loading the dictionary that LogMiner will use to translate internal schema object identifiers to names.

In a CDB, the `START_LOGMNR` procedure must be called from the root database. You must have the `LOGMINING` administrative privilege to use this procedure.

Note:

The ability to create flat file dictionary dumps of pluggable databases (PDBs) is desupported in Oracle Database 21c.

In previous releases, using a flat file dictionary was one means of mining the redo logs for the changes associated with a specific PDB whose data dictionary was contained within the flat file. This feature is now desupported. Starting with Oracle Database 21c, Oracle recommends that you call `DBMS_LOGMNR.START_LOGMNR`, and supply the system change number (SCN) or time range that you want to mine. The SCN or time range options of `START_LOGMNR` are enhanced to support mining of individual PDBs.

Syntax

```
DBMS_LOGMNR.START_LOGMNR (
  startScn          IN NUMBER default 0,
  endScn           IN NUMBER default 0,
  startTime        IN DATE default '01-jan-1988',
  endTime         IN DATE default '31-dec-2110',
  DictFileName     IN VARCHAR2 default '',
  Options          IN BINARY_INTEGER default 0 );
```

Parameters

Table 106-15 START_LOGMNR Procedure Parameters

| Parameter | Description |
|-----------------------|--|
| <code>startScn</code> | Directs LogMiner to return only redo records with an SCN greater than or equal to the <code>startScn</code> specified. This fails if there is no redo log file containing the specified <code>startScn</code> value. (You can query the <code>FILENAME</code> , <code>LOW_SCN</code> , and <code>NEXT_SCN</code> columns in the <code>V\$LOGMNR_LOGS</code> view for each redo log file to determine the range of SCN values contained in each redo log file.) |

Table 106-15 (Cont.) START_LOGMNR Procedure Parameters

| Parameter | Description |
|--------------|--|
| endScn | Directs LogMiner to return only redo records with an SCN less than or equal to the <code>endScn</code> specified. If you specify an <code>endScn</code> value that is beyond the value in any redo log file, then LogMiner uses the greatest <code>endScn</code> value in the redo log file that contains the most recent changes. (You can query the <code>FILENAME</code> , <code>LOW_SCN</code> , and <code>NEXT_SCN</code> columns in the <code>V\$LOGMNR_LOGS</code> view for each redo log file to determine the range of SCN values contained in each redo log file.) |
| startTime | Directs LogMiner to return only redo records with a timestamp greater than or equal to the <code>startTime</code> specified. This fails if there is no redo log file containing the specified <code>startTime</code> value. (You can query the <code>FILENAME</code> , <code>LOW_TIME</code> , and <code>HIGH_TIME</code> columns in the <code>V\$LOGMNR_LOGS</code> view for each redo log file to determine the range of time covered in each redo log file.) This parameter is ignored if <code>startScn</code> is specified. See the Usage Notes for additional information. |
| endTime | Directs LogMiner to return only redo records with a timestamp less than or equal to the <code>endTime</code> specified. If you specify an <code>endTime</code> value that is beyond the value in any redo log file, then LogMiner will use the greatest <code>endTime</code> in the redo log file that contains the most recent changes. You can query the <code>FILENAME</code> , <code>LOW_TIME</code> , and <code>HIGH_TIME</code> columns in the <code>V\$LOGMNR_LOGS</code> view for each redo log file to determine the range of time covered in each redo log file.) This parameter is ignored if <code>endScn</code> is specified. See the Usage Notes for additional information. |
| DictFileName | Specifies the flat file that contains the LogMiner dictionary. It is used to reconstruct <code>SQL_REDO</code> and <code>SQL_UNDO</code> columns in <code>V\$LOGMNR_CONTENTS</code> , as well as to fully translate <code>SEG_NAME</code> , <code>SEG_OWNER</code> , <code>SEG_TYPE_NAME</code> , <code>TABLE_NAME</code> , and <code>TABLE_SPACE</code> columns. The fully qualified path name for the LogMiner dictionary file must be specified. (This file must have been created previously through the <code>DBMS_LOGMNR_D.BUILD</code> procedure.) You need to specify this parameter only if neither <code>DICT_FROM_REDO_LOGS</code> nor <code>DICT_FROM_ONLINE_CATALOG</code> is specified. |
| options | See Table 106-2 . |

Exceptions

Table 106-16 START_LOGMNR Procedure Exceptions

| Exception | Description |
|-----------|--|
| ORA-01280 | Internal error encountered. |
| ORA-01281 | <code>startScn</code> or <code>endScn</code> parameter value is not a valid SCN, or <code>endScn</code> is less than <code>startScn</code> . |

Table 106-16 (Cont.) START_LOGMNR Procedure Exceptions

| Exception | Description |
|-----------|--|
| ORA-01282 | value for the <code>startTime</code> parameter was greater than the value specified for the <code>endTime</code> parameter, or there was no redo log file that was compatible with the date range specified with the <code>startTime</code> and <code>endTime</code> parameters. |
| ORA-01283 | Options parameter specified is invalid. |
| ORA-01284 | LogMiner dictionary file specified in the <code>DictFileName</code> parameter has a full path length greater than 256 characters, or the file cannot be opened. |
| ORA-01285 | Error reading specified file. |
| ORA-01291 | Redo log files that are needed to satisfy the user's requested SCN or time range are missing. |
| ORA-01292 | No log file has been specified for the current LogMiner session. |
| ORA-01293 | Mounted database required for specified LogMiner options. |
| ORA-01294 | Error occurred while processing information in the specified dictionary file, possible corruption. |
| ORA-01295 | Specified LogMiner dictionary does not correspond to the database that produced the log files being analyzed. |
| ORA-01296 | Character set mismatch between specified LogMiner dictionary and log files. |
| ORA-01297 | Redo version mismatch between LogMiner dictionary and log files. |
| ORA-01299 | Specified LogMiner dictionary corresponds to a different database incarnation. |
| ORA-01300 | Writable database required for specified LogMiner options. |

Usage Notes **Note:**

The `continuous_mine` option for the `dbms_logmnr.start_logmnr` package is desupported in Oracle Database 19c (19.1), and is no longer available.

- The `DBMS_LOGMNR.ADD_LOGFILE` call from a PDB connection is not supported for adhoc users and returns error 65040.
- Users can specify the SCN range or the time range. The required logfiles will be added programmatically.
- Dumping Flat File dictionary and mining using Flat File dictionary are not supported from a PDB connection.
- LogMiner can use a dictionary that you previously extracted to the redo log files or to a flat file, or you can specify that LogMiner use the online catalog if LogMiner is mining data from the source system.
- After executing the `START_LOGMNR` procedure, you can query the following views:

- V\$LOGMNR_CONTENTS - contains history of information in redo log files
- V\$LOGMNR_DICTIONARY - contains current information about the LogMiner dictionary file extracted to a flat file
- V\$LOGMNR_PARAMETERS - contains information about the LogMiner session

(You can query the V\$LOGMNR_LOGS view after a redo log file list has been added to the list of files that LogMiner is to mine.)

- Parameters and options are not persistent across calls to DBMS_LOGMNR.START_LOGMNR. You must specify all desired parameters and options (including SCN and time ranges) each time you call DBMS_LOGMNR.START_LOGMNR
- Be aware that specifying redo log files using a timestamp is not precise.
- Keep the following in mind regarding starting and ending times or SCN ranges:
 - If you specify neither a `startTime` nor a `startScn` parameter, LogMiner will set the `startScn` parameter to use the lowest SCN value from the redo log file that contains the oldest changes.
 - If you specify both time and SCN values, LogMiner uses the SCN value or values and ignores the time values.
 - If you specify starting and ending time or SCN values and they are found in the LogMiner redo log file list, then LogMiner mines the logs indicated by those values.
 - If you specify starting and ending times or SCN values that are not in the LogMiner redo log file list, and you specify `DBMS_LOGMNR.START_LOGMNR`, and you specify:
 - * 0 for the `startTime` or `startScn` value, then the lowest SCN in the LogMiner redo log file list will be used as the `startScn`
 - * A nonzero number for the `startTime` or `startScn` value, then an error is returned
 - * 0 or a nonzero number for the `endTime` or `endScn` value, then the highest SCN in the LogMiner redo log file list will be used as the `endScn`
 - If you specify starting and ending times or SCN values and they are not found in the LogMiner redo log file list, and you specify `DBMS_LOGMNR.START_LOGMNR`, and you specify:
 - * 0 for the `startTime` or `startScn` value, then an error is returned.
 - * A `startTime` or `startScn` value that is greater than any value in the database's archived redo log files, then LogMiner starts mining in the online redo log file. LogMiner will continue to process the online redo log file until it finds a change at, or beyond, the requested starting point before it returns rows from the `V$LOGMNR_CONTENTS` view.
 - * An `endTime` or `endScn` parameter value that indicates a time or SCN in the future, then LogMiner includes the online redo log files when it mines. When you query the `V$LOGMNR_CONTENTS` view, rows will be returned from this view as changes are made to the database, and will not stop until LogMiner sees a change beyond the requested ending point.
 - * 0 for the `endTime` or `endScn` parameter value, then LogMiner includes the online redo log files when it mines. When you query the `V$LOGMNR_CONTENTS` view, rows will be returned from this view as changes are made to the database, and will not stop until you enter CTL+C or you terminate the PL/SQL cursor.

DBMS_LOGSTDBY

The `DBMS_LOGSTDBY` package provides subprograms for configuring and managing the logical standby database environment.

This chapter contains the following topics:

- [Overview](#)
- [Security Model](#)
- [Constants](#)
- [Summary of DBMS_LOGSTDBY Subprograms](#)

See Also:

Oracle Data Guard Concepts and Administration

107.1 DBMS_LOGSTDBY Overview

The `DBMS_LOGSTDBY` package helps you manage the SQL Apply (logical standby database) environment.

The subprograms in the `DBMS_LOGSTDBY` package help you to accomplish the following main objectives:

- Manage configuration parameters used by SQL Apply.
For example, controlling how transactions are applied on the logical standby database, how much shared pool is used, and how many processes are used by SQL Apply to mine and apply the changes.
- Ensure an appropriate level of supplemental logging is enabled, and a LogMiner dictionary is built correctly for logical standby database creation.
- Provide a way to skip the application of changes to selected tables or entire schemas in the logical standby database, and specify ways to handle exceptions encountered by SQL Apply.
- Allow controlled access to tables in the logical standby database that may require maintenance.

107.2 DBMS_LOGSTDBY Security Model

You must have the `DBA` role to use the `DBMS_LOGSTDBY` package.

A prototype role, `LOGSTDBY_ADMINISTRATOR`, is created by default with `RESOURCE` and `EXECUTE` privileges on `DBMS_LOGSTDBY`. If you choose to use this role, consider granting `ALTER`

DATABASE and ALTER SESSION privileges to the role so that the grantee can start and stop SQL Apply and can enable and disable the database guard.

The procedures associated with skipping transactions (SKIP and UNSKIP, SKIP_ERROR and UNSKIP_ERROR, and SKIP_TRANSACTION and UNSKIP_TRANSACTION) all require DBA privileges to execute because their scope may contain wildcard schemas. Oracle recommends that where SKIP procedures are specified, these be owned by a secure account with appropriate privileges on the schemas they act on (for example, SYS).

107.3 DBMS_LOGSTDBY Constants

The DBMS_LOGSTDBY package defines several enumerated constants for specifying parameter values. Enumerated constants must be prefixed with the package name, for example, DBMS_LOGSTDBY.SKIP_ACTION_SKIP.

The following table describes the constants for the `proc_name` parameter in the DBMS_LOGSTDBY.SKIP procedure.

Table 107-1 Constants for SKIP Options Flag

| Constant | Description |
|---------------------|---|
| MAX_EVENTS | Maximum number of events to log in the DBA_LOGSTDBY_EVENTS view. See the DBMS_LOGSTDBY APPLY_SET Procedure. |
| SKIP_ACTION_APPLY | Used inside the user-defined procedure registered with DBMS_LOGSTDBY.SKIP. Use this constant when setting the value of the SKIP_ACTION parameter with DBMS_LOGSTDBY_CONTEXT if you want SQL Apply to apply the DDL or PL/SQL statement. |
| SKIP_ACTION_ERROR | Used inside the user-defined procedure registered with DBMS_LOGSTDBY.SKIP. Use this constant when setting the value of the SKIP_ACTION parameter with DBMS_LOGSTDBY_CONTEXT if you want SQL Apply to error out. |
| SKIP_ACTION_REPLACE | Used inside the user-defined procedure registered with DBMS_LOGSTDBY.SKIP. Use this constant when setting the value of the SKIP_ACTION parameter with DBMS_LOGSTDBY_CONTEXT if you want SQL Apply to apply the replacement DDL. (This constant should not be used while handling an Oracle Supplied PL/SQL procedure call). |
| SKIP_ACTION_SKIP | Used inside the user-defined procedure registered with DBMS_LOGSTDBY.SKIP. Use this constant when setting the value of the SKIP_ACTION parameter with DBMS_LOGSTDBY_CONTEXT if you want SQL Apply to skip the associated DDL or Oracle supplied PL/SQL procedure call. |

107.4 Summary of DBMS_LOGSTDBY Subprograms

This table describes each subprogram of the DBMS_LOGSTDBY procedure, including a reference to the section where each procedure is described in more detail.

In a multitenant container database (CDB), some subprograms must be called from the root. There may be other differences as well. See the individual subprogram descriptions for details.

Table 107-2 DBMS_LOGSTDBY Package Subprograms

| Subprogram | Description |
|---|--|
| APPLY_SET Procedure | Sets the values of various parameters that configure and maintain SQL Apply. |
| APPLY_UNSET Procedure | Restores the default values of various parameters that configure and maintain SQL Apply. |
| BUILD Procedure | Ensures supplemental logging is enabled properly and builds the LogMiner dictionary. |
| INSTANTIATE_TABLE Procedure | Creates and populates a table in the standby database from a corresponding table in the primary database. |
| IS_APPLY_SERVER Function | This function returns <code>TRUE</code> if it is executed from PL/SQL in the context of a logical standby apply server process. This function is used in conjunction with triggers that have the <code>fire_once</code> parameter in the <code>DBMS_DDL.SET_TRIGGER FIRING_PROPERTY</code> subprogram set to <code>FALSE</code> (the default is <code>TRUE</code>). Such triggers are executed when the relevant target is updated by an apply process. This function can be used within the body of the trigger to ensure that the trigger takes different (or no) actions on the primary or on the standby. |
| MAP_PRIMARY_SCN Function | Maps an SCN relevant to the primary database to a corresponding SCN at the logical standby database. The mapped SCN is conservative in nature, and can thus be used to flash back the logical standby database to compensate for a flashback database operation performed at the primary database. |
| PREPARE_FOR_NEW_PRIMARY Procedure | Used after a failover, this procedure ensures a local logical standby database that was not involved in the failover has not processed more redo than the new primary database and reports the set of archive redo log files that must be replaced to ensure consistency |
| PURGE_SESSION Procedure | Identifies the archived redo log files that have been applied to the logical standby database and are no longer needed by SQL Apply |
| REBUILD Procedure | Records relevant metadata (including the LogMiner dictionary) in the redo stream in case a database that has recently changed its role to a primary database following a failover operation fails to do so during the failover process |
| SET_TABLESPACE Procedure | Moves metadata tables required by SQL Apply to the user-specified tablespace. By default, the metadata tables are created in the <code>SYSAUX</code> tablespace. |

Table 107-2 (Cont.) DBMS_LOGSTDBY Package Subprograms

| Subprogram | Description |
|--|--|
| SKIP Procedure | Specifies rules that control database operations that should not be applied to the logical standby database |
| SKIP_ERROR Procedure | Specifies rules regarding what action to take upon encountering errors. |
| SKIP_TRANSACTION Procedure | Specifies transactions that should not be applied on the logical standby database. Be careful in using this procedure, because not applying specific transactions may cause data corruption at the logical standby database. |
| UNSKIP Procedure | Deletes rules specified by the <code>SKIP</code> procedure. |
| UNSKIP_ERROR Procedure | Deletes rules specified by the <code>SKIP_ERROR</code> procedure. |
| UNSKIP_TRANSACTION Procedure | Deletes rules specified by the <code>SKIP_TRANSACTION</code> procedure. |

107.4.1 APPLY_SET Procedure

Use this procedure to set values of parameters that configure and manage SQL Apply in a logical standby database environment. All parameters, except for `PRESERVE_COMMIT_ORDER`, can be changed without having to stop SQL Apply.

In a CDB, the `APPLY_SET` procedure must be called from the root database.

Syntax

```
DBMS_LOGSTDBY.APPLY_SET (
    inname          IN VARCHAR,
    value           IN VARCHAR);
```

Parameters

Table 107-3 APPLY_SET Procedure Parameters

| Parameter | Description |
|----------------------------|--|
| <code>APPLY_SERVERS</code> | Controls the number of <code>APPLIER</code> processes used to apply changes. The maximum number allowed is 1024, provided the <code>MAX_SERVERS</code> parameter is set to accommodate this. |

Table 107-3 (Cont.) APPLY_SET Procedure Parameters

| Parameter | Description |
|-------------------------------|--|
| EVENT_LOG_DEST | <p>Controls where SQL Apply records the occurrence of an interesting event. It takes the following values:</p> <ul style="list-style-type: none"> DEST_ALL - All events will be recorded in the DBA_LOGSTDBY_EVENTS view and in the alert log. DEST_EVENTS_TABLE - All events that contain information about user data will be recorded only in the DBA_LOGSTDBY_EVENTS view. This is the default value. <p>For example, if SQL Apply receives an ORA-1403 error, the whole event is recorded in the DBA_LOGSTDBY_EVENTS view. Whereas, the alert log records only that SQL Apply stopped because of ORA-1403. No information regarding the user table or offending statement is logged in the alert log. However, if you stop the SQL Apply engine, it gets recorded in both the DBA_LOGSTDBY_EVENTS view and in the alert log.</p> <p>Note that this parameter affects the behavior of the following parameters: RECORD_APPLIED_DDL, RECORD_SKIP_DDL, RECORD_SKIP_ERRORS, and RECORD_UNSUPPORTED_OPERATIONS. For example, if RECORD_APPLIED_DDL is set to TRUE, but EVENT_LOG_DEST is set to DEST_EVENTS_TABLE, then the applied DDL string will only be recorded in the DBA_LOGSTDBY_EVENTS view.</p> |
| LOG_AUTO_DEL_RETENTION_TARGET | <p>This parameter setting is only meaningful if LOG_AUTO_DELETE has been set to TRUE. The value you supply for this parameter controls how long (in minutes) a remote archived log that is received from the primary database will be retained at the logical standby database once all redo records contained in the log have been applied at the logical standby database. The default value is 1440 minutes.</p> |
| LOG_AUTO_DELETE | <p>Automatically deletes foreign archived redo log files as soon as they have been applied on the logical standby database. By default, a foreign archived redo log file is not deleted until 24 hours (the default value of LOG_AUTO_DEL_RETENTION_TARGET parameter) after it has been applied at the logical standby database. Set to TRUE to enable automatic deletion of archived redo log files. Set to FALSE to disable automatic deletion. The default value is TRUE.</p> |
| MAX_EVENTS_RECORDED | <p>Number of recent events that will be visible through the DBA_LOGSTDBY_EVENTS view. To record all events encountered by SQL Apply, use the DBMS_LOGSTDBY.MAX_EVENTS constant as the number value. The default value is 10,000.</p> |
| MAX_SERVERS | <p>Number of processes that SQL Apply uses to read and apply redo. The default value is 9. The maximum number allowed is 2048.</p> |

Table 107-3 (Cont.) APPLY_SET Procedure Parameters

| Parameter | Description |
|-----------------------|--|
| MAX_SGA | Number of megabytes from shared pool in System Global Area (SGA) that SQL Apply will use. The default value is 30 megabytes or one quarter of the value set for SHARED_POOL_SIZE, whichever is lower. The maximum size allowed is 4095 megabytes. |
| PREPARE_SERVERS | Controls the number of PREPARER processes used to prepare changes. The maximum number allowed is 1024, provided the MAX_SERVERS parameter is set to accommodate this. |
| PRESERVE_COMMIT_ORDER | <p>TRUE: Transactions are applied to the logical standby database in the exact order in which they were committed on the primary database. This is the default parameter setting.</p> <p>FALSE: Transactions containing non-overlapping sets of rows may be committed in a different order than they were committed on the primary database.</p> <p>Regardless of the level chosen, modifications done to the same row are always applied in the same order as they happened on the primary database. See the Usage Notes for details and recommendations.</p> <p>You cannot modify this parameter while SQL Apply is running.</p> |
| RECORD_APPLIED_DDL | <p>Controls whether DDL statements that have been applied to the logical standby database are recorded in the location specified by the EVENT_LOG_DEST parameter. Specify one of the following values:</p> <p>TRUE: Indicates that DDL statements applied to the logical standby database are recorded in the DBA_LOGSTDBY_EVENTS table and the alert log.</p> <p>FALSE: Indicates that applied DDL statements are not recorded. This is the default parameter setting.</p> |
| RECORD_SKIP_DDL | <p>Controls whether skipped DDL statements are recorded in the location specified by the EVENT_LOG_DEST parameter. Specify one of the following values:</p> <p>TRUE: Skipped DDL statements are recorded in the DBA_LOGSTDBY_EVENTS table and the alert log. This is the default parameter setting.</p> <p>FALSE: Skipped DDL statements are not recorded in the DBA_LOGSTDBY_EVENTS table and the alert log.</p> |
| RECORD_SKIP_ERRORS | <p>Controls whether skipped errors (as described by the SKIP_ERROR procedure) are recorded in the location specified by the EVENT_LOG_DEST parameter. Specify one of the following values:</p> <p>TRUE: Skipped errors are recorded in the DBA_LOGSTDBY_EVENTS table and the alert log. This is the default parameter setting.</p> <p>FALSE: Skipped errors are not recorded in the DBA_LOGSTDBY_EVENTS table and the alert log.</p> |

Table 107-3 (Cont.) APPLY_SET Procedure Parameters

| Parameter | Description |
|-------------------------------|--|
| RECORD_UNSUPPORTED_OPERATIONS | <p>Captures information about transactions running on the primary database that will not be supported by a logical standby database. This procedure records its information as events in the DBA_LOGSTDBY_EVENTS table. Specify one of the following values:</p> <p>TRUE: The information is captured and recorded as events in the DBA_LOGSTDBY_EVENTS table.</p> <p>FALSE: The information is not captured. This is the default.</p> |

If a parameter is changed while SQL Apply is running, the change will take effect at some point in the future. In such a case, an informational row is inserted into the DBA_LOGSTDBY_EVENTS view at the time the parameter change takes effect.

Additionally, if you are modifying a parameter while SQL Apply is running on an Oracle RAC configuration, you must be connected to the same instance where SQL Apply is running.

Exceptions

Table 107-4 APPLY_SET Procedure Exceptions

| Exception | Description |
|-----------|---|
| ORA-16103 | Logical Standby apply must be stopped to allow this operation |
| ORA-16104 | invalid Logical Standby option requested |
| ORA-16236 | Logical Standby metadata operation in progress |

Usage Notes

- Use the APPLY_UNSET procedure to restore the default settings of a parameter.
- See *Oracle Data Guard Concepts and Administration* for help with tuning SQL Apply and for information about setting appropriate values for different parameters.

Examples

To record DDLs in the DBA_LOGSTDBY_EVENTS view and in the alert log, issue the following statement:

```
SQL> EXECUTE DBMS_LOGSTDBY.APPLY_SET('RECORD_APPLIED_DDL', TRUE);
```

107.4.2 APPLY_UNSET Procedure

Use the APPLY_UNSET procedure to restore the default values of the parameters that you changed with the APPLY_SET procedure.

In a CDB, the APPLY_UNSET procedure must be called from the root database.

Syntax

```
DBMS_LOGSTDBY.APPLY_UNSET (
    inname          IN VARCHAR);
```

Parameters

The parameter information for the `APPLY_UNSET` procedure is the same as that described for the `APPLY_SET` procedure. See [Table 107-3](#) for complete parameter information.

Exceptions

Table 107-5 `APPLY_UNSET` Procedure Exceptions

| Exception | Description |
|-----------|---|
| ORA-16103 | Logical Standby apply must be stopped to allow this operation |
| ORA-16104 | invalid Logical Standby option requested |
| ORA-16236 | Logical Standby metadata operation in progress |

Usage Notes

- Use the `APPLY_SET` procedure to specify a nondefault value for a parameter.

Examples

If you previously specified that applied DDLs show up in the `DBA_LOGSTDBY_EVENTS` view and the alert log, you can restore the default behavior of SQL Apply regarding applied DDL statements with the following statement:

```
SQL> EXECUTE DBMS_LOGSTDBY.APPLY_UNSET('RECORD_APPLIED_DDL');
```

107.4.3 BUILD Procedure

Use this procedure on the primary database to record relevant metadata (LogMiner dictionary) information in the redo log, which will subsequently be used by SQL Apply. This procedure will enable database-wide primary- and unique-key supplemental logging, if necessary.

In a CDB, the `BUILD` procedure must be called from the root database on the primary. Additionally, you cannot add or remove PDBs from a CDB while this procedure is executing.

 **Note:**

In databases created using Oracle Database 11g release 2 (11.2) or later, supplemental logging information is automatically propagated to any existing physical standby databases. However, for databases in earlier releases, or if the database was created using an earlier release and then upgraded to 11.2, you must check whether supplemental logging is enabled at the physical standby(s) if it is also enabled at the primary database. If it is not enabled at the physical standby(s), then before performing a switchover or failover, you must enable supplemental logging on all existing physical standby databases. To do so, issue the following SQL command on each physical standby:

```
SQL> ALTER DATABASE ADD SUPPLEMENTAL LOG DATA (PRIMARY KEY, UNIQUE INDEX)
COLUMNS;
```

If you do not do this, then any logical standby that is also in the same Data Guard configuration will be unusable if a switchover or failover is performed to one of the physical standby databases. If a switchover or failover has already occurred and supplemental logging was not enabled, then you must recreate all logical standby databases.

Syntax

```
DBMS_LOGSTDBY.BUILD;
```

Usage Notes

- Supplemental log information includes extra information in the redo logs that uniquely identifies a modified row in the logical standby database, and also includes information that helps efficient application of changes to the logical standby database.
- LogMiner dictionary information allows SQL Apply to interpret data in the redo logs.
- `DBMS_LOGSTDBY.BUILD` should be run only once for each logical standby database you want to create. You do not need to use `DBMS_LOGSTDBY.BUILD` for each Oracle RAC instance.
- `DBMS_LOGSTDBY.BUILD` waits for all transactions (including distributed transactions) that are active at the time of the procedure invocation to complete before returning. See *Oracle Database Administrator's Guide* for information about how to handle in-doubt transactions.

Examples

To build the LogMiner dictionary in the redo stream of the primary database and to record additional information so that a logical standby database can be instantiated, issue the following SQL statement at the primary database

```
SQL> EXECUTE DBMS_LOGSTDBY.BUILD;
```

107.4.4 INSTANTIATE_TABLE Procedure

This procedure creates and populates a table in the standby database from a corresponding table in the primary database.

The table requires the name of the database link (`dblink`) as an input parameter. If the table already exists in the logical standby database, it will be dropped and re-created based on the table definition at the primary database. This procedure only brings over the data associated with the table, and not the associated indexes and constraints.

Use the `INSTANTIATE_TABLE` procedure to:

- Add a table to a standby database.
- Re-create a table in a standby database.

In a CDB, the `INSTANTIATE_TABLE` procedure must be called from within the container in which the table to be instantiated resides. Additionally, the database link that is provided to the primary database must point to the corresponding container on the primary.

Syntax

```
DBMS_LOGSTDBY.INSTANTIATE_TABLE (
    schema_name      IN VARCHAR2,
    table_name       IN VARCHAR2,
    dblink           IN VARCHAR2);
```

Parameters

Table 107-6 INSTANTIATE_TABLE Procedure Parameters

| Parameter | Description |
|--------------------------|---|
| <code>schema_name</code> | Name of the schema |
| <code>table_name</code> | Name of the table to be created or re-created in the standby database |
| <code>dblink</code> | Name of the database link account that has privileges to read and lock the table in the primary database, as well as the <code>SELECT_CATALOG_ROLE</code> on the primary database |

Exceptions

Table 107-7 INSTANTIATE_TABLE Procedure Exceptions

| Exception | Description |
|-----------|---|
| ORA-16103 | Logical Standby apply must be stopped to allow this operation |
| ORA-16236 | Logical Standby metadata operation in progress |
| ORA-16276 | Specified database link does not correspond to primary database |
| ORA-16277 | Specified table is not supported by logical standby database |
| ORA-16278 | Specified table has a multi-object skip rule defined |

Usage Notes

- Use this procedure to create and populate a table in a way that keeps the data on the standby database transactionally consistent with the primary database.
- This table will not be synchronized with the rest of the tables being maintained by SQL Apply and SQL Apply will not start to maintain it until SQL Apply encounters redo that occurred after the table was instantiated from the primary. The SCN at which the table was instantiated from the primary database is available in the `DBA_LOGSTDBY_EVENTS` view.
- The specified table must be a table that is supported by logical standby (that is, it does not appear in the `DBA_LOGSTDBY_UNSUPPORTED_TABLES` view on the primary database).
- If there are any skip rules that specifically name this table (without any wildcards), those skip rules will be dropped as part of `INstantiate_Table`, so that the table will be properly maintained by SQL Apply in the future. If there are skip rules that indirectly reference this table (match a skip rule with a wildcard in the `schema_name` or `table_name`, and have a `TABLE`, `DML`, or `SCHEMA_DDL` statement type), `INstantiate_Table` will fail with an ORA-16278 error. Any multi-object skip rules that pertain to the table must be dropped or changed before re-attempting the `INstantiate_Table` call.

Examples

```
SQL> EXECUTE DBMS_LOGSTDBY.INSTANTIATE_TABLE (-
      SCHEMA_NAME => 'HR', TABLE_NAME => 'EMPLOYEES', -
      DBLINK => 'INSTANTIATE_TBL_LINK');
```

107.4.5 IS_APPLY_SERVER Function

This function returns `TRUE` if it is executed from PL/SQL in the context of a logical standby apply server process.

This function is used in conjunction with triggers that have the `fire_once` parameter in the `DBMS_DDL.SET_TRIGGER_FIRING_PROPERTY` subprogram set to `FALSE` (the default is `TRUE`). Such triggers are executed when the relevant target is updated by an apply process. This function can be used within the body of the trigger to ensure that the trigger takes different (or no) actions on the primary or on the standby.

Syntax

```
DBMS_LOGSTDBY.IS_APPLY_SERVER
RETURN BOOLEAN;
```

Parameters

None

107.4.6 MAP_PRIMARY_SCN Function

This function returns an SCN on the standby that predates the supplied SCN from the primary database by at least 5 minutes.

It can be used to determine a safe SCN to use in a compensating flashback database operation at the logical standby database, following a flashback database operation or a point-in-time recovery operation at the primary database.

Syntax

```
DBMS_LOGSTDBY.MAP_PRIMARY_SCN(primary_scn NUMBER) RETURN NUMBER;
```

Exceptions

Table 107-8 MAP_PRIMARY_SCN Function Exceptions

| Exception | Description |
|-----------|---|
| ORA-20001 | Primary SCN is before mapped range |
| ORA-20002 | SCN mapping requires PRESERVE_COMMIT_ORDER to be TRUE |

Usage Notes

Use this function to get a conservative SCN at the logical standby database that corresponds to an SCN at the primary database. This function is useful in the context of doing compensating flashback database operations at the logical standby following a flashback database or a point-in-time recovery operation done at the primary database.

107.4.7 PREPARE_FOR_NEW_PRIMARY Procedure

The `PREPARE_FOR_NEW_PRIMARY` procedure must be invoked at a logical standby database following a failover, if that standby database was not the target of the failover operation.

Such a standby database must process the exact same set of redo logs processed at the new primary database. This routine ensures that the local logical standby database has not processed more redo than the new primary database and reports the set of archive logs that must be replaced to ensure consistency. The set of replacement logs will be reported in the alert.log. These logs must be copied to the logical standby and registered using the `ALTER DATABASE REGISTER LOGICAL LOGFILE` statement.

In a CDB, the `PREPARE_FOR_NEW_PRIMARY` procedure must be called from the root database.

Syntax

```
DBMS_LOGSTDBY.PREPARE_FOR_NEW_PRIMARY (
    FORMER_STANDBY_TYPE    IN VARCHAR2,
    DBLINK                 IN VARCHAR2);
```

Parameters

Table 107-9 PREPARE_FOR_NEW_PRIMARY Procedure Parameters

| Parameter | Description |
|---------------------|---|
| FORMER_STANDBY_TYPE | The type of standby database that was the target of the failover operation to become the new primary database. Valid values are 'PHYSICAL' if the new primary was formerly a physical standby, and 'LOGICAL' if the new primary database was formerly a logical standby database. |

Table 107-9 (Cont.) PREPARE_FOR_NEW_PRIMARY Procedure Parameters

| Parameter | Description |
|-----------|---|
| DBLINK | The name of a database link to the new primary database |

Exceptions**Table 107-10 PREPARE_FOR_NEW_PRIMARY Procedure Exceptions**

| Exception | Description |
|-----------|---|
| ORA-16104 | Invalid Logical Standby option. |
| ORA-16109 | Failed to apply log data from previous primary. |

Usage Notes

- This routine is intended only for logical standby systems. This routine will fail if the new primary database was formerly a logical standby database and the LogMiner dictionary build has not completed successfully. Log files displayed in the alert log will be referred to as *terminal logs*. Users should keep in mind that file paths are relative to the new primary database and may not resolve locally. Upon manual registration of the terminal logs, users should complete the process by calling either `START LOGICAL STANDBY APPLY` if the new primary database was formerly a physical standby database or `START LOGICAL STANDBY APPLY NEW PRIMARY` if the new primary database was formerly a logical standby database. See the alert log for more details regarding the reasons for any exception.

Examples

```
SQL> EXECUTE DBMS_LOGSTDBY.PREPARE_FOR_NEW_PRIMARY ( -
          FORMER_STANDBY_TYPE => 'LOGICAL',      -
          DBLINK => 'dblink_to_newprimary');
```

107.4.8 PURGE_SESSION Procedure

`PURGE_SESSION` identifies all archived redo log files that have been applied to the logical standby database and are no longer needed by SQL Apply.

Once identified, you can issue operating system commands to delete some or all of the unnecessary archived redo log files.

In a CDB, the `PURGE_SESSION` procedure must be called from the root database.

Syntax

```
DBMS_LOGSTDBY.PURGE_SESSION;
```

Exceptions**Table 107-11 PURGE_SESSION Procedure Exceptions**

| Exception | Description |
|-----------|-----------------|
| ORA-01309 | Invalid session |

Usage Notes

- This procedure does not delete the archived redo log files. You must issue operating system commands to delete unneeded files.
- This procedure updates the `DBA_LOGMNR_PURGED_LOG` view that displays the archived redo log files that have been applied to the logical standby database.
- In Oracle Database 10g Release 2, metadata related to the archived redo log files (and the actual archived redo log files) are purged automatically based on the default setting of the `LOG_AUTO_DELETE` parameter described in the `DBMS_LOGSTDBY.APPLY_SET` procedure described.

Example

To identify and remove unnecessary files:

1. Enter the following statement on the logical standby database:

```
SQL> EXECUTE DBMS_LOGSTDBY.PURGE_SESSION;
```

2. Query the `DBA_LOGMNR_PURGED_LOG` view to list the archived redo log files that can be removed:

```
SQL> SELECT * FROM DBA_LOGMNR_PURGED_LOG;
```

```
FILE_NAME
-----

```

3. Use operating system-specific commands to delete archived redo log files from the file system.

107.4.9 REBUILD Procedure

This procedure is used if a database that has recently changed its role to a primary database following a failover operation fails to record relevant metadata (including the LogMiner dictionary) in the redo stream required for other logical standby databases.

In a CDB, the `REBUILD` procedure must be called from the root database.

Syntax

```
DBMS_LOGSTDBY.REBUILD;
```

Usage Notes

- LogMiner dictionary information is logged in the redo log files. The standby redo log files (if present) are archived.

Examples

```
SQL> EXECUTE DBMS_LOGSTDBY.REBUILD;
```

107.4.10 SET_TABLESPACE Procedure

This procedure moves metadata tables required by SQL Apply to the user-specified tablespace.

By default, the metadata tables are created in the `SYSAUX` tablespace. SQL Apply cannot be running when you invoke this procedure.

In a CDB, the `SET_TABLESPACE` procedure must be called from the root database.

Syntax

```
DBMS_LOGSTDBY.SET_TABLESPACE(  
    NEW_TABLESPACE IN VARCHAR2)
```

Parameters

Table 107-12 SET_TABLESPACE Procedure Parameters

| Parameter | Description |
|-----------------------------|---|
| <code>NEW_TABLESPACE</code> | Name of the new tablespace where metadata tables will reside. |

Exceptions

Table 107-13 SET_TABLESPACE Procedure Exceptions

| Exception | Description |
|------------------------|---|
| <code>ORA-16103</code> | Logical Standby apply must be stopped to allow this operation |
| <code>ORA-16236</code> | Logical Standby metadata operation in progress |

Examples

To move metadata tables to a new tablespace named `LOGSTDBY_TBS`, issue the following statement:

```
SQL> EXECUTE DBMS_LOGSTDBY.SET_TABLESPACE (new_tablespace => 'LOGSTDBY_TBS');
```

107.4.11 SKIP Procedure

The `SKIP` procedure can be used to define rules that will be used by SQL Apply to skip the application of certain changes to the logical standby database.

For example, the `SKIP` procedure can be used to skip changes to a subset of tables in the logical standby database. It can also be used to specify DDL statements that should not be applied at the logical standby database or should be modified before they are applied in the logical standby database. One reason why a DDL statement may need to be modified is to accommodate a different directory structure on the logical standby database.

Note:

For information about skipping containers, see "[Skipping Containers](#)."

Syntax

```
DBMS_LOGSTDBY.SKIP (
    stmt                IN VARCHAR2,
    schema_name        IN VARCHAR2 DEFAULT NULL,
    object_name        IN VARCHAR2 DEFAULT NULL,
    proc_name          IN VARCHAR2 DEFAULT NULL,
    use_like           IN BOOLEAN DEFAULT TRUE,
    esc                IN CHAR1 DEFAULT NULL);
```

Parameters

Table 107-14 SKIP Procedure Parameters

| Parameter | Description |
|-------------|---|
| stmt | Either a keyword that identifies a set of SQL statements or a specific SQL statement. The use of keywords simplifies configuration since keywords, generally defined by the database object, identify all SQL statements that operate on the specified object. Table 107-15 shows a list of keywords and the equivalent SQL statements, either of which is a valid value for this parameter. The keyword <code>PL/SQL</code> is used for the execution of Oracle-supplied packages which are supported for replication. |
| schema_name | The name of one or more schemas (wildcards are permitted) associated with the SQL statements identified by the <code>stmt</code> parameter. If not applicable, this value must be set to <code>NULL</code> . |
| object_name | The name of one or more objects (wildcards are permitted) associated with the SQL statements identified by the <code>stmt</code> . If not applicable, this value must be set to <code>NULL</code> . |

Table 107-14 (Cont.) SKIP Procedure Parameters

| Parameter | Description |
|------------------------|---|
| <code>proc_name</code> | <p>Name of a stored procedure to call when SQL Apply determines that a particular statement matches the filter defined by the <code>stmt</code>, <code>schema_name</code>, and <code>object_name</code> parameters. Specify the procedure in the following format:</p> <pre>'schema.package.procedure'</pre> <p>This procedure returns a value that directs SQL Apply to perform one of the following: execute the statement, skip the statement, or execute a replacement statement.</p> <p>The procedures to be invoked in the case of DDL or PL/SQL take no arguments. You can access the various information needed inside the procedure by accessing the context associated with the namespace, <code>LSBY_APPLY_CONTEXT</code>.</p> <p>For a full list of parameters that are accessible in the context of the skip procedure, see the <code>DBMS_LOGSTDBY_CONTEXT</code> package.</p> <p>The parameters of interest in the case of DDLs are: <code>STATEMENT</code>, <code>STATEMENT_TYPE</code>, <code>SCHEMA</code>, <code>NAME</code>, <code>CURRENT_SCHEMA</code>, <code>XIDUSN</code>, <code>XIDSLT</code>, <code>XIDSQN</code> and <code>SKIP_ACTION</code>.</p> <p>The parameters of interest in the case of PL/SQL are: <code>STATEMENT</code>, <code>PACKAGE_SCHEMA</code>, <code>PACKAGE_NAME</code>, <code>PROCEDURE_NAME</code>, <code>CURRENT_SCHEMA</code>, <code>XIDUSN</code>, <code>XIDSLT</code>, <code>XIDSQN</code>, <code>EXIT_STATUS</code>, and <code>SKIP_ACTION</code>.</p> <p>Note 1: The <code>DBMS_LOGSTDBY.SKIP_ACTION_REPLACE</code> constant is not supported for PL/SQL.</p> <p>Note 2: SQL Apply calls the skip handler when the procedure's exit is processed.</p> <p>Note 3: The <code>use_like</code> parameter must be set to <code>FALSE</code> for PL/SQL since wildcarding PL/SQL is not supported.</p> |

Table 107-14 (Cont.) SKIP Procedure Parameters

| Parameter | Description |
|----------------------|---|
| proc_name (cont.) | <p>A sample conditional skip rule on DBMS_RLS.DROP_POLICY is as follows:</p> <pre> create or replace procedure sec_mgr.skip_drop_policy is l_stmt CLOB; l_pkgown varchar2(30); l_pkgnam varchar2(30); l_procnm varchar2(30); l_cur_schema varchar2(30); l_xidusn number; l_xidslt number; l_xidsqn number; l_exit_status number; l_skip_action number; Begin -- read all relevant info dbms_logstdby_context.get_context(name => 'STATEMENT', value => l_stmt); dbms_logstdby_context.get_context(name => 'PACKAGE_SCHEMA', value => l_pkgown); dbms_logstdby_context.get_context(name => 'PACKAGE_NAME', value => l_pkgnam); dbms_logstdby_context.get_context(name => 'PROCEDURE_NAME', value => l_procnm); dbms_logstdby_context.get_context(name => 'CURRENT_SCHEMA', value => l_cur_schema); dbms_logstdby_context.get_context(name => 'XIDUSN', value => l_xidusn); dbms_logstdby_context.get_context(name => 'XIDSLT', value => l_xidslt); dbms_logstdby_context.get_context(name => 'XIDSQN', value => l_xidsqn); dbms_logstdby_context.get_context(name => 'EXIT_STATUS', value => l_ext_status); if 0 == l_ext_status then Insert Into sec_mgr.logit Values ('Success: ' l_pkgown '.' l_pkgnm '.' l_procnm ' by ' l_current_user); If l_current_user != 'TESTSCHEMA' Then l_skip_action := DBMS_LOGSTDBY.SKIP_ACTION_APPLY; Else l_skip_action := DBMS_LOGSTDBY.SKIP_ACTION_SKIP; End If; End If; dbms_logstdby_context.set_context(name=>'SKIP_ACTION', value => l_skip_action); End skip_drop_policy; EXECUTE DBMS_LOGSTDBY.SKIP(- stmt => 'PL/SQL', - schema_name => 'SYS', - </pre> |

Table 107-14 (Cont.) SKIP Procedure Parameters

| Parameter | Description |
|-----------|--|
| | <pre>object_name => 'DBMS_RLS.DROP_POLICY', - proc_name => 'SEC_MGR.SKIP_DROP_POLICY' - use_like=> FALSE);</pre> |
| use_like | Allows pattern matching to isolate the tables that you want to skip on the logical standby database. The use_like parameter matches a portion of one character value to another by searching the first value for the pattern specified by the second, and calculates strings using characters as defined by the input character set. This parameter follows the same rules for pattern matching described in <i>Oracle Database SQL Language Reference</i> . |
| esc | Identifies an escape character (such as the character "/") that you can use for pattern matching. If the escape character appears in the pattern before the character "%" or "_" then Oracle interprets this character literally in the pattern, rather than as a special pattern matching character. See <i>Oracle Database SQL Language Reference</i> for more information about pattern matching. |

Usage Notes

- This procedure requires DBA privileges to execute.
- You cannot associate a stored procedure to be invoked in the context of a DML statement. For example, the following statement returns the ORA-16104: invalid Logical Standby option requested error:

```
SQL> EXECUTE DBMS_LOGSTDBY.SKIP(-
      stmt => 'DML', -
      schema_name => 'HR', -
      object_name => 'EMPLOYEES', -
      proc_name => 'DML_HANDLER');
```

Also, if an event matches multiple rules either because of the use of wildcards while specifying the rule or because of a specification of overlapping rules. For example, if you specify a rule for the SCHEMA_DDL event for the HR.EMPLOYEES table, and a rule for the ALTER TABLE event for the HR.EMPLOYEES table, only one of the matching procedures will be invoked (alphabetically, by procedure). In the following code example, consider the following rules:

```
SQL> EXECUTE DBMS_LOGSTDBY.SKIP( -
      stmt => 'SCHEMA_DDL', -
      schema_name => 'HR', -
      object_name => 'EMPLOYEES', -
      proc_name => 'SCHEMA_DDL_HANDLER');
SQL> EXECUTE DBMS_LOGSTDBY.SKIP( -
      stmt => 'ALTER TABLE', -
      schema_name => 'HR', -
      object_name => 'EMPLOYEES', -
      proc_name => 'TABLE_ALTER_HANDLER');
```

On encountering an ALTER TABLE statement, the schema_ddl_handler procedure will be invoked because its name will be at the top of an alphabetically sorted list of procedures that are relevant to the statement. Collisions on a rule set because of a specification containing wildcard entries are resolved in a similar fashion. For example, the rules in the

following example will result in the `empddl_handler` procedure being invoked upon encountering the `ALTER TABLE HR.EMPLOYEES ADD COLUMN RATING NUMBER` statement:

```
SQL> EXECUTE DBMS_LOGSTDBY.SKIP(-
      stmt => 'ALTER TABLE', -
      schema_name => 'HR', -
      object_name => 'EMP%', -
      proc_name => 'EMPDDL_HANDLER');
SQL> EXECUTE DBMS_LOGSTDBY.SKIP( -
      stmt => 'ALTER TABLE', -
      schema_name => 'HR', -
      object_name => 'EMPLOYEES', -
      proc_name => 'EMPLOYEE_DDL_HANDLER');
```

- Use the `SKIP` procedure with caution, particularly when skipping DDL statements. If a `CREATE TABLE` statement is skipped, for example, you must also specify other DDL statements that refer to that table in the `SKIP` procedure. Otherwise, the statements will fail and cause an exception. When this happens, SQL Apply stops running.
- Before calling the `SKIP` procedure, SQL Apply must be halted. Do this by issuing an `ALTER DATABASE STOP LOGICAL STANDBY APPLY` statement. Once all desired filters have been specified, issue an `ALTER DATABASE START LOGICAL STANDBY APPLY IMMEDIATE` statement to start SQL Apply using the new filter settings.
- See the `UNSKIP` procedure for information about reversing (undoing) the settings of the `SKIP` procedure.
- For `USER` statements, the `SCHEMA_NAME` parameter will be the user and specify '%' for the `OBJECT_NAME` parameter.
- If the `PROC_NAME` parameter is supplied, it must already exist in `DBA PROCEDURES` and it must execute with `DEFINER` rights. If the procedure is declared with `INVOKER` rights, the `ORA-1031: insufficient privileges` message will be returned.
- If the procedure returns a `REPLACEMENT` statement, the `REPLACEMENT` statement will be executed using the `SYSTEM` and `OBJECT` privileges of the owner of the procedure.
- The PL/SQL block of a `SKIP` procedure cannot contain transaction control statements (for example, `COMMIT`, `ROLLBACK`, `SAVEPOINT`, and `SET CONSTRAINT`) unless the block is declared to be an autonomous transaction.

Skip Statement Options

[Table 107-15](#) lists the supported values for the `stmt` parameter of the `SKIP` procedure. The left column of the table lists the keywords that may be used to identify the set of SQL statements to the right of the keyword. In addition, any of the SQL statements listed in the `sys.audit_actions` table (shown in the right column of [Table 107-15](#)) are also valid values. Note that keywords are generally defined by database object.

Table 107-15 Supported Values for the `stmt` Parameter

| Keyword | Associated SQL Statements |
|---|--|
| There is no keyword for this group of SQL statements. | GRANT REVOKE ANALYZE TABLE ANALYZE INDEX ANALYZE CLUSTER |
| CLUSTER | AUDIT CLUSTER CREATE CLUSTER DROP CLUSTER TRUNCATE CLUSTER |
| CONTAINER | See " Skipping Containers " |
| CONTEXT | CREATE CONTEXT DROP CONTEXT |
| DATABASE LINK | CREATE DATABASE LINK CREATE PUBLIC DATABASE LINK DROP DATABASE LINK DROP PUBLIC DATABASE LINK |
| DIMENSION | ALTER DIMENSION CREATE DIMENSION DROP DIMENSION |
| DIRECTORY ¹ | CREATE DIRECTORY DROP DIRECTORY |
| DML | Includes DML statements on a table (for example: INSERT, UPDATE, and DELETE) |
| INDEX | ALTER INDEX CREATE INDEX DROP INDEX |
| NON_SCHEMA_DDL | <i>All DDL that does not pertain to a particular schema</i> Note: SCHEMA_NAME and OBJECT_NAME must be null |
| PL/SQL ² | Execute Oracle-supplied package. |

Table 107-15 (Cont.) Supported Values for the stmt Parameter

| Keyword | Associated SQL Statements |
|------------------------|--|
| PROCEDURE ³ | ALTER FUNCTION ALTER PACKAGE ALTER PACKAGE BODY ALTER PROCEDURE CREATE FUNCTION CREATE LIBRARY CREATE PACKAGE CREATE PACKAGE BODY CREATE PROCEDURE DROP FUNCTION DROP LIBRARY DROP PACKAGE DROP PACKAGE BODY DROP PROCEDURE |
| PROFILE | ALTER PROFILE CREATE PROFILE DROP PROFILE |
| ROLE | ALTER ROLE CREATE ROLE DROP ROLE SET ROLE |
| ROLLBACK STATEMENT | ALTER ROLLBACK SEGMENT CREATE ROLLBACK SEGMENT DROP ROLLBACK SEGMENT |
| SCHEMA_DDL | <i>All DDL statements that create, modify, or drop schema objects (for example: tables, indexes, and columns)</i> Note: SCHEMA_NAME and OBJECT_NAME must <i>not</i> be null |
| SEQUENCE | ALTER SEQUENCE CREATE SEQUENCE DROP SEQUENCE |
| SYNONYM | CREATE PUBLIC SYNONYM CREATE SYNONYM DROP PUBLIC SYNONYM DROP SYNONYM |

Table 107-15 (Cont.) Supported Values for the `stmt` Parameter

| Keyword | Associated SQL Statements |
|------------|---|
| TABLE | CREATE TABLE ALTER TABLE DROP TABLE TRUNCATE TABLE |
| TABLESPACE | CREATE TABLESPACE DROP TABLESPACE ALTER TABLESPACE |
| TRIGGER | ALTER TRIGGER CREATE TRIGGER DISABLE ALL TRIGGERS DISABLE TRIGGER DROP TRIGGER ENABLE ALL TRIGGERS ENABLE TRIGGER |
| TYPE | ALTER TYPE ALTER TYPE BODY CREATE TYPE CREATE TYPE BODY DROP TYPE DROP TYPE BODY |
| USER | ALTER USER CREATE USER DROP USER |
| VIEW | CREATE VIEW DROP VIEW |
| VIEW | CREATE VIEW DROP VIEW |

- ¹ All directory objects are owned by SYS, but for the purpose of filtering them with a skip directive the schema should be specified as '%'
- ² See *Oracle Data Guard Concepts and Administration* for information about supported packages.
- ³ Java schema objects (sources, classes, and resources) are considered the same as procedure for purposes of skipping (ignoring) SQL statements.

Exceptions

Table 107-16 DBMS_LOGSTDBY.SKIP Procedure Exceptions

| Exception | Description |
|-----------|--|
| ORA-01031 | Insufficient privileges: <ul style="list-style-type: none"> Procedure used INVOKER rights Procedure needs DBA privileges |
| ORA-16103 | Logical standby apply must be stopped to allow this operation. |
| ORA-16104 | Invalid logical standby option requested. |
| ORA-16203 | "Unable to interpret SKIP procedure return values." Indicates that a SKIP procedure has either generated an exception or has returned ambiguous values. You can identify the offending procedure by examining the DBA_LOGSTDBY_EVENTS view. |
| ORA-16236 | Logical standby metadata operation in progress. |

Examples

Example 1. Skipping all DML and DDL changes made to a schema

The following example shows how to specify rules so that SQL Apply will skip both DDL and DML statements made to the HR schema.

```
SQL> EXECUTE DBMS_LOGSTDBY.SKIP (STMT => 'SCHEMA_DDL', -
      schema_name => 'HR', -
      object_name => '%', -
      proc_name => null);
SQL> EXECUTE DBMS_LOGSTDBY.SKIP (STMT => 'DML', -
      schema_name => 'HR', -
      object_name => '%', -
      proc_name => null);
```

Example 2. Creating a procedure to handle different file system organization

For example, if the file system organization in the logical standby database is different than that in the primary database, you can write a SKIP procedure to handle DDL statements with file specifications transparently. The following procedure can handle DDL statements as long as you follow a specific naming convention for the file specification string.

1. Create the SKIP procedure to handle tablespace DDL statements:

```
CREATE OR REPLACE PROCEDURE sys.handle_tbs_ddl
IS
  l_old_stmt varchar2(4000);
  l_stmt_typ varchar2(40);
  l_schema  varchar2(30);
  l_name    varchar2(30);
  l_xidusn  number;
  l_xidslt  number;
  l_xidsqn  number;
  l_skip_action number;
  l_new_stmt varchar2(4000);
```

```

-- read all information
dbms_logstdby_context.get_context(name=>'STATEMENT',value=>l_old_stmt);
dbms_logstdby_context.get_context(name=>'STATEMENT_TYPE',value=>l_stmt_type);
dbms_logstdby_context.get_context(name=>'OWNER',value=>l_schema);
dbms_logstdby_context.get_context(name=>'NAME',value=>l_name);
dbms_logstdby_context.get_context(name=>'XIDUSN',value=>l_xidusn);
dbms_logstdby_context.get_context(name=>'XIDSLT',value=>l_xidslt);
dbms_logstdby_context.get_context(name=>'XIDSQN',value=>l_xidsqn);
dbms_logstdby_context.get_context(name=>'CONTAINER_NAME',value=>l_conname);

--
-- All primary file specification that contains a directory
-- /usr/orcl/primary/dbs
-- should go to /usr/orcl/stdby directory specification

BEGIN
  l_new_stmt := replace (l_old_stmt, '/usr/orcl/primary/dbs','/usr/orcl/stdby');
  l_skip_action := DBMS_LOGSTDBY.SKIP_ACTION_REPLACE;
EXCEPTION
  WHEN OTHERS THEN
    l_skip_action := DBMS_LOGSTDBY.SKIP_ACTION_ERROR;
    l_new_stmt := NULL;
END;

dbms_logstdby_context.set_context(name=>new_statement, value => l_new_stmt);
dbms_logstdby_context.set_context(name=>'SKIP_ACTION', value => l_skip_action);
END handle_tbs_ddl;

```

2. Register the SKIP procedure with SQL Apply:

```

SQL> EXECUTE DBMS_LOGSTDBY.SKIP (stmt => 'TABLESPACE', -
                               proc_name => 'SYS.HANDLE_TBS_DDL');

```

Skipping Containers

To skip a container (either a PDB or the root), use the `CONTAINER` keyword. All SQL statements executed on the container, as well as any other actions taken on the container, are skipped.

You can skip a particular PDB within a CDB. For example, the following command skips the PDB named `PDB1`. The command must be executed at the root level:

```

SQL> EXECUTE DBMS_LOGSTDBY.SKIP(stmt => 'CONTAINER', object_name => 'PDB1');

```

As shown in the following example, you could also skip only the root of the CDB, but not any of the PDBs that exist under the root. The command must be executed at the root level:

```

SQL> EXECUTE DBMS_LOGSTDBY.SKIP(stmt => 'CONTAINER', object_name => 'CDB$ROOT');

```

Note:

To create other skip rules for a container, create the rules from within the container. The container to which the rules will apply is automatically derived from the container in which the rules are created.

107.4.12 SKIP_ERROR Procedure

The `SKIP_ERROR` procedure specifies the action to take when a logical standby database detects an error.

Upon encountering an error, the logical standby database uses the criteria contained in this procedure to determine a course of action. The default action when a match is found is to skip the error and continue with applying changes. However, if a procedure is supplied, then `SKIP_ERROR` can take other actions depending on the situation. It can do nothing, which causes SQL Apply to stop, or it can change the error message text and stop SQL Apply, or it can actually skip the error.

Syntax

```
DBMS_LOGSTDBY.SKIP_ERROR (
    stmt                IN VARCHAR2,
    schema_name         IN VARCHAR2 DEFAULT NULL,
    object_name         IN VARCHAR2 DEFAULT NULL,
    proc_name           IN VARCHAR2 DEFAULT NULL,
    use_like            IN BOOLEAN  DEFAULT NULL,
    esc                 IN CHAR1    DEFAULT NULL);
```

Parameters

Table 107-17 SKIP_ERROR Procedure Parameters

| Parameter | Description |
|--------------------------|--|
| <code>stmt</code> | Either a keyword that identifies a set of SQL statements or a specific SQL statement. The use of keywords simplifies configuration because keywords, generally defined by the database object, identify all SQL statements that operate on the specified object. Table 107-15 shows a list of keywords and the equivalent SQL statements, either of which is a valid value for this parameter. |
| <code>schema_name</code> | The name of one or more schemas (wildcards are permitted) associated with the SQL statements identified by the <code>stmt</code> parameter. If not applicable, this value must be set to <code>NULL</code> . |
| <code>object_name</code> | The name of one or more objects (wildcards are permitted) associated with the SQL statements identified by the <code>stmt</code> . If not applicable, this value must be set to <code>NULL</code> . |

Table 107-17 (Cont.) SKIP_ERROR Procedure Parameters

| Parameter | Description |
|------------------------|--|
| <code>proc_name</code> | <p>Name of a stored procedure to call when SQL Apply encounters an error and determines a particular statement matches the filter defined by the <code>stmt</code>, <code>schema_name</code>, and <code>object_name</code> parameters. Specify the procedure in the following format:</p> <pre>'"schema"."package"."procedure"'</pre> <p>This procedure returns an error message that directs SQL Apply to perform one of the following actions:</p> <ul style="list-style-type: none"> • Silently skip the error and continue with SQL Apply • Replace the error message that would have been created with a custom one, and stop SQL Apply • Do nothing, causing SQL Apply to stop and the original error message to be logged <p>The procedure registered with SQL Apply does not take any parameters. The context associated with <code>LSBY_APPLY_CONTEXT</code> can be used to retrieve all relevant information related to the error. See the <code>DBMS_LOGSTDBY_CONTEXT</code> package for a list of all parameters associated with <code>LSBY_APPLY_CONTEXT</code>.</p> <p>The parameters of interest for procedures registered with <code>SKIP_ERROR</code> are <code>CONTAINER_NAME</code>, <code>STATEMENT</code>, <code>STATEMENT_TYPE</code>, <code>SCHEMA</code>, <code>NAME</code>, <code>XIDUSN</code>, <code>XIDSLT</code>, <code>XIDSN</code>, <code>ERROR</code> and <code>NEW_ERROR</code>.</p> |
| <code>use_like</code> | <p>Allows pattern matching to isolate the tables that you want to skip on the logical standby database. The <code>use_like</code> parameter matches a portion of one character value to another by searching the first value for the pattern specified by the second, and calculates strings using characters as defined by the input character set. This parameter follows the same rules for pattern matching described in <i>Oracle Database SQL Language Reference</i>.</p> |
| <code>esc</code> | <p>Identifies an escape character (such as the characters "%" or "_") that you can use for pattern matching. If the escape character appears in the pattern before the character "%" or "_" then Oracle interprets this character literally in the pattern, rather than as a special pattern matching character.</p> |

Usage Notes

- A stored procedure provided to the `SKIP_ERROR` procedure is called when SQL Apply encounters an error that could shut down the application of redo logs to the standby database.
- Running this stored procedure affects the error being written in the `STATUS` column of the `DBA_LOGSTDBY_EVENTS` table. The `STATUS_CODE` column remains unchanged. If the stored procedure is to have no effect, that is, apply will be stopped, then the `NEW_ERROR` is written to the events table. To truly have no effect, set `NEW_ERROR` to `ERROR` in the procedure.
- If the stored procedure requires that a shutdown be avoided, then you must set `NEW_ERROR` to `NULL`.
- This procedure requires `DBA` privileges to execute.
- For `USER` statements, the `SCHEMA_NAME` parameter will be the user and you should specify '%' for the `OBJECT_NAME` parameter.

- If the `PROC_NAME` parameter is specified, it must already exist in `DBA_PROCEDURES` and it must execute with `DEFINERS` rights. If the procedure is declared with `INVOKERS` rights, the `ORA-1031: insufficient privileges` message will be returned.
- The PL/SQL block of a `SKIP_ERROR` procedure cannot contain transaction control statements (for example: `COMMIT`, `ROLLBACK`, `SAVEPOINT`, and `SET CONSTRAINT`) unless the block is declared to be an autonomous transaction using the following syntax:

```
PRAGMA AUTONOMOUS_TRANSACTION
```

Exceptions

Table 107-18 SKIP_ERROR Procedure Exceptions

| Exception | Description |
|-----------|--|
| ORA-01031 | Insufficient privileges: <ul style="list-style-type: none"> • Procedure used <code>INVOKER</code> rights • Procedure needs <code>DBA</code> privileges |
| ORA-16103 | Logical Standby apply must be stopped to allow this operation |
| ORA-16104 | invalid Logical Standby option requested |
| ORA-16236 | Logical Standby metadata operation in progress |

Example 1

The following example shows how to specify rules so that SQL Apply will skip any error raised from any `GRANT DDL` command.

```
SQL> EXECUTE DBMS_LOGSTDBY.SKIP_ERROR('GRANT')
```

Example 2

To skip errors on `GRANT` statements on `SYS` or `HR` schemas, define a procedure `handle_error_ddl` and register it. In the following example, assume that `handle_error_ddl` is a free-standing procedure in the `SYS` schema.

1. Create the error-handler procedure:

```
CREATE OR REPLACE PROCEDURE sys.handle_error_ddl
is
  l_stmt      VARCHAR2(4000);
  l_stmt_type VARCHAR2(40);
  l_schema    VARCHAR2(30);
  l_name      VARCHAR2(30);
  l_xidusn    NUMBER;
  l_xidslt    NUMBER;
  l_xidsqn    NUMBER;
  l_error     VARCHAR2(4000);
  l_conname   VARCHAR2(30);
  l_newerr    VARCHAR2(4000);

BEGIN
  dbms_logstdby_context.get_context(name=>'STATEMENT',value=>l_stmt);

  dbms_logstdby_context.get_context(name=>'STATEMENT_TYPE',value=>l_stmt_type);
```

```

dbms_logstdby_context.get_context(name=>'SCHEMA',value=>l_schema);
dbms_logstdby_context.get_context(name=>'NAME',value=>l_name);
dbms_logstdby_context.get_context(name=>'XIDUSN',value=>l_xidusn);
dbms_logstdby_context.get_context(name=>'XIDSLT',value=>l_xidslt);
dbms_logstdby_context.get_context(name=>'XIDSQN',value=>l_xidsqn);
dbms_logstdby_context.get_context(name=>'ERROR',value=>l_error);
dbms_logstdby_context.get_context(name=>'CONTAINER_NAME',value=>l_conname);

-- default error to what we already have
l_new_error := l_error;

-- Ignore any GRANT errors on SYS or HR schemas

IF INSTR(UPPER(l_stmt), 'GRANT') > 0
THEN
IF l_schema is NULL
OR (l_schema is NOT NULL AND
(UPPER(l_schema) = 'SYS' OR
UPPER(l_schema) = 'HR'))
THEN
l_new_error := NULL;
-- record the fact that we just skipped an error on 'SYS' or 'HR' schemas
-- code not shown here
END IF;
END IF;

dbms_logstdby_context.set_context(name => 'NEW_ERROR', value => l_new_error);

END handle_error_ddl;
/

```

2. Register the error handler with SQL Apply:

```

SQL> EXECUTE DBMS_LOGSTDBY.SKIP_ERROR ( -
statement => 'NON_SCHEMA_DDL', -
schema_name => NULL, -
object_name => NULL, -
proc_name => 'SYS.HANDLE_ERROR_DDL');

```

107.4.13 SKIP_TRANSACTION Procedure

This procedure provides a way to skip (ignore) applying transactions to the logical standby database. You can skip specific transactions by specifying transaction identification information.

Syntax

```

DBMS_LOGSTDBY.SKIP_TRANSACTION (
xidusn_p          IN NUMBER,
xidslt_p          IN NUMBER,
xidsqn_p          IN NUMBER,
con_name_p        VARCHAR2  IN    DEFAULT NULL
);

```

Parameters

Table 107-19 SKIP_TRANSACTION Procedure Parameters

| Parameter | Description |
|-----------------|---|
| xidusn_p NUMBER | Transaction ID undo segment number of the transaction being skipped |
| xidslt_p NUMBER | Transaction ID slot number of the transaction being skipped |
| xidsqn_p NUMBER | Transaction ID sequence number of the transaction being skipped |
| con_name_p | The transaction name. |

Usage Notes

If SQL Apply stops due to a particular transaction (for example, a DDL transaction), you can specify that transaction ID and then continue to apply. You can call this procedure multiple times for as many transactions as you want SQL Apply to ignore.

WARNING:

SKIP_TRANSACTION is an inherently dangerous operation. Do not invoke this procedure unless you have examined the transaction in question through the **V\$logmnr_contents** view and have taken compensating actions at the logical standby database. **SKIP_TRANSACTION** is not the appropriate procedure to invoke to skip DML changes to a table.

To skip a DML failure, use a **SKIP** procedure, such as **SKIP('DML', 'MySchema', 'MyFailed Table')**. Using the **SKIP_TRANSACTION** procedure for DML transactions may skip changes for other tables, thus logically corrupting them.

- This procedure requires **DBA** privileges to execute.
- Use the **DBA_LOGSTDBY_SKIP_TRANSACTION** view to list the transactions that are going to be skipped by SQL Apply.

Exceptions

Table 107-20 SKIP_TRANSACTION Procedure Exceptions

| Exception | Description |
|-----------|---|
| ORA-01031 | Need DBA privileges |
| ORA-16103 | Logical Standby apply must be stopped to allow this operation |
| ORA-16104 | invalid Logical Standby option requested |

Examples

To skip a DDL transaction with (xidusn_p, xidslt_p, xidsqn_p) of (1.13.1726) you can register a rule as shown in the following example:

```
SQL> EXECUTE DBMS_LOGSTDBY.SKIP_TRANSACTION (-
        xidusn_p => 1, xidslt_p => 13, xidsqn_p => 1726);
```

107.4.14 UNSKIP Procedure

Use the `UNSKIP` procedure to delete rules specified earlier with the `SKIP` procedure.

The parameters specified in the `UNSKIP` procedure must match exactly for it to delete an already-specified rule.

The `container_name` argument is valid only in a CDB.

Syntax

```
DBMS_LOGSTDBY.UNSKIP (
    stmt                IN VARCHAR2,
    schema_name         IN VARCHAR2 DEFAULT NULL,
    object_name         IN VARCHAR2 DEFAULT NULL,
    container_name      IN VARCHAR2 DEFAULT NULL);
```

Parameters

The parameter information for the `UNSKIP` procedure is the same as that described for the `SKIP` procedure. See [Table 107-14](#) for complete parameter information.

Exceptions

Table 107-21 UNSKIP Procedure Exceptions

| Exception | Description |
|-----------|---|
| ORA-01031 | need DBA privileges to execute this procedure |
| ORA-16103 | Logical Standby apply must be stopped to allow this operation |
| ORA-16104 | invalid Logical Standby option requested |

Usage Notes

WARNING:

If DML changes for a table have been skipped and not compensated for, you must follow the call to the `UNSKIP` procedure with a call to the `INstantiate_Table` procedure to synchronize this table with those maintained by SQL Apply.

- This procedure requires DBA privileges to execute.
- Wildcards passed in the `schema_name` or the `object_name` parameter are not expanded. The wildcard character is matched at the character level. Thus, you can delete only one specified rule by invoking the `UNSKIP` procedure, and you will need a distinct `UNSKIP` procedure call to delete each rule that was previously specified.

For example, assume you have specified the following two rules to skip applying DML statements to the `HR.EMPLOYEE` and `HR.EMPTEMP` tables:

```
SQL> EXECUTE DBMS_LOGSTDBY.SKIP (STMT => 'DML', -
    SCHEMA_NAME => 'HR', -
    OBJECT_NAME => 'EMPLOYEE', -
    PROC_NAME => null);
SQL> EXECUTE DBMS_LOGSTDBY.SKIP (STMT => 'DML', -
    SCHEMA_NAME => 'HR', -
    OBJECT_NAME => 'EMPTEMP', -
    PROC_NAME => null);
```

In the following example, the wildcard in the `TABLE_NAME` parameter cannot be used to delete the rules that were specified:

```
SQL> EXECUTE DBMS_LOGSTDBY.UNSKIP (STMT => 'DML', -
    SCHEMA_NAME => 'HR', -
    OBJECT_NAME => 'EMP%');
```

In fact, this `UNSKIP` procedure matches neither of the rules, because the wildcard character in the `TABLE_NAME` parameter is not expanded. Instead, the wildcard character will be used in an exact match to find the corresponding `SKIP` rule.

107.4.15 UNSKIP_ERROR Procedure

Use the `UNSKIP_ERROR` procedure to delete rules specified earlier with the `SKIP_ERROR` procedure.

The parameters specified in the `UNSKIP_ERROR` procedure must match exactly for the procedure to delete an already-specified rule.

The `container_name` argument is valid only in a CDB.

Syntax

```
DBMS_LOGSTDBY.UNSKIP_ERROR (
    stmt                IN VARCHAR2,
    schema_name         IN VARCHAR2 DEFAULT NULL,
    object_name         IN VARCHAR2 DEFAULT NULL,
    container_name      IN VARCHAR2 DEFAULT NULL);
```

Parameters

The parameter information for the `UNSKIP_ERROR` procedure is the same as that described for the `SKIP_ERROR` procedure. See [Table 107-17](#) for complete parameter information.

Exceptions

Table 107-22 UNSKIP_ERROR Procedure Exceptions

| Exception | Description |
|-----------|---|
| ORA-01031 | Need DBA privileges |
| ORA-16103 | Logical Standby apply must be stopped to allow this operation |
| ORA-16104 | invalid Logical Standby option requested |

Usage Notes

- This procedure requires DBA privileges to execute.

- Wildcards passed in the `schema_name` or the `object_name` parameters are not expanded. Instead, the wildcard character is treated as any other character and an exact match is made. Thus, you can delete only one specified rule by invoking the `UNSKIP_ERROR` procedure, and you need a distinct `UNSKIP_ERROR` procedure call to delete each rule that you previously specified.

For example, assume you have specified the following two rules to handle the `HR.EMPLOYEE` and `HR.EMPTEMP` tables:

```
SQL> EXECUTE DBMS_LOGSTDBY.SKIP_ERROR (STMT => 'DML', -
    SCHEMA_NAME => 'HR', -
    OBJECT_NAME => 'EMPLOYEE', -
    PROC_NAME => 'hr_employee_handler');
SQL> EXECUTE DBMS_LOGSTDBY.SKIP_ERROR (STMT => 'DML', -
    SCHEMA_NAME => 'HR', -
    OBJECT_NAME => 'EMPTEMP', -
    PROC_NAME => 'hr_tempemp_handler');
```

In this case, the following `UNSKIP` procedure cannot be used to delete the rules that you have specified:

```
SQL> EXECUTE DBMS_LOGSTDBY.UNSKIP_ERROR (STMT => 'DML', -
    SCHEMA_NAME => 'HR', -
    OBJECT_NAME => 'EMP%');
```

In fact, the `UNSKIP` procedure will match neither of the rules, because the wildcard character in the `OBJECT_NAME` parameter will not be expanded.

Example

To remove a handler that was previously registered with SQL Apply from getting called on encountering an error, you can issue the following statement:

```
DBMS_LOGSTDBY.UNSKIP_ERROR ( -
    statement => 'NON_SCHEMA_DDL', -
    schema_name => NULL, -
    object_name => NULL);
```

107.4.16 UNSKIP_TRANSACTION Procedure

Use the `UNSKIP_TRANSACTION` procedure to delete rules specified earlier with the `SKIP_TRANSACTION` procedure.

The parameters specified in the `UNSKIP_TRANSACTION` procedure must match exactly for the procedure to delete an already-specified rule.

Syntax

```
DBMS_LOGSTDBY.UNSKIP_TRANSACTION (
    xidusn_p          IN NUMBER,
    xidslt_p          IN NUMBER,
    xidsqn_p          IN NUMBER);
```

Parameters

Table 107-23 UNSKIP_TRANSACTION Procedure Parameters

| Parameter | Description |
|-----------|---|
| XIDUSN | Transaction ID undo segment number of the transaction being skipped |
| XIDSLT | Transaction ID slot number of the transaction being skipped |
| XIDSQN | Transaction ID sequence number of the transaction being skipped |

Exceptions

Table 107-24 UNSKIP_TRANSACTION Procedure Exceptions

| Exception | Description |
|-----------|---|
| ORA-01031 | need DBA privileges to execute this procedure |
| ORA-16103 | Logical Standby apply must be stopped to allow this operation |
| ORA-16104 | invalid Logical Standby option requested |

Usage Notes

- This procedure requires DBA privileges to execute.
- Query the DBA_LOGSTDBY_SKIP_TRANSACTION view to list the transactions that are going to be skipped by SQL Apply.

Examples

To remove a rule that was originally specified to skip the application of a transaction with (XIDUSN, XIDSLT, XIDSQN) of (1.13.1726) issue the following statement:

```
SQL> DBMS_LOGSTDBY.UNSKIP_TRANSACTION (XIDUSN => 1, XIDSLT => 13, XIDSQN => 1726);
```

DBMS_LOGMNR_D

The `DBMS_LOGMNR_D` package, one of a set of LogMiner packages, contains two subprograms: the `BUILD` procedure and the `SET_TABLESPACE` procedure.

- The `BUILD` procedure extracts the LogMiner data dictionary to either the redo log files or to a flat file. This information is saved in preparation for future analysis of redo log files using the LogMiner tool.
- The `SET_TABLESPACE` procedure re-creates all LogMiner tables in an alternate tablespace.

The **LogMiner data dictionary** consists of the memory data structures and the database tables that are used to store and retrieve information about objects and their versions. It is referred to as the **LogMiner dictionary** throughout the LogMiner documentation.

This chapter contains the following topics:

- [Overview](#)
- [Security Model](#)
- [Summary of DBMS_LOGMNR_D Subprograms](#)

See Also:

Oracle Database Utilities for information regarding LogMiner.

108.1 DBMS_LOGMNR_D Overview

LogMiner requires a dictionary to translate object IDs into object names when it returns redo data to you.

LogMiner gives you two options for supplying the dictionary:

- Using the online catalog
- Extracting a LogMiner dictionary to the redo log files
- Extracting a LogMiner dictionary to a flat file (for non-CDBs only)

 **Note:**

In previous releases, using a flat file dictionary was one means of mining the redo logs for the changes associated with a specific PDB whose data dictionary was contained within the flat file. This feature is desupported for PDBs in Oracle Database 19c, and desupported in later releases. With Oracle Database 19c and later releases, Oracle recommends that you call `DBMS_LOGMNR.START_LOGMNR`, and supply the system change number (SCN) or time range that you want to mine. The SCN or time range options of `START_LOGMNR` are enhanced to support mining of individual PDBs.

Use the `BUILD` procedure to extract the LogMiner dictionary to the redo log files or a flat file. If you want to specify the online catalog as the dictionary source, you do so when you start LogMiner with the `DBMS_LOGMNR.START_LOGMNR` package.

Use the `SET_TABLESPACE` procedure if you want LogMiner tables to use a tablespace other than the default `SYSAUX` tablespace.

 **See Also:**

[DBMS_LOGMNR](#) for information on the package subprograms used in running a LogMiner session.

108.2 DBMS_LOGMNR_D Security Model

You must have the `EXECUTE_CATALOG_ROLE` role to use the `DBMS_LOGMNR_D` package.

108.3 Summary of DBMS_LOGMNR_D Subprograms

This table lists and briefly describes the `DBMS_LOGMNR_D` subprograms.

In a multitenant container database (CDB), some subprograms must be called from the root. There may be other differences as well. See the individual subprogram descriptions for details.

Table 108-1 DBMS_LOGMNR_D Package Subprograms

| Subprogram | Description |
|--|--|
| BUILD Procedure | Extracts the LogMiner dictionary to either a flat file or one or more redo log files |
| SET_TABLESPACE Procedure | Re-creates all LogMiner tables in an alternate tablespace |

108.3.1 BUILD Procedure

This procedure extracts the LogMiner data dictionary to the redo log files.

The following considerations apply to a multitenant container database (CDB) environment.

- In a CDB environment, when you extract to the redo log files, the `BUILD` procedure must be called from the root database. The LogMiner data dictionary for the entire CDB is extracted to the redo log files.
- You cannot add or remove PDBs from a CDB while this procedure is running.

Note:

In previous releases, using a flat file dictionary was one means of mining the redo logs for the changes associated with a specific PDB whose data dictionary was contained within the flat file. This feature is desupported for PDBs in Oracle Database 19c, and desupported in later releases. With Oracle Database 19c and later releases, Oracle recommends that you call `DBMS_LOGMNR.START_LOGMNR`, and supply the system change number (SCN) or time range that you want to mine. The SCN or time range options of `START_LOGMNR` are enhanced to support mining of individual PDBs.

Syntax

```
DBMS_LOGMNR_D.BUILD (  
    dictionary_filename IN VARCHAR2,  
    dictionary_location IN VARCHAR2,  
    options              IN NUMBER);
```

Parameters

Table 108-2 BUILD Procedure Parameters

| Parameter | Description |
|----------------------------------|--|
| <code>dictionary_filename</code> | Specifies the name of the LogMiner dictionary file. |
| <code>dictionary_location</code> | Specifies the directory object for the LogMiner dictionary file. |
| <code>options</code> | Specifies that the LogMiner dictionary is written to the redo log files (<code>STORE_IN_REDO_LOGS</code>). |

Exceptions

Table 108-3 BUILD Procedure Exceptions

| Exception | Description |
|-----------|--|
| ORA-01302 | <p>Dictionary build options are missing or incorrect.</p> <p>This error is returned under the following conditions:</p> <ul style="list-style-type: none"> • If the value of the <code>OPTIONS</code> parameter is not one of the supported values (<code>STORE_IN_REDO_LOGS</code>), or is not specified • If the <code>STORE_IN_REDO_LOGS</code> option is not specified and neither the <code>dictionary_filename</code> nor the <code>dictionary_location</code> parameter is specified • If the <code>STORE_IN_REDO_LOGS</code> option is specified and either the <code>dictionary_filename</code> or the <code>dictionary_location</code> parameter is specified |
| ORA-01308 | <p>Initialization parameter <code>UTL_FILE_DIR</code> is not set.</p> |
| | <div style="border: 1px solid #0070C0; padding: 10px; background-color: #E6F2FF;"> <p> Note:</p> <p>In earlier releases, you used the <code>UTL_FILE_DIR</code> initialization parameter to specify a directory location. However, as of Oracle Database 18c, the <code>UTL_FILE_DIR</code> initialization parameter is desupported. It is still supported for backward compatibility, but Oracle recommends that you instead use directory objects.</p> </div> |
| ORA-01336 | <p>Specified dictionary file cannot be opened.</p> <p>This error is returned when the dictionary file is read-only.</p> |
| ORA-01308 | <p>Dictionary directory is not set.</p> <p>This error is returned under the following conditions:</p> <ul style="list-style-type: none"> • The specified value for the <code>dictionary_location</code> is not a directory object. • The specified value for the <code>dictionary_location</code> is a directory object that is defined to be a file path that cannot be accessed. |

Usage Notes

- To extract the LogMiner dictionary to the redo log files, specify only the `STORE_IN_REDO_LOGS` option. The size of the LogMiner dictionary may cause it to be contained in multiple redo log files.
- The combinations of parameters used result in the following behavior:
- If you do not specify any parameters, an error is returned.

- If you do not specify a filename and location, but do specify the `STORE_IN_REDO_LOGS` option, the LogMiner dictionary is extracted to the redo log files.
- If you specify a filename and location, as well as the `STORE_IN_REDO_LOGS` option, an error is returned.
- Ideally, the LogMiner dictionary file is created after all database dictionary changes have been made, and before the creation of any redo log files that you want to analyze. You can use LogMiner to dump the LogMiner dictionary to the redo log files, perform DDL operations, and dynamically apply the DDL changes to the LogMiner dictionary.
- The database must be open when you run the `DBMS_LOGMNR_D.BUILD` procedure.
- To extract a LogMiner dictionary file to the redo log files, the following conditions must be met:
 - Archivelog mode must be enabled in order to generate usable redo log files.
 - The `COMPATIBLE` parameter in the initialization parameter file must be set to 9.2.0 or higher.
 - The database to which LogMiner is attached must be Oracle9i or later.

In addition, supplemental logging (at least the minimum level) should be enabled to ensure that you can take advantage of all the features that LogMiner offers.

Examples

Example: Extracting the LogMiner Dictionary to the Redo Log Files

The following example extracts the LogMiner dictionary to the redo log files.

```
SQL> EXECUTE dbms_logmnr_d.build( -  
          options => dbms_logmnr_d.store_in_redo_logs);
```

108.3.2 SET_TABLESPACE Procedure

This procedure moves LogMiner tables from the default `SYSAUX` tablespace to an alternate tablespace.

By default, all LogMiner tables are created to use the `SYSAUX` tablespace. However, it may be desirable to have LogMiner tables use an alternate tablespace. Use this procedure to move LogMiner tables to this alternate tablespace

In a CDB, only the LogMiner metadata in the local container is moved to the requested tablespace.

Syntax

```
DBMS_LOGMNR_D.SET_TABLESPACE (  
    new_tablespace          IN VARCHAR2);
```

Parameters

Table 108-4 SET_TABLESPACE Parameter

| Parameter | Description |
|-----------------------------|---|
| <code>new_tablespace</code> | A string naming a preexisting tablespace. To move all LogMiner tables to employ this tablespace, supply this parameter. |

Usage Notes

- Users upgrading from earlier versions of Oracle Database may find LogMiner tables in the `SYSTEM` tablespace. Oracle encourages such users to consider using the `SET_TABLESPACE` procedure to move the tables to the `SYSAUX` tablespace once they are confident that they will not be downgrading to an earlier version of Oracle Database.
- Users of this routine must supply an existing tablespace.

Example: Using the DBMS_LOGMNR_D.SET_TABLESPACE Procedure

The following example shows the creation of an alternate tablespace and execution of the `DBMS_LOGMNR_D.SET_TABLESPACE` procedure.

```
SQL> CREATE TABLESPACE logmnrts$ datafile '/usr/oracle/dbs/logmnrts.f'  
      SIZE 25 M REUSE AUTOEXTEND ON MAXSIZE UNLIMITED;  
  
SQL> EXECUTE dbms_logmnr_d.set_tablespace('logmnrts$');
```

DBMS_LOGSTDBY_CONTEXT

As of Oracle Database 12c release 1 (12.1), SQL Apply processes have access to a context namespace called `LSBY_APPLY_CONTEXT`. You can use the procedures provided in the `DBMS_LOGSTDBY_CONTEXT` package to set and retrieve various parameters associated with `LSBY_APPLY_CONTEXT`. This is useful when writing skip procedures that are registered with SQL Apply using the `DBMS_LOGSTDBY.SKIP` and `DBMS_LOGSTDBY.SKIP_ERROR` procedures.

This chapter contains the following topics:

- [Overview](#)
- [Security Model](#)
- [Summary of DBMS_LOGSTDBY_CONTEXT Subprograms](#)

See Also:

Oracle Data Guard Concepts and Administration for more information about SQL Apply and logical standby databases

109.1 DBMS_LOGSTDBY_CONTEXT Overview

SQL Apply processes have access to a context namespace called `LSBY_APPLY_CONTEXT`.

The following table lists the predefined parameters associated with `LSBY_APPLY_CONTEXT` that you can set and retrieve by using the procedures provided in the `DBMS_LOGSTDBY_CONTEXT` package. The ability to set and retrieve the parameters in this way is useful when writing skip procedures that are registered with SQL Apply using the `DBMS_LOGSTDBY.SKIP` and `DBMS_LOGSTDBY.SKIP_ERROR` procedures.

Table 109-1 Predefined Parameters of Namespace `LSBY_APPLY_CONTEXT`

| Parameter | Description |
|-----------------------------|--|
| <code>STATEMENT</code> | First 4000 bytes of the statement that the Apply process is processing. |
| <code>STATEMENT_TYPE</code> | See Table 107-15 for a list of various statement types. |
| <code>PACKAGE_SCHEMA</code> | Schema that owns the PL/SQL package being processed (if applicable). |
| <code>PACKAGE_NAME</code> | Name of the PL/SQL package being processed (if applicable). |
| <code>PROCEDURE_NAME</code> | Name of the PL/SQL procedure being processed (if applicable). |
| <code>CURRENT_SCHEMA</code> | Current schema in effect when the DDL or PL/SQL procedure was executed at the primary. |
| <code>XIDUSN</code> | XIDUSN of the transaction at the primary database. |

Table 109-1 (Cont.) Predefined Parameters of Namespace LSBY_APPLY_CONTEXT

| Parameter | Description |
|----------------|---|
| XIDSLT | XIDSLT of the transaction at the primary database. |
| XIDSQN | XIDSQN of the transaction at the primary database. |
| SCHEMA | Schema that owns the object being processed by SQL Apply (in the case of DML or DDL operations). |
| NAME | Object name being processed by SQL Apply (in case of DML or DDL operations). |
| CONTAINER_NAME | Container where the target object or the PL/SQL procedure resides (in the case of a multitenant container database (CDB)). |
| ERROR | Text of the original error encountered by the SQL Apply process (if applicable). |
| NEW_ERROR | Text of the new error to be raised by the SQL Apply process (if applicable, See the DBMS_LOGSTDBY SKIP_ERROR Procedure). |
| NEW_STMT | Text of the replacement statement that SQL Apply must execute (If applicable, See the DBMS_LOGSTDBY SKIP Procedure). |
| SKIP_ACTION | The skip action to be performed by SQL Apply (See the DBMS_LOGSTDBY SKIP Procedure). |

109.2 DBMS_LOGSTDBY_CONTEXT Security Model

The security model for the DBMS_LOGSTDBY_CONTEXT package is the same as for the DBMS_LOGSTDBY package.

See Also:

[DBMS_LOGSTDBY](#)

109.3 Summary of DBMS_LOGSTDBY_CONTEXT Subprograms

This table lists and briefly describes the DBMS_LOGSTDBY_CONTEXT package subprograms.

Table 109-2 DBMS_LOGSTDBY_CONTEXT Package Subprograms

| Subprogram | Description |
|---|--|
| CLEAR_ALL_CONTEXT Procedure | Clears all parameters contained within namespace LSBY_APPLY_CONTEXT. |
| CLEAR_CONTEXT Procedure | Clears the specific parameter. |
| GET_CONTEXT Procedure | Retrieves the value for the specified parameter. |

Table 109-2 (Cont.) DBMS_LOGSTDBY_CONTEXT Package Subprograms

| Subprogram | Description |
|---------------------------------------|--|
| SET_CONTEXT Procedure | Sets the named parameter with the specified value. |

109.3.1 CLEAR_ALL_CONTEXT Procedure

This procedure clears all parameters contained within namespace `LSBY_APPLY_CONTEXT`.

Syntax

```
DBMS_LOGSTDBY_CONTEXT.CLEAR_ALL_CONTEXT;
```

Parameters

None

109.3.2 CLEAR_CONTEXT Procedure

This procedure clears the specific parameter.

Syntax

```
DBMS_LOGSTDBY_CONTEXT.CLEAR_CONTEXT (
    name          IN VARCHAR2);
```

Parameters

Table 109-3 CLEAR_CONTEXT Procedure Parameters

| Parameter | Description |
|-----------|--------------------------------------|
| name | Name of the parameter to be cleared. |

109.3.3 GET_CONTEXT Procedure

This procedure retrieves the value for the specified parameter.

Syntax

```
DBMS_LOGSTDBY_CONTEXT.GET_CONTEXT (
    name          IN VARCHAR2,
    value         OUT VARCHAR2);
```

Parameters

Table 109-4 GET_CONTEXT Procedure Parameters

| Parameter | Description |
|-----------|--|
| name | Name of the parameter. |
| value | The value retrieved for the parameter. |

109.3.4 SET_CONTEXT Procedure

This procedure sets the named parameter with the specified value.

Syntax

```
DBMS_LOGSTDBY_CONTEXT.SET_CONTEXT (  
    name           IN VARCHAR2  
    value          IN VARCHAR2);
```

Parameters

Table 109-5 *SET_CONTEXT Procedure Parameters*

| Parameter | Description |
|-----------|--|
| name | Name of the parameter to be set. |
| value | Value to be assigned to the parameter being set. |

DBMS_MEMOPTIMIZE

The `DBMS_MEMOPTIMIZE` package provides the interface for managing the Memoptimized Rowstore data buffered in the large pool and the memoptimize pool.

This chapter contains the following topics:

- [DBMS_MEMOPTIMIZE Overview](#)
- [Summary of DBMS_MEMOPTIMIZE Subprograms](#)

110.1 DBMS_MEMOPTIMIZE Overview

The `DBMS_MEMOPTIMIZE` package provides the interface for managing Memoptimized Rowstore data buffered in the large pool and the memoptimize pool.

The Memoptimized Rowstore provides the following functionality:

- **Fast Ingest**
Fast ingest optimizes the processing of high-frequency, single-row data inserts. Fast ingest uses the large pool in the SGA for buffering the inserts before writing them to disk.
- **Fast Lookup**
Fast lookup enables fast retrieval of data for high-frequency queries. Fast lookup uses a separate memory area in the SGA called the *memoptimize pool* for buffering data queried from tables.

The `DBMS_MEMOPTIMIZE` package provides the following operations related to the Memoptimized Rowstore:

- **Fast ingest operations:**
 - Provide the low high-water mark (low HWM) of the sequence numbers of rows that have been successfully written from the large pool to disk across all the sessions.
 - Provide the high-water mark (HWM) sequence number of the row that has been written to the large pool for the current session.
 - Flush all the fast ingest data from the large pool to disk for the current session.
- **Fast lookup operations:**
 - Remove data for a table from the memoptimize pool.
 - Populate data for a table in the memoptimize pool.

110.2 Summary of DBMS_MEMOPTIMIZE Subprograms

This table lists the `DBMS_MEMOPTIMIZE` subprograms and briefly describes them.

Table 110-1 DBMS_MEMOPTIMIZE Package Subprograms Related to Fast Ingest

| Procedure | Description |
|--|---|
| GET_APPLY_HWM_SEQID Function | Returns the low high-water mark (low HWM) of the sequence numbers of rows that have been successfully written to disk globally across all the sessions. |
| GET_WRITE_HWM_SEQID Function | Returns the high-water mark (HWM) sequence number of the row that has been written to the large pool for the current session. |
| WRITE_END Procedure | Flushes all the fast ingest data from the large pool to disk for the current session. |

Table 110-2 DBMS_MEMOPTIMIZE Package Subprograms Related to Fast Lookup

| Procedure | Description |
|---------------------------------------|---|
| DROP_OBJECT Procedure | Removes data for a table from the memoptimize pool. |
| POPULATE Procedure | Populates data for a table in the memoptimize pool. |

110.2.1 DROP_OBJECT Procedure

This procedure removes data for a table from the memoptimize pool.

Syntax

```
DBMS_MEMOPTIMIZE.DROP_OBJECT (
    schema_name      IN VARCHAR2,
    table_name       IN VARCHAR2,
    partition_name   IN VARCHAR2 DEFAULT NULL);
```

Parameters

Table 110-3 DROP_OBJECT Procedure Parameters

| Parameter | Description |
|----------------|---|
| schema_name | Name of the schema. |
| table_name | Name of the table for which the data needs to be removed from the memoptimize pool. |
| partition_name | Name of the table partition for which the data needs to be removed from the memoptimize pool. This is an optional parameter and its default value is NULL. |

110.2.2 GET_APPLY_HWM_SEQID Function

This function returns the low high-water mark (low HWM) of sequence numbers of the records that have been successfully written to disk across all the sessions.

Syntax

```
DBMS_MEMOPTIMIZE.GET_APPLY_HWM_SEQID
    RETURN number;
```

Return Value

Returns the low high-water mark (low HWM) of sequence numbers of the records that have been successfully written to disk across all the sessions.

110.2.3 GET_WRITE_HWM_SEQID Function

This function returns the high-water mark (HWM) sequence number of the record that has been written to the large pool for the current session.

Syntax

```
DBMS_MEMOPTIMIZE.GET_WRITE_HWM_SEQID
    RETURN number;
```

Return Value

Returns the high-water mark (HWM) sequence number of the record that has been written to the large pool for the current session.

110.2.4 POPULATE Procedure

This procedure populates the data for a table in the memoptimize pool.

Syntax

```
DBMS_MEMOPTIMIZE.POPULATE (
    schema_name      IN VARCHAR2,
    table_name       IN VARCHAR2,
    partition_name   IN VARCHAR2 DEFAULT NULL);
```

Parameters

Table 110-4 POPULATE Procedure Parameters

| Parameter | Description |
|-------------|---|
| schema_name | Name of the schema. |
| table_name | Name of the table for which the data needs to be populated in the memoptimize pool. |

Table 110-4 (Cont.) POPULATE Procedure Parameters

| Parameter | Description |
|-----------------------------|--|
| <code>partition_name</code> | Name of the table partition for which the data needs to be populated in the memoptimize pool. This is an optional parameter and its default value is NULL. |

110.2.5 WRITE_END Procedure

This procedure flushes all the fast ingest data from the large pool to disk for the current session.

Syntax

```
DBMS_MEMOPTIMIZE.WRITE_END;
```

DBMS_MEMOPTIMIZE_ADMIN

The `DBMS_MEMOPTIMIZE_ADMIN` package provides the interface for flushing the Memoptimized Rowstore data buffered in the large pool to disk.

This chapter contains the following topics:

- [DBMS_MEMOPTIMIZE_ADMIN Overview](#)
- [Summary of DBMS_MEMOPTIMIZE_ADMIN Subprograms](#)

111.1 DBMS_MEMOPTIMIZE_ADMIN Overview

The `DBMS_MEMOPTIMIZE_ADMIN` package provides the interface for flushing the Memoptimized Rowstore data that is buffered in the large pool to disk.

The Memoptimized Rowstore provides the following functionality:

- **Fast Ingest**
Fast ingest optimizes the processing of high-frequency, single-row data inserts. Fast ingest uses the large pool in the SGA for buffering the inserts before writing them to disk.
- **Fast Lookup**
Fast lookup enables fast retrieval of data for high-frequency queries. Fast lookup uses a separate memory area in the SGA called the *memoptimize pool* for buffering the data queried from tables.

The `DBMS_MEMOPTIMIZE_ADMIN` package provides the following operation related to fast ingest of the Memoptimized Rowstore:

- Flush fast ingest data from the large pool to disk for all sessions.

111.2 Summary of DBMS_MEMOPTIMIZE_ADMIN Subprograms

This table lists the `DBMS_MEMOPTIMIZE_ADMIN` subprograms and briefly describes them.

Table 111-1 DBMS_MEMOPTIMIZE_ADMIN Package Subprograms

| Procedure | Description |
|--|--|
| WRITES_FLUSH Procedure | Flushes all the fast ingest data of the Memoptimize Rowstore from the large pool to disk for all the sessions. |

111.2.1 WRITES_FLUSH Procedure

This procedure flushes all the fast ingest data of the Memoptimized Rowstore from the large pool to disk for all the sessions.

Syntax

```
DBMS_MEMOPTIMIZE_ADMIN.WRITES_FLUSH;
```

DBMS_METADATA

The `DBMS_METADATA` package provides a way for you to retrieve metadata from the database dictionary as XML or creation DDL and to submit the XML to re-create the object.

See Also:

Oracle Database Utilities for more information and for examples of using the `DBMS_METADATA` package.

This chapter contains the following topics:

- [Overview](#)
- [Security Model](#)
- [Rules and Limits](#)
- [Data Structures - Object and Table Types](#)
- [Subprogram Groupings](#)
 - [Subprograms for Retrieving Multiple Objects From the Database](#)
 - [Subprograms for Submitting XML to the Database](#)
- [Summary of All DBMS_METADATA Subprograms](#)

112.1 DBMS_METADATA Overview

You can use the `DBMS_METADATA` package to retrieve metadata and to submit XML.

Retrieving Metadata

If you are retrieving metadata, you can specify:

- The kind of object to be retrieved. This can be either a particular object type (such as a table, index, or procedure) or a heterogeneous collection of object types that form a logical unit (such as a database export or schema export).
- Optional selection criteria, such as owner or name.
- Parse items (attributes of the returned objects to be parsed and returned separately).
- Optional transformations on the output, implemented by XSLT (Extensible Stylesheet Language Transformation) scripts. By default the output is represented in XML, but you can specify transformations (into SQL DDL, for example), which are implemented by XSLT stylesheets stored in the database or externally.

`DBMS_METADATA` provides the following retrieval interfaces:

- For programmatic use: `OPEN`, `SET_FILTER`, `SET_COUNT`, `GET_QUERY`, `SET_PARSE_ITEM`, `ADD_TRANSFORM`, `SET_TRANSFORM_PARAM`, `SET_REMAP_PARAM`, `FETCH_XXX`, and `CLOSE` retrieve multiple objects.
- For use in SQL queries and for browsing: `GET_XML`, `GET_DDL` and `GET_SXML` return metadata for a single named object. The `GET_DEPENDENT_XML`, `GET_DEPENDENT_DDL`, `GET_GRANTED_XML`, and `GET_GRANTED_DDL` interfaces return metadata for one or more dependent or granted objects. These procedures do not support heterogeneous object types.

Submitting XML

If you are submitting XML, you specify:

- The type of object
- Optional transform parameters to modify the object (for example, changing the object's owner)
- Parse items (attributes of the submitted objects to be parsed and submitted separately)
- Whether to execute the operation or simply return the generated DDL

DBMS_METADATA provides a programmatic interface for submission of XML. It is comprised of the following procedures: `OPENW`, `ADD_TRANSFORM`, `SET_TRANSFORM_PARAM`, `SET_REMAP_PARAM`, `SET_PARSE_ITEM`, `CONVERT`, `PUT`, and `CLOSE`.

112.2 DBMS_METADATA Security Model

The DBMS_METADATA package considers a privileged user to be one who is connected as user `SYS` or who has the `SELECT_CATALOG_ROLE` role.

The object views of the Oracle metadata model implement security as follows:

- Nonprivileged users can see the metadata of only their own objects.
- Nonprivileged users can also retrieve public synonyms, system privileges granted to them, and object privileges granted to them or by them to others. This also includes privileges granted to `PUBLIC`.
- If callers request objects they are not privileged to retrieve, no exception is raised; the object is simply not retrieved.
- If nonprivileged users are granted some form of access to an object in someone else's schema, they will be able to retrieve the grant specification through the Metadata API, but not the object's actual metadata.
- In stored procedures, functions, and definers-rights packages, roles (such as `SELECT_CATALOG_ROLE`) are disabled. Therefore, such a PL/SQL program can only fetch metadata for objects in its own schema. If you want to write a PL/SQL program that fetches metadata for objects in a different schema (based on the invoker's possession of `SELECT_CATALOG_ROLE`), you must make the program invokers-rights.
- For all objects that have passwords, except database links (for example, users and roles), the following rules apply:
 - A user who has the `SELECT_CATALOG_ROLE` can see all metadata for an object except the passwords for that object.

- The SYS user, users who have the EXP_FULL_DATABASE role, and users who own an object can see all metadata for that object, including passwords.
- For database links the password is never displayed. For security reasons Oracle restricts visibility of the password value to SYS users who query the link\$.passwordx column directly. Instead of the password, DBMS_METADATA returns the following invalid syntax:

```
IDENTIFIED BY VALUES ':1'
```

A user who knows the password of the database link can manually replace the :1 with the password.

112.3 Rules and Limits

In an Oracle Shared Server (OSS) environment, the DBMS_METADATA package must disable session migration and connection pooling.

This results in any shared server process that is serving a session running the package to effectively become a default, dedicated server for the life of the session. You should ensure that sufficient shared servers are configured when the package is used and that the number of servers is not artificially limited by too small a value for the MAX_SHARED_SERVERS initialization parameter.

112.4 DBMS_METADATA Data Structures - Object and Table Types

The DBMS_METADATA package defines, in the SYS schema, the OBJECT and TABLE types shown in this code.

```
CREATE TYPE sys.ku$_parsed_item AS OBJECT (
  item          VARCHAR2(30),
  value         VARCHAR2(4000),
  object_row    NUMBER )
/

CREATE PUBLIC SYNONYM ku$_parsed_item FOR sys.ku$_parsed_item;

CREATE TYPE sys.ku$_parsed_items IS TABLE OF sys.ku$_parsed_item
/

CREATE PUBLIC SYNONYM ku$_parsed_items FOR sys.ku$_parsed_items;

CREATE TYPE sys.ku$_ddl AS OBJECT (
  ddlText      CLOB,
  parsedItems  sys.ku$_parsed_items )
/

CREATE PUBLIC SYNONYM ku$_ddl FOR sys.ku$_ddl;

CREATE TYPE sys.ku$_ddls IS TABLE OF sys.ku$_ddl
/

CREATE PUBLIC SYNONYM ku$_ddls FOR sys.ku$_ddls;

CREATE TYPE sys.ku$_multi_ddl AS OBJECT (
  object_row    NUMBER,
  ddls          sys.ku$_ddls )
```

```

/

CREATE OR REPLACE PUBLIC SYNONYM ku$_multi_ddl FOR sys.ku$_multi_ddl;

CREATE TYPE sys.ku$_multi_ddls IS TABLE OF sys.ku$_multi_ddl;
/

CREATE OR REPLACE PUBLIC SYNONYM ku$_multi_ddls FOR
    sys.ku$_multi_ddls;

CREATE TYPE sys.ku$_ErrorLine IS OBJECT (
    errorNumber    NUMBER,
    errorText      VARCHAR2(2000) )
/

CREATE PUBLIC SYNONYM ku$_ErrorLine FOR sys.ku$_ErrorLine;

CREATE TYPE sys.ku$_ErrorLines IS TABLE OF sys.ku$_ErrorLine
/
CREATE PUBLIC SYNONYM ku$ErrorLines FOR sys.ku$_ErrorLines;

CREATE TYPE sys.ku$_SubmitResult AS OBJECT (
    ddl            sys.ku$_ddl,
    errorLines     sys.ku$_ErrorLines );
/

CREATE TYPE sys.ku$_SubmitResults IS TABLE OF sys.ku$_SubmitResult
/

CREATE PUBLIC SYNONYM ku$_SubmitResults FOR sys.ku$_SubmitResults;

```

Note:

The maximum size of the `VARCHAR2`, `NVARCHAR2`, and `RAW` datatypes has been increased to 32 KB when the `COMPATIBLE` initialization parameter is set to 12.0 and the `MAX_STRING_SIZE` initialization parameter is set to `EXTENDED`. The `DBMS_METADATA` package supports this increased size unless the version of the metadata is earlier than Oracle Database 12c Release 1 (12.1).

112.5 DBMS_METADATA Subprogram Groupings

The `DBMS_METADATA` subprograms retrieve objects from, and submit XML to, a database. Some subprograms are used for both activities, while others are used only for retrieval or only for submission.

- [Table 112-1](#) provides a summary, in alphabetical order, of `DBMS_METADATA` subprograms used to retrieve multiple objects from a database.
- [Table 112-2](#) provides a summary, in alphabetical order, of `DBMS_METADATA` subprograms used to submit XML metadata to a database.

112.5.1 DBMS_METADATA Subprograms for Retrieving Multiple Objects From the Database

DBMS_METADATA uses these subprograms used for retrieving multiple objects from the database.

Table 112-1 DBMS_METADATA Subprograms for Retrieving Multiple Objects

| Subprogram | Description |
|--|--|
| ADD_TRANSFORM Function | Specifies a transform that <code>FETCH_XXX</code> applies to the XML representation of the retrieved objects |
| CLOSE Procedure | Invalidates the handle returned by <code>OPEN</code> and cleans up the associated state |
| FETCH_XXX Functions and Procedures | Returns metadata for objects meeting the criteria established by <code>OPEN</code> , <code>SET_FILTER</code> , <code>SET_COUNT</code> , <code>ADD_TRANSFORM</code> , and so on |
| GET_QUERY Function | Returns the text of the queries that are used by <code>FETCH_XXX</code> |
| GET_XXX Functions | Fetches the metadata for a specified object as XML, SXML, or DDL, using only a single call |
| OPEN Function | Specifies the type of object to be retrieved, the version of its metadata, and the object model |
| SET_COUNT Procedure | Specifies the maximum number of objects to be retrieved in a single <code>FETCH_XXX</code> call |
| SET_FILTER Procedure | Specifies restrictions on the objects to be retrieved, for example, the object name or schema |
| SET_PARSE_ITEM Procedure | Enables output parsing by specifying an object attribute to be parsed and returned |
| SET_TRANSFORM_PARAM and SET_REMAP_PARAM Procedures | Specifies parameters to the XSLT stylesheets identified by <code>transform_handle</code> |

112.5.2 DBMS_METADATA Subprograms for Submitting XML to the Database

DBMS_METADATA uses these subprograms for submitting XML to the database.

Table 112-2 DBMS_METADATA Subprograms for Submitting XML

| Subprogram | Description |
|--|---|
| ADD_TRANSFORM Function | Specifies a transform for the XML documents |
| CLOSE Procedure | Closes the context opened with <code>OPENW</code> |
| CONVERT Functions and Procedures | Converts an XML document to DDL |
| OPENW Function | Opens a write context |
| PUT Function | Submits an XML document to the database |
| SET_PARSE_ITEM Procedure | Specifies an object attribute to be parsed |

Table 112-2 (Cont.) DBMS_METADATA Subprograms for Submitting XML

| Subprogram | Description |
|--|---|
| SET_TRANSFORM_PARAM and SET_REMAP_PARAM Procedures | <code>SET_TRANSFORM_PARAM</code> specifies a parameter to a transform <code>SET_REMAP_PARAM</code> specifies a remapping for a transform |

112.6 Summary of All DBMS_METADATA Subprograms

This table lists the DBMS_METADATA subprograms and briefly describes them.

Table 112-3 DBMS_METADATA Package Subprograms

| Subprogram | Description |
|--|--|
| ADD_TRANSFORM Function | Specifies a transform that <code>FETCH_xxx</code> applies to the XML representation of the retrieved objects |
| CLOSE Procedure | Invalidates the handle returned by <code>OPEN</code> and cleans up the associated state |
| CONVERT Functions and Procedures | Converts an XML document to DDL |
| FETCH_xxx Functions and Procedures | Returns metadata for objects meeting the criteria established by <code>OPEN</code> , <code>SET_FILTER</code> , <code>SET_COUNT</code> , <code>ADD_TRANSFORM</code> , and so on |
| GET_xxx Functions | Fetches the metadata for a specified object as XML, SXML, or DDL, using only a single call |
| GET_QUERY Function | Returns the text of the queries that are used by <code>FETCH_xxx</code> |
| OPEN Function | Specifies the type of object to be retrieved, the version of its metadata, and the object model |
| OPENW Function | Opens a write context |
| PUT Function | Submits an XML document to the database |
| SET_COUNT Procedure | Specifies the maximum number of objects to be retrieved in a single <code>FETCH_xxx</code> call |
| SET_FILTER Procedure | Specifies restrictions on the objects to be retrieved, for example, the object name or schema |
| SET_PARSE_ITEM Procedure | Enables output parsing by specifying an object attribute to be parsed and returned |
| SET_TRANSFORM_PARAM and SET_REMAP_PARAM Procedures | Specifies parameters to the XSLT stylesheets identified by <code>transform_handle</code> |

112.6.1 ADD_TRANSFORM Function

The `DBMS_METADATA.ADD_TRANSFORM` function is used for both retrieval and submission.

- When this procedure is used to retrieve objects, it specifies a transform that `FETCH_xxx` applies to the XML representation of the retrieved objects.

- When used to submit objects, it specifies a transform that `CONVERT` or `PUT` applies to the XML representation of the submitted objects. It is possible to add more than one transform.

 **See Also:**

- [Subprograms for Retrieving Multiple Objects From the Database](#)
- [Subprograms for Submitting XML to the Database](#)
- ["SET_TRANSFORM_PARAM and SET_REMAP_PARAM Procedures"](#) for information about how to modify and customize transform output

Syntax

```
DBMS_METADATA.ADD_TRANSFORM (
  handle      IN NUMBER,
  name        IN VARCHAR2,
  encoding    IN VARCHAR2 DEFAULT NULL,
  object_type IN VARCHAR2 DEFAULT NULL)
RETURN NUMBER;
```

Parameters

Table 112-4 ADD_TRANSFORM Function Parameters

| Parameters | Description |
|------------|---|
| handle | The handle returned from <code>OPEN</code> when this transform is used to retrieve objects. Or the handle returned from <code>OPENW</code> when this transform is used in the submission of XML metadata. |
| name | The name of the transform. The name can be an internal keyword like <code>DDL</code> to use internally stored stylesheets. If the name contains a colon, it is interpreted as <code>directory_object_name:file_name</code> of a user-supplied Extensible Stylesheet Language Transformation (XSLT) script. Otherwise, name designates a transform implemented by <code>DBMS_METADATA</code> . See Table 112-5 for descriptions of available transforms. |
| encoding | The name of the Globalization Support character set in which the stylesheet pointed to by name is encoded. This is only valid if name is a URL. If left <code>NULL</code> and the URL is external to the database, UTF-8 encoding is assumed. If left <code>NULL</code> and the URL is internal to the database (that is, it begins with <code>/oradb/</code>), then the encoding is assumed to be the database character set. |

Table 112-4 (Cont.) ADD_TRANSFORM Function Parameters

| Parameters | Description |
|-------------|---|
| object_type | <p>The definition of this parameter depends upon whether you are retrieving objects or submitting XML metadata.</p> <ol style="list-style-type: none"> When you use <code>ADD_TRANSFORM</code> to retrieve objects, the following definition of <code>object_type</code> applies: Designates the object type to which the transform applies. (Note that this is an object type name, not a path name.) By default the transform applies to the object type of the <code>OPEN</code> handle. When the <code>OPEN</code> handle designates a heterogeneous object type, the following behavior can occur: <ul style="list-style-type: none"> if <code>object_type</code> is omitted, the transform applies to all object types within the heterogeneous collection if <code>object_type</code> is specified, the transform only applies to that specific object type within the collection <p>If you omit this parameter you can add the DDL transform to all objects in a heterogeneous collection with a single call. If you supply this parameter, you can add a transform for a specific object type.</p> When you use <code>ADD_TRANSFORM</code> in the submission of XML metadata, this parameter is the object type to which the transform applies. By default, it is the object type of the <code>OPENW</code> handle. Because the <code>OPENW</code> handle cannot designate a heterogeneous object type, the caller would normally leave this parameter <code>NULL</code> in the <code>ADD_TRANSFORM</code> calls. |

The following table describes the transforms available on the `ADD_TRANSFORM` function.

Because new transforms are occasionally added, you might want to query the `DBMS_METADATA_TRANSFORMS` view to see all valid Oracle-supplied transforms for specific object types.

Table 112-5 Transforms Available on ADD_TRANSFORM Function

| Object Type | Transform Name | Input Doc Type | Output Doc Type | Description |
|-------------|----------------|----------------|-----------------|--|
| All | DDL | XML | DDL | Convert XML to SQL to create the object |
| All | MODIFY | XML | XML | Modify XML document according to transform parameters |
| Subset | SXML | XML | SXML | Convert XML to SXML |
| Subset | MODIFYSXML | SXML | SXML | Modify SXML document according to transform parameters |
| Subset | SXMLDDL | SXML | DDL | Convert SXML to DDL |

Table 112-5 (Cont.) Transforms Available on ADD_TRANSFORM Function

| Object Type | Transform Name | Input Doc Type | Output Doc Type | Description |
|-------------|----------------|--------------------------|-----------------|--|
| Subset | ALTERXML | SXML difference document | ALTER_XML | <p>Generate ALTER_XML from SXML difference document. (See the DBMS_METADATA_DIFF PL/SQL package for more information about SXML difference format.)</p> <p>The following parameters are valid for the ALTERXML transform:</p> <ul style="list-style-type: none"> • XPATH - The XPATH of the object being altered • NAME - Name of the object being altered • ALTERABLE - Affirms that the object can be altered. If the object cannot be altered, a NOT_ALTERABLE element is inserted whose value indicates the reason. • CLAUSE_TYPE - The type of clause (for example, ADD_COLUMN) • COLUMN_ATTRIBUTE - The attribute being modified • CONSTRAINT_TYPE - The type of constraint (for example, UNIQUE or PRIMARY) |
| Subset | ALTERDDL | ALTER_XML | ALTER_DDL | Convert ALTER_XML to ALTER_DDL |

Return Values

The opaque handle that is returned is used as input to SET_TRANSFORM_PARAM and SET_REMAP_PARAM. Note that this handle is different from the handle returned by OPEN or OPENW; it refers to the transform, not the set of objects to be retrieved.

Usage Notes

- With no transforms added, objects are returned by default as XML documents. You call ADD_TRANSFORM to specify the XSLT stylesheets to be used to transform the returned XML documents.
- You can call ADD_TRANSFORM more than once to apply multiple transforms to XML documents. The transforms are applied in the order in which they were specified, the output of the first transform being used as input to the second, and so on.
- The output of a DDL transform is *not* an XML document. Therefore, no transform should be added after the DDL transform.
- Each transform expects a certain format XML document as input. If the input document is unspecified, metadata XML format is assumed.

- When the ALTERXML transform is used, parse items are returned in a PARSE_LIST element of the ALTER_XML document. Each PARSE_LIST_ITEM element contains an ITEM and a VALUE. For example:

```
<PARSE_LIST>
  <PARSE_LIST_ITEM>
    <ITEM>XPATH</ITEM>
    <VALUE>/sxml:TABLE/sxml:RELATIONAL_TABLE/sxml:COL_LIST/
sxml:COL_LIST_ITEM[14]</VALUE>
  </PARSE_LIST_ITEM>
  <PARSE_LIST_ITEM>
    <ITEM>NAME</ITEM>
    <VALUE>Z1</VALUE>
  </PARSE_LIST_ITEM>
  <PARSE_LIST_ITEM>
    <ITEM>CLAUSE_TYPE</ITEM>
    <VALUE>ADD_COLUMN</VALUE>
  </PARSE_LIST_ITEM>
  <PARSE_LIST_ITEM>
    <ITEM>COLUMN_ATTRIBUTE</ITEM>
    <VALUE>NOT_NULL</VALUE>
  </PARSE_LIST_ITEM>
</PARSE_LIST>
```

Exceptions

- INVALID_ARGVAL. A NULL or invalid value was supplied for an input parameter. The error message text identifies the parameter.
- INVALID_OPERATION. ADD_TRANSFORM was called after the first call to FETCH_XXX for the OPEN context. After the first call to FETCH_XXX is made, no further calls to ADD_TRANSFORM for the current OPEN context are permitted.
- INCONSISTENT_ARGS. The arguments are inconsistent. Possible inconsistencies include the following:
 - encoding is specified even though name is not a URL.
 - object_type is not part of the collection designated by handle.

112.6.2 CLOSE Procedure

This procedure is used for both retrieval and submission. This procedure invalidates the handle returned by OPEN (or OPENW) and cleans up the associated state.

See Also:

For more information about related subprograms:

- [Subprograms for Retrieving Multiple Objects From the Database](#)
- [Subprograms for Submitting XML to the Database](#)

Syntax

```
DBMS_METADATA.CLOSE (
  handle IN NUMBER);
```

Parameters

Table 112-6 CLOSE Procedure Parameters

| Parameter | Description |
|-----------|---|
| handle | The handle returned from OPEN (or OPENW). |

Usage Notes

**Note:**

The following notes apply only to object retrieval

You can prematurely terminate the stream of objects established by OPEN or (OPENW).

- If a call to FETCH_XXX returns NULL, indicating no more objects, a call to CLOSE is made transparently. In this case, you can still call CLOSE on the handle and not get an exception. (The call to CLOSE is not required.)
- If you know that only one specific object will be returned, you should explicitly call CLOSE after the single FETCH_XXX call to free resources held by the handle.

Exceptions

- INVALID_ARGVAL. The value for the handle parameter is NULL or invalid.

112.6.3 CONVERT Functions and Procedures

The DBMS_METADATA.CONVERT functions and procedures transform input XML documents.

The CONVERT functions return creation DDL. The CONVERT procedures return either XML or DDL, depending on the specified transforms.

**See Also:**

- [Subprograms for Submitting XML to the Database](#)

Syntax

The CONVERT functions are as follows:

```
DBMS_METADATA.CONVERT (
    handle    IN NUMBER,
    document  IN sys.XMLType)
RETURN sys.ku$_multi_ddls;
```

```
DBMS_METADATA.CONVERT (
    handle    IN NUMBER,
```

```
document IN CLOB)
RETURN sys.ku$_multi_ddls;
```

The CONVERT procedures are as follows:

```
DBMS_METADATA.CONVERT (
  handle   IN NUMBER,
  document IN sys.XMLType,
  result   IN OUT NOCOPY CLOB);
```

```
DBMS_METADATA.CONVERT (
  handle   IN NUMBER,
  document IN CLOB,
  result   IN OUT NOCOPY CLOB);
```

Parameters

Table 112-7 CONVERT Subprogram Parameters

| Parameter | Description |
|-----------|---|
| handle | The handle returned from OPENW |
| document | The XML document containing object metadata of the type of the OPENW handle |
| result | The converted document |

Return Values

Either XML or DDL, depending on the specified transforms.

Usage Notes

You can think of CONVERT as the second half of FETCH_XXX, either FETCH_DDL (for the function variants) or FETCH_CLOB (for the procedure variants). There are two differences:

- FETCH_XXX gets its XML document from the database, but CONVERT gets its XML document from the caller
- FETCH_DDL returns its results in a sys.ku\$_ddls nested table, but CONVERT returns a sys.ku\$_multi_ddls nested table

The transforms specified with ADD_TRANSFORM are applied in turn, and the result is returned to the caller. For the function variants, the DDL transform must be specified. If parse items were specified, they are returned in the parsedItems column. Parse items are ignored by the procedure variants.

The encoding of the XML document is embedded in its CLOB or XMLType representation. The version of the metadata is embedded in the XML. The generated DDL is valid for the database version specified in OPENW.

Exceptions

- INVALID_ARGVAL. A NULL or invalid value was supplied for an input parameter. The error message text identifies the parameter.
- INCONSISTENT_OPERATION. No transform was specified. The DDL transform was not specified (function variants only).

- `INCOMPATIBLE_DOCUMENT`. The version of the XML document is not compatible with this version of the software.

112.6.4 FETCH_xxx Functions and Procedures

These functions and procedures return metadata for objects meeting the criteria established by `OPEN`, `SET_FILTER`, `SET_COUNT`, `ADD_TRANSFORM`, and so on.

See "[Usage Notes](#)" for the variants.

See Also:

For more information about related subprograms:

- [Subprograms for Retrieving Multiple Objects From the Database](#)

Syntax

The `FETCH` functions are as follows:

```
DBMS_METADATA.FETCH_XML (
    handle IN NUMBER)
RETURN sys.XMLType;

DBMS_METADATA.FETCH_DDL (
    handle IN NUMBER)
RETURN sys.ku$_ddl;

DBMS_METADATA.FETCH_CLOB (
    handle      IN NUMBER,
    cache_lob   IN BOOLEAN DEFAULT TRUE,
    lob_duration IN PLS_INTEGER DEFAULT DBMS_LOB.SESSION)
RETURN CLOB;
```

The `FETCH` procedures are as follows:

```
DBMS_METADATA.FETCH_CLOB (
    handle IN NUMBER,
    doc    IN OUT NOCOPY CLOB);

DBMS_METADATA.FETCH_XML_CLOB (
    handle IN NUMBER,
    doc    IN OUT NOCOPY CLOB,
    parsed_items OUT sys.ku$_parsed_items,
    object_type_path OUT VARCHAR2);
```

Parameters

Table 112-8 `FETCH_xxx` Function Parameters

| Parameters | Description |
|------------------------|---|
| <code>handle</code> | The handle returned from <code>OPEN</code> . |
| <code>cache_lob</code> | <code>TRUE</code> =read LOB into buffer cache |

Table 112-8 (Cont.) FETCH_XXX Function Parameters

| Parameters | Description |
|------------------|--|
| lob_duration | The duration for the temporary LOB created by <code>FETCH_CLOB</code> , either <code>DBMS_LOB.SESSION</code> (the default) or <code>DBMS_LOB.CALL</code> . |
| doc | The metadata for the objects, or <code>NULL</code> if all objects have been returned. |
| parsed_items | A nested table containing the items specified by <code>SET_PARSE_ITEM</code> . If <code>SET_PARSE_ITEM</code> was not called, a <code>NULL</code> is returned. |
| object_type_path | For heterogeneous object types, this is the full path name of the object type for the objects returned by the call to <code>FETCH_XXX</code> . If <code>handle</code> designates a homogeneous object type, a <code>NULL</code> is returned. |

Return Values

The metadata for the objects or `NULL` if all objects have been returned.

Usage Notes

These functions and procedures return metadata for objects meeting the criteria established by the call to `OPEN` that returned the handle, and subsequent calls to `SET_FILTER`, `SET_COUNT`, `ADD_TRANSFORM`, and so on. Each call to `FETCH_XXX` returns the number of objects specified by `SET_COUNT` (or less, if fewer objects remain in the underlying cursor) until all objects have been returned. After the last object is returned, subsequent calls to `FETCH_XXX` return `NULL` and cause the stream created by `OPEN` to be transparently closed.

There are several different `FETCH_XXX` functions and procedures:

- The `FETCH_XML` function returns the XML metadata for an object as an `XMLType`. It assumes that if any transform has been specified, that transform will produce an XML document. In particular, it assumes that the DDL transform has not been specified.
- The `FETCH_DDL` function returns the DDL (to create the object) in a `sys.ku$_ddls` nested table. It assumes that the DDL transform has been specified. Each row of the `sys.ku$_ddls` nested table contains a single DDL statement in the `ddlText` column; if requested, parsed items for the DDL statement will be returned in the `parsedItems` column. Multiple DDL statements may be returned under the following circumstances:
 - When you call `SET_COUNT` to specify a count greater than 1
 - When an object is transformed into multiple DDL statements. For example, A `TYPE` object that has a DDL transform applied to it can be transformed into both `CREATE TYPE` and `CREATE TYPE BODY` statements. A `TABLE` object can be transformed into a `CREATE TABLE`, and one or more `ALTER TABLE` statements
- The `FETCH_CLOB` function simply returns the object, transformed or not, as a `CLOB`. By default, the `CLOB` is read into the buffer cache and has session duration, but these defaults can be overridden with the `cache_lob` and `lob_duration` parameters.

- The `FETCH_CLOB` procedure returns the objects by reference in an `IN OUT NOCOPY` parameter. This is faster than the function variant, which returns LOBs by value, a practice that involves an expensive LOB copy.
- The `FETCH_XML_CLOB` procedure returns the XML metadata for the objects as a CLOB in an `IN OUT NOCOPY` parameter. This helps to avoid LOB copies, which can consume a lot of resources. It also returns a nested table of parse items and the full path name of the object type of the returned objects.
- All LOBs returned by `FETCH_xxx` are temporary LOBs. You must free the LOB. If the LOB is supplied as an `IN OUT NOCOPY` parameter, you must also create the LOB.
- If `SET_PARSE_ITEM` was called, `FETCH_DDL` and `FETCH_XML_CLOB` return attributes of the object's metadata (or the DDL statement) in a `sys.ku$_parsed_items` nested table. For `FETCH_XML_CLOB`, the nested table is an `OUT` parameter. For `FETCH_DDL`, it is a column in the returned `sys.ku$_ddls` nested table. Each row of the nested table corresponds to an item specified by `SET_PARSE_ITEM` and contains the following columns:
 - `item`—the name of the attribute as specified in the `name` parameter to `SET_PARSE_ITEM`.
 - `value`—the attribute value, or `NULL` if the attribute is not present in the DDL statement.
 - `object_row`—a positive integer indicating the object to which the parse item applies. If multiple objects are returned by `FETCH_xxx`, (because `SET_COUNT` specified a count greater than 1) then `object_row=1` for all items for the first object, 2 for the second, and so on.
- The rows of the `sys.ku$_parsed_items` nested table are ordered by ascending `object_row`, but otherwise the row order is undetermined. To find a particular parse item within an object row the caller must search the table for a match on `item`.
- In general there is no guarantee that a requested parse item will be returned. For example, the parse item may not apply to the object type or to the particular line of DDL, or the item's value may be `NULL`.
- If `SET_PARSE_ITEM` was not called, `NULL` is returned as the value of the parsed items nested table.
- It is expected that the same variant of `FETCH_xxx` will be called for all objects selected by `OPEN`. That is, programs will not intermix calls to `FETCH_XML`, `FETCH_DDL`, `FETCH_CLOB`, and so on using the same `OPEN` handle. The effect of calling different variants is undefined; it might do what you expect, but there are no guarantees.
- Every object fetched will be internally consistent with respect to on-going DDL (and the subsequent recursive DML) operations against the dictionary. In some cases, multiple queries may be issued, either because the object type is heterogeneous or for performance reasons (for example, one query for heap tables, one for index-organized tables). Consequently the `FETCH_xxx` calls may in fact be fetches from different underlying cursors (meaning that read consistency is not guaranteed).

 **Caution:**

Do not run functions and procedures within a query, because they can fail when the handle is for an open context for a heterogeneous object.

Exceptions

Most exceptions raised during execution of the query are propagated to the caller. Also, the following exceptions may be raised:

- `INVALID_ARGVAL`. A `NULL` or invalid value was supplied for an input parameter. The error message text identifies the parameter.
- `INCONSISTENT_OPERATION`. Either `FETCH_XML` was called when the DDL transform had been specified, or `FETCH_DDL` was called when the DDL transform had *not* been specified.

112.6.5 GET_xxx Functions

`GET_xxx` functions let you fetch metadata for objects with a single call.

These `GET_xxx` functions are:

- `GET_XML`
- `GET_DDL`
- `GET_SXML`
- `GET_DEPENDENT_XML`
- `GET_DEPENDENT_DDL`
- `GET_GRANTED_XML`
- `GET_GRANTED_DDL`

See Also:

For more information about related subprograms:

- [Subprograms for Retrieving Multiple Objects From the Database](#)

Syntax

```
DBMS_METADATA.GET_XML (  
object_type      IN VARCHAR2,  
name            IN VARCHAR2,  
schema          IN VARCHAR2 DEFAULT NULL,  
version         IN VARCHAR2 DEFAULT 'COMPATIBLE',  
model           IN VARCHAR2 DEFAULT 'ORACLE',  
transform       IN VARCHAR2 DEFAULT NULL)  
RETURN CLOB;
```

```
DBMS_METADATA.GET_DDL (  
object_type      IN VARCHAR2,  
name            IN VARCHAR2,  
schema          IN VARCHAR2 DEFAULT NULL,  
version         IN VARCHAR2 DEFAULT 'COMPATIBLE',  
model           IN VARCHAR2 DEFAULT 'ORACLE',  
transform       IN VARCHAR2 DEFAULT 'DDL')  
RETURN CLOB;
```

```

DBMS_METADATA.GET_SXML (
object_type      IN VARCHAR2,
name             IN VARCHAR2 DEFAULT NULL,
schema          IN VARCHAR2 DEFAULT NULL,
version         IN VARCHAR2 DEFAULT 'COMPATIBLE',
model           IN VARCHAR2 DEFAULT 'ORACLE',
transform       IN VARCHAR2 DEFAULT 'SXML')
RETURN CLOB;

DBMS_METADATA.GET_DEPENDENT_XML (
object_type      IN VARCHAR2,
base_object_name IN VARCHAR2,
base_object_schema IN VARCHAR2 DEFAULT NULL,
version         IN VARCHAR2 DEFAULT 'COMPATIBLE',
model           IN VARCHAR2 DEFAULT 'ORACLE',
transform       IN VARCHAR2 DEFAULT NULL,
object_count    IN NUMBER   DEFAULT 10000)
RETURN CLOB;

DBMS_METADATA.GET_DEPENDENT_DDL (
object_type      IN VARCHAR2,
base_object_name IN VARCHAR2,
base_object_schema IN VARCHAR2 DEFAULT NULL,
version         IN VARCHAR2 DEFAULT 'COMPATIBLE',
model           IN VARCHAR2 DEFAULT 'ORACLE',
transform       IN VARCHAR2 DEFAULT 'DDL',
object_count    IN NUMBER   DEFAULT 10000)
RETURN CLOB;

DBMS_METADATA.GET_GRANTED_XML (
object_type      IN VARCHAR2,
grantee         IN VARCHAR2 DEFAULT NULL,
version         IN VARCHAR2 DEFAULT 'COMPATIBLE',
model           IN VARCHAR2 DEFAULT 'ORACLE',
transform       IN VARCHAR2 DEFAULT NULL,
object_count    IN NUMBER   DEFAULT 10000)
RETURN CLOB;

DBMS_METADATA.GET_GRANTED_DDL (
object_type      IN VARCHAR2,
grantee         IN VARCHAR2 DEFAULT NULL,
version         IN VARCHAR2 DEFAULT 'COMPATIBLE',
model           IN VARCHAR2 DEFAULT 'ORACLE',
transform       IN VARCHAR2 DEFAULT 'DDL',
object_count    IN NUMBER   DEFAULT 10000)
RETURN CLOB;

```

Parameters

Table 112-9 GET_xxx Function Parameters

| Parameter | Description |
|-------------|--|
| object_type | The type of object to be retrieved. This parameter takes the same values as the OPEN object_type parameter, except that it cannot be a heterogeneous object type. The attributes of the object type must be appropriate to the function. That is, for GET_xxx it must be a named object. |

Table 112-9 (Cont.) GET_xxx Function Parameters

| Parameter | Description |
|--------------------|---|
| name | The object name. It is used internally in a NAME filter. (If the name is longer than 30 characters, it will be used in a LONGNAME filter.) If this parameter is NULL, then no NAME or LONGNAME filter is specified. See Table 112-18 for a list of filters. |
| schema | The object schema. It is used internally in a SCHEMA filter. The default is the current user. |
| version | The version of metadata to be extracted. This parameter takes the same values as the OPEN version parameter. |
| model | The object model to use. This parameter takes the same values as the OPEN model parameter. |
| transform | The name of a transformation on the output. This parameter takes the same values as the ADD_TRANSFORM name parameter. For GET_XML this must not be DDL. |
| base_object_name | The base object name. It is used internally in a BASE_OBJECT_NAME filter. |
| base_object_schema | The base object schema. It is used internally in a BASE_OBJECT_SCHEMA filter. The default is the current user. |
| grantee | The grantee. It is used internally in a GRANTEE filter. The default is the current user. |
| object_count | The maximum number of objects to return. See SET_COUNT Procedure . |

Return Values

The metadata for the specified object as XML or DDL.

Usage Notes

- These functions allow you to fetch metadata for objects with a single call. They encapsulate calls to OPEN, SET_FILTER, and so on. The function you use depends on the characteristics of the object type and on whether you want XML, SXML, or DDL.
 - GET_xxx is used to fetch named objects, especially schema objects (tables, views).
 - GET_DEPENDENT_xxx is used to fetch dependent objects (audits, object grants).
 - GET_GRANTED_xxx is used to fetch granted objects (system grants, role grants).
- For some object types you can use more than one function. For example, you can use GET_xxx to fetch an index by name, or GET_DEPENDENT_xxx to fetch the same index by specifying the table on which it is defined.
- GET_xxx only returns a single named object.
- For GET_DEPENDENT_xxx and GET_GRANTED_xxx, an arbitrary number of dependent or granted objects can match the input criteria. You can specify an object count when fetching these objects. (The default count of 10000 should be adequate in most cases.)

- If the DDL transform is specified, session-level transform parameters are inherited.
- If you invoke these functions from SQL*Plus, you should set the PAGESIZE to 0 and set LONG to some large number to get complete, uninterrupted output.
- Currently, GET_DDL for a USER object does not return the CONTAINER clause.

Exceptions

- INVALID_ARGVAL. A NULL or invalid value was supplied for an input parameter. The error message text identifies the parameter.
- OBJECT_NOT_FOUND. The specified object was not found in the database.

Examples

Example: Fetch the XML Representation of SCOTT.EMP

To generate complete, uninterrupted output, set the PAGESIZE to 0 and set LONG to some large number, as shown, before executing your query.

```
SET LONG 2000000
SET PAGESIZE 0
SELECT DBMS_METADATA.GET_XML('TABLE', 'EMP', 'SCOTT')
FROM DUAL;
```

Example: Fetch the DDL for all Complete Tables in the Current Schema, Filter Out Nested Tables and Overflow Segments

This example fetches the DDL for all "complete" tables in the current schema, filtering out nested tables and overflow segments. The example uses SET_TRANSFORM_PARAM (with the handle value = DBMS_METADATA.SESSION_TRANSFORM meaning "for the current session") to specify that storage clauses are not to be returned in the SQL DDL. Afterwards, the example resets the session-level parameters to their defaults.

To generate complete, uninterrupted output, set the PAGESIZE to 0 and set LONG to some large number, as shown, before executing your query.

```
SET LONG 2000000
SET PAGESIZE 0
EXECUTE
DBMS_METADATA.SET_TRANSFORM_PARAM(DBMS_METADATA.SESSION_TRANSFORM, 'STORAGE', false);
SELECT DBMS_METADATA.GET_DDL('TABLE', u.table_name)
      FROM USER_ALL_TABLES u
      WHERE u.nested='NO'
      AND (u.iot_type is null or u.iot_type='IOT');
EXECUTE DBMS_METADATA.SET_TRANSFORM_PARAM(DBMS_METADATA.SESSION_TRANSFORM, 'DEFAULT');
```

Example: Fetch the DDL For All Object Grants On HR.EMPLOYEES

```
SELECT DBMS_METADATA.GET_DEPENDENT_DDL('OBJECT_GRANT',
      'EMPLOYEES', 'HR') FROM DUAL;
```

Example: Fetch the DDL For All System Grants Granted To SCOTT

```
SELECT DBMS_METADATA.GET_GRANTED_DDL('SYSTEM_GRANT', 'SCOTT')
      FROM DUAL;
```

112.6.6 GET_QUERY Function

This function returns the text of the queries that are used by `FETCH_XXX`. This function assists in debugging.

See Also:

For more information about related subprograms:

- [Subprograms for Retrieving Multiple Objects From the Database](#)

Syntax

```
DBMS_METADATA.GET_QUERY (  
    handle IN NUMBER)  
RETURN VARCHAR2;
```

Parameters

Table 112-10 GET_QUERY Function Parameters

| Parameter | Description |
|-----------|---|
| handle | The handle returned from <code>OPEN</code> . It cannot be the handle for a heterogeneous object type. |

Return Values

The text of the queries that will be used by `FETCH_XXX`.

Exceptions

- `INVALID_ARGVAL`. A `NULL` or invalid value was supplied for the `handle` parameter.

112.6.7 OPEN Function

The `DBMS_METADATA.OPEN` function specifies the type of object to be retrieved, the version of its metadata, and the object model.

The return value is an opaque context handle for the set of objects to be used in subsequent calls.

See Also:

For more information about related subprograms:

- [Subprograms for Retrieving Multiple Objects From the Database](#)

Syntax

```
DBMS_METADATA.OPEN (
  object_type IN VARCHAR2,
  version     IN VARCHAR2 DEFAULT 'COMPATIBLE',
  model      IN VARCHAR2 DEFAULT 'ORACLE',
  network_link IN VARCHAR2 DEFAULT NULL)
RETURN NUMBER;
```

Parameters

Table 112-11 Open Function Parameters

| Parameter | Description |
|--------------|---|
| object_type | <p>The type of object to be retrieved. The table <code>DBMS_METADATA: Object Types</code> lists the valid type names and their meanings. These object types are supported for the <code>ORACLE</code> model of metadata (see <code>model</code> in this table).</p> <p>The Attributes column in the <code>DBMS_METADATA: Object Types</code> table specifies some object type attributes:</p> <ul style="list-style-type: none"> • Schema objects, such as tables, belong to schemas. • Named objects have unique names (if they are schema objects, the name is unique to the schema). • Dependent objects, such as indexes, are defined with reference to a base schema object. • Granted objects are granted or assigned to a user or role and therefore have a named grantee. • Heterogeneous object types denote a collection of related objects of different types. See the table "Object Types Returned for the Heterogeneous Object Type" for a listing of object types returned for the heterogeneous object type. <p>These attributes are relevant when choosing object selection criteria. See "SET_FILTER Procedure" for more information.</p> |
| version | <p>The version of metadata to be extracted. Database objects or attributes that are incompatible with the version will not be extracted. Legal values for this parameter are as follows:</p> <p><code>COMPATIBLE</code> (default)—the version of the metadata corresponds to the database compatibility level.</p> <p><code>LATEST</code>—the version of the metadata corresponds to the database version.</p> <p>A specific database version. The value cannot be lower than 9.2.0.</p> |
| model | <p>Specifies which view to use, because the API can support multiple views on the metadata. Only the <code>ORACLE</code> model is supported.</p> |
| network_link | <p>The name of a database link to the database whose metadata is to be retrieved. If <code>NULL</code> (the default), then metadata is retrieved from the database on which the caller is running</p> |

The table "`DBMS_METADATA: Object Types`" provides the name, meaning, attributes, and notes for the `DBMS_METADATA` package object types. In the attributes column, `S` represents a schema object, `N` represents a named object, `D` represents a dependent object, `G` represents a granted object, and `H` represents a heterogeneous object.

Table 112-12 DBMS_METADATA: Object Types

| Type Name | Meaning | Attributes | Notes |
|-----------------------|--------------------------------------|------------|---|
| AQ_QUEUE | queues | SND | Dependent on table |
| AQ_QUEUE_TABLE | additional metadata for queue tables | ND | Dependent on table |
| AQ_TRANSFORM | transforms | SN | None |
| ASSOCIATION | associate statistics | D | None |
| AUDIT | audits of SQL statements | DG | Modeled as dependent, granted object. The base object name is the statement audit option name (for example, ALTER SYSTEM). There is no base object schema. The grantee is the user or proxy whose statements are audited. |
| AUDIT_OBJ | audits of schema objects | D | None |
| CLUSTER | clusters | SN | None |
| COMMENT | comments | D | None |
| CONSTRAINT | constraints | SND | Does not include: <ul style="list-style-type: none"> • primary key constraint for IOT • column NOT NULL constraints • certain REF SCOPE and WITH ROWID constraints for tables with REF columns |
| CONTEXT | application contexts | N | None |
| DATABASE_EXPORT | all metadata objects in a database | H | Corresponds to a full database export |
| DB_LINK | database links | SN | Modeled as schema objects because they have owners. For public links, the owner is PUBLIC. For private links, the creator is the owner. |
| DEFAULT_ROLE | default roles | G | Granted to a user by ALTER USER |
| DIMENSION | dimensions | SN | None |
| DIRECTORY | directories | N | None |
| FGA_POLICY | fine-grained audit policies | D | Not modeled as named object because policy names are not unique. |
| FUNCTION | stored functions | SN | None |
| INDEX_STATISTICS | precomputed statistics on indexes | D | The base object is the index's table. |
| INDEX | indexes | SND | None |
| INDEXTYPE | indextypes | SN | None |
| JAVA_SOURCE | Java sources | SN | None |
| JOB | jobs | S | None |
| LIBRARY | external procedure libraries | SN | None |
| MATERIALIZED_VIEW | materialized views | SN | None |
| MATERIALIZED_VIEW_LOG | materialized view logs | D | None |

Table 112-12 (Cont.) DBMS_METADATA: Object Types

| Type Name | Meaning | Attributes | Notes |
|-----------------------------|--|------------|--|
| OBJECT_GRANT | object grants | DG | None |
| ON_USER_GRANT | Grants | G | Modeled as user grants. Grants the privileges of one user to other user in the form GRANT ... ON USER The grantee is the user. Example: GRANT INHERIT PRIVILEGES ON USER "USER1" TO "USER2". |
| OPERATOR | operators | SN | None |
| PACKAGE | stored packages | SN | By default, both package specification and package body are retrieved. See " SET_FILTER Procedure ". |
| PACKAGE_SPEC | package specifications | SN | None |
| PACKAGE_BODY | package bodies | SN | None |
| PROCEDURE | stored procedures | SN | None |
| PROFILE | profiles | N | None |
| PROXY | proxy authentications | G | Granted to a user by ALTER USER |
| REF_CONSTRAINT | referential constraint | SND | None |
| REFRESH_GROUP | refresh groups | SN | None |
| RESOURCE_COST | resource cost info | H | None |
| RLS_CONTEXT | driving contexts for enforcement of fine-grained access-control policies | D | Corresponds to the DBMS_RLS.ADD_POLICY_CONTENT procedure |
| RLS_GROUP | fine-grained access-control policy groups | D | Corresponds to the DBMS_RLS.CREATE_GROUP procedure |
| RLS_POLICY | fine-grained access-control policies | D | Corresponds to DBMS_RLS.ADD_GROUPED_POLICY. Not modeled as named objects because policy names are not unique. |
| RMGR_CONSUMER_GROUP | resource consumer groups | SN | Data Pump does not use these object types. Instead, it exports resource manager objects as procedural objects. |
| RMGR_INITIAL_CONSUMER_GROUP | assign initial consumer groups to users | G | None |
| RMGR_PLAN | resource plans | SN | None |
| RMGR_PLAN_DIRECTIVE | resource plan directives | D | Dependent on resource plan |
| ROLE | roles | N | None |
| ROLE_GRANT | role grants | G | None |
| ROLLBACK_SEGMENT | rollback segments | N | None |
| SCHEMA_EXPORT | all metadata objects in a schema | H | Corresponds to user-mode export. |
| SEQUENCE | sequences | SN | None |

Table 112-12 (Cont.) DBMS_METADATA: Object Types

| Type Name | Meaning | Attributes | Notes |
|----------------------|--|------------|--|
| SYNONYM | synonyms | See notes | Private synonyms are schema objects. Public synonyms are not, but for the purposes of this API, their schema name is PUBLIC. The name of a synonym is considered to be the synonym itself. For example, in <code>CREATE PUBLIC SYNONYM FOO FOR BAR</code> , the resultant object is considered to have name FOO and schema PUBLIC. |
| SYSTEM_GRANT | system privilege grants | G | None |
| TABLE | tables | SN | None |
| TABLE_DATA | metadata describing row data for a table, nested table, or partition | SND | For partitions, the object name is the partition name. For nested tables, the object name is the storage table name. The base object is the top-level table to which the table data belongs. For nested tables and partitioning, this is the top-level table (<i>not</i> the parent table or partition). For nonpartitioned tables and non-nested tables this is the table itself. |
| TABLE_EXPORT | metadata for a table and its associated objects | H | Corresponds to table-mode export |
| TABLE_STATISTICS | precomputed statistics on tables | D | None |
| TABLESPACE | tablespaces | N | None |
| TABLESPACE_QUOTA | tablespace quotas | G | Granted with ALTER USER |
| TRANSPORTABLE_EXPORT | metadata for objects in a transportable tablespace set | H | Corresponds to transportable tablespace export |
| TRIGGER | triggers | SND | None |
| TRUSTED_DB_LINK | trusted links | N | None |
| TYPE | user-defined types | SN | By default, both type and type body are retrieved. See "SET_FILTER Procedure". |
| TYPE_SPEC | type specifications | SN | None |
| TYPE_BODY | type bodies | SN | None |
| USER | users | N | None |
| VIEW | views | SN | None |
| XMLSCHEMA | XML schema | SN | The object's name is its URL (which may be longer than 30 characters). Its schema is the user who registered it. |
| XS_USER | Real Application Security (RAS) user | N | Corresponds to RAS users |
| XS_ROLE | Real Application Security (RAS) role | N | Corresponds to RAS roles |
| XS_ROLESET | Real Application Security (RAS) rolesets | N | Corresponds to RAS rolesets |

Table 112-12 (Cont.) DBMS_METADATA: Object Types

| Type Name | Meaning | Attributes | Notes |
|-------------------|--|------------|---|
| XS_ROLE_GRANT | Real Application Security (RAS) role grants | N | Corresponds to RAS role grants |
| XS_SECURITY_CLASS | Real Application Security (RAS) security class | SN | Corresponds to RAS security classes |
| XS_DATA_SECURITY | Real Application Security (RAS) data security policy | SN | Corresponds to RAS data security policies |
| XS_ACL | Real Application Security (RAS) ACL | SN | Corresponds to RAS access control lists (ACLs) and associated access control entries (ACEs) |
| XS_ACL_PARAM | Real Application Security (RAS) ACL parameter | N | Corresponds to RAS access control lists (ACL) parameters |
| XS_NAMESPACE | Real Application Security (RAS) namespace | N | Corresponds to RAS namespaces. |

The following table lists the types of objects returned for the major heterogeneous object types. For SCHEMA_EXPORT, certain object types are only returned if the INCLUDE_USER filter is specified at TRUE. In the table, such object types are marked INCLUDE_USER.

Table 112-13 Object Types Returned for the Heterogeneous Object Type

| Object Type | DATABASE_EXPORT | SCHEMA_EXPORT | TABLE_EXPORT | TRANSPORTABLE_EXPORT |
|------------------|-----------------|---------------|--------------|----------------------|
| ASSOCIATION | Yes | No | No | No |
| AUDIT | Yes | No | No | No |
| AUDIT_OBJ | Yes | Yes | Yes | Yes |
| CLUSTER | Yes | Yes | No | Yes |
| COMMENT | Yes | Yes | Yes | Yes |
| CONSTRAINT | Yes | Yes | Yes | Yes |
| CONTEXT | Yes | No | No | No |

| TRIGGER | Yes | Yes | Yes | Yes |
| TRUSTED_DB_LINK | Yes | No | No | No |
| TYPE | Yes | Yes | No | Yes, if the types are used by tables in the transportable set |

Table 112-13 (Cont.) Object Types Returned for the Heterogeneous Object Type

| Object Type | DATABASE_EXPORT | SCHEMA_EXPORT | TABLE_EXPORT | TRANSPORTABLE_EXPORT |
|-------------|-----------------|---------------|--------------|---|
| TYPE_SPEC | Yes | Yes | No | Yes, if the types are used by tables in the transportable set |
| TYPE_BODY | Yes | Yes | No | Yes, if the types are used by tables in the transportable set |
| USER | Yes | INCLUDE_USER | No | No |
| VIEW | Yes | Yes | No | No |
| XMLSCHEMA | Yes | Yes | No | No |

Return Values

An opaque handle to the class of objects. This handle is used as input to SET_FILTER, SET_COUNT, ADD_TRANSFORM, GET_QUERY, SET_PARSE_ITEM, FETCH_xxx, and CLOSE.

Exceptions

- INVALID_ARGVAL. A NULL or invalid value was supplied for an input parameter. The error message text identifies the parameter.
- INVALID_OBJECT_PARAM. The version or model parameter was not valid for the object_type.

112.6.8 OPENW Function

This function specifies the type of object to be submitted and the object model. The return value is an opaque context handle.

See Also:

For more information about related subprograms:

- [Subprograms for Submitting XML to the Database](#)

Syntax

```
DBMS_METADATA.OPENW
  (object_type IN VARCHAR2,
   version     IN VARCHAR2 DEFAULT 'COMPATIBLE',
   model      IN VARCHAR2 DEFAULT 'ORACLE')
RETURN NUMBER;
```

Parameters

Table 112-14 OPENW Function Parameters

| Parameter | Description |
|-------------|---|
| object_type | The type of object to be submitted. Valid types names and their meanings are listed in Table 112-12 . The type cannot be a heterogeneous object type. |
| version | The version of DDL to be generated by the <code>CONVERT</code> function. DDL clauses that are incompatible with the version will not be generated. The legal values for this parameter are as follows: <ul style="list-style-type: none"> • <code>COMPATIBLE</code> - This is the default. The version of the DDL corresponds to the database compatibility level. Database compatibility must be set to 9.2.0 or higher. • <code>LATEST</code> - The version of the DDL corresponds to the database version. • A specific database version. The value cannot be lower than 9.2.0. |
| model | Specifies which view to use. Only the Oracle proprietary (ORACLE) view is supported by <code>DBMS_METADATA</code> . |

Return Values

An opaque handle to write context. This handle is used as input to the `ADD_TRANSFORM`, `CONVERT`, `PUT`, and `CLOSE` procedures.

Exceptions

- `INVALID_ARGVAL`. A `NULL` or invalid value was supplied for an input parameter. The error message text identifies the parameter.
- `INVALID_OBJECT_PARAM`. The `model` parameter was not valid for the `object_type`.

112.6.9 PUT Function

This function submits an XML document containing object metadata to the database to create the object.

See Also:

For more information about related subprograms:

- [Subprograms for Submitting XML to the Database](#)

Syntax

```
DBMS_METADATA.PUT (
    handle      IN          NUMBER,
    document   IN          sys.XMLType,
    flags      IN          NUMBER,
    results    IN OUT NOCOPY sys.ku$_SubmitResults)
RETURN BOOLEAN;
```

```
DBMS_METADATA.PUT (
    handle      IN          NUMBER,
    document    IN          CLOB,
    flags       IN          NUMBER,
    results     IN OUT NOCOPY sys.ku$_SubmitResults)
RETURN BOOLEAN;
```

Parameters

Table 112-15 PUT Function Parameters

| Parameter | Description |
|-----------|---|
| handle | The handle returned from OPENW. |
| document | The XML document containing object metadata for the type of the OPENW handle. |
| flags | Reserved for future use |
| results | Detailed results of the operation. |

Return Values

TRUE if all SQL operations succeeded; FALSE if there were any errors.

Usage Notes

The PUT function converts the XML document to DDL just as CONVERT does (applying the specified transforms in turn) and then submits each resultant DDL statement to the database. As with CONVERT, the DDL transform must be specified. The DDL statements and associated parse items are returned in the sys.ku\$_SubmitResults nested table. With each DDL statement is a nested table of error lines containing any errors or exceptions raised by the statement.

The encoding of the XML document is embedded in its CLOB or XMLType representation. The version of the metadata is embedded in the XML. The generated DDL is valid for the database version specified in OPENW.

Exceptions

- INVALID_ARGVAL. A NULL or invalid value was supplied for an input parameter. The error message text identifies the parameter.
- INCONSISTENT_OPERATION. The DDL transform was not specified.
- INCOMPATIBLE_DOCUMENT. The version of the XML document is not compatible with this version of the software.

112.6.10 SET_COUNT Procedure

This procedure specifies the maximum number of objects to be retrieved in a single FETCH_XXX call.

By default, each call to FETCH_XXX returns one object. You can use the SET_COUNT procedure to override this default. If FETCH_XXX is called from a client, specifying a count value greater than 1 can result in fewer server round trips and, therefore, improved performance.

For heterogeneous object types, a single `FETCH_XXX` operation only returns objects of a single object type.

See Also:

For more information about related subprograms:

- [Subprograms for Retrieving Multiple Objects From the Database](#)

Syntax

```
DBMS_METADATA.SET_COUNT (
    handle          IN NUMBER,
    value           IN NUMBER,
    object_type_path IN VARCHAR2 DEFAULT NULL);
```

Parameters

Table 112-16 SET_COUNT Procedure Parameters

| Parameter | Description |
|------------------|---|
| handle | The handle returned from <code>OPEN</code> . |
| value | The maximum number of objects to retrieve. |
| object_type_path | A path name designating the object types to which the count value applies. By default, the count value applies to the object type of the <code>OPEN</code> handle. When the <code>OPEN</code> handle designates a heterogeneous object type, behavior can be either of the following: <ul style="list-style-type: none"> • If <code>object_type_path</code> is omitted, then the count applies to all object types within the heterogeneous collection. • If <code>object_type_path</code> is specified, then the count only applies to the specific node (or set of nodes) within the tree of object types forming the heterogeneous collection. |

Exceptions

- `INVALID_ARGVAL`. A `NULL` or invalid value was supplied for an input parameter. The error message text identifies the parameter.
- `INVALID_OPERATION`. `SET_COUNT` was called after the first call to `FETCH_XXX` for the `OPEN` context. After the first call to `FETCH_XXX` is made, no further calls to `SET_COUNT` for the current `OPEN` context are permitted.
- `INCONSISTENT_ARGS`. `object_type` parameter is not consistent with `handle`.

112.6.11 SET_FILTER Procedure

This procedure specifies restrictions on the objects to be retrieved, for example, the object name or schema.

See Also:

For more information about related subprograms:

- [Subprograms for Retrieving Multiple Objects From the Database](#)

Syntax

```
DBMS_METADATA.SET_FILTER (  
    handle          IN NUMBER,  
    name            IN VARCHAR2,  
    value           IN VARCHAR2,  
    object_type_path IN VARCHAR2 DEFAULT NULL);
```

```
DBMS_METADATA.SET_FILTER (  
    handle          IN NUMBER,  
    name            IN VARCHAR2,  
    value           IN BOOLEAN DEFAULT TRUE,  
    object_type_path IN VARCHAR2 DEFAULT NULL);
```

```
DBMS_METADATA.SET_FILTER (  
    handle          IN NUMBER,  
    name            IN VARCHAR2,  
    value           IN NUMBER,  
    object_type_path IN VARCHAR2 DEFAULT NULL);
```

Parameters

Table 112-17 SET_FILTER Procedure Parameters

| Parameter | Description |
|-----------|--------------------------------|
| handle | The handle returned from OPEN. |

Table 112-17 (Cont.) SET_FILTER Procedure Parameters

| Parameter | Description |
|------------------|--|
| name | <p>The name of the filter. For each filter, Table 112-18 lists the <code>object_type</code> it applies to, its name, its datatype (text or Boolean), and its meaning or effect (including its default value, if any).</p> <p>The Datatype column of Table 112-18 also indicates whether a text filter is an expression filter. An expression filter is the right-hand side of a SQL comparison (that is, a SQL comparison operator (=, !=, and so on.) and the value compared against. The value must contain parentheses and quotation marks where appropriate. Note that in PL/SQL and SQL*Plus, two single quotes (<i>not</i> a double quote) are needed to represent an apostrophe. For example, an example of a <code>NAME_EXPR</code> filter in PL/SQL is as follows:</p> <pre>'IN ('DEPT','EMP')'</pre> <p>The filter value is combined with a particular object attribute to produce a <code>WHERE</code> condition in the query that fetches the objects. In the preceding example, the filter is combined with the attribute corresponding to an object name; objects named 'DEPT' and 'EMP' are selected.</p> |
| value | The value of the filter. Text, Boolean, and Numeric filters are supported. |
| object_type_path | <p>A path name designating the object types to which the filter applies. By default, the filter applies to the object type of the <code>OPEN</code> handle. When the <code>OPEN</code> handle designates a heterogeneous object type, you can use this parameter to specify a filter for a specific node or set of nodes within the tree of object types that form the heterogeneous collection. See Table 112-19 for a listing of some of the values for this parameter.</p> |

[Table 112-18](#) describes the object type, name, datatype, and meaning of the filters available with the `SET_FILTER` procedure.

Table 112-18 SET_FILTER: Filters

| Object Type | Name | Datatype | Meaning |
|---------------|-------------------|-----------------|--|
| Named objects | NAME | Text | Objects with this exact name are selected. |
| Named objects | NAME_EXPR | Text expression | <p>The filter value is combined with the object attribute corresponding to the object name to produce a <code>WHERE</code> condition in the query that fetches the objects.</p> <p>By default, all named objects of <code>object_type</code> are selected.</p> |
| Named objects | EXCLUDE_NAME_EXPR | Text expression | <p>The filter value is combined with the attribute corresponding to the object name to specify objects that are to be excluded from the set of objects fetched.</p> <p>By default, all named objects of the object type are selected.</p> |
| TABLE_EXPORT | EXCLUDE_TABLES | Boolean | <p>If <code>TRUE</code>, all paths associated with tables are excluded from the set of objects fetched. If <code>FALSE</code> (the default), all paths associated with tables are fetched.</p> |

Table 112-18 (Cont.) SET_FILTER: Filters

| Object Type | Name | Datatype | Meaning |
|---|--------------------|-----------------|--|
| Schema objects | SCHEMA | Text | Objects in this schema are selected. If the object type is <code>SYNONYM</code> , then specify <code>PUBLIC</code> to select public synonyms. |
| Schema objects | SCHEMA_EXPR | Text expression | The filter value is combined with the attribute corresponding to the object's schema. The default is determined as follows: - if <code>BASE_OBJECT_SCHEMA</code> is specified, then objects in that schema are selected; - otherwise, objects in the current schema are selected. |
| PACKAGE, TYPE | SPECIFICATION | Boolean | If <code>TRUE</code> , retrieve the package or type specification. Defaults to <code>TRUE</code> . |
| PACKAGE, TYPE | BODY | Boolean | If <code>TRUE</code> , retrieve the package or type body. Defaults to <code>TRUE</code> . |
| TABLE, CLUSTER, INDEX, TABLE_DATA, TABLE_EXPORT, TRANSPORTABLE_EXPORT | TABLESPACE | Text | Objects in this tablespace (or having a partition in this tablespace) are selected. |
| TABLE, CLUSTER, INDEX, TABLE_DATA, TABLE_EXPORT, TRANSPORTABLE_EXPORT | TABLESPACE_EXPR | Text expression | The filter value is combined with the attribute corresponding to the object's tablespace (or in the case of a partitioned table or index, the partition's tablespaces). By default, objects in all tablespaces are selected. |
| TABLE, objects dependent on tables | PRIMARY | Boolean | If <code>TRUE</code> , retrieve primary tables (that is, tables for which the secondary object bit in <code>obj\$</code> is clear. Defaults to <code>TRUE</code> . |
| TABLE, objects dependent on tables | SECONDARY | Boolean | If <code>TRUE</code> , retrieve secondary tables (that is, tables for which the secondary object bit in <code>obj\$</code> is set). Defaults to <code>TRUE</code> . |
| Dependent Objects | BASE_OBJECT_NAME | Text | Objects are selected that are defined or granted on objects with this name. Specify <code>SCHEMA</code> for triggers on schemas. Specify <code>DATABASE</code> for database triggers. Column-level comments cannot be selected by column name; the base object name must be the name of the table, view, or materialized view containing the column. |
| Dependent Objects | BASE_OBJECT_SCHEMA | Text | Objects are selected that are defined or granted on objects in this schema. If <code>BASE_OBJECT_NAME</code> is specified with a value other than <code>SCHEMA</code> or <code>DATABASE</code> , this defaults to the current schema. |

Table 112-18 (Cont.) SET_FILTER: Filters

| Object Type | Name | Datatype | Meaning |
|---------------------------------------|-------------------------------|-----------------|---|
| Dependent Objects | BASE_OBJECT_NAME_EXPR | Text expression | The filter value is combined with the attribute corresponding to the name of the base object. Not valid for schema and database triggers. |
| Dependent Objects | EXCLUDE_BASE_OBJECT_NAME_EXPR | Text expression | The filter value is combined with the attribute corresponding to the name of the base object to specify objects that are to be excluded from the set of objects fetched. Not valid for schema and database triggers. |
| Dependent Objects | BASE_OBJECT_SCHEMA_EXPR | Text expression | The filter value is combined with the attribute corresponding to the schema of the base object. |
| Dependent Objects | BASE_OBJECT_TYPE | Text | The object type of the base object. |
| Dependent Objects | BASE_OBJECT_TYPE_EXPR | Text expression | The filter value is combined with the attribute corresponding to the object type of the base object. By default no filtering is done on object type. |
| Dependent Objects | BASE_OBJECT_TABLESPACE | Text | The tablespace of the base object. |
| Dependent Objects | BASE_OBJECT_TABLESPACE_EXPR | Text expression | The filter value is combined with the attribute corresponding to the tablespaces of the base object. By default, no filtering is done on the tablespace. |
| INDEX, TRIGGER | SYSTEM_GENERATED | Boolean | If TRUE, select indexes or triggers even if they are system-generated. If FALSE, omit system-generated indexes or triggers. Defaults to TRUE. |
| Granted Objects | GRANTEE | Text | Objects are selected that are granted to this user or role. Specify PUBLIC for grants to PUBLIC. |
| Granted Objects | PRIVNAME | Text | The name of the privilege or role to be granted. For TABLESPACE_QUOTA, only UNLIMITED can be specified. |
| Granted Objects | GRANTEE_EXPR | Text expression | The filter value is combined with the attribute corresponding to the grantee name. |
| Granted Objects | EXCLUDE_GRANTEE_EXPR | Text expression | The filter value is combined with the attribute corresponding to the grantee name to specify objects that are to be excluded from the set of objects fetched. |
| OBJECT_GRANT | GRANTOR | Text | Object grants are selected that are granted by this user. |
| SYNONYM, JAVA_SOURCE, XMLSCHEMA | LONGNAME | Text | A name longer than 30 characters. Objects with this exact name are selected. If the object name is 30 characters or less, the NAME filter must be used. |

Table 112-18 (Cont.) SET_FILTER: Filters

| Object Type | Name | Datatype | Meaning |
|---------------------------------------|---------------|-----------------|--|
| SYNONYM, JAVA_SOURCE, XMLSCHEMA | LONGNAME_EXPR | Text | The filter value is combined with the attribute corresponding to the object's long name. By default, no filtering is done on the long name of an object. |
| All objects | CUSTOM_FILTER | Text | The text of a WHERE condition. The condition is appended to the query that fetches the objects. By default, no custom filter is used. The other filters are intended to meet the needs of the majority of users. Use CUSTOM_FILTER when no defined filters exist for your purpose. Of necessity such a filter depends on the detailed structure of the UDTs and views used in the query. Because filters may change from version to version, upward compatibility is not guaranteed. |
| All objects | EDITION | Text | The edition filter is accepted for any object type, but affects only objects that support editions. The filter is only accepted for local objects (that is, the network_link parameter is not specified in the OPEN call). The edition name must be a valid edition name. If an edition is not specified, the edition of the active session is used. |
| SCHEMA_EXPORT | SCHEMA | Text | The schema whose objects are selected. |
| SCHEMA_EXPORT | SCHEMA_EXPR | Text expression | The filter value is either: combined with the attribute corresponding to a schema name to produce a WHERE condition in the query that fetches schema objects, combined with the attribute corresponding to a base schema name to produce a WHERE condition in the query that fetches dependent objects. By default the current user's objects are selected. |
| SCHEMA_EXPORT | INCLUDE_USER | Boolean | If TRUE, retrieve objects containing privileged information about the user. For example, USER, PASSWORD_HISTORY, TABLESPACE_QUOTA. Defaults to FALSE. |
| TABLE_EXPORT | SCHEMA | Text | Objects (tables and their dependent objects) in this schema are selected. |

Table 112-18 (Cont.) SET_FILTER: Filters

| Object Type | Name | Datatype | Meaning |
|-----------------------|-------------|-----------------|---|
| TABLE_EXPORT | SCHEMA_EXPR | Text expression | The filter value is either: combined with the attribute corresponding to a schema name to produce a WHERE condition in the query that fetches the tables, combined with the attribute corresponding to a base schema name to produce a WHERE condition in the query that fetches the tables' dependent objects. By default the current user's objects are selected. |
| TABLE_EXPORT | NAME | Text | The table with this exact name is selected along with its dependent objects. |
| TABLE_EXPORT | NAME_EXPR | Text expression | The filter value is combined with the attribute corresponding to a table name in the queries that fetch tables and their dependent objects. By default all tables in the selected schemas are selected, along with their dependent objects. |
| Heterogeneous objects | BEGIN_WITH | Text | The fully qualified path name of the first object type in the heterogeneous collection to be retrieved. Objects normally fetched prior to this object type will not be retrieved. |
| Heterogeneous objects | BEGIN_AFTER | Text | The fully qualified path name of an object type after which the heterogeneous retrieval should begin. Objects of this type will not be retrieved, nor will objects normally fetched prior to this object type. |
| Heterogeneous objects | END_BEFORE | Text | The fully qualified path name of an object type where the heterogeneous retrieval should end. Objects of this type will not be retrieved, nor will objects normally fetched after this object type. |
| Heterogeneous objects | END_WITH | Text | The fully qualified path name of the last object type in the heterogeneous collection to be retrieved. Objects normally fetched after this object type will not be retrieved. |

Table 112-18 (Cont.) SET_FILTER: Filters

| Object Type | Name | Datatype | Meaning |
|-----------------------|---|-----------------|---|
| Heterogeneous objects | INCLUDE_PATH_EXPR R, EXCLUDE_PATH_EXPR R | Text expression | <p>For these two filters, the filter value is combined with the attribute corresponding to an object type path name to produce a WHERE condition in the query that fetches the object types belonging to the heterogeneous collection. Objects of types satisfying this condition are included (INCLUDE_PATH_EXPR) or excluded (EXCLUDE_PATH_EXPR) from the set of object types fetched. Path names in the filter value do not have to be fully qualified. See Table 112-19 for valid path names that can be used with these filters.</p> <p>BEGIN_WITH, BEGIN_AFTER, END_BEFORE, END_WITH, INCLUDE_PATH_EXPR, and EXCLUDE_PATH_EXPR all restrict the set of object types in the heterogeneous collection. By default, objects of all object types in the heterogeneous collection are retrieved.</p> |

Usage Notes

- Each call to SET_FILTER causes a WHERE condition to be added to the underlying query that fetches the set of objects. The WHERE conditions are concatenated with the AND keyword so that you can use multiple SET_FILTER calls to refine the set of objects to be returned. For example to specify that you want the object named EMP in schema SCOTT, do the following:

```
SET_FILTER(handle, 'SCHEMA', 'SCOTT');
SET_FILTER(handle, 'NAME', 'EMP');
```

- You can use the same text expression filter multiple times with different values. All the filter conditions will be applied to the query. For example, to get objects with names between Felix and Oscar, do the following:

```
SET_FILTER(handle, 'NAME_EXPR', '>=' 'FELIX' ');
SET_FILTER(handle, 'NAME_EXPR', '<=' 'OSCAR' ');
```

- With SET_FILTER, you can specify the schema of objects to be retrieved, but security considerations may override this specification. If the caller is SYS or has the SELECT_CATALOG_ROLE role, then any object can be retrieved; otherwise, only the following can be retrieved:
 - Schema objects owned by the current user
 - Public synonyms
 - System privileges granted to the current user or to PUBLIC
 - Grants on objects for which the current user is owner, grantor, or grantee (either explicitly or as PUBLIC).
 - SCHEMA_EXPORT where the name is the current user
 - TABLE_EXPORT where SCHEMA is the current user

If you request objects that you are not privileged to retrieve, no exception is raised; the object is not retrieved, as if it did not exist.

In stored procedures, functions, and definers-rights packages, roles (such as `SELECT_CATALOG_ROLE`) are disabled. Therefore, such a PL/SQL program can only fetch metadata for objects in its own schema. If you want to write a PL/SQL program that fetches metadata for objects in a different schema (based on the invoker's possession of `SELECT_CATALOG_ROLE`), you must make the program invokers-rights.

- For heterogeneous object types, the `BEGIN_WITH` and `BEGIN_AFTER` filters allow restart on an object type boundary. Appropriate filter values are returned by the `FETCH_XML_CLOB` procedure.

Filters on heterogeneous objects provide default values for filters on object types within the collection. You can override this default for a particular object type by specifying the appropriate filter for the specific object type path. For example, for `SCHEMA_EXPORT` the `NAME` filter specifies the schema to be fetched including all the tables in the schema, but you can further restrict this set of tables by supplying a `NAME_EXPR` filter explicitly for the `TABLE` object type path. [Table 112-19](#) lists valid object type path names for the major heterogeneous object types along with an explanation of the scope of each path name. (The same information is available in the following catalog views: `DATABASE_EXPORT_OBJECTS`, `SCHEMA_EXPORT_OBJECTS`, and `TABLE_EXPORT_OBJECTS`.) See [Table 112-18](#) for filters defined for each path name. These path names are valid in the `INCLUDE_PATH_EXPR` and `EXCLUDE_PATH_EXPR` filters. Path names marked with an asterisk (*) are *only* valid in those filters; they cannot be used as values of the `SET_FILTER` `object_type_path` parameter.

Table 112-19 Object Type Path Names for Heterogeneous Object Types

| Heterogeneous Type | Path Name (*=valid only in xxx_PATH_EXPR) | Scope |
|--------------------|---|--|
| TABLE_EXPORT | AUDIT_OBJ | Object audits on the selected tables |
| TABLE_EXPORT | COMMENT | Table and column comments for the selected tables |
| TABLE_EXPORT | CONSTRAINT | Constraints (including referential constraints) on the selected tables |
| TABLE_EXPORT | *GRANT | Object grants on the selected tables |
| TABLE_EXPORT | INDEX | Indexes (including domain indexes) on the selected tables |
| TABLE_EXPORT | OBJECT_GRANT | Object grants on the selected tables |
| TABLE_EXPORT | REF_CONSTRAINT | Referential (foreign key) constraints on the selected tables |
| TABLE_EXPORT | STATISTICS | Statistics on the selected tables |
| TABLE_EXPORT | TABLE_DATA | Row data for the selected tables |
| TABLE_EXPORT | TRIGGER | Triggers on the selected tables |
| SCHEMA_EXPORT | ASSOCIATION | Statistics type associations for objects in the selected schemas |
| SCHEMA_EXPORT | AUDIT_OBJ | Audits on all objects in the selected schemas |
| SCHEMA_EXPORT | CLUSTER | Clusters in the selected schemas and their indexes |
| SCHEMA_EXPORT | COMMENT | Comments on all objects in the selected schemas |

Table 112-19 (Cont.) Object Type Path Names for Heterogeneous Object Types

| Heterogeneous Type | Path Name (*=valid only in xxx_PATH_EXPR) | Scope |
|---------------------------|--|---|
| SCHEMA_EXPORT | CONSTRAINT | Constraints (including referential constraints) on all objects in the selected schemas |
| SCHEMA_EXPORT | DB_LINK | Private database links in the selected schemas |
| SCHEMA_EXPORT | DEFAULT_ROLE | Default roles granted to users associated with the selected schemas |
| SCHEMA_EXPORT | DIMENSION | Dimensions in the selected schemas |
| SCHEMA_EXPORT | FUNCTION | Functions in the selected schemas and their dependent grants and audits |
| SCHEMA_EXPORT | *GRANT | Grants on objects in the selected schemas |
| SCHEMA_EXPORT | INDEX | Indexes (including domain indexes) on tables and clusters in the selected schemas |
| SCHEMA_EXPORT | INDEXTYPE | Indextypes in the selected schemas and their dependent grants and audits |
| SCHEMA_EXPORT | JAVA_SOURCE | Java sources in the selected schemas and their dependent grants and audits |
| SCHEMA_EXPORT | JOB | Jobs in the selected schemas |
| SCHEMA_EXPORT | LIBRARY | External procedure libraries in the selected schemas |
| SCHEMA_EXPORT | MATERIALIZED_VIEW | Materialized views in the selected schemas |
| SCHEMA_EXPORT | MATERIALIZED_VIEW_LOG | Materialized view logs on tables in the selected schemas |
| SCHEMA_EXPORT | OBJECT_GRANT | Grants on objects in the selected schemas |
| SCHEMA_EXPORT | OPERATOR | Operators in the selected schemas and their dependent grants and audits |
| SCHEMA_EXPORT | PACKAGE | Packages (both specification and body) in the selected schemas, and their dependent grants and audits |
| SCHEMA_EXPORT | PACKAGE_BODY | Package bodies in the selected schemas |
| SCHEMA_EXPORT | PACKAGE_SPEC | Package specifications in the selected schemas |
| SCHEMA_EXPORT | PASSWORD_HISTORY | The password history for users associated with the selected schemas |
| SCHEMA_EXPORT | PROCEDURE | Procedures in the selected schemas and their dependent grants and audits |
| SCHEMA_EXPORT | REF_CONSTRAINT | Referential (foreign key) constraints on tables in the selected schemas |
| SCHEMA_EXPORT | REFRESH_GROUP | Refresh groups in the selected schemas |
| SCHEMA_EXPORT | SEQUENCE | Sequences in the selected schemas and their dependent grants and audits |
| SCHEMA_EXPORT | STATISTICS | Statistics on tables and indexes in the selected schemas |
| SCHEMA_EXPORT | SYNONYM | Private synonyms in the selected schemas |

Table 112-19 (Cont.) Object Type Path Names for Heterogeneous Object Types

| Heterogeneous Type | Path Name (*=valid only in xxx_PATH_EXPR) | Scope |
|--------------------|---|--|
| SCHEMA_EXPORT | TABLE | Tables in the selected schemas and their dependent objects (indexes, constraints, triggers, grants, audits, comments, table data, and so on) |
| SCHEMA_EXPORT | TABLE_DATA | Row data for tables in the selected schemas |
| SCHEMA_EXPORT | TABLESPACE_QUOTA | Tablespace quota granted to users associated with the selected schemas |
| SCHEMA_EXPORT | TRIGGER | Triggers on tables in the selected schemas |
| SCHEMA_EXPORT | XS_SECURITY_CLASSES | Oracle Real Application Security (RAS) security classes |
| SCHEMA_EXPORT | XS_DATA_SECURITY | Oracle Real Application Security (RAS) data security policies |
| SCHEMA_EXPORT | XS_ACL | Oracle Real Application Security (RAS) access control lists (ACLs) |
| SCHEMA_EXPORT | TYPE | Types (both specification and body) in the selected schemas, and their dependent grants and audits |
| SCHEMA_EXPORT | TYPE_BODY | Type bodies in the selected schemas |
| SCHEMA_EXPORT | TYPE_SPEC | Type specifications in the selected schemas |
| SCHEMA_EXPORT | USER | User definitions for users associated with the selected schemas |
| SCHEMA_EXPORT | VIEW | Views in the selected schemas and their dependent objects (grants, constraints, comments, audits) |
| DATABASE_EXPORT | ASSOCIATION | Statistics type associations for objects in the database |
| DATABASE_EXPORT | AUDIT | Audits of SQL statements |
| DATABASE_EXPORT | AUDIT_OBJ | Audits on all objects in the database |
| DATABASE_EXPORT | CLUSTER | Clusters and their indexes |
| DATABASE_EXPORT | COMMENT | Comments on all objects |
| DATABASE_EXPORT | CONSTRAINT | Constraints (including referential constraints) |
| DATABASE_EXPORT | CONTEXT | Application contexts |
| DATABASE_EXPORT | DB_LINK | Private and public database links |
| DATABASE_EXPORT | DEFAULT_ROLE | Default roles granted to users in the database |
| DATABASE_EXPORT | DIMENSION | Dimensions in the database |
| DATABASE_EXPORT | DIRECTORY | Directory objects in the database |
| DATABASE_EXPORT | FGA_POLICY | Fine-grained audit policies |
| DATABASE_EXPORT | FUNCTION | Functions |
| DATABASE_EXPORT | * GRANT | Object and system grants |
| DATABASE_EXPORT | INDEX | Indexes (including domain indexes) on tables and clusters |
| DATABASE_EXPORT | INDEXTYPE | Indextypes and their dependent grants and audits |
| DATABASE_EXPORT | JAVA_SOURCE | Java sources and their dependent grants and audits |
| DATABASE_EXPORT | JOB | Jobs |

Table 112-19 (Cont.) Object Type Path Names for Heterogeneous Object Types

| Heterogeneous Type | Path Name (*=valid only in xxx_PATH_EXPR) | Scope |
|--------------------|---|--|
| DATABASE_EXPORT | LIBRARY | External procedure libraries |
| DATABASE_EXPORT | MATERIALIZED_VIEW | Materialized views |
| DATABASE_EXPORT | MATERIALIZED_VIEW_LOG | Materialized view logs |
| DATABASE_EXPORT | OBJECT_GRANT | All object grants in the database |
| DATABASE_EXPORT | OPERATOR | Operators and their dependent grants and audits |
| DATABASE_EXPORT | PACKAGE | Packages (both specification and body) and their dependent grants and audits |
| DATABASE_EXPORT | PACKAGE_BODY | Package bodies |
| DATABASE_EXPORT | PACKAGE_SPEC | Package specifications |
| DATABASE_EXPORT | PASSWORD_HISTORY | Password histories for database users |
| DATABASE_EXPORT | *PASSWORD_VERIFY_FUNCTION | The password complexity verification function |
| DATABASE_EXPORT | PROCEDURE | Procedures and their dependent grants and objects |
| DATABASE_EXPORT | PROFILE | Profiles |
| DATABASE_EXPORT | PROXY | Proxy authentications |
| DATABASE_EXPORT | REF_CONSTRAINT | Referential (foreign key) constraints on tables in the database |
| DATABASE_EXPORT | REFRESH_GROUP | Refresh groups |
| DATABASE_EXPORT | *RESOURCE_COST | Resource cost information |
| DATABASE_EXPORT | RLS_CONTEXT | Fine-grained access-control driving contexts |
| DATABASE_EXPORT | RLS_GROUP | Fine-grained access-control policy groups |
| DATABASE_EXPORT | RLS_POLICY | Fine-grained access-control policies |
| DATABASE_EXPORT | ROLE | Roles |
| DATABASE_EXPORT | ROLE_GRANT | Role grants to users in the database |
| DATABASE_EXPORT | ROLLBACK_SEGMENT | Rollback segments |
| DATABASE_EXPORT | *SCHEMA (named object) | Database schemas including for each schema all related and dependent objects: user definitions and their attributes (default roles, role grants, tablespace quotas, and so on), objects in the schema (tables, view, packages, types, and so on), and their dependent objects (grants, audits, indexes, constraints, and so on). The NAME and NAME_EXPR filters can be used with this object type path name to designate the database schemas to be fetched. |
| DATABASE_EXPORT | SEQUENCE | Sequences |
| DATABASE_EXPORT | STATISTICS | Statistics on tables and indexes |
| DATABASE_EXPORT | SYNONYM | Public and private synonyms |
| DATABASE_EXPORT | SYSTEM_GRANT | System privilege grants |

Table 112-19 (Cont.) Object Type Path Names for Heterogeneous Object Types

| Heterogeneous Type | Path Name (*=valid only in xxx_PATH_EXPR) | Scope |
|--------------------|---|--|
| DATABASE_EXPORT | TABLE | Tables and their dependent objects (indexes, constraints, triggers, grants, audits, comments, table data, and so on) |
| DATABASE_EXPORT | TABLE_DATA | Row data for all tables |
| DATABASE_EXPORT | TABLESPACE | Tablespace definitions |
| DATABASE_EXPORT | TABLESPACE_QUOTA | Tablespace quota granted to users in the database |
| DATABASE_EXPORT | TRIGGER | Triggers on the database, on schemas, and on schema objects |
| DATABASE_EXPORT | XS_USER | Oracle Real Application Security (RAS) users |
| DATABASE_EXPORT | XS_ROLE | Oracle Real Application Security (RAS) roles |
| DATABASE_EXPORT | XS_SECURITY_CLASSES | Oracle Real Application Security (RAS) security classes |
| DATABASE_EXPORT | XS_DATA_SECURITY | Oracle Real Application Security (RAS) data security policies |
| DATABASE_EXPORT | XS_ACL | Oracle Real Application Security (RAS) access control lists (ACLs) |
| DATABASE_EXPORT | XS_NAMESPACE | Oracle Real Application Security (RAS) namespaces |
| DATABASE_EXPORT | TRUSTED_DB_LINK | Trusted links |
| DATABASE_EXPORT | TYPE | Types (both specification and body) and their dependent grants and audits |
| DATABASE_EXPORT | TYPE_BODY | Type bodies |
| DATABASE_EXPORT | TYPE_SPEC | Type specifications |
| DATABASE_EXPORT | USER | User definitions |
| DATABASE_EXPORT | VIEW | Views |

Exceptions

- **INVALID_ARGVAL.** A NULL or invalid value was supplied for an input parameter. The error message text identifies the parameter.
- **INVALID_OPERATION.** SET_FILTER was called after the first call to FETCH_xxx for the OPEN context. After the first call to FETCH_xxx is made, no further calls to SET_FILTER are permitted.
- **INCONSISTENT_ARGS.** The arguments are inconsistent. Possible inconsistencies include the following:
 - The filter name is not valid for the object type associated with the OPEN context.
 - The filter name is not valid for the object_type_path.
 - The object_type_path is not part of the collection designated by handle .
 - The filter value is the wrong datatype.

112.6.12 SET_PARSE_ITEM Procedure

This procedure is used for both retrieval and submission. This procedure enables output parsing and specifies an object attribute to be parsed and returned.

See Also:

For more information about related subprograms:

- [Subprograms for Retrieving Multiple Objects From the Database](#)
- [Subprograms for Submitting XML to the Database](#)

Syntax

The following syntax applies when `SET_PARSE_ITEM` is used for object retrieval:

```
DBMS_METADATA.SET_PARSE_ITEM (
    handle      IN NUMBER,
    name        IN VARCHAR2,
    object_type IN VARCHAR2 DEFAULT NULL);
```

The following syntax applies when `SET_PARSE_ITEM` is used for XML submission:

```
DBMS_METADATA.SET_PARSE_ITEM (
    handle      IN NUMBER,
    name        IN VARCHAR2);
```

Parameters

Table 112-20 SET_PARSE_ITEM Procedure Parameters

| Parameter | Description |
|-------------|---|
| handle | The handle returned from <code>OPEN</code> (or <code>OPENW</code>). |
| name | The name of the object attribute to be parsed and returned. See Table 112-21 for the attribute object type, name, and meaning. |
| object_type | Designates the object type to which the parse item applies (this is an object type name, not a path name). By default, the parse item applies to the object type of the <code>OPEN</code> handle. When the <code>OPEN</code> handle designates a heterogeneous object type, behavior can be either of the following: <ul style="list-style-type: none"> • If <code>object_type</code> is omitted, then the parse item applies to all object types within the heterogeneous collection • If <code>object_type</code> is specified, then the parse item only applies to that specific object type within the collection <p>This parameter only applies when <code>SET_PARSE_ITEM</code> is used for object retrieval.</p> |

[Table 112-21](#) describes the object type, name, and meaning of the items available in the `SET_PARSE_ITEM` procedure.

Because new items are occasionally added, you can query the `DBMS_METADATA_PARSE_ITEMS` view to see a complete list of valid parse items or to find valid parse items for a specific object type.

Table 112-21 SET_PARSE_ITEM: Parse Items

| Object Type | Name | Meaning |
|--|--------------------|--|
| All objects | VERB | If <code>FETCH_XML_CLOB</code> is called, no value is returned. If <code>FETCH_DDL</code> is called, then for every row in the <code>sys.ku\$_ddl\$</code> nested table returned by <code>FETCH_DDL</code> the verb in the corresponding <code>ddlText</code> is returned. If the <code>ddlText</code> is a SQL DDL statement, then the SQL verb (for example, <code>CREATE</code> , <code>GRANT</code> , <code>AUDIT</code>) is returned. If the <code>ddlText</code> is a procedure call (for example, <code>DBMS_AQADM.CREATE_QUEUE_TABLE()</code>) then the package.procedure-name is returned. |
| All objects | OBJECT_TYPE | If <code>FETCH_XML_CLOB</code> is called, an object type name from Table 112-12 is returned. If <code>FETCH_DDL</code> is called and the <code>ddlText</code> is a SQL DDL statement whose verb is <code>CREATE</code> or <code>ALTER</code> , the object type as used in the DDL statement is returned (for example, <code>TABLE</code> , <code>PACKAGE_BODY</code> , and so on). Otherwise, an object type name from Table 112-12 is returned. |
| Schema objects | SCHEMA | The object schema is returned. If the object is not a schema object, no value is returned. |
| Named objects | NAME | The object name is returned. If the object is not a named object, no value is returned. |
| TABLE, TABLE_DATA, INDEX | TABLESPACE | The name of the object's tablespace or, if the object is a partitioned table, the default tablespace is returned. For a <code>TABLE_DATA</code> object, this is always the tablespace where the rows are stored. |
| TRIGGER | ENABLE | If the trigger is enabled, <code>ENABLE</code> is returned. If the trigger is disabled, <code>DISABLE</code> is returned. |
| OBJECT_GRANT, TABLESPACE_QUOTA | GRANTOR | The grantor is returned. |
| Dependent objects (including domain index secondary tables) | BASE_OBJECT_NAME | The name of the base object is returned. If the object is not a dependent object, no value is returned. |
| Dependent objects (including domain index secondary tables) | BASE_OBJECT_SCHEMA | The schema of the base object is returned. If the object is not a dependent object, no value is returned. |
| Dependent objects (including domain index secondary tables) | BASE_OBJECT_TYPE | The object type of the base object is returned. If the object is not a dependent object, no value is returned. |
| Granted objects | GRANTEE | The grantee is returned. If the object is not a granted object, no value is returned. |

Usage Notes

These notes apply when using `SET_PARSE_ITEM` to retrieve objects.

By default, the `FETCH_xxx` routines return an object's metadata as XML or creation DDL. By calling `SET_PARSE_ITEM` you can request that individual attributes of the object be returned as well.

You can call `SET_PARSE_ITEM` multiple times to ask for multiple items to be parsed and returned. Parsed items are returned in the `sys.ku$_parsed_items` nested table.

For `TABLE_DATA` objects, the following parse item return values are of interest:

| If Object Is | NAME, SCHEMA | BASE_OBJECT_NAME, BASE_OBJECT_SCHEMA |
|----------------------|----------------------------|--|
| nonpartitioned table | table name, schema | table name, schema |
| table partition | partition name, schema | table name, schema |
| nested table | storage table name, schema | name and schema of top-level table (<i>not</i> the parent nested table) |

Tables are not usually thought of as dependent objects. However, secondary tables for domain indexes are dependent on the domain indexes. Consequently, the `BASE_OBJECT_NAME`, `BASE_OBJECT_SCHEMA` and `BASE_OBJECT_TYPE` parse items for secondary `TABLE` objects return the name, schema, and type of the domain index.

See Also:

- ["FETCH_xxx Functions and Procedures"](#)
- *Oracle Database Utilities* for more information about using the metadata APIs.

By default, the `CONVERT` and `PUT` procedures simply transform an object's XML metadata to DDL. By calling `SET_PARSE_ITEM` you can request that individual attributes of the object be returned as well.

Exceptions

- `INVALID_ARGVAL`. A `NULL` or invalid value was supplied for an input parameter. The error message text identifies the parameter.
- `INVALID_OPERATION`. `SET_PARSE_ITEM` was called after the first call to `FETCH_xxx` for the `OPEN` context. After the first call to `FETCH_xxx` is made, no further calls to `SET_PARSE_ITEM` are permitted.
- `INCONSISTENT_ARGS`. The attribute `name` is not valid for the object type associated with the `OPEN` context.

112.6.13 SET_TRANSFORM_PARAM and SET_REMAP_PARAM Procedures

These procedures are used for both retrieval and submission. `SET_TRANSFORM_PARAM` and `SET_REMAP_PARAM` specify parameters to the XSLT stylesheet identified by `transform_handle`.

Use them to modify or customize the output of the transform.

Syntax

```
DBMS_METADATA.SET_TRANSFORM_PARAM (
  transform_handle  IN NUMBER,
  name              IN VARCHAR2,
  value            IN VARCHAR2,
  object_type      IN VARCHAR2 DEFAULT NULL);
```

```
DBMS_METADATA.SET_TRANSFORM_PARAM (
  transform_handle  IN NUMBER,
  name              IN VARCHAR2,
  value            IN BOOLEAN DEFAULT TRUE,
  object_type      IN VARCHAR2 DEFAULT NULL);
```

```
DBMS_METADATA.SET_TRANSFORM_PARAM (
  transform_handle  IN NUMBER,
  name              IN VARCHAR2,
  value            IN NUMBER,
  object_type      IN VARCHAR2 DEFAULT NULL);
```

```
DBMS_METADATA.SET_REMAP_PARAM (
  transform_handle  IN NUMBER,
  name              IN VARCHAR2,
  old_value        IN VARCHAR2,
  new_value        IN VARCHAR2,
  object_type      IN VARCHAR2 DEFAULT NULL);
```

Parameters

[Table 112-22](#) describes the parameters for the `SET_TRANSFORM_PARAM` and `SET_REMAP_PARAM` procedures.

Because new parameters are occasionally added, you might want to query the `DBMS_METADATA_TRANSFORM_PARAMS` view to see all the valid transform parameters for each transform or to find valid transform parameters for specific object types.

Table 112-22 SET_TRANSFORM_PARAM and SET_REMAP_PARAM Parameters

| Parameters | Description |
|------------------|---|
| transform_handle | <p>Either (1) the handle returned from <code>ADD_TRANSFORM</code>, or (2) the enumerated constant <code>SESSION_TRANSFORM</code> that designates the DDL transform for the whole session.</p> <p>Note that the handle returned by <code>OPEN</code> is not a valid transform handle.</p> <p>For <code>SET_REMAP_PARAM</code>, the transform handle must designate the <code>MODIFY</code> transform.</p> |
| name | <p>The name of the transform parameter.</p> <p>For descriptions of the parameters available for each transform on the <code>SET_TRANSFORM_PARAM</code> procedure, see the following:</p> <p>Table 112-23 - DDL transform Table 112-24 - <code>MODIFY</code> transform Table 112-26 - <code>SXML</code> transform Table 112-27 - <code>MODIFYXML</code> transform Table 112-28 - <code>SXMLDDL</code> transform</p> <p>For descriptions of the parameters available for the <code>MODIFY</code> transform on the <code>SET_REMAP_PARAM</code> procedure, see Table 112-25.</p> <p>For descriptions of the parameters available for the <code>ALTERXML</code> transform, see Table 112-4.</p> |
| value | The value of the transform. This parameter is valid only for <code>SET_TRANSFORM_PARAM</code> . |
| old_value | The old value for the remapping. This parameter is valid only for <code>SET_REMAP_PARAM</code> . |
| new_value | The new value for the remapping. This parameter is valid only for <code>SET_REMAP_PARAM</code> . |
| object_type | <p>Designates the object type to which the transform or remap parameter applies. By default, it applies to the same object type as the transform. In cases where the transform applies to all object types within a heterogeneous collection, the following apply:</p> <ul style="list-style-type: none"> • If <code>object_type</code> is omitted, the parameter applies to all applicable object types within the heterogeneous collection. • If <code>object_type</code> is specified, the parameter only applies to that object type. <p>This allows a caller who has added a transform to a heterogeneous collection to specify different transform parameters for different object types within the collection.</p> |

[Table 112-23](#) describes the object type, name, datatype, and meaning of the parameters for the DDL transform in the `SET_TRANSFORM_PARAM` procedure.

Table 112-23 SET_TRANSFORM_PARAM: Transform Parameters for the DDL Transform

| Object Type | Name | Datatype | Meaning |
|---|------------------------------|----------|---|
| USER, TABLE, CLUSTER, VIEW, MATERIALIZED_VIEW PROCEDURE, FUNCTION, PACKAGE, TYPE, TRIGGER | COLLATION_CLAUSE | Text | <p>There are three possible values:</p> <ul style="list-style-type: none"> • NEVER — Collation clauses are never generated. • ALWAYS — Collation clauses are always generated. • NON_DEFAULT — Collation clauses other than USING_NLS_COMP are generated. |
| TABLE | OMIT_ENCRYPTION_CLAUSE | BOOLEAN | <p>If set to Y, directs Data Pump to suppress column encryption clauses. Columns encrypted in the source database are not encrypted in imported tables. Defaults to N.</p> <p>If set to N, directs Data Pump to create column encryption clauses, as in the source database.</p> |
| TABLE | DWCS_CVT_IOTS | BOOLEAN | <p>If set to Y, directs Data Pump to transform Index Organized tables to heap organized tables by suppressing the ORGANIZATION INDEX clause when creating the table. Defaults to N.</p> <p>If set to N, the generated DDL retains the table characteristics of the source object.</p> |
| TABLE, CONSTRAINT | DWCS_CVT_CONSTRAINTS | BOOLEAN | <p>If set to Y, directs Data Pump to create pk/fk/uk constraints as disabled. Defaults to N.</p> <p>If set to N, directs Data Pump to create pk/fk/uk constraints based on the source database status.</p> |
| TABLE, CONSTRAINT | CONSTRAINT_USE_DEFAULT_INDEX | BOOLEAN | <p>This transform parameter affects the generation of index relating the pk/uk constraint. If set to Y, forces the name of an index automatically created to enforce the constraint to be identical to the constraint name. Defaults to N.</p> <p>If set to N, the index is created as it was named on the source database.</p> |
| TABLE, CONSTRAINT | CONSTRAINT_NAME_FROM_INDEX | BOOLEAN | <p>This transform parameter affects the generation of pk/uk constraints which reference user created indexes. If set to Y, forces the name of the constraint to match the name of the index. Defaults to N.</p> <p>If set to N, the constraint is created as it was named on the source database.</p> |
| All objects | PRETTY | BOOLEAN | <p>If TRUE, format the output with indentation and line feeds. Defaults to TRUE.</p> |

Table 112-23 (Cont.) SET_TRANSFORM_PARAM: Transform Parameters for the DDL Transform

| Object Type | Name | Datatype | Meaning |
|--------------|----------------------|----------|---|
| All objects | SQLTERMINATOR | BOOLEAN | If TRUE, append a SQL terminator (; or /) to each DDL statement. Defaults to FALSE. |
| TABLE | CONSTRAINTS | BOOLEAN | If TRUE, include all non-referential table constraints in the DDL. If FALSE, omit them. Defaults to TRUE. |
| TABLE | REF_CONSTRAINTS | BOOLEAN | If TRUE, include all referential constraints (foreign keys) in the DDL. If FALSE, omit them. Defaults to TRUE. |
| TABLE | CONSTRAINTS_AS_ALTER | BOOLEAN | If TRUE, include table constraints as separate ALTER TABLE (and, if necessary, CREATE INDEX) statements. If FALSE, specify table constraints as part of the CREATE TABLE statement. Defaults to FALSE. Requires that CONSTRAINTS be TRUE. |
| TABLE, TYPE | OID | BOOLEAN | If TRUE, include the Object ID (OID) clause in the DDL. If FALSE, omit it. Defaults to FALSE. |
| TABLE | SIZE_BYTE_KEYWORD | BOOLEAN | If TRUE, include the BYTE keyword as part of the size specification of CHAR and VARCHAR2 columns that use byte semantics. If FALSE, omit the keyword. Defaults to FALSE. |
| TABLE, INDEX | PARTITIONING | BOOLEAN | If TRUE, include partitioning clauses in the DDL. If FALSE, omit them. Defaults to TRUE. |

 **Note:**

The CONSTRAINTS_AS_ALTER parameter has no effect when an index and a constraint are created for a table in two separate DDL statements.

Table 112-23 (Cont.) SET_TRANSFORM_PARAM: Transform Parameters for the DDL Transform

| Object Type | Name | Datatype | Meaning |
|---|--------------------|----------|---|
| INDEX, CONSTRAINT, ROLLBACK_SEGMENTS, CLUSTER, TABLE, TABLESPACE | SEGMENT_ATTRIBUTES | BOOLEAN | If TRUE, include segment attributes clauses (physical attributes, storage attributes, tablespace, logging) in the DDL. If FALSE, omit them. Defaults to TRUE. |
| INDEX, CONSTRAINT, ROLLBACK_SEGMENTS, CLUSTER, TABLE | STORAGE | BOOLEAN | If TRUE, include storage clauses in the DDL. If FALSE, omit them. (Ignored if SEGMENT_ATTRIBUTES is FALSE.) Defaults to TRUE. |
| INDEX, CONSTRAINT, ROLLBACK_SEGMENTS, CLUSTER, TABLE | TABLESPACE | BOOLEAN | If TRUE, include tablespace clauses in the DDL. If FALSE, omit them. (Ignored if SEGMENT_ATTRIBUTES is FALSE.) Defaults to TRUE. |
| TYPE, PACKAGE | SPECIFICATION | BOOLEAN | If TRUE, include the type or package specification in the DDL. If FALSE, omit it. Defaults to TRUE. |
| TYPE, PACKAGE | BODY | BOOLEAN | If TRUE, include the type body or package body in the DDL. If FALSE, omit it. Defaults to TRUE. |
| VIEW | FORCE | BOOLEAN | If TRUE, use the FORCE keyword in the CREATE VIEW statement. If FALSE, do not use the FORCE keyword in the CREATE VIEW statement. Defaults to TRUE. |
| OUTLINE | INSERT | BOOLEAN | If TRUE, include the INSERT statements into the OL\$ dictionary tables that will create the outline and its hints. If FALSE, omit a CREATE OUTLINE statement. Defaults to FALSE. Note: This object type is being deprecated. |
| All objects | DEFAULT | BOOLEAN | Calling SET_TRANSFORM_PARAM with this parameter set to TRUE has the effect of resetting all parameters for the transform to their default values. Setting this FALSE has no effect. There is no default. |
| All objects | INHERIT | BOOLEAN | If TRUE, inherits session-level parameters. Defaults to FALSE. If an application calls ADD_TRANSFORM to add the DDL transform, then by default the only transform parameters that apply are those explicitly set for that transform handle. This has no effect if the transform handle is the session transform handle. |

Table 112-23 (Cont.) SET_TRANSFORM_PARAM: Transform Parameters for the DDL Transform

| Object Type | Name | Datatype | Meaning |
|---|-------------|----------|---|
| ROLE | REVOKE_FROM | Text | <p>The name of a user from whom the role must be revoked. If this is a non-null string and if the CREATE ROLE statement grants you the role, a REVOKE statement is included in the DDL after the CREATE ROLE statement.</p> <p>Note: When you issue a CREATE ROLE statement, Oracle may grant you the role. You can use this transform parameter to undo the grant.</p> <p>Defaults to null string.</p> |
| TABLESPACE | REUSE | BOOLEAN | <p>If TRUE, include the REUSE parameter for datafiles in a tablespace to indicate that existing files can be reused. If FALSE, omit the REUSE parameter.</p> <p>Defaults to FALSE.</p> |
| CLUSTER, INDEX, ROLLBACK_SEGMENTS, TABLE, TABLESPACE | PCTSPACE | NUMBER | <p>A number representing the percentage by which space allocation for the object type is to be modified. The value is the number of one-hundredths of the current allocation. For example, 100 means 100%.</p> <p>If the object type is TABLESPACE, the following size values are affected:</p> <ul style="list-style-type: none"> - in file specifications, the value of SIZE - MINIMUM EXTENT - EXTENT MANAGEMENT LOCAL UNIFORM SIZE <p>For other object types, INITIAL and NEXT are affected.</p> |
| TABLE | LOB_STORAGE | Text | <p>Specifies the storage type to use for LOB segments. The options are as follows:</p> <ul style="list-style-type: none"> • SECUREFILE - LOB storage is returned as SECUREFILE • BASICFILE - LOB storage is returned as BASICFILE • DEFAULT - The keyword (SECUREFILE or BASICFILE) is omitted in the LOB STORE AS clause. • NO_CHANGE - LOB segments are created with the same storage they had in the source database. This is the default. <p>Specifying this transform changes the LOB storage for all tables in the job, including tables that provide storage for materialized views.</p> |

Table 112-23 (Cont.) SET_TRANSFORM_PARAM: Transform Parameters for the DDL Transform

| Object Type | Name | Datatype | Meaning |
|-------------|--------------------------|----------|--|
| TABLE | TABLE_COMPRESSION_CLAUSE | Text | <p>Specifies a table compression clause (for example, COMPRESS BASIC) to use when the table is created.</p> <p>Specify NONE to omit the table compression clause. The table will have the default compression for the tablespace.</p> <p>Specifying this transform changes the compression type for all tables in the job, including tables that provide storage for materialized views.</p> |

Table 112-24 describes the object type, name, datatype, and meaning of the parameters for the MODIFY transform in the SET_TRANSFORM_PARAM procedure.

Table 112-24 SET_TRANSFORM_PARAM: Transform Parameters for the MODIFY Transform

| Object Type | Name | Datatype | Meaning |
|-------------|------------|----------|--|
| All objects | OBJECT_ROW | NUMBER | <p>A number designating the object row for an object. The object in the document that corresponds to this number will be copied to the output document.</p> <p>This parameter is additive.</p> <p>By default, all objects are copied to the output document.</p> |

Table 112-25 describes the object type, name, datatype, and meaning of the parameters for the MODIFY transform in the SET_REMAP_PARAM procedure.

Table 112-25 SET_REMAP_PARAM: Transform Parameters for the MODIFY Transform

| Object Type | Name | Datatype | Meaning |
|--|----------------|----------|---|
| LIBRARY, TABLESPACE, DIRECTORY | REMAP_DATAFILE | Text | <p>Objects in the document will have their filespecs renamed as follows: any filespec matching old_value will be changed to new_value. Filespecs should <i>not</i> be enclosed in quotes.</p> <p>This parameter is additive.</p> <p>By default, filespecs are not renamed.</p> |
| Named objects and all objects dependent on named objects | REMAP_NAME | Text | <p>Any named object in the document whose name matches old_value will have its name changed to new_value.</p> <p>Any dependent object whose base object name matches old_value will have its base schema name changed to new_value.</p> <p>This parameter is additive.</p> <p>By default, names are not remapped.</p> <p>(Use REMAP_TABLESPACE to remap the name of a TABLESPACE object.)</p> |

Table 112-25 (Cont.) SET_REMAP_PARAM: Transform Parameters for the MODIFY Transform

| Object Type | Name | Datatype | Meaning |
|---|------------------|----------|--|
| Schema Objects, Dependent Objects, Granted Objects, USER | REMAP_SCHEMA | Text | <p>Any schema object in the document whose name matches <code>old_value</code> will have its schema name changed to <code>new_value</code>.</p> <p>Any dependent object whose base object schema name matches <code>old_value</code> will have its base object schema name changed to <code>new_value</code>.</p> <p>Any granted object whose grantee name matches <code>old_value</code> will have its grantee name changed to <code>new_value</code>.</p> <p>Any user whose name matches <code>old_value</code> will have its name changed to <code>new_value</code>.</p> <p>This parameter is additive.</p> <p>By default, schemas are not remapped.</p> <p>NOTE: The mapping may not be 100 percent complete because there are certain schema references that Import is not capable of finding. For example, Import will not find schema references embedded within the body of definitions of triggers, types, views, procedures, and packages.</p> |
| TABLE, CLUSTER, CONSTRAINT, INDEX, ROLLBACK_SEGMENT, MATERIALIZED_VIEW, IEW, MATERIALIZED_VIEW, IEW_LOG, TABLESPACE_QUOTA | REMAP_TABLESPACE | Text | <p>Objects in the document will have their tablespaces renamed as follows: any tablespace name matching <code>old_value</code> will be changed to <code>new_value</code>.</p> <p>This parameter is additive.</p> <p>By default, tablespaces are not remapped.</p> |

Table 112-26 SET_TRANSFORM_PARAM: Transform Parameters for the SXML Transform

| Object type | Name | Datatype | Meaning |
|--|------------------|----------|---|
| USER, TABLE, CLUSTER, VIEW, MATERIALIZED_VIEW, IEW PROCEDURE, FUNCTION, PACKAGE, TYPE, TRIGGER | COLLATION_CLAUSE | Text | <p>There are three possible values:</p> <ul style="list-style-type: none"> NEVER — Collation clauses are never generated. ALWAYS — Collation clauses are always generated. NON_DEFAULT — Collation clauses other than <code>USING_NLS_COMP</code> are generated. |
| TABLE, TYPE | OID | Boolean | <p>If <code>TRUE</code>, include the Oracle Internet Directory (OID) clause in the SXML. If <code>FALSE</code>, omit it. Defaults to <code>FALSE</code>.</p> |

Table 112-26 (Cont.) SET_TRANSFORM_PARAM: Transform Parameters for the SXML Transform

| Object type | Name | Datatype | Meaning |
|--|---------------------|----------|--|
| TABLE, INDEX, CLUSTER, MATERIALIZED_VIEW, MATERIALIZED_VIEW_LOG. | STORAGE | Boolean | If TRUE, include storage clauses in the SXML. If FALSE, omit them. (Ignored if SEGMENT_ATTRIBUTES is FALSE.) Defaults to TRUE. |
| TABLE, INDEX, CLUSTER, MATERIALIZED_VIEW, MATERIALIZED_VIEW_LOG. | TABLESPACE | Boolean | If TRUE, include tablespace clauses in the SXML. If FALSE, omit them. (Ignored if SEGMENT_ATTRIBUTES is FALSE.) Defaults to TRUE. |
| TABLE | REF_CONSTRAINTS | Boolean | If TRUE, include all referential constraints (foreign keys) in the SXML. If FALSE, omit them. Defaults to TRUE. |
| TABLE, INDEX, MATERIALIZED_VIEW | PHYSICAL_PROPERTIES | Boolean | If TRUE, include segment attributes clauses (physical attributes, storage attributes, tablespace, logging) in the SXML. If FALSE, omit them. Defaults to TRUE. |
| INDEX, CONSTRAINT, ROLLBACK_SEGMENT, CLUSTER, TABLE, TABLESPACE | SEGMENT_ATTRIBUTES | Boolean | If TRUE, include segment attributes clauses (physical attributes, storage attributes, tablespace, logging) in the SXML. If FALSE, omit them. Defaults to TRUE. |
| TABLE, INDEX | PARTITIONING | Boolean | If TRUE, include partitioning clauses in the SXML. If FALSE, omit them. Defaults to TRUE. |
| TABLE | CONSTRAINTS | Boolean | If TRUE, include all non-referential table constraints in the SXML. If FALSE, omit them. Defaults to TRUE. |

Table 112-27 SET_TRANSFORM_PARAM: Transform Parameters for the MODIFYXML Transform

| Object type | Name | Datatype | Meaning |
|--|------------|----------|--|
| TABLE, INDEX, MATERIALIZED_VIEW, MATERIALIZED_VIEW_LOG | STORAGE | Boolean | If TRUE, include storage clauses in the output SXML. If FALSE, omit them. (Ignored if SEGMENT_ATTRIBUTES is FALSE.) Defaults to TRUE. |
| TABLE, INDEX, MATERIALIZED_VIEW, MATERIALIZED_VIEW_LOG | TABLESPACE | Boolean | If TRUE, include tablespace clauses in the output SXML. If FALSE, omit them. (Ignored if SEGMENT_ATTRIBUTES is FALSE.) Defaults to TRUE. |

Table 112-27 (Cont.) SET_TRANSFORM_PARAM: Transform Parameters for the MODIFYXML Transform

| Object type | Name | Datatype | Meaning |
|--|--------------------|----------|---|
| TABLE | REF_CONSTRAINTS | Boolean | If TRUE, include all referential constraints (foreign keys) in the output SXML. If FALSE, omit them. Defaults to TRUE. |
| TABLE, INDEX, VIEW, MATERIALIZED_VIEW, IEW, MATERIALIZED_VIEW, IEW_LOG | REMAP_NAME | Text | Any NAME element in the document that matches old_value will be changed to new_value. This does not apply to column names. (See REMAP_COLUMN_NAME). |
| TABLE, INDEX, VIEW, MATERIALIZED_VIEW, IEW, MATERIALIZED_VIEW, IEW_LOG | REMAP_SCHEMA | Text | Any SCHEMA element in the document matching old_value will be changed to new_value. |
| TABLE, INDEX, VIEW, MATERIALIZED_VIEW, IEW | REMAP_COLUMN_NAME | Text | Any column in the document whose name matches old_value will have its name changed to new_value. |
| TABLE, INDEX, MATERIALIZED_VIEW, IEW, MATERIALIZED_VIEW, IEW_LOG | SEGMENT_ATTRIBUTES | Boolean | If TRUE, include segment attributes clauses (physical attributes, storage attributes, tablespace, logging) in the output SXML. If FALSE, omit them. Defaults to TRUE. |
| TABLE | CONSTRAINTS | Boolean | If TRUE, include all non-referential table constraints in the output SXML. If FALSE, omit them. Defaults to TRUE. |

Table 112-28 SET_TRANSFORM_PARAM: Transform Parameters for the SXMLDDL Transform

| Object type | Name | Datatype | Meaning |
|--|------------------|----------|---|
| USER, TABLE, CLUSTER, VIEW, MATERIALIZED_VIEW, PROCEDURE, FUNCTION, PACKAGE, TYPE, TRIGGER | COLLATION_CLAUSE | Text | There are three possible values: <ul style="list-style-type: none"> NEVER — Collation clauses are never generated. ALWAYS — Collation clauses are always generated. NON_DEFAULT — Collation clauses other than USING_NLS_COMP are generated. |
| TABLE | OID | Boolean | If TRUE, include OIDs in the DDL. If FALSE, omit them. (Ignored if SEGMENT_ATTRIBUTES is FALSE.) Defaults to TRUE. |

Table 112-28 (Cont.) SET_TRANSFORM_PARAM: Transform Parameters for the SXMLDDL Transform

| Object type | Name | Datatype | Meaning |
|--|--------------------|----------|--|
| TABLE, INDEX, CLUSTER, MATERIALIZED_VIEW, MATERIALIZED_VIEW_LOG. | TABLESPACE | Boolean | If TRUE, include tablespace clauses in the DDL. If FALSE, omit them. (Ignored if SEGMENT_ATTRIBUTES is FALSE.) Defaults to TRUE. |
| TABLE, INDEX, CLUSTER, MATERIALIZED_VIEW, MATERIALIZED_VIEW_LOG | STORAGE | Boolean | If TRUE, include storage clauses in the DDL. If FALSE, omit them. (Ignored if SEGMENT_ATTRIBUTES is FALSE.) Defaults to TRUE. |
| TABLE | REF_CONSTRAINTS | Boolean | If TRUE, include all referential constraints (foreign keys) in the DDL. If FALSE, omit them. Defaults to TRUE. |
| INDEX | PRESERVE_LOCAL | Boolean | If PARTITIONING is FALSE and PRESERVE_LOCAL is TRUE and the index is a locally partitioned index, include the LOCAL keyword in the DDL. Defaults to FALSE. |
| TABLE, INDEX, CLUSTER, MATERIALIZED_VIEW, MATERIALIZED_VIEW_LOG | SEGMENT_ATTRIBUTES | Boolean | If TRUE, include segment attributes clauses (physical attributes, storage attributes, tablespace, logging) in the DDL. If FALSE, omit them. Defaults to TRUE. |
| TABLESPACE | REUSE | Boolean | If TRUE, include the REUSE parameter for datafiles in a tablespace to indicate that existing files can be reused. If FALSE, omit the REUSE parameter. Defaults to FALSE. |
| TABLE, INDEX | PARTITIONING | Boolean | If TRUE, include partitioning clauses in the DDL. If FALSE, omit them. Defaults to TRUE. |
| TABLE | CONSTRAINTS | Boolean | If TRUE, include all non-referential table constraints in the output SXML. If FALSE, omit them. Defaults to TRUE. |

Exceptions

- **INVALID_ARGVAL.** A NULL or invalid value was supplied for an input parameter. The error message text identifies the parameter.
- **INVALID_OPERATION.** Either SET_TRANSFORM_PARAM or SET_REMAP_PARAM was called after the first call to FETCH_XXX for the OPEN context. After the first call to FETCH_XXX is made, no further calls to SET_TRANSFORM_PARAM or SET_REMAP_PARAM are permitted.
- **INCONSISTENT_ARGS.** The arguments are inconsistent. This can mean the following:

- The transform parameter `name` is not valid for the object type associated with the `OPEN` context or for the transform associated with the transform handle.
- The transform applies to all object types in a heterogeneous collection, but `object_type` is not part of the collection.

Usage Notes

XSLT allows parameters to be passed to stylesheets. You call `SET_TRANSFORM_PARAM` or `SET_REMAP_PARAM` to specify the value of a parameter to be passed to the stylesheet identified by `transform_handle`.

Normally, if you call `SET_TRANSFORM_PARAMETER` multiple times for the same parameter name, each call overrides the prior call. For example, the following sequence simply sets the `STORAGE` transform parameter to `TRUE`.

```
SET_TRANSFORM_PARAM(tr_handle,'STORAGE',false);
SET_TRANSFORM_PARAM(tr_handle,'STORAGE',true);
```

However, some transform parameters are additive which means that all specified parameter values are applied to the document, not just the last one. For example, the `OBJECT_ROW` parameter to the `MODIFY` transform is additive. If you specify the following, then both specified rows are copied to the output document.

```
SET_TRANSFORM_PARAM(tr_handle,'OBJECT_ROW',5);
SET_TRANSFORM_PARAM(tr_handle,'OBJECT_ROW',8);
```

The `REMAP_TABLESPACE` parameter is also additive. If you specify the following, then tablespaces `TBS1` and `TBS3` are changed to `TBS2` and `TBS4`, respectively.

```
SET_REMAP_PARAM(tr_handle,'REMAP_TABLESPACE','TBS1','TBS2');
SET_REMAP_PARAM(tr_handle,'REMAP_TABLESPACE','TBS3','TBS4');
```

The order in which the transformations are performed is undefined. For example, if you specify the following, the result is undefined.

```
SET_REMAP_PARAM(tr_handle,'REMAP_TABLESPACE','TBS1','TBS2');
SET_REMAP_PARAM(tr_handle,'REMAP_TABLESPACE','TBS2','TBS3');
```

Note:

The number of remap parameters that can be specified for a `MODIFY` transform is limited to ten. That is, you can specify up to ten `REMAP_DATAFILE` parameters, up to ten `REMAP_SCHEMA` parameters and so on. Additional instances are ignored. To work around this, you can perform another `DBMS_METADATA.ADD_TRANSFORM` and specify additional remap parameters.

The `GET_DDL`, `GET_DEPENDENT_DDL`, and `GET_GRANTED_DDL` functions allow the casual browser to extract the creation DDL for an object. So that you can specify transform parameters, this package defines an enumerated constant `SESSION_TRANSFORM` as the handle of the DDL transform at the session level. You can call `SET_TRANSFORM_PARAM` using `DBMS_METADATA.SESSION_TRANSFORM` as the transform handle to set transform parameters for the whole session. `GET_DDL`, `GET_DEPENDENT_DDL`, and `GET_GRANTED_DDL` inherit these parameters when they invoke the DDL transform.

Note:

The enumerated constant must be prefixed with the package name
`DBMS_METADATA.SESSION_TRANSFORM`.

DBMS_METADATA_DIFF

The `DBMS_METADATA_DIFF` package contains the interfaces for comparing two metadata documents in SXML format.

This chapter contains the following topics:

- [Overview](#)
- [Security Model](#)
- [Browsing APIs for Fetching and Comparing Objects](#)
- [Summary of DBMS_METADATA_DIFF Subprograms](#)

See Also:

Oracle Database Utilities for more information and for examples of using the `DBMS_METADATA_DIFF` package.

113.1 DBMS_METADATA_DIFF Overview

You can use the interfaces contained in the `DBMS_METADATA_DIFF` package to compare two metadata documents in SXML format.

The result of the comparison is an SXML difference document. This document can be converted to other formats using the `DBMS_METADATA` `submit` interface and the `CONVERT` API.

113.2 DBMS_METADATA_DIFF Security Model

The browsing interface of the `DBMS_METADATA_DIFF` package actually uses the `DBMS_METADATA` package to fetch the metadata to be compared. Therefore, the security model used for `DBMS_METADATA` also applies to `DBMS_METADATA_DIFF`. (Note, however, that `DBMS_METADATA_DIFF` does not support all object types.)

See Also:

[DBMS_METADATA](#) for information about the `DBMS_METADATA` security model

113.3 DBMS_METADATA_DIFF — Browsing APIs for Fetching and Comparing Objects

These functions allow you to compare the metadata for two objects with a single call.

Syntax

```
DBMS_METADATA_DIFF.COMPARE_SXML (
object_type   IN VARCHAR2,
name1        IN VARCHAR2,
name2        IN VARCHAR2,
schema1      IN VARCHAR2 DEFAULT NULL,
schema2      IN VARCHAR2 DEFAULT NULL,
network_link1 IN VARCHAR2 DEFAULT NULL,
network_link2 IN VARCHAR2 DEFAULT NULL)
RETURN CLOB;
```

```
DBMS_METADATA_DIFF.COMPARE_ALTER (
object_type   IN VARCHAR2,
name1        IN VARCHAR2,
name2        IN VARCHAR2,
schema1      IN VARCHAR2 DEFAULT NULL,
schema2      IN VARCHAR2 DEFAULT NULL,
network_link1 IN VARCHAR2 DEFAULT NULL,
network_link2 IN VARCHAR2 DEFAULT NULL)
RETURN CLOB;
```

```
DBMS_METADATA_DIFF.COMPARE_ALTER_XML (
object_type   IN VARCHAR2,
name1        IN VARCHAR2,
name2        IN VARCHAR2,
schema1      IN VARCHAR2 DEFAULT NULL,
schema2      IN VARCHAR2 DEFAULT NULL,
network_link1 IN VARCHAR2 DEFAULT NULL,
network_link2 IN VARCHAR2 DEFAULT NULL)
RETURN CLOB;
```

Parameters

Table 113-1 COMPARE_xxx Function Parameters

| Parameters | Description |
|-------------|--|
| object_type | The type of object to be compared. Valid type names are CLUSTER, CONTEXT, DB_LINK, FGA_POLICY, INDEX, MATERIALIZED_VIEW, MATERIALIZED_VIEW_LOG, QUEUE, QUEUE_TABLE, RLS_CONTEXT, RLS_GROUP, RLS_POLICY, ROLE, SEQUENCE, SYNONYM, TABLE, TABLESPACE, TRIGGER, TYPE, TYPE_SPEC, TYPE_BODY, USER, and VIEW. |
| name1 | The name of the first object in the comparison. |
| name2 | The name of the second object in the comparison. |
| schema1 | The schema of the first object in the comparison. The default is the current user. |

Table 113-1 (Cont.) COMPARE_xxx Function Parameters

| Parameters | Description |
|---------------|--|
| schema2 | The schema of the second object in the comparison. The default is the value of schema1. |
| network_link1 | The name of a database link to the database on which the first object resides. If NULL (the default), then the object is assumed to be in the database on which the caller is running. |
| network_link2 | The name of a database link to the database on which the second object resides. The default is the value of network_link1. |

Return Values

DBMS_METADATA_DIFF.COMPARE_xxx returns the differences between two objects.

Exceptions

- INVALID_ARGVAL
A NULL or invalid value was supplied for an input parameter. The error message text identifies the parameter.
- OBJECT_NOT_FOUND
The specified object was not found in the database.

Usage Notes

These functions encapsulate calls to both DBMS_METADATA and DBMS_METADATA_DIFF functions and procedures to fetch the metadata for each of the two objects and compare them.

Which function you use depends on the comparison format you want:

- COMPARE_SXML returns an SXML difference document.
- COMPARE_ALTER returns a set of ALTER statements for making the first object like the second object.
- COMPARE_ALTER_XML returns an ALTER_XML document.

113.4 Summary of DBMS_METADATA_DIFF Subprograms

The DBMS_METADATA_DIFF subprograms provide comparison functionality for different object types.

These subprograms are used to:

- Specify the type of objects to be compared
- Specify the SXML documents to be compared
- Show the differences between the compared documents
- Clean up after the comparison

Table 113-2 provides a summary of DBMS_METADATA_DIFF subprograms.

Table 113-2 DBMS_METADATA_DIFF Package Subprograms

| Subprogram | Description |
|---|---|
| OPENC Function | Specifies the type of objects to be compared |
| ADD_DOCUMENT Procedure | Specifies an SXML document to be compared |
| FETCH_CLOB Functions and Procedures | Returns a CLOB showing the differences between the two documents specified by <code>ADD_DOCUMENT</code> |
| CLOSE Procedure | Invalidates the handle returned by <code>OPENC</code> and cleans up associated state |

113.4.1 OPENC Function

This function specifies the type of objects to be compared. The return value is an opaque context handle.

Syntax

```
DBMS_METADATA_DIFF.OPENC (
  object_type IN VARCHAR2)
RETURN NUMBER;
```

Parameters

Table 113-3 OPENC Function Parameters

| Parameters | Description |
|--------------------------|--|
| <code>object_type</code> | The type of object to be compared. Valid type names are CLUSTER, CONTEXT, DB_LINK, FGA_POLICY, INDEX, MATERIALIZED_VIEW, MATERIALIZED_VIEW_LOG, QUEUE, QUEUE_TABLE, RLS_CONTEXT, RLS_GROUP, RLS_POLICY, ROLE, SEQUENCE, SYNONYM, TABLE, TABLESPACE, TRIGGER, TYPE, TYPE_SPEC, TYPE_BODY, USER, and VIEW. |

Return Values

The opaque handle that is returned is used as input to `ADD_DOCUMENT`, `FETCH_XXX` and `CLOSE`.

Exceptions

- INVALID_ARGVAL

A NULL or invalid value was supplied for an input parameter. The error message text identifies the parameter.

113.4.2 ADD_DOCUMENT Procedure

This procedure specifies an SXML document that is to be compared.

Syntax

```
DBMS_METADATA_DIFF.ADD_DOCUMENT(  
handle IN NUMBER, document IN sys.XMLType);
```

```
DBMS_METADATA_DIFF.ADD_DOCUMENT(  
handle IN NUMBER, document IN CLOB);
```

Parameters

Table 113-4 ADD_DOCUMENT Procedure Parameters

| Parameter | Description |
|-----------|---|
| handle | The handle returned from OPENC |
| document | A document to be compared. The document must be of the type specified in OPENC. |

Usage Notes

Because the comparison interface allows you to compare exactly two SXML documents, a program must call `ADD_DOCUMENT` exactly twice for each `OPENC` handle. In the comparison result, the document specified by the first call is document 1, and the document specified by the second call is document 2.

Exceptions

- INVALID_ARGVAL

A `NULL` or invalid value was supplied for an input parameter. The error message text identifies the parameter.

113.4.3 FETCH_CLOB Functions and Procedures

The `FETCH_CLOB` functions and procedures return a CLOB showing the differences between the two documents specified by `ADD_DOCUMENT`.

Syntax

```
DBMS_METADATA_DIFF.FETCH_CLOB(  
handle IN NUMBER)  
RETURN CLOB;
```

```
DBMS_METADATA_DIFF.FETCH_CLOB(  
  
handle IN NUMBER,  
doc IN OUT NOCOPY CLOB);
```

```
DBMS_METADATA_DIFF.FETCH_CLOB(  
handle IN NUMBER,  
doc IN OUT NOCOPY CLOB  
diffs OUT BOOLEAN);
```

Parameters

Table 113-5 FETCH_CLOB Subprogram Parameters

| Parameter | Description |
|-----------|---|
| handle | The handle returned from OPENC. |
| doc | A CLOB containing the differences between documents 1 and 2. |
| diffs | TRUE if the documents are different or FALSE if they are identical. |

Return Values

The differences between documents 1 and 2.

Exceptions

- INVALID_ARGVAL

A NULL or invalid value was supplied for an input parameter. The error message text identifies the parameter.

113.4.4 CLOSE Procedure

This procedure invalidates the handle returned by OPENC and cleans up associated state.

Syntax

```
DBMS_METADATA_DIFF.CLOSE(  
handle IN NUMBER);
```

Parameters

Table 113-6 CLOSE Function Parameters

| Parameters | Description |
|------------|--------------------------------|
| handle | The handle returned from OPENC |

Exceptions

- INVALID_ARGVAL

A NULL or invalid value was supplied for an input parameter. The error message text identifies the parameter.

DBMS_MGD_ID_UTL

The `DBMS_MGD_ID_UTL` package contains various utility functions and procedures.

These consist of the following utility subprograms:

- A logging utility that sets and gets Java and PL/SQL logging levels.
- A proxy utility consisting of two procedures used to set and unset the host and port of the proxy server.
- A metadata utility consisting of functions and procedures used for managing metadata.

See Also:

Oracle Database Development Guide for more information.

This chapter describes each of these utility subprograms and contains the following topics:

- [Security Model](#)
- [Constants](#)
- [Exceptions](#)
- [Summary of DBMS_MGD_ID_UTL Subprograms](#)

The examples in this chapter assume that the user has run the following set of commands before running the contents of each script:

```
SQL> connect / as sysdba;
Connected.
SQL> create user mgduser identified by password;
SQL> grant connect, resource to mgduser;
SQL> connect mgduser
Enter password: mgduserpassword
Connected.
SQL> set serveroutput on;
```

114.1 DBMS_MGD_ID_UTL Security Model

You must run the `catmgd.sql` script to load the `DBMS_MGD_ID_UTL` package and Identity Code Package schema objects in the `MGDSYS` schema.

`DBMS_MGD_ID_UTL` is a `MGDSYS`-owned package. Any `DBMS_MGD_ID_UTL` subprogram called from an anonymous PL/SQL block is run using the privileges of the current user.

A user must be granted `connect` and `resource` roles to use the `DBMS_MGD_ID_UTL` package and its subprograms.

`EXECUTE` privilege is granted to `PUBLIC` for these ADTs: `MGD_ID`, `MGD_ID_COMPONENT`, `MGD_ID_COMPONENT_VARRAY`, and for this package `DBMS_MGD_ID_UTL`.

SELECT or READ privilege is granted to PUBLIC for these read-only views:
MGD_ID_CATEGORY and MGD_ID_SCHEME and for these metadata views:
USER_MGD_ID_CATEGORY and USER_MGD_ID_SCHEME, and for table
MGD_ID_XML_VALIDATOR, and for sequence MGD\$SEQUENCE_CATEGORY.

INSERT, UPDATE and DELETE privilege is granted to PUBLIC for these metadata views:
USER_MGD_ID_CATEGORY and USER_MGD_ID_SCHEME.

Public synonyms, by the same name, are created for these ADTs: MGD_ID,
MGD_ID_COMPONENT, MGD_ID_COMPONENT_VARRAY and for this package DBMS_MGD_ID_UTL,
as well as for these read-only views: MGD_ID_CATEGORY and MGD_ID_SCHEME and for
these metadata views: USER_MGD_ID_CATEGORY and USER_MGD_ID_SCHEME, and for table
MGD_ID_XML_VALIDATOR.

114.2 DBMS_MGD_ID_UTL Constants

The DBMS_MGD_ID_UTL package defines several constants for specifying parameter values.

These constants are shown in the following tables.

Table 114-1 DBMS_MGD_ID_UTL Constants — Installed Category IDs and Names

| Name | Value |
|----------------------------|-------|
| EPC_ENCODING_CATEGORY_ID | 1 |
| EPC_ENCODING_CATEGORY_NAME | EPC |

Table 114-2 DBMS_MGD_ID_UTL Constants — Logging Levels

| Name | Value |
|----------------------------|-------|
| LOGGING_LEVEL_0 OFF | 0 |
| LOGGING_LEVEL_1 SEVERE | 1 |
| LOGGING_LEVEL_2 WARNING | 2 |
| LOGGING_LEVEL_3 INFO | 3 |
| LOGGING_LEVEL_4 FINE | 4 |
| LOGGING_LEVEL_5 FINER | 5 |
| LOGGING_LEVEL_6 FINEST | 6 |
| LOGGING_LEVEL_7 ALL | 7 |

114.3 DBMS_MGD_ID_UTL Exceptions

The table in this topic lists the DBMS_MGD_ID_UTL exceptions.

Table 114-3 Exceptions Raised by DBMS_MGD_ID_UTL Package

| Name | Error Code | Description |
|-----------------------------|------------|--|
| TDTJavaException | -55200 | During the tag data translation, a Java exception was raised. |
| TDTCategoryNotFound | -55201 | The specified category was not found. |
| TDTSchemeNotFound | -55202 | During the tag data translation, the specified scheme was not found. |
| TDTLevelNotFound | -55203 | During the tag data translation, the specified level was not found. |
| TDTOptionNotFound | -55204 | During the tag data translation, the specified option was not found. |
| TDTFieldValidationException | -55205 | During the tag data translation, the validation operation failed on a field. |
| TDTUndefinedField | -55206 | During the tag data translation, an undefined field was detected. |
| TDTRuleEvaluationFailed | -55207 | During the tag data translation, the rule evaluation operation failed. |
| TDTTooManyMatchingLevels | -55208 | During the tag data translation, too many matching levels were found. |

114.4 Summary of DBMS_MGD_ID_UTL Subprograms

This table describes the utility subprograms in the DBMS_MGD_ID_UTL package.

All the values and names passed to the procedures defined in the DBMS_MGD_ID_UTL package are case insensitive unless otherwise mentioned. To preserve the case, enclose the values with double quotation marks.

Table 114-4 DBMS_MGD_ID_UTL Package Subprograms

| Subprogram | Description |
|---|--|
| ADD_SCHEME Procedure | Adds a tag data translation scheme to an existing category |
| CREATE_CATEGORY Function | Creates a new category or a new version of a category |
| EPC_TO_ORACLE_SCHEME Function | Converts the EPCglobal tag data translation (TDT) XML to Oracle tag data translation XML |
| GET_CATEGORY_ID Function | Returns the category ID given the category name and the category version |
| GET_COMPONENTS Function | Returns all relevant separated component names separated by semicolon (;) for the specified scheme |
| GET_ENCODINGS Function | Returns a list of semicolon (;) separated encodings (formats) for the specified scheme |

Table 114-4 (Cont.) DBMS_MGD_ID_UTL Package Subprograms

| Subprogram | Description |
|---|--|
| GET_JAVA_LOGGING_LEVEL Function | Returns an integer representing the current Java trace logging level |
| GET_PLSQL_LOGGING_LEVEL Function | Returns an integer representing the current PL/SQL trace logging level |
| GET_SCHEME_NAMES Function | Returns a list of semicolon (;) separated scheme names for the specified category |
| GET_TDT_XML Function | Returns the Oracle tag data translation XML for the specified scheme |
| GET_VALIDATOR Function | Returns the Oracle Database tag data translation schema |
| REFRESH_CATEGORY Function | Refreshes the metadata information on the Java stack for the specified category |
| REMOVE_CATEGORY Procedure | Removes a category including all the related TDT XML if the value of <code>category_version</code> parameter is NULL |
| REMOVE_PROXY Procedure | Unsets the host and port of the proxy server |
| REMOVE_SCHEME Procedure | Removes a tag data translation scheme from a category |
| SET_JAVA_LOGGING_LEVEL Procedure | Sets the Java logging level |
| SET_PLSQL_LOGGING_LEVEL Procedure | Sets the PL/SQL tracing logging level |
| SET_PROXY Procedure | Sets the host and port of the proxy server for Internet access |
| VALIDATE_SCHEME Function | Validates the input tag data translation XML against the Oracle tag data translation schema |

114.4.1 ADD_SCHEME Procedure

This procedure adds a tag data translation scheme to an existing category.

Syntax

```
DBMS_MGD_ID_UTL.ADD_SCHEME (
    category_id IN VARCHAR2,
    tdt_xml     IN CLOB);
```

Parameters

Table 114-5 ADD_SCHEME Procedure Parameters

| Parameter | Description |
|--------------------------|--------------------------|
| <code>category_id</code> | Category ID |
| <code>tdt_xml</code> | Tag data translation XML |

Examples

This example performs the following actions:

1. Creates a category.

2. Adds a contractor scheme and an employee scheme to the MGD_SAMPLE_CATEGORY category.
3. Validates the MGD_SAMPLE_CATEGORY scheme.
4. Tests the tag translation of the contractor scheme and the employee scheme.
5. Removes the contractor scheme.
6. Tests the tag translation of the contractor scheme and this returns the expected exception for the removed contractor scheme.
7. Tests the tag translation of the employee scheme and this returns the expected values.
8. Removes the MGD_SAMPLE_CATEGORY category.

```
--contents of add_scheme2.sql
SET LINESIZE 160
-----
---CREATE CATEGORY, ADD_SCHEME, REMOVE_SCHEME, REMOVE_CATEGORY-----
-----
DECLARE
  amt          NUMBER;

114.4.2 CREATE_CATEGORY Function

This function creates a new category or a new version of a category.

Syntax

```
DBMS_MGD_ID_UTL.CREATE_CATEGORY (
  category_name     IN  VARCHAR2,
  category_version IN  VARCHAR2,
  agency            IN  VARCHAR2,
  URI               IN  VARCHAR2)
RETURN VARCHAR2;
```

Parameters

Table 114-6 CREATE_CATEGORY Function Parameters

| Parameter | Description |
|------------------|--|
| category_name | Name of category |
| category_version | Category version |
| agency | Organization that owns the category. For example, EPCglobal owns the category EPC. |
| URI | URI that provides additional information about the category |

Usage Notes

The return value is the category ID.

Examples

See the [ADD_SCHEME Procedure](#) for an example of creating the MGD_SAMPLE_CATEGORY category.

114.4.3 EPC_TO_ORACLE_SCHEME Function

This function converts the EPCglobal tag data translation (TDT) XML to Oracle Database tag data translation XML.

Syntax

```
DBMS_MGD_ID_UTL.EPC_TO_ORACLE_SCHEME (
  xml_scheme IN CLOB)
RETURN CLOB;
```

Parameters

Table 114-7 EPC_TO_ORACLE_SCHEME Function Parameters

| Parameter | Description |
|------------|--|
| xml_scheme | Name of EPC tag scheme to be converted |

Usage Notes

The return value is the contents of the CLOB containing the Oracle Database tag data translation XML.

Examples

The following example converts standard EPCglobal Tag Data Translation (TDT) files into Oracle Database TDT files:

```
--Contents of MGD_ID_DOC2.sql
-----
-- EPC_TO_ORACLE_SCHEME --
-----
call DBMS_MGD_ID_UTL.set_proxy('www-proxy.example.com', '80');

BEGIN
  DBMS_JAVA.set_output(1000000);
  DBMS_OUTPUT.ENABLE(1000000);
  DBMS_MGD_ID_UTL.set_java_logging_level(DBMS_MGD_ID_UTL.LOGGING_LEVEL_SEVERE);
END;
/

DECLARE
  epcScheme          CLOB;
  oracleScheme       CLOB;
  amt                 NUMBER;
  buf                 VARCHAR2(32767);
  pos                 NUMBER;
  seq                 BINARY_INTEGER;

114.4.4 GET_CATEGORY_ID Function

This function returns the category ID for a given category name and category version.

Syntax

```

DBMS_MGD_ID_UTL.GET_CATEGORY_ID (
    category name    IN  VARCHAR2,
    category version IN  VARCHAR2)
RETURN VARCHAR2;

```

Parameters

Table 114-8 GET_CATEGORY_ID Function Parameters

| Parameter | Description |
|------------------|------------------|
| category_name | Name of category |
| category_version | Category version |

Usage Notes

- If the value of `category_version` is NULL, then the ID of the latest version of the specified category is returned.
- The return value is the category ID for the specified category name.

Examples

The following example returns a category ID given a category name and its version:

```
-- Contents of get_category1.sql file
SELECT DBMS_MGD_ID_UTL.get_category_id('EPC', NULL) FROM DUAL;
```

```
SQL> @get_category1.sql
.
.
.
DBMS_MGD_ID_UTL.GET_CATEGORY_ID('EPC',NULL)-----
-----1
.
.
.
```

114.4.5 GET_COMPONENTS Function

This function returns all relevant separated component names separated by semicolon (;) for the specified scheme.

Syntax

```
DBMS_MGD_ID_UTL.GET_COMPONENTS (
    category_id IN VARCHAR2,
    scheme_name IN VARCHAR2)
RETURN VARCHAR2;
```

Parameters

Table 114-9 GET_COMPONENTS Function Parameters

| Parameter | Description |
|-------------|----------------|
| category_id | Category ID |
| scheme_name | Name of scheme |

Usage Notes

The return value contains the component names separated by a semicolon (;) for the specified scheme.

Examples

The following example gets the components:

```
--Contents of get_components.sql
DECLARE
  id          mgd_id;
  getcomps   VARCHAR2(1000);
  getencodings VARCHAR2(1000);
  getschemenames VARCHAR2(1000);
BEGIN
  DBMS_MGD_ID_UTL.set_java_logging_level(DBMS_MGD_ID_UTL.LOGGING_LEVEL_OFF);
  DBMS_MGD_ID_UTL.refresh_category(DBMS_MGD_ID_UTL.get_category_id('EPC', NULL));
  getcomps := DBMS_MGD_ID_UTL.get_components(1,'SGTIN-64');
  dbms_output.put_line('Component names are: ' || getcomps);
  getencodings := DBMS_MGD_ID_UTL.get_encodings(1,'SGTIN-64');
  dbms_output.put_line('Encodings are: ' || getencodings);
  getschemenames := DBMS_MGD_ID_UTL.get_scheme_names(1);
  dbms_output.put_line('Scheme names are: ' || getschemenames);
END;
/
SHOW ERRORS;

SQL> @get_components.sql
.

114.4.6 GET_ENCODINGS Function

This function returns a list of semicolon (;) separated encodings (formats) for the specified scheme.

Syntax

```
DBMS_MGD_ID_UTL.GET_ENCODINGS (
  category_id IN VARCHAR2,
  scheme_name IN VARCHAR2)
RETURN VARCHAR2;
```

Parameters

Table 114-10 GET_ENCODINGS Function Parameters

| Parameter | Description |
|-------------|----------------|
| category_id | Category ID |
| scheme_name | Name of scheme |

Usage Notes

The return value contains the encodings separated by a semicolon (;) for the specified scheme.

Examples

See the [GET_COMPONENTS Function](#) for an example.

114.4.7 GET_JAVA_LOGGING_LEVEL Function

This function returns an integer representing the current trace logging level.

Syntax

```
DBMS_MGD_ID_UTL.GET_JAVA_LOGGING_LEVEL
RETURN INTEGER;
```

Usage Notes

The return value is the integer value denoting the current Java logging level.

Examples

The following example gets the Java logging level.

```
--Contents of getjavalogginglevel.sql
DECLARE
    loglevel    NUMBER;
BEGIN
    DBMS_MGD_ID_UTL.set_java_logging_level(DBMS_MGD_ID_UTL.LOGGING_LEVEL_OFF);
    loglevel := DBMS_MGD_ID_UTL.get_java_logging_level();
    dbms_output.put_line('Java logging level = ' || loglevel);
END;
/
SHOW ERRORS;

SQL> @getjavalogginglevel.sql

```

114.4.8 GET_PLSQL_LOGGING_LEVEL Function

This function returns an integer representing the current PL/SQL trace logging level.

Syntax

```
DBMS_MGD_ID_UTL.GET_PLSQL_LOGGING_LEVEL  
  RETURN INTEGER;  
  
PRAGMA restrict_references (get_plsql_logging_level, WNDS);
```

Usage Notes

The return value is the integer value denoting the current PL/SQL logging level.

Examples

The following example gets the PL/SQL logging level.

```
--Contents of getplsqllogginglevel.sql  
DECLARE  
    loglevel    NUMBER;  
BEGIN  
    DBMS_MGD_ID_UTL.set_plsql_logging_level(0);  
    loglevel := DBMS_MGD_ID_UTL.get_plsql_logging_level();  
    dbms_output.put_line('PL/SQL logging level = ' || loglevel);  
END;  
/  
SHOW ERRORS;

. . .  
PL/SQL logging level = 0  
PL/SQL procedure successfully completed.  
. . .
```

114.4.9 GET_SCHEME_NAMES Function

This function returns a list of semicolon (;) separated scheme names for the specified category.

Syntax

```
DBMS_MGD_ID_UTL.GET_SCHEME_NAMES (  
    category_id IN VARCHAR2)  
  RETURN VARCHAR2;
```

Parameters

Table 114-11 GET_SCHEME_NAMES Function Parameters

| Parameter | Description |
|-------------|-------------|
| category_id | Category ID |

Usage Notes

The return value contains the scheme names for the specified category ID.

Examples

See the [GET_COMPONENTS Function](#) for an example.

114.4.10 GET_TDT_XML Function

This function returns the Oracle Database tag data translation XML for the specified scheme.

Syntax

```
DBMS_MGD_ID_UTL.GET_TDT_XML (
    category_id IN VARCHAR2,
    scheme_name IN VARCHAR2)
RETURN CLOB;
```

Parameters

Table 114-12 GET_TDT_XML Function Parameters

| Parameter | Description |
|-------------|----------------|
| category_id | Category ID |
| scheme_name | Name of scheme |

Usage Notes

The return value contains the Oracle Database tag data translation XML for the specified scheme.

Examples

The following example gets the Oracle Database TDT XML for the specified scheme:

```
--Contents of get_tdtxml.sql
DECLARE
    gettdtxml    CLOB;

BEGIN
    gettdtxml := DBMS_MGD_ID_UTL.get_tdt_xml(1,'SGTIN-64');
    dbms_output.put_line('Length of tdt XML is '||DBMS_LOB.GETLENGTH(gettdtxml));
    dbms_output.put_line(DBMS_LOB.SUBSTR(gettdtxml, DBMS_LOB.GETLENGTH(gettdtxml), 1));
END;
/
```

114.4.11 GET_VALIDATOR Function

This function returns the Oracle Database tag data translation schema.

Syntax

```
DBMS_MGD_ID_UTL.GET_VALIDATOR
RETURN CLOB;
```

Usage Notes

The return value contains the Oracle Database tag data translation schema.

Examples

This example returns the Oracle Database TDT schema.

```
--Contents of get_validator.sql
DECLARE
  getvalidator          CLOB;
BEGIN
  getvalidator := DBMS_MGD_ID_UTL.get_validator;

114.4.12 REFRESH_CATEGORY Function

This function refreshes the metadata information on the Java stack for the specified category.

This function must be called before using MGD_ID functions.

Syntax

```

DBMS_MGD_ID_UTL.REFRESH_CATEGORY (
  category_id IN VARCHAR2);

```

Parameters

Table 114-13 REFRESH_CATEGORY Function Parameters

| Parameter | Description |
|-------------|-------------|
| category_id | Category ID |

Examples

The following example refreshes the metadata information for the EPC category ID.

```
--Contents of toString3.sql
call DBMS_MGD_ID_UTL.set_proxy('www-proxy.example.com', '80');
DECLARE
id          MGD_ID;
BEGIN
  DBMS_MGD_ID_UTL.set_java_logging_level(DBMS_MGD_ID_UTL.LOGGING_LEVEL_OFF);
  DBMS_MGD_ID_UTL.refresh_category(DBMS_MGD_ID_UTL.get_category_id('EPC', NULL));
  dbms_output.put_line('..Testing to_string');
  DBMS_OUTPUT.PUT_LINE('test to_string');
  id := mgd_id('EPC', NULL, 'urn:epc:id:gid:0037000.30241.1041970',
'scheme=GID-96');
  DBMS_OUTPUT.PUT_LINE('mgd_id object as a string');
  DBMS_OUTPUT.PUT_LINE(id.to_string);
END;
/

```

PL/SQL procedure successfully completed.

114.4.13 REMOVE_CATEGORY Procedure

This procedure removes a category including all the related TDT XML.

This procedure is overloaded. The different functionality of each form of syntax is presented along with the definitions.

Syntax

Removes a category based on the specified category ID.

```
DBMS_MGD_ID_UTL.REMOVE_CATEGORY (
  category_id IN VARCHAR2);
```

Removes a category based on the specified category name and category version.

```
DBMS_MGD_ID_UTL.REMOVE_CATEGORY (
  category_name IN VARCHAR2,
  category_version IN VARCHAR2);
```

Parameters

Table 114-14 REMOVE_CATEGORY Procedure Parameters

| Parameter | Description |
|-------------|-------------|
| category_id | Category ID |

Table 114-14 (Cont.) REMOVE_CATEGORY Procedure Parameters

| Parameter | Description |
|------------------|------------------|
| category_name | Name of category |
| category_version | Category version |

Usage Notes

If the value of `category_version` is NULL, all versions for the specified category will be removed.

Examples

See the [ADD_SCHEME Procedure](#) for an example of removing a category.

114.4.14 REMOVE_PROXY Procedure

This procedure unsets the host and port of the proxy server.

Syntax

```
DBMS_MGD_ID_UTL.REMOVE_PROXY;
```

Examples

See the [REFRESH_CATEGORY Function](#) for an example.

114.4.15 REMOVE_SCHEME Procedure

This procedure removes a tag data translation scheme from a category.

Syntax

```
DBMS_MGD_ID_UTL.REMOVE_SCHEME (
    category_id IN VARCHAR2,
    scheme_name IN VARCHAR2);
```

Parameters

Table 114-15 REMOVE_SCHEME Procedure Parameters

| Parameter | Description |
|-------------|----------------|
| category_id | Category ID |
| scheme_name | Name of scheme |

Examples

See the [ADD_SCHEME Procedure](#) for an example of removing a scheme.

114.4.16 SET_JAVA_LOGGING_LEVEL Procedure

This procedure sets the Java trace logging level.

Syntax

```
DBMS_MGD_ID_UTL.SET_JAVA_LOGGING_LEVEL (
    logginglevel IN INTEGER);
```

Parameters

Table 114-16 SET_JAVA_LOGGING_LEVEL Procedure Parameters

| Parameter | Description |
|--------------|---|
| logginglevel | <p>Logging level. The Java logging level can be one of the following values in descending order:</p> <ul style="list-style-type: none"> • LOGGING_LEVEL_OFF CONSTANT INTEGER := 0 • LOGGING_LEVEL_SEVERE CONSTANT INTEGER := 1 • LOGGING_LEVEL_WARNING CONSTANT INTEGER := 2 • LOGGING_LEVEL_INFO CONSTANT INTEGER := 3 • LOGGING_LEVEL_FINE CONSTANT INTEGER := 4 • LOGGING_LEVEL_FINER CONSTANT INTEGER := 5 • LOGGING_LEVEL_FINEST CONSTANT INTEGER := 6 • LOGGING_LEVEL_ALL CONSTANT INTEGER := 7 |

Examples

See the [GET_JAVA_LOGGING_LEVEL Function](#) for an example.

114.4.17 SET_PLSQL_LOGGING_LEVEL Procedure

This procedure sets the PL/SQL trace logging level.

Syntax

```
DBMS_MGD_ID_UTL.SET_PLSQL_LOGGING_LEVEL (
    level IN INTEGER);

PRAGMA restrict_references(set_plsql_logging_level, WNDS);
```

Parameters

Table 114-17 SET_PLSQL_LOGGING_LEVEL Procedure Parameters

| Parameter | Description |
|-----------|---|
| level | <p>Logging level. The PL/SQL logging level can be one of the following values in descending order:</p> <ul style="list-style-type: none"> • LOGGING_LEVEL_OFF CONSTANT INTEGER := 0 • LOGGING_LEVEL_SEVERE CONSTANT INTEGER := 1 • LOGGING_LEVEL_WARNING CONSTANT INTEGER := 2 • LOGGING_LEVEL_INFO CONSTANT INTEGER := 3 • LOGGING_LEVEL_FINE CONSTANT INTEGER := 4 • LOGGING_LEVEL_FINER CONSTANT INTEGER := 5 • LOGGING_LEVEL_FINEST CONSTANT INTEGER := 6 • LOGGING_LEVEL_ALL CONSTANT INTEGER := 7 |

Examples

See the [GET_PLSQL_LOGGING_LEVEL Function](#) for an example.

114.4.18 SET_PROXY Procedure

This procedure sets the host and port of the proxy server for Internet access.

This procedure must be called if the database server accesses the Internet using a proxy server. Internet access is necessary because some rules need to look up the Object Naming Service (ONS) table to get the company prefix index.

You do not need to call this procedure does if you are only using schemes that do not contain any rules requiring Internet access.

Syntax

```
DBMS_MGD_ID_UTL.SET_PROXY (
    prox_host IN VARCHAR2,
    proxy_port IN VARCHAR2);
```

Parameters

Table 114-18 SET_PROXY Procedure Parameters

| Parameter | Description |
|------------|------------------|
| proxy_host | Name of host |
| proxy_port | Host port number |

Examples

See the [REFRESH_CATEGORY Function](#) for an example.

114.4.19 VALIDATE_SCHEME Function

This function validates the input tag data translation XML against the Oracle Database tag data translation schema.

Syntax

```
DBMS_MGD_ID_UTL.VALIDATE_SCHEME (  
    xml_scheme IN CLOB)  
RETURN VARCHAR2;
```

Parameters

Table 114-19 VALIDATE_SCHEME Function Parameters

| Parameter | Description |
|------------|-------------------------|
| xml_scheme | Scheme to be validated. |

Usage Notes

The return value contains the components names for the specified scheme.

Examples

See the [ADD_SCHEME Procedure](#) or the [EPC_TO_ORACLE_SCHEME Function](#) for an example.

DBMS_MGWADM

DBMS_MGWADM defines the Messaging Gateway administrative interface. The package and object types are owned by SYS.

Note:

You must run the `catmgw.sql` script to load the Messaging Gateway packages and types into the database.

See Also:

Oracle Database Advanced Queuing User's Guide contains information on loading database objects and using DBMS_MGWADM

This chapter contains the following topics:

- [Security Model](#)
- [Deprecated Subprograms](#)
- [Constants](#)
- [Data Structures](#)
- [Summary of DBMS_MGWADM Subprograms](#)

115.1 DBMS_MGWADM Security Model

A user with administrative privilege can run all procedures in DBMS_MGWADM.

115.2 DBMS_MGWADM Deprecated Subprograms

Oracle recommends that you do not use deprecated procedures in new applications. Support for deprecated features is for backward compatibility only.

The following subprograms are deprecated with Oracle Database 11g Release 1 having been superseded by improved technology:

- [ADD_SUBSCRIBER Procedure](#) - use instead [CREATE_JOB Procedure](#)
- [ALTER_PROPAGATION_SCHEDULE Procedure](#) - use instead [ALTER_JOB Procedure](#)
- [ALTER_SUBSCRIBER Procedure](#) - use instead [ALTER_JOB Procedure](#)
- [DB_CONNECT_INFO Procedure](#) - use instead [ALTER_AGENT Procedures](#)

- [DISABLE_PROPAGATION_SCHEDULE Procedure](#) - use instead [DISABLE_JOB Procedure](#)
- [ENABLE_PROPAGATION_SCHEDULE Procedure](#) - use instead [ENABLE_JOB Procedure](#)
- [REMOVE_SUBSCRIBER Procedure](#) - use instead [REMOVE_JOB Procedure](#)
- [RESET_SUBSCRIBER Procedure](#) - use instead [RESET_JOB Procedure](#)
- [SCHEDULE_PROPAGATION Procedure](#) - use instead [CREATE_JOB Procedure](#)
- [UNSCHEDULE_PROPAGATION Procedure](#) - use instead [REMOVE_JOB Procedure](#)

115.3 DBMS_MGWADM Constants

The `DBMS_MGWADM` package defines various constants for specifying parameter values.

- [Table 115-1](#)
- [Table 115-2](#)
- [Table 115-3](#)
- [Table 115-4](#)
- [Table 115-5](#)
- [Table 115-6](#)
- [Table 115-7](#)
- [Table 115-8](#)
- [Table 115-9](#)
- [Table 115-10](#)
- [Table 115-11](#)

Table 115-1 DBMS_MGWADM Constants—Cleanup Actions

| Name | Type | Description |
|---|--------------------------------------|--|
| <code>CLEAN_STARTUP_STATE</code> | <code>CONSTANT BINARY_INTEGER</code> | Sets the Messaging Gateway agent to a known state so that it can be started |
| <code>CLEAN_LOG_QUEUES</code> | <code>CONSTANT BINARY_INTEGER</code> | Messaging Gateway agent will clean log queues for all configured messaging system links |
| <code>RESET_SUB_MISSING_LOG_RECORD</code> | <code>CONSTANT BINARY_INTEGER</code> | Messaging Gateway agent recovers a Messaging Gateway subscriber that has failed due to a missing log record |
| <code>RESET_SUB_MISSING_MESSAGE</code> | <code>CONSTANT BINARY_INTEGER</code> | Messaging Gateway agent recovers a Messaging Gateway subscriber that has failed due to a missing persistent source message |

Table 115-2 DBMS_MGWADM Constants—Force Values

| Name | Type | Description |
|----------|-------------------------|---------------------------------------|
| FORCE | CONSTANT BINARY_INTEGER | Represents a forced action |
| NO_FORCE | CONSTANT BINARY_INTEGER | Represents a normal, nonforced action |

Table 115-3 DBMS_MGWADM Constants—Logging Levels

| Name | Type | Description |
|---------------------|-------------------------|--|
| BASIC_LOGGING | CONSTANT BINARY_INTEGER | The standard (the least) information written to the log file |
| TRACE_DEBUG_LOGGING | CONSTANT BINARY_INTEGER | The greatest information written to the log file |
| TRACE_HIGH_LOGGING | CONSTANT BINARY_INTEGER | The third level of detail of logging information written to the log file |
| TRACE_LITE_LOGGING | CONSTANT BINARY_INTEGER | The second level detail of logging information written to the log file |

Table 115-4 DBMS_MGWADM Constants—Named Property Constants

| Name | Type | Description |
|--------------------|-------------------|--|
| MGWPROP_PREFIX | CONSTANT VARCHAR2 | A constant (MGWPROP\$_) for the reserved property name prefix |
| MGWPROP_REMOVE | CONSTANT VARCHAR2 | A constant (MGWPROP\$_REMOVE) for the reserved property name used to remove an existing property |
| MGWPROP_REMOVE_ALL | CONSTANT VARCHAR2 | A constant (MGWPROP\$_REMOVE_ALL) for the reserved property name used to remove all properties |

Table 115-5 DBMS_MGWADM Constants—Other Constants

| Name | Type | Description |
|----------------------|-------------------------|--|
| JMS_CONNECTION | CONSTANT BINARY_INTEGER | Used to indicate that JMS connections will be used to access JMS destinations in a domain-independent manner that supports a unified messaging model |
| JMS_QUEUE_CONNECTION | CONSTANT BINARY_INTEGER | Used to indicate that JMS queue connections will be used to access JMS destinations |
| JMS_TOPIC_CONNECTION | CONSTANT BINARY_INTEGER | Used to indicate that JMS topic connections will be used to access JMS destinations |
| NO_CHANGE | CONSTANT VARCHAR2 | Indicates that an existing value should be preserved (not changed). This is used for certain APIs where the desire is to change one or more parameters but leave others unchanged. |

Table 115-5 (Cont.) DBMS_MGWADM Constants—Other Constants

| Name | Type | Description |
|---------------|-------------------|---|
| DEFAULT_AGENT | CONSTANT VARCHAR2 | Name of the Messaging Gateway default agent |

Table 115-6 DBMS_MGWADM Constants—Propagation Types

| Name | Type | Description |
|----------------------|-------------------------|---|
| INBOUND_PROPAGATION | CONSTANT BINARY_INTEGER | Represents the propagation type for non-Oracle to Oracle Database Advanced Queuing propagation. The propagation source is a queue in a foreign (non-Oracle) messaging system and the destination is a local Oracle Database Advanced Queuing queue. |
| OUTBOUND_PROPAGATION | CONSTANT BINARY_INTEGER | Represents the propagation type for Oracle Database Advanced Queuing to non-Oracle propagation. The propagation source is a local Oracle Database Advanced Queuing queue and the destination is a queue in a foreign (non-Oracle) messaging system. |

Table 115-7 DBMS_MGWADM Constants—Queue Domain Types

| Name | Type | Description |
|--------------|-------------------------|---|
| DOMAIN_QUEUE | CONSTANT BINARY_INTEGER | Represents a queue destination. A JMS queue (point-to-point model) is classified as a queue. |
| DOMAIN_TOPIC | CONSTANT BINARY_INTEGER | Represents a topic destination. A JMS topic (publish-subscribe model) is classified as a topic. |

Table 115-8 DBMS_MGWADM Constants—Shutdown Modes

| Name | Type | Description |
|--------------------|-------------------------|--|
| SHUTDOWN_IMMEDIATE | CONSTANT BINARY_INTEGER | Represents the immediate shutdown mode |
| SHUTDOWN_NORMAL | CONSTANT BINARY_INTEGER | Represents the normal shutdown mode |

Table 115-9 DBMS_MGWADM Constants—WebSphere MQ Interface Types

| Name | Type | Description |
|------------------------------|-------------------------|--|
| MQSERIES_BASE_JAVA_INTERFACE | CONSTANT BINARY_INTEGER | Represents the Base Java interface for the WebSphere MQ messaging system |

Table 115-10 DBMS_MGWADM Constants—target_type Argument of SET_OPTION and REMOVE_OPTION Procedures

| Name | Type | Description |
|-----------------|----------------------|---|
| AGENT_JAVA_PROP | CONSTANT PLS_INTEGER | Used for an agent option used to set a Java System property |
| MSGLINK_OPTION | CONSTANT PLS_INTEGER | Used for a messaging system link option |
| JOB_OPTION | CONSTANT PLS_INTEGER | Used for a propagation job option |

Table 115-11 DBMS_MGWADM Constants—conntype Argument of CREATE_AGENT and ALTER_AGENT Procedures

| Name | Type | Description |
|-----------|-------------------|--------------------------------------|
| JDBC_OCI | CONSTANT VARCHAR2 | Used to specify the JDBC OCI driver |
| JDBC_THIN | CONSTANT VARCHAR2 | Used to specify the JDBC Thin driver |

115.4 DBMS_MGWADM Data Structures

The DBMS_MGWADM package defines several OBJECT types.

DBMS_MGWADM Object Types

- [SYS.MGW_MQSERIES_PROPERTIES Object Type](#)
- [SYS.MGW_PROPERTIES Object Type](#)
- [SYS.MGW_PROPERTY Object Type](#)
- [SYS.MGW_TIBRV_PROPERTIES Object Type](#)

115.4.1 DBMS_MGWADM SYS.MGW_MQSERIES_PROPERTIES Object Type

This type specifies basic properties for a WebSphere MQ messaging system link.

Syntax

```
TYPE SYS.MGW_MQSERIES_PROPERTIES IS OBJECT (
    queue_manager      VARCHAR2(64),
    hostname           VARCHAR2(64),
    port               INTEGER,
    channel            VARCHAR2(64),
    interface_type     INTEGER,
    username           VARCHAR2(64),
    password           VARCHAR2(64),
    inbound_log_queue  VARCHAR2(64),
    outbound_log_queue VARCHAR2(64),

    -- Methods
    STATIC FUNCTION construct
    RETURN SYS.MGW_MQSERIES_PROPERTIES,
```

```

STATIC FUNCTION alter_construct
RETURN SYS.MGW_MQSERIES_PROPERTIES );

```

Attributes

Table 115-12 SYS.MGW_MQSERIES_PROPERTIES Attributes

| Attribute | Description |
|-------------------|--|
| queue_manager | The name of the WebSphere MQ queue manager |
| hostname | The host on which the WebSphere MQ messaging system resides. If hostname is NULL, then a WebSphere MQ bindings connection is used. If not NULL, then a client connection is used and requires that a port and channel be specified. |
| port | The port number. This is used only for client connections; that is, when hostname is not NULL. |
| channel | The channel used when establishing a connection to the queue manager. This is used only for client connections; that is, when hostname is not NULL. |
| interface_type | The type of messaging interface to use. Values: <ul style="list-style-type: none"> DBMS_MGWADM.MQSERIES_BASE_JAVA_INTERFACE if the WebSphere MQ Base Java interface should be used. DBMS_MGWADM.JMS_CONNECTION if the link is to be used to access JMS destinations in a unified, domain-independent manner. DBMS_MGWADM.JMS_QUEUE_CONNECTION if the link is to be used for accessing JMS queues DBMS_MGWADM.JMS_TOPIC_CONNECTION if the link is to be used for accessing JMS topics. |
| username | The username used for authentication to the WebSphere MQ messaging system |
| password | The password used for authentication to the WebSphere MQ messaging system |
| inbound_log_queue | The name of the WebSphere MQ queue used for propagation recovery purposes when this messaging link is used for inbound propagation; that is, when queues associated with this link serve as a propagation source: <ul style="list-style-type: none"> For MQSERIES_BASE_JAVA_INTERFACE, this is the name of a physical WebSphere MQ queue created using WebSphere MQ administration tools. For the JMS_CONNECTION interface and the JMS_QUEUE_CONNECTION interface, this is the name of a physical WebSphere MQ queue created using WebSphere MQ administration tools. For JMS_TOPIC_CONNECTION interface, this specifies the name of a WebSphere MQ JMS topic. The physical WebSphere MQ queue used by subscribers of that topic must be created using WebSphere MQ administration tools. By default, the physical queue used is SYSTEM.JMS.D.SUBSCRIBER.QUEUE. |

Table 115-12 (Cont.) SYS.MGW_MQSERIES_PROPERTIES Attributes

| Attribute | Description |
|--------------------|---|
| outbound_log_queue | <p>The name of the WebSphere MQ queue used for propagation recovery purposes when this messaging link is used for outbound propagation; that is, when queues associated with this link serve as a propagation destination:</p> <ul style="list-style-type: none"> For MQSERIES_BASE_JAVA_INTERFACE, this is the name of a physical WebSphere MQ queue created using WebSphere MQ administration tools. For the JMS_CONNECTION interface and the JMS_QUEUE_CONNECTION interface, this is the name of a physical WebSphere MQ queue created using WebSphere MQ administration tools. For JMS_TOPIC_CONNECTION interface, this specifies the name of a WebSphere MQ JMS topic. The physical WebSphere MQ queue used by subscribers of that topic must be created using WebSphere MQ administration tools. By default, the physical queue used is SYSTEM.JMS.D.SUBSCRIBER.QUEUE. |

Methods**Table 115-13 SYS.MGW_MQSERIES_PROPERTIES Methods**

| Method | Description |
|-----------------|---|
| construct | Constructs a new SYS.MGW_MQSERIES_PROPERTIES instance. All attributes are assigned a value of NULL. |
| alter_construct | Constructs a new SYS.MGW_MQSERIES_PROPERTIES instance for altering the properties of an existing messaging link. All attributes having a VARCHAR2 datatype are assigned a value of DBMS_MGWADM.NO_CHANGE. Attributes of other datatypes are assigned a value of NULL. |

115.4.2 DBMS_MGWADM SYS.MGW_PROPERTIES Object Type

This type specifies an array of properties.

Syntax

```
TYPE SYS.MGW_PROPERTIES AS VARRAY (2000) OF SYS.MGW_PROPERTY;
```

Attributes**Table 115-14 SYS.MGW_PROPERTIES Attributes**

| Attribute | Description |
|-----------|----------------|
| name | Property name |
| value | Property value |

Usage Notes

Unless noted otherwise, Messaging Gateway uses named properties as follows:

- Names with the `MGWPROP$_` prefix are reserved. They are used for special purposes and are invalid when used as a normal property name.
- A property name can exist only once in a property list; that is, a list can contain only one value for a given name. The name is case-insensitive.
- In general, a property list is order-independent, and the property names may appear in any order. An alter property list is an exception.
- You can use a new property list to alter an existing property list. Each new property modifies the original list in one of the following ways: adds a new property, modifies a property, removes a property, or removes all properties.

The alter list is processed in order, from the first element to the last element. Thus the order in which the elements appear in the alter list is meaningful, especially when the alter list is used to remove properties from an existing list.

The property name and value are used to determine how that element affects the original list. The following rules apply:

- Add or modify property

```
MGW_PROPERTY.NAME = property_name
MGW_PROPERTY.VALUE = property_value
```

If a property of the given name already exists, then the current value is replaced with the new value; otherwise the new property is added to the end of the list.

- Remove property

```
MGW_PROPERTY.NAME = 'MGWPROP$_REMOVE'
MGW_PROPERTY.VALUE = name_of_property_to_remove
```

No action is taken if the property name does not exist in the original list.

- Remove all properties

```
MGW_PROPERTY.NAME = 'MGWPROP$_REMOVE_ALL'
MGW_PROPERTY.VALUE = not used
```

See Also:

"The `DBMS_MGWADM` package defines constants to represent the reserved property names on [Table 115-4](#)

115.4.3 DBMS_MGWADM SYS.MGW_PROPERTY Object Type

This type specifies a named property which is used to specify optional properties for messaging links, foreign queues, and subscribers.

Syntax

```
TYPE SYS.MGW_PROPERTY IS OBJECT(
  name VARCHAR2(500),
```

```

    value VARCHAR2(4000),

-- Methods
STATIC FUNCTION construct    --- (1)
RETURN SYS.MGW_PROPERTY,

STATIC FUNCTION construct(   --- (2)
    p_name  IN VARCHAR2,
    p_value IN VARCHAR2)
RETURN SYS.MGW_PROPERTY );

```

Attributes

Table 115-15 SYS.MGW_PROPERTY Attributes

| Attribute | Description |
|-----------|----------------|
| name | Property name |
| value | Property value |

Methods

Table 115-16 SYS.MGW_PROPERTY Methods

| Method | Description |
|-------------------|---|
| construct --- (1) | Constructs a new MGW_PROPERTY instance. All attributes are assigned a value of NULL |
| construct --- (2) | Constructs a new MGW_PROPERTY instance initialized using the given parameters |

See Also:

"The DBMS_MGWADM package defines constants to represent the reserved property names on [Table 115-4](#)

115.4.4 SYS.MGW_TIBRV_PROPERTIES Object Type

A type that specifies basic properties for a TIB/Rendezvous messaging system link. The Messaging Gateway agent creates a TIB/Rendezvous transport of type `TibrvRvdTransport` for each Messaging Gateway link.

Syntax

```

TYPE SYS.MGW_TIBRV_PROPERTIES IS OBJECT(
    service  VARCHAR2(128),
    daemon   VARCHAR2(128),
    network  VARCHAR2(256),
    cm_name  VARCHAR2(256),
    cm_ledger VARCHAR2(256),

-- Methods
STATIC FUNCTION construct

```

```
RETURN SYS.MGW_TIBRV_PROPERTIES,

STATIC FUNCTION alter_construct
RETURN SYS.MGW_TIBRV_PROPERTIES );
```

Attributes

Table 115-17 SYS.MGW_TIBRV_PROPERTIES Attributes

| Attribute | Description |
|-----------|---|
| service | The service parameter for the rvd transport |
| daemon | The daemon parameter for the rvd transport |
| network | The network parameter for the rvd transport |
| cm_name | The CM correspondent name. Reserved for future use. |
| cm_ledger | The CM ledger file name. Reserved for future use. |

Methods

Table 115-18 SYS.MGW_TIBRV_PROPERTIES Methods

| Method | Description |
|-----------------|---|
| construct | Constructs a new SYS.MGW_TIBRV_PROPERTIES instance. All attributes will be assigned a value of NULL. |
| alter_construct | Constructs a new SYS.MGW_TIBRV_PROPERTIES instance. This function is useful for altering the properties of an existing messaging link. All attributes having a VARCHAR2 datatype will be assigned a value of DBMS_MGWADM.NO_CHANGE. Attributes of other datatypes will be assigned a value of NULL. |

115.5 Summary of DBMS_MGWADM Subprograms

This table lists the DBMS_MGWADM subprograms and briefly describes them.

Table 115-19 DBMS_MGWADM Package Subprograms

| Subprogram | Description |
|---|---|
| ADD_SUBSCRIBER Procedure | Adds a subscriber used to consume messages from a source queue for propagation to a destination |
| ALTER_AGENT Procedures | Alters Messaging Gateway agent parameters |
| ALTER_JOB Procedure | Alters the properties of a propagation job |
| ALTER_MSGSYSTEM_LINK Procedure for TIB/Rendezvous | Alters the properties of a TIB/Rendezvous messaging system link |
| ALTER_MSGSYSTEM_LINK Procedure for WebSphere MQ | Alters the properties of a WebSphere MQ messaging system link |
| ALTER_PROPAGATION_SCHEDULE Procedure | Alters a propagation schedule |

Table 115-19 (Cont.) DBMS_MGWADM Package Subprograms

| Subprogram | Description |
|---|---|
| ALTER_SUBSCRIBER Procedure | Alters the parameters of a subscriber used to consume messages from a source queue for propagation to a destination |
| CLEANUP_GATEWAY Procedures | Cleans up Messaging Gateway |
| CREATE_AGENT Procedure | Creates a Messaging Gateway agent that will be used to process propagation jobs |
| CREATE_JOB Procedure | Creates a job used to propagate message from a source to a destination |
| CREATE_MSGSYSTEM_LINK Procedures for TIB/Rendezvous | Creates a messaging system link to a TIB/Rendezvous messaging system |
| CREATE_MSGSYSTEM_LINK Procedures for WebSphere MQ | Creates a messaging system link to a WebSphere MQ messaging system |
| DB_CONNECT_INFO Procedure | Configures connection information used by the Messaging Gateway agent for connections to Oracle Database |
| DISABLE_JOB Procedure | Disables a propagation job |
| DISABLE_PROPAGATION_SCHEDULE Procedure | Disables a propagation schedule |
| ENABLE_JOB Procedure | Enables a propagation job |
| ENABLE_PROPAGATION_SCHEDULE Procedure | Enables a propagation schedule |
| REGISTER_FOREIGN_QUEUE Procedure | Registers a non-Oracle queue entity in Messaging Gateway |
| REMOVE_AGENT Procedure | Removes a Messaging Gateway agent |
| REMOVE_JOB Procedure | Removes a propagation job |
| REMOVE_MSGSYSTEM_LINK Procedure | Removes a messaging system link for a non-Oracle messaging system |
| REMOVE_OPTION Procedure | Removes a Messaging Gateway configuration option |
| REMOVE_SUBSCRIBER Procedure | Removes a subscriber used to consume messages from a source queue for propagation to a destination |
| RESET_JOB Procedure | Resets the propagation error state for a propagation job |
| RESET_SUBSCRIBER Procedure | Resets the propagation error state for a subscriber |
| SCHEDULE_PROPAGATION Procedure | Schedules message propagation from a source to a destination |
| SET_LOG_LEVEL Procedures | Dynamically alters the Messaging Gateway agent logging level |
| SET_OPTION Procedure | Sets a Messaging Gateway configuration option |
| SHUTDOWN Procedures | Shuts down the Messaging Gateway agent |
| STARTUP Procedures | Starts the Messaging Gateway agent |
| UNREGISTER_FOREIGN_QUEUE Procedure | Removes a non-Oracle queue entity in Messaging Gateway |
| UNSCHEDULE_PROPAGATION Procedure | Removes a propagation schedule |

115.5.1 ADD_SUBSCRIBER Procedure

This procedure adds a subscriber used to consume messages from a source queue for propagation to a destination.

Note:

This subprogram has been deprecated as a result of improved technology (see [CREATE_JOB Procedure](#)), and is retained only for reasons of backward compatibility.

Syntax

```
DBMS_MGWADM.ADD_SUBSCRIBER(
  subscriber_id      IN VARCHAR2,
  propagation_type   IN BINARY_INTEGER,
  queue_name         IN VARCHAR2,
  destination        IN VARCHAR2,
  rule               IN VARCHAR2 DEFAULT NULL,
  transformation     IN VARCHAR2 DEFAULT NULL,
  exception_queue    IN VARCHAR2 DEFAULT NULL
  options            IN SYS.MGW_PROPERTIES DEFAULT NULL);
```

Parameters

Table 115-20 ADD_SUBSCRIBER Procedure Parameters

| Parameter | Description |
|------------------|--|
| subscriber_id | Specifies a user-defined name that identifies this subscriber |
| propagation_type | Specifies the type of message propagation. DBMS_MGWADM.OUTBOUND_PROPAGATION is for Oracle Database Advanced Queuing to non-Oracle propagation. DBMS_MGWADM.INBOUND_PROPAGATION is for non-Oracle to Oracle Database Advanced Queuing propagation |
| queue_name | Specifies the source queue to which this subscriber is being added. The syntax and interpretation of this parameter depend on the value specified for propagation_type. |
| destination | Specifies the destination queue to which messages consumed by this subscriber are propagated. The syntax and interpretation of this parameter depend on the value specified for propagation_type. |
| rule | Specifies an optional subscription rule used by the subscriber to dequeue messages from the source queue. This is NULL if no rule is needed. The syntax and interpretation of this parameter depend on the value specified for propagation_type. |

Table 115-20 (Cont.) ADD_SUBSCRIBER Procedure Parameters

| Parameter | Description |
|------------------------------|---|
| <code>transformation</code> | Specifies the transformation needed to convert between the Oracle Database Advanced Queuing payload and an ADT defined by Messaging Gateway. The type of transformation needed depends on the value specified for <code>propagation_type</code> . If <code>NULL</code> , then the Oracle Database Advanced Queuing payload type must be supported by Messaging Gateway. |
| <code>exception_queue</code> | Specifies a queue used for exception message logging purposes. This queue must be on the same messaging system as the propagation source. If <code>NULL</code> , then an exception queue is not used and propagation stops if a problem occurs. The syntax and interpretation of this parameter depend on the value specified for <code>propagation_type</code> . The source queue and exception queue cannot be the same queue. |
| <code>options</code> | Optional subscriber properties. <code>NULL</code> if there are none. Typically these are lesser used configuration properties supported by the messaging system. |

Usage Notes **See Also:**

"Handling Arbitrary Payload Types Using Message Transformations", in *Oracle Database Advanced Queuing User's Guide* for more information regarding message conversion and transformation

If the non-Oracle messaging link being accessed for the subscriber uses a JMS interface, then the Messaging Gateway agent will use the Oracle JMS interface to access the Oracle Database Advanced Queuing queues. Otherwise the native Oracle Database Advanced Queuing interface will be used. Parameters are interpreted differently when the Messaging Gateway agent uses Oracle JMS for JMS connections.

Transformations are not currently supported if the Oracle JMS interface is used for propagation. The transformation parameter must be `NULL`.

 **See Also:**

For additional information regarding subscriber options

- "WebSphere MQ System Properties" in *Oracle Database Advanced Queuing User's Guide*
- "TIB/Rendezvous System Properties" in *Oracle Database Advanced Queuing User's Guide*

OUTBOUND_PROPAGATION Subscribers

The parameters for a subscriber used for outbound propagation are interpreted as follows:

- `queue_name` specifies the local Oracle Database Advanced Queuing queue that is the propagation source. This must have a syntax of `schema.queue`.
- `destination` specifies the foreign queue to which messages are propagated. This must have a syntax of `registered_queue@message_link`.
- `rule` specifies an optional Oracle Database Advanced Queuing subscriber rule if the native Oracle Database Advanced Queuing interface is used, or a JMS selector if the Oracle JMS interface is used. If `NULL`, then no rule or selector is used.
- `transformation` specifies the transformation used to convert the Oracle Database Advanced Queuing payload to an ADT defined by Messaging Gateway.

Messaging Gateway propagation dequeues messages from the Oracle Database Advanced Queuing queue using the transformation to convert the Oracle Database Advanced Queuing payload to a known ADT defined by Messaging Gateway. The message is then enqueued in the foreign messaging system based on the Messaging Gateway ADT.

- `exception_queue` specifies the name of a local Oracle Database Advanced Queuing queue to which messages are moved if an exception occurs. This must have a syntax of `schema.queue`.

If the native Oracle Database Advanced Queuing interface is used, then a subscriber will be added to the Oracle Database Advanced Queuing queue when this procedure is called, whether or not Messaging Gateway is running. The local subscriber will be of the form `sys.aq$agent('MGW_subscriber_id', NULL, NULL)`.

If the Oracle JMS interface is used, then the Messaging Gateway agent will create a JMS durable subscriber with the name of `MGW_subscriber_id`. If the agent is not running when this procedure is called, then the durable subscriber will be created the next time the agent starts.

The exception queue has the following caveats:

- The user is responsible for creating the Oracle Database Advanced Queuing queue to be used as the exception queue.
- The payload type of the source and exception queue must match.
- The exception queue must be created as a queue type of `DBMS_AQADM.NORMAL_QUEUE` rather than `DBMS_AQADM.EXCEPTION_QUEUE`. Enqueue restrictions prevent Messaging Gateway propagation from using an Oracle Database Advanced Queuing queue of type `EXCEPTION_QUEUE` as a Messaging Gateway exception queue.

INBOUND_PROPAGATION Subscribers

The parameters for a subscriber used for inbound propagation are interpreted as follows:

- `queue_name` specifies the foreign queue that is the propagation source. This must have a syntax of `registered_queue@message_link`.
- `destination` specifies the local Oracle Database Advanced Queuing queue to which messages are propagated. This must have a syntax of `schema.queue`.

- `rule` specifies an optional subscriber rule that is valid for the foreign messaging system. This is `NULL` if no rule is needed.
- `transformation` specifies the transformation used to convert an ADT defined by Messaging Gateway to the Oracle Database Advanced Queuing payload type.
Messaging Gateway propagation dequeues messages from the foreign messaging system and converts the message body to a known ADT defined by Messaging Gateway. The transformation is used to convert the Messaging Gateway ADT to an Oracle Database Advanced Queuing payload type when the message is enqueued to the Oracle Database Advanced Queuing queue.
- `exception_queue` specifies the name of a foreign queue to which messages are moved if an exception occurs. This must have a syntax of `registered_queue@message_link`.

Whether or not a subscriber is needed depends on the requirements of the non-Oracle messaging system. If a durable subscriber is necessary, then it will be created by the Messaging Gateway agent. If the agent is not running at the time this procedure is called, then the creation of the subscriber on the non-Oracle messaging system will occur when the agent next starts.

The exception queue has the following caveats:

- The exception queue must be a registered non-Oracle queue.
- The source and exception queues must use the same messaging system link.

115.5.2 ALTER_AGENT Procedures

This procedure configures Messaging Gateway agent parameters.

Syntax

```
DBMS_MGWADM.ALTER_AGENT (
    max_memory      IN BINARY_INTEGER DEFAULT NULL,
    max_threads     IN BINARY_INTEGER DEFAULT NULL,
    service         IN VARCHAR2 DEFAULT DBMS_MGWADM.NO_CHANGE );
```

```
DBMS_MGWADM.ALTER_AGENT (
    agent_name      IN VARCHAR2,
    username        IN VARCHAR2 DEFAULT DBMS_MGWADM.NO_CHANGE,
    password        IN VARCHAR2 DEFAULT DBMS_MGWADM.NO_CHANGE,
    database        IN VARCHAR2 DEFAULT DBMS_MGWADM.NO_CHANGE,
    conntype       IN VARCHAR2 DEFAULT DBMS_MGWADM.NO_CHANGE,
    max_memory      IN PLS_INTEGER DEFAULT NULL,
    max_threads     IN PLS_INTEGER DEFAULT NULL,
    service         IN VARCHAR2 DEFAULT DBMS_MGWADM.NO_CHANGE,
    initfile       IN VARCHAR2 DEFAULT DBMS_MGWADM.NO_CHANGE,
    comment        IN VARCHAR2 DEFAULT DBMS_MGWADM.NO_CHANGE );
```

Parameters

Table 115-21 ALTER_AGENT Procedure Parameters

| Parameter | Description |
|-------------------------|--|
| <code>max_memory</code> | The maximum heap size, in MB, used by the Messaging Gateway agent. If it is <code>NULL</code> , then the current value is unchanged. |

Table 115-21 (Cont.) ALTER_AGENT Procedure Parameters

| Parameter | Description |
|-------------|--|
| max_threads | The number of messaging threads that the Messaging Gateway agent creates. If it is NULL, then the current value is unchanged. The maximum value of max_threads is limited to 128. |
| service | Specifies the database service that the Oracle Scheduler job class used by this agent will have affinity to. In an Oracle RAC environment, this means that the Messaging Gateway agent will run on only those database instances that are assigned to the service. If NULL, the job class used by this agent will be altered to belong to the default service which is mapped to every instance. If DBMS_MGWADM.NO_CHANGE, the current value is unchanged. |
| agent_name | Identifies the Messaging Gateway agent. DBMS_MGWADM.DEFAULT_AGENT specifies the default agent. |
| username | Specifies the username used for connections to the Oracle Database. NULL is not allowed. If DBMS_MGWADM.NO_CHANGE, then the current value is unchanged. If a username is specified then a password must also be specified. |
| password | Specifies the password used for connections to the Oracle Database. NULL is not allowed. If DBMS_MGWADM.NO_CHANGE, then the current value is unchanged. A password must be specified if a username is specified. |
| database | Specifies the database connect string used for connections to the Oracle Database. NULL indicates that a local connection should be used. If DBMS_MGWADM.NO_CHANGE, then the current value is unchanged. Oracle strongly recommends that a connect string, rather than NULL, be specified. Usually it will be a net service name from tnsnames.ora. |
| conntype | Specifies the type of connection to the Oracle Database, DBMS_MGWADM.JDBC_OCI or DBMS_MGWADM.JDBC_THIN. If DBMS_MGWADM.NO_CHANGE, then the current value is unchanged |
| initfile | Specifies a Messaging Gateway initialization file used by this agent. NULL indicates that the default initialization file is used. If a value is specified, it should be the full path name of the file. If DBMS_MGWADM.NO_CHANGE, then the current value is unchanged. |
| comment | Optional comments for this agent. NULL if a comment is not desired. If DBMS_MGWADM.NO_CHANGE, then the current value is unchanged. |

Usage Notes

- Default values for these configuration parameters are set when the Messaging Gateway agent is installed.
- Changes to the max_memory and max_threads parameters take effect the next time the Messaging Gateway agent is active. If the Messaging Gateway agent is currently active, then it must be shut down and restarted for the changes to take effect.
- The service parameter is used to set an Oracle Scheduler job class attribute. The job class is used to create a Scheduler job that starts the Messaging Gateway agent. An Oracle administrator must create the database service. If the value is

NULL, the job class will belong to an internal service that is mapped to all instances.

- The `username`, `password`, and `database` parameters specify connection information used by the Messaging Gateway agent for connections to the Oracle Database. An Oracle administrator should create the user and grant it the role `MGW_AGENT_ROLE`.

115.5.3 ALTER_JOB Procedure

This procedure alters the properties of a propagation job.

Syntax

```
DBMS_MGWADM.ALTER_JOB (
  job_name      IN  VARCHAR2,
  rule          IN  VARCHAR2 DEFAULT DBMS_MGWADM.NO_CHANGE,
  transformation IN  VARCHAR2 DEFAULT DBMS_MGWADM.NO_CHANGE,
  exception_queue IN VARCHAR2 DEFAULT DBMS_MGWADM.NO_CHANGE,
  poll_interval IN  PLS_INTEGER DEFAULT 0,
  options       IN  SYS.MGW_PROPERTIES DEFAULT NULL,
  comments      IN  VARCHAR2 DEFAULT DBMS_MGWADM.NO_CHANGE );
```

Parameters

Table 115-22 ALTER_JOB Procedure Parameters

| Parameter | Description |
|------------------------------|--|
| <code>job_name</code> | Identifies the propagation job |
| <code>rule</code> | Specifies an optional subscription rule used to dequeue messages from the propagation source. The syntax and interpretation of this parameter depend on the propagation type. A NULL value indicates that no subscription rule is needed. If <code>DBMS_MGWADM.NO_CHANGE</code> , then the current value is unchanged. |
| <code>transformation</code> | Specifies the transformation needed to convert between the Oracle Streams AQ payload and an ADT defined by Messaging Gateway. The type of transformation needed depends on the value specified for <code>propagation_type</code> . A NULL value indicates that no transformation is needed. If <code>DBMS_MGWADM.NO_CHANGE</code> , the current value is unchanged. |
| <code>exception_queue</code> | Specifies a queue used for exception message logging purposes. This queue must be on the same messaging system as the propagation source. In cases in which no exception queue is associated with the job, propagation stops if a problem occurs. The syntax and interpretation of this parameter depend on the propagation type. A NULL value indicates that no exception queue is used. If <code>DBMS_MGWADM.NO_CHANGE</code> , the current value is unchanged. |

Table 115-22 (Cont.) ALTER_JOB Procedure Parameters

| Parameter | Description |
|----------------------------|---|
| <code>poll_interval</code> | <p>Specifies the polling interval, in seconds, used by the Messaging Gateway agent when checking for messages in the source queue. If no messages are available the agent will not poll again until the polling interval has passed. Once the agent detects a message it will continue propagating messages as long as any are available.</p> <p>Values: NULL, 0, or value > 0:</p> <ul style="list-style-type: none"> • If zero (default), the current value will not be changed. • If NULL, the current value will be reset and the Messaging Gateway default polling interval will be used. The default polling interval is 5 seconds and can be overridden by the Messaging Gateway initialization file. |
| <code>options</code> | <p>Optional job properties. If NULL, no options will be changed. If not NULL, then the properties specified in this list are combined with the current optional properties to form a new set of job options.</p> |
| <code>comments</code> | <p>An optional comment for this agent, or NULL if one is not desired. If DBMS_MGWADM.NO_CHANGE, the current value will not be changed.</p> |

Usage Notes

- If the non-Oracle messaging link being accessed for the propagation job uses a JMS interface, then the Messaging Gateway agent will use the Oracle JMS interface to access the Oracle Streams AQ queues. Otherwise the native Oracle Streams AQ interface will be used. Parameters are interpreted differently when the Messaging Gateway agent uses Oracle JMS for JMS connections.
- The subscriber rule cannot be altered when propagating from a JMS source. Instead, the propagation job must be dropped and re-created with the new rule. For JMS, changing the message selector on a durable subscription is equivalent to deleting and re-creating the subscription.
- Transformations are not currently supported if the Oracle JMS interface is used for propagation. The transformation parameter must be DBMS_MGWADM.NO_CHANGE (the default value).
- The options parameter specifies a set of properties used to alter the current optional properties. Each property affects the current property list in a particular manner; add a new property, replace an existing property, remove an existing property or remove all properties.

Note:

- [SYS.MGW_PROPERTY Object Type](#) for more information about the options parameter
- [OUTBOUND_PROPAGATION Jobs](#) for outbound propagation parameter interpretation
- [INBOUND_PROPAGATION Jobs](#) for inbound propagation parameter interpretation

115.5.4 ALTER_MSGSYSTEM_LINK Procedure for TIB/Rendezvous

This procedure alters the properties of a TIB/Rendezvous messaging system link.

Syntax

```
DBMS_MGWADM.ALTER_MSGSYSTEM_LINK (
  linkname      IN VARCHAR2,
  properties    IN SYS.MGW_TIBRV_PROPERTIES,
  options       IN SYS.MGW_PROPERTIES DEFAULT NULL,
  comment       IN VARCHAR2 DEFAULT DBMS_MGWADM.NO_CHANGE );
```

Parameters

Table 115-23 ALTER_MSGSYSTEM_LINK Procedure Parameters for TIB/Rendezvous

| Parameters | Description |
|------------|---|
| linkname | The messaging system link name |
| properties | Basic properties for a TIB/Rendezvous messaging system link. If NULL, then no link properties will be changed. |
| options | Optional link properties. If NULL, then no options will be changed. If not NULL, then the properties specified in this list are combined with the current options properties to form a new set of link options. |
| comment | A user-specified description, or NULL if one is not desired. If DBMS_MGWADM.NO_CHANGE, then the current value will not be changed. |

Usage Notes

To retain an existing value for a messaging link property with a VARCHAR2 datatype, specify DBMS_MGWADM.NO_CHANGE for that particular property. To preserve an existing value for a property of another datatype, specify NULL for that property.

The options parameter specifies a set of properties used to alter the current optional properties. Each property affects the current property list in a particular manner: add a new property, replace an existing property, remove an existing property, or remove all properties.

See Also:

[SYS.MGW_PROPERTIES Object Type](#)

Some properties cannot be modified, and this procedure will fail if an attempt is made to alter such a property. For properties and options that can be changed, a few are dynamic, and Messaging Gateway uses the new values immediately. Others require the Messaging Gateway agent to be shut down and restarted before they take effect.

 **See Also:**

"TIB/Rendezvous System Properties" in *Oracle Database Advanced Queuing User's Guide* for more information about the messaging system properties and options

115.5.5 ALTER_MSGSYSTEM_LINK Procedure for WebSphere MQ

This procedure alters the properties of a WebSphere MQ messaging system link.

Syntax

```
DBMS_MGWADM.ALTER_MSGSYSTEM_LINK (
    linkname   IN   VARCHAR2,
    properties IN   SYS.MGW_MQSERIES_PROPERTIES,
    options    IN   SYS.MGW_PROPERTIES DEFAULT NULL,
    comment    IN   VARCHAR2 DEFAULT DBMS_MGWADM.NO_CHANGE);
```

Parameters

Table 115-24 ALTER_MSGSYSTEM_LINK Procedure Parameters for WebSphere MQ

| Parameters | Description |
|------------|---|
| linkname | The messaging system link name |
| properties | Basic properties for a WebSphere MQ messaging system link. If it is NULL, then no link properties are changed. |
| options | Optional link properties. NULL if no options are changed. If not NULL, then the properties specified in this list are combined with the current options properties to form a new set of link options. |
| comment | An optional description or NULL if not desired. If DBMS_MGWADM.NO_CHANGE is specified, then the current value is not changed. |

Usage Notes

To retain an existing value for a messaging link property with a VARCHAR2 datatype, specify DBMS_MGWADM.NO_CHANGE for that particular property. To preserve an existing value for a property of another datatype, specify NULL for that property.

The options parameter specifies a set of properties used to alter the current optional properties. Each property affects the current property list in a particular manner: add a new property, replace an existing property, remove an existing property, or remove all properties.

 **See Also:**

[SYS.MGW_PROPERTIES Object Type](#)

Some properties cannot be modified, and this procedure will fail if an attempt is made to alter such a property. For properties and options that can be changed, a few are dynamic, and Messaging Gateway uses the new values immediately. Others require the Messaging Gateway agent to be shut down and restarted before they take effect.

 **See Also:**

"WebSphere MQ System Properties" in *Oracle Database Advanced Queuing User's Guide* for more information about the messaging system properties and options

115.5.6 ALTER_PROPAGATION_SCHEDULE Procedure

This procedure alters a propagation schedule.

 **Note:**

This subprogram has been deprecated as a result of improved technology (see [ALTER_JOB Procedure](#)), and is retained only for reasons of backward compatibility.

Syntax

```
DBMS_MGWADM.ALTER_PROPAGATION_SCHEDULE (
    schedule_id  IN VARCHAR2,
    duration     IN NUMBER DEFAULT NULL,
    next_time    IN VARCHAR2 DEFAULT NULL,
    latency      IN NUMBER DEFAULT NULL);
```

Parameters

Table 115-25 ALTER_PROPAGATION_SCHEDULE Procedure Parameters

| Parameter | Description |
|-------------|--|
| schedule_id | Identifies the propagation schedule to be altered |
| duration | Reserved for future use |
| next_time | Reserved for future use |
| latency | Specifies the polling interval, in seconds, used by the Messaging Gateway agent when checking for messages in the source queue. If no messages are available in the source queue, then the agent will not poll again until the polling interval has passed. Once the agent detects a message it will continue propagating messages as long as any are available. Values: NULL or value > 0. If latency is NULL, then the Messaging Gateway agent default polling interval will be used. The default polling interval is 5 seconds, but it can be overridden by the Messaging Gateway initialization file. |

Usage Notes

This procedure always overwrites the existing value for each parameter. If a given parameter is not specified, then the existing values are overwritten with the default value.

115.5.7 ALTER_SUBSCRIBER Procedure

This procedure alters the parameters of a subscriber used to consume messages from a source queue for propagation to a destination.

Note:

This subprogram has been deprecated as a result of improved technology (see [ALTER_JOB Procedure](#)), and is retained only for reasons of backward compatibility.

Syntax

```
DBMS_MGWADM.ALTER_SUBSCRIBER (
  subscriber_id   IN VARCHAR2,
  rule            IN VARCHAR2 DEFAULT DBMS_MGWADM.NO_CHANGE,
  transformation  IN VARCHAR2 DEFAULT DBMS_MGWADM.NO_CHANGE,
  exception_queue IN VARCHAR2 DEFAULT DBMS_MGWADM.NO_CHANGE,
  options        IN SYS.MGW_PROPERTIES DEFAULT NULL );
```

Parameters

Table 115-26 ALTER_SUBSCRIBER Procedure Parameters

| Parameter | Description |
|----------------|---|
| subscriber_id | Identifies the subscriber to be altered |
| rule | Specifies an optional subscription rule used by the subscriber to dequeue messages from the source queue. The syntax and interpretation of this parameter depend on the subscriber propagation type. A NULL value indicates that no subscription rule is needed. If DBMS_MGWADM.NO_CHANGE, then the current value is unchanged. |
| transformation | Specifies the transformation needed to convert between the Oracle Database Advanced Queuing payload and an ADT defined by Messaging Gateway. The type of transformation needed depends on the subscriber propagation type. A NULL value indicates that no transformation is needed. If DBMS_MGWADM.NO_CHANGE, then the current value is unchanged. |

Table 115-26 (Cont.) ALTER_SUBSCRIBER Procedure Parameters

| Parameter | Description |
|------------------------------|---|
| <code>exception_queue</code> | <p>Specifies a queue used for exception message logging. This queue must be on the same messaging system as the propagation source. If no exception queue is associated with the subscriber, then propagation stops if a problem occurs. The syntax and interpretation of this parameter depend on the subscriber propagation type.</p> <p>A <code>NULL</code> value indicates that no exception queue is used. If <code>DBMS_MGWADM.NO_CHANGE</code>, then the current value is unchanged.</p> <p>The source queue and exception queue cannot be the same queue.</p> |
| <code>options</code> | <p>Optional subscriber properties. If <code>NULL</code>, then no options will be changed. If not <code>NULL</code>, then the properties specified in this list are combined with the current optional properties to form a new set of subscriber options.</p> |

Usage Notes

If the non-Oracle messaging link being accessed for the subscriber uses a JMS interface, then the Messaging Gateway agent will use the Oracle JMS interface to access the Oracle Database Advanced Queuing queues. Otherwise the native Oracle Database Advanced Queuing interface will be used. Parameters are interpreted differently when the Messaging Gateway agent uses Oracle JMS for JMS connections.

When propagating from a JMS source, the subscriber rule cannot be altered. Instead, the subscriber must be removed and added with the new rule. For JMS, changing the message selector on a durable subscription is equivalent to deleting and re-creating the subscription.

Transformations are not currently supported if the Oracle JMS interface is used for propagation. The transformation parameter must be `DBMS_MGWADM.NO_CHANGE` (the default value).

The `options` parameter specifies a set of properties used to alter the current optional properties. Each property affects the current property list in a particular manner: add a new property, replace an existing property, remove an existing property, or remove all properties.

 **See Also:**

- [SYS.MGW_PROPERTIES Object Type](#) for more information on the options parameter
- "WebSphere MQ System Properties" in *Oracle Database Advanced Queuing User's Guide* for more information about WebSphere MQ subscriber options
- "TIB/Rendezvous System Properties" in *Oracle Database Advanced Queuing User's Guide* for more information about TIB/Rendezvous subscriber options
- "[OUTBOUND_PROPAGATION Subscribers](#)" for outbound propagation parameter interpretation
- "[INBOUND_PROPAGATION Subscribers](#)" for inbound propagation parameter interpretation

115.5.8 CLEANUP_GATEWAY Procedures

This procedure cleans up Messaging Gateway. The procedure performs cleanup or recovery actions that may be needed when Messaging Gateway is left in some abnormal or unexpected condition. The `MGW_GATEWAY` view lists Messaging Gateway status and configuration information that pertains to the cleanup actions.

Syntax

```
DBMS_MGWADM.CLEANUP_GATEWAY (
    action      IN    BINARY_INTEGER,
    sarg        IN    VARCHAR2 DEFAULT NULL);

DBMS_MGWADM.CLEANUP_GATEWAY (
    agent_name  IN    VARCHAR2,  action      IN    BINARY_INTEGER,
    sarg        IN    VARCHAR2 DEFAULT NULL );
```

Parameters

Table 115-27 CLEANUP_GATEWAY Procedure Parameters

| Parameter | Description |
|-----------|--|
| action | The cleanup action to be performed. Values: <ul style="list-style-type: none"> • <code>DBMS_MGWADM.CLEAN_STARTUP_STATE</code> for Messaging Gateway start up state recovery • <code>DBMS_MGWADM.CLEAN_LOG_QUEUES</code> for log queue cleanup • <code>DBMS_MGWADM.RESET_SUB_MISSING_LOG_REC</code> for propagation job recovery due to missing log record • <code>DBMS_MGWADM.RESET_SUB_MISSING_MESSAGE</code> for propagation job recovery due to missing message |
| sarg | Optional argument whose meaning depends on the value specified for <code>action</code> . This should be <code>NULL</code> if it is not used for the specified action. |

Table 115-27 (Cont.) CLEANUP_GATEWAY Procedure Parameters

| Parameter | Description |
|------------|---|
| agent_name | Identifies the Messaging Gateway agent. DBMS_MGWADM.DEFAULT_AGENT specifies the default agent. |

Usage Notes

CLEAN_STARTUP_STATE

sarg is not used and must be NULL.

The CLEAN_STARTUP_STATE action recovers Messaging Gateway to a known state when the Messaging Gateway agent has crashed or some other abnormal event occurs, and Messaging Gateway cannot be restarted. This should be done only when the Messaging Gateway agent has been started but appears to have crashed or has been nonresponsive for an extended period of time.

The CLEAN_STARTUP_STATE action may be needed when the MGW_GATEWAY view shows that the AGENT_STATUS value is something other than NOT_STARTED or START_SCHEDULED, and the AGENT_PING value is UNREACHABLE for an extended period of time.

If the AGENT_STATUS value is BROKEN, then the Messaging Gateway agent cannot be started until the problem has been resolved and the CLEAN_STARTUP_STATE action used to reset the agent status. A BROKEN status can indicate that the Messaging Gateway start job detected a Messaging Gateway agent already running. This condition that should never occur under normal use.

Cleanup tasks include:

- Removing the Scheduler job used to start the external Messaging Gateway agent process.
- Setting certain configuration information to a known state. For example, setting the agent status to NOT_STARTED.

Execution of this command fails if:

- The agent status is NOT_STARTED or START_SCHEDULED.
- No shutdown attempt has been made prior to calling this procedure, except if the agent status is STARTING.
- The Messaging Gateway agent is successfully contacted.

The assumption is that the agent is active, and this procedure fails. If the agent does not respond after several attempts have been made, then the cleanup tasks are performed. This procedure takes at least several seconds and possibly up to one minute. This is expected behavior under conditions where this particular cleanup action is appropriate and necessary.

 **Note:**

Terminate any Messaging Gateway agent process that may still be running after a `CLEAN_STARTUP_STATE` action has been successfully performed. This should be done before calling `DBMS_MGWADM.STARTUP` to start Messaging Gateway. The process is usually named `extprocmgwextproc`.

`CLEAN_LOG_QUEUES`

`sarg` is not used and must be `NULL`.

The Messaging Gateway agent will clean log queues for all configured messaging system links. The agent will temporarily stop all propagation activity and then remove all obsolete and bad log records from the log queues for all links. The procedure will fail if the Messaging Gateway agent is not running.

This cleanup action is automatically performed each time the Messaging Gateway agent is started.

 **Note:**

The `CLEAN_LOG_QUEUES` action is performed only on agent startup. If this procedure is called when the agent is running, then the Messaging Gateway agent ignores it.

`RESET_SUB_MISSING_LOG_REC`

`sarg` specifies a Messaging Gateway job name (or subscriber ID) to be reset. It must not be `NULL`.

The Messaging Gateway agent recovers a Messaging Gateway propagation job that has failed due to a missing log record. The agent will reset the source and destination log records. The procedure will fail if the Messaging Gateway agent is not running.

 **Note:**

If the messages in the source queue had already been propagated to the destination queue, then this action may result in duplicate messages.

`RESET_SUB_MISSING_MESSAGE`

`sarg` specifies a Messaging Gateway job name (or subscriber ID) to be reset. It must not be `NULL`.

The Messaging Gateway agent recovers a Messaging Gateway propagation job that has failed due to a missing persistent source message. The agent will treat the message as a non-persistent message and continue processing that propagation job. The procedure will fail if the Messaging Gateway agent is not running.

115.5.9 CREATE_AGENT Procedure

This procedure creates a Messaging Gateway agent that will be used to process propagation jobs.

Syntax

```
DBMS_MGWADM.CREATE_AGENT (
    agent_name      IN  VARCHAR2,
    username        IN  VARCHAR2 DEFAULT NULL,
    password        IN  VARCHAR2 DEFAULT NULL,
    database        IN  VARCHAR2 DEFAULT NULL,
    conntype        IN  VARCHAR2 DEFAULT DBMS_MGWADM.JDBC_OCI,
    max_memory      IN  PLS_INTEGER DEFAULT 64,
    max_threads     IN  PLS_INTEGER DEFAULT 1,
    service         IN  VARCHAR2 DEFAULT NULL,
    initfile        IN  VARCHAR2 DEFAULT NULL,
    comment         IN  VARCHAR2  DEFAULT NULL );
```

Parameters

Table 115-28 CREATE_AGENT Procedure Parameters

| Parameter | Description |
|-------------|--|
| agent_name | A name used to identify the agent |
| username | Specifies the username used for connections to the Oracle Database |
| password | Specifies the password used for connections to the Oracle Database. A password must be specified if a username is specified. |
| database | Specifies the database connect string used for connections to the Oracle Database. NULL indicates that a local connection should be used. A value can be specified only if username is specified. Oracle strongly recommends that a connect string, rather than NULL be specified. Usually it will be a net service name from tnsnames.ora. |
| conntype | Specifies the type of connection to the Oracle Database. Values: DBMS_MGWADM.JDBC_OCI, DBMS_MGWADM.JDBC_THIN |
| max_memory | Specifies the maximum heap size, in MB, used by the Messaging Gateway agent |
| max_threads | Specifies the number of messaging threads that the Messaging Gateway agent creates. This determines the number of propagation jobs that the agent can concurrently process. The maximum value of max_threads is limited to 128. |
| service | Specifies the database service that the Oracle Scheduler job class used by this agent will have affinity to. In an Oracle RAC environment, this means that the Messaging Gateway agent will only run on those database instances that are assigned to the service. If NULL, then the job class will belong to the default service which is mapped to every instance. |
| initfile | Specifies a Messaging Gateway initialization file used by this agent. NULL indicates that the default initialization file is used. If a value is specified, it should be the full path name of the file. |
| comment | An optional comment for this agent. NULL if one is not desired. |

Usage Notes

- The Messaging Gateway automatically configures a default agent when Messaging Gateway is installed. The name of the default agent is `DEFAULT_AGENT`. This procedure can be used to create additional agents.
- The `username`, `password`, and `database` parameters specify connection information used by the Messaging Gateway agent for connections to the Oracle Database. An Oracle administrator should create the database user and grant it the role `MGW_AGENT_ROLE`. It is not mandatory that the connection information be specified when this procedure is called but it must be set before the agent can be started.
- The `service` parameter is used to create an Oracle Scheduler job class. The job class is used to create a Scheduler job that starts the Messaging Gateway agent. An Oracle administrator must create the database service. If the value is `NULL`, the job class will belong to an internal service that is mapped to all instances.

115.5.10 CREATE_JOB Procedure

This procedure creates a job used to propagate message from a source to a destination.

Syntax

```
DBMS_MGWADM.CREATE_JOB (
  job_name          IN  VARCHAR2,
  propagation_type  IN  PLS_INTEGER,
  source            IN  VARCHAR2,
  destination       IN  VARCHAR2,
  rule              IN  VARCHAR2 DEFAULT NULL,
  transformation    IN  VARCHAR2 DEFAULT NULL,
  exception_queue   IN  VARCHAR2 DEFAULT NULL,
  poll_interval     IN  PLS_INTEGER DEFAULT NULL,
  options           IN  SYS.MGW_PROPERTIES DEFAULT NULL,
  enabled           IN  BOOLEAN DEFAULT TRUE,
  comments          IN  VARCHAR2 DEFAULT NULL);
```

Parameters

Table 115-29 CREATE_JOB Procedure Parameters

| Parameter | Description |
|-------------------------------|--|
| <code>job_name</code> | A user defined name to identify the propagation job |
| <code>propagation_type</code> | Specifies the type of message propagation. <ul style="list-style-type: none"> • <code>DBMS_MGWADM.OUTBOUND_PROPAGATION</code> for Oracle Streams AQ to non-Oracle propagation. • <code>DBMS_MGWADM.INBOUND_PROPAGATION</code> for non-Oracle to Oracle Streams AQ propagation. |
| <code>source</code> | Specifies the source queue whose messages are to be propagated. The syntax and interpretation of this parameter depend on the value specified for <code>propagation_type</code> . |
| <code>destination</code> | Specifies the destination queue to which messages are propagated. The syntax and interpretation of this parameter depend on the value specified for <code>propagation_type</code> . |

Table 115-29 (Cont.) CREATE_JOB Procedure Parameters

| Parameter | Description |
|-----------------|--|
| rule | Specifies an optional subscription rule used to dequeue messages from the source queue. This should be <code>NULL</code> if no rule is needed. The syntax and interpretation of this parameter depend on the value specified for <code>propagation_type</code> . |
| transformation | Specifies the transformation needed to convert between the Oracle Streams AQ payload and an ADT defined by Messaging Gateway. The type of transformation needed depends on the value specified for <code>propagation_type</code> . If no transformation is specified the Oracle Streams AQ payload type must be supported by Messaging Gateway. |
| exception_queue | Specifies a queue used for exception message logging purposes. This queue must be on the same messaging system as the propagation source. If <code>NULL</code> , an exception queue will not be used and propagation will stop if a problem occurs. The syntax and interpretation of this parameter depend on the value specified for <code>propagation_type</code> . The source queue and exception queue cannot be the same queue. |
| poll_interval | Specifies the polling interval, in seconds, used by the Messaging Gateway agent when checking for messages in the source queue. If no messages are available the agent will not poll again until the polling interval has passed. Once the agent detects a message it will continue propagating messages as long as any are available. Values: <code>NULL</code> or value > 0. If <code>NULL</code> , then the Messaging Gateway default polling interval will be used. The default polling interval is 5 seconds and can be overridden by the Messaging Gateway initialization file. |
| options | Optional job properties, <code>NULL</code> if there are none. Typically these are lesser used configuration properties supported by the messaging system. |
| enabled | Specifies whether this propagation job is enabled after creation. Values: <code>TRUE</code> , <code>FALSE</code> . <ul style="list-style-type: none"> • If <code>TRUE</code> (default), the job will be enabled after it is created. • If <code>FALSE</code>, the job will be disabled after it is created. A propagation job must be enabled and the Messaging Gateway agent running before messages can be propagated. |
| comments | An optional comment for this job. <code>NULL</code> if one is not desired. |

Usage Notes

- The job must be enabled and Messaging Gateway agent started in order for messages to be propagated.
- If the non-Oracle messaging link being accessed for the propagation job uses a JMS interface, then the Messaging Gateway agent will use the Oracle JMS interface to access the Oracle Streams AQ queues. Otherwise the native Oracle Streams AQ interface will be used. Parameters are interpreted differently when the Messaging Gateway agent uses Oracle JMS for JMS connections.

- Transformations are not currently supported if the Oracle JMS interface is used for propagation. The transformation parameter must be `NULL`.

OUTBOUND_PROPAGATION Jobs

The parameters for an outbound propagation job are interpreted as follows:

- `source` specifies the local Oracle Streams AQ queue that is the propagation source. This must have syntax of `schema.queue`. This can be either a multiple consumer queue or a single consumer queue.
- `destination` specifies the non-Oracle queue to which messages are propagated. This must have syntax of `registered_queue@message_link`.
- `rule` specifies an optional Oracle Streams AQ subscriber rule if the native Oracle Stream AQ interface is used, or a JMS selector if the Oracle JMS interface is used. If `NULL`, then no rule or selector is used. This parameter must be `NULL` if the native Oracle Stream AQ interface is used and the propagation source is a single consumer queue.
- `transformation` specifies the transformation used to convert the Oracle Streams AQ payload to an ADT defined by Messaging Gateway. The full transformation name (`schema.name`) should be used if one is specified.

Messaging Gateway propagation dequeues messages from the Oracle Streams AQ queue using the transformation to convert the Oracle Streams AQ payload to a known ADT defined by Messaging Gateway. The message is then enqueued in the non-Oracle messaging system based on the Messaging Gateway ADT.

- `exception_queue` specifies the name of a local Oracle Streams AQ queue to which messages are moved if an exception occurs. The syntax must be `schema.queue`.

If the native Oracle Streams AQ interface is used and the source is a multiple consumer queue, then a subscriber will be added to the Oracle Streams AQ queue when this procedure is called, whether or not the Messaging Gateway agent is running. The local subscriber will be of the form `sys.aq$_agent('MGW_job_name', NULL, NULL)`.

If the Oracle JMS interface is used, then the Messaging Gateway agent will create a JMS durable subscriber with the name of `MGW_job_name`. If the agent is not running when this procedure is called, then the durable subscriber will be created the next time the agent starts.

The exception queue has the following conditions:

- The user is responsible for creating the Oracle Streams AQ queue to be used as the exception queue.
- The payload type of the source queue and exception queue must match.
- The exception queue must be created as a queue type of `DBMS_AQADM.NORMAL_QUEUE`. Enqueue restrictions prevent Messaging Gateway from using an Oracle Streams AQ queue of type `DBMS_AQADM.EXCEPTION_QUEUE` as a Messaging Gateway exception queue.

INBOUND_PROPAGATION Jobs

The parameters for an inbound propagation job are interpreted as follows:

- `source` specifies the non-Oracle queue that is the propagation source. The syntax must be `registered_queue@message_link`.

- `destination` specifies the local Oracle Streams AQ queue to which messages are propagated. The syntax must be `schema.queue`.
- `rule` specifies an optional subscriber rule that is valid for the non-Oracle messaging system. This should be `NULL` if no rule is needed.
- `transformation` specifies the transformation used to convert an ADT defined by Messaging Gateway to the Oracle Streams AQ payload type. The full transformation name (`schema.name`) should be used if one is specified

Messaging Gateway propagation dequeues messages from the non-Oracle messaging system and converts the message body to a known ADT defined by Messaging Gateway. The transformation is used to convert the Messaging Gateway ADT to an Oracle Streams AQ payload type when the message is enqueued to the Oracle Streams AQ queue.

- `exception_queue` specifies the name of a registered non-Oracle queue to which messages are moved if an exception occurs. The syntax must be `registered_queue@message_link`.

Whether or not a subscriber is needed for the source queue depends on the requirements of the non-Oracle messaging system. If a durable subscriber is necessary, then the Messaging Gateway agent will create it. If the agent is not running when this procedure is called, then the subscriber will be created on the non-Oracle messaging system the next time the agent starts.

The exception queue has the following conditions:

- The exception queue must be a registered non-Oracle queue.
- The source queue and exception queue must use the same messaging system link.

115.5.11 CREATE_MSGSYSTEM_LINK Procedures for TIB/Rendezvous

This procedure creates a link to a TIB/Rendezvous messaging system.

Syntax

```
DBMS_MGWADM.CREATE_MSGSYSTEM_LINK (
    linkname      IN  VARCHAR2,
    properties    IN  SYS.MGW_TIBRV_PROPERTIES,
    options       IN  SYS.MGW_PROPERTIES DEFAULT NULL,
    comment       IN  VARCHAR2 DEFAULT NULL );
```

```
DBMS_MGWADM.CREATE_MSGSYSTEM_LINK (
    linkname      IN  VARCHAR2,
    agent_name    IN  VARCHAR2,
    properties    IN  SYS.MGW_TIBRV_PROPERTIES,
    options       IN  SYS.MGW_PROPERTIES DEFAULT NULL,
    comment       IN  VARCHAR2 DEFAULT NULL );
```

Parameters

Table 115-30 CREATE_MSGSYSTEM_LINK Procedure Parameters for TIB/Rendezvous

| Parameter | Description |
|-------------------------|---|
| <code>linkname</code> | A user-defined name to identify this messaging system link |
| <code>properties</code> | Basic properties of a TIB/Rendezvous messaging system link. |

Table 115-30 (Cont.) CREATE_MSGSYSTEM_LINK Procedure Parameters for TIB/Rendezvous

| Parameter | Description |
|------------|--|
| options | Optional link properties. NULL if there are none. These are less frequently used configuration properties supported by the messaging system |
| comment | A user-specified description. NULL if one is not desired. |
| agent_name | Specifies the Messaging Gateway agent that will be used to process all propagation jobs associated with this link. DBMS_MGWADM.DEFAULT_AGENT specifies the default agent. |

Usage Notes

The Messaging Gateway default agent will process the propagation jobs associated with this link if an agent name is not specified.

See Also:

"TIB/Rendezvous System Properties" in *Oracle Database Advanced Queuing User's Guide* for more information about the messaging system properties and options

115.5.12 CREATE_MSGSYSTEM_LINK Procedures for WebSphere MQ

This procedure creates a messaging system link to a WebSphere MQ messaging system.

Syntax

```
DBMS_MGWADM.CREATE_MSGSYSTEM_LINK(
    linkname      IN VARCHAR2,
    properties    IN SYS.MGW_MQSERIES_PROPERTIES,
    options       IN SYS.MGW_PROPERTIES DEFAULT NULL,
    comment       IN VARCHAR2 DEFAULT NULL);
```

```
DBMS_MGWADM.CREATE_MSGSYSTEM_LINK(
    linkname      IN VARCHAR2,
    agent_name    IN VARCHAR2,
    properties    IN SYS.MGW_MQSERIES_PROPERTIES,
    options       IN SYS.MGW_PROPERTIES DEFAULT NULL,
    comment       IN VARCHAR2 DEFAULT NULL);
```

Parameters

Table 115-31 CREATE_MSGSYSTEM_LINK Procedure Parameters for WebSphere MQ

| Parameter | Description |
|------------|---|
| linkname | A user-defined name to identify the messaging system link |
| properties | Basic properties of a WebSphere MQ messaging system link |
| options | Optional link properties. <code>NULL</code> if there are none. These are less frequently used configuration properties supported by the messaging system. |
| comment | A user-specified description. <code>NULL</code> if one is not desired |
| agent_name | Specifies the Messaging Gateway agent that will be used to process all propagation jobs associated with this link. <code>DBMS_MGWADM.DEFAULT_AGENT</code> specifies the default agent. |

Usage Notes

The Messaging Gateway default agent will process the propagation jobs associated with this link if an agent name is not specified.

See Also:

"WebSphere MQ System Properties" in *Oracle Database Advanced Queuing User's Guide* for more information about the messaging system properties and options

115.5.13 DB_CONNECT_INFO Procedure

This deprecated procedure configures connection information used by the Messaging Gateway default agent for connections to Oracle Database.

Note:

This subprogram has been deprecated as a result of improved technology (see [ALTER_AGENT Procedures](#)), and is retained only for reasons of backward compatibility.

Syntax

```
DBMS_MGWADM.DB_CONNECT_INFO (
  username      IN VARCHAR2,
  password      IN VARCHAR2,
  database      IN VARCHAR2 DEFAULT NULL);
```

Parameters

Table 115-32 DB_CONNECT_INFO Procedure Parameters

| Parameter | Description |
|-----------|--|
| username | The username used for connections to Oracle Database. NULL is not allowed |
| password | The password used for connections to Oracle Database. NULL is not allowed |
| database | The database connect string used by the Messaging Gateway agent. NULL indicates that a local connection should be used. Oracle strongly recommends that a not NULL value be specified. Usually it will be a net service name from <code>tnsnames.ora</code> . |

Usage Notes

The Messaging Gateway agent connects to Oracle Database as the user configured by this procedure. An Oracle administrator should create the user, grant it the role `MGW_AGENT_ROLE`, and then call this procedure to configure Messaging Gateway. Role `MGW_AGENT_ROLE` is used to grant this user special privileges needed to access Messaging Gateway configuration information stored in the database, enqueue or dequeue messages to and from Oracle Database Advanced Queuing queues, and perform certain Oracle Database Advanced Queuing administration tasks.

115.5.14 DISABLE_JOB Procedure

This procedure disables a propagation job.

Syntax

```
DBMS_MGWADM.DISABLE_JOB (
    job_name IN VARCHAR2);
```

Parameters

Table 115-33 DISABLE_JOB Procedure Parameters

| Parameter | Description |
|-----------|--------------------------------|
| job_name | Identifies the propagation job |

115.5.15 DISABLE_PROPAGATION_SCHEDULE Procedure

This **deprecated procedure** disables a propagation schedule.

Note:

This subprogram has been deprecated as a result of improved technology (see [DISABLE_JOB Procedure](#)), and is retained only for reasons of backward compatibility.

Syntax

```
DBMS_MGWADM.DISABLE_PROPAGATION_SCHEDULE (  
    schedule_id IN VARCHAR2);
```

Parameters

Table 115-34 DISABLE_PROPAGATION_SCHEDULE Procedure Parameters

| Parameter | Description |
|-------------|--|
| schedule_id | Identifies the propagation schedule to be disabled |

115.5.16 ENABLE_JOB Procedure

This procedure enables a propagation job.

Syntax

```
DBMS_MGWADM.ENABLE_JOB (  
    job_name IN VARCHAR2 );
```

Parameters

Table 115-35 ENABLE_JOB Procedure Parameters

| Parameter | Description |
|-----------|--------------------------------|
| job_name | Identifies the propagation job |

115.5.17 ENABLE_PROPAGATION_SCHEDULE Procedure

This deprecated procedure enables a propagation schedule.

Note:

This subprogram has been deprecated as a result of improved technology (see [ENABLE_JOB Procedure](#)), and is retained only for reasons of backward compatibility.

Syntax

```
DBMS_MGWADM.ENABLE_PROPAGATION_SCHEDULE (
    schedule_id IN VARCHAR2 );
```

Parameters

Table 115-36 ENABLE_PROPAGATION_SCHEDULE Procedure Parameters

| Parameter | Description |
|-------------|---|
| schedule_id | Identifies the propagation schedule to be enabled |

115.5.18 REGISTER_FOREIGN_QUEUE Procedure

This procedure registers a non-Oracle queue entity in Messaging Gateway.

Syntax

```
DBMS_MGWADM.REGISTER_FOREIGN_QUEUE (
    name           IN VARCHAR2,
    linkname       IN VARCHAR2,
    provider_queue IN VARCHAR2 DEFAULT NULL,
    domain         IN INTEGER DEFAULT NULL,
    options        IN SYS.MGW_PROPERTIES DEFAULT NULL,
    comment        IN VARCHAR2 DEFAULT NULL);
```

Parameters

Table 115-37 REGISTER_FOREIGN_QUEUE Procedure Parameters

| Parameters | Description |
|----------------|--|
| name | The registered queue name. This name identifies the foreign queue within Messaging Gateway and need not match the name of the queue in the foreign messaging system. |
| linkname | The link name for the messaging system on which this queue exists |
| provider_queue | The message provider (native) queue name. If NULL, then the value provided for the name parameter is used as the provider queue name. |

Table 115-37 (Cont.) REGISTER_FOREIGN_QUEUE Procedure Parameters

| Parameters | Description |
|------------|---|
| domain | The domain type of the queue. NULL means the domain type is automatically determined based on the messaging system of the queue. DBMS_MGWADM.DOMAIN_QUEUE is for a queue (point-to-point model). DBMS_MGWADM.DOMAIN_TOPIC is for a topic (publish-subscribe model). |
| options | Optional queue properties |
| comment | A user-specified description. Can be NULL. |

Usage Notes

This procedure does not create the physical queue in the non-Oracle messaging system. The non-Oracle queue must be created using the administration tools for that messaging system.

See Also:

For more information when registering queues for the WebSphere MQ messaging system or the TIB/Rendezvous messaging system, specifically "Optional Foreign Queue Configuration Properties" in *Oracle Database Advanced Queuing User's Guide*.

115.5.19 REMOVE_AGENT Procedure

This procedure removes a Messaging Gateway agent.

Syntax

```
DBMS_MGWADM.REMOVE_AGENT (
    agent_name IN VARCHAR2 );
```

Parameters

Table 115-38 REMOVE_AGENT Procedure Parameters

| Parameters | Description |
|------------|--|
| agent_name | Identifies the Messaging Gateway agent |

Usage Notes

All messaging system links associated with this Messaging Gateway agent must be removed and the agent must be stopped before it can be removed. The Messaging Gateway default agent cannot be removed.

115.5.20 REMOVE_JOB Procedure

This procedure removes a propagation job.

Syntax

```
DBMS_MGWADM.REMOVE_JOB (
    job_name IN VARCHAR2, force IN PLS_INTEGER DEFAULT
    DBMS_MGWADM.NO_FORCE);
```

Parameters

Table 115-39 REMOVE_JOB Procedure Parameters

| Parameters | Description |
|------------|--|
| job_name | Identifies the propagation job |
| force | Specifies whether the procedure should succeed even if Messaging Gateway is not able to perform all cleanup actions pertaining to this propagation job. Values: DBMS_MGWADM.NO_FORCE, DBMS_MGWADM.FORCE <ul style="list-style-type: none"> NO_FORCE (default) means the job is not removed if Messaging Gateway is unable to clean up successfully FORCE means the job is removed even though all cleanup actions may not be done |

Usage Notes

- The Messaging Gateway agent uses various resources of the Oracle Database and the non-Oracle messaging system for its propagation work. These resources need to be released when the job is removed. For example, Messaging Gateway may create a durable subscriber on the source queue that should be removed when the job is removed. Therefore, this procedure should normally be called when the Messaging Gateway agent is running and able to access the non-Oracle messaging system associated with this job.
- For outbound propagation, a local subscriber is removed from the Oracle Streams AQ queue when the propagation source is a multiple consumer queue.

115.5.21 REMOVE_MSGSYSTEM_LINK Procedure

This procedure removes a messaging system link for a non-Oracle messaging system.

Syntax

```
DBMS_MGWADM.REMOVE_MSGSYSTEM_LINK (
    linkname IN VARCHAR2);
```

Parameters

Table 115-40 REMOVE_MSGSYSTEM_LINK Procedure Parameters

| Parameters | Description |
|------------|--------------------------------|
| linkname | The messaging system link name |

Usage Notes

All registered queues associated with this link must be removed before the messaging system link can be removed. This procedure fails if there is a registered foreign (non-Oracle) queue that references this link.

115.5.22 REMOVE_OPTION Procedure

This procedure removes a Messaging Gateway configuration option. It can be used to remove an agent option, a messaging link option, or a propagation job option.

Syntax

```
DBMS_MGWADM.REMOVE_OPTION (
    target_type IN PLS_INTEGER,
    target_name IN VARCHAR2,
    option_name IN VARCHAR2);
```

Parameters

Table 115-41 REMOVE_OPTION Procedure Parameters

| Parameter | Description |
|-------------|--|
| target_type | Specifies the target type of the Messaging Gateway entity: <ul style="list-style-type: none"> DBMS_MGWADM.AGENT_JAVA_PROP to remove a Java System property for a Messaging Gateway agent DBMS_MGWADM.MSGLINK_OPTION to remove a messaging link option DBMS_MGWADM.JOB_OPTION to remove a propagation job option |
| target_name | Name or identifier of the target. The value for this parameter depends on the value specified for target_type parameter. This must not be NULL. |
| option_name | Option name. This must not be NULL. |

See Also:

[Table 115-10](#) regarding options for the option_type parameter

Usage Notes

DBMS_MGWADM.AGENT_JAVA_PROP Target

The procedure removes an agent option used to set a Java System property when the Messaging Gateway agent is started. The agent must be restarted for the change to take effect.

The parameters are interpreted as follows:

- `target_name` specifies the name of the Messaging Gateway agent. `DBMS_MGWADM.DEFAULT_AGENT` can be used for the default agent.
- `option_name` specifies the Java System property
- `encrypted` can be either `TRUE` or `FALSE`

DBMS_MGWADM.MSGLINK_OPTION Target

The procedure removes a single option for a Messaging Gateway messaging system link. This is equivalent to calling `DBMS_MGWADM.ALTER_MSGSYSTEM_LINK` and using the `options` parameter to remove an option.

The parameters are interpreted as follows:

- `target_name` specifies the name of the message system link
- `option_name` specifies the option to set
- `encrypted` must be `FALSE`

DBMS_MGWADM.JOB_OPTION Target

The procedure removes a single option for a Messaging Gateway propagation job. This is equivalent to calling `DBMS_MGWADM.ALTER_JOB` and using the `options` parameter to remove an option.

The parameters are interpreted as follows:

- `target_name` specifies the name of the propagation job
- `option_name` specifies the option to set
- `encrypted` must be `FALSE`

115.5.23 REMOVE_SUBSCRIBER Procedure

This procedure removes a subscriber used to consume messages from a source queue for propagation to a destination.

Note:

This subprogram has been deprecated as a result of improved technology (see [REMOVE_JOB Procedure](#)), and is retained only for reasons of backward compatibility.

Syntax

```
DBMS_MGWADM.REMOVE_SUBSCRIBER (  
    subscriber_id IN VARCHAR2,  
    force         IN BINARY_INTEGER DEFAULT DBMS_MGWADM.NO_FORCE );
```

Parameters

Table 115-42 REMOVE_SUBSCRIBER Procedure Parameters

| Parameter | Description |
|---------------|--|
| subscriber_id | Identifies the subscriber to be removed |
| force | Specifies whether this procedure should succeed even if Messaging Gateway is not able to perform all cleanup actions pertaining to this subscriber. Values: DBMS_MGWADM.NO_FORCE, DBMS_MGWADM.FORCE <ul style="list-style-type: none"> NO_FORCE means the subscriber is not removed if Messaging Gateway is unable to clean up successfully (default) FORCE means the subscriber is removed even though all cleanup actions may not be done |

Usage Notes

- The Messaging Gateway agent uses various resources of Oracle Database and the non-Oracle messaging system for its propagation work. These resources are typically associated with each subscriber and need to be released when the subscriber is no longer needed. Therefore, this procedure should only be called when the Messaging Gateway agent is running and able to access the non-Oracle messaging system associated with this subscriber.
- For outbound propagation, a local subscriber is removed from the Oracle Database Advanced Queuing queue.

115.5.24 RESET_JOB Procedure

This procedure resets the propagation error state for a propagation job.

Syntax

```
DBMS_MGWADM.RESET_JOB (
    job_name IN VARCHAR2);
```

Parameters

Table 115-43 RESET_JOB Procedure Parameters

| Parameter | Description |
|-----------|--------------------------------|
| job_name | Identifies the propagation job |

Usage Notes

This procedure can be used to reset a propagation job that has been set to a failed state and propagation activities have been stopped. The administrator should correct the problem and then call this procedure to allow the agent to retry the propagation job. The STATUS field of the MGW_JOBS view indicates the job status.

115.5.25 RESET_SUBSCRIBER Procedure

This procedure resets the propagation error state for a subscriber.

Note:

This subprogram has been deprecated as a result of improved technology (see [RESET_JOB Procedure](#)), and is retained only for reasons of backward compatibility.

Syntax

```
DBMS_MGWADM.RESET_SUBSCRIBER (
    subscriber_id IN VARCHAR2 );
```

Parameters

Table 115-44 RESET_SUBSCRIBER Procedure Parameters

| Parameter | Description |
|---------------|---------------------------|
| subscriber_id | Identifies the subscriber |

115.5.26 SCHEDULE_PROPAGATION Procedure

This procedure schedules message propagation from a source to a destination.

The schedule must be enabled and Messaging Gateway started in order for messages to be propagated.

Note:

This subprogram has been deprecated as a result of improved technology (see [CREATE_JOB Procedure](#)), and is retained only for reasons of backward compatibility.

Syntax

```
DBMS_MGWADM.SCHEDULE_PROPAGATION (
    schedule_id      IN VARCHAR2,
    propagation_type IN BINARY_INTEGER,
    source           IN VARCHAR2,
    destination      IN VARCHAR2,
    start_time       IN DATE DEFAULT SYSDATE,
    duration         IN NUMBER DEFAULT NULL,
    next_time        IN VARCHAR2 DEFAULT NULL,
    latency          IN NUMBER DEFAULT NULL);
```

Parameters

Table 115-45 SCHEDULE_PROPAGATION Procedure Parameters

| Parameter | Description |
|-------------------------------|--|
| <code>schedule_id</code> | Specifies a user-defined name that identifies the schedule |
| <code>propagation_type</code> | Specifies the type of message propagation. DBMS_MGWADM.OUTBOUND_PROPAGATION is for Oracle Database Advanced Queuing to non-Oracle propagation. DBMS_MGWADM.INBOUND_PROPAGATION is for non-Oracle to Oracle Database Advanced Queuing propagation. |
| <code>source</code> | Specifies the source queue whose messages are to be propagated. The syntax and interpretation of this parameter depend on the value specified for <code>propagation_type</code> . |
| <code>destination</code> | Specifies the destination queue to which messages are propagated. The syntax and interpretation of this parameter depend on the value specified for <code>propagation_type</code> . |
| <code>start_time</code> | Reserved for future use |
| <code>duration</code> | Reserved for future use |
| <code>next_time</code> | Reserved for future use |
| <code>latency</code> | Specifies the polling interval, in seconds, used by the Messaging Gateway agent when checking for messages in the source queue. If no messages are available in the source queue, then the agent will not poll again until the polling interval has passed. Once the agent detects a message it will continue propagating messages as long as any are available. Values: NULL or value > 0. If <code>latency</code> is NULL, then the Messaging Gateway agent default polling interval will be used. The default polling interval is 5 seconds but it can be overridden by the Messaging Gateway initialization file. |

Usage Notes

For outbound propagation, parameters are interpreted as follows:

- `source` specifies the local Oracle Database Advanced Queuing queue from which messages are propagated. This must have a syntax of `schema.queue`.
- `destination` specifies the foreign queue to which messages are propagated. This must have a syntax of `registered_queue@message_link`.

For inbound propagation, parameters are interpreted as follows:

- `source` specifies the foreign queue from which messages are propagated. This must have a syntax of `registered_queue@message_link`.
- `destination` specifies the local Oracle Database Advanced Queuing queue to which messages are propagated. This must have a syntax of `schema.queue`.

The schedule is set to an enabled state when it is created.

115.5.27 SET_LOG_LEVEL Procedures

This procedure dynamically alters the Messaging Gateway agent logging level. The Messaging Gateway agent must be running.

Syntax

```
DBMS_MGWADM.SET_LOG_LEVEL (
    log_level    IN    BINARY_INTEGER);

DBMS_MGWADM.SET_LOG_LEVEL (
    agent_name  IN    VARCHAR2,
    log_level   IN    BINARY_INTEGER);
```

Parameters

Table 115-46 SET_LOG_LEVEL Procedure Parameters

| Parameter | Description |
|------------|--|
| log_level | Level at which the Messaging Gateway agent logs information. DBMS_MGWADM.BASIC_LOGGING generates the least information while DBMS_MGWADM.TRACE_DEBUG_LOGGING generates the most information. |
| agent_name | Identifies the Messaging Gateway agent. DBMS_MGWADM.DEFAULT_AGENT specifies the default agent. |

See Also:

[Table 115-3](#) for details on the log_level parameter

115.5.28 SET_OPTION Procedure

This procedure sets a Messaging Gateway configuration option. It can be used to set an agent option, a messaging link option, or a propagation job option.

Syntax

```
DBMS_MGWADM.SET_OPTION (
    target_type  IN    PLS_INTEGER,
    target_name  IN    VARCHAR2,
    option_name  IN    VARCHAR2,
    option_value IN    VARCHAR2,
    encrypted   IN    BOOLEAN DEFAULT FALSE );
```

Parameters

Table 115-47 SET_OPTION Procedure Parameters

| Parameter | Description |
|--------------|---|
| target_type | Specifies the target type of the Messaging Gateway entity: <ul style="list-style-type: none"> DBMS_MGWADM.AGENT_JAVA_PROP to set a Java System property for a Messaging Gateway agent DBMS_MGWADM.MSGLINK_OPTION to set a messaging link option DBMS_MGWADM.JOB_OPTION to set a propagation job option |
| target_name | Name or identifier of the target. The value for this parameter depends on the value specified for target_type parameter. This must not be NULL. |
| option_name | Option name. This must not be NULL. |
| option_value | Option value |
| encrypted | Indicates whether the value should be stored as encrypted: <ul style="list-style-type: none"> TRUE if the value should be stored in an encrypted form FALSE if the value should be stored in a cleartext form |

**See Also:**

[Table 115-10](#) regarding options for the option_type parameter

Usage Notes

DBMS_MGWADM.AGENT_JAVA_PROP Target

The procedure will store an agent option used to set a Java System property when the Messaging Gateway agent is started. The agent must be restarted for the change to take effect.

The parameters are interpreted as follows:

- target_name specifies the name of the Messaging Gateway agent. DBMS_MGWADM.DEFAULT_AGENT can be used for the default agent.
- option_name specifies the Java System property
- encrypted can be either TRUE or FALSE

DBMS_MGWADM.MSGLINK_OPTION Target

The procedure will set or alter a single option for a Messaging Gateway messaging system link. This is equivalent to calling DBMS_MGWADM.ALTER_MSGSYSTEM_LINK and using the options parameter to set an option.

The parameters are interpreted as follows:

- target_name specifies the name of the message system link
- option_name specifies the option to set
- encrypted must be FALSE

DBMS_MGWADM.JOB_OPTION Target

The procedure will set or alter a single option for a Messaging Gateway propagation job. This is equivalent to calling `DBMS_MGWADM.ALTER_JOB` and using the `options` parameter to set an option.

The parameters are interpreted as follows:

- `target_name` specifies the name of the propagation job
- `option_name` specifies the option to set
- `encrypted` must be `FALSE`

115.5.29 SHUTDOWN Procedures

This procedure shuts down the Messaging Gateway agent. No propagation activity occurs until Messaging Gateway is restarted.

Syntax

```
DBMS_MGWADM.SHUTDOWN (
    sdmode          IN BINARY_INTEGER DEFAULT DBMS_MGWADM.SHUTDOWN_NORMAL);
```

```
DBMS_MGWADM.SHUTDOWN (
    agent_name     IN VARCHAR2);
```

Parameters

Table 115-48 SHUTDOWN Procedure Parameters

| Parameter | Description |
|-------------------------|--|
| <code>sdmode</code> | The shutdown mode. The only value currently supported is <code>DBMS_MGWADM.SHUTDOWN_NORMAL</code> for normal shutdown. The Messaging Gateway agent may attempt to complete any propagation work currently in progress. |
| <code>agent_name</code> | Identifies the Messaging Gateway agent. <code>DBMS_MGWADM.DEFAULT_AGENT</code> specifies the default agent. |

Usage Notes

The Messaging Gateway default agent is shut down if no agent name is specified.

115.5.30 STARTUP Procedures

This procedure starts the Messaging Gateway agent. It must be called before any propagation activity can take place.

Syntax

```
DBMS_MGWADM.STARTUP (
    instance       IN BINARY_INTEGER DEFAULT 0,
    force         IN BINARY_INTEGER DEFAULT DBMS_MGWADM.NO_FORCE);
```

```
DBMS_MGWADM.STARTUP (
    agent_name     IN VARCHAR2);
```

Parameters

Table 115-49 STARTUP Procedure Parameters

| Parameter | Description |
|------------|--|
| instance | Specifies which instance can run the job queue job used to start the Messaging Gateway agent. If this is zero, then the job can be run by any instance. Caution: This parameter has been deprecated. |
| force | If this is DBMS_MGWADM.FORCE, then any positive integer is acceptable as the job instance. If this is DBMS_MGWADM.NO_FORCE (the default), then the specified instance must be running; otherwise the routine raises an exception. Caution: This parameter has been deprecated. |
| agent_name | Identifies the Messaging Gateway agent. DBMS_MGWADM.DEFAULT_AGENT specifies the default agent. |

Usage Notes

- The Messaging Gateway default agent will be started if an agent name is not specified.
- The `force` and `instance` parameters are no longer used and will be ignored. If the `instance` affinity parameters were being used to start the default agent on a specific instance, the administrator will need to create a database service and then assign that service to the default agent using the `DBMS_MGWADM.ALTER_AGENT` procedure.
- The Messaging Gateway agent cannot be started until an agent user has been configured by the `DBMS_MGWADM.CREATE_AGENT` or `DBMS_MGWADM.ALTER_AGENT` subprograms.

115.5.31 UNREGISTER_FOREIGN_QUEUE Procedure

This procedure removes a non-Oracle queue entity in Messaging Gateway.

Syntax

```
DBMS_MGWADM.UNREGISTER_FOREIGN_QUEUE(
    name          IN VARCHAR2,
    linkname      IN VARCHAR2);
```

Parameters

Table 115-50 UNREGISTER_FOREIGN_QUEUE Procedure Parameters

| Parameter | Description |
|-----------|--|
| name | The queue name |
| linkname | The link name for the messaging system on which the queue exists |

Usage Notes

- This procedure does not remove the physical queue in the non-Oracle messaging system.

- All propagation jobs, subscribers and schedules referencing this queue must be removed before it can be unregistered. This procedure fails if a propagation job, subscriber, or propagation schedule references the non-Oracle queue.

115.5.32 UNSCHEDULE_PROPAGATION Procedure

This deprecated procedure removes a propagation schedule.

Note:

This subprogram has been deprecated as a result of improved technology (see [REMOVE_JOB Procedure](#)), and is retained only for reasons of backward compatibility.

Syntax

```
DBMS_MGWADM.UNSCHEDULE_PROPAGATION (  
    schedule_id    IN VARCHAR2 );
```

Parameters

Table 115-51 UNSCHEDULE_PROPAGATION Procedure Parameters

| Parameter | Description |
|-------------|---|
| schedule_id | Identifies the propagation schedule to be removed |

DBMS_MGWMSG

DBMS_MGWMSG provides object types used by the canonical message types to convert message bodies, and methods, constants, and subprograms for working with Messaging Gateway message types.

This chapter contains the following topics:

- [Security Model](#)
- [Constants](#)
- [Types](#)
- [Summary of DBMS_MGWMSG Subprograms](#)

See Also:

[DBMS_MGWADM](#) which describes the Messaging Gateway administrative interface, [DBMS_MGWADM](#)

116.1 DBMS_MGWMSG Security Model

The EXECUTE privilege is granted to PUBLIC on all types defined in the DBMS_MGWMSG package as well as the canonical types. The DBMS_MGWMSG packages and object types are owned by SYS.

Note:

You must run the `catmgw.sql` script to load the Messaging Gateway packages and object types into the database. Refer to the *Oracle Database Advanced Queuing User's Guide* for information on loading database objects and using DBMS_MGWMSG.

116.2 DBMS_MGWMSG Constants

The DBMS_MGWMSG package defines constants for specifying various parameter values.

Table 116-1 DBMS_MGWMSG Constants: Value Types and Constants Representing the Type of Value for a SYS.MGW_NAME_VALUE_T Object

| Value | Constant |
|------------|------------------------------|
| TEXT_VALUE | CONSTANT BINARY_INTEGER := 1 |
| RAW_VALUE | CONSTANT BINARY_INTEGER := 2 |

Table 116-1 (Cont.) DBMS_MGWMSG Constants: Value Types and Constants Representing the Type of Value for a SYS.MGW_NAME_VALUE_T Object

| Value | Constant |
|---------------|-------------------------------|
| BOOLEAN_VALUE | CONSTANT BINARY_INTEGER := 3 |
| BYTE_VALUE | CONSTANT BINARY_INTEGER := 4 |
| SHORT_VALUE | CONSTANT BINARY_INTEGER := 5 |
| INTEGER_VALUE | CONSTANT BINARY_INTEGER := 6 |
| LONG_VALUE | CONSTANT BINARY_INTEGER := 7 |
| FLOAT_VALUE | CONSTANT BINARY_INTEGER := 8 |
| DOUBLE_VALUE | CONSTANT BINARY_INTEGER := 9 |
| DATE_VALUE | CONSTANT BINARY_INTEGER := 10 |

Table 116-2 DBMS_MGWMSG Constants: Boolean Values—Constants Representing a Boolean as a Numeric Value

| Value | Constant |
|---------------|------------------------------|
| BOOLEAN_FALSE | CONSTANT BINARY_INTEGER := 0 |
| BOOLEAN_TRUE | CONSTANT BINARY_INTEGER := 1 |

Table 116-3 DBMS_MGWMSG Constants: Case Comparisons

| Value | Constant |
|------------------|------------------------------|
| CASE_SENSITIVE | CONSTANT BINARY_INTEGER := 0 |
| CASE_INSENSITIVE | CONSTANT BINARY_INTEGER := 1 |

Table 116-4 Constants for the TIB/Rendezvous field type

| Value | Constant |
|-------------------|------------------------|
| TIBRVMSG_BOOL | CONSTANT INTEGER := 1 |
| TIBRVMSG_F32 | CONSTANT INTEGER := 2 |
| TIBRVMSG_F64 | CONSTANT INTEGER := 3 |
| TIBRVMSG_I8 | CONSTANT INTEGER := 4 |
| TIBRVMSG_I16 | CONSTANT INTEGER := 5 |
| TIBRVMSG_I32 | CONSTANT INTEGER := 6 |
| TIBRVMSG_I64 | CONSTANT INTEGER := 7 |
| TIBRVMSG_IPADDR32 | CONSTANT INTEGER := 8 |
| TIBRVMSG_IPPORT16 | CONSTANT INTEGER := 9 |
| TIBRVMSG_DATETIME | CONSTANT INTEGER := 10 |
| TIBRVMSG_F32ARRAY | CONSTANT INTEGER := 11 |
| TIBRVMSG_F64ARRAY | CONSTANT INTEGER := 12 |

Table 116-4 (Cont.) Constants for the TIB/Rendezvous field type

| Value | Constant |
|-------------------|------------------------|
| TIBRVMSG_I8ARRAY | CONSTANT INTEGER := 13 |
| TIBRVMSG_I16ARRAY | CONSTANT INTEGER := 14 |
| TIBRVMSG_I32ARRAY | CONSTANT INTEGER := 15 |
| TIBRVMSG_I64ARRAY | CONSTANT INTEGER := 16 |
| TIBRVMSG_OPAQUE | CONSTANT INTEGER := 17 |
| TIBRVMSG_STRING | CONSTANT INTEGER := 18 |
| TIBRVMSG_XML | CONSTANT INTEGER := 19 |

116.3 DBMS_MGWMSG Types

DBMS_MGWMSG uses types to specify certain information.

- [SYS.MGW_NAME_VALUE_T Type](#)
- [SYS.MGW_NAME_VALUE_T Type-Attribute Mapping](#)
- [SYS.MGW_NAME_TYPE_ARRAY_T Type](#)
- [SYS.MGW_TEXT_VALUE_T Type](#)
- [SYS.MGW_RAW_VALUE_T Type](#)
- [SYS.MGW_BASIC_MSG_T Type](#)
- [SYS.MGW_NUMBER_ARRAY_T Type](#)
- [SYS.MGW_TIBRV_FIELD_T Type](#)
- [SYS.MGW_TIBRV_MSG_T Type](#)

116.3.1 DBMS_MGWMSG SYS.MGW_NAME_VALUE_T Type

This type specifies a named value.

The name attribute, type attribute, and one of the <>_value attributes are typically not NULL.

Syntax

```

TYPE SYS.MGW_NAME_VALUE_T IS OBJECT (
    name          VARCHAR2 (250),
    type          INTEGER,
    integer_value INTEGER,
    number_value  NUMBER,
    text_value    VARCHAR2 (4000),
    raw_value     RAW (2000),
    date_value    DATE,

    -- Methods
    STATIC FUNCTION CONSTRUCT
    RETURN SYS.MGW_NAME_VALUE_T,

    STATIC FUNCTION CONSTRUCT_BOOLEAN (
        name IN VARCHAR2,
```

```

    value IN INTEGER )
RETURN SYS.MGW_NAME_VALUE_T,

STATIC FUNCTION CONSTRUCT_BYTE (
    name IN VARCHAR2,
    value IN INTEGER )
RETURN SYS.MGW_NAME_VALUE_T,

STATIC FUNCTION CONSTRUCT_SHORT (
    name IN VARCHAR2,
    value IN INTEGER )
RETURN SYS.MGW_NAME_VALUE_T,

STATIC FUNCTION CONSTRUCT_INTEGER (
    name IN VARCHAR2,
    value IN INTEGER )
RETURN SYS.MGW_NAME_VALUE_T,

STATIC FUNCTION CONSTRUCT_LONG (
    name IN VARCHAR2,
    value IN NUMBER )
RETURN SYS.MGW_NAME_VALUE_T,

STATIC FUNCTION CONSTRUCT_FLOAT (
    name IN VARCHAR2,
    value IN NUMBER )
RETURN SYS.MGW_NAME_VALUE_T,

STATIC FUNCTION CONSTRUCT_DOUBLE (
    name IN VARCHAR2,
    value IN NUMBER )
RETURN SYS.MGW_NAME_VALUE_T,

STATIC FUNCTION CONSTRUCT_TEXT (
    name IN VARCHAR2,
    value IN VARCHAR2 )
RETURN SYS.MGW_NAME_VALUE_T,

STATIC FUNCTION CONSTRUCT_RAW (
    name IN VARCHAR2,
    value IN RAW )
RETURN SYS.MGW_NAME_VALUE_T,

STATIC FUNCTION CONSTRUCT_DATE (
    name IN VARCHAR2,
    value IN DATE )
RETURN SYS.MGW_NAME_VALUE_T );

```

Attributes

Table 116-5 SYS.MGW_NAME_VALUE_T Attributes

| Attribute | Description |
|-----------|--|
| name | Name associated with the value |
| type | Value type. Refer to the DBMS_MGWMSG.<>_VALUE constants in Table 116-1 . This indicates which Java datatype and class are associated with the value. It also indicates which attribute stores the value. |

Table 116-5 (Cont.) SYS.MGW_NAME_VALUE_T Attributes

| Attribute | Description |
|----------------------------|---|
| <code>integer_value</code> | Stores a numeric integer value |
| <code>number_value</code> | Stores a numeric float or large integer value |
| <code>text_value</code> | Stores a text value |
| <code>raw_value</code> | Stores a RAW (bytes) value |
| <code>date_value</code> | Stores a date value |

SYS.MGW_NAME_VALUE_T Type-Attribute Mapping

[Table 116-6](#) shows the mapping between the value type and the attribute used to store the value.

Table 116-6 SYS.MGW_NAME_VALUE_T Type Attribute Mapping

| Type | Value Stored in Attribute |
|--|----------------------------|
| <code>DBMS_MGWMSG.TEXT_VALUE</code> | <code>text_value</code> |
| <code>DBMS_MGWMSG.RAW_VALUE</code> | <code>raw_value</code> |
| <code>DBMS_MGWMSG.BOOLEAN_VALUE</code> | <code>integer_value</code> |
| <code>DBMS_MGWMSG.BYTE_VALUE</code> | <code>integer_value</code> |
| <code>DBMS_MGWMSG.SHORT_VALUE</code> | <code>integer_value</code> |
| <code>DBMS_MGWMSG.INTEGER_VALUE</code> | <code>integer_value</code> |
| <code>DBMS_MGWMSG.LONG_VALUE</code> | <code>number_value</code> |
| <code>DBMS_MGWMSG.FLOAT_VALUE</code> | <code>number_value</code> |
| <code>DBMS_MGWMSG.DOUBLE_VALUE</code> | <code>number_value</code> |
| <code>DBMS_MGWMSG.DATE_VALUE</code> | <code>date_value</code> |

CONSTRUCT Method

This method constructs a new `SYS.MGW_NAME_VALUE_T` instance. All attributes are assigned a value of `NULL`.

Syntax

```
STATIC FUNCTION CONSTRUCT
RETURN SYS.MGW_NAME_VALUE_T;
```

CONSTRUCT_TYPE Methods

These methods construct a new `SYS.MGW_NAME_VALUE_T` instance initialized with the value of a specific type. Each method sets the `name` and `type` attributes and one of the `<>_value` attributes, as shown in the mappings in [Table 116-6](#).

Syntax

```
STATIC FUNCTION CONSTRUCT_<> (
    name    IN VARCHAR2,
```

```
value IN datatype )
RETURN SYS.MGW_NAME_VALUE_T;
```

Usage Notes

The `construct_boolean` method sets the value to either `DBMS_MGWMSG.BOOLEAN_TRUE` or `DBMS_MGWMSG.BOOLEAN_FALSE`.

116.3.2 DBMS_MGWMSG SYS.MGW_NAME_TYPE_ARRAY_T Type

This type specifies an array of name-value pairs. An object of `SYS.MGW_NAME_VALUE_ARRAY_T` type can have up to 1024 elements.

Syntax

```
TYPE SYS.MGW_NAME_VALUE_ARRAY_T
AS VARRAY (1024) OF SYS.MGW_NAME_VALUE_T;
```

116.3.3 DBMS_MGWMSG SYS.MGW_TEXT_VALUE_T Type

This type specifies a `TEXT` value. It can store a large value as a `CLOB` or a smaller value (size \leq 4000) as `VARCHAR2`. Only one of the `<` `>` `_value` attributes should be set.

Syntax

```
TYPE SYS.MGW_TEXT_VALUE_T IS OBJECT(
    small_value VARCHAR2(4000),
    large_value CLOB,

-- Methods
    STATIC FUNCTION CONSTRUCT
    RETURN SYS.MGW_TEXT_VALUE_T);
```

Attributes

Table 116-7 SYS.MGW_TEXT_VALUE_T Attributes

| Attribute | Description |
|--------------------------|---|
| <code>small_value</code> | Small <code>TEXT</code> value. Used for values \leq 4000. |
| <code>large_value</code> | Large <code>TEXT</code> value. Used when the value is too large for the <code>small_value</code> attribute. |

CONSTRUCT Method

This method constructs a new `SYS.MGW_TEXT_VALUE_T` instance. All attributes are assigned a value of `NULL`.

Syntax

```
STATIC FUNCTION CONSTRUCT
RETURN SYS.MGW_TEXT_VALUE_T;
```

116.3.4 DBMS_MGWMSG SYS.MGW_RAW_VALUE_T Type

This type specifies a RAW value. This type can store a large value as a BLOB or a smaller value (size <= 2000) as RAW. You must set no more than one of the < >_value attributes.

Syntax

```
TYPE SYS.MGW_RAW_VALUE_T IS OBJECT(
    small_value RAW(2000),
    large_value BLOB,

--Methods
    STATIC FUNCTION CONSTRUCT
    RETURN SYS.MGW_RAW_VALUE_T);
```

Attributes

Table 116-8 SYS.MGW_RAW_VALUE_T Attributes

| Attribute | Description |
|-------------|--|
| small_value | Small RAW (bytes) value <= 2000 |
| large_value | Large RAW value. Used when the value is too large for the small_value attribute. |

CONSTRUCT Method

This method constructs a new SYS.MGW_RAW_VALUE_T instance. All attributes are assigned a value of NULL.

Syntax

```
STATIC FUNCTION CONSTRUCT
RETURN SYS.MGW_RAW_VALUE_T;
```

116.3.5 DBMS_MGWMSG SYS.MGW_BASIC_MSG_T Type

This is a canonical type for a basic TEXT or RAW message. Only a single TEXT or RAW value is typically set. An object of this type must not have both TEXT and RAW set to a not NULL value at the same time.

Syntax

```
TYPE SYS.MGW_BASIC_MSG_T IS OBJECT(
    header      SYS.MGW_NAME_VALUE_ARRAY_T,
    text_body   SYS.MGW_TEXT_VALUE_T,
    raw_body    SYS.MGW_RAW_VALUE_T,

--Methods
    STATIC FUNCTION CONSTRUCT
    RETURN SYS.MGW_BASIC_MSG_T);
```

Attributes

Table 116-9 SYS.MGW_BASIC_MSG_T Attributes

| Attribute | Description |
|-----------|--|
| header | Message header information as an array of name-value pairs |
| text_body | Message body for a TEXT message |
| raw_body | Message body for a RAW (bytes) message |

CONSTRUCT Method

This method constructs a new SYS.MGW_BASIC_MSG_T instance. All attributes are assigned a value of NULL.

Syntax

```
STATIC FUNCTION CONSTRUCT
RETURN SYS.MGW_BASIC_MSG_T;
```

116.3.6 DBMS_MGWMSG SYS.MGW_NUMBER_ARRAY_T Type

A type that specifies an array of numbers.

Syntax

```
TYPE SYS.MGW_NUMBER_ARRAY_T AS VARRAY(1024) OF NUMBER;
```

116.3.7 DBMS_MGWMSG SYS.MGW_TIBRV_FIELD_T Type

This type represents a TIB/Rendezvous message field, typically used in a read-only fashion to retrieve field information from a SYS.MGW_TIBRV_MSG_T instance.

Syntax

```
TYPE SYS.MGW_TIBRV_FIELD_T IS OBJECT(
  field_name      VARCHAR2(256),
  field_id        INTEGER,
  field_type      INTEGER,
  number_value    NUMBER,
  number_array_value SYS.MGW_NUMBER_ARRAY_T,
  text_value      VARCHAR2(4000),
  raw_value       RAW(2000),
  date_value      DATE,
  clob_value      CLOB,
  blob_value      BLOB);
```

Attributes

Table 116-10 SYS.MGW_TIBRV_FIELD_T Attributes

| Attribute | Description |
|------------|---|
| field_name | Field name. This will be NULL if the field has no name. |

Table 116-10 (Cont.) SYS.MGW_TIBRV_FIELD_T Attributes

| Attribute | Description |
|--------------------|---|
| field_id | Field identifier. If the field identifier is zero (0), then that field is considered not to have a field identifier. Otherwise the field identifier is a nonzero value that is unique for all fields of that message. |
| field_type | Field wire format datatype. The DBMS_MGWMSG.TIBRVMSG_<> constants represent valid values for this attribute. The value of this field discriminates which value attribute is used to store the field data. |
| number_value | Used to store a numeric value |
| number_array_value | Used to store a numeric array value |
| text_value | Used to store a small text value |
| raw_value | Used to store a small raw value |
| date_value | Used to store a date value |
| clob_value | Used to store a large text value. This is used when the text data will not fit in text_value, that is, when size is larger than 4000. |
| blob_value | Used to store a large raw value. This is used when the raw data will not fit in raw_value; that is, when size is larger than 2000. |

SYS.MGW_TIBRV_FIELD_T Type and Attribute Mapping

[Table 116-11](#) describes the mapping in type SYS.MGW_TIBRV_FIELD_T between the field type and attribute used to store the value.

Table 116-11 SYS.MGW_TIBRV_FIELD_T Type and Attribute Mapping

| Field Type (DBMS_MGWMSG constant) | Value Stored in Attribute |
|-----------------------------------|---------------------------|
| TIBRVMSG_BOOL | number_value |
| TIBRVMSG_F32 | number_value |
| TIBRVMSG_F64 | number_value |
| TIBRVMSG_I8 | number_value |
| TIBRVMSG_I16 | number_value |
| TIBRVMSG_I32 | number_value |
| TIBRVMSG_I64 | number_value |
| TIBRVMSG_IPADDR32 | text_value |
| TIBRVMSG_IPPORT16 | number_value |
| TIBRVMSG_DATETIME | date_value |
| TIBRVMSG_F32ARRAY | number_array_value |
| TIBRVMSG_F64ARRAY | number_array_value |
| TIBRVMSG_I8ARRAY | number_array_value |
| TIBRVMSG_I16ARRAY | number_array_value |
| TIBRVMSG_I32ARRAY | number_array_value |

Table 116-11 (Cont.) SYS.MGW_TIBRV_FIELD_T Type and Attribute Mapping

| Field Type (DBMS_MGWMSG constant) | Value Stored in Attribute |
|-----------------------------------|---------------------------|
| TIBRVMSG_I64ARRAY | number_array_value |
| TIBRVMSG_OPAQUE | raw_value or blob_value |
| TIBRVMSG_STRING | text_value or clob_value |
| TIBRVMSG_XML | raw_value or blob_value |

116.3.8 DBMS_MGWMSG SYS.MGW_TIBRV_MSG_T Type

This type represents a TIB/Rendezvous message. You must never directly reference the attributes of this type. Instead use the type methods.

Syntax

```

TYPE SYS.MGW_TIBRV_MSG_T IS OBJECT(
    send_subject    VARCHAR2(256),
    reply_subject   VARCHAR2(256),
    cm_time_limit   NUMBER,
    cm_sender_name  VARCHAR2(256),
    cm_sequence_num NUMBER,
    fields          SYS.MGW_TIBRV_IFIELDS_T,
    clob_data1      CLOB,
    clob_data2      CLOB,
    clob_data3      CLOB,
    blob_data1      BLOB,
    blob_data2      BLOB,
    blob_data3      BLOB,

    STATIC FUNCTION construct
    RETURN SYS.MGW_TIBRV_MSG_T,

    MEMBER PROCEDURE add_bool (
        name IN  VARCHAR2,
        id   IN  INTEGER,
        value IN INTEGER ),

```

Attributes

Table 116-12 SYS.MGW_TIBRV_MSG_T Type Attributes

| Attribute | Description |
|-----------------|--|
| send_subject | Send subject name |
| reply_subject | Reply subject name |
| cm_time_limit | Time limit for a certified message |
| cm_sender_name | Sender name of a certified message |
| cm_sequence_num | Sequence number of a certified message |
| fields | Collection of message fields |
| clob_data1 | Used to store a large text value |
| clob_data2 | Used to store a large text value |
| clob_data3 | Used to store a large text value |
| blob_data1 | Used to store a large raw value |
| blob_data2 | Used to store a large raw value |
| blob_data3 | Used to store a large raw value |

Construct Method

Constructs a new SYS.MGW_TIBRV_MSG_T instance. All attributes are set to NULL.

Syntax

```

STATIC FUNCTION construct
RETURN SYS.MGW_TIBRV_MSG_T;

```

ADD_<> Methods

Adds a new field to the message.

Syntax

```
MEMBER PROCEDURE ADD_<> (
    name IN VARCHAR2,
    id   IN INTEGER,
    value IN datatype );
```

Parameters

Table 116-13 SYS.MGW_TIBRV_MSG_T ADD_<> Method Parameters

| Parameter | Description |
|-----------|------------------|
| name | Field name |
| id | Field identifier |
| value | Field data |

Table 116-14 shows, for each add method, the field type that will be assigned and valid values for the field data.

Table 116-14 MGW_TIBRV_MSG_T Add Method Field Types

| Method Name | Field Type Assigned | Comment |
|--------------|---------------------|---|
| add_bool | TIBRVMSG_BOOL | Valid values: 0 (false), 1 (true) |
| add_f32 | TIBRVMSG_F32 | n/a |
| add_f64 | TIBRVMSG_F64 | n/a |
| add_i8 | TIBRVMSG_I8 | Valid range: -128...127 |
| add_i16 | TIBRVMSG_I16 | Valid range: -32768...32767 |
| add_i32 | TIBRVMSG_I32 | Valid range: -2147483648... 2147483647 |
| add_i64 | TIBRVMSG_I64 | n/a |
| add_ipaddr32 | TIBRVMSG_IPADDR32 | n/a |
| add_ipport16 | TIBRVMSG_IPPORT16 | n/a |

| add_i64array | TIBRVMSG_I64ARRAY | n/a |
| add_opaque | TIBRVMSG_OPAQUE | Value stored as RAW if size < 2000; otherwise value stored in BLOB |
| add_string | TIBRVMSG_STRING | Value stored as VARCHAR2 if size < 4000; otherwise value stored in CLOB |
| add_xml | TIBRVMSG_XML | Value stored as RAW if size < 2000; otherwise value stored in BLOB |

SET_<> Methods

Accessor methods to set an instance attribute to a specific value.

Syntax

```
MEMBER PROCEDURE SET_<> (
    value IN datatype );
```

Parameters**Table 116-15 SYS.MGW_TIBRV_MSG_T SET_<> Method Parameters**

| Parameter | Description |
|-----------|----------------------|
| value | Value to be assigned |

GET_<> Methods

Accessor methods to retrieve the value for an instance attribute.

Syntax

```
MEMBER PROCEDURE GET_<>
RETURN datatype;
```

Parameters

None

Return Values

Returns the attribute value.

GET_FIELD_COUNT Function

Gets the number of message fields.

Syntax

```
MEMBER PROCEDURE get_field_count
RETURN INTEGER;
```

Parameters

None

Return Values

Returns the number of fields, or zero (0) if there are none.

GET_FIELD Function

Retrieves field information for the field having a given field collection index. This method should only be called if the `GET_FIELD_COUNT` Function returns a nonzero value and `idx` must specify a valid collection index; that is, `1<=idx<=get_field_count()`.

Syntax

```
MEMBER PROCEDURE get_field (
    idx    IN    INTEGER )
RETURN SYS.MGW_TIBRV_FIELD_T;
```

Parameters

Table 116-16 SYS.MGW_TIBRV_MSG_T GET_FIELD Function Parameters

| Parameter | Description |
|-----------|---|
| idx | Specifies the 1-based field collection index of the field to retrieve |

Note:

A 1-based index begins at one (1) instead of zero (0).

Return Values

Returns the field information.

GET_FIELD_BY_NAME Function

Retrieves field information for the first field that has a given field name. The name comparison is case-sensitive.

Syntax

```
MEMBER PROCEDURE get_field_by_name (
    name IN  VARCHAR2 )
RETURN SYS.MGW_TIBRV_FIELD_T;
```

Parameters

Table 116-17 SYS.MGW_TIBRV_MSG_T GET_FIELD_BY_NAME Function Parameters

| Parameter | Description |
|-----------|---|
| name | Specifies the field name to search for. This can be NULL to find the first field that does not have a field name. |

Return Values

Returns the field information, or NULL if no match was found.

GET_FIELD_BY_ID Function

Retrieves field information for the first field that has a given field identifier.

A field can have either a unique identifier or no identifier. If the field identifier value is zero (0) or NULL, then the field is considered to have no identifier. Otherwise, the identifier is a nonzero value that is unique for all the fields of this message.

Syntax

```
MEMBER PROCEDURE get_field_by_id (
    id IN INTEGER )
RETURN SYS.MGW_TIBRV_FIELD_T;
```

Parameters

Table 116-18 SYS.MGW_TIBRV_MSG_T GET_FIELD_BY_ID Function Parameters

| Parameter | Description |
|-----------|--|
| id | Specifies the field identifier to search for. This can be zero (0) or NULL to find the first field that does not have an identifier. |

Return Values

Returns the field information, or NULL if no match was found.

FIND_FIELD_NAME Function

Searches for a field with a given field name, starting from a given index of the field collection. It returns the index of that field. The name comparison is case-sensitive. This function is useful for finding all the fields that have the same name.

Syntax

```
MEMBER PROCEDURE find_field_name (
    name IN VARCHAR2,
    start_idx IN INTEGER )
RETURN INTEGER;
```

Parameters

Table 116-19 SYS.MGW_TIBRV_MSG_T FIND_FIELD_NAME Function Parameters

| Parameter | Description |
|-----------|---|
| name | Specifies the field name to search for. This can be NULL to search for a field that does not have a field name. |
| start_idx | Specifies the 1-based field collection index from which the search should start. |

Return Values

Returns the field index (> 0) if a match was found, or zero (0) if no match was found.

FIND_FIELD_ID Function

Searches for a field with a given field identifier, starting from a given index of the field collection. It returns the index of that field.

Syntax

```
MEMBER PROCEDURE find_field_id (
    id IN INTEGER,
    start_idx IN INTEGER )
RETURN INTEGER;
```

Parameters

Table 116-20 SYS.MGW_TIBRV_MSG_T FIND_FIELD_ID Function Parameters

| Parameter | Description |
|-----------|--|
| id | Specifies the field identifier to search for. This can be zero (0) or NULL to find a field that does not have an identifier. |
| start_idx | Specifies the 1-based field collection index from which the search should start. |

Return Values

Returns the field index (> 0) if a match was found, or zero (0) if no match was found.

116.4 Summary of DBMS_MGWMSG Subprograms

This table lists the DBMS_MGWMSG subprograms and briefly describes them.

Table 116-21 DBMS_MGWMSG Package Subprograms

| Subprogram | Description |
|---|--|
| LCR_TO_XML Function | Converts a SYS.ANYDATA object encapsulating a row LCR (LCR\$_ROW_RECORD) or a DDL LCR (LCR\$_DDL_RECORD) to a SYS.XMLTYPE object |
| NVARRAY_ADD Procedure | Appends a name-value element to the end of a name-value array |
| NVARRAY_FIND_NAME Function | Searches a name-value array for the element with the name you specify in p_name |
| NVARRAY_FIND_NAME_TYPE Function | Searches a name-value array for an element with the name and value type you specify |
| NVARRAY_GET Function | Gets the name-value element of the name you specify in p_name from a name-value array |
| NVARRAY_GET_BOOLEAN Function | Gets the value of the name-value array element that you specify in p_name and with the BOOLEAN_VALUE value type |
| NVARRAY_GET_BYTE Function | Gets the value of the name-value array element that you specify in p_name and with the BYTE_VALUE value type |
| NVARRAY_GET_DATE Function | Gets the value of the name-value array element that you specify in p_name and with the DATE_VALUE value type |
| NVARRAY_GET_DOUBLE Function | Gets the value of the name-value array element that you specify in p_name and with the DOUBLE_VALUE value type |
| NVARRAY_GET_FLOAT Function | Gets the value of the name-value array element that you specify in p_name and with the FLOAT_VALUE value type |
| NVARRAY_GET_INTEGER Function | Gets the value of the name-value array element that you specify in p_name and with the INTEGER_VALUE value type |
| NVARRAY_GET_LONG Function | Gets the value of the name-value array element that you specify in p_name and with the LONG_VALUE value type |
| NVARRAY_GET_RAW Function | Gets the value of the name-value array element that you specify in p_name and with the RAW_VALUE value type |

Table 116-21 (Cont.) DBMS_MGWMSG Package Subprograms

| Subprogram | Description |
|--|--|
| NVARARRAY_GET_SHORT Function | Gets the value of the name-value array element that you specify in <code>p_name</code> and with the <code>SHORT_VALUE</code> value type |
| NVARARRAY_GET_TEXT Function | Gets the value of the name-value array element that you specify in <code>p_name</code> and with the <code>TEXT_VALUE</code> value type |
| XML_TO_LCR Function | Converts a <code>SYS.XMLTYPE</code> object to a <code>SYS.ANYDATA</code> object encapsulating a row LCR (<code>LCR\$_ROW_RECORD</code>) or a DDL LCR (<code>LCR\$_DDL_RECORD</code>) |

116.4.1 LCR_TO_XML Function

This function converts a `SYS.ANYDATA` object encapsulating a row LCR (Logical Change Record, in this case a `LCR$_ROW_RECORD`) or a DDL LCR (`LCR$_DDL_RECORD`) to a `SYS.XMLTYPE` object.

See Also:

[XML_TO_LCR Function](#)

Syntax

```
DBMS_MGWMSG.LCR_TO_XML (
    p_anydata IN SYS.ANYDATA )
RETURN SYS.XMLTYPE;
```

Parameters

Table 116-22 LCR_TO_XML Function Parameters

| Parameter | Description |
|------------------------|--|
| <code>p_anydata</code> | An <code>ANYDATA</code> object to be converted |

Return Values

Returns a `SYS.XMLTYPE` object.

Usage Notes

An exception is raised if the encapsulated type `p_anydata` is not an LCR.

116.4.2 NVARRAY_ADD Procedure

This procedure appends a name-value element to the end of a name-value array.

Syntax

```
DBMS_MGWMSG.NVARRAY_ADD (
    p_array IN OUT SYS.MGW_NAME_VALUE_ARRAY_T,
    p_value IN SYS.MGW_NAME_VALUE_T );
```

Parameters

Table 116-23 NVARRAY_ADD Procedure Parameters

| Parameter | Description |
|-----------|---|
| p_array | On input, the name-value array instance to modify. If NULL, then a new array is created. On output, the modified name-value array instance. |
| p_value | The value to add. If NULL, then p_array is not changed. |

116.4.3 NVARRAY_FIND_NAME Function

This function searches a name-value array for the element with the name you specify in p_name.

Syntax

```
DBMS_MGWMSG.NVARRAY_FIND_NAME (
    p_array IN SYS.MGW_NAME_VALUE_ARRAY_T,
    p_name IN VARCHAR2,
    p_compare IN BINARY_INTEGER DEFAULT CASE_SENSITIVE )
RETURN BINARY_INTEGER;
```

Parameters

Table 116-24 NVARRAY_FIND_NAME Function Parameters

| Parameters | Description |
|------------|---|
| p_array | The name-value array to search |
| p_name | The name to find |
| p_compare | Name comparison method. Values are CASE_SENSITIVE and CASE_INSENSITIVE. |

Return Values

Returns a positive integer that is the array index of the matching element or zero (0) if the specified name is not found.

116.4.4 NVARRAY_FIND_NAME_TYPE Function

This function searches a name-value array for an element with the name and value type you specify.

Syntax

```
DBMS_MGWMSG.NVARRAY_FIND_NAME_TYPE (
  p_array    IN SYS.MGW_NAME_VALUE_ARRAY_T,
  p_name     IN VARCHAR2,
  p_type     IN BINARY_INTEGER
  p_compare  IN BINARY_INTEGER DEFAULT CASE_SENSITIVE )
RETURN BINARY_INTEGER;
```

Parameters

Table 116-25 NVARRAY_FIND_NAME_TYPE Function Parameters

| Parameter | Description |
|-----------|--|
| p_array | The name-value array to search |
| p_name | The name to find |
| p_type | The value type. Refer to the value type constants in Table 116-1 . |
| p_compare | Name comparison method. Values are CASE_SENSITIVE and CASE_INSENSITIVE. |

Return Values

Returns a positive integer that is the array index of the matching element, zero (0) if the specified name is not found, or negative one (-1) if the specified name is found but a type mismatch exists.

116.4.5 NVARRAY_GET Function

This function gets the name-value element of the name you specify in p_name from a name-value array.

Syntax

```
DBMS_MGWMSG.NVARRAY_GET (
  p_array    IN SYS.MGW_NAME_VALUE_ARRAY_T,
  p_name     IN VARCHAR2,
  p_compare  IN BINARY_INTEGER DEFAULT CASE_SENSITIVE )
RETURN SYS.MGW_NAME_VALUE_T;
```

Parameters

Table 116-26 NVARRAY_GET Function Parameters

| Parameter | Description |
|-----------|----------------------|
| p_array | The name-value array |
| p_name | The value name |

Table 116-26 (Cont.) NVARRAY_GET Function Parameters

| Parameter | Description |
|-----------|---|
| p_compare | Name comparison method. Values are CASE_SENSITIVE and CASE_INSENSITIVE. |

Return Values

Returns the matching element, or NULL if the specified name is not found.

116.4.6 NVARRAY_GET_BOOLEAN Function

This function gets the value of the name-value array element that you specify in p_name and with the BOOLEAN_VALUE value type.

Syntax

```
DBMS_MGWMSG.NVARRAY_GET_BOOLEAN (
    p_array    IN SYS.MGW_NAME_VALUE_ARRAY_T,
    p_name     IN VARCHAR2,
    p_compare  IN BINARY_INTEGER DEFAULT CASE_SENSITIVE )
RETURN INTEGER;
```

Parameters**Table 116-27 NVARRAY_GET_BOOLEAN Function Parameters**

| Parameter | Description |
|-----------|---|
| p_array | The name-value array |
| p_name | The value name |
| p_compare | Name comparison method. Values are CASE_SENSITIVE and CASE_INSENSITIVE. |

Return Values

Returns the value, or NULL if either the specified name is not found or a type mismatch exists.

116.4.7 NVARRAY_GET_BYTE Function

This function gets the value of the name-value array element that you specify in p_name and with the BYTE_VALUE value type.

Syntax

```
DBMS_MGWMSG.NVARRAY_GET_BYTE (
    p_array    IN SYS.MGW_NAME_VALUE_ARRAY_T,
    p_name     IN VARCHAR2,
    p_compare  IN BINARY_INTEGER DEFAULT CASE_SENSITIVE )
RETURN INTEGER;
```

Parameters

Table 116-28 NVARRAY_GET_BYTE Function Parameters

| Parameter | Description |
|-----------|---|
| p_array | The name-value array |
| p_name | The value name |
| p_compare | Name comparison method. Values are CASE_SENSITIVE and CASE_INSENSITIVE. |

Return Values

Returns the value, or NULL if either the specified name is not found or a type mismatch exists.

116.4.8 NVARRAY_GET_DATE Function

This function gets the value of the name-value array element that you specify in p_name and with the DATE_VALUE value type.

Syntax

```
DBMS_MGWMSG.NVARRAY_GET_DATE (
  p_array   IN SYS.MGW_NAME_VALUE_ARRAY_T,
  p_name    IN VARCHAR2,
  p_compare IN BINARY_INTEGER DEFAULT CASE_SENSITIVE )
RETURN DATE;
```

Parameters

Table 116-29 NVARRAY_GET_DATE Function Parameters

| Parameters | Description |
|------------|---|
| p_array | The name-value array |
| p_name | The value name |
| p_compare | Name comparison method. Values are CASE_SENSITIVE and CASE_INSENSITIVE. |

Return Values

Returns the value, or NULL if either the specified name is not found or a type mismatch exists.

116.4.9 NVARRAY_GET_DOUBLE Function

This function gets the value of the name-value array element that you specify in p_name and with the DOUBLE_VALUE value type.

Syntax

```
DBMS_MGWMSG.NVARRAY_GET_DOUBLE (
  p_array   IN SYS.MGW_NAME_VALUE_ARRAY_T,
  p_name    IN VARCHAR2,
```

```

    p_compare IN BINARY_INTEGER DEFAULT CASE_SENSITIVE )
RETURN NUMBER;

```

Parameters

Table 116-30 NVARRAY_GET_DOUBLE Function Parameters

| Parameter | Description |
|-----------|---|
| p_array | The name-value array |
| p_name | The value name |
| p_compare | Name comparison method. Values are CASE_SENSITIVE and CASE_INSENSITIVE. |

Return Values

Returns the value, or NULL if either the specified name is not found or a type mismatch exists.

116.4.10 NVARRAY_GET_FLOAT Function

This function gets the value of the name-value array element that you specify in p_name and with the FLOAT_VALUE value type.

Syntax

```

DBMS_MGWMSG.NVARRAY_GET_FLOAT (
    p_array    IN SYS.MGW_NAME_VALUE_ARRAY_T,
    p_name     IN VARCHAR2,
    p_compare  IN BINARY_INTEGER DEFAULT CASE_SENSITIVE )
RETURN NUMBER;

```

Parameters

Table 116-31 NVARRAY_GET_FLOAT Function Parameters

| Parameter | Description |
|-----------|---|
| p_array | The name-value array |
| p_name | The value name |
| p_compare | Name comparison method. Values are CASE_SENSITIVE and CASE_INSENSITIVE. |

Return Values

Returns the value, or NULL if either the specified name is not found or a type mismatch exists.

116.4.11 NVARRAY_GET_INTEGER Function

This function gets the value of the name-value array element that you specify in `p_name` and with the `INTEGER_VALUE` value type.

Syntax

```
DBMS_MGWMSG.NVARRAY_GET_INTEGER (
  p_array   IN SYS.MGW_NAME_VALUE_ARRAY_T,
  p_name    IN VARCHAR2,
  p_compare IN BINARY_INTEGER DEFAULT CASE_SENSITIVE )
RETURN INTEGER;
```

Parameters

Table 116-32 NVARRAY_GET_INTEGER Function Parameters

| Parameter | Description |
|------------------------|--|
| <code>p_array</code> | The name-value array |
| <code>p_name</code> | The value name |
| <code>p_compare</code> | Name comparison method. Values are <code>CASE_SENSITIVE</code> and <code>CASE_INSENSITIVE</code> . |

Return Values

Returns the value, or `NULL` if either the specified name is not found or a type mismatch exists.

116.4.12 NVARRAY_GET_LONG Function

This function gets the value of the name-value array element that you specify in `p_name` and with the `LONG_VALUE` value type.

Syntax

```
DBMS_MGWMSG.NVARRAY_GET_LONG (
  p_array   IN SYS.MGW_NAME_VALUE_ARRAY_T,
  p_name    IN VARCHAR2,
  p_compare IN BINARY_INTEGER DEFAULT CASE_SENSITIVE )
RETURN NUMBER;
```

Parameters

Table 116-33 NVARRAY_GET_LONG Function Parameters

| Parameter | Description |
|------------------------|--|
| <code>p_array</code> | The name-value array |
| <code>p_name</code> | The value name |
| <code>p_compare</code> | Name comparison method. Values are <code>CASE_SENSITIVE</code> and <code>CASE_INSENSITIVE</code> . |

Return Values

Returns the value, or `NULL` if either the specified name is not found or a type mismatch exists.

116.4.13 NVARRAY_GET_RAW Function

This function gets the value of the name-value array element that you specify in `p_name` and with the `RAW_VALUE` value type.

Syntax

```
DBMS_MGWMSG.NVARRAY_GET_RAW (
    p_array    IN SYS.MGW_NAME_VALUE_ARRAY_T,
    p_name     IN VARCHAR2,
    p_compare  IN BINARY_INTEGER DEFAULT CASE_SENSITIVE )
RETURN RAW;
```

Parameters

Table 116-34 NVARRAY_GET_RAW Function Parameters

| Parameter | Description |
|------------------------|--|
| <code>p_array</code> | The name-value array |
| <code>p_name</code> | The value name |
| <code>p_compare</code> | Name comparison method. Values are <code>CASE_SENSITIVE</code> and <code>CASE_INSENSITIVE</code> . |

Return Values

Returns the value, or `NULL` if either the specified name is not found or a type mismatch exists.

116.4.14 NVARRAY_GET_SHORT Function

This function gets the value of the name-value array element that you specify in `p_name` and with the `SHORT_VALUE` value type.

Syntax

```
DBMS_MGWMSG.NVARRAY_GET_SHORT (
    p_array    IN SYS.MGW_NAME_VALUE_ARRAY_T,
    p_name     IN VARCHAR2,
    p_compare  IN BINARY_INTEGER DEFAULT CASE_SENSITIVE )
RETURN INTEGER;
```

Parameters

Table 116-35 NVARRAY_GET_SHORT Function Parameters

| Parameter | Description |
|----------------------|----------------------|
| <code>p_array</code> | The name-value array |

Table 116-35 (Cont.) NVARRAY_GET_SHORT Function Parameters

| Parameter | Description |
|-----------|---|
| p_name | The value name |
| p_compare | Name comparison method. Values are CASE_SENSITIVE and CASE_INSENSITIVE. |

Return Values

Returns the value, or NULL if either the specified name is not found or a type mismatch exists.

116.4.15 NVARRAY_GET_TEXT Function

This function gets the value of the name-value array element that you specify in p_name and with the TEXT_VALUE value type.

Syntax

```
DBMS_MGWMSG.NVARRAY_GET_TEXT (
  p_array    IN SYS.MGW_NAME_VALUE_ARRAY_T,
  p_name     IN VARCHAR2,
  p_compare  IN BINARY_INTEGER DEFAULT CASE_SENSITIVE )
RETURN VARCHAR2;
```

Parameters**Table 116-36 NVARRAY_GET_TEXT Function Parameters**

| Parameter | Description |
|-----------|---|
| p_array | The name-value array |
| p_name | The value name |
| p_compare | Name comparison method. Values are CASE_SENSITIVE and CASE_INSENSITIVE. |

Return Values

Returns the value, or NULL if either the specified name is not found or a type mismatch exists.

116.4.16 XML_TO_LCR Function

This function converts a SYS.XMLTYPE object to a SYS.ANYDATA object encapsulating a row LCR (LCR\$_ROW_RECORD) or a DDL LCR (LCR\$_DDL_RECORD).

**See Also:**

[LCR_TO_XML Function](#)

Syntax

```
DBMS_MGWMSG.XML_TO_LCR (  
  p_xmldata IN SYS.XMLTYPE )  
  RETURN SYS.ANYDATA;
```

Parameters

Table 116-37 XML_TO_LCR Function Parameters

| Parameter | Description |
|-----------|---------------------------------------|
| p_xmldata | An XMLTYPE object representing an LCR |

Return Values

Returns a SYS.ANYDATA object.

Usage Notes

An exception is raised if p_xmldata cannot be converted to an LCR.

DBMS_MLE

The `DBMS_MLE` package allows users to execute JavaScript code inside the Oracle Database and exchange data seamlessly between PL/SQL and JavaScript. The JavaScript code itself can execute PL/SQL and SQL through built-in JavaScript modules. JavaScript data types are automatically mapped to Oracle Database data types and vice versa.

With the `DBMS_MLE` package, developers can write their data processing logic in JavaScript.

This chapter contains the following topics:

- [DBMS_MLE Overview](#)
- [DBMS_MLE Security Model](#)
- [Summary of DBMS_MLE Subprograms](#)

117.1 DBMS_MLE Overview

Runtime state for MLE execution is encapsulated in execution contexts that users can explicitly create and destroy. Users can also export values from PL/SQL to MLE, and import values from MLE back into PL/SQL.

The following example captures the typical workflow for MLE execution:

```
set serveroutput on;
declare
  ctx dbms_mle.context_handle_t;
  source clob;
  greeting varchar2(100);
begin
  ctx := dbms_mle.create_context(); -- Create execution context for MLE execution
  dbms_mle.export_to_mle(ctx, 'person', 'World'); -- Export value from PL/SQL
  source := q'~
    var bindings = require("mle-js-bindings");
    var person = bindings.importValue("person"); // Import value previously exported
from PL/SQL
    var greeting = "Hello, " + person + "!";
    bindings.exportValue("greeting", greeting); // Export value to PL/SQL
  ~';
  dbms_mle.eval(ctx, 'JAVASCRIPT', source); -- Evaluate the source code snippet in the
execution context
  dbms_mle.import_from_mle(ctx, 'greeting', greeting); -- Import value previously
exported from MLE
  dbms_output.put_line('Greetings from MLE: ' || greeting);
  dbms_mle.drop_context(ctx); -- Drop the execution context once no longer required
end;
/
```

Executing the above code block produces the following output:

```
Greetings from MLE: Hello, World!
```

117.2 DBMS_MLE Security Model

Access to MLE features is protected by database privileges. The user must have the `EXECUTE DYNAMIC MLE` privilege while calling any of its functions and procedures that pertain to MLE execution. In addition to this, the user must also have the `EXECUTE` privilege on an MLE language (for example, `EXECUTE ON JAVASCRIPT`) to execute code in that language. An `ORA-01031` error is raised if the user calling any of the `DBMS_MLE` subprograms does not have the appropriate privileges. See the summary of `DBMS_MLE` subprograms for the privileges required to call each `DBMS_MLE` subprogram.

117.3 Summary of DBMS_MLE Subprograms

This table lists the `DBMS_MLE` subprograms and briefly describes them.

Table 117-1 DBMS_MLE Package Subprograms

| Subprogram | Description |
|---|--|
| <code>CREATE_CONTEXT</code> Function | Creates an MLE context for executing snippets in any MLE language. |
| <code>DISABLE_CTX_STDERR</code> Procedure | This procedure disables <code>stderr</code> stream of the specified MLE context, so that future writes to <code>stderr</code> are discarded. |
| <code>DISABLE_CTX_STDOUT</code> Procedure | This procedure disables <code>stdout</code> stream of the specified MLE context, so that future writes to <code>stdout</code> are discarded. |
| <code>DISABLE_STDERR</code> Procedure | This procedure disables the <code>stderr</code> stream of all MLE contexts, so that future writes to <code>stderr</code> are discarded. |
| <code>DISABLE_STDOUT</code> Procedure | This procedure disables the <code>stdout</code> stream of all MLE contexts, so that future writes to <code>stdout</code> are discarded. |
| <code>DROP_CONTEXT</code> Procedure | This procedure is used to drop an MLE context that was previously created using the <code>CREATE_CONTEXT</code> procedure. After the context is dropped, the context handle is no longer valid and cannot be used anymore. |
| <code>EVAL</code> Procedure | This procedure executes the given MLE language code within the context identified by the context handle. |
| <code>EXPORT_TO_MLE</code> Procedure | This procedure allows you to assign the given value, with appropriate conversion, to the named property in the MLE context. The property is created if it is not already present. |
| <code>GET_AVAILABLE_LANGUAGES</code> Function | This function returns the set of available MLE languages. |
| <code>GET_CTX_ERROR_STACK</code> Function | This function retrieves the MLE language stack trace for the most recent application error in the given execution context. |
| <code>IMPORT_FROM_MLE</code> Procedure | This procedure retrieves the value of the named property from the MLE context and converts it to the requested PL/SQL type. |
| <code>SET_CTX_STDERR</code> Procedure | This procedure redirects the <code>stderr</code> stream of the MLE context to the given <code>CLOB</code> . |
| <code>SET_CTX_STDERR_TO_DBMS_OUTPUT</code> Procedure | This procedure redirects the <code>stderr</code> stream of the MLE context to <code>DBMS_OUTPUT</code> . |
| <code>SET_CTX_STDOUT</code> Procedure | This procedure redirects the <code>stdout</code> stream of the MLE context to the given <code>CLOB</code> . |

Table 117-1 (Cont.) DBMS_MLE Package Subprograms

| Subprogram | Description |
|---|---|
| SET_CTX_STDOUT_TO_DBMS_OUTPUT Procedure | This procedure redirects the stdout stream of the MLE context to DBMS_OUTPUT. |
| SET_STDERR Procedure | This procedure redirects the stderr stream of all MLE contexts to the given CLOB. |
| SET_STDERR_TO_DBMS_OUTPUT Procedure | This procedure redirects the stderr stream of all MLE contexts to DBMS_OUTPUT. |
| SET_STDOUT Procedure | This procedure redirects the stdout stream of all MLE contexts to the given CLOB. |
| SET_STDOUT_TO_DBMS_OUTPUT Procedure | This procedure redirects the stdout stream of all MLE contexts to DBMS_OUTPUT. |

117.3.1 CREATE_CONTEXT Function

Creates an MLE context for executing snippets in any MLE language. You need the EXECUTE DYNAMIC MLE privilege to execute this function.

Syntax

```
DBMS_MLE.CREATE_CONTEXT
RETURN CONTEXT_HANDLE_T;
```

Return Values

This function returns a handle that uniquely identifies a context within a session for use in subsequent operations, such as EXPORT_TO_MLE and EVAL.

Usage Notes

A context has a lifetime limited to the session in which it was created. When a client session is terminated, all its contexts are dropped. All MLE contexts created in a session are also dropped when the session state is reset, for example, by calling DBMS_SESSION.RESET_PACKAGE. MLE language code is evaluated in the context using the user, roles, and schema that are in effect at the time of context creation.

The procedure may raise the ORA-01031 error if the caller does not have sufficient privileges.

117.3.2 DISABLE_CTX_STDERR Procedure

This procedure disables stderr stream of the specified MLE context, so that future writes to stderr are discarded. You need the EXECUTE DYNAMIC MLE privilege to execute this function.

Syntax

```
DBMS_MLE.DISABLE_CTX_STDERR(
    context_handle          IN          context_handle_t);
```

Parameters

Table 117-2 DISABLE_CTX_STDERR Procedure Parameters

| Parameter | Description |
|-----------------------------|--|
| <code>context_handle</code> | The handle to an MLE context in the current session. |

Usage Notes

Any output that was buffered so far gets flushed to the pre-existing sink.

The procedure may raise the following errors:

- ORA-01031: if the caller does not have sufficient privileges

117.3.3 DISABLE_CTX_STDOUT Procedure

This procedure disables `stdout` stream of the specified MLE context, so that future writes to `stdout` are discarded. You need the `EXECUTE DYNAMIC MLE` privilege to execute this function.

Syntax

```
DBMS_MLE.DISABLE_CTX_STDOUT(
    context_handle          IN          context_handle_t);
```

Parameters

Table 117-3 DISABLE_CTX_STDOUT Procedure Parameters

| Parameter | Description |
|-----------------------------|--|
| <code>context_handle</code> | The handle to an MLE context in the current session. |

Usage Notes

Any output that was buffered so far gets flushed to the pre-existing sink.

The procedure may raise the following errors:

- ORA-01031: if the caller does not have sufficient privileges

117.3.4 DISABLE_STDERR Procedure

This procedure disables the `stderr` stream of all MLE contexts, so that future writes to `stderr` are discarded. This applies to all existing contexts and contexts created in the future. You need the `EXECUTE DYNAMIC MLE` privilege to execute this function.

Syntax

```
DBMS_MLE.DISABLE_STDERR();
```

Usage Notes

Any output that was buffered so far gets flushed to the pre-existing sink.

The procedure may raise the following errors:

- ORA-01031: if the caller does not have sufficient privileges

117.3.5 DISABLE_STDOUT Procedure

This procedure disables the stdout stream of all MLE contexts, so that future writes to `stdout` are discarded. This applies to all existing contexts and contexts created in the future. You need the `EXECUTE DYNAMIC MLE` privilege to execute this function.

Syntax

```
DBMS_MLE.DISABLE_STDOUT();
```

Usage Notes

Any output that was buffered so far gets flushed to the pre-existing sink.

The procedure may raise the following errors:

- ORA-01031: if the caller does not have sufficient privileges

117.3.6 DROP_CONTEXT Procedure

This procedure is used to drop an MLE context that was previously created using the `CREATE_CONTEXT` function. After the context is dropped, the context handle is no longer valid and cannot be used anymore. You need the `EXECUTE DYNAMIC MLE` privilege to execute this procedure.

Syntax

```
DBMS_MLE.DROP_CONTEXT (
    context_handle IN context_handle_t);
```

Parameters

Table 117-4 DROP_CONTEXT Procedure Parameters

| Parameter | Description |
|-----------------------------|--|
| <code>context_handle</code> | The handle to an MLE context in the current session. |

Usage Notes

The procedure may raise ORA-01031 error if the caller does not have sufficient privileges.

117.3.7 EVAL Procedure

This procedure executes the given MLE language code within the context identified by the context handle.

The evaluated code has access to all previous modifications to the state of the context, including variables defined by code previously evaluated in the context and values exported through `EXPORT_TO_MLE()`. The evaluated code can also import MLE built-in modules such as the MLE SQL driver.

You need the EXECUTE DYNAMIC MLE privilege to execute this procedure. It also requires the EXECUTE privilege for the given language, for example, EXECUTE ON JAVASCRIPT.

Syntax

```
DBMS_MLE.EVAL(
  context_handle IN          context_handle_t,
  language_id    IN          language_t,
  source         IN          CLOB,
  result         IN OUT     NOCOPY CLOB CHARACTER SET ANY_CS);
```

```
DBMS_MLE.EVAL(
  context_handle IN          context_handle_t,
  language_id    IN          language_t,
  source         IN          VARCHAR2,
  result         IN OUT     NOCOPY CLOB CHARACTER SET ANY_CS);
```

```
DBMS_MLE.EVAL(
  context_handle IN          context_handle_t,
  language_id    IN          language_t,
  source         IN          CLOB);
```

```
DBMS_MLE.EVAL(
  context_handle IN          context_handle_t,
  language_id    IN          language_t,
  source         IN          VARCHAR2);
```

Parameters

Table 117-5 EVAL Procedure Parameters

| Parameter | Description |
|----------------|---|
| context_handle | The handle to an MLE context. |
| language_id | The language of the provided source code. For example, JavaScript. |
| source | The source code to be executed. |
| result | A non-NULL buffer to which the result of the evaluation of the source code is appended. |

Usage Notes

The procedure may raise the following errors:

- ORA-01031: if the caller does not have sufficient privileges
- ORA-04108: if the current container, the current user, or the currently enabled roles are different from those in effect at the time of context creation.

117.3.8 EXPORT_TO_MLE Procedure

This procedure allows you to assign the given value, with appropriate conversion, to the named property in the MLE context. The property is created if it is not already present. You need the EXECUTE DYNAMIC MLE privilege to execute this function.

Syntax

```
DBMS_MLE.EXPORT_TO_MLE (
    context_handle IN    context_handle_t,
    property_name  IN    VARCHAR2,
    property_value IN    BINARY_INTEGER);

DBMS_MLE.EXPORT_TO_MLE (
    context_handle IN    context_handle_t,
    property_name  IN    VARCHAR2,
    property_value IN    BINARY_DOUBLE);

DBMS_MLE.EXPORT_TO_MLE (
    context_handle IN    context_handle_t,
    property_name  IN    VARCHAR2,
    property_value IN    BINARY_FLOAT);

DBMS_MLE.EXPORT_TO_MLE (
    context_handle IN    context_handle_t,
    property_name  IN    VARCHAR2,
    property_value IN    BLOB);

DBMS_MLE.EXPORT_TO_MLE (
    context_handle IN    context_handle_t,
    property_name  IN    VARCHAR2,
    property_value IN    BOOLEAN);

DBMS_MLE.EXPORT_TO_MLE (
    context_handle IN    context_handle_t,
    property_name  IN    VARCHAR2,
    property_value IN    CLOB CHARACTER SET ANY_CS);

DBMS_MLE.EXPORT_TO_MLE (
    context_handle IN    context_handle_t,
    property_name  IN    VARCHAR2,
    property_value IN    DATE);

DBMS_MLE.EXPORT_TO_MLE (
    context_handle IN    context_handle_t,
    property_name  IN    VARCHAR2,
    property_value IN    DSINTERVAL_UNCONSTRAINED);

DBMS_MLE.EXPORT_TO_MLE (
    context_handle IN    context_handle_t,
    property_name  IN    VARCHAR2,
    property_value IN    NUMBER);

DBMS_MLE.EXPORT_TO_MLE (
    context_handle IN    context_handle_t,
    property_name  IN    VARCHAR2,
    property_value IN    TIMESTAMP_TZ_UNCONSTRAINED);

DBMS_MLE.EXPORT_TO_MLE (
```

```

context_handle IN context_handle_t,
property_name IN VARCHAR2,
property_value IN TIMESTAMP_UNCONSTRAINED);

DBMS_MLE.EXPORT_UROWID (
context_handle IN context_handle_t,
property_name IN VARCHAR2,
property_value IN UROWID);

DBMS_MLE.EXPORT_TO_MLE (
context_handle IN context_handle_t,
property_name IN VARCHAR2,
property_value IN VARCHAR2 CHARACTER SET ANY_CS);

DBMS_MLE.EXPORT_TO_MLE (
context_handle IN context_handle_t,
property_name IN VARCHAR2,
property_value IN YMINTERVAL_UNCONSTRAINED);

DBMS_MLE.EXPORT_CHAR (
context_handle IN context_handle_t,
property_name IN VARCHAR2,
property_value IN CHAR CHARACTER SET ANY_CS);

DBMS_MLE.EXPORT_RAW (
context_handle IN context_handle_t,
property_name IN VARCHAR2,
property_value IN RAW);

```

Parameters

Table 117-6 EXPORT_TO_MLE Procedure Parameters

| Parameter | Description |
|----------------|---|
| context_handle | The handle to an MLE context in the current session. |
| property_name | The name of the variable to be set. If the property_name value is NULL or an empty string, ORA-04157 error is thrown. |
| property_value | The value to which the variable should be set. |

Usage Notes

The procedure may raise the following errors:

- ORA-01031: if the caller does not have sufficient privileges.
- ORA-04157: if the value of the passed property_name is NULL or an empty string.
- ORA-04108: if the current container, the current user, or the currently enabled roles are different from those in effect at the time of context creation.

117.3.9 GET_AVAILABLE_LANGUAGES Function

This function returns the set of available MLE languages.

Syntax

```

DBMS_MLE.GET_AVAILABLE_LANGUAGES ()
RETURN languages_t;

```

Return Values

A set of available MLE languages as a table of language identifiers as they can be used as an argument to `DBMS_MLE.EVAL()`.

117.3.10 GET_CTX_ERROR_STACK Function

This function retrieves the MLE language stack trace for the most recent application error in the given execution context. You need the `EXECUTE DYNAMIC MLE` privilege to execute this function.

Syntax

```
DBMS_MLE.GET_CTX_ERROR_STACK(
    context_handle          IN          context_handle_t)
RETURN error_frames_t;
```

Parameters

Table 117-7 GET_CTX_ERROR_STACK Function Parameters

| Parameter | Description |
|-----------------------------|--|
| <code>context_handle</code> | The handle to an MLE context in the current session. |

Return Values

A collection of error stack frames, each of type `error_frame_t`. An empty collection is returned if there is no error stack to report.

Usage Notes

The Function may raise the following errors:

- ORA-01031: if the caller does not have sufficient privileges

117.3.11 IMPORT_FROM_MLE Procedure

This procedure retrieves the value of the named property from the MLE context and converts it to the requested PL/SQL type. You need the `EXECUTE DYNAMIC MLE` privilege to execute this procedure.

Syntax

```
DBMS_MLE.IMPORT_FROM_MLE (
    context_handle  IN          context_handle_t,
    property_name   IN          VARCHAR2,
    target          OUT         NOCOPY BINARY_INTEGER);
```

```
DBMS_MLE.IMPORT_FROM_MLE (
    context_handle  IN          context_handle_t,
    property_name   IN          VARCHAR2,
    target          OUT         NOCOPY BINARY_DOUBLE);
```

```
DBMS_MLE.IMPORT_FROM_MLE (
    context_handle  IN          context_handle_t,
    property_name   IN          VARCHAR2,
```

```

target          OUT      NOCOPY BINARY_FLOAT);

DBMS_MLE.IMPORT_FROM_MLE (
  context_handle IN      context_handle_t,
  property_name  IN      VARCHAR2,
  target        OUT      NOCOPY BLOB);

DBMS_MLE.IMPORT_FROM_MLE (
  context_handle IN      context_handle_t,
  property_name  IN      VARCHAR2,
  target        OUT      NOCOPY BOOLEAN);

DBMS_MLE.IMPORT_FROM_MLE (
  context_handle IN      context_handle_t,
  property_name  IN      VARCHAR2,
  target        OUT      NOCOPY CLOB CHARACTER SET ANY_CS);

DBMS_MLE.IMPORT_FROM_MLE (
  context_handle IN      context_handle_t,
  property_name  IN      VARCHAR2,
  target        OUT      NOCOPY DATE);

DBMS_MLE.IMPORT_FROM_MLE (
  context_handle IN      context_handle_t,
  property_name  IN      VARCHAR2,
  target        OUT      NOCOPY DSINTERVAL_UNCONSTRAINED);

DBMS_MLE.IMPORT_FROM_MLE (
  context_handle IN      context_handle_t,
  property_name  IN      VARCHAR2,
  target        OUT      NOCOPY NUMBER);

DBMS_MLE.IMPORT_FROM_MLE (
  context_handle IN      context_handle_t,
  property_name  IN      VARCHAR2,
  target        OUT      NOCOPY TIMESTAMP_TZ_UNCONSTRAINED);

DBMS_MLE.IMPORT_FROM_MLE (
  context_handle IN      context_handle_t,
  property_name  IN      VARCHAR2,
  target        OUT      NOCOPY TIMESTAMP_UNCONSTRAINED);

DBMS_MLE.IMPORT_UROWID (
  context_handle IN      context_handle_t,
  property_name  IN      VARCHAR2,
  target        OUT      NOCOPY UROWID);

DBMS_MLE.IMPORT_FROM_MLE (
  context_handle IN      context_handle_t,
  property_name  IN      VARCHAR2,
  target        OUT      NOCOPY VARCHAR2 CHARACTER SET ANY_CS);

DBMS_MLE.IMPORT_FROM_MLE (
  context_handle IN      context_handle_t,
  property_name  IN      VARCHAR2,
  target        OUT      NOCOPY YMINTERVAL_UNCONSTRAINED);

DBMS_MLE.IMPORT_CHAR (
  context_handle IN      context_handle_t,
  property_name  IN      VARCHAR2,
  target        OUT      CHAR CHARACTER SET ANY_CS);

```

```

DBMS_MLE.IMPORT_RAW (
    context_handle IN    context_handle_t,
    property_name  IN    VARCHAR2,
    target        OUT   RAW);

```

Parameters

Table 117-8 IMPORT_FROM_MLE Procedure Parameters

| Parameter | Description |
|----------------|---|
| context_handle | The handle to an MLE context in the current session. |
| property_name | The name of the property to be retrieved. If the property_name is NULL or an empty string, ORA-04157 error is thrown. |
| target | A PL/SQL variable into which the retrieved property is stored. |

Usage Notes

The `IMPORT_FROM_MLE` procedure may throw the following exceptions:

- ORA-01031: if the caller does not have sufficient privileges.
- ORA-04108: if the current container, the current user, or the currently enabled roles are different from those in effect at the time of context creation.
- ORA-04157: if the value of the passed property_name is NULL or an empty string.
- ORA-04205: the value cannot be converted to the target PL/SQL type.
- ORA-06502: the buffer of the PL/SQL variable is too small to hold the retrieved value.

117.3.12 SET_CTX_STDERR Procedure

This procedure redirects the `stderr` stream of the MLE context to the given CLOB. You need the `EXECUTE DYNAMIC MLE` privilege to execute this function.

Syntax

```

DBMS_MLE.SET_CTX_STDERR(
    context_handle IN    context_handle_t,
    sink          IN OUT NOCOPY CLOB CHARACTER SET ANY_CS);

```

Parameters

Table 117-9 SET_CTX_STDERR Procedure Parameters

| Parameter | Description |
|----------------|---|
| context_handle | Handle to an MLE context in the current session. |
| sink | The CLOB sink to redirect stderr to. Providing a NULL value will result in ORA-06530 error. |

Usage Notes

Any output that was buffered so far gets flushed to the pre-existing sink before redirecting to the new sink.

The procedure may raise the following errors:

- ORA-01031: if the caller does not have sufficient privileges
- ORA-06530: if the sink is NULL.

117.3.13 SET_CTX_STDERR_TO_DBMS_OUTPUT Procedure

This procedure redirects the `stderr` stream of the MLE context to `DBMS_OUTPUT`. You need the `EXECUTE DYNAMIC MLE` privilege to execute this function.

Syntax

```
DBMS_MLE.SET_CTX_STDERR_TO_DBMS_OUTPUT(
    context_handle      IN      context_handle_t);
```

Parameters

Table 117-10 SET_CTX_STDERR_TO_DBMS_OUTPUT Procedure Parameters

| Parameter | Description |
|-----------------------------|--|
| <code>context_handle</code> | Handle to an MLE context in the current session. |

Usage Notes

Any output that was buffered so far gets flushed to the pre-existing sink before redirecting to `DBMS_OUTPUT`.

The procedure may raise the following errors:

- ORA-01031: if the caller does not have sufficient privileges

117.3.14 SET_CTX_STDOUT Procedure

This procedure redirects the `stdout` stream of the MLE context to the given CLOB. You need the `EXECUTE DYNAMIC MLE` privilege to execute this function.

Syntax

```
DBMS_MLE.SET_CTX_STDOUT(
    context_handle      IN context_handle_t,
    sink                IN OUT NOCOPY CLOB CHARACTER SET ANY_CS);
```

Parameters

Table 117-11 SET_CTX_STDOUT Procedure Parameters

| Parameter | Description |
|-----------------------------|---|
| <code>context_handle</code> | The handle to an MLE context in the current session. |
| <code>sink</code> | The CLOB to redirect <code>stdout</code> to. Providing a NULL value will result in ORA-06530 error. |

Usage Notes

Any output that was buffered so far gets flushed to the pre-existing sink before redirecting to the new sink.

This procedure may raise the following errors:

- ORA-01031: if the caller does not have sufficient privileges
- ORA-06530: if the sink is NULL.

117.3.15 SET_CTX_STDOUT_TO_DBMS_OUTPUT Procedure

This procedure redirects the `stdout` stream of the MLE context to `DBMS_OUTPUT`. You need the `EXECUTE DYNAMIC MLE` privilege to execute this function.

Syntax

```
DBMS_MLE.SET_CTX_STDOUT_TO_DBMS_OUTPUT(
    context_handle      IN      context_handle_t);
```

Parameters

Table 117-12 SET_CTX_STDOUT_TO_DBMS_OUTPUT Procedure Parameters

| Parameter | Description |
|-----------------------------|--|
| <code>context_handle</code> | The handle to an MLE context in the current session. |

Usage Notes

Any output that was buffered so far gets flushed to the pre-existing sink before redirecting to `DBMS_OUTPUT`.

The procedure may raise the following errors:

- ORA-01031: if the caller does not have sufficient privileges

117.3.16 SET_STDERR Procedure

This procedure redirects the `stderr` stream of all MLE contexts to the given CLOB. This applies to all existing contexts and contexts created in the future. You need the `EXECUTE DYNAMIC MLE` privilege to execute this function.

Syntax

```
DBMS_MLE.SET_STDERR(
    sink                IN OUT      NOCOPY CLOB CHARACTER SET ANY_CS);
```

Parameters

Table 117-13 SET_STDERR Procedure Parameters

| Parameter | Description |
|-------------------|--|
| <code>sink</code> | The CLOB to redirect <code>stdout</code> to. |

Usage Notes

Any output that was buffered so far gets flushed to the pre-existing sink before redirecting to the new sink.

The procedure may raise the following errors:

- ORA-01031: if the caller does not have sufficient privileges
- ORA-06530: if the sink is NULL.

117.3.17 SET_STDERR_TO_DBMS_OUTPUT Procedure

This procedure redirects the `stderr` stream of all MLE contexts to `DBMS_OUTPUT`. This applies to all existing contexts and contexts created in the future. You need the `EXECUTE DYNAMIC MLE` privilege to execute this function.

Syntax

```
DBMS_MLE.SET_STDERR_TO_DBMS_OUTPUT();
```

Usage Notes

Any output that was buffered so far gets flushed to the pre-existing sink before redirecting to `DBMS_OUTPUT`.

The procedure may raise the following errors:

- ORA-01031: if the caller does not have sufficient privileges

117.3.18 SET_STDOUT Procedure

This procedure redirects the `stdout` stream of all MLE contexts to the given `CLOB`. This applies to all existing contexts and contexts created in the future. You need the `EXECUTE DYNAMIC MLE` privilege to execute this function.

Syntax

```
DBMS_MLE.SET_STDOUT(
    sink          IN OUT NOCOPY CLOB CHARACTER SET ANY_CS);
```

Parameters

Table 117-14 SET_STDOUT Procedure Parameters

| Parameter | Description |
|-------------------|---------------------------------|
| <code>sink</code> | The CLOB to redirect stdout to. |

Usage Notes

Any output that was buffered so far gets flushed to the pre-existing sink before redirecting to the new sink.

The procedure may raise the following errors:

- ORA-01031: if the caller does not have sufficient privileges

- ORA-06530: if the sink is NULL.

117.3.19 SET_STDOUT_TO_DBMS_OUTPUT Procedure

This procedure redirects the `stdout` stream of all MLE contexts to `DBMS_OUTPUT`. This applies to all existing contexts and contexts created in the future. You need the `EXECUTE DYNAMIC MLE` privilege to execute this function.

Syntax

```
DBMS_MLE.SET_STDOUT_TO_DBMS_OUTPUT();
```

Usage Notes

Any output that was buffered so far gets flushed to the pre-existing sink before redirecting to `DBMS_OUTPUT`.

The procedure may raise the following errors:

- ORA-01031: if the caller does not have sufficient privileges

DBMS_MONITOR

The `DBMS_MONITOR` package enables you to use PL/SQL for controlling additional tracing and statistics gathering.

The chapter contains the following topics:

- [Summary of DBMS_MONITOR Subprograms](#)

118.1 Summary of DBMS_MONITOR Subprograms

This table lists the `DBMS_MONITOR` subprograms and briefly describes them.

Table 118-1 DBMS_MONITOR Package Subprograms

| Subprogram | Description |
|--|---|
| CLIENT_ID_STAT_DISABLE Procedure | Disables statistic gathering previously enabled for a given Client Identifier |
| CLIENT_ID_STAT_ENABLE Procedure | Enables statistic gathering for a given Client Identifier |
| CLIENT_ID_TRACE_DISABLE Procedure | Disables the trace previously enabled for a given Client Identifier globally for the database |
| CLIENT_ID_TRACE_ENABLE Procedure | Enables the trace for a given Client Identifier globally for the database |
| DATABASE_TRACE_DISABLE Procedure | Disables SQL trace for the whole database or a specific instance |
| DATABASE_TRACE_ENABLE Procedure | Enables SQL trace for the whole database or a specific instance |
| SERV_MOD_ACT_STAT_DISABLE Procedure | Disables statistic gathering enabled for a given combination of Service Name, <code>MODULE</code> and <code>ACTION</code> |
| SERV_MOD_ACT_STAT_ENABLE Procedure | Enables statistic gathering for a given combination of Service Name, <code>MODULE</code> and <code>ACTION</code> |
| SERV_MOD_ACT_TRACE_DISABLE Procedure | Disables the trace for <code>ALL</code> enabled instances for a or a given combination of Service Name, <code>MODULE</code> and <code>ACTION</code> name globally |
| SERV_MOD_ACT_TRACE_ENABLE Procedure | Enables SQL tracing for a given combination of Service Name, <code>MODULE</code> and <code>ACTION</code> globally unless an <code>instance_name</code> is specified |
| SESSION_TRACE_DISABLE Procedure | Disables the previously enabled trace for a given database session identifier (SID) on the local instance |
| SESSION_TRACE_ENABLE Procedure | Enables the trace for a given database session identifier (SID) on the local instance |

118.1.1 CLIENT_ID_STAT_DISABLE Procedure

This procedure will disable statistics accumulation for all instances and remove the accumulated results from V\$CLIENT_STATS view enabled by the CLIENT_ID_STAT_ENABLE Procedure.

Syntax

```
DBMS_MONITOR.CLIENT_ID_STAT_DISABLE(  
    client_id          IN  VARCHAR2);
```

Parameters

Table 118-2 CLIENT_ID_STAT_DISABLE Procedure Parameters

| Parameter | Description |
|-----------|---|
| client_id | Client Identifier for which statistic aggregation is disabled |

Examples

To disable accumulation:

```
EXECUTE DBMS_MONITOR.CLIENT_ID_STAT_DISABLE('janedoe');
```

118.1.2 CLIENT_ID_STAT_ENABLE Procedure

This procedure enables statistic gathering for a given Client Identifier.

Statistics gathering is global for the database and persistent across instance starts and restarts. That is, statistics are enabled for all instances of the same database, including restarts. Statistics are viewable through V\$CLIENT_STATS views.

Syntax

```
DBMS_MONITOR.CLIENT_ID_STAT_ENABLE(  
    client_id          IN  VARCHAR2);
```

Parameters

Table 118-3 CLIENT_ID_STAT_ENABLE Procedure Parameters

| Parameter | Description |
|-----------|--|
| client_id | Client Identifier for which statistic aggregation is enabled |

Examples

To enable statistic accumulation for a client with a given client ID:

```
EXECUTE DBMS_MONITOR.CLIENT_ID_STAT_ENABLE('janedoe');
```

118.1.3 CLIENT_ID_TRACE_DISABLE Procedure

This procedure will disable tracing enabled by the CLIENT_ID_TRACE_ENABLE Procedure.

Syntax

```
DBMS_MONITOR.CLIENT_ID_TRACE_DISABLE(
  client_id  IN  VARCHAR2);
```

Parameters

Table 118-4 CLIENT_ID_TRACE_DISABLE Procedure Parameters

| Parameter | Description |
|-----------|---|
| client_id | Client Identifier for which SQL tracing is disabled |

Examples

```
EXECUTE DBMS_MONITOR.CLIENT_ID_TRACE_DISABLE ('janedoe');
```

118.1.4 CLIENT_ID_TRACE_ENABLE Procedure

This procedure will enable the trace for a given client identifier globally for the database.

Syntax

```
DBMS_MONITOR.CLIENT_ID_TRACE_ENABLE(
  client_id  IN  VARCHAR2,
  waits     IN  BOOLEAN DEFAULT TRUE,
  binds     IN  BOOLEAN DEFAULT FALSE,
  plan_stat IN  VARCHAR2 DEFAULT NULL);
```

Parameters

Table 118-5 CLIENT_ID_TRACE_ENABLE Procedure Parameters

| Parameter | Description |
|-----------|--|
| client_id | Database Session Identifier for which SQL tracing is enabled |
| waits | If TRUE, wait information is present in the trace |
| binds | If TRUE, bind information is present in the trace |
| plan_stat | Frequency at which we dump row source statistics. Value should be 'NEVER', 'FIRST_EXECUTION' (equivalent to NULL) or 'ALL_EXECUTIONS'. |

Usage Notes

- The trace will be written to multiple trace files because more than one Oracle shadow process can work on behalf of a given client identifier.
- The tracing is enabled for all instances and persistent across restarts.

Examples

```
EXECUTE DBMS_MONITOR.CLIENT_ID_TRACE_ENABLE('janedoe', TRUE,
FALSE);
```

118.1.5 DATABASE_TRACE_DISABLE Procedure

This procedure disables SQL trace for the whole database or a specific instance.

Syntax

```
DBMS_MONITOR.DATABASE_TRACE_DISABLE (
    instance_name IN VARCHAR2 DEFAULT NULL);
```

Parameters**Table 118-6 DATABASE_TRACE_DISABLE Procedure Parameters**

| Parameter | Description |
|---------------|---|
| instance_name | Disables tracing for the named instance |

118.1.6 DATABASE_TRACE_ENABLE Procedure

This procedure enables SQL trace for the whole database or a specific instance.

Syntax

```
DBMS_MONITOR.DATABASE_TRACE_ENABLE (
    waits          IN BOOLEAN DEFAULT TRUE,
    binds          IN BOOLEAN DEFAULT FALSE,
    instance_name  IN VARCHAR2 DEFAULT NULL,
    plan_stat      IN VARCHAR2 DEFAULT NULL);
```

Parameters**Table 118-7 DATABASE_TRACE_ENABLE Procedure Parameters**

| Parameter | Description |
|---------------|--|
| waits | If TRUE, wait information will be present in the trace |
| binds | If TRUE, bind information will be present in the trace |
| instance_name | If set, restricts tracing to the named instance |
| plan_stat | Frequency at which we dump row source statistics. Value should be 'NEVER', 'FIRST_EXECUTION' (equivalent to NULL) or 'ALL_EXECUTIONS'. |

118.1.7 SERV_MOD_ACT_STAT_DISABLE Procedure

This procedure will disable statistics accumulation and remove the accumulated results from V\$SERV_MOD_ACT_STATS view.

Statistics disabling is persistent for the database. That is, service statistics are disabled for instances of the same database (plus dblinks that have been activated as a result of the enable).

Syntax

```
DBMS_MONITOR.SERV_MOD_ACT_STAT_DISABLE (
    service_name    IN VARCHAR2,
    module_name     IN VARCHAR2,
    action_name     IN VARCHAR2 DEFAULT ALL_ACTIONS);
```

Parameters

Table 118-8 SERV_MOD_ACT_STAT_DISABLE Procedure Parameters

| Parameter | Description |
|--------------|---|
| service_name | Name of the service for which statistic aggregation is disabled |
| module_name | Name of the MODULE. An additional qualifier for the service. It is a required parameter. |
| action_name | Name of the ACTION. An additional qualifier for the Service and MODULE name. Omitting the parameter (or supplying ALL_ACTIONS constant) means enabling aggregation for all Actions for a given Service/MODULE combination. In this case, statistics are aggregated on the module level. |

Usage Notes

Regarding statistics gathering, when you change the module or action, the change takes effect when the next user call is executed in the session. For example, if a module is set to 'module 1' in a session, and the module is reset to 'module 2' in a user call in the session, then the module remains 'module 1' during this user call. The module is changed to 'module 2' in the next user call in the session.

118.1.8 SERV_MOD_ACT_STAT_ENABLE Procedure

This procedure enables statistic gathering for a given combination of Service Name, MODULE and ACTION.

Calling this procedure enables statistic gathering for a hierarchical combination of Service name, MODULE name, and ACTION name on all instances for the same database. Statistics are accessible by means of the V\$SERV_MOD_ACT_STATS view.

Syntax

```
DBMS_MONITOR.SERV_MOD_ACT_STAT_ENABLE (
    service_name    IN VARCHAR2,
    module_name     IN VARCHAR2,
    action_name     IN VARCHAR2 DEFAULT ALL_ACTIONS);
```

Parameters

Table 118-9 SERV_MOD_ACT_STAT_ENABLE Procedure Parameters

| Parameter | Description |
|--------------|---|
| service_name | Name of the service for which statistic aggregation is enabled |
| module_name | Name of the MODULE. An additional qualifier for the service. It is a required parameter. |
| action_name | Name of the ACTION. An additional qualifier for the Service and MODULE name. Omitting the parameter (or supplying ALL_ACTIONS constant) means enabling aggregation for all Actions for a given Service/MODULE combination. In this case, statistics are aggregated on the module level. |

Usage Notes

Enabling statistic aggregation for the given combination of Service/Module/Action names is slightly complicated by the fact that the Module/Action values can be empty strings which are indistinguishable from NULLs. For this reason, we adopt the following conventions:

A special constant (unlikely to be a real action names) is defined:

```
ALL_ACTIONS constant VARCHAR2 := '###ALL_ACTIONS';
```

Using ALL_ACTIONS for an action specification means that aggregation is enabled for all actions with a given module name, while using NULL (or empty string) means that aggregation is enabled for an action whose name is an empty string.

Regarding statistics gathering, when you change the module or action, the change takes effect when the next user call is executed in the session. For example, if a module is set to 'module 1' in a session, and the module is reset to 'module 2' in a user call in the session, then the module remains 'module 1' during this user call. The module is changed to 'module 2' in the next user call in the session.

Examples

To enable statistic accumulation for a given combination of Service name and MODULE:

```
EXECUTE DBMS_MONITOR.SERV_MOD_ACT_STAT_ENABLE( 'APPS1', 'PAYROLL');
```

To enable statistic accumulation for a given combination of Service name, MODULE and ACTION:

```
EXECUTE
DBMS_MONITOR.SERV_MOD_ACT_STAT_ENABLE('APPS1', 'GLEDGER', 'DEBIT_ENTRY');
```

If both of the preceding commands are issued, statistics are accumulated as follows:

- For the APPS1 service, because accumulation for each Service Name is the default.
- For all actions in the PAYROLL Module.
- For the DEBIT_ENTRY Action within the GLEDGER Module.

118.1.9 SERV_MOD_ACT_TRACE_DISABLE Procedure

This procedure will disable the trace at ALL enabled instances for a given combination of Service Name, MODULE, and ACTION name globally.

Syntax

```
DBMS_MONITOR.SERV_MOD_ACT_TRACE_DISABLE (
  service_name  IN  VARCHAR2,
  module_name   IN  VARCHAR2,
  action_name   IN  VARCHAR2 DEFAULT ALL_ACTIONS,
  instance_name IN  VARCHAR2 DEFAULT NULL);
```

Parameters

Table 118-10 SERV_MOD_ACT_TRACE_DISABLE Procedure Parameters

| Parameter | Description |
|---------------|--|
| service_name | Name of the service for which tracing is disabled. |
| module_name | Name of the MODULE. An additional qualifier for the service |
| action_name | Name of the ACTION. An additional qualifier for the Service and MODULE name. |
| instance_name | If set, this restricts tracing to the named instance_name |

Usage Notes

Specifying NULL for the module_name parameter means that statistics will no longer be accumulated for the sessions which do not set the MODULE attribute.

Examples

To enable tracing for a Service named APPS1:

```
EXECUTE DBMS_MONITOR.SERV_MOD_ACT_TRACE_ENABLE ('APPS1',
  DBMS_MONITOR.ALL_MODULES, DBMS_MONITOR.ALL_ACTIONS, TRUE,
  FALSE, NULL);
```

To disable tracing specified in the previous step:

```
EXECUTE DBMS_MONITOR.SERV_MOD_ACT_TRACE_DISABLE ('APPS1');
```

To enable tracing for a given combination of Service and MODULE (all ACTIONS):

```
EXECUTE DBMS_MONITOR.SERV_MOD_ACT_TRACE_ENABLE ('APPS1', 'PAYROLL',
  DBMS_MONITOR.ALL_ACTIONS, TRUE, FALSE, NULL);
```

To disable tracing specified in the previous step:

```
EXECUTE DBMS_MONITOR.SERV_MOD_ACT_TRACE_DISABLE ('APPS1', 'PAYROLL');
```

118.1.10 SERV_MOD_ACT_TRACE_ENABLE Procedure

This procedure will enable SQL tracing for a given combination of Service Name, MODULE and ACTION globally unless an instance_name is specified.

Syntax

```
DBMS_MONITOR.SERV_MOD_ACT_TRACE_ENABLE (
    service_name      IN VARCHAR2,
    module_name       IN VARCHAR2 DEFAULT ANY_MODULE,
    action_name       IN VARCHAR2 DEFAULT ANY_ACTION,
    waits             IN BOOLEAN DEFAULT TRUE,
    binds             IN BOOLEAN DEFAULT FALSE,
    instance_name     IN VARCHAR2 DEFAULT NULL,
    plan_stat         IN VARCHAR2 DEFAULT NULL);
```

Parameters

Table 118-11 SERV_MOD_ACT_TRACE_ENABLE Procedure Parameters

| Parameter | Description |
|---------------|--|
| service_name | Name of the service for which SQL trace is enabled |
| module_name | Name of the MODULE for which SQL trace is enabled. An optional additional qualifier for the service. If omitted, SQL trace is enabled for all modules and actions in a given service. |
| action_name | Name of the ACTION for which SQL trace is enabled. An optional additional qualifier for the Service and MODULE name. If omitted, SQL trace is enabled for all actions in a given module. |
| waits | If TRUE, wait information is present in the trace |
| binds | If TRUE, bind information is present in the trace |
| instance_name | If set, this restricts tracing to the named instance_name |
| plan_stat | Frequency at which we dump row source statistics. Value should be 'NEVER', 'FIRST_EXECUTION' (equivalent to NULL) or 'ALL_EXECUTIONS'. |

Usage Notes

- The procedure enables a trace for a given combination of Service, MODULE and ACTION name. The specification is strictly hierarchical: Service Name or Service Name/MODULE, or Service Name, MODULE, and ACTION name must be specified. Omitting a qualifier behaves like a wild-card, so that not specifying an ACTION means all ACTIONS. Using the ALL_ACTIONS constant achieves the same purpose.
- This tracing is useful when an application MODULE and optionally known ACTION is experiencing poor service levels.
- By default, tracing is enabled globally for the database. The instance_name parameter is provided to restrict tracing to named instances that are known, for example, to exhibit poor service levels.
- Tracing information is present in multiple trace files and you must use the trcsess tool to collect it into a single file.

- Specifying NULL for the `module_name` parameter means that statistics will be accumulated for the sessions which do not set the `MODULE` attribute.

Examples

To enable tracing for a Service named APPS1:

```
EXECUTE DBMS_MONITOR.SERV_MOD_ACT_TRACE_ENABLE('APPS1',
        DBMS_MONITOR.ALL_MODULES, DBMS_MONITOR.ALL_ACTIONS, TRUE,
FALSE, NULL);
```

To enable tracing for a given combination of Service and MODULE (all ACTIONS):

```
EXECUTE DBMS_MONITOR.SERV_MOD_ACT_TRACE_ENABLE('APPS1', 'PAYROLL',
        DBMS_MONITOR.ALL_ACTIONS, TRUE, FALSE, NULL);
```

118.1.11 SESSION_TRACE_DISABLE Procedure

This procedure will disable the trace for a given database session at the local instance.

Syntax

```
DBMS_MONITOR.SESSION_TRACE_DISABLE(
    session_id    IN    BINARY_INTEGER DEFAULT NULL,
    serial_num    IN    BINARY_INTEGER DEFAULT NULL);
```

Parameters

Table 118-12 SESSION_TRACE_DISABLE Procedure Parameters

| Parameter | Description |
|-------------------------|---|
| <code>session_id</code> | Database Session Identifier for which SQL trace is disabled |
| <code>serial_num</code> | Serial number for this session |

Usage Notes

If `serial_num` is NULL but `session_id` is specified, a session with a given `session_id` is no longer traced irrespective of its serial number. If both `session_id` and `serial_num` are NULL, the current user session is no longer traced. It is illegal to specify NULL `session_id` and non-NULL `serial_num`. In addition, the NULL values are default and can be omitted.

Examples

To enable tracing for a client with a given client session ID:

```
EXECUTE DBMS_MONITOR.SESSION_TRACE_ENABLE(7,4634, TRUE, FALSE);
```

To disable tracing specified in the previous step:

```
EXECUTE DBMS_MONITOR.SESSION_TRACE_DISABLE(7,4634);;
```

118.1.12 SESSION_TRACE_ENABLE Procedure

This procedure enables a SQL trace for the given Session ID on the local instance

Syntax

```
DBMS_MONITOR.SESSION_TRACE_ENABLE (
  session_id IN BINARY_INTEGER DEFAULT NULL,
  serial_num IN BINARY_INTEGER DEFAULT NULL,
  waits      IN BOOLEAN DEFAULT TRUE,
  binds      IN BOOLEAN DEFAULT FALSE,
  plan_stat  IN VARCHAR2 DEFAULT NULL);
```

Parameters

Table 118-13 SESSION_TRACE_ENABLE Procedure Parameters

| Parameter | Description |
|------------|--|
| session_id | Client Identifier for which SQL trace is enabled. If omitted (or NULL), the user's own session is assumed. |
| serial_num | Serial number for this session. If omitted (or NULL), only the session ID is used to determine a session. |
| waits | If TRUE, wait information is present in the trace |
| binds | If TRUE, bind information is present in the trace |
| plan_stat | Frequency at which we dump row source statistics. Value should be 'NEVER', 'FIRST_EXECUTION' (equivalent to NULL) or 'ALL_EXECUTIONS'. |

Usage Notes

The procedure enables a trace for a given database session, and is still useful for client/server applications. The trace is enabled only on the instance to which the caller is connected, since database sessions do not span instances. This tracing is strictly local to an instance.

If `serial_num` is NULL but `session_id` is specified, a session with a given `session_id` is traced irrespective of its serial number. If both `session_id` and `serial_num` are NULL, the current user session is traced. It is illegal to specify NULL `session_id` and non-NULL `serial_num`. In addition, the NULL values are default and can be omitted.

Examples

To enable tracing for a client with a given client session ID:

```
EXECUTE DBMS_MONITOR.SESSION_TRACE_ENABLE(7,4634, TRUE, FALSE);
```

To disable tracing specified in the previous step:

```
EXECUTE DBMS_MONITOR.SESSION_TRACE_DISABLE(7,4634);
```

Either

```
EXECUTE DBMS_MONITOR.SESSION_TRACE_ENABLE(5);
```

or

```
EXECUTE DBMS_MONITOR.SESSION_TRACE_ENABLE(5, NULL);
```

traces the session with session ID of 5, while either

```
EXECUTE DBMS_MONITOR.SESSION_TRACE_ENABLE();
```

or

```
EXECUTE DBMS_MONITOR.SESSION_TRACE_ENABLE(NULL, NULL);
```

traces the current user session. Also,

```
EXECUTE DBMS_MONITOR.SESSION_TRACE_ENABLE(NULL, NULL, TRUE, TRUE);
```

traces the current user session including waits and binds. The same can be also expressed using keyword syntax:

```
EXECUTE DBMS_MONITOR.SESSION_TRACE_ENABLE(binds=>TRUE);
```

DBMS_MVIEW

DBMS_MVIEW enables you to understand capabilities for materialized views and potential materialized views, including their rewrite availability. It also enables you to refresh materialized views that are not part of the same refresh group and purge logs.

**Note:**

DBMS_MVIEW is a synonym for DBMS_SNAPSHOT.

**See Also:**

Oracle Database Data Warehousing Guide for more information about using materialized views in a data warehousing environment

This chapter contains the following topics:

- [Operational Notes](#)
- [Security Model](#)
- [Rules and Limits](#)
- [Summary of DBMS_MVIEW Subprograms](#)

119.1 DBMS_MVIEW Operational Notes

If a query is less than 256 characters long, you can invoke `EXPLAIN_REWRITE` using the `EXECUTE` command from SQL*Plus. Otherwise, the recommended method is to use a PL/SQL `BEGIN..END` block, as shown in the examples in `/rdbms/demo/smxrw.sql`.

119.2 DBMS_MVIEW Security Model

The `DBMS_MVIEW` package consists of a number of materialized view-related subprograms, each of which has different functionality and privilege requirements.

The privilege model is generally based on the invoker's right. Each package subprogram is executed by first checking the privileges against the invoker. If all the required privileges are met, the subprogram will be executed. Otherwise, an insufficient privileges error will be thrown.

119.3 DBMS_MVIEW Rules and Limits

The `DBMS_MVIEW.EXPLAIN_REWRITE` procedure cannot accept queries longer than 32627 characters. These restrictions also apply when passing the defining query of a materialized view to the `DBMS_MVIEW.EXPLAIN_MVIEW` procedure.

119.4 Summary of DBMS_MVIEW Subprograms

This table lists the `DBMS_MVIEW` subprograms and briefly describes them.

Table 119-1 DBMS_MVIEW Package Subprograms

| Subprogram | Description |
|---|---|
| <code>BEGIN_TABLE_REORGANIZATION Procedure</code> | Performs a process to preserve materialized view data needed for refresh |
| <code>END_TABLE_REORGANIZATION Procedure</code> | Ensures that the materialized view data for the master table is valid and that the master table is in the proper state |
| <code>ESTIMATE_MVIEW_SIZE Procedure</code> | Estimates the size of a materialized view that you might create, in bytes and rows |
| <code>EXPLAIN_MVIEW Procedure</code> | Explains what is possible with a materialized view or potential materialized view |
| <code>EXPLAIN_REWRITE Procedure</code> | Explains why a query failed to rewrite or why the optimizer chose to rewrite a query with a particular materialized view or materialized views |
| <code>I_AM_A_REFRESH Function</code> | Returns the value of the <code>I_AM_REFRESH</code> package state |
| <code>PMARKER Function</code> | Returns a partition marker from a rowid, and is used for Partition Change Tracking (PCT) |
| <code>PURGE_DIRECT_LOAD_LOG Procedure</code> | Purges rows from the direct loader log after they are no longer needed by any materialized views (used with data warehousing) |
| <code>PURGE_LOG Procedure</code> | Purges rows from the materialized view log |
| <code>PURGE_MVIEW_FROM_LOG Procedure</code> | Purges rows from the materialized view log |
| <code>REFRESH Procedures</code> | Refreshes one or more materialized views that are not members of the same refresh group |
| <code>REFRESH_ALL_MVIEWS Procedure</code> | Refreshes all materialized views that do not reflect changes to their master table or master materialized view |
| <code>REFRESH_DEPENDENT Procedures</code> | Refreshes all table-based materialized views that depend on a specified master table or master materialized view, or list of master tables or master materialized views |
| <code>REGISTER_MVIEW Procedure</code> | Enables the administration of individual materialized views |
| <code>UNREGISTER_MVIEW Procedure</code> | Enables the administration of individual materialized views once invoked at a master site or master materialized view site to unregister a materialized view |

119.4.1 BEGIN_TABLE_REORGANIZATION Procedure

This procedure performs a process to preserve materialized view data needed for refresh. It must be called before a master table is reorganized.

Syntax

```
DBMS_MVIEW.BEGIN_TABLE_REORGANIZATION (
    tabowner    IN  VARCHAR2,
    tabname     IN  VARCHAR2);
```

Parameters

Table 119-2 BEGIN_TABLE_REORGANIZATION Procedure Parameters

| Parameter | Description |
|-----------|--------------------------------------|
| tabowner | Owner of the table being reorganized |
| tabname | Name of the table being reorganized |

119.4.2 END_TABLE_REORGANIZATION Procedure

This procedure ensures that the materialized view data for the master table is valid and that the master table is in the proper state. It must be called after a master table is reorganized.

Syntax

```
DBMS_MVIEW.END_TABLE_REORGANIZATION (
    tabowner    IN  VARCHAR2,
    tabname     IN  VARCHAR2);
```

Parameters

Table 119-3 END_TABLE_REORGANIZATION Procedure Parameters

| Parameter | Description |
|-----------|--------------------------------------|
| tabowner | Owner of the table being reorganized |
| tabname | Name of the table being reorganized |

119.4.3 ESTIMATE_MVIEW_SIZE Procedure

This procedure estimates the size of a materialized view that you might create, in bytes and number of rows.

Syntax

```
DBMS_MVIEW.ESTIMATE_MVIEW_SIZE (
    stmt_id      IN  VARCHAR2,
    select_clause IN  VARCHAR2,
    num_rows     OUT NUMBER,
    num_bytes    OUT NUMBER);
```

Parameters

Table 119-4 ESTIMATE_MVIEW_SIZE Procedure Parameters

| Parameter | Description |
|---------------|--|
| stmt_id | Arbitrary string used to identify the statement in an EXPLAIN PLAN |
| select_clause | The SELECT statement to be analyzed |
| num_rows | Estimated cardinality |
| num_bytes | Estimated number of bytes |

119.4.4 EXPLAIN_MVIEW Procedure

This procedure enables you to learn what is possible with a materialized view or potential materialized view. For example, you can determine if a materialized view is fast refreshable and what types of query rewrite you can perform with a particular materialized view.

Using this procedure is straightforward. You simply call `DBMS_MVIEW.EXPLAIN_MVIEW`, passing in as parameters the schema and materialized view name for an existing materialized view. Alternatively, you can specify the `SELECT` string or `CREATE MATERIALIZED VIEW` statement for a potential materialized view. The materialized view or potential materialized view is then analyzed and the results are written into either a table called `MV_CAPABILITIES_TABLE`, which is the default, or to an array called `MSG_ARRAY`.

The procedure is overloaded:

- The first version is for explaining an existing or potential materialized view with output to `MV_CAPABILITIES_TABLE`.
- The second version is for explaining an existing or potential materialized view with output to a `VARRAY`.

Syntax

```
DBMS_MVIEW.EXPLAIN_MVIEW (
    mv          IN VARCHAR2,
    statement_id IN VARCHAR2:= NULL);

DBMS_MVIEW.EXPLAIN_MVIEW (
    mv          IN VARCHAR2,
    msg_array   OUT SYS.ExplainMVArrayType);
```

Parameters

Table 119-5 EXPLAIN_MVIEW Procedure Parameters

| Parameter | Description |
|-----------|--|
| mv | The name of an existing materialized view (optionally qualified with the owner name separated by a ".") or a SELECT statement or a CREATE MATERIALIZED VIEW statement for a potential materialized view. |

Table 119-5 (Cont.) EXPLAIN_MVIEW Procedure Parameters

| Parameter | Description |
|--------------|---|
| statement_id | A client-supplied unique identifier to associate output rows with specific invocations of EXPLAIN_MVIEW |
| msg_array | The PL/SQL VARRAY that receives the output. Use this parameter to direct EXPLAIN_MVIEW's output to a PL/SQL VARRAY rather than MV_CAPABILITIES_TABLE. |

Usage Notes

You must run the `utlxmlv.sql` script to create `MV_CAPABILITIES_TABLE` in the current schema prior to calling `EXPLAIN_MVIEW` except when you direct output to a VARRAY. The script is found in the `ADMIN` directory.

119.4.5 EXPLAIN_REWRITE Procedure

This procedure enables you to learn why a query failed to rewrite, or, if it rewrites, which materialized views will be used.

Using the results from the procedure, you can take the appropriate action needed to make a query rewrite if at all possible. The query specified in the `EXPLAIN_REWRITE` statement is never actually executed.

A demo file, `xrwutl.sql`, is available to help format the output from `EXPLAIN_REWRITE`.

Syntax

You can obtain the output from `DBMS_MVIEW.EXPLAIN_REWRITE` in two ways. The first is to use a table, while the second is to create a VARRAY. The following shows the basic syntax for using an output table:

```
DBMS_MVIEW.EXPLAIN_REWRITE (
    query          VARCHAR2,
    mv             VARCHAR2(30),
    statement_id   VARCHAR2(30));
```

You can create an output table called `REWRITE_TABLE` by executing the `utlxmlw.sql` script.

The `query` parameter is a text string representing the SQL query. The parameter, `mv`, is a fully qualified materialized view name in the form of `schema.mv`. This is an optional parameter. When it is not specified, `EXPLAIN_REWRITE` returns any relevant messages regarding all the materialized views considered for rewriting the given query. When `schema` is omitted and only `mv` is specified, `EXPLAIN_REWRITE` looks for the materialized view in the current schema.

If you want to direct the output of `EXPLAIN_REWRITE` to a VARRAY instead of a table, you should call the procedure as follows:

```
DBMS_MVIEW.EXPLAIN_REWRITE (
    query          [VARCHAR2 | CLOB],
    mv             VARCHAR2(30),
    output_array   SYS.RewriteArrayType);
```

Note that if the query is less than 256 characters long, `EXPLAIN_REWRITE` can be easily invoked with the `EXECUTE` command from SQL*Plus. Otherwise, the recommended method is to use a PL/SQL `BEGIN... END` block, as shown in the examples in `/rdbms/demo/smxrw*`.

You can also use `EXPLAIN_REWRITE` with multiple materialized views, in which case the syntax will be the same as with a single materialized view, except that the materialized views are specified by a comma-delimited string. For example, to find out whether a given set of materialized views `mv1`, `mv2`, and `mv3` could be used to rewrite the query, `query_txt`, and, if not, why not, use `EXPLAIN_REWRITE` as follows:

```
DBMS_MVIEW.EXPLAIN_REWRITE(query_txt, 'mv1, mv2, mv3')
```

See *Oracle Database Data Warehousing Guide* for more information on using the `EXPLAIN_REWRITE` procedure.

Parameters

Table 119-6 EXPLAIN_REWRITE Procedure Parameters

| Parameter | Description |
|---------------------------|---|
| <code>query</code> | SQL <code>SELECT</code> statement to be explained |
| <code>mv</code> | The fully qualified name of an existing materialized view in the form of <code>SCHEMA.MV</code> . For multiple materialized views, you can provide a comma-delimited list of names. |
| <code>statement_id</code> | A client-supplied unique identifier to distinguish output messages |
| <code>msg_array</code> | The PL/SQL <code>VARRAY</code> that receives the output. Use this parameter to direct <code>EXPLAIN_REWRITE</code> 's output to a PL/SQL <code>VARRAY</code> . |

Usage Notes

To obtain the output into a table, you must run the `utlxrw.sql` script before calling `EXPLAIN_REWRITE`. This script creates a table named `REWRITE_TABLE` in the current schema.

119.4.6 I_AM_A_REFRESH Function

This function returns the value of the `I_AM_REFRESH` package state.

Syntax

```
DBMS_MVIEW.I_AM_A_REFRESH
RETURN BOOLEAN;
```

Return Values

A return value of `true` indicates that all local replication triggers for materialized views are effectively disabled in this session because each replication trigger first checks this state. A return value of `false` indicates that these triggers are enabled.

119.4.7 PMARKER Function

This function returns a partition marker from a rowid. It is used for Partition Change Tracking (PCT).

Syntax

```
DBMS_MVIEW.PMARKER(  
    rid IN ROWID)  
    RETURN NUMBER;
```

Parameters

Table 119-7 PMARKER Function Parameters

| Parameter | Description |
|-----------|--|
| rid | The rowid of a row entry in a master table |

119.4.8 PURGE_DIRECT_LOAD_LOG Procedure

This procedure removes entries from the direct loader log after they are no longer needed for any known materialized view. This procedure usually is used in environments using Oracle's data warehousing technology.

Syntax

```
DBMS_MVIEW.PURGE_DIRECT_LOAD_LOG();
```

119.4.9 PURGE_LOG Procedure

This procedure purges rows from the materialized view log.

Syntax

```
DBMS_MVIEW.PURGE_LOG (  
    master      IN  VARCHAR2,  
    num         IN  BINARY_INTEGER := 1,  
    flag        IN  VARCHAR2      := 'NOP');
```

Parameters

Table 119-8 PURGE_LOG Procedure Parameters

| Parameter | Description |
|-----------|---|
| master | Name of the master table or master materialized view. |

Table 119-8 (Cont.) PURGE_LOG Procedure Parameters

| Parameter | Description |
|-----------|---|
| num | <p>Number of least recently refreshed materialized views whose rows you want to remove from materialized view log. For example, the following statement deletes rows needed to refresh the two least recently refreshed materialized views:</p> <pre>DBMS_MVIEW.PURGE_LOG('master_table', 2);</pre> <p>To delete all rows in the materialized view log, indicate a high number of materialized views to disregard, as in this example:</p> <pre>DBMS_MVIEW.PURGE_LOG('master_table', 9999);</pre> <p>This statement completely purges the materialized view log that corresponds to <code>master_table</code> if fewer than 9999 materialized views are based on <code>master_table</code>. A simple materialized view whose rows have been purged from the materialized view log must be completely refreshed the next time it is refreshed.</p> |
| flag | <p>Specify <code>delete</code> to guarantee that rows are deleted from the materialized view log for at least one materialized view. This parameter can override the setting for the parameter <code>num</code>. For example, the following statement deletes rows from the materialized view log that has dependency rows in the least recently refreshed materialized view:</p> <pre>DBMS_MVIEW.PURGE_LOG('master_table',1,'delete');</pre> |

119.4.10 PURGE_MVIEW_FROM_LOG Procedure

This procedure is called on the master site or master materialized view site to delete the rows in materialized view refresh related data dictionary tables maintained at the master for the specified materialized view identified by `mview_id` or the combination of `mviewowner`, `mviewname`, and `mviewsite`.

If the materialized view specified is the oldest materialized view to have refreshed from any of the master tables or master materialized views, then the materialized view log is also purged. This procedure does not unregister the materialized view.

Syntax

```
DBMS_MVIEW.PURGE_MVIEW_FROM_LOG (
    mview_id      IN  BINARY_INTEGER);
```

```
DBMS_MVIEW.PURGE_MVIEW_FROM_LOG (
    mviewowner    IN  VARCHAR2,
    mviewname     IN  VARCHAR2,
    mviewsite     IN  VARCHAR2);
```

Note:

This procedure is overloaded. The parameter `mview_id` is mutually exclusive with the three remaining parameters: `mviewowner`, `mviewname`, and `mviewsite`.

Parameters

Table 119-9 PURGE_MVIEW_FROM_LOG Procedure Parameters

| Parameter | Description |
|-------------------------|---|
| <code>mview_id</code> | If you want to execute this procedure based on the identification of the target materialized view, specify the materialized view identification using the <code>mview_id</code> parameter. Query the <code>DBA_BASE_TABLE_MVIEWS</code> view at the materialized view log site for a listing of materialized view IDs. Executing this procedure based on the materialized view identification is useful if the target materialized view is not listed in the list of registered materialized views (<code>DBA_REGISTERED_MVIEWS</code>). |
| <code>mviewowner</code> | If you do not specify an <code>mview_id</code> , enter the owner of the target materialized view using the <code>mviewowner</code> parameter. Query the <code>DBA_REGISTERED_MVIEWS</code> view at the materialized view log site to view the materialized view owners. |
| <code>mviewname</code> | If you do not specify an <code>mview_id</code> , enter the name of the target materialized view using the <code>mviewname</code> parameter. Query the <code>DBA_REGISTERED_MVIEWS</code> view at the materialized view log site to view the materialized view names. |
| <code>mviewsite</code> | If you do not specify an <code>mview_id</code> , enter the site of the target materialized view using the <code>mviewsite</code> parameter. Query the <code>DBA_REGISTERED_MVIEWS</code> view at the materialized view log site to view the materialized view sites. |

Usage Notes

If there is an error while purging one of the materialized view logs, the successful purge operations of the previous materialized view logs are not rolled back. This is to minimize the size of the materialized view logs. In case of an error, this procedure can be invoked again until all the materialized view logs are purged.

119.4.11 REFRESH Procedures

This procedure refreshes a list of materialized views.

Syntax

```
DBMS_MVIEW.REFRESH (
  { list          IN      VARCHAR2,
  | tab           IN      DBMS_UTILITY.UNCL_ARRAY, }
  method         IN      VARCHAR2      := NULL,
  rollback_seg   IN      VARCHAR2      := NULL,
  push_deferred_rpc IN    BOOLEAN      := true,
  refresh_after_errors IN    BOOLEAN      := false,
  purge_option    IN      BINARY_INTEGER := 1,
  parallelism     IN      BINARY_INTEGER := 0,
  heap_size       IN      BINARY_INTEGER := 0,
  atomic_refresh  IN      BOOLEAN      := true,
  nested          IN      BOOLEAN      := false,
  out_of_place    IN      BOOLEAN      := false,
  skip_ext_data   IN      BOOLEAN      := false);
```

Note:

This procedure is overloaded. The `list` and `tab` parameters are mutually exclusive.

Parameters

Table 119-10 REFRESH Procedure Parameters

| Parameter | Description |
|--------------------------------------|---|
| <code>list</code> <code>tab</code> | <p>Comma-delimited list of materialized views that you want to refresh. (Synonyms are not supported.) These materialized views can be located in different schemas and have different master tables or master materialized views. However, all of the listed materialized views must be in your local database.</p> <p>Alternatively, you may pass in a PL/SQL index-by table of type <code>DBMS_UTILITY.UNCL_ARRAY</code>, where each element is the name of a materialized view.</p> |
| <code>method</code> | <p>A string of refresh methods indicating how to refresh the listed materialized views. An <code>f</code> indicates fast refresh, <code>?</code> indicates force refresh, <code>C</code> or <code>c</code> indicates complete refresh, and <code>A</code> or <code>a</code> indicates always refresh. <code>A</code> and <code>C</code> are equivalent. <code>P</code> or <code>p</code> refreshes by recomputing the rows in the materialized view affected by changed partitions in the detail tables.</p> <p>If a materialized view does not have a corresponding refresh method (that is, if more materialized views are specified than refresh methods), then that materialized view is refreshed according to its default refresh method. For example, consider the following <code>EXECUTE</code> statement within <code>SQL*Plus</code>:</p> <pre>DBMS_MVIEW.REFRESH ('countries_mv,regions_mv,hr.employees_mv','cf');</pre> <p>This statement performs a complete refresh of the <code>countries_mv</code> materialized view, a fast refresh of the <code>regions_mv</code> materialized view, and a default refresh of the <code>hr.employees</code> materialized view.</p> |
| <code>rollback_seg</code> | Name of the materialized view site rollback segment to use while refreshing materialized views |
| <code>push_deferred_rpc</code> | Used by updatable materialized views only. Set this parameter to <code>true</code> if you want to push changes from the materialized view to its associated master tables or master materialized views before refreshing the materialized view. Otherwise, these changes may appear to be temporarily lost. |
| <code>refresh_after_errors</code> | If this parameter is <code>true</code> , an updatable materialized view continues to refresh even if there are outstanding conflicts logged in the <code>DEFERROR</code> view for the materialized view's master table or master materialized view. If this parameter is <code>true</code> and <code>atomic_refresh</code> is <code>false</code> , this procedure continues to refresh other materialized views if it fails while refreshing a materialized view. |

Table 119-10 (Cont.) REFRESH Procedure Parameters

| Parameter | Description |
|-----------------------------|--|
| <code>purge_option</code> | If you are using the parallel propagation mechanism (in other words, parallelism is set to 1 or greater), 0 means do not purge, 1 means lazy purge, and 2 means aggressive purge. In most cases, lazy purge is the optimal setting. Set purge to aggressive to trim the queue if multiple master replication groups are pushed to different target sites, and updates to one or more replication groups are infrequent and infrequently pushed. If all replication groups are infrequently updated and pushed, then set this parameter to 0 and occasionally execute <code>PUSH</code> with this parameter set to 2 to reduce the queue. |
| <code>parallelism</code> | 0 specifies serial propagation. $n > 1$ specifies parallel propagation with n parallel processes. 1 specifies parallel propagation using only one parallel process. |
| <code>heap_size</code> | Maximum number of transactions to be examined simultaneously for parallel propagation scheduling. Oracle automatically calculates the default setting for optimal performance. Note: Do not set this parameter unless directed to do so by Oracle Support Services. |
| <code>atomic_refresh</code> | If this parameter is set to <code>true</code> , then the list of materialized views is refreshed in a single transaction. All of the refreshed materialized views are updated to a single point in time. If the refresh fails for any of the materialized views, none of the materialized views are updated. If this parameter is set to <code>false</code> , then each of the materialized views is refreshed non-atomically in separate transactions. As part of complete refresh, if <code>truncate</code> is used (non-atomic refresh), unique index rebuild is executed. <code>INDEX REBUILD</code> automatically computes statistics. Thus, statistics are updated for truncated tables. |
| <code>nested</code> | If <code>true</code> , then perform nested refresh operations for the specified set of materialized views. Nested refresh operations refresh all the depending materialized views and the specified set of materialized views based on a dependency order to ensure the nested materialized views are truly fresh with respect to the underlying base tables. |
| <code>out_of_place</code> | If <code>true</code> , then it performs an out-of-place refresh. The default is <code>false</code> . This parameter uses the four methods of refresh (F, P, C, ?). So, for example, if you specify F and <code>out_of_place = true</code> , then an out-of-place fast refresh will be attempted. Similarly, if you specify P and <code>out_of_place = true</code> , then out-of-place PCT refresh will be attempted. |
| <code>skip_ext_data</code> | Provides you an option to skip the MV data refresh corresponding to the external partitions. |

119.4.12 REFRESH_ALL_MVIEWS Procedure

This procedure refreshes all materialized views that have certain properties

All materialized views with the following properties are refreshed:

- The materialized view has not been refreshed since the most recent change to a master table or master materialized view on which it depends.

- The materialized view and all of the master tables or master materialized views on which it depends are local.
- The materialized view is in the view `DBA_MVIEWS`.

This procedure is intended for use with data warehouses.

Syntax

```
DBMS_MVIEW.REFRESH_ALL_MVIEWS (
    number_of_failures    OUT    BINARY_INTEGER,
    method                IN     VARCHAR2          := NULL,
    rollback_seg          IN     VARCHAR2          := NULL,
    refresh_after_errors  IN     BOOLEAN           := false,
    atomic_refresh        IN     BOOLEAN           := true,
    out_of_place          IN     BOOLEAN           := false);
```

Parameters

Table 119-11 REFRESH_ALL_MVIEWS Procedure Parameters

| Parameter | Description |
|-----------------------------------|--|
| <code>number_of_failures</code> | Returns the number of failures that occurred during processing |
| <code>method</code> | A single refresh method indicating the type of refresh to perform for each materialized view that is refreshed. <code>F</code> or <code>f</code> indicates fast refresh, <code>?</code> indicates force refresh, <code>C</code> or <code>c</code> indicates complete refresh, and <code>A</code> or <code>a</code> indicates always refresh. <code>A</code> and <code>C</code> are equivalent. If no method is specified, a materialized view is refreshed according to its default refresh method. <code>P</code> or <code>p</code> refreshes by recomputing the rows in the materialized view affected by changed partitions in the detail tables. |
| <code>rollback_seg</code> | Name of the materialized view site rollback segment to use while refreshing materialized views |
| <code>refresh_after_errors</code> | If this parameter is <code>true</code> , an updatable materialized view continues to refresh even if there are outstanding conflicts logged in the <code>DEFERROR</code> view for the materialized view's master table or master materialized view. If this parameter is <code>true</code> and <code>atomic_refresh</code> is <code>false</code> , this procedure continues to refresh other materialized views if it fails while refreshing a materialized view. |
| <code>atomic_refresh</code> | If this parameter is set to <code>true</code> , then the refreshed materialized views are refreshed in a single transaction. All of the refreshed materialized views are updated to a single point in time. If the refresh fails for any of the materialized views, none of the materialized views are updated. If this parameter is set to <code>false</code> , then each of the materialized views is refreshed non-atomically in separate transactions. |
| <code>out_of_place</code> | If <code>true</code> , then it performs an out-of-place refresh. The default is <code>false</code> . This parameter uses the four methods of refresh (<code>F</code> , <code>P</code> , <code>C</code> , <code>?</code>). So, for example, if you specify <code>F</code> and <code>out_of_place = true</code> , then an out-of-place fast refresh will be attempted. Similarly, if you specify <code>P</code> and <code>out_of_place = true</code> , then out-of-place PCT refresh will be attempted. |

119.4.13 REFRESH_DEPENDENT Procedures

This procedure refreshes all materialized views that have certain properties.

Materialized views with the following properties are refreshed:

- The materialized view depends on a master table or master materialized view in the list of specified masters.
- The materialized view has not been refreshed since the most recent change to a master table or master materialized view on which it depends.
- The materialized view and all of the master tables or master materialized views on which it depends are local.
- The materialized view is in the view `DBA_MVIEWS`.

This procedure is intended for use with data warehouses.

Syntax

```
DBMS_MVIEW.REFRESH_DEPENDENT (
  number_of_failures  OUT  BINARY_INTEGER,
  { list              IN   VARCHAR2,
  | tab              IN   DBMS_UTILITY.UNCL_ARRAY, }
  method             IN   VARCHAR2      := NULL,
  rollback_seg       IN   VARCHAR2      := NULL,
  refresh_after_errors IN  BOOLEAN      := false,
  atomic_refresh     IN   BOOLEAN      := true,
  nested             IN   BOOLEAN      := false,
  out_of_place       IN   BOOLEAN      := false);
```

Note:

This procedure is overloaded. The `list` and `tab` parameters are mutually exclusive.

Parameters

Table 119-12 REFRESH_DEPENDENT Procedure Parameters

| Parameter | Description |
|--------------------------------------|---|
| <code>number_of_failures</code> | Returns the number of failures that occurred during processing |
| <code>list</code> <code>tab</code> | Comma-delimited list of master tables or master materialized views on which materialized views can depend. (Synonyms are not supported.) These tables and the materialized views that depend on them can be located in different schemas. However, all of the tables and materialized views must be in your local database. Alternatively, you may pass in a PL/SQL index-by table of type <code>DBMS_UTILITY.UNCL_ARRAY</code> , where each element is the name of a table. |

Table 119-12 (Cont.) REFRESH_DEPENDENT Procedure Parameters

| Parameter | Description |
|----------------------|--|
| method | <p>A string of refresh methods indicating how to refresh the dependent materialized views. All of the materialized views that depend on a particular table are refreshed according to the refresh method associated with that table. F or f indicates fast refresh, ? indicates force refresh, C or c indicates complete refresh, and A or a indicates always refresh. A and C are equivalent. P or p refreshes by recomputing the rows in the materialized view affected by changed partitions in the detail tables.</p> <p>If a table does not have a corresponding refresh method (that is, if more tables are specified than refresh methods), then any materialized view that depends on that table is refreshed according to its default refresh method. For example, the following EXECUTE statement within SQL*Plus:</p> <pre>DBMS_MVIEW.REFRESH_DEPENDENT ('employees,departments,hr.regions','cf');</pre> <p>performs a complete refresh of the materialized views that depend on the employees table, a fast refresh of the materialized views that depend on the departments table, and a default refresh of the materialized views that depend on the hr.regions table.</p> |
| rollback_seg | Name of the materialized view site rollback segment to use while refreshing materialized views |
| refresh_after_errors | If this parameter is true , an updatable materialized view continues to refresh even if there are outstanding conflicts logged in the DEFERROR view for the materialized view's master table or master materialized view. If this parameter is true and atomic_refresh is false , this procedure continues to refresh other materialized views if it fails while refreshing a materialized view. |
| atomic_refresh | <p>If this parameter is set to true, then the refreshed materialized views are refreshed in a single transaction. All of the refreshed materialized views are updated to a single point in time. If the refresh fails for any of the materialized views, none of the materialized views are updated.</p> <p>If this parameter is set to false, then each of the materialized views is refreshed non-atomically in separate transactions.</p> |
| nested | If true , then perform nested refresh operations for the specified set of tables. Nested refresh operations refresh all the depending materialized views of the specified set of tables based on a dependency order to ensure the nested materialized views are truly fresh with respect to the underlying base tables. |
| out_of_place | <p>If true, then it performs an out-of-place refresh. The default is false.</p> <p>This parameter uses the four methods of refresh (F, P, C, ?). So, for example, if you specify F and out_of_place = true, then an out-of-place fast refresh will be attempted. Similarly, if you specify P and out_of_place = true, then out-of-place PCT refresh will be attempted.</p> |

119.4.14 REGISTER_MVIEW Procedure

This procedure enables the administration of individual materialized views. It is invoked at a master site or master materialized view site to register a materialized view.

Note that, typically, a materialized view is registered automatically during materialized view creation. You should only run this procedure to manually register a materialized view if the automatic registration failed or if the registration information was deleted.

Syntax

```
DBMS_MVIEW.REGISTER_MVIEW (
  mviewowner IN VARCHAR2,
  mviewname  IN VARCHAR2,
  mviewsite  IN VARCHAR2,
  mview_id   IN DATE | BINARY_INTEGER,
  flag       IN BINARY_INTEGER,
  qry_txt    IN VARCHAR2,
  rep_type   IN BINARY_INTEGER := DBMS_MVIEW.REG_UNKNOWN);
```

Parameters

Table 119-13 REGISTER_MVIEW Procedure Parameters

| Parameter | Description |
|------------|--|
| mviewowner | Owner of the materialized view. |
| mviewname | Name of the materialized view. |
| mviewsite | Name of the materialized view site for a materialized view registering at an Oracle database version 8.x and higher master site or master materialized view site. This name should not contain any double quotes. |
| mview_id | The identification number of the materialized view. Specify an Oracle database version 8.x and higher materialized view as a BINARY_INTEGER. Specify an Oracle database version 7 materialized view registering at an Oracle database version 8.x and higher master sites or master materialized view sites as a DATE. |
| flag | A constant that describes the properties of the materialized view being registered. Valid constants that can be assigned include the following: DBMS_MVIEW.REG_ROWID_MVIEW for a rowid materialized view DBMS_MVIEW.REG_PRIMARY_KEY_MVIEW for a primary key materialized view DBMS_MVIEW.REG_OBJECT_ID_MVIEW for an object id materialized view DBMS_MVIEW.REG_FAST_REFRESHABLE_MVIEW for a materialized view that can be fast refreshed DBMS_MVIEW.REG_UPDATABLE_MVIEW for a materialized view that is updatable A materialized view can have more than one of these properties. In this case, use the plus sign (+) to specify more than one property. For example, if a primary key materialized view can be fast refreshed, you can enter the following for this parameter: DBMS_MVIEW.REG_PRIMARY_KEY_MVIEW + DBMS_MVIEW.REG_FAST_REFRESHABLE_MVIEW You can determine the properties of a materialized view by querying the ALL_MVIEWS data dictionary view. |
| qry_txt | The first 32,000 bytes of the materialized view definition query. |

Table 119-13 (Cont.) REGISTER_MVIEW Procedure Parameters

| Parameter | Description |
|-----------|--|
| rep_type | Version of the materialized view. Valid constants that can be assigned include the following: DBMS_MVIEW.REG_V7_SNAPSHOT if the materialized view is at an Oracle database version 7 site <ul style="list-style-type: none"> DBMS_MVIEW.REG_V8_SNAPSHOT reg_repapi_snapshot if the materialized view is at an Oracle database version 8.x or higher site DBMS_MVIEW.REG_UNKNOWN (the default) if you do not know whether the materialized view is at an Oracle database version 7 site or an Oracle database version 8.x (or higher) site |

Usage Notes

This procedure is invoked at the master site or master materialized view site by a remote materialized view site using a remote procedure call. If REGISTER_MVIEW is called multiple times with the same mviewowner, mviewname, and mviewsite, then the most recent values for mview_id, flag, and qry_txt are stored. If a query exceeds the maximum VARCHAR2 size, then qry_txt contains the first 32000 characters of the query and the remainder is truncated. When invoked manually, the value of mview_id must be looked up in the materialized view data dictionary views by the person who calls the procedure.

119.4.15 UNREGISTER_MVIEW Procedure

This procedure enables the administration of individual materialized views. It is invoked at a master site or master materialized view site to unregister a materialized view.

Syntax

```
DBMS_MVIEW.UNREGISTER_MVIEW (
    mviewowner    IN   VARCHAR2,
    mviewname     IN   VARCHAR2,
    mviewsite     IN   VARCHAR2);
```

Parameters

Table 119-14 UNREGISTER_MVIEW Procedure Parameters

| Parameters | Description |
|------------|------------------------------------|
| mviewowner | Owner of the materialized view |
| mviewname | Name of the materialized view |
| mviewsite | Name of the materialized view site |

DBMS_MVIEW_STATS

DBMS_MVIEW_STATS package provides an interface to manage the collection and retention of statistics for materialized view refresh operations.

See Also:

Oracle Database Data Warehousing Guide for information about managing and using materialized view refresh statistics

This chapter contains the following topics:

- [DBMS_MVIEW_STATS Overview](#)
- [DBMS_MVIEW_STATS Security Model](#)
- [Summary of DBMS_MVIEW_STATS Subprograms](#)

120.1 DBMS_MVIEW_STATS Overview

You can use the procedures contained in the DBMS_MVIEW_STATS package to manage the collection and retention of statistics for materialized view refresh operations. This includes the level and granularity at which these statistics are collected and the duration for which they are retained in the database.

You can also set database level system defaults for the parameters that control statistics collection.

120.2 DBMS_MVIEW_STATS Security Model

Refer to the Usage Notes section in each subprogram for information about the privileges required to use the subprogram.

120.3 Summary of DBMS_MVIEW_STATS Subprograms

This table lists the DBMS_MVIEW_STATS subprograms and briefly describes them.

Table 120-1 DBMS_MVIEW_STATS Package Subprograms

| Subprogram | Description |
|---|---|
| PURGE_REFRESH_STATS Procedure | Purges the statistics of materialized view refresh operations that are older than the specified retention period. |

Table 120-1 (Cont.) DBMS_MVIEW_STATS Package Subprograms

| Subprogram | Description |
|--|---|
| SET_MVREF_STATS_PARAMS Procedure | Sets the values of parameters that define the collection level and retention period for materialized view refresh statistics. You can set the values either at the database level or for individual materialized views. |
| SET_SYSTEM_DEFAULT Procedure | Sets the system default value of a refresh statistics parameter. The two refresh statistics parameters are collection level and the retention period. |

120.3.1 PURGE_REFRESH_STATS Procedure

This procedure purges refresh statistics that are older than the specified retention period for the specified materialized views.

This procedure forces a purge of refresh statistics without altering the retention period defined for the specified materialized views.

Syntax

```
DBMS_MVIEW_STATS.PURGE_REFRESH_STATS (
    mv_list           IN    VARCHAR2,
    retention_period  IN    NUMBER);
```

Parameters

Table 120-2 PURGE_REFRESH_STATS Procedure Parameters

| Parameter | Description |
|-------------------------------|--|
| <code>mv_list</code> | <p>The fully-qualified name of an existing materialized view in the form of <code>schema_name.mv_name</code>. Use a comma-separated list to specify multiple materialized views.</p> <p>Specify <code>NULL</code> to purge materialized view refresh statistics for all materialized views in the database.</p> |
| <code>retention_period</code> | <p>The number of days for which refresh statistics must be preserved in the data dictionary. Statistics for materialized view refresh operations that are older than the retention period are purged from the data dictionary.</p> <p>The retention period specified in this procedure overrides the retention period that may have been set previously either at the database level or for specified materialized views.</p> <p>Specify <code>NULL</code> to use the purging policy defined by the automatic statistics purge. Specify <code>-1</code> to purge all refresh statistics.</p> |

Usage Notes

To invoke this procedure, you need either the `SYSDBA` privilege or privileges on every materialized view that is specified in `mv_list`.

120.3.2 SET_MVREF_STATS_PARAMS Procedure

This procedure sets the collection level and retention period for materialized view refresh statistics. You can set these properties either for individual materialized views or for all materialized views in the database.

Syntax

```
DBMS_MVIEW_STATS.SET_MVREF_STATS_PARAMS (
    mv_list           IN    VARCHAR2,
    collection_level IN    VARCHAR2 DEFAULT NULL,
    retention_period  IN    NUMBER DEFAULT NULL);
```

Parameters

Table 120-3 SET_MVREF_STATS_PARAMS Procedure Parameters

| Parameter | Description |
|-------------------------------|---|
| <code>mv_list</code> | <p>The fully-qualified name of an existing materialized view in the form of <code>schema_name.mv_name</code>. Use a comma-separated list to specify multiple materialized views.</p> <p>Specify <code>NULL</code> to set properties for all existing materialized views in the database.</p> |
| <code>collection_level</code> | <p>Specifies the level of detail used when collecting refresh statistics for the materialized views specified in <code>mv_list</code>.</p> <p>Set one of the following values for <code>collection_level</code>:</p> <ul style="list-style-type: none"> <code>NONE</code>: No materialized view refresh statistics are collected. <code>TYPICAL</code>: Only basic refresh statistics are collected and stored for the materialized views specified in <code>mv_list</code>. <code>ADVANCED</code>: Detailed refresh statistics are collected and stored for materialized view specified in <code>mv_list</code>. <p>If this parameter is set to <code>NULL</code>, then the system default value for <code>collection_level</code> (set using <code>SET_SYSTEM_DEFAULT</code>) is used.</p> |
| <code>retention_period</code> | <p>Specifies the retention period, in days, for the refresh statistics of the materialized views specified in <code>mv_list</code>. Statistics that are older than the retention period are automatically purged from the data dictionary.</p> <p>Valid values are between 1 and 1365000.</p> <p>If this parameter is set to <code>NULL</code>, then the system default value for <code>retention_period</code> (set using <code>SET_SYSTEM_DEAFULT</code>) is used.</p> <p>Set <code>retention_period</code> to -1 to specify that refresh statistics for the materialized views in <code>mv_list</code> must never be purged.</p> |

Usage Notes

To set the collection level or retention period of one or more materialized views, you must have privileges on those materialized views. To set the collection level or retention period for all materialized views in the database, you must have either the `SYSDBA` privilege or privileges on every materialized view in the database.

To set the system-level default values for statistics collection level and retention period, use the `SET_SYSTEM_DEAFULT` procedure.

Use the `DBA_MVREF_STATS_PARAMS` view to determine the currently-set retention period and collection level for materialized view statistics collection.

To disable refresh statistics collection for all materialized views in the database, use the following:

```
DBMS_MVIEW_STATS.SET_MVREF_STATS_PARAMS (NULL, 'NONE', NULL);
```

Note that the parameters set using `SET_MVREF_STATS_PARAMS` only affect materialized views that exist in the database at the time the procedure is run. Any new materialized views created after this procedure is run will use the system default values for `collection_level` and `retention_period`.

120.3.3 SET_SYSTEM_DEFAULT Procedure

This procedure sets system-wide defaults that manage the collection and retention of materialized view refresh statistics. All newly-created materialized views use these defaults until the parameters are reset explicitly using the `SET_MVREF_STATS_PARAMS` procedure.

Syntax

```
DBMS_MVIEW_STATS.SET_SYSTEM_DEFAULT (
    parameter_name    IN  VARCHAR2,
    value             IN  VARCHAR2 DEFAULT NULL);
```

Parameters

Table 120-4 SET_SYSTEM_DEFAULT Procedure Parameters

| Parameter | Description |
|-----------------------------|---|
| <code>parameter_name</code> | <p>The name of the materialized view refresh statistics parameter whose system default value is being set.</p> <p>The parameters that can be set are:</p> <ul style="list-style-type: none"> <code>COLLECTION_LEVEL</code>: Specifies the level of detail for collecting materialized view refresh statistics. <code>RETENTION_PERIOD</code>: Specifies the duration, in days, for which refresh statistics are retained in the data dictionary |
| <code>value</code> | <p>The value of the materialized view refresh statistics parameter.</p> <p>The valid values for <code>COLLECTION_LEVEL</code> are:</p> <ul style="list-style-type: none"> <code>NONE</code>: No refresh statistics are collected for the refresh operation. <code>TYPICAL</code>: Only basic refresh statistics are collected for the refresh operation. This is the default setting. <code>ADVANCED</code>: Detailed refresh statistics are collected for the refresh operation. <p>The valid values for <code>RETENTION_PERIOD</code> are:</p> <ul style="list-style-type: none"> <code>-1</code> Numbers between 1 and 1365000 <p>The default value for <code>retention_period</code> is 31.</p> <p>If you specify <code>NULL</code> for any of the parameters, then the system default setting for that parameter is used.</p> |

Usage Notes

You must have `SYSDBA` privilege to invoke this procedure.

Use the `DBA_MVREF_STATS_SYS_DEFAULTS` view to display the current default settings for materialized view refresh statistics collection.

DBMS_NETWORK_ACL_ADMIN

The `DBMS_NETWORK_ACL_ADMIN` package provides the interface to administer the network Access Control List (ACL).

The chapter contains the following topics:

- [Overview](#)
- [Deprecated Subprograms](#)
- [Security Model](#)
- [Constants](#)
- [Exceptions](#)
- [Examples](#)
- [Summary of DBMS_NETWORK_ACL_ADMIN Subprograms](#)

See Also:

For more information, see "Managing Fine-grained Access to External Network Services" in *Oracle Database Security Guide*

121.1 DBMS_NETWORK_ACL_ADMIN Overview

The `DBMS_NETWORK_ACL_ADMIN` package provides the interface to administer the network access control lists (ACL).

ACLs are used to control access by users to external network services and resources from the database through PL/SQL network utility packages including [UTL_TCP](#) , [UTL_HTTP](#) , [UTL_SMTP](#) and [UTL_INADDR](#) .

121.2 DBMS_NETWORK_ACL_ADMIN Deprecated Subprograms

Oracle recommends that you do not use deprecated subprograms in new applications. Support for deprecated features is for backward compatibility only

The following subprograms are deprecated with release Oracle Database 12c:

- [ADD_PRIVILEGE Procedure](#)
- [ASSIGN_ACL Procedure](#)
- [ASSIGN_WALLET_ACL Procedure](#)
- [CHECK_PRIVILEGE Function](#)

- [CHECK_PRIVILEGE_ACLID Function](#)
- [CREATE_ACL Procedure](#)
- [DELETE_PRIVILEGE Procedure](#)
- [DROP_ACL Procedure](#)
- [UNASSIGN_ACL Procedure](#)
- [UNASSIGN_WALLET_ACL Procedure](#)

121.3 DBMS_NETWORK_ACL_ADMIN Security Model

The EXECUTE privilege on the DBMS_NETWORK_ACL_ADMIN package is granted to the DBA role and to the EXECUTE_CATALOG_ROLE by default.

121.4 DBMS_NETWORK_ACL_ADMIN Constants

The DBMS_NETWORK_ACL_ADMIN package defines constants to use specifying parameter values.

These are shown in the following table.

Table 121-1 DBMS_NETWORK_ACL_ADMIN Constants

| Constant | Type | Value | Description |
|----------------|--------------|--------------------------------------|--|
| IP_ADDR_MASK | VARCHAR2(80) | '([[:digit:]]+\.) {3} [[:digit:]]+' | IP address mask: xxx.xxx.xxx.xxx |
| IP_SUBNET_MASK | VARCHAR2(80) | '([[:digit:]]+\.) {0,3}*' | IP subnet mask: xxx.xxx...* |
| HOSTNAME_MASK | VARCHAR2(80) | '[^\.\.:\/*]+\(\. [^\.\.:\/*]+\)*' | Hostname mask: ???..???..???...?? ? |
| DOMAIN_MASK | VARCHAR2(80) | "*(\.[^\.\:\/*]+)*" | Domain mask: *.???..???..???..??? |

121.5 DBMS_NETWORK_ACL_ADMIN Exceptions

The following table lists the exceptions raised by the DBMS_NETWORK_ACL_ADMIN package.

Table 121-2 DBMS_NETWORK_ACL_ADMIN Exceptions

| Exception | Error Code | Description |
|--------------------|------------|--------------------|
| ACE_ALREADY_EXISTS | 24243 | ACE already exists |
| EMPTY_ACL | 24246 | Empty ACL |
| ACL_NOT_FOUND | 46114 | ACL not found |
| ACL_ALREADY_EXISTS | 46212 | ACL already exists |
| INVALID_ACL_PATH | 46059 | Invalid ACL path |

Table 121-2 (Cont.) DBMS_NETWORK_ACL_ADMIN Exceptions

| Exception | Error Code | Description |
|-----------------------|------------|-----------------------|
| INVALID_HOST | 24244 | Invalid host |
| INVALID_PRIVILEGE | 24245 | Invalid privilege |
| INVALID_WALLET_PATH | 29248 | Invalid wallet path |
| BAD_ARGUMENT | 29261 | Bad argument |
| UNRESOLVED_PRINCIPAL | 46238 | Unresolved principal |
| PRIVILEGE_NOT_GRANTED | 01927 | Privilege not granted |

121.6 DBMS_NETWORK_ACL_ADMIN Examples

Grant the `connect` and `resolve` privileges for host `www.us.example.com` to SCOTT.

Example 1

```
DBMS_NETWORK_ACL_ADMIN.APPEND_HOST_ACE(
  host => 'www.us.example.com',
  ace => xs$ace_type(privilege_list => xs$name_list('connect', 'resolve'),
                    principal_name => 'scott',
                    principal_type => xs_acl.ptype_db));
```

Example 2

Revoke the `resolve` privilege for host `www.us.example.com` from SCOTT.

```
dbms_network_acl_admin.remove_host_ace(
  host => 'www.us.example.com',
  ace => xs$ace_type(privilege_list => xs$name_list('resolve'),
                    principal_name => 'scott',
                    principal_type => xs_acl.ptype_db));
```

Example 3

Grant the `use_client_certificates` and `use_passwords` privileges for wallet `file:/example/wallets/hr_wallet` to SCOTT.

```
dbms_network_acl_admin.append_wallet_ace(
  wallet_path => 'file:/example/wallets/hr_wallet',
  ace => xs$ace_type(privilege_list =>
                    xs$name_list('use_client_certificates', 'use_passwords'),
                    principal_name => 'scott',
                    principal_type => xs_acl.ptype_db));
```

Example 4

Revoke the `use_passwords` privilege for wallet `file:/example/wallets/hr_wallet` from SCOTT.

```
dbms_network_acl_admin.remove_wallet_ace(
  wallet_path => 'file:/example/wallets/hr_wallet',
  ace => xs$ace_type(privilege_list => xs$name_list('use_passwords'),
                    principal_name => 'scott',
                    principal_type => xs_acl.ptype_db));
```

Example 5

The `CONTAINS_HOST` in the `DBMS_NETWORK_ACL_UTILITY` package determines if a host is contained in a domain. It can be used in conjunction with the `DBA_HOST_ACE` view to determine the users and their privilege assignments to access a network host. For example, for access to `www.us.example.com`:

```
SELECT HOST, LOWER_PORT, UPPER_PORT,
       ACE_ORDER, PRINCIPAL, PRINCIPAL_TYPE,
       GRANT_TYPE, INVERTED_PRINCIPAL, PRIVILEGE,
       START_DATE, END_DATE
  FROM (SELECT ACES.*,
             DBMS_NETWORK_ACL_UTILITY.CONTAINS_HOST('www.us.example.com',
                                                    HOST) PRECEDENCE
        FROM DBA_HOST_ACES ACES)
 WHERE PRECEDENCE IS NOT NULL
 ORDER BY PRECEDENCE DESC,
          LOWER_PORT NULLS LAST,
          UPPER_PORT NULLS LAST,
          ACE_ORDER;
```

| HOST | LOWER_PORT | UPPER_PORT | ACE_ORDER | PRINCIPAL | PRINCIPAL_TYPE |
|--------------------|------------|------------|-----------|-----------|----------------|
| www.us.example.com | 80 | 80 | 1 | SCOTT | DATABASE USER |
| GRANT | NO | HTTP | | | |
| www.us.example.com | 80 | 80 | 2 | ADAMS | DATABASE USER |
| GRANT | NO | HTTP | | | |
| * | | | 1 | HQ_DBA | DATABASE USER |
| GRANT | NO | CONNECT | | | |
| * | | | 1 | HQ_DBA | DATABASE USER |
| GRANT | NO | RESOLVE | | | |

Example 6

For example, for `HQ_DBA`'s own permission to access to `www.us.example.com`:

```
SELECT HOST, LOWER_PORT, UPPER_PORT, PRIVILEGE, STATUS
  FROM (SELECT ACES.*,
             DBMS_NETWORK_ACL_UTILITY.CONTAINS_HOST('www.us.example.com',
                                                    HOST) PRECEDENCE
        FROM USER_HOST_ACES ACES)
 WHERE PRECEDENCE IS NOT NULL
 ORDER BY PRECEDENCE DESC,
          LOWER_PORT NULLS LAST,
          UPPER_PORT NULLS LAST;
```

| HOST | LOWER_PORT | UPPER_PORT | PRIVILEGE | STATUS |
|------|------------|------------|-----------|---------|
| * | | | CONNECT | GRANTED |
| * | | | RESOLVE | GRANTED |

121.7 Summary of DBMS_NETWORK_ACL_ADMIN Subprograms

This table lists and briefly describes the DBMS_NETWORK_ACL_ADMIN package subprograms.

Table 121-3 DBMS_NETWORK_ACL_ADMIN Package Subprograms

| Subprogram | Description |
|--|---|
| ADD_PRIVILEGE Procedure | [DEPRECATED] Adds a privilege to grant or deny the network access to the user in an access control list (ACL) |
| APPEND_HOST_ACE Procedure | Appends an access control entry (ACE) to the access control list (ACL) of a network host. |
| APPEND_HOST_ACL Procedure | Appends access control entries (ACE) of an access control list (ACL) to the ACL of a network host |
| APPEND_WALLET_ACE Procedure | Appends an access control entry (ACE) to the access control list (ACL) of a wallet |
| APPEND_WALLET_ACL Procedure | Appends access control entries (ACE) of an access control list (ACL) to the ACL of a wallet |
| ASSIGN_ACL Procedure | [DEPRECATED] Assigns an access control list (ACL) to a host computer, domain, or IP subnet, and if specified, the TCP port range. |
| ASSIGN_WALLET_ACL Procedure | [DEPRECATED] Assigns an access control list (ACL) to a wallet |
| CHECK_PRIVILEGE Function | [DEPRECATED] Checks if a privilege is granted or denied the user in an access control list (ACL) |
| CHECK_PRIVILEGE_ACLID Function | [DEPRECATED] Checks if a privilege is granted to or denied from the user in an ACL by specifying the object ID of the access control list |
| CREATE_ACL Procedure | [DEPRECATED] Creates an access control list (ACL) with an initial privilege setting |
| DELETE_PRIVILEGE Procedure | [DEPRECATED] Deletes a privilege in an access control list (ACL) |
| DROP_ACL Procedure | [DEPRECATED] Drops an access control list (ACL) |
| REMOVE_HOST_ACE Procedure | Removes privileges from access control entries (ACE) in the access control list (ACL) of a network host matching the given ACE |
| REMOVE_WALLET_ACE Procedure | Removes privileges from access control entries (ACE) in the access control list (ACL) of a wallet matching the given ACE |
| SET_HOST_ACL Procedure | Sets the access control list (ACL) of a network host which controls access to the host from the database |
| SET_WALLET_ACL Procedure | Sets the access control list (ACL) of a wallet which controls access to the wallet from the database |
| UNASSIGN_ACL Procedure | [DEPRECATED] Unassigns the access control list (ACL) currently assigned to a network host |
| UNASSIGN_WALLET_ACL Procedure | [DEPRECATED] Unassigns the access control list (ACL) currently assigned to a wallet |

121.7.1 ADD_PRIVILEGE Procedure

This procedure adds a privilege to grant or deny the network access to the user. The access control entry (ACE) is created if it does not exist.

Note:

This procedure is deprecated in Oracle Database 12c. While the procedure remains available in the package for reasons of backward compatibility, Oracle recommends using the [APPEND_HOST_ACE Procedure](#) and the [APPEND_WALLET_ACE Procedure](#).

Syntax

```
DBMS_NETWORK_ACL_ADMIN.ADD_PRIVILEGE (
    acl          IN VARCHAR2,
    principal    IN VARCHAR2,
    is_grant     IN BOOLEAN,
    privilege    IN VARCHAR2,
    position     IN PLS_INTEGER DEFAULT NULL,
    start_date   IN TIMESTAMP WITH TIMESTAMP DEFAULT NULL,
    end_date     IN TIMESTAMP WITH TIMESTAMP DEFAULT NULL );
```

Parameters

Table 121-4 ADD_PRIVILEGE Function Parameters

| Parameter | Description |
|------------|--|
| acl | Name of the ACL. Relative path will be relative to "/sys/acls" |
| principal | Principal (database user or role) to whom the privilege is granted or denied. Case sensitive. |
| is_grant | Privilege is granted or denied. |
| privilege | Network privilege to be granted or denied |
| position | Position (1-based) of the ACE. If a non-NULL value is given, the privilege will be added in a new ACE at the given position and there should not be another ACE for the principal with the same <code>is_grant</code> (grant or deny). If a NULL value is given, the privilege will be added to the ACE matching the principal and the <code>is_grant</code> if one exists, or to the end of the ACL if the matching ACE does not exist. |
| start_date | Start date of the access control entry (ACE). When specified, the ACE will be valid only on and after the specified date. The <code>start_date</code> will be ignored if the privilege is added to an existing ACE. |
| end_date | End date of the access control entry (ACE). When specified, the ACE expires after the specified date. The <code>end_date</code> must be greater than or equal to the <code>start_date</code> . The <code>end_date</code> will be ignored if the privilege is added to an existing ACE. |

Usage Notes

To remove the permission, use the [DELETE_PRIVILEGE Procedure](#).

Examples

```
BEGIN
  DBMS_NETWORK_ACL_ADMIN.ADD_PRIVILEGE(
    acl      => 'us-example-com-permissions.xml',
    principal => 'ST_USERS',
    is_grant => TRUE,
    privilege => 'connect')
END;
```

121.7.2 APPEND_HOST_ACE Procedure

This procedure appends an access control entry (ACE) to the access control list (ACL) of a network host. The ACL controls access to the given host from the database and the ACE specifies the privileges granted to or denied from the specified principal.

Syntax

```
DBMS_NETWORK_ACL_ADMIN.APPEND_HOST_ACE (
  host      IN VARCHAR2,
  lower_port IN PLS_INTEGER DEFAULT NULL,
  upper_port IN PLS_INTEGER DEFAULT NULL,
  ace       IN XS$ACE_TYPE);
```

Parameters

Table 121-5 APPEND_HOST_ACE Function Parameters

| Parameter | Description |
|------------|--|
| host | The host, which can be the name or the IP address of the host. You can use a wildcard to specify a domain or a IP subnet. The host or domain name is case-insensitive. |
| lower_port | Lower bound of an optional TCP port range |
| upper_port | Upper bound of an optional TCP port range. If NULL, lower_port is assumed. |
| ace | The ACE |

Usage Notes

- Duplicate privileges in the matching ACE in the host ACL will be skipped.
- To remove the ACE, use the [REMOVE_HOST_ACE Procedure](#).
- A host's ACL takes precedence over its domains' ACLs. For a given host, say `www.us.example.com`, the following domains are listed in decreasing precedence:
 - `www.us.example.com`
 - `*.us.example.com`
 - `*.example.com`
 - `*.com`

- *
- An IP address' ACL takes precedence over its subnets' ACLs. For a given IP address, say 192.168.0.100, the following subnets are listed in decreasing precedence:
 - 192.168.0.100
 - 192.168.0.*
 - 192.168.*
 - 192.*
 - *
- An ACE with a "resolve" privilege can be appended only to a host's ACL without a port range.
- When ACEs with "connect" privileges are appended to a host's ACLs with and without a port range, the one appended to the host with a port range takes precedence.
- When specifying a TCP port range of a host, it cannot overlap with other existing port ranges of the host.
- If the ACL is shared with another host or wallet, a copy of the ACL will be made before the ACL is modified.

See Also:

Oracle Database Real Application Security Administrator's and Developer's Guide for more information about the `X$ACE_TYPE` object type

121.7.3 APPEND_HOST_ACL Procedure

This procedure appends access control entries (ACE) of an access control list (ACL) to the ACL of a network host.

Syntax

```
DBMS_NETWORK_ACL_ADMIN.APPEND_HOST_ACL (
    host          IN VARCHAR2,
    lower_port    IN PLS_INTEGER DEFAULT NULL,
    upper_port    IN PLS_INTEGER DEFAULT NULL,
    acl           IN VARCHAR2);
```

Parameters

Table 121-6 APPEND_HOST_ACL Function Parameters

| Parameter | Description |
|------------|--|
| host | The host, which can be the name or the IP address of the host. You can use a wildcard to specify a domain or a IP subnet. The host or domain name is case-insensitive. |
| lower_port | Lower bound of an optional TCP port range |

Table 121-6 (Cont.) APPEND_HOST_ACL Function Parameters

| Parameter | Description |
|------------|--|
| upper_port | Upper bound of an optional TCP port range. If NULL, lower_port is assumed. |
| acl | The ACL from which to append |

Usage Notes

- Duplicate privileges in the matching ACE in the host ACL will be skipped.
- To remove the ACE, use the [REMOVE_HOST_ACE Procedure](#).
- A host's ACL takes precedence over its domains' ACLs. For a given host, say `www.us.example.com`, the following domains are listed in decreasing precedence:
 - `www.us.example.com`
 - `*.us.example.com`
 - `*.example.com`
 - `*.com`
 - `*`
- An IP address' ACL takes precedence over its subnets' ACLs. For a given IP address, say `192.168.0.100`, the following subnets are listed in decreasing precedence:
 - `192.168.0.100`
 - `192.168.0.*`
 - `192.168.*`
 - `192.*`
 - `*`
- An ACE with a "resolve" privilege can be appended only to a host's ACL without a port range.
- When ACEs with "connect" privileges are appended to a host's ACLs with and without a port range, the one appended to the host with a port range takes precedence.
- When specifying a TCP port range of a host, it cannot overlap with other existing port ranges of the host.- If the ACL is shared with another host or wallet, a copy of the ACL will be made before the ACL is modified.

121.7.4 APPEND_WALLET_ACE Procedure

This procedure appends an access control entry (ACE) to the access control list (ACL) of a wallet. The ACL controls access to the given wallet from the database and the ACE specifies the privileges granted to or denied from the specified principal.

Syntax

```
DBMS_NETWORK_ACL_ADMIN.APPEND_WALLET_ACE (
  wallet_path  IN VARCHAR2,
  ace         IN XS$ACE_TYPE);
```

Parameters

Table 121-7 APPEND_WALLET_ACE Function Parameters

| Parameter | Description |
|-------------|---|
| wallet_path | Directory path of the wallet. The path is case-sensitive of the format <code>file:directory-path</code> . |
| ace | The ACE |

Usage Notes

- Duplicate privileges in the matching ACE in the host ACL will be skipped.
- To remove the ACE, use the [REMOVE_WALLET_ACE Procedure](#).
- If the ACL is shared with another host or wallet, a copy of the ACL is made before the ACL is modified.

See Also:

Oracle Database Real Application Security Administrator's and Developer's Guide for more information about the `XS$ACE_TYPE` object type

121.7.5 APPEND_WALLET_ACL Procedure

This procedure appends access control entries (ACE) of an access control list (ACL) to the ACL of a wallet.

Syntax

```
DBMS_NETWORK_ACL_ADMIN.APPEND_WALLET_ACL (
    wallet_path  IN VARCHAR2,
    acl          IN VARCHAR2);
```

Parameters

Table 121-8 APPEND_WALLET_ACL Function Parameters

| Parameter | Description |
|-------------|---|
| wallet_path | Directory path of the wallet. The path is case-sensitive of the format <code>file:directory-path</code> . |
| ace | The ACL from which to append |

Usage Notes

- Duplicate privileges in the matching ACE in the host ACL will be skipped.
- To remove the ACE, use `REMOVE_WALLET_ACE`.
- If the ACL is shared with another host or wallet, a copy of the ACL is made before the ACL is modified.

121.7.6 ASSIGN_ACL Procedure

This procedure assigns an access control list (ACL) to a host computer, domain, or IP subnet, and if specified, the TCP port range.

Note:

This procedure is deprecated in Oracle Database 12c. While the procedure remains available in the package for reasons of backward compatibility, Oracle recommends using the [APPEND_HOST_ACE Procedure](#) and the [APPEND_WALLET_ACE Procedure](#).

Syntax

```
DBMS_NETWORK_ACL_ADMIN.ASSIGN_ACL (
  acl          IN VARCHAR2,
  host         IN VARCHAR2,
  lower_port   IN PLS_INTEGER DEFAULT NULL,
  upper_port   IN PLS_INTEGER DEFAULT NULL);
```

Parameters

Table 121-9 ASSIGN_ACL Function Parameters

| Parameter | Description |
|------------|--|
| acl | Name of the ACL. Relative path will be relative to "/sys/acls". |
| host | Host to which the ACL is to be assigned. The host can be the name or the IP address of the host. A wildcard can be used to specify a domain or a IP subnet. The host or domain name is case-insensitive. |
| lower_port | Lower bound of a TCP port range if not NULL |
| upper_port | Upper bound of a TCP port range. If NULL, lower_port is assumed. |

Usage Notes

- Only one ACL can be assigned to any host computer, domain, or IP subnet, and if specified, the TCP port range. When you assign a new access control list to a network target, Oracle Database unassigns the previous access control list that was assigned to the same target. However, Oracle Database does not drop the access control list. You can drop the access control list by using the [DROP_ACL Procedure](#). To remove an access control list assignment, use the [UNASSIGN_ACL Procedure](#).
- The ACL assigned to a domain takes a lower precedence than the other ACLs assigned sub-domains, which take a lower precedence than the ACLs assigned to the individual hosts. So for a given host, for example, "www.us.example.com", the following domains are listed in decreasing precedences:
 - www.us.example.com
 - *.us.example.com
 - *.example.com

```
- *.com
- *
```

In the same way, the ACL assigned to an subnet takes a lower precedence than the other ACLs assigned smaller subnets, which take a lower precedence than the ACLs assigned to the individual IP addresses. So for a given IP address, for example, "192.168.0.100", the following subnets are listed in decreasing precedences:

```
- 192.168.0.100
- 192.168.0.*
- 192.168.*
- 192.*
- *
```

- The port range is applicable only to the "connect" privilege assignments in the ACL. The "resolve" privilege assignments in an ACL have effects only when the ACL is assigned to a host without a port range.

For the "connect" privilege assignments, an ACL assigned to the host without a port range takes a lower precedence than other ACLs assigned to the same host with a port range.

- When specifying a TCP port range, both `lower_port` and `upper_port` must not be NULL and `upper_port` must be greater than or equal to `lower_port`. The port range must not overlap with any other port ranges for the same host assigned already.
- To remove the assignment, use [UNASSIGN_ACL Procedure](#).

Examples

```
BEGIN
  DBMS_NETWORK_ACL_ADMIN.ASSIGN_ACL(
    acl          => 'us-example-com-permissions.xml',
    host         => '*.us.example.com',
    lower_port   => 80);
END;
```

121.7.7 ASSIGN_WALLET_ACL Procedure

This procedure assigns an access control list (ACL) to a wallet.

Note:

This procedure is deprecated in Oracle Database 12c. While the procedure remains available in the package for reasons of backward compatibility, Oracle recommends using the [APPEND_HOST_ACE Procedure](#) and the [APPEND_WALLET_ACE Procedure](#).

Syntax

```
UTL_HTTP.ASSIGN_WALLET_ACL (
  acl          IN  VARCHAR2,
  wallet_path  IN  VARCHAR2);
```

Parameters

Table 121-10 ASSIGN_WALLET_ACL Procedure Parameters

| Parameter | Description |
|-------------|--|
| acl | Name of the ACL. Relative path will be relative to <code>"/sys/acls"</code> |
| wallet_path | Directory path of the wallet to which the ACL is to be assigned. The path is case-sensitive and of the format <code>file:directory-path</code> . |

Usage Notes

To remove the assignment, use the [UNASSIGN_WALLET_ACL Procedure](#).

Examples

```
BEGIN
  DBMS_NETWORK_ACL_ADMIN.CREATE_ACL(
    acl          => 'wallet-acl.xml',
    description => 'Wallet ACL',
    principal   => 'SCOTT',
    is_grant    => TRUE,
    privilege   => 'use-client-certificates');

  DBMS_NETWORK_ACL_ADMIN.ADD_PRIVILEGE(
    acl          => 'wallet-acl.xml',
    principal   => 'SCOTT',
    is_grant    => TRUE,
    privilege   => 'use-passwords');

  DBMS_NETWORK_ACL_ADMIN.ASSIGN_WALLET_ACL(
    acl          => 'wallet-acl.xml',
    wallet_path => 'file:/example/wallets/test_wallet');
END;
```

121.7.8 CHECK_PRIVILEGE Function

This function checks if a privilege is granted or denied the user in an ACL.

**Note:**

This procedure is deprecated in Oracle Database 12c. The procedure remains available in the package only for reasons of backward compatibility.

Syntax

```
DBMS_NETWORK_ACL_ADMIN.CHECK_PRIVILEGE (
  acl          IN VARCHAR2,
  user         IN VARCHAR2,
  privilege    IN VARCHAR2)
RETURN NUMBER;
```

Parameters

Table 121-11 CHECK_PRIVILEGE Function Parameters

| Parameter | Description |
|-----------|---|
| acl | Name of the ACL. Relative path will be relative to "/sys/acls". |
| user | User to check against. If the user is NULL, the invoker is assumed. The username is case-sensitive as in the USERNAME column of the ALL_USERS view. |
| privilege | Network privilege to check |

Return Values

Returns 1 when the privilege is granted; 0 when the privilege is denied; NULL when the privilege is neither granted or denied.

Examples

```
SELECT DECODE (
  DBMS_NETWORK_ACL_ADMIN.CHECK_PRIVILEGE (
    'us-example-com-permissions.xml', 'SCOTT', 'resolve'),
  1, 'GRANTED', 0, 'DENIED', NULL) PRIVILEGE
FROM DUAL;
```

121.7.9 CHECK_PRIVILEGE_ACLID Function

This function checks if a privilege is granted to or denied from the user in an ACL by specifying the object ID of the access control list.

Note:

This procedure is deprecated in Oracle Database 12c. The procedure remains available in the package only for reasons of backward compatibility.

Syntax

```
DBMS_NETWORK_ACL_ADMIN.CHECK_PRIVILEGE_ACLID (
  aclid          IN RAW,
  user           IN VARCHAR2 DEFAULT NULL)
  privilege      IN VARCHAR2,
RETURN NUMBER;
```

Parameters

Table 121-12 CHECK_PRIVILEGE_ACLID Function Parameters

| Parameter | Description |
|-----------|----------------------|
| aclid | Object ID of the ACL |

Table 121-12 (Cont.) CHECK_PRIVILEGE_ACLID Function Parameters

| Parameter | Description |
|-----------|---|
| user | User to check against. If the user is <code>NULL</code> , the invoker is assumed. The username is case-sensitive as in the <code>USERNAME</code> column of the <code>ALL_USERS</code> view. |
| privilege | Network privilege to check |

Return Values

Returns 1 when the privilege is granted; 0 when the privilege is denied; `NULL` when the privilege is neither granted or denied.

121.7.10 CREATE_ACL Procedure

This deprecated procedure creates an access control list (ACL) with an initial privilege setting. An ACL must have at least one privilege setting. The ACL has no access control effect unless it is assigned to the network target.

Note:

This procedure is deprecated in Oracle Database 12c. While the procedure remains available in the package for reasons of backward compatibility, Oracle recommends using the [APPEND_HOST_ACE Procedure](#) and the [APPEND_WALLET_ACE Procedure](#).

Syntax

```
DBMS_NETWORK_ACL_ADMIN.CREATE_ACL (
  acl          IN VARCHAR2,
  description  IN VARCHAR2,
  principal    IN VARCHAR2,
  is_grant     IN BOOLEAN,
  privilege    IN VARCHAR2,
  start_date   IN TIMESTAMP WITH TIMEZONE DEFAULT NULL,
  end_date     IN TIMESTAMP WITH TIMEZONE DEFAULT NULL );
```

Parameters**Table 121-13 CREATE_ACL Procedure Parameters**

| Parameter | Description |
|-------------|---|
| acl | Name of the ACL. Relative path will be relative to <code>"/sys/acls"</code> . |
| description | Description attribute in the ACL |
| principal | Principal (database user or role) to whom the privilege is granted or denied. Case sensitive. |
| is_grant | Privilege is granted or not (denied) |

Table 121-13 (Cont.) CREATE_ACL Procedure Parameters

| Parameter | Description |
|------------|--|
| privilege | Network privilege to be granted or denied - 'connect resolve' (case sensitive). A database user needs the <code>connect</code> privilege to an external network host computer if he or she is connecting using the <code>UTL_TCP</code> , <code>UTL_HTTP</code> , <code>UTL_SMTP</code> , and <code>UTL_MAIL</code> utility packages. To resolve a host name that was given a host IP address, or the IP address that was given a host name, with the <code>UTL_INADDR</code> package, grant the database user the <code>resolve</code> privilege. |
| start_date | Start date of the access control entry (ACE). When specified, the ACE is valid only on and after the specified date. |
| end_date | End date of the access control entry (ACE). When specified, the ACE expires after the specified date. The <code>end_date</code> must be greater than or equal to the <code>start_date</code> . |

Usage Notes

To drop the access control list, use the [DROP_ACL Procedure](#).

Examples

```
BEGIN
  DBMS_NETWORK_ACL_ADMIN.CREATE_ACL(
    acl      => 'us-example-com-permissions.xml',
    description => 'Network permissions for *.us.example.com',
    principal => 'SCOTT',
    is_grant  => TRUE,
    privilege => 'connect');
END;
```

121.7.11 DELETE_PRIVILEGE Procedure

This deprecated procedure deletes a privilege in an access control list.

Note:

This procedure is deprecated in Oracle Database 12c. While the procedure remains available in the package for reasons of backward compatibility, Oracle recommends using the [REMOVE_HOST_ACE Procedure](#) and the [REMOVE_WALLET_ACE Procedure](#).

Syntax

```
DBMS_NETWORK_ACL_ADMIN.DELETE_PRIVILEGE (
  acl          IN VARCHAR2,
  principal    IN VARCHAR2,
  is_grant     IN BOOLEAN DEFAULT NULL,
  privilege    IN VARCHAR2 DEFAULT NULL);
```

Parameters

Table 121-14 DELETE_PRIVILEGE Function Parameters

| Parameter | Description |
|-----------|--|
| acl | Name of the ACL. Relative path will be relative to "/sys/acls". |
| principal | Principal (database user or role) for whom all the ACE will be deleted |
| is_grant | Privilege is granted or not (denied). If a NULL value is given, the deletion is applicable to both granted or denied privileges. |
| privilege | Network privilege to be deleted. If a NULL value is given, the deletion is applicable to all privileges. |

Examples

```
BEGIN
  DBMS_NETWORK_ACL_ADMIN.DELETE_PRIVILEGE (
    acl      => 'us-example-com-permissions.xml',
    principal => 'ST_USERS')
END;
```

121.7.12 DROP_ACL Procedure

This **deprecated procedure** drops an access control list (ACL).

Note:

This procedure is deprecated in Oracle Database 12c. The procedure remains available in the package only for reasons of backward compatibility.

Syntax

```
DBMS_NETWORK_ACL_ADMIN.DROP_ACL (
  acl          IN VARCHAR2);
```

Parameters

Table 121-15 DROP_ACL Procedure Parameters

| Parameter | Description |
|-----------|---|
| acl | Name of the ACL. Relative path will be relative to "/sys/acls". |

Examples

```
BEGIN
  DBMS_NETWORK_ACL_ADMIN.DROP_ACL (
    acl => 'us-example-com-permissions.xml');
END;
```

121.7.13 REMOVE_HOST_ACE Procedure

This procedure removes privileges from access control entries (ACE) in the access control list (ACL) of a network host matching the given ACE.

Syntax

```
DBMS_NETWORK_ACL_ADMIN.REMOVE_HOST_ACE (
  host          IN VARCHAR2,
  lower_port    IN PLS_INTEGER DEFAULT NULL,
  upper_port    IN PLS_INTEGER DEFAULT NULL,
  ace           IN XS$ACE_TYPE,
  remove_empty_acl IN BOOLEAN DEFAULT FALSE);
```

Parameters

Table 121-16 REMOVE_HOST_ACE Function Parameters

| Parameter | Description |
|------------------|--|
| host | The host, which can be the name or the IP address of the host. You can use a wildcard to specify a domain or a IP subnet. The host or domain name is case-insensitive. |
| lower_port | Lower bound of an optional TCP port range |
| upper_port | Upper bound of an optional TCP port range. If NULL, lower_port is assumed. |
| ace | The ACE |
| remove_empty_acl | Whether to remove the ACL when it becomes empty when the ACE is removed |

Usage Notes

If the ACL is shared with another host or wallet, a copy of the ACL is made before the ACL is modified.

121.7.14 REMOVE_WALLET_ACE Procedure

This procedure removes privileges from access control entries (ACE) in the access control list (ACL) of a wallet matching the given ACE.

Syntax

```
DBMS_NETWORK_ACL_ADMIN.REMOVE_WALLET_ACE (
  wallet_path    IN VARCHAR2,
  ace            IN XS$ACE_TYPE,
  remove_empty_acl IN BOOLEAN DEFAULT FALSE);
```

Parameters

Table 121-17 REMOVE_WALLET_ACE Function Parameters

| Parameter | Description |
|------------------|---|
| wallet_path | Directory path of the wallet. The path is case-sensitive of the format <i>file:directory-path</i> . |
| ace | The ACE |
| remove_empty_acl | Whether to remove the ACL when it becomes empty when the ACE is removed |

Usage Notes

If the ACL is shared with another host or wallet, a copy of the ACL is made before the ACL is modified.

121.7.15 SET_HOST_ACL Procedure

This procedure sets the access control list (ACL) of a network host which controls access to the host from the database.

Syntax

```
DBMS_NETWORK_ACL_ADMIN.SET_HOST_ACL (
  host          IN VARCHAR2,
  lower_port    IN PLS_INTEGER DEFAULT NULL,
  upper_port    IN PLS_INTEGER DEFAULT NULL,
  acl           IN VARCHAR2);
```

Parameters

Table 121-18 SET_HOST_ACL Function Parameters

| Parameter | Description |
|------------|--|
| host | The host, which can be the name or the IP address of the host. You can use a wildcard to specify a domain or a IP subnet. The host or domain name is case-insensitive. |
| lower_port | Lower bound of an optional TCP port range |
| upper_port | Upper bound of an optional TCP port range. If NULL, lower_port is assumed. |
| acl | The ACL. NULL to unset the host's ACL. |

Usage Notes

A host's ACL is created and set on-demand when an access control entry (ACE) is appended to the host's ACL. Users are discouraged from setting a host's ACL manually.

121.7.16 SET_WALLET_ACL Procedure

This procedure sets the access control list (ACL) of a wallet which controls access to the wallet from the database.

Syntax

```
DBMS_NETWORK_ACL_ADMIN.SET_WALLET_ACL (
    wallet_path    IN VARCHAR2,
    acl           IN VARCHAR2);
```

Parameters

Table 121-19 SET_WALLET_ACL Function Parameters

| Parameter | Description |
|-------------|---|
| wallet_path | Directory path of the wallet. The path is case-sensitive of the format <code>file:directory-path</code> . |
| acl | The ACL. NULL to unset the host's ACL. |

Usage Notes

A wallet's ACL is created and set on-demand when an access control entry (ACE) is appended to the wallet's ACL. Users are discouraged from setting a wallet's ACL manually.

121.7.17 UNASSIGN_ACL Procedure

This deprecated procedure unassigns the access control list (ACL) currently assigned to a network host.

Note:

This procedure is deprecated in Oracle Database 12c. While the procedure remains available in the package for reasons of backward compatibility, Oracle recommends using the [REMOVE_HOST_ACE Procedure](#) and the [REMOVE_WALLET_ACE Procedure](#).

Syntax

```
DBMS_NETWORK_ACL_ADMIN.UNASSIGN_ACL (
    acl          IN VARCHAR2 DEFAULT NULL,
    host         IN VARCHAR2 DEFAULT NULL,
    lower_port   IN PLS_INTEGER DEFAULT NULL,
    upper_port   IN PLS_INTEGER DEFAULT NULL);
```

Parameters

Table 121-20 UNASSIGN_ACL Function Parameters

| Parameter | Description |
|------------|--|
| acl | Name of the ACL. Relative path will be relative to "/sys/acls". If ACL is NULL, any ACL assigned to the host is unassigned. |
| host | Host from which the ACL is to be removed. The host can be the name or the IP address of the host. A wildcard can be used to specify a domain or a IP subnet. The host or domain name is case-insensitive. If host is NULL, the ACL will be unassigned from any host. If both host and acl are NULL, all ACLs assigned to any hosts are unassigned. |
| lower_port | Lower bound of a TCP port range if not NULL |
| upper_port | Upper bound of a TCP port range. If NULL, lower_port is assumed. |

Examples

```
BEGIN
  DBMS_NETWORK_ACL_ADMIN.UNASSIGN_ACL(
    host      => '*.us.example.com',
    lower_port => 80);
END;
```

121.7.18 UNASSIGN_WALLET_ACL Procedure

This deprecated procedure unassigns the access control list (ACL) currently assigned to a wallet.

Note:

This procedure is deprecated in Oracle Database 12c. While the procedure remains available in the package for reasons of backward compatibility, Oracle recommends using the [REMOVE_HOST_ACE Procedure](#) and the [REMOVE_WALLET_ACE Procedure](#).

Syntax

```
UTL_HTTP.UNASSIGN_WALLET_ACL (
  acl          IN  VARCHAR2 DEFAULT NULL,
  wallet_path  IN  VARCHAR2 DEFAULT NULL);
```

Parameters

Table 121-21 UNASSIGN_WALLET_ACL Procedure Parameters

| Parameter | Description |
|-----------|--|
| acl | Name of the ACL. Relative path will be relative to "/sys/acls". If acl is NULL, any ACL assigned to the wallet is unassigned |

Table 121-21 (Cont.) UNASSIGN_WALLET_ACL Procedure Parameters

| Parameter | Description |
|-------------|---|
| wallet_path | Directory path of the wallet to which the ACL is assigned. The path is case-sensitive and of the format <code>file:directory-path</code> . If both <code>acl</code> and <code>wallet_path</code> are NULL, all ACLs assigned to any wallets are unassigned. |

Examples

```
BEGIN
  DBMS_NETWORK_ACL_ADMIN.UNASSIGN_WALLET_ACL(
    acl      => 'wallet-acl.xml',
    wallet_path => 'file:/example/wallets/test_wallet');
END;
```

DBMS_NETWORK_ACL_UTILITY

The `DBMS_NETWORK_ACL_UTILITY` package provides the utility functions to facilitate the evaluation of access control list (ACL) assignments governing TCP connections to network hosts.

See Also:

For more information, see ["Managing Fine-grained Access to External Network Services"](#) in *Oracle Database Security Guide*

The chapter contains the following topics:

- [Security Model](#)
- [Examples](#)
- [Summary of DBMS_NETWORK_ACL_UTILITY Subprograms](#)

122.1 DBMS_NETWORK_ACL_UTILITY Security Model

EXECUTE on the `DBMS_NETWORK_ACL_UTILITY` package is granted to PUBLIC.

122.2 DBMS_NETWORK_ACL_UTILITY Examples

The `CONTAINS_HOST` Function in this package indicates if a domain or subnet contains a given host or IP address.

It can be used in conjunction with the [CHECK_PRIVILEGE_ACLID Function](#) in the `DBMS_NETWORK_ACL_ADMIN` package to determine the privilege assignments affecting a user's permission to access a network host. The return value of the `CONTAINS_HOST` Function in can also be used to order the ACL assignments by their precedence.

Example 1

For example, for SCOTT's permission to connect to `www.hr.example.com`:

```
SELECT host, lower_port, upper_port, acl,
       DECODE(
         DBMS_NETWORK_ACL_ADMIN.CHECK_PRIVILEGE_ACLID(aclid, 'SCOTT', 'connect'),
         1, 'GRANTED', 0, 'DENIED', NULL) privilege
FROM (SELECT host, acl, aclid, lower_port, upper_port,
            DBMS_NETWORK_ACL_UTILITY.CONTAINS_HOST('www.hr.example.com', host)
       precedence
      FROM dba_network_acls)
WHERE precedence > 0
ORDER BY precedence DESC, lower_port nulls LAST;
```

| HOST | LOWER_PORT | UPPER_PORT | ACL | PRIVILEGE |
|--------------------|------------|------------|-------------------|-----------|
| www.hr.example.com | 80 | 80 | /sys/acls/www.xml | GRANTED |
| www.hr.example.com | 3000 | 3999 | /sys/acls/www.xml | GRANTED |
| www.hr.example.com | | | /sys/acls/www.xml | GRANTED |
| *.hr.example.com | | | /sys/acls/all.xml | |
| *.example.com | | | /sys/acls/all.xml | |

Example 2

For example, for SCOTT's permission to do domain name resolution for www.hr.example.com:

```
SELECT host, acl,
       DECODE(
         DBMS_NETWORK_ACL_ADMIN.CHECK_PRIVILEGE_ACLID(aclid, 'SCOTT', 'resolve'),
         1, 'GRANTED', 0, 'DENIED', null) privilege
FROM (SELECT host, acl, aclid,
            DBMS_NETWORK_ACL_UTILITY.CONTAINS_HOST('www.hr.example.com', host)
            precedence
      FROM dba_network_acls
      WHERE lower_port IS NULL AND upper_port IS NULL)
WHERE precedence > 0
ORDER BY precedence DESC;
```

| HOST | ACL | PRIVILEGE |
|--------------------|---------------------------|-----------|
| www.hr.example.com | /sys/acls/hr-www.xml | GRANTED |
| *.hr.example.com | /sys/acls/hr-domain.xml | |
| *.example.com | /sys/acls/corp-domain.xml | |

Note that the "resolve" privilege takes effect only in ACLs assigned without any port range (when `lower_port` and `upper_port` are NULL). For this reason, the example does not include `lower_port` and `upper_port` columns in the query.

Related Topics

- [CONTAINS_HOST Function](#)
This function determines if the given host is equal to or contained in the given host, domain, or subnet. It handles different representation of the same IP address or subnet. For example, an IPv4-mapped IPv6 address is considered equal to the IPv4-native address it represents. It does not perform domain name resolution when evaluating the host or domain.

122.3 Summary of DBMS_NETWORK_ACL_UTILITY Subprograms

This table lists and briefly describes the DBMS_NETWORK_ACL_UTILITY package subprograms.

Table 122-1 DBMS_NETWORK_ACL_UTILITY Package Subprograms

| Subprogram | Description |
|--|--|
| CONTAINS_HOST Function | Determines if the given host is equal to or contained in the given host, domain, or subnet |

Table 122-1 (Cont.) DBMS_NETWORK_ACL_UTILITY Package Subprograms

| Subprogram | Description |
|---------------------------------------|--|
| DOMAIN_LEVEL Function | Returns the domain level of the given host name, domain, or subnet |
| DOMAINS Function | For a given host, this function returns the domains whose ACL assigned is used to determine if a user has the privilege to access the given host or not. |
| EQUALS_HOST Function | Determines if the two given hosts, domains, or subnets are equal |

122.3.1 CONTAINS_HOST Function

This function determines if the given host is equal to or contained in the given host, domain, or subnet. It handles different representation of the same IP address or subnet. For example, an IPv4-mapped IPv6 address is considered equal to the IPv4-native address it represents. It does not perform domain name resolution when evaluating the host or domain.

Syntax

```
DBMS_NETWORK_ACL_UTILITY.CONTAINS_HOST (
    host      IN   VARCHAR2,
    domain    IN   VARCHAR2)
RETURN NUMBER;
```

Parameters

Table 122-2 CONTAINS_HOST Function Parameters

| Parameter | Description |
|-----------|---------------------------------|
| host | Network host |
| domain | Network host, domain, or subnet |

Return Values

Returns a non-NULL value if the given host is equal to or contained in the related host, domain, or subnet:

- If `domain` is a hostname, returns the level of its domain + 1
- If `domain` is a domain name, returns the domain level
- If `domain` is an IP address or subnet, return the number of significant address bits of the IP address or subnet
- If `domain` is the wildcard "*", returns 0

The non-NULL value returned indicates the precedence of the domain or subnet for ACL assignment. The higher the value, the higher is the precedence. NULL will be returned if the host is not equal to or contained in the given host, domain or subnet.

Examples

```
SELECT host, acl, precedence
   FROM (select host, acl,
                DBMS_NETWORK_ACL_UTILITY.CONTAINS_HOST('192.0.2.3', host)
                precedence
          FROM dba_network_acls)
 WHERE precedence > 0
 ORDER BY precedence DESC;
```

| HOST | ACL | PRECEDENCE |
|----------------------|---------------------------|------------|
| 192.0.2.3 | /sys/acls/hr-www.xml | 32 |
| ::ffff:192.0.2.0/120 | /sys/acls/hr-domain.xml | 24 |
| ::ffff:192.0.0.0/104 | /sys/acls/corp-domain.xml | 8 |

122.3.2 DOMAIN_LEVEL Function

This function returns the domain level of the given host name, domain, or subnet.

Syntax

```
DBMS_NETWORK_ACL_UTILITY.DOMAIN_LEVEL (
    host IN VARCHAR2)
RETURN NUMBER;
```

Parameters

Table 122-3 DOMAIN_LEVEL Function Parameters

| Parameter | Description |
|-----------|---------------------------------|
| host | Network host, domain, or subnet |

Return Values

The domain level of the given host, domain, or subnet.

Usage Notes

Note that this function cannot handle IPv6 addresses and subnets, and subnets in CIDR notation.

Examples

```
SELECT host, acl, domain_level
   FROM (select host, acl,
                DBMS_NETWORK_ACL_UTILITY.DOMAIN_LEVEL(host) domain_level
          FROM dba_network_acls)
 ORDER BY domain_level desc;
```

| HOST | ACL | DOMAIN_LEVEL |
|--------------------|---------------------------|--------------|
| www.hr.example.com | /sys/acls/hr-www.xml | 4 |
| *.hr.example.com | /sys/acls/hr-domain.xml | 3 |
| *.example.com | /sys/acls/corp-domain.xml | 2 |

122.3.3 DOMAINS Function

For a given host, this function returns the domains whose ACL assigned determines if a user has the privilege to access the given host or not. When the IP address of the host is given, return the subnets instead.

Syntax

```
DBMS_NETWORK_ACL_UTILITY.DOMAINS (
    host IN VARCHAR2)
RETURN DOMAIN_TABLE PIPELINED;
```

Parameters

Table 122-4 DOMAINS Function Parameters

| Parameter | Description |
|-----------|--------------|
| host | Network host |

Return Values

The domains or subnets for the given host.

Usage Notes

Note that this function cannot handle IPv6 addresses. Nor can it generate subnets of arbitrary number of prefix bits for an IPv4 address.

Examples

```
select * from table(dbms_network_acl_utility.domains('www.hr.example.com'));

DOMAINS
-----
www.hr.example.com
*.hr.example.com
*.example.com
*.com
*
```

122.3.4 EQUALS_HOST Function

This function determines if the two given hosts, domains, or subnets are equal. It handles different representation of the same IP address or subnet. For example, an IPv4-mapped IPv6 address is considered equal to the IPv4- native address it represents. It does not perform domain name resolution when comparing the two hosts or domains.

Syntax

```
DBMS_NETWORK_ACL_UTILITY.EQUALS_HOST (
    host1 IN VARCHAR2,
    host2 IN VARCHAR2)
RETURN NUMBER;
```

Parameters

Table 122-5 EQUALS_HOST Function Parameters

| Parameter | Description |
|-----------|--|
| host1 | Network host, domain, or subnet to compare |
| host2 | Network host, domain, or subnet to compare |

Return Values

1 if the two hosts, domains, or subnets are equal. 0 otherwise.

Examples

```
SELECT host, acl
   FROM dba_network_acls
  WHERE DBMS_NETWORK_ACL_UTILITY.EQUALS_HOST('192.0.2.*', host) = 1;
```

```
HOST          ACL
-----
::ffff:192.0.2.0/120  /sys/acls/hr-domain.xml
```

DBMS_ODCI

DBMS_ODCI package contains a single user function related to the use of Data Cartridges.

This chapter contains the following topic:

- [Summary of DBMS_ODCI Subprograms](#)

See Also:

- *Oracle Database Data Cartridge Developer's Guide*

123.1 Summary of DBMS_ODCI Subprograms

The DBMS_ODCI package has one subprogram, the ESTIMATE_CPU_UNITS function.

Table 123-1 DBMS_ODCI Package Subprograms

| Subprogram | Description |
|---|---|
| ESTIMATE_CPU_UNITS Function | Returns the approximate number of CPU instructions (in thousands) corresponding to a specified time interval (in seconds) |

123.1.1 ESTIMATE_CPU_UNITS Function

This function returns the approximate number of CPU instructions (in thousands) corresponding to a specified time interval (in seconds). This information can be used to associate the CPU cost with a user-defined function for the extensible optimizer.

The function takes as input the elapsed time of the user function, measures CPU units by multiplying the elapsed time by the processor speed of the machine, and returns the approximate number of CPU instructions that should be associated with the user function. For a multiprocessor machine, ESTIMATE_CPU_UNITS considers the speed of a single processor.

Syntax

```
DBMS_ODCI.ESTIMATE_CPU_UNITS (
    elapsed_time    NUMBER)
RETURN NUMBER;
```

Parameters

| Parameter | Description |
|--------------|--|
| elapsed_time | The elapsed time in seconds that it takes to execute a function. |

Usage Notes

When associating CPU cost with a user-defined function, use the full number of CPU units rather than the number of *thousands* of CPU units returned by `ESTIMATE_CPU_UNITS`; multiply the number returned by `ESTIMATE_CPU_UNITS` by 1,000.

DBMS_OPTIM_BUNDLE

The `DBMS_OPTIM_BUNDLE` package is used to manage the installed but disabled module bug fixes which cause an execution plan change.

This chapter contains the following topics:

- [DBMS_OPTIM_BUNDLE Security Model](#)
- [Summary of DBMS_OPTIM_BUNDLE Subprograms](#)

124.1 DBMS_OPTIM_BUNDLE Security Model

The `DBMS_OPTIM_BUNDLE` package runs with the privileges of the user starting the package. DBA role is required to run this package.

124.2 Summary of DBMS_OPTIM_BUNDLE Subprograms

This table lists the `DBMS_OPTIM_BUNDLE` subprograms and briefly describes them.

Table 124-1 DBMS_OPTIM_BUNDLE Package Subprograms

| Subprogram | Description |
|--|---|
| ENABLE_OPTIM_FIXES Procedure | This procedure enables or disables fixes with plan changes up to the latest installed release update. |
| GETBUGSFORBUNDLE Procedure | This procedure displays execution plan bug fixes applied as part of release updates. |
| LISTBUNDLESWITHFCFIXES Procedure | This procedure lists the release update names and release update IDs of release updates with fix control fixes. |
| SET_FIX_CONTROLS Procedure | This procedure enables or disables a list of fixes with <code>_fix_controls</code> . |

124.2.1 ENABLE_OPTIM_FIXES Procedure

The `DBMS_OPTIM_BUNDLE` subprogram, `ENABLE_OPTIM_FIXES` procedure enables or disables fixes with plan changes up to the latest installed release update.

Syntax

```
DBMS_OPTIM_BUNDLE.ENABLE_OPTIM_FIXES (
  action                IN  VARCHAR2  DEFAULT 'OFF',
  scope                 IN  VARCHAR2  DEFAULT 'MEMORY',
  current_setting_precedence IN  VARCHAR2  DEFAULT 'YES');
```

Parameters

Table 124-2 ENABLE_OPTIM_FIXES Procedure Parameters

| Parameter | Description |
|----------------------------|--|
| action | <p>Enables or disables all of the installed but disabled execution plan bug fixes up to and including the current release update.</p> <p>The possible values are:</p> <ul style="list-style-type: none"> • ON-enables the bundle fixes. • OFF-disables bundle fixes by setting the <code>_fix_controls</code> to the value 0. It will not remove <code>_fix_control</code> entries from SPFILE. <p>The default value is OFF.</p> |
| scope | <p>The scope of enabling or disabling the installed but disabled execution plan bug fixes.</p> <p>The possible values are:</p> <ul style="list-style-type: none"> • MEMORY • SPFILE • BOTH • INITORA <p>MEMORY/SPFILE/BOTH: These three input values enables or disables the fixes in a given scope.</p> <p>INITORA: This input value will just display manual command syntax that the user needs to manually enter into the database's <code>init.ora</code> file in order to enable or disable execution plan bug fixes. When using <code>SCOPE=INITORA</code> in this way, the <code>current_setting_precedence</code> field has no significance.</p> |
| current_setting_precedence | <p>Sets the precedence of environment settings or release update settings, where these settings are in conflict.</p> <p>The possible values are:</p> <ul style="list-style-type: none"> • YES-the current environment settings take precedence in case of conflict • NO-release update settings take precedence in case of conflict <p>The default value is YES.</p> |

Examples

To enable all of the installed but disabled execution plan bug fixes up to and including those from the current release update:

```
SQL> execute dbms_optim_bundle.enable_optim_fixes('ON','BOTH', 'YES');
```

This instruction would enable all fixes, in both `MEMORY` and in the persistent `SPFILE`, with a precedence of current setting.

Exceptions

The following exceptions are raised by the `ENABLE_OPTIM_FIXES` Procedure:

- ORA-20001: Bad input value
- ORA-20002: Internal or other errors

124.2.2 GETBUGSFORBUNDLE Procedure

The `DBMS_OPTIM_BUNDLE.GETBUGSFORBUNDLE` subprogram, `GETBUGSFORBUNDLE` procedure displays execution plan bug fixes applied as part of release updates.

Syntax

```
DBMS_OPTIM_BUNDLE.GETBUGSFORBUNDLE (  
    bundleid          IN NUMBER DEFAULT NULL);
```

Parameters

Table 124-3 GETBUGSFORBUNDLE Procedure Parameters

| Parameter | Description |
|-----------|--|
| bundleid | The release update ID. If <code>NULL</code> , the execution plan bug fixes from the latest bundle is displayed. If a bundle ID is specified, then the execution plan bug fixes up to the specified bundle is displayed. The default value is <code>NULL</code> . |

Examples

To view a listing of the installed but disabled execution plan bug fixes from the most recent release update applied:

```
SQL> set serveroutput on;  
SQL> execute dbms_optim_bundle.getbugsforbundle;  
  
19.8.0.0.200714DBRU:  
  Bug: 29304314, fix_controls: 29304314  
  Bug: 29930457, fix_controls: 29930457
```

The above example lists the installed but disabled execution plan bug fixes from the 19.8.0.0.200714DBRU release.

To view a listing of the installed but disabled execution plan bug fixes from release updates up to and including release update 171017:

```
SQL> execute dbms_optim_bundle.getbugsforbundle(171017);
```

Exceptions

The following exceptions are raised by the `GETBUGSFORBUNDLE` Procedure:

- `ORA-20001`: Bad input value
- `ORA-20002`: Internal or other errors

124.2.3 LISTBUNDLESWITHFCFIXES Procedure

The DBMS_OPTIM_BUNDLE subprogram, LISTBUNDLESWITHFCFIXES procedure lists the release update names and release update IDs of release updates with fix control fixes.

Syntax

```
DBMS_OPTIM_BUNDLE.LISTBUNDLESWITHFCFIXES ( );
```

Examples

To view the release update names and release update IDs:

```
SQL> set serveroutput on
SQL> exec dbms_optim_bundle.listBundlesWithFCFixes;
bundleId: 190719, bundleName: 19.4.0.0.190719DBRU
bundleId: 191015, bundleName: 19.5.0.0.191015DBRU
bundleId: 200414, bundleName: 19.7.0.0.200414DBRU
bundleId: 200714, bundleName: 19.8.0.0.200714DBRU
bundleId: 201020, bundleName: 19.9.0.0.201020DBRU
bundleId: 210119, bundleName: 19.10.0.0.210119DBRU
bundleId: 210420, bundleName: 19.11.0.0.210420DBRU
bundleId: 210720, bundleName: 19.12.0.0.210720DBRU
```

PL/SQL procedure successfully completed.

Exceptions

The following exception is raised by the LISTBUNDLESWITHFCFIXES Procedure:

ORA-20002: Internal or other errors

124.2.4 SET_FIX_CONTROLS Procedure

The DBMS_OPTIM_BUNDLE subprogram, SET_FIX_CONTROLS procedure enables or disables a list of fixes with `_fix_controls`. The fixes can be present in a base version, in a release update, or in a one-off release. This procedure appends the new fix control settings to the existing ones.

Syntax

```
DBMS_OPTIM_BUNDLE.SET_FIX_CONTROLS (
    fix_control_string          IN  VARCHAR2,
    sid                        IN  VARCHAR2  DEFAULT '*',
    scope                      IN  VARCHAR2  DEFAULT 'MEMORY',
    current_setting_precedence IN  VARCHAR2  DEFAULT 'YES');
```

Parameters

Table 124-4 SET_FIX_CONTROLS Procedure Parameters

| Parameter | Description |
|---------------------------------|--|
| <code>fix_control_string</code> | Comma separated list of <code>fix_control:value</code> pair. For example: <code>'13329748:0,20355502:4, 27060221:1'</code> |

Table 124-4 (Cont.) SET_FIX_CONTROLS Procedure Parameters

| Parameter | Description |
|----------------------------|--|
| sid | The name of the instance on which <code>fix_control</code> setting need to be made. Acceptable values are * or valid <code>instance_name</code> from <code>sys.gv\$instance</code> . The default value is *. |
| scope | The scope of enabling or disabling the installed but disabled execution plan bug fixes. The possible values are: <ul style="list-style-type: none">• MEMORY• SPFILE• BOTH The default value is MEMORY. |
| current_setting_precedence | Precedence of current setting over user supplied setting. The possible values are: <ul style="list-style-type: none">• YES—the current environment settings take precedence in case of conflict• NO—input settings take precedence in case of conflict The default value is YES. |

Exceptions

The following exceptions are raised by the `SET_FIX_CONTROLS` Procedure:

- ORA-20001: Bad input value
- ORA-20002: Internal or other errors

DBMS_OUTLN

The `DBMS_OUTLN` package, synonymous with `OUTLN_PKG`, contains the functional interface for subprograms associated with the management of stored outlines.

See Also:

For more information about using the `DBMS_OUTLN` package, see *Oracle Database SQL Tuning Guide*.

Note:

Stored outlines will be desupported in a future release in favor of SQL plan management. In Oracle Database 11g Release 1 (11.1), stored outlines continue to function as in past releases. However, Oracle strongly recommends that you use SQL plan management for new applications. SQL plan management creates SQL plan baselines, which offer superior SQL performance and stability compared with stored outlines. If you have existing stored outlines, please consider migrating them to SQL plan baselines by using the [LOAD_PLANS_FROM_CURSOR_CACHE Functions](#) or [LOAD_PLANS_FROM_SQLSET Function](#) of the `DBMS_SPM` package. When the migration is complete, you should disable or remove the stored outlines.

This chapter contains the following topics:

- [Overview](#)
- [Security Model](#)
- [Summary of DBMS_OUTLN Subprograms](#)

125.1 DBMS_OUTLN Overview

A stored outline is the stored data that pertains to an execution plan for a given SQL statement. It enables the optimizer to repeatedly re-create execution plans that are equivalent to the plan originally generated along with the outline. The data stored in an outline consists, in part, of a set of hints that are used to achieve plan stability.

Stored outlines will be de-supported in a future release in favor of SQL plan management. As of 11g R1, stored outlines continue to function as in past releases, but Oracle strongly recommends that you use SQL plan management for new applications. SQL plan management creates SQL plan baselines, which offer superior SQL performance and stability compared with stored outlines. If you have existing stored outlines, please consider migrating them to SQL plan baselines by using the [LOAD_PLANS_FROM_CURSOR_CACHE Functions](#) or the [LOAD_PLANS_FROM_SQLSET Function](#) of the `DBMS_SPM` package. When the migration is complete, you should disable or remove the stored outlines.

125.2 DBMS_OUTLN Security Model

DBMS_OUTLN contains management procedures that should be available to appropriate users only. EXECUTE privilege is not extended to the general user community unless the DBA explicitly does so.

PL/SQL functions that are available for outline management purposes can be executed only by users with EXECUTE privilege on the procedure (or package).

125.3 Summary of DBMS_OUTLN Subprograms

This table lists the DBMS_OUTLN subprograms and briefly describes them.

Table 125-1 DBMS_OUTLN Package Subprograms

| Subprogram | Description |
|---|---|
| CLEAR_USED Procedure | Clears the outline 'used' flag |
| CREATE_OUTLINE Procedure | Generates outlines from the shared cursor identified by hash value and child number |
| DROP_BY_CAT Procedure | Drops outlines that belong to a specified category |
| DROP_UNUSED Procedure | Drops outlines that have never been applied in the compilation of a SQL statement |
| EXACT_TEXT_SIGNATURES Procedure | Updates outline signatures to those that compute based on exact text matching |
| UPDATE_BY_CAT Procedure | Changes the category of outlines in one category to a new category |
| UPDATE_SIGNATURES Procedure | Updates outline signatures to the current version's signature |

125.3.1 CLEAR_USED Procedure

This procedure clears the outline 'used' flag.

Syntax

```
DBMS_OUTLN.CLEAR_USED (
    name      IN      VARCHAR2);
```

Parameters

Table 125-2 CLEAR_USED Procedure Parameters

| Parameter | Description |
|-----------|----------------------|
| name | Name of the outline. |

125.3.2 CREATE_OUTLINE Procedure

This procedure generates an outline by reparsing the SQL statement from the shared cursor identified by hash value and child number.

Syntax

```
DBMS_OUTLN.CREATE_OUTLINE (  
    hash_value    IN NUMBER,  
    child_number  IN NUMBER,  
    category      IN VARCHAR2 DEFAULT 'DEFAULT');
```

Parameters

Table 125-3 CREATE_OUTLINE Procedure Parameters

| Parameter | Description |
|--------------|--|
| hash_value | Hash value identifying the target shared cursor. |
| child_number | Child number of the target shared cursor. |
| category | Category in which to create outline (optional). |

125.3.3 DROP_BY_CAT Procedure

This procedure drops outlines that belong to a particular category. While outlines are put into the `DEFAULT` category unless otherwise specified, users have the option of grouping their outlines into groups called categories.

Syntax

```
DBMS_OUTLN.DROP_BY_CAT (  
    cat VARCHAR2);
```

Parameters

Table 125-4 DROP_BY_CAT Procedure Parameters

| Parameter | Description |
|-----------|-------------------------------|
| cat | Category of outlines to drop. |

Usage Notes

This procedure purges a category of outlines in a single call.

Examples

This example drops all outlines in the `DEFAULT` category:

```
DBMS_OUTLN.DROP_BY_CAT('DEFAULT');
```

125.3.4 DROP_UNUSED Procedure

This procedure drops outlines that have never been applied in the compilation of a SQL statement.

Syntax

```
DBMS_OUTLN.DROP_UNUSED;
```

Usage Notes

You can use `DROP_UNUSED` for outlines generated by an application for one-time use SQL statements created as a result of dynamic SQL. These outlines are never used and take up valuable disk space.

125.3.5 EXACT_TEXT_SIGNATURES Procedure

This procedure updates outline signatures to those that compute based on exact text matching.

Syntax

```
DBMS_OUTLN.EXACT_TEXT_SIGNATURES;
```

Usage Notes

This procedure is relevant only for downgrading an outline to 8.1.6 or earlier.

125.3.6 UPDATE_BY_CAT Procedure

This procedure changes the category of all outlines in one category to a new category.

Syntax

```
DBMS_OUTLN.UPDATE_BY_CAT (  
    oldcat    VARCHAR2 default 'DEFAULT',  
    newcat    VARCHAR2 default 'DEFAULT');
```

Parameters

Table 125-5 UPDATE_BY_CAT Procedure Parameters

| Parameter | Description |
|-----------|-----------------------------------|
| oldcat | The current category of outlines. |
| newcat | The new category of outlines. |

125.3.7 UPDATE_SIGNATURES Procedure

This procedure updates outline signatures to the current version's signature.

Syntax

```
DBMS_OUTLN.UPDATE_SIGNATURES;
```

Usage Notes

You should execute this procedure if you have imported outlines generated in an earlier release to ensure that the signatures are compatible with the current release's computation algorithm.

DBMS_OUTPUT

The `DBMS_OUTPUT` package enables you to send messages from stored procedures, packages, and triggers. The package is especially useful for displaying PL/SQL debugging information.

This chapter contains the following topics:

- [Overview](#)
- [Security Model](#)
- [Operational Notes](#)
- [Exceptions](#)
- [Rules and Limits](#)
- [Examples](#)
- [Data Structures](#)
- [Summary of DBMS_OUTPUT Subprograms](#)

126.1 DBMS_OUTPUT Overview

The package is typically used for debugging, or for displaying messages and reports to SQL*DBA or SQL*Plus (such as are produced by applying the SQL command `DESCRIBE` to procedures).

The [PUT Procedure](#) and [PUT_LINE Procedure](#) in this package enable you to place information in a buffer that can be read by another trigger, procedure, or package. In a separate PL/SQL procedure or anonymous block, you can display the buffered information by calling the [GET_LINE Procedure](#) and [GET_LINES Procedure](#).

If the package is disabled, all calls to subprograms are ignored. In this way, you can design your application so that subprograms are available only when a client is able to process the information.

126.2 DBMS_OUTPUT Security Model

The `dbmsotpt.sql` script must be run as user `SYS`. This creates the public synonym `DBMS_OUTPUT`, and `EXECUTE` permission on this package is granted to `public`.

126.3 DBMS_OUTPUT Operational Notes

The following operational notes apply to `DBMS_OUTPUT`.

- If you do not call `GET_LINE`, or if you do not display the messages on your screen in SQL*Plus, the buffered messages are ignored.
- SQL*Plus calls `GET_LINES` after issuing a SQL statement or anonymous PL/SQL calls.

- Typing `SET SERVEROUTPUT ON` in SQL*Plus has the effect of invoking `DBMS_OUTPUT.ENABLE (buffer_size => NULL);` with no limit on the output.
- You should generally avoid having application code invoke either the [DISABLE Procedure](#) or [ENABLE Procedure](#) because this could subvert the attempt of an external tool like SQL*Plus to control whether or not to display output.

**Note:**

Messages sent using `DBMS_OUTPUT` are not actually sent until the sending subprogram or trigger completes. There is no mechanism to flush output during the execution of a procedure.

126.4 DBMS_OUTPUT Exceptions

`DBMS_OUTPUT` subprograms raise the application error `ORA-20000` and return errors.

The output procedures can return the following errors:

Table 126-1 DBMS_OUTPUT Errors

| Error | Description |
|------------|----------------------|
| ORU-10027: | Buffer overflow |
| ORU-10028: | Line length overflow |

126.5 DBMS_OUTPUT Rules and Limits

The following are limits on `DBMS_OUTPUT` line and buffer size.

- The maximum line size is 32767 bytes.
- The default buffer size is 20000 bytes. The minimum size is 2000 bytes and the maximum is unlimited.

126.6 DBMS_OUTPUT Examples

This topic contains three examples of using `DBMS_OUTPUT`.

Example 1: Using a Trigger to Produce Output

You can use a trigger to print out some output from the debugging process. For example, you could code the trigger to invoke:

```
DBMS_OUTPUT.PUT_LINE('I got here:'||:new.col||' is the new value');
```

If you have enabled the `DBMS_OUTPUT` package, then the text produced by this `PUT_LINE` would be buffered, and you could, after executing the statement (presumably

some INSERT, DELETE, or UPDATE that caused the trigger to fire), retrieve the line of information. For example:

```
BEGIN
  DBMS_OUTPUT.GET_LINE(:buffer, :status);
END;
```

You could then optionally display the buffer on the screen. You repeat calls to `GET_LINE` until `status` comes back as nonzero. For better performance, you should use calls to [GET_LINES Procedure](#) which can return an array of lines.

Example 2: Debugging Stored Procedures and Triggers

The `DBMS_OUTPUT` package is commonly used to debug stored procedures and triggers. This package can also be used to enable you to retrieve information about an object and format this output, as shown in ["Example 3: Retrieving Information About an Object"](#).

This function queries the employee table and returns the total salary for a specified department. The function includes several calls to the `PUT_LINE` procedure:

```
CREATE FUNCTION dept_salary (dnum NUMBER) RETURN NUMBER IS
  CURSOR emp_cursor IS
    SELECT sal, comm FROM emp WHERE deptno = dnum;
  total_wages  NUMBER(11, 2) := 0;
  counter      NUMBER(10) := 1;
BEGIN

  FOR emp_record IN emp_cursor LOOP
    emp_record.comm := NVL(emp_record.comm, 0);
    total_wages := total_wages + emp_record.sal
      + emp_record.comm;
    DBMS_OUTPUT.PUT_LINE('Loop number = ' || counter ||
      ' ; Wages = ' || TO_CHAR(total_wages)); /* Debug line */
    counter := counter + 1; /* Increment debug counter */
  END LOOP;
  /* Debug line */
  DBMS_OUTPUT.PUT_LINE('Total wages = ' ||
    TO_CHAR(total_wages));
  RETURN total_wages;

END dept_salary;
```

Assume the `EMP` table contains the following rows:

| EMPNO | SAL | COMM | DEPT |
|-------|------|------|------|
| 1002 | 1500 | 500 | 20 |
| 1203 | 1000 | | 30 |
| 1289 | 1000 | | 10 |
| 1347 | 1000 | 250 | 20 |

Assume the user executes the following statements in `SQL*Plus`:

```
SET SERVEROUTPUT ON
VARIABLE salary NUMBER;
EXECUTE :salary := dept_salary(20);
```

The user would then see the following information displayed in the output pane:

```
Loop number = 1; Wages = 2000
Loop number = 2; Wages = 3250
```

```
Total wages = 3250
```

```
PL/SQL procedure successfully executed.
```

Example 3: Retrieving Information About an Object

In this example, the user has used the `EXPLAIN PLAN` command to retrieve information about the execution plan for a statement and has stored it in `PLAN_TABLE`. The user has also assigned a statement ID to this statement. The example `EXPLAIN_OUT` procedure retrieves the information from this table and formats the output in a nested manner that more closely depicts the order of steps undergone in processing the SQL statement.

```

/*****
/* Create EXPLAIN_OUT procedure. User must pass STATEMENT_ID to */
/* to procedure, to uniquely identify statement.                */
*****/
CREATE OR REPLACE PROCEDURE explain_out
  (statement_id IN VARCHAR2) AS

  -- Retrieve information from PLAN_TABLE into cursor EXPLAIN_ROWS.

  CURSOR explain_rows IS
    SELECT level, id, position, operation, options,
           object_name
    FROM plan_table
    WHERE statement_id = explain_out.statement_id
    CONNECT BY PRIOR id = parent_id
              AND statement_id = explain_out.statement_id
    START WITH id = 0
    ORDER BY id;

BEGIN

  -- Loop through information retrieved from PLAN_TABLE:

  FOR line IN explain_rows LOOP

    -- At start of output, include heading with estimated cost.

    IF line.id = 0 THEN
      DBMS_OUTPUT.PUT_LINE ('Plan for statement '
        || statement_id
        || ', estimated cost = ' || line.position);
    END IF;

    -- Output formatted information. LEVEL determines indentation level.

    DBMS_OUTPUT.PUT_LINE (lpad(' ', 2*(line.level-1)) ||
      line.operation || ' ' || line.options || ' ' ||
      line.object_name);
  END LOOP;

END;
```

126.7 DBMS_OUTPUT Data Structures

The `DBMS_OUTPUT` package declares 2 collection types for use with the `GET_LINES` Procedure.

TABLE Types

[CHARARR Table Type](#)

OBJECT Types

[DBMSOUTPUT_LINESARRAY Object Type](#)

Related Topics

- [GET_LINES Procedure](#)
This procedure retrieves an array of lines from the buffer.

126.7.1 CHARARR Table Type

This package type is to be used with the `GET_LINES` Procedure to obtain text submitted through the `PUT` Procedure and `PUT_LINE` Procedure.

Syntax

```
TYPE CHARARR IS TABLE OF VARCHAR2(32767) INDEX BY BINARY_INTEGER;
```

Related Topics

- [GET_LINES Procedure](#)
This procedure retrieves an array of lines from the buffer.
- [PUT Procedure](#)
This procedure places a partial line in the buffer.
- [PUT_LINE Procedure](#)
This procedure places a line in the buffer.

126.7.2 DBMS_OUTPUT DBMSOUTPUT_LINESARRAY Object Type

This type, defined outside the package, is to be used with the `GET_LINES` Procedure to obtain text submitted through the `PUT` Procedure and `PUT_LINE` Procedure.

Syntax

```
TYPE DBMSOUTPUT_LINESARRAY IS  
  VARRAY(2147483647) OF VARCHAR2(32767);
```

Related Topics

- [GET_LINES Procedure](#)
This procedure retrieves an array of lines from the buffer.

- [PUT Procedure](#)
This procedure places a partial line in the buffer.
- [PUT_LINE Procedure](#)
This procedure places a line in the buffer.

126.8 Summary of DBMS_OUTPUT Subprograms

This table lists the `DBMS_OUTPUT` subprograms and briefly describes them.

Table 126-2 DBMS_OUTPUT Package Subprograms

| Subprogram | Description |
|-------------------------------------|---|
| DISABLE Procedure | Disables message output |
| ENABLE Procedure | Enables message output |
| GET_LINE Procedure | Retrieves one line from buffer |
| GET_LINES Procedure | Retrieves an array of lines from buffer |
| NEW_LINE Procedure | Terminates a line created with <code>PUT</code> |
| PUT Procedure | Places a partial line in the buffer |
| PUT_LINE Procedure | Places line in buffer |

Note:

The [PUT Procedure](#) that take a number are obsolete and, while currently supported, are included in this release for legacy reasons only.

126.8.1 DISABLE Procedure

This procedure disables calls to `PUT`, `PUT_LINE`, `NEW_LINE`, `GET_LINE`, and `GET_LINES`, and purges the buffer of any remaining information.

As with the [ENABLE Procedure](#), you do not need to call this procedure if you are using the `SERVEROUTPUT` option of `SQL*Plus`.

Syntax

```
DBMS_OUTPUT.DISABLE;
```

Pragmas

```
pragma restrict_references(disable,WNDS,RNDS);
```

126.8.2 ENABLE Procedure

This procedure enables calls to `PUT`, `PUT_LINE`, `NEW_LINE`, `GET_LINE`, and `GET_LINES`.

Calls to these procedures are ignored if the `DBMS_OUTPUT` package is not activated.

Syntax

```
DBMS_OUTPUT.ENABLE (
    buffer_size IN INTEGER DEFAULT 20000);
```

Pragmas

```
pragma restrict_references(enable,WNDS,RNDS);
```

Parameters**Table 126-3** ENABLE Procedure Parameters

| Parameter | Description |
|-------------|---|
| buffer_size | Upper limit, in bytes, the amount of buffered information. Setting buffer_size to NULL specifies that there should be no limit. |

Usage Notes

- It is not necessary to call this procedure when you use the SET SERVEROUTPUT option of SQL*Plus.
- If there are multiple calls to ENABLE, then buffer_size is the last of the values specified. The maximum size is 1,000,000, and the minimum is 2,000 when the user specifies buffer_size (NOT NULL).
- NULL is expected to be the usual choice. The default is 20,000 for backwards compatibility with earlier database versions that did not support unlimited buffering.

126.8.3 GET_LINE Procedure

This procedure retrieves a single line of buffered information.

Syntax

```
DBMS_OUTPUT.GET_LINE (
    line    OUT VARCHAR2,
    status  OUT INTEGER);
```

Parameters**Table 126-4** GET_LINE Procedure Parameters

| Parameter | Description |
|-----------|---|
| line | Returns a single line of buffered information, excluding a final newline character. You should declare the actual for this parameter as VARCHAR2 (32767) to avoid the risk of "ORA-06502: PL/SQL: numeric or value error: character string buffer too small". |
| status | If the call completes successfully, then the status returns as 0. If there are no more lines in the buffer, then the status is 1. |

Usage Notes

- You can choose to retrieve from the buffer a single line or an array of lines. Call the `GET_LINE` procedure to retrieve a single line of buffered information. To reduce the number of calls to the server, call the `GET_LINES` procedure to retrieve an array of lines from the buffer.
- You can choose to automatically display this information if you are using SQL*Plus by using the special `SET SERVEROUTPUT ON` command.
- After calling `GET_LINE` or `GET_LINES`, any lines not retrieved before the next call to `PUT`, `PUT_LINE`, or `NEW_LINE` are discarded to avoid confusing them with the next message.

126.8.4 GET_LINES Procedure

This procedure retrieves an array of lines from the buffer.

Syntax

```
DBMS_OUTPUT.GET_LINES (
    lines      OUT   CHARARR,
    numlines   IN OUT INTEGER);

DBMS_OUTPUT.GET_LINES (
    lines      OUT   DBMSOUTPUT_LINESARRAY,
    numlines   IN OUT INTEGER);
```

Parameters

Table 126-5 GET_LINES Procedure Parameters

| Parameter | Description |
|-----------|---|
| lines | Returns an array of lines of buffered information. The maximum length of each line in the array is 32767 bytes. It is recommended that you use the <code>VARRAY</code> overload version in a 3GL host program to execute the procedure from a PL/SQL anonymous block. |
| numlines | Number of lines you want to retrieve from the buffer. After retrieving the specified number of lines, the procedure returns the number of lines actually retrieved. If this number is less than the number of lines requested, then there are no more lines in the buffer. |

Usage Notes

- You can choose to retrieve from the buffer a single line or an array of lines. Call the `GET_LINE` procedure to retrieve a single line of buffered information. To reduce the number of calls to the server, call the `GET_LINES` procedure to retrieve an array of lines from the buffer.
- You can choose to automatically display this information if you are using SQL*Plus by using the special `SET SERVEROUTPUT ON` command.

- After calling `GET_LINE` or `GET_LINES`, any lines not retrieved before the next call to `PUT`, `PUT_LINE`, or `NEW_LINE` are discarded to avoid confusing them with the next message.

126.8.5 NEW_LINE Procedure

This procedure puts an end-of-line marker.

The [GET_LINE Procedure](#) and the [GET_LINES Procedure](#) return "lines" as delimited by "newlines". Every call to the [PUT_LINE Procedure](#) or [NEW_LINE Procedure](#) generates a line that is returned by `GET_LINE(S)`.

Syntax

```
DBMS_OUTPUT.NEW_LINE;
```

126.8.6 PUT Procedure

This procedure places a partial line in the buffer.

Note:

The `PUT` procedure that takes a `NUMBER` is obsolete and, while currently supported, is included in this release for legacy reasons only.

Syntax

```
DBMS_OUTPUT.PUT (
    item IN VARCHAR2);
```

Parameters

Table 126-6 PUT Procedure Parameters

| Parameter | Description |
|-----------|-----------------|
| item | Item to buffer. |

Exceptions

Table 126-7 PUT Procedure Exceptions

| Error | Description |
|--------------------------|---|
| ORA-20000, ORU-10027: | Buffer overflow, limit of <buf_limit> bytes. |
| ORA-20000, ORU-10028: | Line length overflow, limit of 32767 bytes for each line. |

Usage Notes

- You can build a line of information piece by piece by making multiple calls to `PUT`, or place an entire line of information into the buffer by calling `PUT_LINE`.

- When you call `PUT_LINE` the item you specify is automatically followed by an end-of-line marker. If you make calls to `PUT` to build a line, then you must add your own end-of-line marker by calling `NEW_LINE`. `GET_LINE` and `GET_LINES` do not return lines that have not been terminated with a newline character.
- If your lines exceed the line limit, you receive an error message.
- Output that you create using `PUT` or `PUT_LINE` is buffered. The output cannot be retrieved until the PL/SQL program unit from which it was buffered returns to its caller.

For example, SQL*Plus does not display `DBMS_OUTPUT` messages until the PL/SQL program completes. There is no mechanism for flushing the `DBMS_OUTPUT` buffers within the PL/SQL program.

```
SQL> SET SERVEROUTPUT ON
SQL> BEGIN
  2  DBMS_OUTPUT.PUT_LINE ('hello');
  3  DBMS_LOCK.SLEEP (10);
  4  END;
```

126.8.7 PUT_LINE Procedure

This procedure places a line in the buffer.

Note:

The `PUT_LINE` procedure that takes a `NUMBER` is obsolete and, while currently supported, is included in this release for legacy reasons only.

Syntax

```
DBMS_OUTPUT.PUT_LINE (
  item IN VARCHAR2);
```

Parameters

Table 126-8 PUT_LINE Procedure Parameters

| Parameter | Description |
|-----------|-----------------|
| item | Item to buffer. |

Exceptions

Table 126-9 PUT_LINE Procedure Exceptions

| Error | Description |
|--------------------------|---|
| ORA-20000, ORU-10027: | Buffer overflow, limit of <buf_limit> bytes. |
| ORA-20000, ORU-10028: | Line length overflow, limit of 32767 bytes for each line. |

Usage Notes

- You can build a line of information piece by piece by making multiple calls to `PUT`, or place an entire line of information into the buffer by calling `PUT_LINE`.
- When you call `PUT_LINE` the item you specify is automatically followed by an end-of-line marker. If you make calls to `PUT` to build a line, then you must add your own end-of-line marker by calling `NEW_LINE`. `GET_LINE` and `GET_LINES` do not return lines that have not been terminated with a newline character.
- If your lines exceeds the line limit, you receive an error message.
- Output that you create using `PUT` or `PUT_LINE` is buffered. The output cannot be retrieved until the PL/SQL program unit from which it was buffered returns to its caller.

For example, SQL*Plus does not display `DBMS_OUTPUT` messages until the PL/SQL program completes. There is no mechanism for flushing the `DBMS_OUTPUT` buffers within the PL/SQL program. For example:

```
SQL> SET SERVEROUTPUT ON
SQL> BEGIN
  2 DBMS_OUTPUT.PUT_LINE ('hello');
  3 DBMS_LOCK.SLEEP (10);
  4 END;
```

DBMS_PARALLEL_EXECUTE

The `DBMS_PARALLEL_EXECUTE` package enables incremental update of table data in parallel.

This chapter contains the following topics:

- [Overview](#)
- [Security Model](#)
- [Constants](#)
- [Views](#)
- [Exceptions](#)
- [Examples](#)
- [Summary of DBMS_PARALLEL_EXECUTE Subprograms](#)

See Also:

- [Oracle Database Development Guide](#)
- [Oracle Database Reference](#)

127.1 DBMS_PARALLEL_EXECUTE Overview

This package lets you incrementally update table data in parallel, in two high-level steps.

1. Group sets of rows in the table into smaller-sized chunks.
2. Run a user-specified statement on these chunks in parallel, and commit when finished processing each chunk.

This package introduces the notion of *parallel execution task*. This task groups the various steps associated with the parallel execution of a PL/SQL block, which is typically updating table data.

All of the package subroutines (except the [GENERATE_TASK_NAME Function](#) and the [TASK_STATUS Procedure](#)) perform a commit.

127.2 DBMS_PARALLEL_EXECUTE Security Model

`DBMS_PARALLEL_EXECUTE` is a SYS-owned package which is granted to PUBLIC.

Users who have the `ADM_PARALLEL_EXECUTE_TASK` role can perform administrative routines (qualified by the prefix `ADM_`) and access the DBA view.

Apart from the administrative routines, all the subprograms refer to tasks owned by the current user.

To execute chunks in parallel, you must have `CREATE JOB` system privilege.

The `CHUNK_BY_SQL`, `RUN_TASK`, and `RESUME_TASK` subprograms require a query, and are executed using `DBMS_SQL`. Invokers of the `DBMS_SQL` interface must ensure that no query contains SQL injection.

127.3 DBMS_PARALLEL_EXECUTE Constants

The `DBMS_PARALLEL_EXECUTE` package uses the constants described in these two tables.

Table 127-1 DBMS_PARALLEL_EXECUTE Constants - Chunk Status Value

| Constant | Type | Value | Description |
|----------------------|--------|-------|---|
| ASSIGNED | NUMBER | 1 | Chunk has been assigned for processing |
| PROCESSED | NUMBER | 2 | Chunk has been processed successfully |
| PROCESSED_WITH_ERROR | NUMBER | 3 | Chunk has been processed, but an error occurred during processing |
| UNASSIGNED | NUMBER | 0 | Chunk is unassigned |

Table 127-2 DBMS_PARALLEL_EXECUTE Constants - Task Status Value

| Constant | Type | Value | Description |
|---------------------|--------|-------|---|
| CHUNKED | NUMBER | 5 | Table associated with the task has been chunked, but none of the chunk has been assigned for processing |
| CHUNKING | NUMBER | 2 | Table associated with the task is being chunked |
| CHUNKING_FAILED | NUMBER | 3 | Chunking failed |
| CRASHED | NUMBER | 9 | Only applicable if parallel execution is used, this occurs if a job slave crashes or if the database crashes during <code>EXECUTE</code> , leaving a chunk in <code>ASSIGNED</code> or <code>UNASSIGNED</code> state. |
| CREATED | NUMBER | 1 | The task has been created by the CREATE_TASK Procedure |
| FINISHED | NUMBER | 7 | All chunks processed without error |
| FINISHED_WITH_ERROR | NUMBER | 8 | All chunks processed, but with errors in some cases |
| NO_CHUNKS | NUMBER | 4 | Table associated with the task has no chunks created |
| PROCESSING | NUMBER | 6 | Part of the chunk assigned for processing, or which has been processed |

**Note:**

Use constants instead of absolute values, because absolute values might change in future.

127.4 DBMS_PARALLEL_EXECUTE Views

The `DBMS_PARALLEL_EXECUTE` package uses the following views.

- `DBA_PARALLEL_EXECUTE_CHUNKS`
- `DBA_PARALLEL_EXECUTE_TASKS`
- `USER_PARALLEL_EXECUTE_CHUNKS`
- `USER_PARALLEL_EXECUTE_TASKS`

127.5 DBMS_PARALLEL_EXECUTE Exceptions

The following table lists the exceptions raised by `DBMS_PARALLEL_EXECUTE`.

Table 127-3 Exceptions Raised by DBMS_PARALLEL_EXECUTE

| Exception | Error Code | Description |
|---------------------------------------|------------|---|
| <code>CHUNK_NOT_FOUND</code> | 29499 | Specified chunk does not exist |
| <code>DUPLICATE_TASK_NAME</code> | 29497 | Same task name has been used by an existing task |
| <code>INVALID_STATE_FOR_CHUNK</code> | 29492 | Attempts to chunk a table that is not in <code>CREATED</code> or <code>CHUNKING_FAILED</code> state |
| <code>INVALID_STATE_FOR_RESUME</code> | 29495 | Attempts to resume execution, but the task is not in <code>FINISHED_WITH_ERROR</code> or <code>CRASHED</code> state |
| <code>INVALID_STATE_FOR_RUN</code> | 29494 | Attempts to execute the task that is not in <code>CHUNKED</code> state |
| <code>INVALID_STATUS</code> | 29493 | Attempts to set an invalid value to the chunk status |
| <code>INVALID_TABLE</code> | 29491 | Attempts to chunk a table by rowid in cases in which the table is not a physical table, or the table is an IOT |
| <code>MISSING_ROLE</code> | 29490 | User does not have the necessary <code>ADM_PARALLEL_EXECUTE</code> role |
| <code>TASK_NOT_FOUND</code> | 29498 | Specified <code>task_name</code> does not exist |

127.6 DBMS_PARALLEL_EXECUTE Examples

The following examples run on the Human Resources (HR) schema of the Oracle Database Sample Schemas. They require that the HR schema be created with the `JOB SYSTEM` privilege.

Chunk by ROWID

This example shows the most common usage of this package. After calling the [RUN_TASK Procedure](#), it checks for errors and reruns in the case of error.

```

DECLARE
  l_sql_stmt VARCHAR2(1000);
  l_try NUMBER;
  l_status NUMBER;
BEGIN

  -- Create the TASK
  DBMS_PARALLEL_EXECUTE.CREATE_TASK ('mytask');

  -- Chunk the table by ROWID
  DBMS_PARALLEL_EXECUTE.CREATE_CHUNKS_BY_ROWID('mytask', 'HR', 'EMPLOYEES',
true, 100);

  -- Execute the DML in parallel
  l_sql_stmt := 'update EMPLOYEES e
    SET e.salary = e.salary + 10
    WHERE rowid BETWEEN :start_id AND :end_id';
  DBMS_PARALLEL_EXECUTE.RUN_TASK('mytask', l_sql_stmt, DBMS_SQL.NATIVE,
    parallel_level => 10);

  -- If there is an error, RESUME it for at most 2 times.
  L_try := 0;
  L_status := DBMS_PARALLEL_EXECUTE.TASK_STATUS('mytask');
  WHILE (l_try < 2 and L_status != DBMS_PARALLEL_EXECUTE.FINISHED)
  LOOP
    L_try := l_try + 1;
    DBMS_PARALLEL_EXECUTE.RESUME_TASK('mytask');
    L_status := DBMS_PARALLEL_EXECUTE.TASK_STATUS('mytask');
  END LOOP;

  -- Done with processing; drop the task
  DBMS_PARALLEL_EXECUTE.DROP_TASK('mytask');

END;
/

```

Chunk by User-Provided SQL

A user can specify a chunk algorithm by using the [CREATE_CHUNKS_BY_SQL Procedure](#). This example shows that rows with the same `manager_id` are grouped together and processed in one chunk.

```

DECLARE
  l_chunk_sql VARCHAR2(1000);
  l_sql_stmt VARCHAR2(1000);
  l_try NUMBER;
  l_status NUMBER;
BEGIN

  -- Create the TASK
  DBMS_PARALLEL_EXECUTE.CREATE_TASK ('mytask');

  -- Chunk the table by MANAGER_ID
  l_chunk_sql := 'SELECT distinct manager_id, manager_id FROM employees';
  DBMS_PARALLEL_EXECUTE.CREATE_CHUNKS_BY_SQL('mytask', l_chunk_sql, false);

  -- Execute the DML in parallel
  -- the WHERE clause contain a condition on manager_id, which is the chunk
  -- column. In this case, grouping rows is by manager_id.
  l_sql_stmt := 'update EMPLOYEES e
    SET e.salary = e.salary + 10

```

```

        WHERE manager_id between :start_id and :end_id';
DBMS_PARALLEL_EXECUTE.RUN_TASK('mytask', l_sql_stmt, DBMS_SQL.NATIVE,
                               parallel_level => 10);

-- If there is error, RESUME it for at most 2 times.
L_try := 0;
L_status := DBMS_PARALLEL_EXECUTE.TASK_STATUS('mytask');
WHILE(l_try < 2 and L_status != DBMS_PARALLEL_EXECUTE.FINISHED)
Loop
    L_try := l_try + 1;
    DBMS_PARALLEL_EXECUTE.RESUME_TASK('mytask');
    L_status := DBMS_PARALLEL_EXECUTE.TASK_STATUS('mytask');
END LOOP;

-- Done with processing; drop the task
DBMS_PARALLEL_EXECUTE.DROP_TASK('mytask');

end;
/

```

Executing Chunks in an User-defined Framework

You can execute chunks in a self-defined framework without using the [RUN_TASK Procedure](#). This example shows how to use [GET_ROWID_CHUNK Procedure](#), [EXECUTE IMMEDIATE](#), [SET_CHUNK_STATUS Procedure](#) to execute the chunks.

```

DECLARE
    l_sql_stmt varchar2(1000);
    l_try number;
    l_status number;
    l_chunk_id number;
    l_start_rowid rowid;
    l_end_rowid rowid;
    l_any_rows boolean;
    CURSOR c1 IS SELECT chunk_id
                  FROM user_parallel_execute_chunks
                  WHERE task_name = 'mytask'
                  AND STATUS IN (DBMS_PARALLEL_EXECUTE.PROCESSED_WITH_ERROR,
                                DBMS_PARALLEL_EXECUTE.ASSIGNED);
BEGIN
    -- Create the Objects, task, and chunk by ROWID
    DBMS_PARALLEL_EXECUTE.CREATE_TASK ('mytask');
    DBMS_PARALLEL_EXECUTE.CREATE_CHUNKS_BY_ROWID('mytask', 'HR', 'EMPLOYEES', true, 100);

    l_sql_stmt := 'update EMPLOYEES e
                  SET e.salary = e.salary + 10
                  WHERE rowid BETWEEN :start_id AND :end_id';

    -- Execute the DML in his own framework
    --
    -- Process each chunk and commit.
    -- After processing one chunk, repeat this process until
    -- all the chunks are processed.
    --
    <<main_processing>>
    LOOP
        --
        -- Get a chunk to process; if there is nothing to process, then exit the
        -- loop;
        --
    
```

```

DBMS_PARALLEL_EXECUTE.GET_ROWID_CHUNK('mytask',
                                        l_chunk_id,
                                        l_start_rowid,
                                        l_end_rowid,
                                        l_any_rows);

IF (l_any_rows = false) THEN EXIT; END IF;

--
-- The chunk is specified by start_id and end_id.
-- Bind the start_id and end_id and then execute it
--
-- If no error occurred, set the chunk status to PROCESSED.
--
-- Catch any exception. If an exception occurred, store the error num/msg
-- into the chunk table and then continue to process the next chunk.
--
BEGIN
  EXECUTE IMMEDIATE l_sql_stmt using l_start_rowid, l_end_rowid;
  DBMS_PARALLEL_EXECUTE.SET_CHUNK_STATUS('mytask',l_chunk_id,
    DBMS_PARALLEL_EXECUTE.PROCESSED);
EXCEPTION WHEN OTHERS THEN
  DBMS_PARALLEL_EXECUTE.SET_CHUNK_STATUS('mytask', l_chunk_id,
    DBMS_PARALLEL_EXECUTE.PROCESSED_WITH_ERROR, SQLCODE, SQLERRM);
END;

--
-- Finished processing one chunk; Commit here
--
COMMIT;
END LOOP;

```

127.7 Summary of DBMS_PARALLEL_EXECUTE Subprograms

This table lists the DBMS_PARALLEL_EXECUTE subprograms and briefly describes them.

Table 127-4 DBMS_PARALLEL_EXECUTE Package Subprograms

| Subprogram | Description |
|--|--|
| ADM_DROP_CHUNKS Procedure | Drops all chunks of the specified task owned by the specified owner |
| ADM_DROP_TASK Procedure | Drops the task of the given user and all related chunks |
| ADM_TASK_STATUS Function | Returns the task status |
| ADM_STOP_TASK Procedure | Stops the task of the given owner and related job slaves |
| CREATE_TASK Procedure | Creates a task for the current user |
| CREATE_CHUNKS_BY_NUMBER_COLUMN Procedure | Chunks the table associated with the given task by the specified column. |
| CREATE_CHUNKS_BY_ROWID Procedure | Chunks the table associated with the given task by ROWID |
| CREATE_CHUNKS_BY_SQL Procedure | Chunks the table associated with the given task by means of a user-provided SELECT statement |
| DROP_TASK Procedure | Drops the task and all related chunks |

Table 127-4 (Cont.) DBMS_PARALLEL_EXECUTE Package Subprograms

| Subprogram | Description |
|--|---|
| DROP_CHUNKS Procedure | Drops the task's chunks |
| GENERATE_TASK_NAME Function | Returns a unique name for a task |
| GET_NUMBER_COL_CHUNK Procedure | Picks an unassigned NUMBER chunk and changes it to ASSIGNED |
| GET_ROWID_CHUNK Procedure | Picks an unassigned ROWID chunk and changes it to ASSIGNED |
| PURGE_PROCESSED_CHUNKS Procedure | Deletes all the processed chunks whose status is PROCESSED or PROCESSED_WITH_ERROR |
| RESUME_TASK Procedures | Retries the given the task if the RUN_TASK Procedure finished with an error, or resumes the task if a crash occurred. |
| RUN_TASK Procedure | Executes the specified SQL statement on the chunks in parallel |
| SET_CHUNK_STATUS Procedure | Sets the status of the chunk |
| STOP_TASK Procedure | Stops the task and related job slaves |
| TASK_STATUS Procedure | Returns the task status |

127.7.1 ADM_DROP_CHUNKS Procedure

This procedure drops all chunks of the specified task owned by the specified owner.

Syntax

```
DBMS_PARALLEL_EXECUTE.ADM_DROP_CHUNKS (
    task_owner    IN VARCHAR2,
    task_name     IN VARCHAR2);
```

Parameters

Table 127-5 ADM_DROP_CHUNKS Procedure Parameters

| Parameter | Description |
|------------|-------------------|
| task_owner | Owner of the task |
| task_name | Name of the task |

127.7.2 ADM_DROP_TASK Procedure

This procedure drops the task of the specified user and all related chunks.

Syntax

```
DBMS_PARALLEL_EXECUTE.ADM_DROP_TASK (
    task_owner    IN VARCHAR2,
    task_name     IN VARCHAR2);
```

Parameters

Table 127-6 ADM_DROP_TASK Procedure Parameters

| Parameter | Description |
|------------|-------------------|
| task_owner | Owner of the task |
| task_name | Name of the task |

127.7.3 ADM_TASK_STATUS Function

This function returns the task status.

Syntax

```
DBMS_PARALLEL_EXECUTE.ADM_TASK_STATUS (  
    task_owner    IN VARCHAR2,  
    task_name     IN VARCHAR2)  
RETURN NUMBER;
```

Parameters

Table 127-7 ADM_TASK_STATUS Function Parameters

| Parameter | Description |
|------------|-------------------|
| task_owner | Owner of the task |
| task_name | Name of the task |

127.7.4 ADM_STOP_TASK Procedure

This procedure stops the task of the specified owner and related job slaves.

Syntax

```
DBMS_PARALLEL_EXECUTE.ADM_STOP_TASK (  
    task_owner    IN VARCHAR2,  
    task_name     IN VARCHAR2);
```

Parameters

Table 127-8 ADM_STOP_TASK Procedure Parameters

| Parameter | Description |
|------------|-------------------|
| task_owner | Owner of the task |
| task_name | Name of the task |

127.7.5 CREATE_TASK Procedure

This procedure creates a task for the current user. The pairing of `task_name` and `current_user` must be unique.

Syntax

```
DBMS_PARALLEL_EXECUTE.CREATE_TASK (
    task_name      IN  VARCHAR2,
    comment        IN  VARCHAR2 DEFAULT NULL);
```

Parameters

Table 127-9 CREATE_TASK Procedure Parameters

| Parameter | Description |
|------------------------|---|
| <code>task_name</code> | Name of the task. The <code>task_name</code> can be any string in which related length must be less than or equal to 128 bytes. |
| <code>comment</code> | Comment field. The comment must be less than 4000 bytes. |

127.7.6 CREATE_CHUNKS_BY_NUMBER_COL Procedure

This procedure chunks the table (associated with the specified task) by the specified column. The specified column must be a `NUMBER` column. This procedure takes the `MIN` and `MAX` value of the column, and then divides the range evenly according to `chunk_size`.

The chunks are:

| START_ID | END_ID |
|--------------------------------------|--|
| ----- | ----- |
| <code>min_id_val</code> | <code>min_id_val+1*chunk_size-1</code> |
| <code>min_id_val+1*chunk_size</code> | <code>min_id_val+2*chunk_size-1</code> |
| ... | ... |
| <code>min_id_val+i*chunk_size</code> | <code>max_id_val</code> |

Syntax

```
DBMS_PARALLEL_EXECUTE.CREATE_CHUNKS_BY_NUMBER_COL (
    task_name      IN  VARCHAR2,
    table_owner    IN  VARCHAR2,
    table_name     IN  VARCHAR2,
    table_column   IN  VARCHAR2,
    chunk_size     IN  NUMBER);
```

Parameters

Table 127-10 CREATE_CHUNKS_BY_NUMBER_COL Procedure Parameters

| Parameter | Description |
|--------------------------|--------------------|
| <code>task_name</code> | Name of the task |
| <code>table_owner</code> | Owner of the table |
| <code>table_name</code> | Name of the table |

Table 127-10 (Cont.) CREATE_CHUNKS_BY_NUMBER_COL Procedure Parameters

| Parameter | Description |
|--------------|---------------------------|
| table_column | Name of the NUMBER column |
| chunk_size | Range of each chunk |

127.7.7 CREATE_CHUNKS_BY_ROWID Procedure

This procedure chunks the table (associated with the specified task) by ROWID.

num_row and num_block are approximate guidance for the size of each chunk. The table to be chunked must be a physical table with physical ROWID having views and table functions. Index-organized tables are not allowed.

Syntax

```
DBMS_PARALLEL_EXECUTE.CREATE_CHUNKS_BY_ROWID (
    task_name      IN  VARCHAR2,
    table_owner    IN  VARCHAR2,
    table_name     IN  VARCHAR2,
    by_row         IN  BOOLEAN,
    chunk_size     IN  NUMBER);
```

Parameters

Table 127-11 CREATE_CHUNKS_BY_ROWID Procedure Parameters

| Parameter | Description |
|-------------|---|
| task_name | Name of the task |
| table_owner | Owner of the table |
| table_name | Name of the table |
| by_row | TRUE if chunk_size refers to the number of rows, otherwise, chunk_size refers to the number of blocks |
| chunk_size | Approximate number of rows/blocks to process for each commit cycle |

127.7.8 CREATE_CHUNKS_BY_SQL Procedure

This procedure chunks the table (associated with the specified task) by means of a user-provided SELECT statement.

The SELECT statement that returns the range of each chunk must have two columns: start_id and end_id. If the task is to chunk by ROWID, then the two columns must be of ROWID type. If the task is to chunk the table by NUMBER column, then the two columns must be of NUMBER type. The procedure provides the flexibility to users who want to deploy user-defined chunk algorithms.

Syntax

```
DBMS_PARALLEL_EXECUTE.CREATE_CHUNKS_BY_SQL (
    task_name      IN VARCHAR2,
    sql_stmt       IN CLOB,
    by_rowid       IN BOOLEAN);
```

Parameters

Table 127-12 CREATE_CHUNKS_BY_SQL Procedure Parameters

| Parameter | Description |
|-----------|--|
| task_name | Name of the task |
| sql_stmt | SQL that returns the chunk ranges |
| by_rowid | TRUE if the table is chunked by rowids |

127.7.9 DROP_TASK Procedure

This procedure drops the task and all related chunks.

Syntax

```
DBMS_PARALLEL_EXECUTE.DROP_TASK (
    task_name      IN VARCHAR2);
```

Parameters

Table 127-13 DROP_TASK Procedure Parameters

| Parameter | Description |
|-----------|------------------|
| task_name | Name of the task |

127.7.10 DROP_CHUNKS Procedure

This procedure drops the task's chunks.

Syntax

```
DBMS_PARALLEL_EXECUTE.DROP_CHUNKS (
    task_name      IN VARCHAR2);
```

Parameters

Table 127-14 DROP_CHUNKS Procedure Parameters

| Parameter | Description |
|-----------|------------------|
| task_name | Name of the task |

127.7.11 GENERATE_TASK_NAME Function

This function returns a unique name for a task.

The name is of the form *prefix*N where N is a number from a sequence. If no prefix is specified, the generated name is, by default, TASK\$_1, TASK\$_2, TASK\$_3, and so on. If 'SCOTT' is specified as the prefix, the name is SCOTT1, SCOTT2, and so on.

Syntax

```
DBMS_PARALLEL_EXECUTE.GENERATE_TASK_NAME (
    prefix      IN      VARCHAR2 DEFAULT 'TASK$_')
RETURN VARCHAR2;
```

Parameters

Table 127-15 GENERATE_TASK_NAME Function Parameters

| Parameter | Description |
|-----------|---|
| prefix | The prefix to use when generating the task name |

127.7.12 GET_NUMBER_COL_CHUNK Procedure

This procedure picks an unassigned NUMBER chunk and changes it to ASSIGNED. If there are no more chunks to assign, any_rows is set to FALSE. Otherwise, the chunk_id, start, and end_id of the chunk are returned as OUT parameters.

The chunk information in DBMS_PARALLEL_EXECUTE_CHUNKS\$ is updated as follows: STATUS becomes ASSIGNED; START_TIMESTAMP records the current time; END_TIMESTAMP is cleared.

 **See Also:**

[Views](#)

Syntax

```
DBMS_PARALLEL_EXECUTE.GET_NUMBER_COL_CHUNK (
    task_name      IN VARCHAR2,
    chunk_id       OUT NUMBER,
    start_id       OUT NUMBER,
    end_id         OUT NUMBER,
    any_rows       OUT BOOLEAN);
```

Parameters

Table 127-16 GET_NUMBER_COL_CHUNK Procedure Parameters

| Parameter | Description |
|-----------|------------------|
| task_name | Name of the task |

Table 127-16 (Cont.) GET_NUMBER_COL_CHUNK Procedure Parameters

| Parameter | Description |
|-----------|--|
| chunk_id | Chunk ID of the chunk |
| start_id | ID of the start row in the returned range |
| end_id | ID of the end row in the returned range |
| any_rows | Indicates if there could be any rows to process in the range |

Usage Notes

If the task is chunked by ROWID, then use `get_rowid_range`. If the task is chunked by NUMBER column, then use `get_number_col_range`. If you make the wrong function call, the returning `chunk_id` and `any_rows` have valid values but `start_id` and `end_id` are NULL.

127.7.13 GET_ROWID_CHUNK Procedure

This procedure picks an unassigned ROWID chunk and changes it to ASSIGNED.

If there are no more chunks to assign, `any_rows` is set to FALSE. Otherwise, the `chunk_id`, `start`, and `end_rowid` of the chunk are returned as OUT parameters. The chunk info in `DBMS_PARALLEL_EXECUTE_CHUNKS$` is updated as follows: STATUS becomes ASSIGNED; START_TIMESTAMP records the current time; END_TIMESTAMP is cleared.

 **See Also:**
[Views](#)

Syntax

```
DBMS_PARALLEL_EXECUTE.GET_ROWID_CHUNK (
    task_name      IN VARCHAR2,
    chunk_id       OUT NUMBER,
    start_rowid    OUT ROWID,
    end_rowid      OUT ROWID,
    any_rows       OUT BOOLEAN);
```

Parameters

Table 127-17 GET_ROWID_CHUNK Procedure Parameters

| Parameter | Description |
|-------------|--|
| task_name | Name of the task |
| chunk_id | Chunk ID of the chunk |
| start_rowid | Start rowid in the returned range |
| end_rowid | End rowid in the returned range |
| any_rows | Indicates that the range could include rows to process |

Usage Notes

If the task is chunked by ROWID, then use `get_rowid_range`. If the task is chunked by NUMBER column, then use `get_number_col_range`. If you make the wrong function call, the returning `chunk_id` and `any_rows` will still have valid values but `start_id` and `end_id` are NULL.

127.7.14 PURGE_PROCESSED_CHUNKS Procedure

This procedure deletes all the processed chunks whose status is PROCESSED or PROCESSED_WITH_ERROR.

Syntax

```
DBMS_PARALLEL_EXECUTE.PURGE_PROCESSED_CHUNKS (
    task_name          IN VARCHAR2);
```

Parameters

Table 127-18 PURGE_PROCESSED_CHUNKS Procedure Parameters

| Parameter | Description |
|-----------|------------------|
| task_name | Name of the task |

127.7.15 RESUME_TASK Procedures

This procedure retries the specified the task if the RUN_TASK Procedure finished with an error, or resumes the task if a crash occurred.

You can only invoke this procedure if the task is in a CRASHED or FINISHED_WITH_ERROR state.

For a crashed serial execution, the state remains in PROCESSING. The FORCE option allows you to resume any task in PROCESSING state. However, it is your responsibility to determine that a crash has occurred.

The procedure resumes processing the chunks which have not been processed. Also, chunks which are in PROCESSED_WITH_ERROR or ASSIGNED (due to crash) state are processed because those chunks did not commit.

This procedure takes the same argument as the RUN_TASK Procedure. The overload which takes task_name as the only input argument re-uses the arguments provided in the previous invoking of the RUN_TASK Procedure or RESUME_TASK Procedures.

See Also:

[Table 127-2](#)

Syntax

```
DBMS_PARALLEL_EXECUTE.RESUME_TASK (
    task_name          IN  VARCHAR2,
    sql_stmt           IN  CLOB,
    language_flag      IN  NUMBER,
    edition            IN  VARCHAR2  DEFAULT NULL,
    apply_crossedition_trigger IN  VARCHAR2  DEFAULT NULL,
    fire_apply_trigger IN  BOOLEAN   DEFAULT TRUE,
    parallel_level     IN  NUMBER    DEFAULT 0,
    job_class          IN  VARCHAR2  DEFAULT 'DEFAULT_JOB_CLASS',
    force              IN  BOOLEAN   DEFAULT FALSE);
```

```
DBMS_PARALLEL_EXECUTE.RESUME_TASK (
    task_name          IN  VARCHAR2,
    force              IN  BOOLEAN   DEFAULT FALSE);
```

Parameters

Table 127-19 RESUME_TASK Procedure Parameters

| Parameter | Description |
|----------------------------|---|
| task_name | Name of the task |
| sql_stmt | SQL statement; must have :start_id and :end_id placeholders |
| language_flag | Determines how Oracle handles the SQL statement. The following options are recognized: <ul style="list-style-type: none"> V6 (or 0) specifies version 6 behavior NATIVE (or 1) specifies normal behavior for the database to which the program is connected V7 (or 2) specifies Oracle database version 7 behavior |
| edition | Specifies the edition in which to run the statement. Default is the current edition. |
| apply_crossedition_trigger | Specifies the unqualified name of a forward crossedition trigger that is to be applied to the specified SQL. The name is resolved using the edition and current_schema setting in which the statement is to be executed. The trigger must be owned by the user who executes the statement. |
| fire_apply_trigger | Indicates whether the specified apply_crossedition_trigger is itself to be executed, or only to be used as a guide in selecting other triggers |
| parallel_level | Number of parallel jobs; zero if run in serial; NULL uses the default parallelism |
| job_class | If running in parallel, the jobs all belong to the specified job class |
| force | If TRUE, do not raise an error if the status is PROCESSING. |

Examples

Suppose the chunk table contains the following chunk ranges:

```
START_ID          END_ID
-----          -
1                10
```

```

11                                  20
21                                  30

```

And the specified SQL statement is:

```

UPDATE employees
   SET salary = salary + 10
   WHERE e.employee_id BETWEEN :start_id AND :end_id

```

This procedure executes the following statements in parallel:

```

UPDATE employees
   SET salary =.salary + 10 WHERE employee_id BETWEEN 1 and 10;
COMMIT;

```

```

UPDATE employees
   SET salary =.salary + 10 WHERE employee_id between 11 and 20;
COMMIT;

```

```

UPDATE employees
   SET salary =.salary + 10 WHERE employee_id between 21 and 30;
COMMIT;

```

Related Topics

- [RUN_TASK Procedure](#)
 This procedure executes the specified statement (sql_stmt) on the chunks in parallel.

127.7.16 RUN_TASK Procedure

This procedure executes the specified statement (sql_stmt) on the chunks in parallel.

It commits after processing each chunk.

The specified statement must have two placeholders called start_id and end_id, respectively, which represent the range of the chunk to be processed. The type of each placeholder must be ROWID where ROWID-based chunking was used, or NUMBER where NUMBER-based chunking was used.

Syntax

```

DBMS_PARALLEL_EXECUTE.RUN_TASK (
    task_name          IN  VARCHAR2,
    sql_stmt           IN  CLOB,
    language_flag      IN  NUMBER,
    edition            IN  VARCHAR2  DEFAULT NULL,
    apply_crossedition_trigger IN  VARCHAR2  DEFAULT NULL,
    fire_apply_trigger IN  BOOLEAN   DEFAULT TRUE,
    parallel_level     IN  NUMBER    DEFAULT 0,
    job_class          IN  VARCHAR2  DEFAULT 'DEFAULT_JOB_CLASS');

```

Parameters

Table 127-20 RUN_TASK Procedure Parameters

| Parameter | Description |
|-----------|------------------|
| task_name | Name of the task |

Table 127-20 (Cont.) RUN_TASK Procedure Parameters

| Parameter | Description |
|----------------------------|---|
| sql_stmt | SQL statement; must have :start_id and :end_id placeholders |
| language_flag | Determines how Oracle handles the SQL statement. The following options are recognized: <ul style="list-style-type: none"> V6 (or 0) specifies version 6 behavior NATIVE (or 1) specifies normal behavior for the database to which the program is connected V7 (or 2) specifies Oracle database version 7 behavior |
| edition | Specifies the edition in which to run the statement. Default is the current edition. |
| apply_crossedition_trigger | Specifies the unqualified name of a forward crossedition trigger that is to be applied to the specified SQL. The name is resolved using the edition and current_schema setting in which the statement is to be executed. The trigger must be owned by the user executes the statement. |
| fire_apply_trigger | Indicates whether the specified apply_crossedition_trigger is itself to be executed, or only a guide to be used in selecting other triggers. |
| parallel_level | Number of parallel jobs; zero if run in serial; NULL uses the default parallelism. |
| job_class | If running in parallel, the jobs belong to the specified job class |

Usage Notes

- The SQL statement is executed as the current user.
- Since this subprogram is subject to reexecution on error, you need to take great care in submitting a statement to RUN_TASK that is not idempotent.
- Chunks can be executed in parallel by DBMS_SCHEDULER job slaves. Therefore, parallel execution requires CREATE JOB system privilege. The job slaves is created under the current user. The default number of job slaves is computed as the product of Oracle parameters cpu_count and parallel_threads_per_cpu. On a Real Application Clusters installation, the number of job slaves is the sum of individual settings on each node in the cluster. This procedure returns only when all the chunks are processed. In parallel cases, this procedure returns only when all the job slaves finished.

Examples

Suppose the chunk table contains the following chunk ranges:

| START_ID | END_ID |
|----------|--------|
| 1 | 10 |
| 11 | 20 |
| 21 | 30 |

And the specified SQL statement is:

```
UPDATE employees
   SET salary = salary + 10
   WHERE e.employee_id BETWEEN :start_id AND :end_id
```

This procedure executes the following statements in parallel:

```
UPDATE employees
   SET salary =.salary + 10 WHERE employee_id BETWEEN 1 and 10;
COMMIT;
```

```
UPDATE employees
   SET salary =.salary + 10 WHERE employee_id between 11 and 20;
COMMIT;
```

```
UPDATE employees
   SET salary =.salary + 10 WHERE employee_id between 21 and 30;
COMMIT;
```

127.7.17 SET_CHUNK_STATUS Procedure

This procedure sets the status of the chunk.

The `START_TIMESTAMP` and `END_TIMESTAMP` of the chunk is updated according to the new status:

| Value of the new Status | Side Effect |
|-----------------------------------|---|
| UNASSIGNED | <code>START_TIMESTAMP</code> and <code>END_TIMESTAMP</code> will be cleared |
| ASSIGNED | <code>START_TIMESTAMP</code> will be the current time and <code>END_TIMESTAMP</code> will be cleared. |
| PROCESSED or PROCESSED_WITH_ERROR | The current time will be recorded in <code>END_TIMESTAMP</code> |

 **See Also:**
[Views](#)

Syntax

```
DBMS_PARALLEL_EXECUTE.SET_CHUNK_STATUS (
   task_name      IN VARCHAR2,
   chunk_id       OUT NUMBER,
   status         IN NUMBER,
   err_num        IN NUMBER DEFAULT NULL,
   err_msg        IN VARCHAR2 DEFAULT NULL);
```

Parameters

Table 127-21 SET_CHUNK_STATUS Procedure Parameters

| Parameter | Description |
|------------------------|-----------------------|
| <code>task_name</code> | Name of the task |
| <code>chunk_id</code> | Chunk_id of the chunk |

DBMS_PART

The `DBMS_PART` package provides an interface for maintenance and management operations on partitioned objects.

See Also:

- *Oracle Database Reference* for related views

This chapter contains the following topics:

- [Security Model](#)
- [Operational Notes](#)
- [Summary of DBMS_PART Subprograms](#)

128.1 DBMS_PART Security Model

`DBMS_PART` is an invoker's rights package, running with the privileges of the user.

128.2 DBMS_PART Operational Notes

The following operational notes apply to `DBMS_PART`.

- `DBMS_PART` ignores all the errors that it runs into during the cleanup process.
- To display the message `PL/SQL procedure executed successfully` requires at least one cleanup operation to be successful.

128.3 Summary of DBMS_PART Subprograms

This table briefly describes the subprograms of `DBMS_PART` package.

Table 128-1 DBMS_PART Package Subprograms

| Subprogram | Description |
|---|--|
| CLEANUP_GIDX Procedure | Gathers the list of global indexes where optimized asynchronous index maintenance has taken place to clean up entries pointing to data segments that no longer exist |
| CLEANUP_GIDX_JOB Procedure | |
| CLEANUP_ONLINE_OP Procedure | Cleans up failed online move operations |

128.3.1 CLEANUP_GIDX Procedure

As a consequence of prior partition maintenance operations with asynchronous global index maintenance, global indexes can contain entries pointing to data segments that no longer exist. These stale index rows will not cause any correctness issues or corruptions during any operation on the table or index, whether these are queries, DMLs, DDLs or analyze. This procedure will identify and cleanup these global indexes to ensure efficiency in terms of storage and performance.

Syntax

```
DBMS_PART.CLEANUP_GIDX (
  schema_name_in  IN  VARCHAR2 DEFAULT NULL,
  table_name_in   IN  VARCHAR2 DEFAULT NULL,
  parallel        IN  VARCHAR2 DEFAULT NULL,
  options         IN  VARCHAR2 DEFAULT NULL);
```

Parameters

Table 128-2 CLEANUP_GIDX Function Parameters

| Parameter | Description |
|----------------|--|
| schema_name_in | Non-NULL processes only indexes on tables in the given schema |
| table_name_in | Non-NULL processes only indexes on the given table in the given schema (schema_name_in must be non-NULL if table_name_in is non-NULL) |
| parallel | The parallel degree to use for the ALTER INDEX DDLs. |
| options | The following options are supported: <ul style="list-style-type: none"> CLEANUP_ORPHANS: implies that 'cleanup only' mechanism is used. COALESCE: implies that 'coalesce cleanup' mechanism is used. |

128.3.2 CLEANUP_GIDX_JOB Procedure

This procedure will identify and cleanup these global indexes to ensure efficiency in terms of storage and performance.

Syntax

```
DBMS_PART.CLEANUP_GIDX_JOB (
  parallel  IN  VARCHAR2 DEFAULT NULL,
  options   IN  VARCHAR2 DEFAULT NULL);
```

Parameters

Table 128-3 CLEANUP_GIDX_JOB Function Parameters

| Parameter | Description |
|-----------|--|
| parallel | The parallel degree to use for the ALTER INDEX DDLs. |

Table 128-3 (Cont.) CLEANUP_GIDX_JOB Function Parameters

| Parameter | Description |
|-----------|--|
| options | The following options are supported: <ul style="list-style-type: none"> CLEANUP_ORPHANS: implies that 'cleanup only' mechanism is used. COALESCE: implies that coalesce cleanup mechanism is used. |

128.3.3 CLEANUP_ONLINE_OP Procedure

There are many possible points of failure when performing `ALTER TABLE ... MOVE PARTITION ... ONLINE` operations. This procedure pro-actively cleans up such failed online move operations instead of waiting for the background process (SMON) to do so.

Syntax

```
DBMS_PART.CLEANUP_ONLINE_OP (
  schema_name      IN  VARCHAR2 DEFAULT NULL,
  table_name       IN  VARCHAR2 DEFAULT NULL,
  partition_name   IN  VARCHAR2 DEFAULT NULL);
```

Parameters

Table 128-4 CLEANUP_ONLINE_OP Function Parameters

| Parameter | Description |
|----------------|-------------------|
| schema_name | Name of schema |
| table_name | Name of schema |
| partition_name | Name of partition |

Usage Notes

- If `schema_name`, `table_name` and `partition_name` are specified, this cleans up the failed online move operation for the specified partition.
- If `schema_name` and `table_name` are specified, this cleans up all failed online move operations for all the partitions of the specified table.
- If only `schema_name` is specified, this cleans up all failed online move operations in the schema.
- If no arguments are provided, we cleans up all the failed online move operations in the system.
- All other cases raise `ORA-20000` to inform the user of invalid inputs as arguments.

DBMS_PCLXUTIL

The `DBMS_PCLXUTIL` package provides intra-partition parallelism for creating partition-wise local indexes. `DBMS_PCLXUTIL` circumvents the limitation that, for local index creation, the degree of parallelism is restricted to the number of partitions as only one parallel execution server process for each partition is used.

See Also:

There are several rules concerning partitions and indexes. For more information, see *Oracle Database Concepts* and *Oracle Database Administrator's Guide*.

This chapter contains the following topics:

- [Overview](#)
- [Security Model](#)
- [Operational Notes](#)
- [Rules and Limits](#)
- [Summary of DBMS_PCLXUTIL Subprograms](#)

129.1 DBMS_PCLXUTIL Overview

`DBMS_PCLXUTIL` uses the `DBMS_JOB` package to provide a greater degree of parallelism for creating a local index for a partitioned table. This is achieved by asynchronous inter-partition parallelism using the background processes (with `DBMS_SCHEDULER`), in combination with intra-partition parallelism using the parallel execution server.

`DBMS_PCLXUTIL` works with both range and range-hash composite partitioning.

The `DBMS_PCLXUTIL` package can be used during the following DBA tasks:

1. Local index creation

The procedure `BUILD_PART_INDEX` assumes that the dictionary information for the local index already exists. This can be done by issuing the create index SQL command with the `UNUSABLE` option.

```
CREATE INDEX <idx_name> on <tab_name>(…) local(…) unusable;
```

This causes the dictionary entries to be created without "building" the index itself, the time consuming part of creating an index. Now, invoking the procedure `BUILD_PART_INDEX` causes a concurrent build of local indexes with the specified degree of parallelism.

```
EXECUTE dbms_pclxutil.build_part_index(4,4,<tab_name>,<idx_name>,FALSE);
```

For composite partitions, the procedure automatically builds local indexes for all subpartitions of the composite table.

2. Local index maintenance

By marking desired partitions usable or unusable, the `BUILD_PART_INDEX` procedure also enables selective rebuilding of local indexes. The `force_opt` parameter provides a way to override this and build local indexes for all partitions.

```
ALTER INDEX <idx_name> local(...) unusable;
```

Rebuild only the desired (sub)partitions (that are marked unusable):

```
EXECUTE dbms_pclxutil.build_part_index(4,4,<tab_name>,<idx_name>,FALSE);
```

Rebuild all (sub)partitions using `force_opt = TRUE`:

```
EXECUTE dbms_pclxutil.build_part_index(4,4,<tab_name>,<idx_name>,TRUE);
```

A progress report is produced, and the output appears on screen when the program is ended (because the `DBMS_OUTPUT` package writes messages to a buffer first, and flushes the buffer to the screen only upon termination of the program).

129.2 DBMS_PCLXUTIL Security Model

This utility can be run only as table owner, and not as any other user.

129.3 DBMS_PCLXUTIL Operational Notes

`DBMS_PCLXUTIL` submits a job for each partition. It is the responsibility of the user/dba to control the number of concurrent jobs by setting the `INIT.ORA` parameter `JOB_QUEUE_PROCESSES` correctly. There is minimal error checking for correct syntax. Any errors are reported in the job queue process trace files.

129.4 DBMS_PCLXUTIL Rules and Limits

Because `DBMS_PCLXUTIL` uses the `DBMS_JOB` package, you must be aware of the following limitations pertaining to `DBMS_JOB`:

- You must decide appropriate values for the `job_queue_processes` initialization parameter. Clearly, if the job processes are not started before calling `BUILD_PART_INDEX()`, then the package will not function properly. The background processes are specified by the following `init.ora` parameters:

```
job_queue_processes=n    #the number of background processes = n
```
- Failure conditions are reported only in the trace files (a `DBMS_JOB` limitation), making it impossible to give interactive feedback to the user. This package prints a failure message, removes unfinished jobs from the queue, and requests the user to take a look at the `j*.trc` trace files.

**Note:**

For range partitioning, the minimum compatibility mode is 8.0; for range-hash composite partitioning, the minimum compatibility mode is 8*i*.

129.5 Summary of DBMS_PCLXUTIL Subprograms

The DBMS_PCLXUTIL package has one subprogram, the BUILD_PART_INDEX procedure.

Table 129-1 DBMS_PCLXUTIL Package Subprograms

| Subprogram | Description |
|--|--|
| BUILD_PART_INDEX Procedure | Provides intra-partition parallelism for creating partition-wise local indexes |

129.5.1 BUILD_PART_INDEX Procedure

This procedure provides intra-partition parallelism for creating partition-wise local indexes.

Syntax

```
DBMS_PCLXUTIL.BUILD_PART_INDEX (
  jobs_per_batch IN NUMBER DEFAULT 1,
  procs_per_job  IN NUMBER DEFAULT 1,
  tab_name       IN VARCHAR2 DEFAULT NULL,
  idx_name       IN VARCHAR2 DEFAULT NULL,
  force_opt      IN BOOLEAN  DEFAULT FALSE);
```

Parameters

Table 129-2 BUILD_PART_INDEX Procedure Parameters

| Parameter | Description |
|----------------|--|
| jobs_per_batch | The number of concurrent partition-wise "local index builds". |
| procs_per_job | The number of parallel execution servers to be utilized for each local index build (1 <= procs_per_job <= max_slaves). |
| tab_name | The name of the partitioned table (an exception is raised if the table does not exist or not partitioned). |
| idx_name | The name given to the local index (an exception is raised if a local index is not created on the table tab_name). |
| force_opt | If TRUE, then force rebuild of all partitioned indexes; otherwise, rebuild only the partitions marked 'UNUSABLE'. |

Usage Notes

This utility can be run only as table owner, and not as any other user.

Examples

Suppose a table `PROJECT` is created with two partitions `PROJ001` and `PROJ002`, along with a local index `IDX`.

A call to the procedure `BUILD_PART_INDEX(2,4,'PROJECT','IDX',TRUE)` produces the following output:

```
SQLPLUS> EXECUTE dbms_pclxutil.build_part_index(2,4,'PROJECT','IDX',TRUE);  
Statement processed.  
INFO: Job #21 created for partition PROJ002 with 4 slaves  
INFO: Job #22 created for partition PROJ001 with 4 slaves
```

DBMS_PDB

The `DBMS_PDB` package provides an interface to examine and manipulate data about pluggable databases (PDBs) in a multitenant container database (CDB). It also contains an interface that specifies which database objects are application common objects. You can migrate a PDB from one CDB to another CDB. After the migration is complete, all backups of the PDB before the migration are available and usable in the destination CDB.

Note:

A multitenant container database is the only supported architecture in Oracle Database 20c. While the documentation is being revised, legacy terminology may persist. In most cases, "database" and "non-CDB" refer to a CDB or PDB, depending on context. In some contexts, such as upgrades, "non-CDB" refers to a non-CDB from a previous release.

See Also:

- *Oracle Database Administrator's Guide* for information about creating and managing PDBs and CDBs
- *Oracle XML DB Developer's Guide* for information about configuring protocol ports and DNS mappings
- *Oracle Database SQL Language Reference* for information about creating PDBs
- *Oracle Database Security Guide* regarding how to create audit policies in a multitenant environment

This chapter contains the following topics:

- [Overview](#)
- [Security Model](#)
- [Summary of DBMS_PDB Subprograms](#)

130.1 DBMS_PDB Overview

A multitenant container database (CDB) is an Oracle database that includes zero, one, or many user-created pluggable databases (PDBs). The `DBMS_PDB` package provides an interface to examine and manipulate data about pluggable databases (PDBs). The subprograms in this package can also set a database object to one of the following types of

application common objects in an application container: data-linked object, extended data-linked object, or metadata-linked object.

A data-linked application common object stores data in the application root that can be accessed and modified by all of the application PDBs in the application container. For an extended data-linked object, each application PDB can create its own specific data while sharing the common data in the application root. Therefore, with an extended data-linked object, only the data stored in the application root is common for all application PDBs. A metadata-linked application common object stores the metadata for the specific object, such as a table, in the application root, so that the containers in the application container have the same structure for the object but different data. This package also contains a procedure that specifies that a database object is not an application common object.

Typically, the subprograms in this package are used in the following cases:

- An application that is installed in a PDB is migrated to an application container. The application can be migrated to the application root or to an application PDB. For example, you can migrate an application installed in a PDB plugged into an Oracle Database 12c Release 1 (12.1) CDB to an application container in an Oracle Database 12c Release 2 (12.2) CDB.
- An application is installed in an application root using an installation program that does not allow setting application common objects.

See Also:

Oracle Database Administrator's Guide for information about migrating an application to an application container

130.2 DBMS_PDB Security Model

Users must have the `EXECUTE` privilege to run the procedures of `DBMS_PDB` package.

130.3 Summary of DBMS_PDB Subprograms

This table lists and describes `DBMS_PDB` package subprograms.

Note:

A multitenant container database is the only supported architecture in Oracle Database 20c. While the documentation is being revised, legacy terminology may persist. In most cases, "database" and "non-CDB" refer to a CDB or PDB, depending on context. In some contexts, such as upgrades, "non-CDB" refers to a non-CDB from a previous release.

Table 130-1 DBMS_PDB Package Subprograms

| Subprogram | Description |
|---|---|
| CHECK_PLUG_COMPATIBILITY Function | Uses an XML file describing a pluggable database (PDB) to determine whether it may be plugged into a given multitenant container database (CDB). |
| DESCRIBE Procedure | Generates an XML file describing the specified pluggable database (PDB). |
| EXPORTMANBACKUP Procedure | Needs to be called only when a non-CDB is migrated as PDB. This procedure needs to be executed in non-CDB database. For PDB relocation, it is automatically called during unplug. |
| RECOVER Procedure | Generates an XML file describing a pluggable database by using data files belonging to the pluggable database (PDB). |
| REMOVE_LINK Procedure | Specifies that a database object is not an application common object. |
| SET_DATA_LINKED Procedure | Sets a database object to a data-linked application common object |
| SET_EXT_DATA_LINKED Procedure | Sets a database object to an extended data-linked application common object. |
| SET_METADATA_LINKED Procedure | Sets a database object to a metadata-linked application common object. |
| SET_PROFILE_EXPLICIT Procedure | Sets a profile as an application common profile in an application container. |
| SET_ROLE_EXPLICIT Procedure | Sets a role as an application common role in an application container. |
| SET_USER_EXPLICIT Procedure | This procedure sets a local user as an application common user in an application container. |

130.3.1 CHECK_PLUG_COMPATIBILITY Function

This function uses an XML file describing a pluggable database (PDB) to determine whether it may be plugged into a given multitenant container database (CDB).

Syntax

```
DBMS_PDB.CHECK_PLUG_COMPATIBILITY (
    pdb_descr_file IN VARCHAR2,
    pdb_name       IN VARCHAR2 DEFAULT NULL)
RETURN BOOLEAN;
```

Parameters

Table 130-2 CHECK_PLUG_COMPATIBILITY Procedure Parameters

| Parameter | Description |
|-----------------------------|---|
| <code>pdb_descr_file</code> | Path of the XML file that will contain description of a PDB |
| <code>pdb_name</code> | Name which will be given to the PDB represented by <code>pdb_descr_file</code> when plugged into a given CDB. If not specified, the name will be extracted from <code>pdb_descr_file</code> . |

Return Values

TRUE if the PDB described by `pdb_descr_file` is compatible with the given CDB, FALSE otherwise. If this function returns FALSE, then query the `PDB_PLUG_IN_VIOLATIONS` data dictionary view to find information about the errors that are found.

See Also:

Oracle Database Reference for information about the `PDB_PLUG_IN_VIOLATIONS` view

130.3.2 DESCRIBE Procedure

This procedure generates an XML file describing the specified pluggable database (PDB). This file can then be passed to the `CHECK_PLUG_COMPATIBILITY` Function to determine if the PDB described by the XML file may be plugged into a given multitenant container database (CDB).

Syntax

```
DBMS_PDB.DESCRIBE (
  pdb_descr_file  IN  VARCHAR2,
  pdb_name       IN  VARCHAR2 DEFAULT NULL);
```

Parameters

Table 130-3 DESCRIBE Procedure Parameters

| Parameter | Description |
|-----------------------------|---|
| <code>pdb_descr_file</code> | Path of the XML file that will contain description of a PDB |
| <code>pdb_name</code> | Name of a PDB to be described. A remote database is specified by including <code>@dblink</code> . |

Usage Notes

- If `pdb_name` is omitted, the PDB to which the session is connected will be described.
- If `pdb_name` is omitted, and the session is connected to the Root, an error will be returned.

Related Topics

- [CHECK_PLUG_COMPATIBILITY Function](#)
This function uses an XML file describing a pluggable database (PDB) to determine whether it may be plugged into a given multitenant container database (CDB).

130.3.3 EXPORTRMANBACKUP Procedure

This procedure exports the RMAN backup information that belongs to a pluggable database to its dictionary before unplug so that pre-plugin backups can be used. This procedure needs to be called only for non-CDB to PDB migration. For PDB relocation, this procedure need not be called.

Note:

A multitenant container database is the only supported architecture in Oracle Database 20c. While the documentation is being revised, legacy terminology may persist. In most cases, "database" and "non-CDB" refer to a CDB or PDB, depending on context. In some contexts, such as upgrades, "non-CDB" refers to a non-CDB from a previous release.

Syntax

```
DBMS_PDB.EXPORTRMANBACKUP (  
    pdb_name      IN VARCHAR2  DEFAULT NULL);
```

Parameters

Table 130-4 EXPORTRMANBACKUP Procedure Parameters

| Parameter | Description |
|-----------------------|---|
| <code>pdb_name</code> | Name of a pluggable database whose backup information needs to be exported. Omit this parameter if you are connected to a pluggable database or a non-cdb. |

Usage Notes

- The PDB must be opened in `read/write` mode.
- If the database is non-CDB, then `pdb_name` must be omitted.
- If the `pdb_name` is omitted, then the pluggable database to which the session is connected is exported.
- If the `pdb_name` is omitted and the session is connected to the `root`, an error is returned.

130.3.4 RECOVER Procedure

This procedure generates an XML file describing a pluggable database by using data files belonging to the pluggable database. This XML file can then be used to plug the pluggable database into a multitenant container database (CDB) using the `CREATE PLUGGABLE DATABASE` statement.

Use this procedure when an XML file describing a pluggable database is corrupted or lost.

Syntax

```
DBMS_PDB.RECOVER (
  pdb_descr_file  IN  VARCHAR2,
  pdb_name        IN  VARCHAR2,
  filenames       IN  VARCHAR2);
```

Parameters**Table 130-5 RECOVER Procedure Parameters**

| Parameter | Description |
|----------------|---|
| pdb_descr_file | Path of the XML file that contains description of a pluggable database |
| pdb_name | Name of a pluggable database |
| filenames | Comma-separated list of datafile paths and/or directories containing datafiles for the pluggable database |

130.3.5 REMOVE_LINK Procedure

This procedure specifies that a database object is not an application common object. In an application container, application common objects are shared between multiple containers.

Syntax

```
DBMS_PDB.REMOVE_LINK (
  schema_name  IN VARCHAR2,
  object_name  IN VARCHAR2,
  namespace    IN NUMBER,
  edition_name IN VARCHAR2 DEFAULT NULL);
```

Parameters**Table 130-6 REMOVE_LINK Procedure Parameters**

| Parameter | Description |
|--------------|---|
| schema_name | The name of the schema that owns the database object. |
| object_name | The name of the database object. |
| namespace | The namespace of the database object. The <code>NAMESPACE</code> column of the <code>DBA_OBJECTS</code> view shows the namespace of an object. |
| edition_name | The name of the edition for the database object. |

 **See Also:**

Oracle Database Administrator's Guide for information about migrating an application to an application container

130.3.6 SET_DATA_LINKED Procedure

This procedure sets a database object to a data-linked application common object. In an application container, data-linked application common objects store data in the application root only, and the data can be accessed by all of the application PDBs in the application container. The data in a data-linked application common object can be modified only in the application root.

You can use this procedure to set data-linked application common objects when you migrate an application that is installed in a PDB to an application container. The application can be migrated to the application root or to an application PDB. For example, you can migrate an application installed in a PDB plugged into an Oracle Database 12c Release 1 (12.1) CDB to an application container in an Oracle Database 12c Release 2 (12.2) CDB.

Syntax

```
DBMS_PDB.SET_DATA_LINKED (
  schema_name  IN VARCHAR2,
  object_name  IN VARCHAR2,
  namespace    IN NUMBER,
  edition_name IN VARCHAR2  DEFAULT NULL);
```

Parameters

Table 130-7 SET_DATA_LINKED Procedure Parameters

| Parameter | Description |
|--------------|---|
| schema_name | The name of the schema that owns the database object. |
| object_name | The name of the database object. |
| namespace | The namespace of the database object. The NAMESPACE column of the DBA_OBJECTS view shows the namespace of an object. |
| edition_name | The name of the edition for the database object. |

See Also:

Oracle Database Administrator's Guide for information about migrating an application to an application container

130.3.7 SET_EXT_DATA_LINKED Procedure

This procedure sets a database object to an extended data-linked application common object. In an application container, for an extended data-linked object, each application PDB can create its own specific data while sharing the common data in the application root. Therefore, only the data stored in the application root is common for all application PDBs.

You can use this procedure to set extended data-linked application common objects when you migrate an application that is installed in a PDB to an application container. The application can be migrated to the application root or to an application PDB. For example,

you can migrate an application installed in a PDB plugged into an Oracle Database 12c Release 1 (12.1) CDB to an application container in an Oracle Database 12c Release 2 (12.2) CDB.

Syntax

```
DBMS_PDB.SET_EXT_DATA_LINKED (
  schema_name  IN VARCHAR2,
  object_name  IN VARCHAR2,
  namespace    IN NUMBER,
  edition_name IN VARCHAR2  DEFAULT NULL);
```

Parameters

Table 130-8 *SET_EXT_DATA_LINKED Procedure Parameters*

| Parameter | Description |
|--------------|---|
| schema_name | The name of the schema that owns the database object. |
| object_name | The name of the database object. |
| namespace | The namespace of the database object. The <code>NAMESPACE</code> column of the <code>DBA_OBJECTS</code> view shows the namespace of an object. |
| edition_name | The name of the edition for the database object. |

See Also:

Oracle Database Administrator's Guide for information about migrating an application to an application container

130.3.8 SET_METADATA_LINKED Procedure

This procedure sets a database object to a metadata-linked application common object. In an application container, metadata-linked application common objects store the metadata for specific objects, such as tables, so that the containers that share the application common object have the same structure but different data.

You can use this procedure to set metadata-linked application common objects when you migrate an application that is installed in a PDB to an application container. The application can be migrated to the application root or to an application PDB. For example, you can migrate an application installed in a PDB plugged into an Oracle Database 12c Release 1 (12.1) CDB to an application container in an Oracle Database 12c Release 2 (12.2) CDB.

Syntax

```
DBMS_PDB.SET_METADATA_LINKED (
  schema_name  IN VARCHAR2,
  object_name  IN VARCHAR2,
  namespace    IN NUMBER,
  edition_name IN VARCHAR2  DEFAULT NULL);
```

Parameters

Table 130-9 *SET_METADATA_LINKED Procedure Parameters*

| Parameter | Description |
|--------------|---|
| schema_name | The name of the schema that owns the database object. |
| object_name | The name of the database object. |
| namespace | The namespace of the database object. The NAMESPACE column of the DBA_OBJECTS view shows the namespace of an object. |
| edition_name | The name of the edition for the database object. |

 **See Also:**

Oracle Database Administrator's Guide for information about migrating an application to an application container

130.3.9 SET_PROFILE_EXPLICIT Procedure

This procedure sets a profile as an application common profile in an application container. This procedure is intended for migrating a profile from a previous release to an application container in the current release.

This procedure must be invoked in an application install, patch, upgrade, or uninstall operation in an application root.

Syntax

```
DBMS_PDB.SET_PROFILE_EXPLICIT (
    profile_name IN VARCHAR2);
```

Parameters

Table 130-10 *SET_PROFILE_EXPLICIT Procedure Parameters*

| Parameter | Description |
|--------------|--------------------------|
| profile_name | The name of the profile. |

 **See Also:**

Oracle Database Administrator's Guide for information about migrating an application to an application container.

130.3.10 SET_ROLE_EXPLICIT Procedure

This procedure sets a role as an application common role in an application container. This procedure is intended for migrating a role from a previous release to an application container in the current release.

This procedure must be invoked in an application install, patch, upgrade, or uninstall operation in an application root.

Syntax

```
DBMS_PDB.SET_ROLE_EXPLICIT (  
    role_name IN VARCHAR2);
```

Parameters

Table 130-11 SET_ROLE_EXPLICIT Procedure Parameters

| Parameter | Description |
|-----------|-----------------------|
| role_name | The name of the role. |

See Also:

Oracle Database Administrator's Guide for information about migrating an application to an application container.

130.3.11 SET_USER_EXPLICIT Procedure

This procedure sets a local user as an application common user in an application container.

This procedure must be invoked in an application install, patch, upgrade, or uninstall operation in an application root.

Syntax

```
DBMS_PDB.SET_USER_EXPLICIT (  
    user_name IN VARCHAR2);
```

Parameters

Table 130-12 SET_USER_EXPLICIT Procedure Parameters

| Parameter | Description |
|-----------|-----------------------|
| user_name | The name of the user. |

 **See Also:**

Oracle Database Administrator's Guide for information about migrating an application to an application container.

DBMS_PDB_ALTER_SHARING

In an application container with a pre-installed application, the `DBMS_PDB_ALTER_SHARING` package provides an interface to set database objects as application common objects or to specify that a database object is not an application common object.

Note:

This package provides a subset of the subprograms in the `DBMS_PDB` package. Users who do not have `EXECUTE` privilege on the `DBMS_PDB` package can be granted `EXECUTE` privilege on this package to run these subprograms.

This chapter contains the following topics:

- [DBMS_PDB_ALTER_SHARING Overview](#)
- [DBMS_PDB_ALTER_SHARING Security Model](#)
- [Summary of DBMS_PDB_ALTER_SHARING Subprograms](#)

131.1 DBMS_PDB_ALTER_SHARING Overview

The subprograms in this package can set a database object to one of the following types of application common objects in an application container: data-linked object, extended data-linked object, or metadata-linked object.

A data-linked application common object stores data in the application root that can be accessed and modified by all of the application PDBs in the application container. For an extended data-linked object, each application PDB can create its own specific data while sharing the common data in the application root. Therefore, with an extended data-linked object, only the data stored in the application root is common for all application PDBs. A metadata-linked application common object stores the metadata for the specific object, such as a table, in the application root, so that the containers in the application container have the

same structure for the object but different data. This package also contains a procedure that specifies that a database object is not an application common object.

You can use the subprograms in this package when you

Typically, the subprograms in this package are used in the following cases:

- An application that is installed in a PDB is migrated to an application container. The application can be migrated to the application root or to an application PDB. For example, you can migrate an application installed in a PDB plugged into an Oracle Database 12c Release 1 (12.1) CDB to an application container in an Oracle Database 12c Release 2 (12.2) CDB.
- An application is installed in an application root using an installation program that does not allow setting application common objects.

See Also:

Oracle Database Administrator's Guide for information about migrating an application to an application container

131.2 DBMS_PDB_ALTER_SHARING Security Model

This package provides a subset of the subprograms in the `DBMS_PDB` package. User who do not have `EXECUTE` privilege on the `DBMS_PDB` package can be granted `EXECUTE` privilege on this package to run these subprograms.

Security on this package can be controlled in either of the following ways:

- Granting `EXECUTE` on this package to selected users or roles.
- Granting `EXECUTE_CATALOG_ROLE` to selected users or roles.

If subprograms in the package are run from within a stored procedure, then the user who runs the subprograms must be granted `EXECUTE` privilege on the package directly. It cannot be granted through a role.

131.3 Summary of DBMS_PDB_ALTER_SHARING Subprograms

This table lists and briefly describes `DBMS_PDB_ALTER_SHARING` package subprograms.

Table 131-1 DBMS_PDB_ALTER_SHARING Subprograms

| Subprogram | Description |
|---|---|
| REMOVE_LINK Procedure | Specifies that a database object is not an application common object |
| SET_DATA_LINKED Procedure | Sets a database object to a data-linked application common object |
| SET_EXT_DATA_LINKED Procedure | Sets a database object to an extended data-linked application common object |

Table 131-1 (Cont.) DBMS_PDB_ALTER_SHARING Subprograms

| Subprogram | Description |
|--|--|
| SET_METADATA_LINKED Procedure | Sets a database object to a metadata-linked application common object |
| SET_PROFILE_EXPLICIT Procedure | Sets a profile as an application common profile in an application container. |
| SET_ROLE_EXPLICIT Procedure | Sets a role as an application common role in an application container. |
| SET_USER_EXPLICIT Procedure | Sets a local user as an application common user in an application container. |

131.3.1 REMOVE_LINK Procedure

This procedure specifies that a database object is not an application common object. In an application container, application common objects are shared between multiple containers.

Syntax

```
DBMS_PDB_ALTER_SHARING.REMOVE_LINK (
  schema_name IN VARCHAR2,
  object_name IN VARCHAR2,
  namespace   IN NUMBER,
  edition_name IN VARCHAR2 DEFAULT NULL);
```

Parameters

Table 131-2 REMOVE_LINK Procedure Parameters

| Parameter | Description |
|--------------|---|
| schema_name | The name of the schema that owns the database object. |
| object_name | The name of the database object. |
| namespace | The namespace of the database object. The NAMESPACE column of the DBA_OBJECTS view shows the namespace of an object. |
| edition_name | The name of the edition for the database object. |

See Also:

Oracle Database Administrator's Guide for information about migrating an application to an application container

131.3.2 SET_DATA_LINKED Procedure

This procedure sets a database object to a data-linked application common object. In an application container, data-linked application common objects store data in the application root only, and the data can be accessed by all of the application PDBs in the application

container. The data in a data-linked application common object can be modified only in the application root.

You can use this procedure to set data-linked application common objects when you migrate an application that is installed in a PDB to an application container. The application can be migrated to the application root or to an application PDB. For example, you can migrate an application installed in a PDB plugged into an Oracle Database 12c Release 1 (12.1) CDB to an application container in an Oracle Database 12c Release 2 (12.2) CDB.

Syntax

```
DBMS_PDB_ALTER_SHARING.SET_DATA_LINKED (
  schema_name IN VARCHAR2,
  object_name IN VARCHAR2,
  namespace   IN NUMBER,
  edition_name IN VARCHAR2 DEFAULT NULL);
```

Parameters

Table 131-3 *SET_DATA_LINKED Procedure Parameters*

| Parameter | Description |
|--------------|---|
| schema_name | The name of the schema that owns the database object. |
| object_name | The name of the database object. |
| namespace | The namespace of the database object. The NAMESPACE column of the DBA_OBJECTS view shows the namespace of an object. |
| edition_name | The name of the edition for the database object. |

See Also:

Oracle Database Administrator's Guide for information about migrating an application to an application container

131.3.3 SET_EXT_DATA_LINKED Procedure

This procedure sets a database object to an extended data-linked application common object. In an application container, for an extended data-linked object, each application PDB can create its own specific data while sharing the common data in the application root. Therefore, only the data stored in the application root is common for all application PDBs.

You can use this procedure to set extended data-linked application common objects when you migrate an application that is installed in a PDB to an application container. The application can be migrated to the application root or to an application PDB. For example, you can migrate an application installed in a PDB plugged into an Oracle Database 12c Release 1 (12.1) CDB to an application container in an Oracle Database 12c Release 2 (12.2) CDB.

Syntax

```
DBMS_PDB_ALTER_SHARING.SET_EXT_DATA_LINKED (
  schema_name  IN VARCHAR2,
  object_name  IN VARCHAR2,
  namespace    IN NUMBER,
  edition_name IN VARCHAR2  DEFAULT NULL);
```

Parameters

Table 131-4 *SET_EXT_DATA_LINKED Procedure Parameters*

| Parameter | Description |
|--------------|---|
| schema_name | The name of the schema that owns the database object. |
| object_name | The name of the database object. |
| namespace | The namespace of the database object. The <code>NAMESPACE</code> column of the <code>DBA_OBJECTS</code> view shows the namespace of an object. |
| edition_name | The name of the edition for the database object. |

See Also:

Oracle Database Administrator's Guide for information about migrating an application to an application container

131.3.4 SET_METADATA_LINKED Procedure

This procedure sets a database object to a metadata-linked application common object. In an application container, metadata-linked application common objects store the metadata for specific objects, such as tables, so that the containers that share the application common object have the same structure but different data.

You can use this procedure to set metadata-linked application common objects when you migrate an application that is installed in a PDB to an application container. The application can be migrated to the application root or to an application PDB. For example, you can migrate an application installed in a PDB plugged into an Oracle Database 12c Release 1 (12.1) CDB to an application container in an Oracle Database 12c Release 2 (12.2) CDB.

Syntax

```
DBMS_PDB_ALTER_SHARING.SET_METADATA_LINKED (
  schema_name  IN VARCHAR2,
  object_name  IN VARCHAR2,
  namespace    IN NUMBER,
  edition_name IN VARCHAR2  DEFAULT NULL);
```

Parameters

Table 131-5 *SET_METADATA_LINKED Procedure Parameters*

| Parameter | Description |
|--------------|---|
| schema_name | The name of the schema that owns the database object. |
| object_name | The name of the database object. |
| namespace | The namespace of the database object. The <code>NAMESPACE</code> column of the <code>DBA_OBJECTS</code> view shows the namespace of an object. |
| edition_name | The name of the edition for the database object. |

 **See Also:**

Oracle Database Administrator's Guide for information about migrating an application to an application container

131.3.5 SET_PROFILE_EXPLICIT Procedure

This procedure sets a profile as an application common profile in an application container. This procedure is intended for migrating a profile from a previous release to an application container in the current release.

This procedure must be invoked in an application install, patch, upgrade, or uninstall operation in an application root.

Syntax

```
DBMS_PDB_ALTER_SHARING.SET_PROFILE_EXPLICIT (
    profile_name IN VARCHAR2);
```

Parameters

Table 131-6 *SET_PROFILE_EXPLICIT Procedure Parameters*

| Parameter | Description |
|--------------|--------------------------|
| profile_name | The name of the profile. |

 **See Also:**

Oracle Database Administrator's Guide for information about migrating an application to an application container.

131.3.6 SET_ROLE_EXPLICIT Procedure

This procedure sets a role as an application common role in an application container. This procedure is intended for migrating a role from a previous release to an application container in the current release.

This procedure must be invoked in an application install, patch, upgrade, or uninstall operation in an application root.

Syntax

```
DBMS_PDB_ALTER_SHARING.SET_ROLE_EXPLICIT (  
    role_name IN VARCHAR2);
```

Parameters

Table 131-7 SET_ROLE_EXPLICIT Procedure Parameters

| Parameter | Description |
|-----------|-----------------------|
| role_name | The name of the role. |

See Also:

Oracle Database Administrator's Guide for information about migrating an application to an application container.

131.3.7 SET_USER_EXPLICIT Procedure

This procedure sets a local user as an application common user in an application container.

This procedure must be invoked in an application install, patch, upgrade, or uninstall operation in an application root.

Syntax

```
DBMS_PDB_ALTER_SHARING.SET_USER_EXPLICIT (  
    user_name IN VARCHAR2);
```

Parameters

Table 131-8 SET_USER_EXPLICIT Procedure Parameters

| Parameter | Description |
|-----------|-----------------------|
| user_name | The name of the user. |

 **See Also:**

DBMS_PERF

The DBMS_PERF package provides an interface to generate active reports for monitoring database performance.

See Also:

Oracle Database PL/SQL Language Reference for more information about "Avoiding SQL Injection in PL/SQL"

This chapter contains the following topics:

- [Overview](#)
- [Security Model](#)
- [Summary of DBMS_PERF Subprograms](#)

132.1 DBMS_PERF Overview

The DBMS_PERF package provides an interface for generating database performance reports. All subprograms return an active report and these reports can be generated at the system level, session level or at SQL level.

132.2 DBMS_PERF Security Model

The DBMS_PERF package requires the DBA role.

132.3 Summary of DBMS_PERF Subprograms

This table lists the DBMS_PERF subprograms and briefly describes them.

Table 132-1 DBMS_PERF Package Subprograms

| Subprogram | Description |
|---|---|
| REPORT_PERFHUB Function | Generates a composite active performance report of the entire database system for a specified time period |
| REPORT_SESSION Function | Generates a performance report for a specific database session where a session is identified by <code>inst_id</code> , <code>sid</code> , and <code>serial_num</code> . |
| REPORT_SQL Function | Generates an active performance report for a particular SQL statement identified by its <code>sql_id</code> . |

132.3.1 REPORT_PERFHUB Function

This function generates a composite active performance report of the entire database system for a specified time period.

Syntax

```
DBMS_PERF.REPORT_PERFHUB (
  is_realtime          IN NUMBER    DEFAULT NULL,
  outer_start_time     IN DATE      DEFAULT NULL,
  outer_end_time       IN DATE      DEFAULT NULL,
  selected_start_time  IN DATE      DEFAULT NULL,
  selected_end_time    IN DATE      DEFAULT NULL,
  inst_id              IN NUMBER    DEFAULT NULL,
  dbid                 IN NUMBER    DEFAULT NULL,
  monitor_list_detail  IN NUMBER    DEFAULT NULL,
  workload_sql_detail  IN NUMBER    DEFAULT NULL,
  admn_task_detail     IN NUMBER    DEFAULT NULL,
  report_reference     IN VARCHAR2  DEFAULT NULL,
  report_level         IN VARCHAR2  DEFAULT NULL,
  type                 IN VARCHAR2  DEFAULT 'ACTIVE',
  base_path            IN VARCHAR2  DEFAULT NULL);
RETURN CLOB;
```

Parameters

Table 132-2 *REPORT_PERFHUB Function Parameters*

| Parameter | Description |
|---------------------|--|
| is_realtime | If 1, then real-time. If NULL (default) or 0, then historical mode. |
| outer_start_time | Start time of outer period shown in the time selector. If NULL (default): <ul style="list-style-type: none"> If is_realtime=0 (historical), then 24 hours before outer_end_time. If is_realtime=1 (realtime mode), then 1 hour before outer_end_time. |
| outer_end_time | End time of outer period shown in the time selector. If NULL (default), then latest AWR snapshot. <ul style="list-style-type: none"> If is_realtime=0 (historical), then the latest AWR snapshot If is_realtime=1 (realtime mode), this is the current time (and any input is ignored) |
| selected_start_time | Start time period of selection. If NULL (default) <ul style="list-style-type: none"> If is_realtime=0, then 1 hour before selected_end_time If is_realtime=1, then 5 minutes before selected_end_time |
| selected_end_time | End time period of selection. If NULL (default) <ul style="list-style-type: none"> If is_realtime=0, then latest AWR snapshot If is_realtime=1, then current time |

Table 132-2 (Cont.) REPORT_PERFHUB Function Parameters

| Parameter | Description |
|---------------------|---|
| inst_id | Instance ID to for which to retrieve data <ul style="list-style-type: none"> If -1, then current instance If number is specified, then for that instance If NULL (default), then all instances |
| dbid | DBID to query. <ul style="list-style-type: none"> If NULL, then current DBID. If is_realtime=1, then DBID must be the local DBID. |
| monitor_list_detail | Top N in SQL monitor list for which to retrieve SQL monitor details. <ul style="list-style-type: none"> If NULL (default), then retrieves top 10 If 0, then retrieves no monitor list details |
| workload_sql_detail | Top N in Workload Top SQL list to retrieve monitor details, <ul style="list-style-type: none"> If NULL (default), then retrieves top 10 If 0, then retrieves no monitor list details |
| addm_task_detail | Maximum N latest ADDM tasks to retrieve <ul style="list-style-type: none"> If NULL (default), retrieves available data but no more than N If 0, then retrieves no ADDM task details |
| report_reference | Must be NULL when used from SQL*Plus. |
| report_level | 'typical' will get all tabs in performance hub |
| type | Report type: <ul style="list-style-type: none"> 'ACTIVE' (default) 'xml' returns XML |
| base_path | URL path for HTML resources since flex HTML requires access to external files. This is only valid for type='ACTIVE' and is typically not used. Default value will retrieve the required files from OTN. |

Usage Notes

- Once a time period is selected, the performance information is collected and presented based on performance subject areas.
- The time period can be real-time or historical.
- When real-time data is selected, more granular data is presented because data points are available every minute.
- When historical data is selected, more detailed data (broken down by different metrics) is presented, but the data points are averaged out to the Automatic Workload Repository (AWR) interval (usually an hour).
- Different tabs are available in the Performance Hub, depending on whether is_real-time is 1 for real time mode or 0 for historical mode.

132.3.2 REPORT_SESSION Function

This function produces a performance report for a specific database session where a session is identified by `inst_id`, `sid`, and `serial_num`.

If any of those parameters are missing, then the report is for the current session.

The session-level performance report contains the following tabs:

- **Summary** - This tab contains key identifiers and attributes of the session along with a summary of its activity data. It also contains a list of SQLs, PLSQL blocks and Database Operations (DBOP) executed by that session that were monitored by Real-time SQL Monitoring.
- **Activity** - This tab shows activity broken down by wait classes for this session. The data used for this chart is fetched from Active Session History (ASH).
- **Metrics** - This tab shows charts for certain key metrics for the selected session over time and is only available in historical mode. Some of the metrics shown are CPU usage, PGA usage, IO Throughput and IO Requests.

Syntax

```
DBMS_PERF.REPORT_SESSION (
  inst_id          IN NUMBER    DEFAULT NULL,
  sid              IN NUMBER    DEFAULT NULL,
  serial           IN NUMBER    DEFAULT NULL,
  is_realtime      IN NUMBER    DEFAULT NULL,
  outer_start_time IN DATE      DEFAULT NULL,
  outer_end_time   IN DATE      DEFAULT NULL,
  selected_start_time IN DATE    DEFAULT NULL,
  selected_end_time IN DATE    DEFAULT NULL,
  dbid             IN NUMBER    DEFAULT NULL,
  monitor_list_detail IN NUMBER  DEFAULT NULL,
  report_reference IN VARCHAR2  DEFAULT NULL,
  report_level     IN VARCHAR2  DEFAULT NULL,
  type             IN VARCHAR2  DEFAULT 'ACTIVE',
  base_path        IN VARCHAR2  DEFAULT NULL)
RETURN CLOB;
```

Parameters

Table 132-3 *REPORT_SESSION Function Parameters*

| Parameter | Description |
|--------------------------|--|
| <code>inst_id</code> | Instance ID to for which to retrieve data. If <code>NULL</code> (default), then instance of current session. |
| <code>sid</code> | Session ID for which to retrieve performance. If <code>NULL</code> , uses current session. |
| <code>serial</code> | Serial# of session. If <code>NULL</code> , then the serial# of the specified <code>sid</code> is used provided the session is connected. |
| <code>is_realtime</code> | If 1, then real-time. If <code>NULL</code> (default) or 0, then historical mode. |

Table 132-3 (Cont.) REPORT_SESSION Function Parameters

| Parameter | Description |
|---------------------|--|
| outer_start_time | Start time of outer period shown in the time selector. If NULL (default): <ul style="list-style-type: none"> If is_realtime=0 (historical), then 24 hours before outer_end_time. If is_realtime=1 (realtime mode), then 1 hour before outer_end_time. |
| outer_end_time | End time of outer period shown in the time selector. If NULL (default), then latest AWR snapshot. <ul style="list-style-type: none"> If is_realtime=0 (historical), then the latest AWR snapshot If is_realtime=1 (realtime mode), this is the current time (and any input is ignored) |
| selected_start_time | Start time period of selection. If NULL (default) <ul style="list-style-type: none"> If is_realtime=0, then 1 hour before selected_end_time If is_realtime=1, then 5 minutes before selected_end_time |
| selected_end_time | End time period of selection. If NULL (default) <ul style="list-style-type: none"> If is_realtime=0, then latest AWR snapshot If is_realtime=1, then current time |
| dbid | DBID to query. <ul style="list-style-type: none"> If NULL, then current DBID. If is_realtime=1, then DBID must be the local DBID.\ |
| monitor_list_detail | Top N in SQL monitor list for which to retrieve SQL monitor details. <ul style="list-style-type: none"> If NULL (default), then retrieves top 10 If 0, then retrieves no monitor list details |
| report_reference | Must be NULL when used from SQL*Plus. |
| report_level | 'typical' will get all tabs in the session hub (or session details) |
| type | Report type: <ul style="list-style-type: none"> 'ACTIVE' (default) 'xml' returns XML |
| base_path | URL path for HTML resources since flex HTML requires access to external files |

132.3.3 REPORT_SQL Function

This function generates an active performance report for a particular SQL statement identified by its `sql_id`.

The SQL-level performance report contains the following tabs:

- Summary - This tab contains an overview of the SQL statement with key attributes like the SQL text, user name, sessions executing it, and related information. It also contains a

Plans tab which shows statistics and activity for each distinct plan for this SQL statement found in memory and in the AWR.

- Activity - This tab shows activity broken down by wait classes for this SQL statement. The data used for this chart is fetched from Active Session History (ASH).
- Execution Statistics - This tab shows statistics and activity for each distinct plan for this statement along with a graphical and tabular representation of the plan.
- Monitored SQL - All executions of this SQL statement that were monitored by Real-time SQL Monitoring are listed in this tab.
- Plan Control - This tab shows information about SQL Profiles and SQL Plan Baselines if they exist for this SQL statement.
- Historical Statistics - This tab is available only in Historical mode. It contains statistics, such as number of executions, number of I/Os, rows processed, and other information produced over time for different execution plans. This information is retrieved from AWR.

Syntax

```
DBMS_PERF.REPORT_SQL (
    sql_id          IN varchar2 default null,
    is_realtime     IN number   default null,
    outer_start_time IN date     default null,
    outer_end_time  IN date     default null,
    selected_start_time IN date   default null,
    selected_end_time IN date   default null,
    inst_id        IN number   default null,
    dbid           IN number   default null,
    monitor_list_detail IN number default null,
    report_reference IN varchar2 default null,
    report_level    IN varchar2 default null,      type          IN
    varchar2 default 'ACTIVE',
    base_path      IN varchar2 default null);
RETURN CLOB;
```

Parameters

Table 132-4 *REPORT_SQL Function Parameters*

| Parameter | Description |
|------------------|---|
| sql_id | SQL_ID for which to retrieve performance. If NULL, gets SQL details for the last executed SQL statement. |
| is_realtime | If 1, then real-time. If NULL (default) or 0, then historical mode. |
| outer_start_time | Start time of outer period shown in the time selector. If NULL (default): <ul style="list-style-type: none"> • If is_realtime=0 (historical), then 24 hours before outer_end_time. • If is_realtime=1 (realtime mode), then 1 hour before outer_end_time. |

Table 132-4 (Cont.) REPORT_SQL Function Parameters

| Parameter | Description |
|---------------------|--|
| outer_end_time | End time of outer period shown in the time selector. If NULL (default), then latest AWR snapshot. <ul style="list-style-type: none"> If is_realtime=0 (historical), then the latest AWR snapshot If is_realtime=1 (realtime mode), this is the current time (and any input is ignored) |
| selected_start_time | Start time period of selection. If NULL (default) <ul style="list-style-type: none"> If is_realtime=0, then 1 hour before selected_end_time If is_realtime=1, then 5 minutes before selected_end_time |
| selected_end_time | End time period of selection. If NULL (default) <ul style="list-style-type: none"> If is_realtime=0, then latest AWR snapshot If is_realtime=1, then current time |
| inst_id | Instance ID to for which to retrieve data. If NULL (default), then instance of current session. |
| dbid | DBID to query. <ul style="list-style-type: none"> If NULL, then current DBID. If is_realtime=1, then DBID must be the local DBID.\ |
| monitor_list_detail | Top N in SQL monitor list for which to retrieve SQL monitor details. <ul style="list-style-type: none"> If NULL (default), then retrieves top 10 If 0, then retrieves no monitor list details |
| report_reference | Must be NULL when used from SQL*Plus. |
| report_level | 'typical' will get all tabs in performance hub |
| type | Report type: <ul style="list-style-type: none"> 'ACTIVE' (default) 'xml' returns XML |
| base_path | URL path for HTML resources since flex HTML requires access to external files |

DBMS_PIPE

The `DBMS_PIPE` package lets two or more sessions in the same instance communicate. Oracle pipes are similar in concept to the pipes used in UNIX, but Oracle pipes are not implemented using the operating system pipe mechanisms.

This chapter contains the following topics:

- [Overview](#)
- [Security Model](#)
- [Constants](#)
- [Operational Notes](#)
- [Exceptions](#)
- [Examples](#)
- [Summary of DBMS_PIPE Subprograms](#)

133.1 DBMS_PIPE Overview

Pipe functionality has several potential applications: external service interface, independent transactions, alerters (non-transactional), debugging, and concentrator.

- **External service interface:** You can communicate with user-written services that are external to the RDBMS. This can be done effectively in a shared server process, so that several instances of the service are executing simultaneously. Additionally, the services are available asynchronously. The requestor of the service does not need to block a waiting reply. The requestor can check (with or without time out) at a later time. The service can be written in any of the 3GL languages that Oracle supports.
- **Independent transactions:** The pipe can communicate to a separate session which can perform an operation in an independent transaction (such as logging an attempted security violation detected by a trigger).
- **Alerters (non-transactional):** You can post another process without requiring the waiting process to poll. If an "after-row" or "after-statement" trigger were to alert an application, then the application would treat this alert as an indication that the data probably changed. The application would then read the data to get the current value. Because this is an "after" trigger, the application would want to do a "SELECT FOR UPDATE" to make sure it read the correct data.
- **Debugging:** Triggers and stored procedures can send debugging information to a pipe. Another session can keep reading out of the pipe and display it on the screen or write it to a file.
- **Concentrator:** This is useful for multiplexing large numbers of users over a fewer number of network connections, or improving performance by concentrating several user-transactions into one DBMS transaction.

133.2 DBMS_PIPE Security Model

Security can be achieved by use of `GRANT EXECUTE` on the `DBMS_PIPE` package by creating a pipe using the `private` parameter in the `CREATE_PIPE` function and by writing cover packages that only expose particular features or pipenames to particular users or roles.

Depending upon your security requirements, you may choose to use either public pipes or private pipes, which are described in [DBMS_PIPE Operational Notes](#).

133.3 DBMS_PIPE Constants

This is the maximum time to wait attempting to send or receive a message.

```
maxwait    constant integer := 86400000; /* 1000 days */
```

133.4 DBMS_PIPE Operational Notes

Information sent through Oracle pipes is buffered in the system global area (SGA). All information in pipes is lost when the instance is shut down.

WARNING:

Pipes are independent of transactions. Be careful using pipes when transaction control can be affected.

The operation of `DBMS_PIPE` is considered with regard to the following topics:

- Public Pipes
- Writing and Reading Pipes
- Private Pipes

Public Pipes

You may create a public pipe either implicitly or explicitly. For *implicit* public pipes, the pipe is automatically created when it is referenced for the first time, and it disappears when it no longer contains data. Because the pipe descriptor is stored in the SGA, there is some space usage overhead until the empty pipe is aged out of the cache.

You create an *explicit* public pipe by calling the `CREATE_PIPE` function with the `private` flag set to `FALSE`. You must deallocate explicitly-created pipes by calling the `REMOVE_PIPE` function.

The domain of a public pipe is the schema in which it was created, either explicitly or implicitly.

Reading and Writing Pipes

Each public pipe works asynchronously. Any number of schema users can write to a public pipe, as long as they have `EXECUTE` permission on the `DBMS_PIPE` package, and

they know the name of the public pipe. However, once buffered information is read by one user, it is emptied from the buffer, and is not available for other readers of the same pipe.

The sending session builds a message using one or more calls to the `PACK_MESSAGE` procedure. This procedure adds the message to the session's local message buffer. The information in this buffer is sent by calling the `SEND_MESSAGE` function, designating the pipe name to be used to send the message. When `SEND_MESSAGE` is called, all messages that have been stacked in the local buffer are sent.

A process that wants to receive a message calls the `RECEIVE_MESSAGE` function, designating the pipe name from which to receive the message. The process then calls the `UNPACK_MESSAGE` procedure to access each of the items in the message.

Private Pipes

You explicitly create a private pipe by calling the `CREATE_PIPE` function. Once created, the private pipe persists in shared memory until you explicitly deallocate it by calling the `REMOVE_PIPE` function. A private pipe is also deallocated when the database instance is shut down.

You cannot create a private pipe if an implicit pipe exists in memory and has the same name as the private pipe you are trying to create. In this case, `CREATE_PIPE` returns an error.

Access to a private pipe is restricted to:

- Sessions running under the same userid as the creator of the pipe
- Stored subprograms executing in the same userid privilege domain as the pipe creator
- Users connected as `SYSDBA`

An attempt by any other user to send or receive messages on the pipe, or to remove the pipe, results in an immediate error. Any attempt by another user to create a pipe with the same name also causes an error.

As with public pipes, you must first build your message using calls to `PACK_MESSAGE` before calling `SEND_MESSAGE`. Similarly, you must call `RECEIVE_MESSAGE` to retrieve the message before accessing the items in the message by calling `UNPACK_MESSAGE`.

133.5 DBMS_PIPE Exceptions

DBMS_PIPE package subprograms can return the errors listed in the following table.

Table 133-1 DBMS_PIPE Errors

| Error | Description |
|------------|---|
| ORA-23321: | Pipename may not be null. This can be returned by the <code>CREATE_PIPE</code> function, or any subprogram that takes a pipe name as a parameter. |
| ORA-23322: | Insufficient privilege to access pipe. This can be returned by any subprogram that references a private pipe in its parameter list. |

133.6 DBMS_PIPE Examples

These examples show use of DBMS_PIPE in debugging PL/SQL, debugging Pro*C, executing system commands, and an external service interface.

Example 1: Debugging - PL/SQL

This example shows the procedure that a PL/SQL program can call to place debugging information in a pipe.

```
CREATE OR REPLACE PROCEDURE debug (msg VARCHAR2) AS
    status NUMBER;
BEGIN
    DBMS_PIPE.PACK_MESSAGE(LENGTH(msg));
    DBMS_PIPE.PACK_MESSAGE(msg);
    status := DBMS_PIPE.SEND_MESSAGE('plsql_debug');
    IF status != 0 THEN
        raise_application_error(-20099, 'Debug error');
    END IF;
END debug;
```

Example 2: Debugging - Pro*C

The following Pro*C code receives messages from the PLSQL_DEBUG pipe in the previous example, and displays the messages. If the Pro*C session is run in a separate window, then it can be used to display any messages that are sent to the debug procedure from a PL/SQL program executing in a separate session.

```
#include <stdio.h>
#include <string.h>

EXEC SQL BEGIN DECLARE SECTION;
    VARCHAR username[20];
    int status;
    int msg_length;
    char retval[2000];
EXEC SQL END DECLARE SECTION;

EXEC SQL INCLUDE SQLCA;

void sql_error();

main()
{
    -- Prepare username:
    strcpy(username.arr, "HR/<password>");
    username.len = strlen(username.arr);

    EXEC SQL WHENEVER SQLERROR DO sql_error();
    EXEC SQL CONNECT :username;

    printf("connected\n");

    -- Start an endless loop to look for and print messages on the pipe:
    FOR (;;)
    {
        EXEC SQL EXECUTE
            DECLARE
```

```

        len INTEGER;
        typ INTEGER;
        sta INTEGER;
        chr VARCHAR2(2000);
BEGIN
    chr := '';
    sta := dbms_pipe.receive_message('plsql_debug');
    IF sta = 0 THEN
        DBMS_PIPE.UNPACK_MESSAGE(len);
        DBMS_PIPE.UNPACK_MESSAGE(chr);
    END IF;
    :status := sta;
    :retval := chr;
    IF len IS NOT NULL THEN
        :msg_length := len;
    ELSE
        :msg_length := 2000;
    END IF;
END;
END-EXEC;
IF (status == 0)
    printf("\n%.*s\n", msg_length, retval);
ELSE
    printf("abnormal status, value is %d\n", status);
}
}

void sql_error()
{
    char msg[1024];
    int rlen, len;
    len = sizeof(msg);
    sqlglm(msg, &len, &rlen);
    printf("ORACLE ERROR\n");
    printf("%.*s\n", rlen, msg);
    exit(1);
}

```

Example 3: Execute System Commands

This example shows PL/SQL and Pro*C code let a PL/SQL stored procedure (or anonymous block) call PL/SQL procedures to send commands over a pipe to a Pro*C program that is listening for them.

The Pro*C program sleeps and waits for a message to arrive on the named pipe. When a message arrives, the Pro*C program processes it, carrying out the required action, such as executing a UNIX command through the `system()` call or executing a SQL command using embedded SQL.

DAEMON.SQL is the source code for the PL/SQL package. This package contains procedures that use the DBMS_PIPE package to send and receive message to and from the Pro*C daemon. Note that full handshaking is used. The daemon always sends a message back to the package (except in the case of the STOP command). This is valuable, because it allows the PL/SQL procedures to be sure that the Pro*C daemon is running.

You can call the DAEMON packaged procedures from an anonymous PL/SQL block using SQL*Plus or Enterprise Manager. For example:

```

SQLPLUS> variable rv number
SQLPLUS> execute :rv := DAEMON.EXECUTE_SYSTEM('ls -la');

```

On a UNIX system, this causes the Pro*C daemon to execute the command `system("ls -la")`.

Remember that the daemon needs to be running first. You might want to run it in the background, or in another window beside the SQL*Plus or Enterprise Manager session from which you call it.

The `DAEMON.SQL` also uses the `DBMS_OUTPUT` package to display the results. For this example to work, you must have execute privileges on this package.

DAEMON.SQL Example. This is the code for the PL/SQL `DAEMON` package:

```
CREATE OR REPLACE PACKAGE daemon AS
  FUNCTION execute_sql(command VARCHAR2,
                      timeout NUMBER DEFAULT 10)
    RETURN NUMBER;

  FUNCTION execute_system(command VARCHAR2,
                          timeout NUMBER DEFAULT 10)
    RETURN NUMBER;

  PROCEDURE stop(timeout NUMBER DEFAULT 10);
END daemon;
/
CREATE OR REPLACE PACKAGE BODY daemon AS

  FUNCTION execute_system(command VARCHAR2,
                          timeout NUMBER DEFAULT 10)
  RETURN NUMBER IS

    status      NUMBER;
    result      VARCHAR2(20);
    command_code NUMBER;
    pipe_name   VARCHAR2(30);
  BEGIN
    pipe_name := DBMS_PIPE.UNIQUE_SESSION_NAME;

    DBMS_PIPE.PACK_MESSAGE('SYSTEM');
    DBMS_PIPE.PACK_MESSAGE(pipe_name);
    DBMS_PIPE.PACK_MESSAGE(command);
    status := DBMS_PIPE.SEND_MESSAGE('daemon', timeout);
    IF status <> 0 THEN
      RAISE_APPLICATION_ERROR(-20010,
        'Execute_system: Error while sending. Status = ' ||
        status);
    END IF;

    status := DBMS_PIPE.RECEIVE_MESSAGE(pipe_name, timeout);
    IF status <> 0 THEN
      RAISE_APPLICATION_ERROR(-20011,
        'Execute_system: Error while receiving.
        Status = ' || status);
    END IF;

    DBMS_PIPE.UNPACK_MESSAGE(result);
    IF result <> 'done' THEN
      RAISE_APPLICATION_ERROR(-20012,
        'Execute_system: Done not received.');
```

```
END IF;
```

```
DBMS_PIPE.UNPACK_MESSAGE(command_code);
```

```
        DBMS_OUTPUT.PUT_LINE('System command executed.  result = ' ||
                               command_code);
    RETURN command_code;
END execute_system;

FUNCTION execute_sql(command VARCHAR2,
                    timeout NUMBER DEFAULT 10)
RETURN NUMBER IS

    status      NUMBER;
    result      VARCHAR2(20);
    command_code NUMBER;
    pipe_name   VARCHAR2(30);

BEGIN
    pipe_name := DBMS_PIPE.UNIQUE_SESSION_NAME;

    DBMS_PIPE.PACK_MESSAGE('SQL');
    DBMS_PIPE.PACK_MESSAGE(pipe_name);
    DBMS_PIPE.PACK_MESSAGE(command);
    status := DBMS_PIPE.SEND_MESSAGE('daemon', timeout);
    IF status <> 0 THEN
        RAISE_APPLICATION_ERROR(-20020,
            'Execute_sql: Error while sending.  Status = ' || status);
    END IF;

    status := DBMS_PIPE.RECEIVE_MESSAGE(pipe_name, timeout);

    IF status <> 0 THEN
        RAISE_APPLICATION_ERROR(-20021,
            'execute_sql: Error while receiving.
            Status = ' || status);
    END IF;

    DBMS_PIPE.UNPACK_MESSAGE(result);
    IF result <> 'done' THEN
        RAISE_APPLICATION_ERROR(-20022,
            'execute_sql: done not received.');
```

```
    END IF;

    DBMS_PIPE.UNPACK_MESSAGE(command_code);
    DBMS_OUTPUT.PUT_LINE
        ('SQL command executed.  sqlcode = ' || command_code);
    RETURN command_code;
END execute_sql;

PROCEDURE stop(timeout NUMBER DEFAULT 10) IS
    status NUMBER;
BEGIN
    DBMS_PIPE.PACK_MESSAGE('STOP');
    status := DBMS_PIPE.SEND_MESSAGE('daemon', timeout);
    IF status <> 0 THEN
        RAISE_APPLICATION_ERROR(-20030,
            'stop: error while sending.  status = ' || status);
    END IF;
END stop;
END daemon;
```

daemon.pc Example. This is the code for the Pro*C daemon. You must precompile this using the Pro*C Precompiler, Version 1.5.x or later. You must also specify the `USERID` and `SQLCHECK` options, as the example contains embedded PL/SQL code.

 **Note:**

To use a VARCHAR output host variable in a PL/SQL block, you must initialize the length component before entering the block.

```
proc iname=daemon userid=HR/<password> sqlcheck=semantics
```

Then C-compile and link in the normal way.

```
#include <stdio.h>
#include <string.h>

EXEC SQL INCLUDE SQLCA;

EXEC SQL BEGIN DECLARE SECTION;
    char *uid = "HR/<password>";
    int status;
    VARCHAR command[20];
    VARCHAR value[2000];
    VARCHAR return_name[30];
EXEC SQL END DECLARE SECTION;

void
connect_error()
{
    char msg_buffer[512];
    int msg_length;
    int buffer_size = 512;

    EXEC SQL WHENEVER SQLERROR CONTINUE;
    sqlglm(msg_buffer, &buffer_size, &msg_length);
    printf("Daemon error while connecting:\n");
    printf("%.*s\n", msg_length, msg_buffer);
    printf("Daemon quitting.\n");
    exit(1);
}

void
sql_error()
{
    char msg_buffer[512];
    int msg_length;
    int buffer_size = 512;

    EXEC SQL WHENEVER SQLERROR CONTINUE;
    sqlglm(msg_buffer, &buffer_size, &msg_length);
    printf("Daemon error while executing:\n");
    printf("%.*s\n", msg_length, msg_buffer);
    printf("Daemon continuing.\n");
}

main()
{
    command.len = 20; /*initialize length components*/
    value.len = 2000;
    return_name.len = 30;
    EXEC SQL WHENEVER SQLERROR DO connect_error();
    EXEC SQL CONNECT :uid;
    printf("Daemon connected.\n");
}
```

```
EXEC SQL WHENEVER SQLERROR DO sql_error();
printf("Daemon waiting...\n");
while (1) {
    EXEC SQL EXECUTE
        BEGIN
            :status := DBMS_PIPE.RECEIVE_MESSAGE('daemon');
            IF :status = 0 THEN
                DBMS_PIPE.UNPACK_MESSAGE(:command);
            END IF;
        END;
    END-EXEC;
    IF (status == 0)
    {
        command.arr[command.len] = '\0';
        IF (!strcmp((char *) command.arr, "STOP"))
        {
            printf("Daemon exiting.\n");
            break;
        }

        ELSE IF (!strcmp((char *) command.arr, "SYSTEM"))
        {
            EXEC SQL EXECUTE
                BEGIN
                    DBMS_PIPE.UNPACK_MESSAGE(:return_name);
                    DBMS_PIPE.UNPACK_MESSAGE(:value);
                END;
            END-EXEC;
            value.arr[value.len] = '\0';
            printf("Will execute system command '%s'\n", value.arr);

            status = system(value.arr);
            EXEC SQL EXECUTE
                BEGIN
                    DBMS_PIPE.PACK_MESSAGE('done');
                    DBMS_PIPE.PACK_MESSAGE(:status);
                    :status := DBMS_PIPE.SEND_MESSAGE(:return_name);
                END;
            END-EXEC;

            IF (status)
            {
                printf
                    ("Daemon error while responding to system command.");
                printf(" status: %d\n", status);
            }
        }
        ELSE IF (!strcmp((char *) command.arr, "SQL")) {
            EXEC SQL EXECUTE
                BEGIN
                    DBMS_PIPE.UNPACK_MESSAGE(:return_name);
                    DBMS_PIPE.UNPACK_MESSAGE(:value);
                END;
            END-EXEC;
            value.arr[value.len] = '\0';
            printf("Will execute sql command '%s'\n", value.arr);

            EXEC SQL WHENEVER SQLERROR CONTINUE;
            EXEC SQL EXECUTE IMMEDIATE :value;
            status = sqlca.sqlcode;
        }
    }
}
```

```

EXEC SQL WHENEVER SQLERROR DO sql_error();
EXEC SQL EXECUTE
  BEGIN
    DBMS_PIPE.PACK_MESSAGE('done');
    DBMS_PIPE.PACK_MESSAGE(:status);
    :status := DBMS_PIPE.SEND_MESSAGE(:return_name);
  END;
END-EXEC;

IF (status)
{
  printf("Daemon error while responding to sql command.");
  printf("  status: %d\n", status);
}
}
ELSE
{
  printf
    ("Daemon error: invalid command '%s' received.\n",
     command.arr);
}
}
ELSE
{
  printf("Daemon error while waiting for signal.");
  printf("  status = %d\n", status);
}
}
EXEC SQL COMMIT WORK RELEASE;
exit(0);

```

Example 4: External Service Interface

Put the user-written 3GL code into an OCI or Precompiler program. The program connects to the database and executes PL/SQL code to read its request from the pipe, computes the result, and then executes PL/SQL code to send the result on a pipe back to the requestor.

Below is an example of a stock service request. The recommended sequence for the arguments to pass on the pipe for all service requests is:

| | | |
|------------------|----------------------|-------------------------|
| protocol_version | VARCHAR2 | - '1', 10 bytes or less |
| returnpipe | VARCHAR2 | - 30 bytes or less |
| service | VARCHAR2 | - 30 bytes or less |
| arg1 | VARCHAR2/NUMBER/DATE | |
| ... | | |
| argn | VARCHAR2/NUMBER/DATE | |

The recommended format for returning the result is:

| | | |
|---------|----------------------|---|
| success | VARCHAR2 | - 'SUCCESS' if OK, otherwise error message |
| arg1 | VARCHAR2/NUMBER/DATE | |
| ... | | |
| argn | VARCHAR2/NUMBER/DATE | |

The "stock price request server" would do, using OCI or PRO* (in pseudo-code):

```

<loop forever>
  BEGIN dbms_stock_server.get_request(:stocksymbol); END;

```

```

<figure out price based on stocksymbol (probably from some radio
    signal), set error if can't find such a stock>
BEGIN dbms_stock_server.return_price(:error, :price); END;

```

A client would do:

```
BEGIN :price := stock_request('YOURCOMPANY'); end;
```

The stored procedure, `dbms_stock_server`, which is called by the preceding "stock price request server" is:

```

CREATE OR REPLACE PACKAGE dbms_stock_server IS
    PROCEDURE get_request(symbol OUT VARCHAR2);
    PROCEDURE return_price(errormsg IN VARCHAR2, price IN VARCHAR2);
END;

CREATE OR REPLACE PACKAGE BODY dbms_stock_server IS
    returnpipe    VARCHAR2(30);

    PROCEDURE returnerror(reason VARCHAR2) IS
        s INTEGER;
    BEGIN
        dbms_pipe.pack_message(reason);
        s := dbms_pipe.send_message(returnpipe);
        IF s <> 0 THEN
            raise_application_error(-20000, 'Error: ' || to_char(s) ||
                ' sending on pipe');
        END IF;
    END;

    PROCEDURE get_request(symbol OUT VARCHAR2) IS
        protocol_version VARCHAR2(10);
        s                 INTEGER;
        service           VARCHAR2(30);
    BEGIN
        s := dbms_pipe.receive_message('stock_service');
        IF s <> 0 THEN
            raise_application_error(-20000, 'Error: ' || to_char(s) ||
                ' reading pipe');
        END IF;
        dbms_pipe.unpack_message(protocol_version);
        IF protocol_version <> '1' THEN
            raise_application_error(-20000, 'Bad protocol: ' ||
                protocol_version);
        END IF;
        dbms_pipe.unpack_message(returnpipe);
        dbms_pipe.unpack_message(service);
        IF service != 'getprice' THEN
            returnerror('Service ' || service || ' not supported');
        END IF;
        dbms_pipe.unpack_message(symbol);
    END;

    PROCEDURE return_price(errormsg in VARCHAR2, price in VARCHAR2) IS
        s INTEGER;
    BEGIN
        IF errormsg is NULL THEN
            dbms_pipe.pack_message('SUCCESS');
            dbms_pipe.pack_message(price);
        ELSE
            dbms_pipe.pack_message(errormsg);
        END IF;
    END;

```

```

END IF;
s := dbms_pipe.send_message(returnpipe);
IF s <> 0 THEN
    raise_application_error(-20000, 'Error:'||to_char(s)||
        ' sending on pipe');
END IF;
END;
END;

```

The procedure called by the client is:

```

CREATE OR REPLACE FUNCTION stock_request (symbol VARCHAR2)
RETURN VARCHAR2 IS
s      INTEGER;
price  VARCHAR2(20);
errmsg VARCHAR2(512);
BEGIN
dbms_pipe.pack_message('1'); -- protocol version
dbms_pipe.pack_message(dbms_pipe.unique_session_name); -- return pipe
dbms_pipe.pack_message('getprice');
dbms_pipe.pack_message(symbol);
s := dbms_pipe.send_message('stock_service');
IF s <> 0 THEN
    raise_application_error(-20000, 'Error:'||to_char(s)||
        ' sending on pipe');
END IF;
s := dbms_pipe.receive_message(dbms_pipe.unique_session_name);
IF s <> 0 THEN
    raise_application_error(-20000, 'Error:'||to_char(s)||
        ' receiving on pipe');
END IF;
dbms_pipe.unpack_message(errormsg);
IF errormsg <> 'SUCCESS' THEN
    raise_application_error(-20000, errormsg);
END IF;
dbms_pipe.unpack_message(price);
RETURN price;
END;

```

You would typically only **GRANT EXECUTE** on **DBMS_STOCK_SERVICE** to the stock service application server, and would only **GRANT EXECUTE** on **stock_request** to those users allowed to use the service.

133.7 Summary of DBMS_PIPE Subprograms

This table lists the **DBMS_PIPE** subprograms and briefly describes them.

Table 133-2 DBMS_PIPE Package Subprograms

| Subprogram | Description |
|--|---|
| CREATE_PIPE Function | Creates a pipe (necessary for private pipes) |
| NEXT_ITEM_TYPE Function | Returns datatype of next item in buffer |
| PACK_MESSAGE Procedures | Builds message in local buffer |
| PURGE Procedure | Purges contents of named pipe |
| RECEIVE_MESSAGE Function | Copies message from named pipe into local buffer |
| REMOVE_PIPE Function | Removes the named pipe |
| RESET_BUFFER Procedure | Purges contents of local buffer |
| SEND_MESSAGE Function | Sends message on named pipe: This implicitly creates a public pipe if the named pipe does not exist |
| UNIQUE_SESSION_NAME Function | Returns unique session name |
| UNPACK_MESSAGE Procedures | Accesses next item in buffer |

133.7.1 CREATE_PIPE Function

This function explicitly creates a public or private pipe. If the `private` flag is `TRUE`, then the pipe creator is assigned as the owner of the private pipe.

Explicitly-created pipes can only be removed by calling `REMOVE_PIPE`, or by shutting down the instance.

Syntax

```
DBMS_PIPE.CREATE_PIPE (
    pipename      IN VARCHAR2,
    maxpipesize   IN INTEGER DEFAULT 8192,
    private       IN BOOLEAN DEFAULT TRUE)
RETURN INTEGER;
```

Pragmas

```
pragma restrict_references(create_pipe,WNDS,RNDS);
```

Parameters

Table 133-3 CREATE_PIPE Function Parameters

| Parameter | Description |
|-----------------------|---|
| <code>pipename</code> | Name of the pipe you are creating. You must use this name when you call <code>SEND_MESSAGE</code> and <code>RECEIVE_MESSAGE</code> . This name must be unique across the instance. Caution: Do not use pipe names beginning with <code>ORA\$</code> . These are reserved for use by procedures provided by Oracle. Pipename should not be longer than 128 bytes, and is case insensitive. At this time, the name cannot contain Globalization Support characters. |

Table 133-3 (Cont.) CREATE_PIPE Function Parameters

| Parameter | Description |
|-------------|--|
| maxpipesize | The maximum size allowed for the pipe, in bytes. The total size of all of the messages on the pipe cannot exceed this amount. The message is blocked if it exceeds this maximum. The default maxpipesize is 8192 bytes. The maxpipesize for a pipe becomes a part of the characteristics of the pipe and persists for the life of the pipe. Callers of SEND_MESSAGE with larger values cause the maxpipesize to be increased. Callers with a smaller value use the existing, larger value. |
| private | Uses the default, TRUE, to create a private pipe. Public pipes can be implicitly created when you call SEND_MESSAGE. |

Return Values

Table 133-4 CREATE_PIPE Function Return Values

| Return | Description |
|-----------|---|
| 0 | Successful. If the pipe already exists and the user attempting to create it is authorized to use it, then Oracle returns 0, indicating success, and any data already in the pipe remains. If a user connected as SYSDBA/SYSOPER re-creates a pipe, then Oracle returns status 0, but the ownership of the pipe remains unchanged. |
| ORA-23322 | Failure due to naming conflict. If a pipe with the same name exists and was created by a different user, then Oracle signals error ORA-23322, indicating the naming conflict. |

Exceptions

Table 133-5 CREATE_PIPE Function Exception

| Exception | Description |
|----------------|--|
| Null pipe name | Permission error: Pipe with the same name already exists, and you are not allowed to use it. |

133.7.2 NEXT_ITEM_TYPE Function

This function determines the datatype of the next item in the local message buffer.

After you have called RECEIVE_MESSAGE to place pipe information in a local buffer, call NEXT_ITEM_TYPE.

Syntax

```
DBMS_PIPE.NEXT_ITEM_TYPE
RETURN INTEGER;
```

Pragmas

```
pragma restrict_references(next_item_type,WNDS,RNDS);
```

Return Values**Table 133-6 NEXT_ITEM_TYPE Function Return Values**

| Return | Description |
|--------|---------------|
| 0 | No more items |
| 6 | NUMBER |
| 9 | VARCHAR2 |
| 11 | ROWID |
| 12 | DATE |
| 23 | RAW |

133.7.3 PACK_MESSAGE Procedures

This procedure builds your message in the local message buffer.

To send a message, first make one or more calls to `PACK_MESSAGE`. Then, call `SEND_MESSAGE` to send the message in the local buffer on the named pipe.

The procedure is overloaded to accept items of type `VARCHAR2`, `NCHAR`, `NUMBER`, `DATE`, `RAW` and `ROWID` items. In addition to the data bytes, each item in the buffer requires one byte to indicate its type, and two bytes to store its length. One additional byte is needed to terminate the message. The overhead for all types other than `VARCHAR` is 4 bytes.

Syntax

```
DBMS_PIPE.PACK_MESSAGE (
    item IN VARCHAR2);

DBMS_PIPE.PACK_MESSAGE (
    item IN NCHAR);

DBMS_PIPE.PACK_MESSAGE (
    item IN NUMBER);

DBMS_PIPE.PACK_MESSAGE (
    item IN DATE);

DBMS_PIPE.PACK_MESSAGE_RAW (
    item IN RAW);

DBMS_PIPE.PACK_MESSAGE_ROWID (
    item IN ROWID);
```

Pragmas

```
pragma restrict_references(pack_message,WNDS,RNDS);
pragma restrict_references(pack_message_raw,WNDS,RNDS);
pragma restrict_references(pack_message_rowid,WNDS,RNDS);
```

Parameters

Table 133-7 PACK_MESSAGE Procedure Parameters

| Parameter | Description |
|-----------|---|
| item | Item to pack into the local message buffer. |

Usage Notes

In Oracle database version 8.x, the char-set-id (2 bytes) and the char-set-form (1 byte) are stored with each data item. Therefore, the overhead when using Oracle database version 8.x is 7 bytes.

When you call `SEND_MESSAGE` to send this message, you must indicate the name of the pipe on which you want to send the message. If this pipe already exists, then you must have sufficient privileges to access this pipe. If the pipe does not already exist, then it is created automatically.

Exceptions

ORA-06558 is raised if the message buffer overflows (currently 4096 bytes). Each item in the buffer takes one byte for the type, two bytes for the length, plus the actual data. There is also one byte needed to terminate the message.

133.7.4 PURGE Procedure

This procedure empties the contents of the named pipe.

An empty implicitly-created pipe is aged out of the shared global area according to the least-recently-used algorithm. Thus, calling `PURGE` lets you free the memory associated with an implicitly-created pipe.

Syntax

```
DBMS_PIPE.PURGE (
    pipename IN VARCHAR2);
```

Pragmas

```
pragma restrict_references (purge,WNDS,RNDS);
```

Parameters

Table 133-8 PURGE Procedure Parameters

| Parameter | Description |
|-----------|--|
| pipename | Name of pipe from which to remove all messages. The local buffer may be overwritten with messages as they are discarded. Pipename should not be longer than 128 bytes, and is case-insensitive. |

Usage Notes

Because `PURGE` calls `RECEIVE_MESSAGE`, the local buffer might be overwritten with messages as they are purged from the pipe. Also, you can receive an `ORA-23322` (insufficient privileges) error if you attempt to purge a pipe with which you have insufficient access rights.

Exceptions

Permission error if pipe belongs to another user.

133.7.5 RECEIVE_MESSAGE Function

This function copies the message into the local message buffer.

Syntax

```
DBMS_PIPE.RECEIVE_MESSAGE (
    pipename      IN VARCHAR2,
    timeout       IN INTEGER      DEFAULT maxwait)
RETURN INTEGER;
```

Pragmas

```
pragma restrict_references (receive_message, WNDS, RNDS);
```

Parameters

Table 133-9 RECEIVE_MESSAGE Function Parameters

| Parameter | Description |
|-----------------------|---|
| <code>pipename</code> | Name of the pipe on which you want to receive a message. Names beginning with <code>ORA\$</code> are reserved for use by Oracle. |
| <code>timeout</code> | Time to wait for a message, in seconds. The default value is the constant <code>MAXWAIT</code> , which is defined as 86400000 (1000 days). A timeout of 0 lets you read without blocking. |

Return Values

Table 133-10 RECEIVE_MESSAGE Function Return Values

| Return | Description |
|------------------------|---|
| 0 | Success |
| 1 | Timed out. If the pipe was implicitly-created and is empty, then it is removed. |
| 2 | Record in the pipe is too large for the buffer. (This should not happen.) |
| 3 | An interrupt occurred. |
| <code>ORA-23322</code> | User has insufficient privileges to read from the pipe. |

Usage Notes

To receive a message from a pipe, first call `RECEIVE_MESSAGE`. When you receive a message, it is removed from the pipe; hence, a message can only be received once. For implicitly-created pipes, the pipe is removed after the last record is removed from the pipe.

If the pipe that you specify when you call `RECEIVE_MESSAGE` does not already exist, then Oracle implicitly creates the pipe and waits to receive the message. If the message does not arrive within a designated timeout interval, then the call returns and the pipe is removed.

After receiving the message, you must make one or more calls to `UNPACK_MESSAGE` to access the individual items in the message. The `UNPACK_MESSAGE` procedure is overloaded to unpack items of type `DATE`, `NUMBER`, `VARCHAR2`, and there are two additional procedures to unpack `RAW` and `ROWID` items. If you do not know the type of data that you are attempting to unpack, then call `NEXT_ITEM_TYPE` to determine the type of the next item in the buffer.

Exceptions

Table 133-11 RECEIVE_MESSAGE Function Exceptions

| Exception | Description |
|----------------|---|
| Null pipe name | Permission error. Insufficient privilege to remove the record from the pipe. The pipe is owned by someone else. |

133.7.6 RESET_BUFFER Procedure

This procedure resets the `PACK_MESSAGE` and `UNPACK_MESSAGE` positioning indicators to 0.

Because all pipes share a single buffer, you may find it useful to reset the buffer before using a new pipe. This ensures that the first time you attempt to send a message to your pipe, you do not inadvertently send an expired message remaining in the buffer.

Syntax

```
DBMS_PIPE.RESET_BUFFER;
```

Pragmas

```
pragma restrict_references(reset_buffer,WNDS,RNDS);
```

133.7.7 REMOVE_PIPE Function

This function removes explicitly-created pipes.

Pipes created implicitly by `SEND_MESSAGE` are automatically removed when empty. However, pipes created explicitly by `CREATE_PIPE` are removed only by calling `REMOVE_PIPE`, or by shutting down the instance. All unconsumed records in the pipe are removed before the pipe is deleted.

This is similar to calling `PURGE` on an implicitly-created pipe.

Syntax

```
DBMS_PIPE.REMOVE_PIPE (
    pipename IN VARCHAR2)
RETURN INTEGER;
```

Pragmas

```
pragma restrict_references(remove_pipe,WNDS,RNDS);
```

Parameters**Table 133-12 REMOVE_PIPE Function Parameters**

| Parameter | Description |
|-----------|---------------------------------------|
| pipename | Name of pipe that you want to remove. |

Return Values**Table 133-13 REMOVE_PIPE Function Return Values**

| Return | Description |
|-----------|---|
| 0 | Success If the pipe does not exist, or if the pipe already exists and the user attempting to remove it is authorized to do so, then Oracle returns 0, indicating success, and any data remaining in the pipe is removed. |
| ORA-23322 | Insufficient privileges. If the pipe exists, but the user is not authorized to access the pipe, then Oracle signals error ORA-23322, indicating insufficient privileges. |

Exceptions**Table 133-14 REMOVE_PIPE Function Exception**

| Exception | Description |
|----------------|---|
| Null pipe name | Permission error: Insufficient privilege to remove pipe. The pipe was created and is owned by someone else. |

133.7.8 SEND_MESSAGE Function

This function sends a message on the named pipe.

The message is contained in the local message buffer, which was filled with calls to `PACK_MESSAGE`. You can create a pipe explicitly using `CREATE_PIPE`, otherwise, it is created implicitly.

Syntax

```
DBMS_PIPE.SEND_MESSAGE (
    pipename      IN VARCHAR2,
    timeout       IN INTEGER DEFAULT MAXWAIT,
```

```
    maxpipesize IN INTEGER DEFAULT 8192)
RETURN INTEGER;
```

Pragmas

```
pragma restrict_references(send_message,WNDS,RNDS);
```

Parameters

Table 133-15 SEND_MESSAGE Function Parameters

| Parameter | Description |
|-------------|--|
| pipename | <p>Name of the pipe on which you want to place the message.</p> <p>If you are using an explicit pipe, then this is the name that you specified when you called <code>CREATE_PIPE</code>.</p> <p>Caution: Do not use pipe names beginning with 'ORA\$'. These names are reserved for use by procedures provided by Oracle. Pipename should not be longer than 128 bytes, and is case-insensitive. At this time, the name cannot contain Globalization Support characters.</p> |
| timeout | <p>Time to wait while attempting to place a message on a pipe, in seconds.</p> <p>The default value is the constant <code>MAXWAIT</code>, which is defined as 86400000 (1000 days).</p> |
| maxpipesize | <p>Maximum size allowed for the pipe, in bytes.</p> <p>The total size of all the messages on the pipe cannot exceed this amount. The message is blocked if it exceeds this maximum. The default is 8192 bytes.</p> <p>The <code>maxpipesize</code> for a pipe becomes a part of the characteristics of the pipe and persists for the life of the pipe. Callers of <code>SEND_MESSAGE</code> with larger values cause the <code>maxpipesize</code> to be increased. Callers with a smaller value simply use the existing, larger value.</p> <p>Specifying <code>maxpipesize</code> as part of the <code>SEND_MESSAGE</code> procedure eliminates the need for a separate call to open the pipe. If you created the pipe explicitly, then you can use the optional <code>maxpipesize</code> parameter to override the creation pipe size specifications.</p> |

Return Values

Table 133-16 SEND_MESSAGE Function Return Values

| Return | Description |
|--------|--|
| 0 | <p>Success.</p> <p>If the pipe already exists and the user attempting to create it is authorized to use it, then Oracle returns 0, indicating success, and any data already in the pipe remains.</p> <p>If a user connected as <code>SYSDBS/SYSOPER</code> re-creates a pipe, then Oracle returns status 0, but the ownership of the pipe remains unchanged.</p> |

Table 133-16 (Cont.) SEND_MESSAGE Function Return Values

| Return | Description |
|-----------|---|
| 1 | Timed out. This procedure can timeout either because it cannot get a lock on the pipe, or because the pipe remains too full to be used. If the pipe was implicitly-created and is empty, then it is removed. |
| 3 | An interrupt occurred. If the pipe was implicitly created and is empty, then it is removed. |
| ORA-23322 | Insufficient privileges. If a pipe with the same name exists and was created by a different user, then Oracle signals error ORA-23322, indicating the naming conflict. |

Exceptions**Table 133-17 SEND_MESSAGE Function Exception**

| Exception | Description |
|----------------|---|
| Null pipe name | Permission error. Insufficient privilege to write to the pipe. The pipe is private and owned by someone else. |

133.7.9 UNIQUE_SESSION_NAME Function

This function receives a name that is unique among all of the sessions that are currently connected to a database.

Multiple calls to this function from the same session always return the same value. You might find it useful to use this function to supply the PIPENAME parameter for your SEND_MESSAGE and RECEIVE_MESSAGE calls.

Syntax

```
DBMS_PIPE.UNIQUE_SESSION_NAME
    RETURN VARCHAR2;
```

Pragmas

```
pragma restrict_references(unique_session_name,WNDS,RNDS,WNPS);
```

Return Values

This function returns a unique name. The returned name can be up to 30 bytes.

133.7.10 UNPACK_MESSAGE Procedures

This procedure retrieves items from the buffer.

After you have called RECEIVE_MESSAGE to place pipe information in a local buffer, call UNPACK_MESSAGE.

 **Note:**

The UNPACK_MESSAGE procedure is overloaded to return items of type VARCHAR2, NCHAR, NUMBER, or DATE. There are two additional procedures to unpack RAW and ROWID items.

Syntax

```
DBMS_PIPE.UNPACK_MESSAGE (
    item OUT VARCHAR2);

DBMS_PIPE.UNPACK_MESSAGE (
    item OUT NCHAR);

DBMS_PIPE.UNPACK_MESSAGE (
    item OUT NUMBER);

DBMS_PIPE.UNPACK_MESSAGE (
    item OUT DATE);

DBMS_PIPE.UNPACK_MESSAGE_RAW (
    item OUT RAW);

DBMS_PIPE.UNPACK_MESSAGE_ROWID (
    item OUT ROWID);
```

Pragmas

```
pragma restrict_references (unpack_message, WNDS, RNDS);
pragma restrict_references (unpack_message_raw, WNDS, RNDS);
pragma restrict_references (unpack_message_rowid, WNDS, RNDS);
```

Parameters**Table 133-18 UNPACK_MESSAGE Procedure Parameters**

| Parameter | Description |
|-----------|---|
| item | Argument to receive the next unpacked item from the local message buffer. |

Exceptions

ORA-06556 or 06559 are generated if the buffer contains no more items, or if the item is not of the same type as that requested.

DBMS_PLSQL_CODE_COVERAGE

The `DBMS_PLSQL_CODE_COVERAGE` package provides an interface for the collection of code coverage data of PL/SQL applications at the basic block level.

This chapter contains the following topics:

- [DBMS_PLSQL_CODE_COVERAGE Overview](#)
- [DBMS_PLSQL_CODE_COVERAGE Security Model](#)
- [DBMS_PLSQL_CODE_COVERAGE Data Structures](#)
- [Summary of DBMS_PLSQL_CODE_COVERAGE Subprograms](#)

134.1 DBMS_PLSQL_CODE_COVERAGE Overview

The `DBMS_PLSQL_CODE_COVERAGE` package provides an interface for collecting code coverage information at the basic block level of PL/SQL applications. A basic block refers to a single entry single exit block of PL/SQL code. PL/SQL developers want to know how well their test infrastructure exercised their code. The coverage tables are created using the `CREATE_COVERAGE_TABLES` procedure.

A typical code coverage run in a session involves calls to :

- `START_COVERAGE`
- Run PL/SQL code
- `STOP_COVERAGE`

The `GET_BLOCK_MAP` function helps you calculate your total coverage.

See Also:

- *Oracle Database Development Guide* for more information about using PL/SQL basic block coverage to maintain quality
- *Oracle Database PL/SQL Language Reference* for the `COVERAGE PRAGMA` syntax and semantics
- *Oracle Database PL/SQL Language Reference* for more information about the `PLSQL_OPTIMIZE_LEVEL` compilation parameter

134.2 DBMS_PLSQL_CODE_COVERAGE Security Model

The user must have `EXECUTE` privilege on the `DBMS_PLSQL_CODE_COVERAGE` package.

The user must have `CREATE` privilege on the unit to collect coverage information about this unit.

PL/SQL basic block coverage data is collected when program units use `INTERPRETED` compilation (parameter set `PLSQL_CODE_TYPE = INTERPRETED`). PL/SQL basic block coverage data is not collected when program units use `NATIVE` compilation. You can disable the `NATIVE` compiler by setting the parameter `PLSQL_OPTIMIZE_LEVEL <= 1`. Regardless of the compilation mode, coverage data for wrapped units is not collected.

134.3 DBMS_PLSQL_CODE_COVERAGE Constants

The `DBMS_PLSQL_CODE_COVERAGE` package provides constants that are used with the `namespace` parameter of the `GET_BLOCK_MAP` function.

These constants are described in the following table.

Table 134-1 DBMS_PLSQL_CODE_COVERAGE Constants

| Name | Type | Value | Description |
|-------------------------------------|--------|-------|---|
| <code>function_namespace</code> | NUMBER | 1 | Specifies the function namespace |
| <code>package_spec_namespace</code> | NUMBER | 1 | Specifies the package specification namespace |
| <code>package_body_namespace</code> | NUMBER | 2 | Specifies the package definition (body) namespace |
| <code>procedure_namespace</code> | NUMBER | 1 | Specifies the procedure namespace |
| <code>trigger_namespace</code> | NUMBER | 3 | Specifies the trigger namespace |
| <code>type_spec_namespace</code> | NUMBER | 1 | Specifies the type specification namespace |
| <code>type_body_namespace</code> | NUMBER | 2 | Specifies the type definition (body) namespace |

134.4 DBMS_PLSQL_CODE_COVERAGE Data Structures

Record Types

- [MAP_REC Record Type](#)

Table Types

- [T_MAP_REC Table Type](#)

134.4.1 MAP_REC Record Type

The MAP_REC record type defines the PL/SQL basic block location in the source code.

Syntax

```
TYPE map_rec IS RECORD (
  procedure_name VARCHAR2(32767),
  block_num      NUMBER,
  line           NUMBER,
  col            NUMBER,
  not_feasible   NUMBER);
```

Fields

Table 134-2 MAP_REC Fields

| Field | Description |
|----------------|--|
| procedure_name | The name of the procedure containing the basic block |
| block_num | Identifies the basic block |
| line | Starting line of the basic block |
| col | Starting column of the basic block |
| not_feasible | Not_feasible marking of the basic block |

134.4.2 T_MAP_REC Table Type

The T_MAP_REC table type specifies the collection of PL/SQL basic blocks in a unit.

Syntax

```
TYPE t_map_rec IS TABLE OF map_rec;
```

134.5 Summary of DBMS_PLSQL_CODE_COVERAGE Subprograms

This table lists the DBMS_PLSQL_CODE_COVERAGE subprograms and briefly describes them.

Table 134-3 DBMS_PLSQL_CODE_COVERAGE Package Subprograms

| Subprogram | Description |
|--|--|
| CREATE_COVERAGE_TABLES Procedure | Creates coverage tables |
| GET_BLOCK_MAP Function | Gets the mapping of basic blocks to PL/SQL source |
| START_COVERAGE Function | Starts the coverage data collection in the user's session and returns the RUN_ID |
| STOP_COVERAGE Procedure | Ends the current coverage run |

134.5.1 CREATE_COVERAGE_TABLES Procedure

This procedure creates the tables used for coverage data collection.

Syntax

```
DBMS_PLSQL_CODE_COVERAGE.CREATE_COVERAGE_TABLES (
    FORCE_IT      IN BOOLEAN DEFAULT FALSE);
```

Parameters

| Parameter | Description |
|-----------|--|
| FORCE_IT | The default is to raise an error if the coverage tables already exists. If set to TRUE, the tables are dropped silently if the tables already exist, and new tables are created. |

Exceptions

Table 134-4 CREATE_COVERAGE_TABLES Exceptions

| Exception | Description |
|----------------|---|
| COVERAGE_ERROR | The FORCE_IT parameter is FALSE and the tables already exist. |

134.5.2 GET_BLOCK_MAP Function

This function gets the mapping of basic blocks to PL/SQL source.

Syntax

```
DBMS_PLSQL_CODE_COVERAGE.GET_BLOCK_MAP(
    unit_owner IN VARCHAR2,
    unit_name  IN VARCHAR2,
    namespace  IN POSITIVE)
RETURN T_MAP_REC;
```

Table 134-5 Parameters

| Parameter | Description |
|------------|---|
| unit_owner | The owner of the unit. The unit owner is case insensitive. If the unit_owner is empty or NULL, then it defaults to the current schema. |
| unit_name | The unit whose mapping is to be gotten. The unit_name is case insensitive. |
| namespace | Namespace to which this unit_name gets resolved. See DBMS_PLSQL_CODE_COVERAGE Constants for a list of valid namespace values. |

134.5.3 START_COVERAGE Function

This function starts the coverage data collection in the user's session and returns a unique identifier `RUN_ID` for the run.

Syntax

```
DBMS_PLSQL_CODE_COVERAGE.START_COVERAGE (  
    run_comment    IN VARCHAR2)  
    RETURN NUMBER;
```

Parameters

| Parameter | Description |
|--------------------------|--|
| <code>run_comment</code> | Allows the user to name a run and identify the test. |

134.5.4 STOP_COVERAGE Procedure

This procedure ends the current coverage run.

Syntax

```
DBMS_PLSQL_CODE_COVERAGE.STOP_COVERAGE;
```

Exceptions

Table 134-6 STOP_COVERAGE Exceptions

| Exception | Description |
|-----------------------------|---|
| <code>COVERAGE_ERROR</code> | An error is raised if the coverage tables do not exist. |

DBMS_PREDICTIVE_ANALYTICS

Machine learning can discover useful information buried in vast amounts of data. However, both the programming interfaces and the machine learning expertise required to obtain these results are too complex for use by the wide audiences that can obtain benefits from using Oracle Machine Learning for SQL.

The `DBMS_PREDICTIVE_ANALYTICS` package addresses both of these complexities by automating the entire machine learning process from data preprocessing through model building to scoring new data. This package provides an important tool that makes machine learning possible for a broad audience of users, in particular, business analysts.

This chapter contains the following topics:

- [Overview](#)
- [Security Model](#)
- [Summary of DBMS_PREDICTIVE_ANALYTICS Subprograms](#)

135.1 DBMS_PREDICTIVE_ANALYTICS Overview

`DBMS_PREDICTIVE_ANALYTICS` automates parts of the machine learning process.

Machine learning, according to a commonly used process model, requires the following steps:

1. Understand the business problem.
2. Understand the data.
3. Prepare the data for mining.
4. Create models using the prepared data.
5. Evaluate the models.
6. Deploy and use the model to score new data.

`DBMS_PREDICTIVE_ANALYTICS` automates parts of step 3 — 5 of this process.

Predictive analytics procedures analyze and prepare the input data, create and test machine learning models using the input data, and then use the input data for scoring. The results of scoring are returned to the user. The models and supporting objects are not preserved after the operation completes.

135.2 DBMS_PREDICTIVE_ANALYTICS Security Model

The `DBMS_PREDICTIVE_ANALYTICS` package is owned by user `SYS` and is installed as part of database installation. Execution privilege on the package is granted to `public`. The routines in the package are run with invokers' rights (run with the privileges of the current user).

The `DBMS_PREDICTIVE_ANALYTICS` package exposes APIs which are leveraged by the Oracle Machine Learning for SQL option. Users who wish to invoke procedures in this package

require the `CREATE MINING MODEL` system privilege (as well as the `CREATE TABLE` and `CREATE VIEW` system privilege).

135.3 Summary of DBMS_PREDICTIVE_ANALYTICS Subprograms

This table lists and briefly describes the `DBMS_PREDICTIVE_ANALYTICS` package subprograms.

Table 135-1 DBMS_PREDICTIVE_ANALYTICS Package Subprograms

| Subprogram | Purpose |
|-----------------------------------|--|
| EXPLAIN Procedure | Ranks attributes in order of influence in explaining a target column. |
| PREDICT Procedure | Predicts the value of a target column based on values in the input data. |
| PROFILE Procedure | Generates rules that identify the records that have the same target value. |

135.3.1 EXPLAIN Procedure

The `EXPLAIN` procedure identifies the attributes that are important in explaining the variation in values of a target column.

The input data must contain some records where the target value is known (not `NULL`). These records are used by the procedure to train a model that calculates the attribute importance.

Note:

`EXPLAIN` supports `DATE` and `TIMESTAMP` datatypes in addition to the numeric, character, and nested datatypes supported by Oracle Machine Learning for SQL models.

Data requirements for Oracle Machine Learning for SQL are described in *Oracle Machine Learning for SQL User's Guide*

The `EXPLAIN` procedure creates a result table that lists the attributes in order of their explanatory power. The result table is described in the Usage Notes.

Syntax

```
DBMS_PREDICTIVE_ANALYTICS.EXPLAIN (
  data_table_name      IN VARCHAR2,
  explain_column_name  IN VARCHAR2,
  result_table_name    IN VARCHAR2,
  data_schema_name     IN VARCHAR2 DEFAULT NULL);
```

Parameters

Table 135-2 EXPLAIN Procedure Parameters

| Parameter | Description |
|----------------------------------|--|
| <code>data_table_name</code> | Name of input table or view |
| <code>explain_column_name</code> | Name of the column to be explained |
| <code>result_table_name</code> | Name of the table where results are saved |
| <code>data_schema_name</code> | Name of the schema where the input table or view resides and where the result table is created. Default: the current schema. |

Usage Notes

The `EXPLAIN` procedure creates a result table with the columns described in [Table 135-3](#).

Table 135-3 EXPLAIN Procedure Result Table

| Column Name | Datatype | Description |
|--------------------------------|---------------------------|--|
| <code>ATTRIBUTE_NAME</code> | <code>VARCHAR2(30)</code> | Name of a column in the input data; all columns except the explained column are listed in the result table. |
| <code>EXPLANATORY_VALUE</code> | <code>NUMBER</code> | Value indicating how useful the column is for determining the value of the explained column. Higher values indicate greater explanatory power. Value can range from 0 to 1. An individual column's explanatory value is independent of other columns in the input table. The values are based on how strong each individual column correlates with the explained column. The value is affected by the number of records in the input table, and the relations of the values of the column to the values of the explain column. An explanatory power value of 0 implies there is no useful correlation between the column's values and the explain column's values. An explanatory power of 1 implies perfect correlation; such columns should be eliminated from consideration for <code>PREDICT</code> . In practice, an explanatory power equal to 1 is rarely returned. |
| <code>RANK</code> | <code>NUMBER</code> | Ranking of explanatory power. Rows with equal values for <code>explanatory_value</code> have the same rank. Rank values are not skipped in the event of ties. |

Example

The following example performs an `EXPLAIN` operation on the `SUPPLEMENTARY_DEMOGRAPHICS` table of Sales History.

```
--Perform EXPLAIN operation
BEGIN
    DBMS_PREDICTIVE_ANALYTICS.EXPLAIN(
        data_table_name      => 'supplementary_demographics',
        explain_column_name  => 'home_theater_package',
        result_table_name    => 'demographics_explain_result');
END;
/
--Display results
SELECT * FROM demographics_explain_result;
```

| ATTRIBUTE_NAME | EXPLANATORY_VALUE | RANK |
|-------------------------|-------------------|------|
| Y_BOX_GAMES | .524311073 | 1 |
| YRS_RESIDENCE | .495987246 | 2 |
| HOUSEHOLD_SIZE | .146208506 | 3 |
| AFFINITY_CARD | .0598227 | 4 |
| EDUCATION | .018462703 | 5 |
| OCCUPATION | .009721543 | 6 |
| FLAT_PANEL_MONITOR | .00013733 | 7 |
| PRINTER_SUPPLIES | 0 | 8 |
| OS_DOC_SET_KANJI | 0 | 8 |
| BULK_PACK_DISKETTES | 0 | 8 |
| BOOKKEEPING_APPLICATION | 0 | 8 |
| COMMENTS | 0 | 8 |
| CUST_ID | 0 | 8 |

The results show that Y_BOX_GAMES, YRS_RESIDENCE, and HOUSEHOLD_SIZE are the best predictors of HOME_THEATER_PACKAGE.

135.3.2 PREDICT Procedure

The PREDICT procedure predicts the values of a target column.

The input data must contain some records where the target value is known (not NULL). These records are used by the procedure to train and test a model that makes the predictions.

Note:

PREDICT supports DATE and TIMESTAMP datatypes in addition to the numeric, character, and nested datatypes supported by Oracle Machine Learning for SQL models.

Data requirements for Oracle Machine Learning for SQL are described in *Oracle Machine Learning for SQL User's Guide*

The PREDICT procedure creates a result table that contains a predicted target value for every record. The result table is described in the Usage Notes.

Syntax

```
DBMS_PREDICTIVE_ANALYTICS.PREDICT (
    accuracy                OUT NUMBER,
    data_table_name         IN VARCHAR2,
    case_id_column_name     IN VARCHAR2,
    target_column_name      IN VARCHAR2,
    result_table_name       IN VARCHAR2,
    data_schema_name        IN VARCHAR2 DEFAULT NULL);
```

Parameters

Table 135-4 PREDICT Procedure Parameters

| Parameter | Description |
|---------------------|---|
| accuracy | Output parameter that returns the predictive confidence, a measure of the accuracy of the predicted values. The predictive confidence for a categorical target is the most common target value; the predictive confidence for a numerical target is the mean. |
| data_table_name | Name of the input table or view. |
| case_id_column_name | Name of the column that uniquely identifies each case (record) in the input data. |
| target_column_name | Name of the column to predict. |
| result_table_name | Name of the table where results will be saved. |
| data_schema_name | Name of the schema where the input table or view resides and where the result table is created. Default: the current schema. |

Usage Notes

The `PREDICT` procedure creates a result table with the columns described in [Table 135-5](#).

Table 135-5 PREDICT Procedure Result Table

| Column Name | Datatype | Description |
|---------------------|--------------------|--|
| Case ID column name | VARCHAR2 or NUMBER | The name of the case ID column in the input data. |
| PREDICTION | VARCHAR2 or NUMBER | The predicted value of the target column for the given case. |
| PROBABILITY | NUMBER | For classification (categorical target), the probability of the prediction. For regression problems (numerical target), this column contains <code>NULL</code> . |

Note:

Make sure that the name of the case ID column is not 'PREDICTION' or 'PROBABILITY'.

Predictions are returned for all cases whether or not they contained target values in the input.

Predicted values for known cases may be interesting in some situations. For example, you could perform deviation analysis to compare predicted values and actual values.

Example

The following example performs a `PREDICT` operation and displays the first 10 predictions. The results show an accuracy of 79% in predicting whether each customer has an affinity card.

```

--Perform PREDICT operation
DECLARE
    v_accuracy NUMBER(10,9);
BEGIN
    DBMS_PREDICTIVE_ANALYTICS.PREDICT(
        accuracy          => v_accuracy,
        data_table_name   => 'supplementary_demographics',
        case_id_column_name => 'cust_id',
        target_column_name => 'affinity_card',
        result_table_name => 'pa_demographics_predict_result');
    DBMS_OUTPUT.PUT_LINE('Accuracy = ' || v_accuracy);
END;
/

Accuracy = .788696903

--Display results
SELECT * FROM pa_demographics_predict_result WHERE rownum < 10;

  CUST_ID PREDICTION PROBABILITY
-----
101501          1 .834069848
101502          0 .991269965
101503          0 .99978311
101504          1 .971643388
101505          1 .541754127
101506          0 .803719133
101507          0 .999999303
101508          0 .999999987
101509          0 .999953074

```

135.3.3 PROFILE Procedure

The `PROFILE` procedure generates rules that describe the cases (records) from the input data.

For example, if a target column `CHURN` has values 'Yes' and 'No', `PROFILE` generates a set of rules describing the expected outcomes. Each profile includes a rule, record count, and a score distribution.

The input data must contain some cases where the target value is known (not `NULL`). These cases are used by the procedure to build a model that calculates the rules.

Note:

`PROFILE` does not support nested types or dates.

Data requirements for Oracle Machine Learning for SQL are described in *Oracle Machine Learning for SQL User's Guide*

The `PROFILE` procedure creates a result table that specifies rules (profiles) and their corresponding target values. The result table is described in the Usage Notes.

Syntax

```
DBMS_PREDICTIVE_ANALYTICS.PROFILE (
    data_table_name          IN VARCHAR2,
    target_column_name      IN VARCHAR2,
    result_table_name       IN VARCHAR2,
    data_schema_name       IN VARCHAR2 DEFAULT NULL);
```

Parameters

Table 135-6 PROFILE Procedure Parameters

| Parameter | Description |
|--------------------|--|
| data_table_name | Name of the table containing the data to be analyzed. |
| target_column_name | Name of the target column. |
| result_table_name | Name of the table where the results will be saved. |
| data_schema_name | Name of the schema where the input table or view resides and where the result table is created. Default: the current schema. |

Usage Notes

The `PROFILE` procedure creates a result table with the columns described in [Table 135-7](#).

Table 135-7 PROFILE Procedure Result Table

| Column Name | Datatype | Description |
|--------------|-------------|---|
| PROFILE_ID | NUMBER | A unique identifier for this profile (rule). |
| RECORD_COUNT | NUMBER | The number of records described by the profile. |
| DESCRIPTION | SYS.XMLTYPE | The profile rule. See " XML Schema for Profile Rules ". |

XML Schema for Profile Rules

The `DESCRIPTION` column of the result table contains XML that conforms to the following XSD:

```
<xs:element name="SimpleRule">
  <xs:complexType>
    <xs:sequence>
      <xs:group ref="PREDICATE"/>
      <xs:element ref="ScoreDistribution" minOccurs="0" maxOccurs="unbounded"/>
    </xs:sequence>
    <xs:attribute name="id" type="xs:string" use="optional"/>
    <xs:attribute name="score" type="xs:string" use="required"/>
    <xs:attribute name="recordCount" type="NUMBER" use="optional"/>
  </xs:complexType>
</xs:element>
```

Example

This example generates a rule describing customers who are likely to use an affinity card (target value is 1) and a set of rules describing customers who are not likely to use an affinity card (target value is 0). The rules are based on only two predictors: education and occupation.

```

SET serveroutput ON
SET trimspool ON
SET pages 10000
SET long 10000
SET pagesize 10000
SET linesize 150
CREATE VIEW cust_edu_occ_view AS
    SELECT cust_id, education, occupation, affinity_card
    FROM sh.supplementary_demographics;
BEGIN
    DBMS_PREDICTIVE_ANALYTICS.PROFILE(
        DATA_TABLE_NAME => 'cust_edu_occ_view',
        TARGET_COLUMN_NAME => 'affinity_card',
        RESULT_TABLE_NAME => 'profile_result');
END;
/

```

This example generates eight rules in the result table `profile_result`. Seven of the rules suggest a target value of 0; one rule suggests a target value of 1. The `score` attribute on a rule identifies the target value.

This `SELECT` statement returns all the rules in the result table.

```

SELECT a.profile_id, a.record_count, a.description.getstringval()
FROM profile_result a;

```

This `SELECT` statement returns the rules for a target value of 0.

```

SELECT *
FROM profile_result t
WHERE extractvalue(t.description, '/SimpleRule/@score') = 0;

```

The eight rules generated by this example are displayed as follows.

```

<SimpleRule id="1" score="0" recordCount="443">
  <CompoundPredicate booleanOperator="and">
    <SimpleSetPredicate field="OCCUPATION" booleanOperator="isIn">
      <Array type="string">"Armed-F" "Exec." "Prof." "Protec."

```

DBMS_PREPROCESSOR

The DBMS_PREPROCESSOR package provides an interface to print or retrieve the source text of a PL/SQL unit in its post-processed form.

This package contains the following topics:

- [Overview](#)
- [Operating Notes](#)
- [Data Structures](#)
- [Summary of DBMS_PREPROCESSOR Subprograms](#)

136.1 DBMS_PREPROCESSOR Overview

It is necessary to first understand the three styles of subprograms, in order to understand how DBMS_PREPROCESSOR works.

The following are the three styles of subprograms:

1. Subprograms that take a schema name, a unit type name, and the unit name.
2. Subprograms that take a VARCHAR2 string which contains the source text of an arbitrary PL/SQL compilation unit.
3. Subprograms that take a VARCHAR2 index-by table which contains the segmented source text of an arbitrary PL/SQL compilation unit.

Subprograms of the first style are used to print or retrieve the post-processed source text of a stored PL/SQL unit. The user must have the privileges necessary to view the original source text of this unit. The user must also specify the schema in which the unit is defined, the type of the unit, and the name of the unit. If the schema is null, then the current user schema is used. If the status of the stored unit is VALID and the user has the required privilege, then the post-processed source text is guaranteed to be the same as that of the unit the last time it was compiled.

Subprograms of the second or third style are used to generate post-processed source text in the current user schema. The source text is passed in as a single VARCHAR2 string in the second style, or as a VARCHAR2 index-by table in the third style. The source text can represent an arbitrary PL/SQL compilation unit. A typical usage is to pass the source text of an anonymous block and generate its post-processed source text in the current user schema. The third style can be useful when the source text exceeds the VARCHAR2 length limit.

136.2 DBMS_PREPROCESSOR Operating Notes

These notes explain how DBMS_PREPROCESSOR works with the three subprogram styles.

- For subprograms of the first style, the status of the stored PL/SQL unit does not need to be VALID. Likewise, the source text passed in as a VARCHAR2 string or a VARCHAR2 index-by table may contain compile time errors. If errors are found when generating the post-

processed source, the error message text will also appear at the end of the post-processed source text. In some cases, the preprocessing can be aborted because of errors. When this happens, the post-processed source text will appear to be incomplete and the associated error message can help to indicate that an error has occurred during preprocessing.

- For subprograms of the second or third style, the source text can represent any arbitrary PL/SQL compilation unit. However, the source text of a valid PL/SQL compilation unit cannot include commonly used prefixes such as `CREATE OR REPLACE`. In general, the input source should be syntactically prepared in a way as if it were obtained from the `ALL_SOURCE` view. The following list gives some examples of valid initial syntax for some PL/SQL compilation units.

| | |
|-----------------|-------------------------|
| anonymous block | (BEGIN DECLARE) ... |
| package | PACKAGE <name> ... |
| package body | PACKAGE BODY <name> ... |
| procedure | PROCEDURE <name> ... |
| function | FUNCTION <name> ... |
| type | TYPE <name> ... |
| type body | TYPE BODY <name> ... |
| trigger | (BEGIN DECLARE) ... |

If the source text represents a named PL/SQL unit that is valid, that unit will not be created after its post-processed source text is generated.

- If the text of a wrapped PL/SQL unit is obtained from the `ALL_SOURCE` view, the keyword `WRAPPED` always immediately follows the name of the unit, as in this example:

```
PROCEDURE "some proc" WRAPPED
a000000
b2
...
```

If such source text is presented to one of the [GET_POST_PROCESSED_SOURCE Functions](#) or to one of the [PRINT_POST_PROCESSED_SOURCE Procedures](#), the exception `DBMS_PREPROCESSOR.WRAPPED_INPUT` is raised.

136.3 DBMS_PREPROCESSOR Data Structures

The `DBMS_PREPROCESSOR` package defines a `TABLE` type.

Table Types

[SOURCE_LINES_T Table Type](#)

136.3.1 DBMS_PREPROCESSOR SOURCE_LINES_T Table Type

This table type stores lines of post-processed source text. It is used to hold PL/SQL source text both before and after it is processed. It is especially useful in cases in which the amount of text exceeds 32K.

Syntax

```
TYPE source_lines_t IS
TABLE OF VARCHAR2(32767) INDEX BY BINARY_INTEGER;
```

136.4 Summary of DBMS_PREPROCESSOR Subprograms

This table lists the DBMS_PREPROCESSOR subprograms and briefly describes them.

Table 136-1 DBMS_PREPROCESSOR Package Subprograms

| Subprogram | Description |
|--|--|
| GET_POST_PROCESSED_SOURCE Functions | Returns the post-processed source text |
| PRINT_POST_PROCESSED_SOURCE Procedures | Prints post-processed source text |

136.4.1 GET_POST_PROCESSED_SOURCE Functions

This overloaded function returns the post-processed source text. The different functionality of each form of syntax is presented along with the definition.

Syntax

Returns post-processed source text of a stored PL/SQL unit:

```
DBMS_PREPROCESSOR.GET_POST_PROCESSED_SOURCE (
    object_type    IN VARCHAR2,
    schema_name    IN VARCHAR2,
    object_name    IN VARCHAR2)
RETURN source_lines_t;
```

Returns post-processed source text of a compilation unit:

```
DBMS_PREPROCESSOR.GET_POST_PROCESSED_SOURCE (
    source         IN VARCHAR2)
RETURN source_lines_t;
```

Returns post-processed source text of an INDEX-BY table containing the source text of the compilation unit:

```
DBMS_PREPROCESSOR.GET_POST_PROCESSED_SOURCE (
    source         IN source_lines_t)
RETURN source_lines_t;
```

Parameters

Table 136-2 GET_POST_PROCESSED_SOURCE Function Parameters

| Parameter | Description |
|-------------|--|
| object_type | Must be one of PACKAGE, PACKAGE BODY, PROCEDURE, FUNCTION, TYPE, TYPE, BODY or TRIGGER. Case sensitive. |
| schema_name | The schema name. Case insensitive unless a quoted identifier is used. If NULL, use current schema. |
| object_name | The name of the object. The object_type is always case insensitive. Case insensitive unless a quoted identifier is used. |
| source | The source text of the compilation unit |

Table 136-2 (Cont.) GET_POST_PROCESSED_SOURCE Function Parameters

| Parameter | Description |
|----------------|---|
| source_lines_t | INDEX-BY table containing the source text of the compilation unit. The source text is a concatenation of all the non-NULL INDEX-BY table elements in ascending index order. |

Return Values

The function returns an INDEX-BY table containing the lines of the post-processed source text starting from index 1.

Usage Notes

- Newline characters are not removed.
- Each line in the post-processed source text is mapped to a row in the INDEX-BY table.
- In the post-processed source, unselected text will have blank lines.

Exceptions**Table 136-3 GET_POST_PROCESSED_SOURCE Function Exceptions**

| Exception | Description |
|-----------|--|
| ORA-24234 | Insufficient privileges or object does not exist |
| ORA-24235 | Bad value for object type. Should be one of PACKAGE, PACKAGE BODY, PROCEDURE, FUNCTION, TYPE, TYPE, BODY or TRIGGER. |
| ORA-24236 | The source text is empty |
| ORA-00931 | Missing identifier. The object_name should not be NULL. |
| ORA-06502 | Numeric or value error: <ul style="list-style-type: none"> • Character string buffer too small • A line is too long (> 32767 bytes) |

136.4.2 PRINT_POST_PROCESSED_SOURCE Procedures

This overloaded procedure calls DBMS_OUTPUT.PUT_LINE to let you view post-processed source text. The different functionality of each form of syntax is presented along with the definition.

Syntax

Prints post-processed source text of a stored PL/SQL unit:

```
DBMS_PREPROCESSOR.PRINT_POST_PROCESSED_SOURCE (
  object_type  IN VARCHAR2,
  schema_name  IN VARCHAR2,
  object_name  IN VARCHAR2);
```

Prints post-processed source text of a compilation unit:

```
DBMS_PREPROCESSOR.PRINT_POST_PROCESSED_SOURCE (
    source          IN VARCHAR2);
```

Prints post-processed source text of an INDEX-BY table containing the source text of the compilation unit:

```
DBMS_PREPROCESSOR.PRINT_POST_PROCESSED_SOURCE (
    source          IN source_lines_t);
```

Parameters

Table 136-4 PRINT_POST_PROCESSED_SOURCE Procedure Parameters

| Parameter | Description |
|----------------|---|
| object_type | Must be one of PACKAGE, PACKAGE BODY, PROCEDURE, FUNCTION, TYPE, TYPE, BODY or TRIGGER. Case sensitive. |
| schema_name | The schema name. Case insensitive unless a quoted identifier is used. If NULL, use current schema. |
| object_name | The name of the object. The object_type is always case insensitive. Case insensitive unless a quoted identifier is used. |
| source | The source text of the compilation unit |
| source_lines_t | INDEX-BY table containing the source text of the compilation unit. The source text is a concatenation of all the non-NULL INDEX-BY table elements in ascending index order. |

Exceptions

Table 136-5 PRINT_POST_PROCESSED_SOURCE Procedure Exceptions

| Exception | Description |
|-----------|--|
| ORA-24234 | Insufficient privileges or object does not exist |
| ORA-24235 | Bad value for object type. Should be one of PACKAGE, PACKAGE BODY, PROCEDURE, FUNCTION, TYPE, TYPE, BODY or TRIGGER. |
| ORA-24236 | The source text is empty |
| ORA-00931 | Missing identifier. The object_name should not be NULL. |
| ORA-06502 | Numeric or value error: <ul style="list-style-type: none"> Character string buffer too small A line is too long (> 32767 bytes) |

Usage Notes

The index-by table may contain holes. NULL elements are ignored when doing the concatenation.

DBMS_PRIVILEGE_CAPTURE

The `DBMS_PRIVILEGE_CAPTURE` package provides an interface to database privilege analysis.

See Also:

Oracle® Database Security Guide regarding on how to analyze the use of privilege grants

This chapter contains the following topics:

- [Overview](#)
- [Security Model](#)
- [Constants](#)
- [Examples](#)
- [Summary of DBMS_PRIVILEGE_CAPTURE Subprograms](#)

137.1 DBMS_PRIVILEGE_CAPTURE Overview

Database privilege analysis enables you to create a policy that records the usage of system and object privileges that have been granted to users. You then can determine the privileges that your users are using and not using. From there, you can revoke any unused privileges, thereby reducing the number of excess privilege grants for users.

By analyzing the privileges that users must have to perform specific tasks, privilege analysis policies help you to achieve a least privilege model for your users.

137.2 DBMS_PRIVILEGE_CAPTURE Security Model

The privilege analysis administrator role, `CAPTURE_ADMIN`, is granted `EXECUTE` permission on the `DBMS_PRIVILEGE_CAPTURE` package by default.

The `CAPTURE_ADMIN` role is granted to the `DBA` role during database installation.

137.3 DBMS_PRIVILEGE_CAPTURE Constants

The `DBMS_PRIVILEGE_CAPTURE` package defines several enumerated constants for specifying parameter values.

Table 137-1 DBMS_PRIVILEGE_CAPTURE Constants

| Constant | Value | Type | Description |
|--------------------|-------|--------|--|
| G_DATABASE | 1 | NUMBER | Analyzes all privilege use, except privileges used by the SYS user. |
| G_ROLE | 2 | NUMBER | Analyzes privilege use for the specified roles. |
| G_CONTEXT | 3 | NUMBER | Analyzes privilege use when the condition parameter evaluates to true. |
| G_ROLE_AND_CONTEXT | 4 | NUMBER | Analyzes privilege use for the specified roles when the condition parameter evaluates to true. |

137.4 DBMS_PRIVILEGE_CAPTURE Examples

These examples illustrate using the `DBMS_PRIVILEGE_CAPTURE.CREATE_CAPTURE` procedure to create various types of privilege analysis, like database analysis, role analysis, and context-specific analysis. The examples also illustrate combining different conditions in context-specific analysis.

```
--Create a database privilege analysis policy
BEGIN
DBMS_PRIVILEGE_CAPTURE.CREATE_CAPTURE(
    name      => 'all_priv_analysis_pol',
    description => 'database-wide policy to analyze all privileges',
    type      => DBMS_PRIVILEGE_CAPTURE.G_DATABASE);
END;

--Create a privilege analysis policy to analyze privileges from the role PUBLIC
BEGIN
DBMS_PRIVILEGE_CAPTURE.CREATE_CAPTURE(
    name      => 'pub_analysis_pol',
    description => 'Policy to record privilege use by PUBLIC',
    type      => DBMS_PRIVILEGE_CAPTURE.G_ROLE,
    roles     => role_name_list('PUBLIC'));
END;

-- Create a policy to analyze privileges from the application module, "Account
-- Payable"
BEGIN
DBMS_PRIVILEGE_CAPTURE.CREATE_CAPTURE(
    name      => 'acc_pay_analysis_pol',
    type      => DBMS_PRIVILEGE_CAPTURE.G_CONTEXT,
    condition => 'SYS_CONTEXT(''USERENV'', ''MODULE'') = ''Account Payable''');
END;

-- Create a policy that records privileges for session user APPS when running the
-- application module "Account Payable"
BEGIN
DBMS_PRIVILEGE_CAPTURE.CREATE_CAPTURE(
    name      => 'acc_pay_analysis_pol',
    type      => DBMS_PRIVILEGE_CAPTURE.G_CONTEXT,
    condition => 'SYS_CONTEXT(''USERENV'', ''MODULE'') = ''Account Payable'' AND
    SYS_CONTEXT(''USERENV'', ''SESSION_USER'') = ''APPS''');
END;
```

137.5 Summary of DBMS_PRIVILEGE_CAPTURE Subprograms

This table lists and briefly describes the DBMS_PRIVILEGE_CAPTURE package subprograms.

Table 137-2 DBMS_PRIVILEGE_CAPTURE Package Subprograms

| Subprogram | Description |
|--|--|
| CAPTURE_DEPENDENCY_PRIVS Procedure | Captures the privileges that are used by definer's rights and invoker's rights PL/SQL program units for compilation. |
| CREATE_CAPTURE Procedure | Creates a policy that specifies the conditions for analyzing privilege use. |
| DELETE_RUN Procedure | Deletes a privilege analysis capture run |
| DISABLE_CAPTURE Procedure | Stops the recording of privilege use for a specified privilege analysis policy |
| DROP_CAPTURE Procedure | Removes a privilege analysis policy together with the data recorded |
| ENABLE_CAPTURE Procedure | Starts the recording of privilege analysis for a specified privilege analysis policy |
| GENERATE_RESULT Procedure | Populates the privilege analysis data dictionary views with data |

137.5.1 CAPTURE_DEPENDENCY_PRIVS Procedure

This procedure captures the privileges that are used by definer's rights and invoker's rights PL/SQL program units for compilation.

Syntax

```
DBMS_PRIVILEGE_CAPTURE.CAPTURE_DEPENDENCY_PRIVS ();
```

Parameters

This procedure has no parameters.

Usage Notes

Every rerun of the DBMS_PRIVILEGE_CAPTURE.CAPTURE_DEPENDENCY_PRIVS procedure deletes any existing records from the privilege analysis data dictionary views. It then recaptures records based on the existing PL/SQL program units.

137.5.2 CREATE_CAPTURE Procedure

This procedure creates a privilege analysis policy that specifies the conditions for analyzing privilege use. It also optionally specifies the roles for which privilege use is to be analyzed, and the conditions under which privilege use is to be analyzed.

Syntax

```
DBMS_PRIVILEGE_CAPTURE.CREATE_CAPTURE (
    name          IN VARCHAR2,
    description   IN VARCHAR2 DEFAULT NULL,
    type          IN NUMBER DEFAULT G_DATABASE,
    roles         IN ROLE_NAME_LIST DEFAULT ROLE_NAME_LIST(),
    condition     IN VARCHAR2 DEFAULT NULL);
```

Parameters

Table 137-3 CREATE_CAPTURE Procedure Parameters

| Parameter | Description |
|-------------|--|
| name | Name of the privilege analysis policy. A string of size up to 30 characters. |
| description | Description of the policy (up to 1024 characters) |
| type | Type of the privilege analysis policy. Possible values are: <ul style="list-style-type: none"> G_DATABASE: Captures all privilege use in the database, except privileges used by the SYS user. G_ROLE: Captures the use of a privilege if the privilege is part of a specified role or list of roles. G_CONTEXT: Captures the use of a privilege if the context specified by the <code>condition</code> parameter evaluates to true. G_ROLE_AND_CONTEXT: Captures the use of a privilege if the privilege is part of the specified list of roles and when the condition specified by the <code>condition</code> parameter is true. |
| roles | The roles whose privileges are to be analyzed. Required if the type is G_ROLE or G_ROLE_AND_CONTEXT. |
| condition | PL/SQL boolean expression containing up to 4000 characters. Required if type is G_CONTEXT or G_ROLE_AND_CONTEXT. Note that the boolean expression can only contain SYS_CONTEXT, but not other functions. |

Usage Notes

- When using role-based analysis for the `CREATE_CAPTURE` procedure, privilege use is analyzed even if the privilege is indirectly granted to the specified role.

For example, say role R2 contains role R1, and R1 contains privilege P1. If the privilege policy includes only role R2, any use of the P1 privilege is still analyzed, as privilege P1 is an indirect part of role R2.

- When using the `condition` parameter, use the following syntax for the PL/SQL expression:

```
condition ::= predicate | (predicate1) AND (predicate2)
            | (predicate1) OR (predicate2)
```

Where,

```
predicate ::= sys_context(namespace, attribute) relop constant_value |
sys_context(namespace, attribute) between constant_value and
constant_value | sys_context(namespace, attribute) in {constant_value
(,constant_value)* }
```

Where,

```
relop ::= = | < | <= | > | >= | <>
```

- A privilege analysis policy cannot analyze the use of SYS user privileges.

137.5.3 DELETE_RUN Procedure

This procedure deletes a privilege analysis capture run.

Syntax

```
DBMS_PRIVILEGE_CAPTURE.DELETE_RUN (
    name          IN VARCHAR2,
    run_name      IN VARCHAR2);
```

Parameters

Table 137-4 *DELETE_RUN Procedure Parameters*

| Parameter | Description |
|-----------|--|
| name | Name of the privilege analysis policy with which the capture run is associated |
| run_name | Name of the capture run |

Usage Notes

- You can find the names of existing privilege capture policies by querying the DBA_PRIV_CAPTURES data dictionary view.
- Another way to delete a capture run is to drop the policy with which the capture run is associated. Dropping the policy automatically drops its associated capture runs.
- When you drop a capture run it is no longer accessible through the privilege capture data dictionary views.

137.5.4 DISABLE_CAPTURE Procedure

This procedure stops the recording of privilege use for a specified privilege analysis policy. When a policy is disabled, privilege use meeting the policy condition is no longer recorded.

Syntax

```
DBMS_PRIVILEGE_CAPTURE.DISABLE_CAPTURE (
    name          IN VARCHAR2);
```

Parameters

Table 137-5 DISABLE_CAPTURE Procedure Parameters

| Parameter | Description |
|-----------|--|
| name | Name of the privilege analysis policy to be disabled |

Usage Notes

When a privilege analysis policy is first created, it is disabled by default.

137.5.5 DROP_CAPTURE Procedure

This procedure removes a privilege analysis policy together with the data recorded. When a policy is removed, all previously recorded privilege use data associated with the policy is deleted.

Syntax

```
DBMS_PRIVILEGE_CAPTURE.DROP_CAPTURE (  
    name          IN VARCHAR2);
```

Parameters

Table 137-6 DROP_CAPTURE Procedure Parameters

| Parameter | Description |
|-----------|---|
| name | Name of the privilege analysis policy to be removed |

Usage Notes

- You must disable a privilege analysis policy before removing it. An enabled policy cannot be removed.
- If there are capture runs associated with this policy, then they are automatically dropped when you drop the policy.

137.5.6 ENABLE_CAPTURE Procedure

This procedure starts the recording of privilege analysis for a specified privilege analysis policy and optionally provides a capture run for this policy. After a policy is enabled, all privilege use under the policy condition is recorded.

Syntax

```
DBMS_PRIVILEGE_CAPTURE.ENABLE_CAPTURE (  
    name          IN VARCHAR2,  
    run_name     IN VARCHAR2 DEFAULT NULL);
```

Parameters

Table 137-7 *ENABLE_CAPTURE Procedure Parameters*

| Parameter | Description |
|-----------|---|
| name | Name of the privilege analysis policy to be enabled |
| run_name | Name of the capture run to associate with this policy, less than 128 characters. Enclose exotic characters in double quotation marks. |

Usage Notes

The following usage notes apply:

- When a privilege analysis policy is first created, it is disabled by default. You must run `ENABLE_CAPTURE` to enable the privilege analysis policy.
- You can enable only one privilege analysis policy at a time. However, a database-wide privilege analysis of the `G_DATABASE` type can be enabled together with another non `G_DATABASE` privilege analysis.
- You cannot enable the same run multiple times. For example, `run_01` cannot be used again if you want to re-enable the capture for `run_01`. Instead, create a new run.

137.5.7 GENERATE_RESULT Procedure

This procedure populates the privilege analysis data dictionary views with data.

See Also:

Oracle® Database Security Guide for more information about privilege analysis views.

Syntax

```
DBMS_PRIVILEGE_CAPTURE.GENERATE_RESULT (
    name          IN VARCHAR2,
    run_name      IN VARCHAR2 DEFAULT NULL,
    DEPENDENCY    IN BOOLEAN DEFAULT NULL);
```

Parameters

Table 137-8 *GENERATE_RESULT Procedure Parameters*

| Parameter | Description |
|-----------|--|
| name | Name of the privilege analysis policy for which views are populated |
| run_name | Name of the capture run that is associated with the privilege analysis policy. If you omit this parameter, then the records of all created runs will be analyzed. When you specify the <code>run_name</code> parameter, only the records of that run are analyzed and all other runs are unaffected. |

Table 137-8 (Cont.) *GENERATE_RESULT* Procedure Parameters

| Parameter | Description |
|------------------|--|
| dependency | Enter Y (yes) or N (no) to indicate if PL/SQL compilation privileges, set by the <code>DBMS_PRIVILEGE_CAPTURE.CAPTURE_DEPENDENCY_PRIVS</code> procedure, should be included in the report. |

Usage Notes

You must disable a privilege analysis policy before populating the privilege analysis views for the policy. You cannot invoke this subprogram on an enabled privilege analysis policy.

DBMS_PROCESS

The `DBMS_PROCESS` package provides an interface to manage the prespawmed servers.

This chapter contains the following topics:

- [DBMS_PROCESS Overview](#)
- [DBMS_PROCESS Security Model](#)
- [Summary of DBMS_PROCESS Subprograms](#)

138.1 DBMS_PROCESS Overview

By default, Oracle Database can prespawn foreground processes to improve the performance of client connections.

A prespawmed process refers to a process that has been spawned but does not have a session yet. When a user connects to the database or a service process is needed, the process performs further initialization as needed.

To manage foreground processes, use the `DBMS_PROCESS` package. The procedures in this package configure the number of foreground processes for a connection pool, start a connection pool, and stop a connection pool.

See Also:

- *Oracle Database Administrator's Guide* for a detailed description of managing a pre-created processes
- *Oracle Database Reference* for information about the `USE_DEDICATED_BROKER` parameter, which determines how dedicated servers are spawned. `TRUE` enables the listener to send the connection to a dedicated connection broker that spawns the dedicated server. `FALSE` sets the listener to spawn a dedicated server directly.

138.2 DBMS_PROCESS Security Model

You must be granted the `SYSDBA` administrative privilege to use the `DBMS_PROCESS` package.

138.3 Summary of DBMS_PROCESS Subprograms

This table lists the DBMS_PROCESS subprograms and briefly describes them.

Table 138-1 DBMS_PROCESS Package Subprograms

| Subprogram | Description |
|--|---|
| CONFIGURE_POOL Procedure | Configures the minimum number of prespawnd processes, the number of prespawnd processes in a batch, and the initial number of pre-spawnd processes for a foreground connection pool |
| START_POOL Procedure | Starts a prespawnd foreground process pool. |
| STOP_POOL Procedure | Stops a prespawnd foreground process pool. |

138.3.1 CONFIGURE_POOL Procedure

This procedure configures the minimum number of prespawnd processes, the number of prespawnd processes in a batch, and the initial number of pre-spawnd processes for a foreground connection pool.

Syntax

```
DBMS_PROCESS.CONFIGURE_POOL(
    pool_name      IN  VARCHAR2 DEFAULT "SYS_DEFAULT_FOREGROUND_POOL",
    min_count      IN  NUMBER  DEFAULT 10,
    batch_count    IN  NUMBER  DEFAULT 20,
    init_count     IN  NUMBER  DEFAULT 0);
```

Parameters

Table 138-2 CONFIGURE_POOL Procedure Parameters

| Parameter | Description |
|-------------|---|
| pool_name | Name of the foreground pool |
| min_count | Count after which a batch of prespawnd processes will be spawned in the pool (default 10; maximum number of processes 64,000) |
| batch_count | Batch of prespawnd servers to be spawned in the pool (default 20). The total value of the min_count and batch_count values cannot exceed the PROCESSES parameter value. |
| init_count | Set of prespawnd servers to be spawned in startup, or before a storm of connections, spawned in batches (default 0). Do not exceed the PROCESSES parameter value. |

Exceptions

Table 138-3 CONFIGURE_POOL Procedure Exceptions

| Error | Description |
|---------|---|
| ORA-456 | Prespawn not enabled |
| ORA-457 | Prespawn pool not found |
| ORA-458 | Prespawn pool already started |
| ORA-459 | Prespawn pool not started |
| ORA-460 | Process pool invalid configuration value(s) |

Usage Notes

- To find information about foreground processes, query the V\$PROCESS_POOL dynamic view.

Example

```
BEGIN
  DBMS_PROCESS.CONFIGURE_POOL (
    pool_name => 'hrdb_pool',
    min_count => 40,
    batch_count => 20,
    init_count => 10);
END;
/
```

138.3.2 START_POOL Procedure

This procedure starts a prespawnd foreground process pool.

Syntax

```
DBMS_PROCESS.START_POOL(
  pool_name          IN  VARCHAR2 DEFAULT "SYS_DEFAULT_FOREGROUND_POOL");
```

Parameters

Table 138-4 START_POOL Procedure Parameters

| Parameter | Description |
|-----------|--|
| pool_name | Name of prespawnd foreground process pool. To find existing pools, query the V\$PROCESS_POOL dynamic view. |

Exceptions

Table 138-5 START_POOL Procedure Exceptions

| Error | Description |
|---------|-------------------------------|
| ORA-457 | Prespawn pool not found |
| ORA-458 | Prespawn pool already started |
| ORA-459 | Prespawn pool not started |

Example

```
BEGIN
  DBMS_PROCESS.START_POOL (
    pool_name => 'hrdb_pool',
  );
END;
```

138.3.3 STOP_POOL Procedure

This procedure stops a prespawnd foreground process pool.

Syntax

```
DBMS_PROCESS.STOP_POOL(
  pool_name          IN  VARCHAR2 DEFAULT "SYS_DEFAULT_FOREGROUND_POOL");
```

Parameters

Table 138-6 STOP_POOL Procedure Parameters

| Parameter | Description |
|-----------|--|
| pool_name | Name of the prespawnd foreground process pool. To find existing pools, query the V\$PROCESS_POOL dynamic view. |

Exceptions

Table 138-7 STOP_POOL Procedure Exceptions

| Error | Description |
|---------|-------------------------------|
| ORA-457 | Prespawn pool not found |
| ORA-458 | Prespawn pool already started |
| ORA-459 | Prespawn pool not started |

Example

```
BEGIN
  DBMS_PROCESS.STOP_POOL (
    pool_name => 'hrdb_pool',
  );
END;
```

DBMS_PROFILER

The package provides an interface to profile existing PL/SQL applications and identify performance bottlenecks. You can then collect and persistently store the PL/SQL profiler data.
