This function drops all mapping information in the shared memory of the instance.

Syntax

```
DBMS_STORAGE_MAP.DROP_ALL(
    dictionary_update IN BOOLEAN DEFAULT TRUE);
```

Parameters

Table 178-2 DROP_ALL Function Parameters

| Parameter | Description |
|-------------------|--|
| dictionary_update | If TRUE, mapping information in the data dictionary is updated to reflect the changes. The default value is TRUE; dictionary_update is an overloaded argument. |

178.3.2 DROP_ELEMENT Function

This function drops the mapping information for the element defined by `elemname`.

Syntax

```
DBMS_STORAGE_MAP.DROP_ELEMENT(
    elemname          IN VARCHAR2,
    cascade           IN BOOLEAN,
    dictionary_update IN BOOLEAN DEFAULT TRUE);
```

Parameters

Table 178-3 DROP_ELEMENT Function Parameters

| Parameter | Description |
|-------------------|--|
| elemname | The element for which mapping information is dropped. |
| cascade | If TRUE, then DROP_ELEMENT is invoked recursively on all elements of the DAG defined by elemname, if possible. |
| dictionary_update | If TRUE, mapping information in the data dictionary is updated to reflect the changes. The default value is TRUE; dictionary_update is an overloaded argument. |

178.3.3 DROP_FILE Function

This function drops the file mapping information defined by `filename`.

Syntax

```
DBMS_STORAGE_MAP.DROP_FILE(
    filename          IN VARCHAR2,
    cascade           IN BOOLEAN,
    dictionary_update IN BOOLEAN DEFAULT TRUE);
```

Parameters

Table 178-4 DROP_FILE Function Parameters

| Parameter | Description |
|-------------------|--|
| filename | The file for which file mapping information is dropped. |
| cascade | If TRUE, then the mapping DAGs for the elements where the file resides are also dropped, if possible. |
| dictionary_update | If TRUE, mapping information in the data dictionary is updated to reflect the changes. The default value is TRUE; dictionary_update is an overloaded argument. |

178.3.4 LOCK_MAP Procedure

This procedure locks the mapping information in the shared memory of the instance.

This is useful when you need a consistent snapshot of the V\$MAP tables. Without locking the mapping information, V\$MAP_ELEMENT and V\$MAP_SUBELEMENT, for example, may be inconsistent.

Syntax

```
DBMS_STORAGE_MAP.LOCK_MAP;
```

178.3.5 MAP_ALL Function

This function builds the entire mapping information for all types of Oracle files (except archive logs), including all directed acyclic graph (DAG) elements. It obtains the latest mapping information because it explicitly synchronizes all mapping libraries.

Syntax

```
DBMS_STORAGE_MAP.MAP_ALL(  
    max_num_fileext IN NUMBER DEFAULT 100,  
    dictionary_update IN BOOLEAN DEFAULT TRUE);
```

Parameters

Table 178-5 MAP_ALL Function Parameters

| Parameter | Description |
|-------------------|---|
| max_num_fileext | Defines the maximum number of file extents to be mapped. This limits the amount of memory used when mapping file extents. The default value is 100; max_num_fileextent is an overloaded argument. |
| dictionary_update | If TRUE, mapping information in the data dictionary is updated to reflect the changes. The default value is TRUE; dictionary_update is an overloaded argument. |

Usage Notes

You must explicitly call `MAP_ALL` in a cold startup scenario.

178.3.6 MAP_ELEMENT Function

This function builds mapping information for the element identified by `elemname`. It may not obtain the latest mapping information if the element being mapped, or any one of the elements within its I/O stack (if `cascade` is `TRUE`), is owned by a library that must be explicitly synchronized.

Syntax

```
DBMS_STORAGE_MAP.MAP_ELEMENT (
  elemname          IN VARCHAR2,
  cascade           IN BOOLEAN,
  dictionary_update IN BOOLEAN DEFAULT TRUE);
```

Parameters

Table 178-6 MAP_ELEMENT Function Parameters

| Parameter | Description |
|--------------------------------|---|
| <code>elemname</code> | The element for which mapping information is built. |
| <code>cascade</code> | If <code>TRUE</code> , all elements within the <code>elemname</code> I/O stack DAG are mapped. |
| <code>dictionary_update</code> | If <code>TRUE</code> , mapping information in the data dictionary is updated to reflect the changes. The default value is <code>TRUE</code> ; <code>dictionary_update</code> is an overloaded argument. |

178.3.7 MAP_FILE Function

This function builds mapping information for the file identified by `filename`. Use this function if the mapping of one particular file has changed. The Oracle database server does not have to rebuild the entire mapping.

Syntax

```
DBMS_STORAGE_MAP.MAP_FILE (
  filename          IN VARCHAR2,
  filetype          IN VARCHAR2,
  cascade           IN BOOLEAN,
  max_num_fileextent IN NUMBER DEFAULT 100,
  dictionary_update IN BOOLEAN DEFAULT TRUE);
```

Parameters

Table 178-7 MAP_FILE Function Parameters

| Parameter | Description |
|-----------------------|--|
| <code>filename</code> | The file for which mapping information is built. |

Table 178-7 (Cont.) MAP_FILE Function Parameters

| Parameter | Description |
|--------------------|--|
| filetype | Defines the type of the file to be mapped. It can be "DATAFILE", "SPFILE", "TEMPFILE", "CONTROLFILE", "LOGFILE", or "ARCHIVEFILE". |
| cascade | Should be TRUE only if a storage reconfiguration occurred. For all other instances, such as file resizing (either through an ALTER SYSTEM command or DML operations on extended files), cascade can be set to FALSE because the mapping changes are limited to the file extents only. If TRUE, mapping DAGs are also built for the elements where the file resides. |
| max_num_fileextent | Defines the maximum number of file extents to be mapped. This limits the amount of memory used when mapping file extents. The default value is 100; max_num_fileextent is an overloaded argument. |
| dictionary_update | If TRUE, mapping information in the data dictionary is updated to reflect the changes. The default value is TRUE; dictionary_update is an overloaded argument. |

Usage Notes

This function may not obtain the latest mapping information if the file being mapped, or any one of the elements within its I/O stack (if cascade is TRUE), is owned by a library that must be explicitly synchronized.

178.3.8 MAP_OBJECT Function

This function builds the mapping information for the Oracle object identified by the object name, owner, and type.

Syntax

```
DBMS_STORAGE_MAP.MAP_OBJECT(
  objname IN VARCHAR2,
  owner   IN VARCHAR2,
  objtype IN VARCHAR2);
```

Parameters

Table 178-8 MAP_OBJECT Function Parameters

| Parameter | Description |
|-----------|--------------------------|
| objname | The name of the object. |
| owner | The owner of the object. |
| objtype | The type of the object. |

178.3.9 RESTORE Function

This function loads the entire mapping information from the data dictionary into the shared memory of the instance.

You can invoke `RESTORE` only after a `SAVE` operation. You must explicitly call `RESTORE` in a warm startup scenario.

Syntax

```
DBMS_STORAGE_MAP.RESTORE;
```

178.3.10 SAVE Function

This function saves information needed to regenerate the entire mapping into the data dictionary.

Syntax

```
DBMS_STORAGE_MAP.SAVE;
```

178.3.11 UNLOCK_MAP Procedure

This procedure unlocks the mapping information in the shared memory of the instance.

Syntax

```
DBMS_STORAGE_MAP.UNLOCK_MAP;
```

DBMS_SYNC_REFRESH

The `DBMS_SYNC_REFRESH` package provides an interface to perform a synchronous refresh of materialized views.

See Also:

Oracle Database Data Warehousing Guide for more information on using `DBMS_SYNC_REFRESH`

This chapter contains the following topics:

- [Overview](#)
- [Security Model](#)
- [Summary of DBMS_SYNC_REFRESH Subprograms](#)

179.1 DBMS_SYNC_REFRESH Overview

Synchronous refresh is a refresh method introduced in Oracle Database Release 12c, which enables you to keep a set of tables and the materialized views defined on them to be always in sync.

See Also:

Oracle Database Data Warehousing Guide for more information about using synchronous refresh

179.2 DBMS_SYNC_REFRESH Security Model

The execute privilege for this package is granted to `PUBLIC`, so all users can execute the procedures in this package to perform synchronous refresh on objects owned by them. The database administrator can perform synchronous refresh operations on all tables and materialized views in the database.

In general, if a user without the `DBA` privilege wants to use synchronous refresh on another user's table, he must complete privileges to read from and write to that table, that is, the user must have the `SELECT` or `READ`, `INSERT`, `UPDATE`, and `DELETE` privileges on that table or materialized view. A couple of exceptions are:

- `PURGE_REFRESH_STATS` and `ALTER_REFRESH_STATS_RETENTION` Functions

These two functions implement the purge policy and can be used to change the default retention period. These functions can be only be executed by the database administrator.

- The `CAN_SYNCREF_TABLE` Function
This is an advisory function which examines the eligibility for sync refresh of all the materialized views associated with a specified table. Hence, this function requires the `SELECT` or `READ` privilege on all materialized views associated with the specified table.

179.3 Summary of DBMS_SYNC_REFRESH Subprograms

This table lists and briefly describes the `DBMS_SYNC_REFRESH` package subprograms.

Table 179-1 DBMS_SYNC_REFRESH Package Subprograms

| Subprogram | Description |
|--|--|
| ABORT_REFRESH Procedure | Aborts a refresh. |
| ALTER_REFRESH_STATS_RETENTION Procedure | Alters the refresh history retention value, specified in days. |
| CAN_SYNCREF_TABLE Procedure | Advises on whether a table and its dependent materialized views are eligible for synchronous refresh. |
| EXECUTE_REFRESH Procedure | Executes synchronous refresh on the synchronous refresh groups. |
| GET_ALL_GROUP_IDS Function | Returns the group IDs of all the synchronous refresh groups in the database. |
| GET_GROUP_ID Function | Returns the group ID of a table or materialized view. |
| GET_GROUP_ID_LIST Function | Returns the group IDs of the tables in a given list of objects (tables or materialized views). |
| PREPARE_REFRESH Procedure | Prepares the sync refresh groups for refresh. |
| PREPARE_STAGING_LOG Procedure | Validates and collects statistics on the data in the staging log. |
| PURGE_REFRESH_STATS Procedure | Purges the refresh history of sync refreshes that took place within a time specified by a timestamp parameter. |
| REGISTER_MVIEWS | Registers materialized views for synchronous refresh. |
| REGISTER_PARTITION_OPERATION Procedure | Registers a partition maintenance operation on a partition of a base table. |
| UNREGISTER_MVIEWS | Unregisters materialized views from synchronous refresh. |
| UNREGISTER_PARTITION_OPERATION Procedure | Unregisters a partition maintenance operation on a partition of a base table. |

179.3.1 ABORT_REFRESH Procedure

This procedure undoes all the changes made by `PREPARE_REFRESH` or `EXECUTE_REFRESH` for the specified sync refresh groups. It helps you to recover to a state where the tables and materialized views are usable and consistent in case they encounter unexpected errors.

This procedure is overloaded.

Syntax

```
DBMS_SYNC_REFRESH.ABORT_REFRESH (
    group_id      IN NUMBER);

DBMS_SYNC_REFRESH.ABORT_REFRESH (
    group_id_list IN DBMS_UTILITY.NUMBER_ARRAY);
```

Parameters**Table 179-2 ABORT_REFRESH Procedure Parameters**

| Parameter | Description |
|---------------|--|
| group_id | The group ID of a sync refresh group. |
| group_id_list | An array of group IDs of the sync refresh groups to be aborted for sync refresh. |

Usage Notes

If called after `PREPARE_REFRESH`, this procedure drops the outside tables created by it and unlocks the tables and materialized views in the sync refresh group.

If called after `EXECUTE_REFRESH` fails, this procedure restores the state of tables to before `EXECUTE_REFRESH` by undoing any partition exchanges which successfully finished.

This procedure releases the locks placed on the tables in the sync refresh group which were placed on them by the `PREPARE_REFRESH` procedure. See "[PREPARE_REFRESH Procedure](#)" for a description of these locks.

`ABORT_REFRESH` will work only if a `PREPARE_REFRESH` or `EXECUTE_REFRESH` statement has failed. It cannot be used after successful runs of those commands, and throws an error in such cases.

179.3.2 ALTER_REFRESH_STATS_RETENTION Procedure

This procedure alters the refresh history retention value, specified in days. It is intended for use in conjunction with `PURGE_REFRESH_HISTORY`. It also requires the `SYSDBA` privilege in addition to the privilege to execute it.

Syntax

```
DBMS_SYNC_REFRESH.ALTER_REFRESH_STATS_RETENTION (
    retention    IN NUMBER);
```

Parameters

Table 179-3 ALTER_REFRESH_STATS_RETENTION Procedure Parameters

| Parameter | Description |
|-----------|--|
| retention | <p>The retention time in days. The refresh history will be retained for at least these many number of days. The valid range is 1 to 365,000.</p> <p>You can use the following values for special purposes:</p> <ul style="list-style-type: none"> • -1 - Refresh history is never purged by PREPARE_REFRESH. • 0 - Old refresh history is never saved. PREPARE_REFRESH will delete all refresh history. • NULL - Change refresh history retention to default value. |

179.3.3 CAN_SYNCREF_TABLE Procedure

This procedure advises on whether a table and its dependent materialized views are eligible for sync refresh. It provides an explanation of its analysis. If not eligible, you can examine the reasons and take appropriate action if possible.

This procedure lists all of the table's dependent materialized views and whether they qualify for sync refresh. Note that a materialized view may qualify for sync refresh even though the base table may not.

The eligibility rules for materialized views for synchronous refresh are discussed in detail in *Oracle Database Data Warehousing Guide*.

You can invoke CAN_SYNCREF_TABLE in two ways. The first is to use a table, while the second is to create a VARRAY.

Syntax

```
DBMS_SYNC_REFRESH.CAN_SYNCREF_TABLE (
    schema_name    IN VARCHAR2,
    table_name     IN VARCHAR2,
    statement_id   IN VARCHAR2);

DBMS_SYNC_REFRESH.CAN_SYNCREF_TABLE (
    schema_name    IN VARCHAR2,
    table_name     IN VARCHAR2,
    output_array   IN OUT Sys.CanSyncRefTypeArray);
```

Note that only one of statement_id or output_array need be provided to CAN_SYNCREF_TABLE.

Parameters

Table 179-4 CAN_SYNCREF_TABLE Procedure Parameters

| Parameter | Description |
|-------------|---|
| schema_name | The name of the schema of the base table. |
| table_name | The name of the base table. |

Table 179-4 (Cont.) CAN_SYNCREF_TABLE Procedure Parameters

| Parameter | Description |
|--------------|---|
| statement_id | A string (VARCHAR2 (30)) to identify the rows pertaining to an invocation of CAN_SYNCREF_TABLE when the output is directed to a table named SYNCREF_TABLE in the user's schema. |
| output_array | The output array into which CAN_SYNCREF_TABLE records the information on the eligibility of the base table and its dependent materialized views for synchronous refresh. |

Using SYNCREF_TABLE

The output of CAN_SYNCREF_TABLE can be directed to a table named SYNCREF_TABLE. The user is responsible for creating the SYNCREF_TABLE; it can be dropped when it is no longer needed. Its structure is as follows:

```
CREATE TABLE SYNCREF_TABLE (
  statement_id  VARCHAR2(30),
  schema_name  VARCHAR2(30),
  table_name    VARCHAR2(30),
  mv_schema_name VARCHAR2(30),
  mv_name      VARCHAR2(30),
  eligible     VARCHAR2(1),
  seq_num      NUMBER,
  msg_number   NUMBER,
  message      VARCHAR2(4000));
```

Using a VARRAY

You can save the output of CAN_SYNCREF_TABLE in a PL/SQL VARRAY. The elements of this array are of type CanSyncRefMessage, which is predefined in the SYS schema, as shown in the following:

```
TYPE CanSyncRefMessage IS OBJECT (
  schema_name  VARCHAR2(30),
  table_name    VARCHAR2(30),
  mv_schema_name VARCHAR2(30),
  mv_name      VARCHAR2(30),
  eligible     VARCHAR2(1),
  seq_num      NUMBER,
  msg_number   NUMBER,
  message      VARCHAR2(4000));
```

The array type CanSyncRefArrayType, which is a varray of CanSyncRefMessage objects, is predefined in the SYS schema as follows:

```
TYPE CanSyncRefArrayType AS VARRAY(256) OF CanSyncRefMessage;
```

Each CanSyncRefMessage record provides a message concerning the eligibility of the base table or a dependent materialized view for synchronous refresh. The semantics of the fields is the same as that of the corresponding fields in the SYNCREF_TABLE. However, the SYNCREF_TABLE has a statement_id field which is absent in CanSyncRefMessage because no statement_id is supplied (because it is not required) when CAN_SYNCREF_TABLE is called with a VARRAY parameter.

179.3.4 EXECUTE_REFRESH Procedure

This procedure executes sync refresh on the sync refresh groups prepared by `DBMS_SYNC_REFRESH.PREPARE_REFRESH`. These groups are identified by their group IDs.

Note this procedure will only perform the refresh on those materialized views that have been registered for synch refresh; any other materialized views will become stale once this procedure completes.

For more information on how to monitor the status of the two synchronous refresh operations, `PREPARE_REFRESH` and `EXECUTE_REFRESH` and how to troubleshoot errors that might occur using the information in the catalog views, refer to "Trouble-Shooting Synchronous Refresh Operations" in *Oracle Database Data Warehousing Guide*.

This procedure is overloaded.

Syntax

```
DBMS_SYNC_REFRESH.EXECUTE_REFRESH (
    group_id    IN NUMBER);

DBMS_SYNC_REFRESH.EXECUTE_REFRESH (
    group_id_list  IN DBMS_UTILITY.NUMBER_ARRAY);
```

Parameters

Table 179-5 EXECUTE_REFRESH Procedure Parameters

| Parameter | Description |
|----------------------------|---|
| <code>group_id</code> | The group ID of a sync refresh group. |
| <code>group_id_list</code> | An array of group IDs of the sync refresh groups to be executed for sync refresh. |

Usage Notes

This procedure also releases the locks placed on the tables in the sync refresh group that were placed on them by the `PREPARE_REFRESH` procedure. See "[PREPARE_REFRESH Procedure](#)" for a description of these locks and *Oracle Database Reference* for information regarding the status of the refresh operation after `DBMS_SYNC_REFRESH.EXECUTE_REFRESH`.

179.3.5 GET_ALL_GROUP_IDS Function

This function returns the group IDs of all the sync refresh groups in the database.

Syntax

```
FUNCTION DBMS_SYNC_REFRESH.GET_ALL_GROUP_IDS
    RETURN DBMS_UTILITY.NUMBER_ARRAY;
```

Parameters

Table 179-6 GET_ALL_GROUP_IDS Function Parameter

| Parameter | Description |
|-------------------|---|
| get_all_group_ids | Returns the group IDs of all the sync refresh groups in the database. |

179.3.6 GET_GROUP_ID Function

This function returns the group ID of a materialized view. The group ID identifies the sync refresh group the table belongs to. A sync refresh group is a group of related tables and their dependent materialized views which must be all refreshed together jointly to ensure consistency and correctness.

Syntax

```
DBMS_SYNC_REFRESH.GET_GROUP_ID (
    object_name_list IN VARCHAR2)
RETURN DBMS_UTILITY.NUMBER_ARRAY;
```

Parameters

Table 179-7 GET_GROUP_ID Function Parameter

| Parameter | Description |
|------------------|--|
| object_name_list | The name of the materialized view. The name can be schema-qualified. |

179.3.7 GET_GROUP_ID_LIST Function

This function returns the group IDs of the tables in a given list of objects (materialized views).

Syntax

```
DBMS_SYNC_REFRESH.GET_GROUP_ID_LIST (
    object_name_list IN VARCHAR2)
RETURN DBMS_UTILITY.NUMBER_ARRAY;
```

Parameters

Table 179-8 GET_GROUP_ID_LIST Function Parameter

| Parameter | Description |
|------------------|---|
| object_name_list | A comma-separated list of object names (materialized views). Each name can be schema-qualified. |

179.3.8 PREPARE_REFRESH Procedure

This procedure prepares for refresh the sync refresh groups identified by the group ID in the input.

A sync refresh group consists of a set of related tables and all materialized views dependent on those base tables. Note this procedure will only prepare for refresh those dependent materialized views that have been registered for synchronous refresh.

For more information on how to monitor the status of the two synchronous refresh operations, `PREPARE_REFRESH` and `EXECUTE_REFRESH` and how to troubleshoot errors that might occur using the information in the catalog views, refer to "Trouble-Shooting Synchronous Refresh Operations" in *Oracle Database Data Warehousing Guide*.

Syntax

```
DBMS_SYNC_REFRESH.PREPARE_REFRESH (
    group_id IN NUMBER)
RETURN DBMS_UTILITY.NUMBER_ARRAY;
```

Parameters

Table 179-9 PREPARE_REFRESH Procedure Parameters

| Parameter | Description |
|-----------------------|---|
| <code>group_id</code> | The group ID of the sync refresh group to be prepared for sync refresh. |

Usage Notes

This procedure plans the three phases of the sync refresh operation and executes the steps associated with the prepare phase itself. These steps include identifying the partitions of the fact tables and materialized views that have been changed, and computing their new values as a result of the changes. The new values of the partitions are stored in tables called outside tables that are exchanged into their corresponding partitions at the time of the `EXECUTE_REFRESH`.

Before running this procedure, the user must run `PREPARE_STAGING_LOG` on all tables in the group. This is required even for staging logs that do not have changes in them. The user must also register any partition operations on the tables in the group using the `REGISTER_PARTITION_OPERATION`.

One of the side effects of this procedure is that the tables being prepared are locked in this sense: the staging logs of the tables will be locked to prevent any DMLs from occurring and the registration of partition operations will be disabled. These locks will be in effect until you issue an `EXECUTE_REFRESH` statement. Alternatively, you can issue an `ABORT_REFRESH` operation to release these locks. Another side effect of this procedure is that it purges from the catalog records of earlier sync refresh operations; if they are older than the retention period, they are purged.

The degree of parallelism of the prepare refresh job is inherited from the session parameters which you can control with an `ALTER SESSION` statement.

The group ID of a table can be found using `GET_GROUP_ID(table_name)`. The group IDs of a list of tables can be found with `GET_GROUP_ID_LIST(table_name_list)`. The group IDs of all the lists of tables can be retrieved with `GET_ALL_GROUP_IDS`.

By default, synchronous refresh does not maintain global indexes belonging to the tables and materialized views in the sync refresh group. If you wish to do so, you can set event 31904, level 64 before executing `PREPARE_REFRESH`. This will cause the partition exchange DDL statements generated by `PREPARE_REFRESH` to have the `UPDATE INDEXES` clause appended to them, and when they are executed by `EXECUTE_REFRESH`, the global indexes will be maintained.

179.3.9 PREPARE_STAGING_LOG Procedure

This procedure collects statistics on the data in the staging log of the base table and validates the data in the log.

It can be run in several different modes ranging from the enforced mode in which strict checking of the data is done to trusted mode in which no checking is done. You should run this procedure after loading the staging log and before running `PREPARE_REFRESH`.

In the enforced mode, which is the default, this procedure will fill in the missing values of the columns of the rows being deleted or updated. An error is thrown if any violations of the staging-log rules are found. You can query the view `USER_SR_STLOG_EXCEPTIONS` to get details on the exceptions.

The notion of the staging log key is described in *Oracle Database Data Warehousing Guide*.

In the enforced mode, this procedure processes each delete/update row in the staging log as follows:

- It verifies the existence of the row in the base table using the key.
- For the rows being deleted (`DMLTYPE$$` is 'D'), it verifies a row with this key exists in the base table; if non-null non-key values are supplied in the staging log, it verifies the values match the corresponding columns in the base table; else an exception is logged in the exceptions table. If the values of any of the non-key columns are missing, it fills in those values from the row in the base table.
- For the rows being updated (`DMLTYPE$$` is 'UO' or 'UN'), it verifies a row with this key exists in the base table. In the old values row (`DMLTYPE$$` is 'UO'), it makes the same check and does the same processing as with rows being deleted. In the new values row (`DMLTYPE$$` is 'UN'), it checks that at least the value of one the columns differs from its old value; else an exception is logged.
- In the new values row (`DMLTYPE$$` is 'UN'), a null value in a column is interpreted as having the same value as the old value of the column except if the old value is non-null and the new value is null in which case, the new value of the column is interpreted as being null. This requires that the user must provide the old value of columns which are being updated to `NULL`.

In the default enforced mode, this procedure verifies that each key is specified for at most once for a delete or update operation. This means that the user, when doing the change consolidation, must consolidate delete-insert of the same row into an update operation with rows 'UO' and 'UN;' multiple updates must be consolidated into a single update; and null changes such as an insert-update-delete of the same row must not appear in the staging log.

The checking done in the enforced mode can be time-consuming. If you are confident in the integrity of the data, you can choose a lower level of checking. You can choose to:

- trust all the insert rows (DMLTYPE\$\$ is 'I') by choosing the `psl_mode` of `DBMS_SYNC_REFRESH.INSERT_TRUSTED`
- trust all the delete rows (DMLTYPE\$\$ is 'D') by choosing the `psl_mode` of `DBMS_SYNC_REFRESH.DELETE_TRUSTED`
- trust all the update rows (DMLTYPE\$\$ is 'UO' or 'UN') by choosing the `psl_mode` of `DBMS_SYNC_REFRESH.UPDATE_TRUSTED`
- trust all three types of DMLs by choosing the `psl_mode` of `DBMS_SYNC_REFRESH.TRUSTED`.

In addition, you can specify the `psl_mode` as a bitmask of the flags described above. For example, `DBMS_SYNC_REFRESH.INSERT_TRUSTED + DBMS_SYNC_REFRESH.DELETE_TRUSTED` will treat inserts and deletes to be trusted but not updates.

Syntax

```
DBMS_SYNC_REFRESH.PREPARE_STAGING_LOG (
    schema_name      IN VARCHAR2,
    base_table_name  IN VARCHAR2,
    psl_mode         IN NUMBER DEFAULT
    DBMS_SYNC_REFRESH.ENFORCED);
```

Parameters

Table 179-10 PREPARE_STAGING_LOG Procedure Parameters

| Parameter | Description |
|------------------------------|---|
| <code>schema_name</code> | The name of the schema of the base table. |
| <code>base_table_name</code> | The name of the base table. |
| <code>psl_mode</code> | The mode in which staging log preparation should be done. The possible values are: <ul style="list-style-type: none"> • <code>DBMS_SYNC_REFRESH.ENFORCED</code> (the default) • <code>DBMS_SYNC_REFRESH.INSERT_TRUSTED</code> • <code>DBMS_SYNC_REFRESH.DELETE_TRUSTED</code> • <code>DBMS_SYNC_REFRESH.UPDATE_TRUSTED</code> • <code>DBMS_SYNC_REFRESH.TRUSTED</code> |

179.3.10 PURGE_REFRESH_STATS Procedure

This procedure purges the refresh history of sync refreshes that took place before the value specified by the `BEFORE_TIMESTAMP` parameter.

This procedure requires the `SYSDBA` privilege in addition to the privilege to execute it.

Syntax

```
DBMS_SYNC_REFRESH.PURGE_REFRESH_STATS (
    before_timestamp IN TIMESTAMP WITH TIME ZONE);
```

Parameters

Table 179-11 PURGE_REFRESH_STATS Procedure Parameter

| Parameter | Description |
|-------------------------------|---|
| <code>before_timestamp</code> | Records of sync refreshes saved before this timestamp are purged. If NULL, it uses the purging policy used by automatic purge. The automatic purge deletes all history older than (current time - refresh - history retention). The refresh history retention value can be changed using <code>ALTER_REFRESH_STATS_RETENTION</code> . The default is 31 days. |

179.3.11 REGISTER_MVIEWS

This procedure registers a list of materialized views for synchronous refresh.

It checks each materialized view in the list for eligibility and places it in the sync refresh group it belongs to. A sync refresh group is a set of related tables and materialized views defined on top of them. Two tables are considered related if there is a referential constraint between them.

The eligibility rules of materialized views for synchronous refresh are described in detail in *Oracle Database Data Warehousing Guide*. The principal requirements are that the materialized view must be partitioned and its partition key must be derivable from the partition key of its fact table. The materialized view definition must specify the `USING TRUSTED CONSTRAINTS` clause because sync refresh trusts the foreign key and primary key relationships to perform various refresh optimizations. The materialized view's refresh policy must be specified as `ON DEMAND`.

You have an option to register only some of the materialized views associated with a table, and leave some unregistered. Oracle Corporation does not recommend this, and in such a case, the user has to maintain the unregistered ones using the PCT or complete refresh methods.

A staging table must have been created for each base table of each materialized view in the materialized view list (`mv_list`), or else an error is thrown.

If any of the materialized views are not eligible for sync refresh, an error is thrown and the registration of all materialized views in the materialized view list fails.

Syntax

```
DBMS_SYNC_REFRESH.REGISTER_MVIEWS (
    mv_list IN VARCHAR2);
```

Parameter

Table 179-12 REGISTER_MVIEWS Procedure Parameter

| Parameter | Description |
|----------------------|--|
| <code>mv_list</code> | A comma-delimited list of materialized views to register. These names are optionally schema-qualified. |

179.3.12 REGISTER_PARTITION_OPERATION Procedure

This procedure registers a partition-maintenance operation (PMOP) on a partition of a base table.

Syntax

```
DBMS_SYNC_REFRESH.REGISTER_PARTITION_OPERATION (
    partition_op          IN VARCHAR2,
    schema_name          IN VARCHAR2,
    base_table_name      IN VARCHAR2,
    partition_name       IN VARCHAR2,
    outside_partn_table_schema IN VARCHAR2,
    outside_partn_table_name IN VARCHAR2);
```

Parameters

Table 179-13 REGISTER_PARTITION_OPERATION Procedure Parameters

| Parameter | Description |
|----------------------------|---|
| partition_op | The name of the partition operation (DROP, EXCHANGE, or TRUNCATE). |
| schema_name | The name of the schema of the base table. |
| base_table_name | The name of the base table. |
| partition_name | The name of the partition to be changed; either exchanged with the outside partition table or dropped or truncated. |
| outside_partn_table_schema | The name of the schema of the outside partition table (required for EXCHANGE only). |
| outside_partn_table_name | The name of the outside partition table (required for EXCHANGE only). |

Usage Notes

The three kinds of change operations that may be specified on partitions are DROP, TRUNCATE, and EXCHANGE.

If DROP is specified, then the partition will be dropped from the base table at the time of EXECUTE_REFRESH. If TRUNCATE is specified, then the data from the partition will be deleted but the partition itself will not be dropped. These operations provide a more efficient way of specifying the deletes of all the rows in a partition than specifying them individually in the staging log.

If EXCHANGE is specified, then the contents of the outside table is exchanged with contents of the specified partition of EXECUTE_REFRESH. This provides an alternative method to the user of providing the changes to the base tables instead of populating the staging log.

179.3.13 UNREGISTER_MVIEWS

This procedure unregisters a list of materialized views from synchronous refresh. Once a materialized view is unregistered, it can be maintained by the user with any of the traditional refresh methods, such as complete or PCT, refresh.

Syntax

```
DBMS_SYNC_REFRESH.UNREGISTER_MVIEWS (
    mv_list    IN VARCHAR20;
```

Parameter

Table 179-14 UNREGISTER_MVIEWS Parameter

| Parameter | Description |
|-----------|--|
| mv_list | A comma-delimited list of materialized views to unregister. These names are optionally schema-qualified. |

179.3.14 UNREGISTER_PARTITION_OPERATION Procedure

This procedure unregisters a partition-maintenance operation (PMOP) that had been previously registered with REGISTER_PARTITION_OPERATION on a base table. The three kinds of change operations that can be specified on partitions are DROP, TRUNCATE, and EXCHANGE.

Syntax

```
DBMS_SYNC_REFRESH.UNREGISTER_PARTITION_OPERATION (
    partition_op    IN VARCHAR2,
    schema_name     IN VARCHAR2,
    base_table_name IN VARCHAR2,
    partition_name  IN VARCHAR2);
```

Parameters

Table 179-15 UNREGISTER_PARTITION_OPERATION Procedure Parameters

| Parameter | Description |
|-----------------|---|
| partition_op | The name of the partition operation (DROP, EXCHANGE, or TRUNCATE). |
| schema_name | The name of the schema of the base table. |
| base_table_name | The name of the base table. |
| partition_name | The name of the partition to be changed; either exchanged with the outside partition table or dropped or truncated. |

DBMS_TABLE_DATA

The `DBMS_TABLE_DATA` package provides procedures that can be used to retrieve the byte value of a single column, or a series of columns, in any table. These procedures, along with a publicly documented meta-data structure for columns, can be used to retrieve the row content for row data on which the hash or user signature is computed.

This chapter contains the following topics:

- [DBMS_TABLE_DATA Overview](#)
- [DBMS_TABLE_DATA Security Model](#)
- [Summary of DBMS_TABLE_DATA Subprograms](#)

See Also:

- *Oracle Database Administrator's Guide*
- *Oracle Database Concepts*
- *Oracle Database SQL Language Reference*
- *Oracle Database Reference*

180.1 DBMS_TABLE_DATA Overview

The `DBMS_TABLE_DATA` package can be used to retrieve the byte value of a single column, or a series of columns, in any table.

These procedures, along with a publicly documented meta-data structure for columns, can be used to retrieve the `row content` for row data on which the hash or user signature is computed.

The procedures provide platform-neutral binary values for columns.

The procedures give you fine-grained control over the scope of a digital signature or cryptographic hash in terms of the columns you extract and the order in which you assemble the results.

180.2 DBMS_TABLE_DATA Security Model

The `DBMS_TABLE_DATA` package is owned by `SYS` and is installed as part of database installation. The routines in the package are run with invokers' rights (run with the privileges of the current user). The current user needs `SELECT` privileges on the table to extract column data.

180.3 Summary of DBMS_TABLE_DATA Subprograms

The DBMS_TABLE_DATA package uses GET_BYTES_FOR_COLUMN, GET_BYTES_FOR_COLUMNS, and GET_BYTES_FOR_ROW subprograms to perform various functions.

Table 180-1 DBMS_TABLE_DATA Package Subprograms

| Subprogram | Description |
|---|--|
| GET_BYTES_FOR_COLUMN Procedure | Returns the <code>column_data</code> in bytes for the particular column with name <code>column_name</code> for <code>row_id</code> row in the particular table identified by <code>schema_name.table_name</code> . |
| GET_BYTES_FOR_COLUMNS Procedure | Returns a concatenated array of column byte values in <code>column_data</code> in the order of columns specified in the <code>column_names</code> array. |
| GET_BYTES_FOR_ROW Procedure | Returns a concatenated array of column byte values in <code>column_data</code> in the order of column positions for the particular row identified by <code>row_id</code> . |

180.3.1 GET_BYTES_FOR_COLUMN Procedure

This procedure returns the `column_data` in bytes for the particular column with name `column_name` for `row_id` row in the particular table identified by `schema_name.table_name`.

Syntax

```
DBMS_TABLE_DATA.GET_BYTES_FOR_COLUMN(
  schema_name      IN VARCHAR2,
  table_name       IN VARCHAR2,
  row_id           IN ROWID,
  column_name      IN VARCHAR2,
  column_data      IN OUT BLOB);
```

Parameters

Table 180-2 GET_BYTES_FOR_COLUMN Procedure Parameters

| Parameter | Description |
|--------------------------|-------------------------|
| <code>schema_name</code> | The name of the schema. |
| <code>table_name</code> | The name of the table. |
| <code>row_id</code> | The row id. |
| <code>column_name</code> | The column name. |
| <code>column_data</code> | The data in the column. |

Usage Notes

All arguments are required.

180.3.2 GET_BYTES_FOR_COLUMNS Procedure

This procedure returns a concatenated array of column byte values in `column_data` in the order of columns specified in the `column_names` array.

Syntax

```
DBMS_TABLE_DATA.GET_BYTES_FOR_COLUMNS (
  schema_name      IN VARCHAR2,
  table_name       IN VARCHAR2,
  row_id           IN ROWID,
  column_names     IN VARCHAR2,
  column_data      IN OUT BLOB);
```

Parameters

Table 180-3 GET_BYTES_FOR_COLUMNS Procedure Parameters

| Parameter | Description |
|---------------------------|---------------------------|
| <code>schema_name</code> | The name of the schema. |
| <code>table_name</code> | The name of the table. |
| <code>row_id</code> | The row id. |
| <code>column_names</code> | The names of the columns. |
| <code>column_data</code> | The data in the columns. |

Usage Notes

All arguments are required.

180.3.3 GET_BYTES_FOR_ROW Procedure

This procedure returns a concatenated array of column byte values in `column_data` in the order of column positions for the particular row identified by `row_id`.

Syntax

```
DBMS_TABLE_DATA.GET_BYTES_FOR_ROW (
  schema_name      IN VARCHAR2,
  table_name       IN VARCHAR2,
  row_id           IN ROWID,
  column_data      IN OUT BLOB);
```

Parameters

Table 180-4 GET_BYTES_FOR_ROW Procedure Parameters

| Parameter | Description |
|--------------------------|-------------------------|
| <code>schema_name</code> | The name of the schema. |
| <code>table_name</code> | The name of the table. |
| <code>row_id</code> | The row id. |
| <code>column_data</code> | The data in the row. |

Usage Notes

All arguments are required.

DBMS_TDB

The `DBMS_TDB` package reports whether a database can be transported between platforms using the `RMAN CONVERT DATABASE` command.

The package verifies that databases on the current host platform are of the same endian format as the destination platform, and that the state of the current database does not prevent transport of the database.

See Also:

Oracle Database Backup and Recovery User's Guide regarding database transport using `CONVERT DATABASE`

This chapter contains the following topics:

- [Overview](#)
- [DBMS_TDB Security Model](#)
- [Constants](#)
- [Views](#)
- [Operational Notes](#)
- [Summary of DBMS_TDB Subprograms](#)

181.1 DBMS_TDB Overview

In many cases, Oracle supports transporting databases between platforms which have the same endian format. However, even when the endian formats are the same, a database must undergo a conversion process to move from one platform to another. There are also preconditions required for the process of transporting a database, such as having the database to be transported open read-only.

The `DBMS_TDB` package serves two purposes:

- Confirming that Oracle supports transporting a database from a given source platform to a given target platform
- Determining whether a database to be transported has been properly prepared for transport, and if not, identifying the condition that prevents database transport

The actual conversion is performed using the Recovery Manager `CONVERT DATABASE` command. For a complete discussion of the requirements for transporting a database, the process of converting a database for transport across platforms, and examples of the use of the `DBMS_TDB` subprograms in the conversion process, see *Oracle Database Backup and Recovery User's Guide*.

181.2 DBMS_TDB Security Model

Use of this package requires the `DBA` privilege.

181.3 DBMS_TDB Constants

The `DBMS_TDB` package defines several enumerated constants that should be used for specifying parameter values. Enumerated constants must be prefixed with the package name, for example, `DBMS_TDB.SKIP_NONE`.

The `DBMS_TDB` package uses the constants shown in [Table 181-1](#).

Table 181-1 DBMS_TDB Constants

| Name | Type | Value | Description |
|----------------------------|--------|-------|--|
| <code>SKIP_NONE</code> | NUMBER | 0 | Check all files when checking whether a database is ready for transport. |
| <code>SKIP_OFFLINE</code> | NUMBER | 2 | Skip files in offline tablespaces when checking whether a database is ready for transport. |
| <code>SKIP_READONLY</code> | NUMBER | 3 | Skip files in read-only tablespaces when checking whether a database is ready for transport. |

181.4 DBMS_TDB Views

The `DBMS_TDB` package uses the `V$DB_TRANSPORTABLE_PLATFORM` view.

This view is described in *Oracle Database Reference*.

- `V$DB_TRANSPORTABLE_PLATFORM`, which specifies which combinations of source and target platforms support database transport

181.5 DBMS_TDB Operational Notes

The following notes apply to `DBMS_TDB`.

- The subprograms in this package are useful both in determining whether the desired cross-platform database conversion is possible, and in checking whether the database is ready for conversion. See *Oracle Database Backup and Recovery User's Guide* for details on the different uses of these subprograms are used in the conversion process.
- The subprograms in this package return simple `TRUE` or `FALSE` results to indicate whether database transport is possible. Use the subprograms with `SERVEROUTPUT ON` for informative messages about why transport is not possible.

181.6 Summary of DBMS_TDB Subprograms

This table lists the `DBMS_TDB` subprograms and briefly describes them.

Table 181-2 DBMS_TDB Package Subprograms

| Subprogram | Description |
|---|--|
| CHECK_DB Function | Checks whether a database can be transported to a target platform |
| CHECK_EXTERNAL Function | Checks whether a database has external tables, directory or BFILES |

181.6.1 CHECK_DB Function

This function checks whether a database can be transported to a target platform. It tests whether transport is supported at all for a given source and destination platform, and whether the database is currently in the correct state for transport.

You can specify whether to skip checking parts of the database that are read-only or offline, if you do not plan to transport them.

The function is overloaded. The different functionality of each form of syntax is presented along with the definition.

Syntax

```
DBMS_TDB.CHECK_DB (
    target_platform_name  IN VARCHAR2,
    skip_option           IN NUMBER)
RETURN BOOLEAN;

DBMS_TDB.CHECK_DB (
    target_platform_name  IN VARCHAR2)
RETURN BOOLEAN;

DBMS_TDB.CHECK_DB
RETURN BOOLEAN;
```

Parameters

Table 181-3 CHECK_DB Function Parameters

| Parameter | Description |
|----------------------|--|
| target_platform_name | The name of the destination platform, as it appears in V\$DB_TRANSPORTABLE_PLATFORM. |
| skip_option | Specifies which, if any, parts of the database to skip when checking whether the database can be transported. Supported values are listed in Table 181-1 . |

Return Values

If the database cannot be transported to the target platform or is not ready to be transported, returns `FALSE`. If the database is ready for transport, returns `TRUE`.

Usage Notes

- If `SERVEROUTPUT` is `ON`, then the output will contain the reasons why the database cannot be transported and how to fix the problems. For details on possible reasons and fixes, see [Table 181-4](#).

Table 181-4 Reasons for CHECK_DB Function to Return FALSE

| Cause | Action |
|--|--|
| Unrecognized target platform name. | Check <code>V\$DB_TRANSPORTABLE_PLATFORM</code> for recognized platform names. |
| Target platform has a different endian format. | Conversion is not supported. |
| Database is not open read-only. | Open database read-only and retry. |
| There are active or in-doubt transactions in the database. | Open the database read-write. After the active transactions are rolled back, open the database read-only and retry the operation. This situation can occur if users flash back the database and open it read only. The active transactions will be rolled back when the database is opened read-write. |
| Deferred transaction rollback needs to be done. | Open the database read-write and bring online the necessary tablespaces. Once the deferred transaction rollback is complete, open the database read-only and retry the operation. |
| Database compatibility version is below 10.0.0. | Change the <code>COMPATIBLE</code> initialization parameter to 10.0.0 or higher, open the database read-only, and retry the operation. |
| Some tablespaces have not been open read-write with compatibility version is 10.0.0 or higher. | Change the <code>COMPATIBLE</code> initialization parameter to 10.0.0 or higher, then open the affected tablespaces read-write. Shut down the database, open it read-only, and retry the operation. |

Examples

This example illustrates the use of `CHECK_DB` with a database that is open read-write:

```
SQL> SET SERVEROUTPUT ON
SQL> DECLARE
    db_ready BOOLEAN;
BEGIN
    db_ready := DBMS_TDB.CHECK_DB('Microsoft Windows IA (32-bit)');
END;
/
```

Database is not open READ ONLY. Please open database READ ONLY and retry.

PL/SQL procedure successfully completed.

181.6.2 CHECK_EXTERNAL Function

This function determines whether a database has external tables, directories, or BFILEs.

Syntax

```
DBMS_TDB.CHECK_EXTERNAL  
    RETURN BOOLEAN;
```

Return Values

If the database has external tables, directories, or BFILEs, return `TRUE`. Otherwise, return `FALSE`.

Usage Notes

- If `SERVEROUTPUT` is ON, then the function will output the names of the external tables, directories, and BFILEs in the database.
- The database must be open read-write.

Examples

This example illustrates the use of `CHECK_EXTERNAL` with a database that has several external tables, directories, and BFILEs:

```
SQL> SET SERVEROUTPUT ON  
SQL> DECLARE  
    external BOOLEAN;  
    BEGIN  
        external := DBMS_TDB.CHECK_EXTERNAL;  
    END;  
    /
```

The following external tables exist in the database:

SH.SALES_TRANSACTIONS_EXT

The following directories exist in the database:

SYS.MEDIA_DIR, SYS.DATA_FILE_DIR, SYS.LOG_FILE_DIR, SYS.DATA_PUMP_DIR

The following BFILEs exist in the database:

PM.PRINT_MEDIA

PL/SQL procedure successfully completed.

DBMS_TF

The DBMS_TF package contains utilities for Polymorphic Table Functions (PTF) implementation. You can use DBMS_TF subprograms to consume and produce data, and get information about its execution environment.

You must be familiar with the Polymorphic Table Function (PTF) concepts, syntax and semantics.

See Also:

- *Oracle Database PL/SQL Language Reference* for an overview of Polymorphic Table Function (PTF) concepts
- *Oracle Database PL/SQL Language Reference* for more information about `CREATE FUNCTION PIPELINED` clause syntax and semantics

This chapter contains the following topics:

- [DBMS_TF Overview](#)
- [DBMS_TF Security Model](#)
- [DBMS_TF Constants](#)
- [DBMS_TF Operational Notes](#)
- [DBMS_TF Execution Flow](#)
- [DBMS_TF Restrictions](#)
- [DBMS_TF Examples](#)
- [DBMS_TF Data Structures](#)
- [Summary of DBMS_TF Subprograms](#)

182.1 DBMS_TF Overview

The DBMS_TF package contains types, constants, and subprograms that can be used by Polymorphic Table Functions (PTFs).

Polymorphic Table Functions (PTFs) need various services from the database to implement their functionality. PTFs need a mechanism to get rows from the database and send back new rows, for instance. The DBMS_TF package provides these server and client interfaces utilities.

182.2 DBMS_TF Security Model

PUBLIC is granted the EXECUTE privilege on package DBMS_TF. Its subprograms execute with invoker's rights privileges.

182.3 DBMS_TF Constants

This topic describes useful constants defined in the DBMS_TF package.

The DBMS_TF package defines several enumerated constants that should be used for specifying parameter values or types. Enumerated constants must be prefixed with the package name, for example, DBMS_TF.TYPE_DATE.

Table 182-1 DBMS_TF Supported Types

| Name | Description |
|--------------------|-----------------------------|
| TYPE_BINARY_DOUBLE | Type code for BINARY_DOUBLE |
| TYPE_BINARY_FLOAT | Type code for BINARY_FLOAT |
| TYPE_BLOB | Type code for BLOB |
| TYPE_CHAR | Type code for CHAR |
| TYPE_CLOB | Type code for CLOB |
| TYPE_DATE | Type code for DATE |
| TYPE_INTERVAL_DS | Type code for INTERVAL_DS |
| TYPE_INTERVAL_YM | Type code for INTERVAL_YM |
| TYPE_NUMBER | Type code for NUMBER |
| TYPE_ROWID | Type code for ROWID |
| TYPE_RAW | Type code for RAW |
| TYPE_TIMESTAMP | Type code for TIMESTAMP |
| TYPE_TIMESTAMP_TZ | Type code for TIMESTAMP_TZ |
| TYPE_VARCHAR2 | Type code for VARCHAR2 |

Additional constants are defined for use with specific subprograms.

See Also:

- [Table 182-3](#) for more information about CSTORE related constants
- [Table 182-4](#) for more information about predefined PTF method names
- [Table 182-6](#) for more information about XSTORE related constants
- [Supported Types Collections](#) for more information about predefined collections of supported types

182.4 DBMS_TF Operational Notes

These operational notes describe the client and the server-side interfaces, and detail the compilation and execution statement management of Polymorphic Table Functions (PTF).

182.4.1 PTF Client Interface

The Polymorphic Table Function (PTF) implementation client interface is a set of subprograms with fixed names that every PTF must provide.

The PTF client interface can have up to four subprograms as follow :

- `DESCRIBE` function (Required)
- `OPEN` procedure (Optional)
- `FETCH_ROWS` procedure (Optional)
- `CLOSE` procedure (Optional)

The function `DESCRIBE` is invoked during SQL cursor compilation.

The procedures `OPEN`, `FETCH_ROWS`, and `CLOSE` are invoked during query execution.

The arguments to the implementation functions must match the PTF function with the following modifications:

1. Arguments of the type `TABLE` and `COLUMNS` are skipped for the execution procedures `OPEN`, `FETCH_ROWS`, and `CLOSE`.
2. The `TABLE` and `COLUMNS` arguments have descriptor types for the `DESCRIBE` function.
3. Scalar arguments that are not available during compilation are passed as `NULL` values (when using bind variables for instance). During execution, the actual values are passed in.

DESCRIBE Function

The `DESCRIBE` function is invoked to determine the type of rows (row shape) produced by the Polymorphic Table Function (PTF). It returns a `DBMS_TF.DESCRIBE_T` table.

The function `DESCRIBE` is invoked during SQL cursor compilation when a SQL query references a PTF. The SQL compiler locates the `DESCRIBE` function defined in the PTF implementation package. All the argument values from the query calling the PTF are passed to the `DESCRIBE` function. Like any PLSQL function, the `DESCRIBE` function can be overloaded and can have arguments default values.

The arguments of the PTF function and `DESCRIBE` function must match, but with the type of any `TABLE` argument replaced with the `DBMS_TF.TABLE_T` descriptor type, and the type of any `COLUMNS` argument replaced with `DBMS_TF.COLUMN_T` descriptor.

The `DESCRIBE` function indicates which columns must be kept by the database and passed unchanged as the PTF output (Pass-Through columns). In addition, the `DESCRIBE` function indicates any input columns that the PTF will use for its computation (Read columns).

Finally, the `DESCRIBE` function returns the list of any new columns that the PTF will create (or `NULL` if no new columns are being produced) using the `DBMS_TF.DESCRIBE_T` descriptor.

OPEN Procedure

The `OPEN` procedure purpose is to initialize and allocate any execution specific state. The `OPEN` procedure is most useful when you implement a Table Semantics PTF. The function typically calls the `GET_XID` function to get a unique ID for managing the execution state.

`OPEN` procedure is generally invoked before calling the `FETCH_ROWS` procedure.

FETCH_ROWS Procedure

The `FETCH_ROWS` procedure produces an output rowset that it sends to the database. The number of invocations of this function and the size of each rowset are data dependent and determined during query execution.

CLOSE Procedure

The `CLOSE` procedure is called at the end of the PTF execution. The procedure releases resources associated with the PTF execution state.

Example 182-1 Noop Polymorphic Table Function Example

This example creates a PTF called `noop`. This PTF returns the input rows as the output rows without any modification or filtering. `Noop` is one of the smallest PTF you can write.

Live SQL:

You can view and run this example on Oracle Live SQL at [Noop Polymorphic Table Function](#)

To implement the `noop` PTF, you first create the implementation package `noop_package`.

```
CREATE PACKAGE noop_package AS
  FUNCTION describe(t IN OUT DBMS_TF.TABLE_T)
    RETURN DBMS_TF.DESCRIBE_T;

  PROCEDURE fetch_rows;
END noop_package;
```

The `DESCRIBE` function does not produce any new columns and hence, returns `NULL`. Executing `FETCH_ROWS` also results in `NULL`.

```
CREATE PACKAGE BODY noop_package AS
  FUNCTION describe(t IN OUT DBMS_TF.TABLE_T)
    RETURN DBMS_TF.DESCRIBE_T AS
  BEGIN
    RETURN NULL;
  END;

  PROCEDURE fetch_rows AS
```

```

BEGIN
    RETURN;
END;
END noop_package;

```

The noop PTF is defined to execute the noop_package when it is invoked.

```

CREATE FUNCTION noop (t TABLE)
    RETURN TABLE PIPELINED ROW POLYMORPHIC USING noop_package;

```

The PTF can be invoked in queries. For example:

```

SELECT *
FROM   NOOP(emp)
WHERE  deptno = 10;

```

| | | | | | | |
|------|--------|-----------|------|-----------|------|----|
| 7782 | CLARK | MANAGER | 7839 | 09-JUN-81 | 2450 | 10 |
| 7839 | KING | PRESIDENT | | 17-NOV-81 | 5000 | 10 |
| 7934 | MILLER | CLERK | 7782 | 23-JAN-82 | 1300 | 10 |

```

WITH e
    AS (SELECT *
        FROM   emp
            NATURAL JOIN dept
            WHERE dname = 'SALES')
SELECT t.*
FROM   NOOP(e) t;

```

| | | | | | | | |
|-------|------|---------|----------|------|-----------|------|------|
| 30 | 7499 | ALLEN | SALESMAN | 7698 | 20-FEB-81 | 1600 | 300 |
| SALES | | CHICAGO | | | | | |
| 30 | 7521 | WARD | SALESMAN | 7698 | 22-FEB-81 | 1250 | 500 |
| SALES | | CHICAGO | | | | | |

| 30 | 7900 | JAMES | CLERK | 7698 | 03-DEC-81 | 950 | |
| SALES | | CHICAGO | | | | | |

182.4.1.1 DESCRIBE Only Polymorphic Table Function

A Polymorphic Table Function (PTF) can have a DESCRIBE function only.

A PTF which does not have any runtime methods (Open/Fetch_Rows/Close) is used only at cursor compilation time with no runtime row source allocated. The explain plan output of a Describe-Only PTF will not show any rows for the PTF.

182.4.2 PTF Server Side Interface

The DBMS_TF package provides the server side interface needed for Polymorphic Table Functions (PTFs) implementation to read and write information in the database.

This topic contains a partial list of types and subprograms used for the PTF server side implementation.

Table 182-2 Summary of Commonly Used Types and Subprograms in PTF Server Side Interface

| NAME | DESCRIPTION |
|-------------------------|--|
| COLUMN_METADATA_T | Column metadata record |
| COLUMN_T | Column descriptor record |
| TABLE_T | Table descriptor record |
| COLUMNS_T | Collection containing column names |
| COLUMNS_NEW_T | Collection for new columns |
| TAB_<typ>_T | Collection for each supported types, where <typ> is described in " Supported Types Collections " |
| ROW_SET_T | Data for a rowset record |
| GET_COL Procedure | Fetches data for a specified (input) column |
| PUT_COL Procedure | Returns data for a specified (new) column |
| GET_ROW_SET Procedure | Fetches the input rowset of column values |
| PUT_ROW_SET Procedure | Returns data for ALL (new) columns |
| SUPPORTED_TYPE Function | Verifies if a type is supported by DBMS_TF subprograms |
| GET_XID Function | Returns a unique execution ID to index PTF state in a session |

See Also:

- [DBMS_TF Data Structures](#) for the complete list of types
- [Summary of DBMS_TF Subprograms](#) for the complete list of subprograms

182.4.3 Read Columns

Read columns are a set of table columns that the Polymorphic Table Function (PTF) processes when executing the `FETCH_ROWS` procedure.

The PTF indicates the read columns inside `DESCRIBE` by annotating them in the input table descriptor, `TABLE_T`. Only the indicated read columns will be fetched and thus available for processing during `FETCH_ROWS`.

The PTF invocation in a query will typically use the `COLUMNS` operator to indicate which columns the query wants the PTF to read, and this information is passed to the `DESCRIBE` function which then in turn sets the `COLUMN_T.FOR_READ` boolean flag.

Only scalar SQL data types are allowed for the read columns.

The [Echo Polymorphic Table Function Example](#) takes a table and a list of columns and produces new columns with the same values.

182.4.4 Pass-Through Columns

Pass-through columns are passed from the input table of the Polymorphic Table Function (PTF) to the output, without any modifications.

The `DESCRIBE` function indicates the pass-through columns by setting the `COLUMN_T.PASS_THROUGH` boolean flag on the input table descriptor, `DBMS_TF.TABLE_T`.

All columns in the `Row Semantics` PTF are marked as pass-through by default. For `Table Semantics` PTF, the default value for pass-through is set to `false`. For the `Table Semantics` PTF, the partitioning columns are always pass-through and this cannot be changed by the `DESCRIBE` function.

Note, the notions of Pass-Through and Read are orthogonal, and indicating a column as one has no implication for the other.

182.4.5 State Management

The database manages the compilation and execution states of the polymorphic table functions (PTF).

The database fulfills the PTF conductor role. As such, it is responsible for the PTF compilation state and execution state.

1. **Compilation State** : This is the immutable state that is generated by `DESCRIBE` which is needed before execution.
2. **Execution State**: This is the state used by the execution time procedures (`OPEN`, `FETCH_ROWS`, and `CLOSE`) of a `Table semantics` PTF.

The most common use of compilation state is to keep track of the columns to be read and the new columns that are to be produced. The PTF Server interface provides functions that can be used to achieve this: `GET_ENV`, and `GET_ROW_SET`. The PTF author who defines, documents, and implements the PTF can rely on the database to manage the PTF states. The PTF author should not attempt to use the session state (such as PL/SQL package global variables) to store any compilation state. Problems can arise because in a given session all cursors using the PTF will share that state, and other sessions executing the PTF cursor will not see the original compilation state.

Since the execution state is session and cursor private, a `Table Semantics` PTF can use package globals for storing execution state, but with the provision that the PTF uses the database provided unique execution ID to identify that state. The `GET_XID` function guarantees to provide an execution unique ID for the PTF's execution procedures, where this ID remains constant for all the execution functions of a PTF.

182.4.5.1 CSTORE Compilation State Management

The CSTORE is the PTF compilation state management interface.

The CSTORE enables Polymorphic Table Functions (PTF) to store the compilation state in the SQL cursor.

The CSTORE interface is used to store key-value pairs during cursor compilation through the `DBMS_TF.DESCRIBE_T` record.

The compilation state information is retrieved during execution procedures such as OPEN, FETCH_ROWS and CLOSE.

CSTORE Subprograms

The CSTORE interface consists of the following subprograms.

| Name | Description |
|------------------------|---|
| CSTORE_GET procedure | Fetches item of specified type. If not found, the OUT value remains unchanged. |
| CSTORE_EXISTS function | If an item with the given key exists in the CSTORE, this function returns TRUE. |

CSTORE Supported Types

The DBMS_TF.DESCRIBE_T supports specifying key-value pairs for these scalar types: VARCHAR2, NUMBER, DATE, BOOLEAN.

Table 182-3 DBMS_TF CSTORE Scalar Supported Types

| Name | Description |
|----------------------|---------------------------|
| CSTORE_TYPE_VARCHAR2 | CSTORE VARCHAR2 type code |
| CSTORE_TYPE_NUMBER | CSTORE NUMBER type code |
| CSTORE_TYPE_DATE | CSTORE DATE type code |
| CSTORE_TYPE_BOOLEAN | CSTORE BOOLEAN type code |

Collections For Compilation Storage

These predefined collection types are used for compilation state management.

```
TYPE CSTORE_CHR_T IS TABLE OF VARCHAR2(32767) INDEX BY VARCHAR2(32767);
TYPE CSTORE_NUM_T IS TABLE OF NUMBER INDEX BY VARCHAR2(32767);
TYPE CSTORE_BOL_T IS TABLE OF BOOLEAN INDEX BY VARCHAR2(32767);
TYPE CSTORE_DAT_T IS TABLE OF DATE INDEX BY VARCHAR2(32767);
```

DBMS_TF Method Names

The method names are also stored in the DBMS_TF.DESCRIBE_T record. These predefined values for the method names can be customized by the PTF author.

See [Method Name Overrides](#) for more information about changing the default method names

Table 182-4 DBMS_TF Method Names Constants

| Name | Type | Value | Description |
|-------|----------------|---------|---|
| CLOSE | DBMS_QUOTED_ID | 'CLOSE' | Predefined index value for the method named CLOSE |

Table 182-4 (Cont.) DBMS_TF Method Names Constants

| Name | Type | Value | Description |
|------------|----------------|--------------|--|
| FETCH_ROWS | DBMS_QUOTED_ID | 'FETCH_ROWS' | Predefined index value for the method named FETCH_ROWS |
| OPEN | DBMS_QUOTED_ID | 'OPEN' | Predefined index value for the method named OPEN |

182.4.5.2 XSTORE Execution State Management

XSTORE is the PTF execution state management interface.

The XSTORE key-value interface simplifies the implementation of Table Semantics PTFs by providing automatic state management capabilities when the keys are strings and values are of commonly used scalar types.

The database automatically manages the deletion of all execution states allocated using this interface.

XSTORE Subprograms

The execution state management interface consists of the following subprograms.

Table 182-5 DBMS_TF XSTORE Subprograms

| Name | Description |
|-------------------------|---|
| XSTORE_CLEAR procedure | Removes all key-value pairs from the XSTORE execution state |
| XSTORE_EXISTS function | Returns TRUE if an item with a given key exists in the XSTORE |
| XSTORE_GET procedure | Gets the associated value for a given key stored in the XSTORE |
| XSTORE_REMOVE procedure | Removes an item associated with the given key and key_type |
| XSTORE_SET procedure | Sets the value for the given key for PTF Execution State Management |

XSTORE Predefined Types

The XSTORE supports specifying key-value pairs for these scalar types: VARCHAR2, NUMBER, DATE, and BOOLEAN.

Table 182-6 DBMS_TF XSTORE Scalar Supported Types

| Name | Description |
|----------------------|---------------------------|
| XSTORE_TYPE_VARCHAR2 | XSTORE VARCHAR2 type code |
| XSTORE_TYPE_NUMBER | XSTORE NUMBER type code |

Table 182-6 (Cont.) DBMS_TF XSTORE Scalar Supported Types

| Name | Description |
|---------------------|--------------------------|
| XSTORE_TYPE_DATE | XSTORE DATE type code |
| XSTORE_TYPE_BOOLEAN | XSTORE BOOLEAN type code |

182.4.6 Method Name Overrides

When multiple polymorphic table function (PTF) implementations are in the same package, you can override the default runtime method names (`OPEN`, `FETCH_ROWS`, and `CLOSE`) with your PTF specific names.

To override a method name, the application can specify the new method names using `DBMS_TF.METHOD_NAMES` collection (see [DESCRIBE_T Record Type](#)).

See Also:

[Table 182-4](#)

Example 182-2 DBMS_TF Method Name Overrides

This example shows how to change the default method name of the `noop_p` PTF `fetch_rows` method to `noop_fetch`.

Live SQL:

You can view and run this example on Oracle Live SQL at [DBMS_TF Method Name Overrides](#)

Create the PTF implementation package `noop_p`.

```
CREATE PACKAGE noop_p AS
  FUNCTION describe(tab IN OUT DBMS_TF.table_t)
    RETURN DBMS_TF.describe_t;
  PROCEDURE noop_fetch;
END noop_p;
```

To provide a method name override, you can specify the new method names using `DBMS_TF.Method_Names` collection. The `FETCH_ROWS` method name is changed to `Noop_Fetch`. The procedure `noop_fetch` to implement this method is defined in the package.

```
CREATE OR replace PACKAGE BODY noop_p
AS
  FUNCTION describe(tab IN OUT DBMS_TF.table_t)
    RETURN DBMS_TF.describe_t AS
```

```

        methods DBMS_TF.methods_t := DBMS_TF.methods_t(DBMS_TF.fetch_rows =>
'Noop_Fetch');
    BEGIN
        RETURN DBMS_TF.describe_t(method_names => methods);
    END;
    PROCEDURE noop_fetch AS
    BEGIN
        RETURN;
    END;
END noop_p;

```

The noop PTF is defined to execute the noop_p when it is invoked.

```

CREATE FUNCTION noop (t TABLE) RETURN TABLE PIPELINED ROW POLYMORPHIC USING
noop_p;

```

The PTF is invoked in the FROM clause of a query block.

```

SELECT *
FROM noop(scott.emp)
WHERE deptno =10;

```

182.4.7 Using the COLUMNS Pseudo-Operator

The COLUMNS pseudo-operator is an addition to the SQL expression language.

Use the COLUMNS pseudo-operator to specify the arguments when invoking a Polymorphic Table Function (PTF) in the FROM clause. The COLUMNS pseudo-operator arguments specify the list of column names, or the list of column names with associated types.

See Also:

Oracle Database PL/SQL Language Reference for more information about the COLUMNS pseudo-operator syntax and semantics

182.4.8 Query Transformations

About predicate, projection and partitioning.

The pass-through columns of a Row Semantics PTF, and the PARTITION BY key columns of a Table Semantics PTF can be used for projection and predicate pushdown.

Example 182-3 Query Transformations

This example illustrates the predicate and projection pushdown for a Row Semantics PTF.

This query calls the echo PTF created in [Echo Polymorphic Table Function Example](#).

```

SELECT empno, ename, sal, comm, echo_sal
FROM echo(emp, COLUMNS(sal,comm))

```

```
WHERE deptno = 30
      AND echo_sal > 1000;
```

| EMPNO | ENAME | SAL | COMM | ECHO_SAL |
|-------|--------|------|------|----------|
| 7499 | ALLEN | 1600 | 300 | 1600 |
| 7521 | WARD | 1250 | 500 | 1250 |
| 7654 | MARTIN | 1250 | 1400 | 1250 |
| 7698 | BLAKE | 2850 | | 2850 |
| 7844 | TURNER | 1500 | 0 | 1500 |

Conceptually, this query will get rewritten as:

```
WITH t AS (SELECT empno, ename, sal, comm
FROM emp
WHERE deptno=30)
SELECT empno, ename, sal, comm, echo_sal
FROM echo(t, COLUMNS(sal, comm))
WHERE echo_sal > 1000;
```

182.4.9 Parallel Execution

A key benefit of Polymorphic Table Functions (PTFs) is that their execution can be parallelized.

Row and table semantic PTFs execute in parallel differently.

Row Semantics PTF

Under `Row Semantics` PTF, the parallel query executes with the same degree of parallelism (DOP) as it would if the PTF were not present. The DOP is driven by the child row source.

Provided that the DOP on table `emp` has been set to 5, the following is an example that shows this parallelization:

```
EXPLAIN PLAN FOR
SELECT * FROM echo(emp, COLUMNS(ename, job))
WHERE deptno != 20;
```

| Id | Operation | Name |
|-----|----------------------------|----------|
| 0 | SELECT STATEMENT | |
| 1 | PX COORDINATOR | |
| 2 | PX SEND QC (RANDOM) | :TQ10000 |
| 3 | POLYMORPHIC TABLE FUNCTION | ECHO |
| 6 | PX BLOCK ITERATOR | |
| * 7 | TABLE ACCESS FULL | EMP |

```

Predicate Information (identified by operation id):
5 - filter("EMP"."DEPTNO"<>20)
```

Table Semantics PTF

Table Semantics PTF requires its input table rows to be redistributed using the `PARTITION BY` key. The parallel execution is determined by the `PARTITION BY` clause specified in the query.

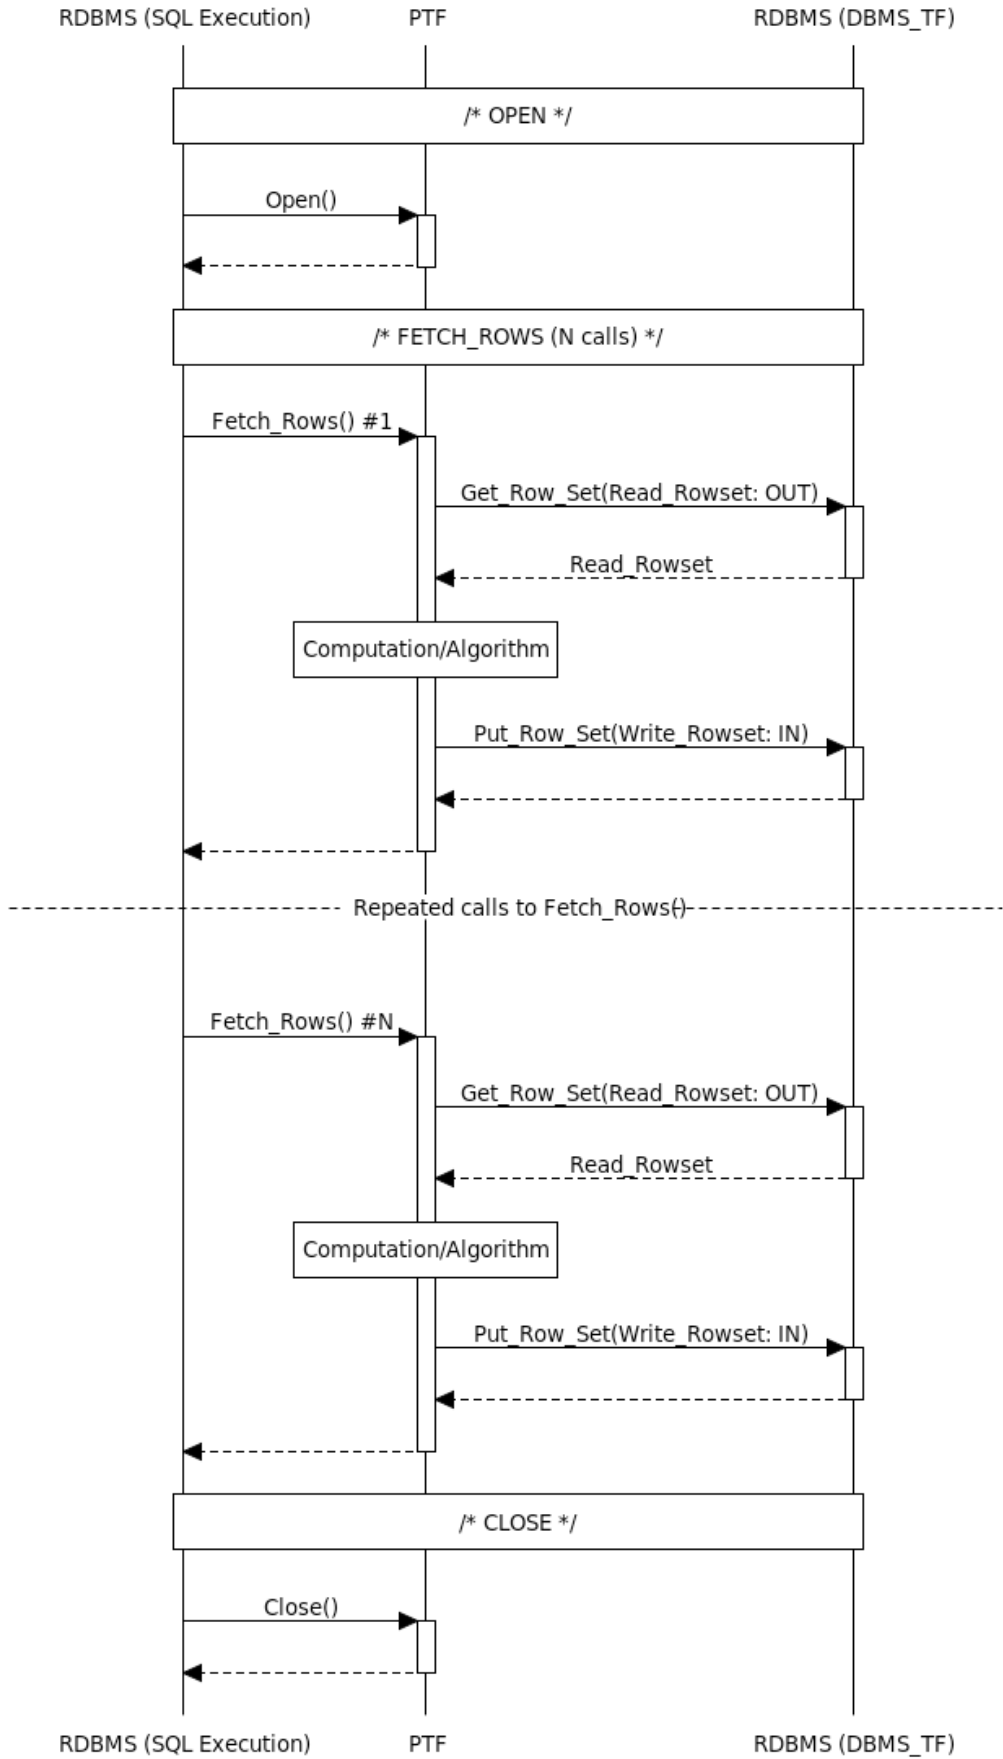

182.5 DBMS_TF Execution Flow

Query executions invoking Polymorphic Table Functions (PTF) follow this execution model and data transfers flow.

The PTF execution procedures (`OPEN`, `FETCH_ROWS` and `CLOSE`) are called by the database during query execution.

The PTF execution follows this flow :

1. `OPEN` (if present)
2. `FETCH_ROWS` (can be invoked multiple times)
3. `CLOSE` (if present)

The `FETCH_ROWS` procedure reads the data for a rowset (collection of rows), and produces an output rowset.

Each call to `FETCH_ROWS` is associated with a rowset which is a data collection of input rows that is expected to be processed by the PTF.

The `GET_ROW_SET` or `GET_COL` is used to read the input rowset.

The `PUT_ROW_SET` or `PUT_COL` is used to produce an output rowset, that is written back to the database.

`PUT_ROW_SET` is used to set all the new columns in a single call.

The `ROWSET_T` record holds data for multiple columns. When the PTF algorithm is more suited toward producing a single output column at a time, you can use `PUT_COL` to produce a single column. A given column can only be produced once within a call to `FETCH_ROWS`.

For a Row Semantics PTF, the `FETCH_ROWS` procedure will return the new rows using the PTF Server interface before returning back to the database.

182.6 DBMS_TF Restrictions

These restrictions apply to Polymorphic Table Functions (PTFs) and using the `DBMS_TF` package.

Type Restrictions

A Polymorphic Table Function (PTF) can operate on a table with columns of any SQL types. However, read and new columns are restricted to scalar types. The read and new columns are used in the `PUT_ROW_SET`, `PUT_COL`, `GET_ROW_SET` and `GET_COL` procedures. All SQL types can be used with pass-through columns. The `DESCRIBE` function can determine the supported types using the `DBMS_TF.SUPPORTED_TYPE` function.

PTF Invocation and Execution Restrictions

Polymorphic table functions cannot be nested in the `FROM` clause of a query. Nesting PTF is only allowed using `WITH` clause.

Nesting table function with polymorphic table function is only allowed using `CURSOR` expressions. A PTF cannot be specified as an argument of a table function.

You cannot select a rowid from a Polymorphic Table Function (PTF).

The `PARTITION BY` and the `ORDER BY` clause can only be specified on an argument of a Table Semantics PTF.

The PTF execution methods `OPEN`, `FETCH_ROWS`, and `CLOSE` must be invoked in the polymorphic table function execution context only.

You cannot invoke the `DESCRIBE` method directly.

This example shows ten PTF nested invocation.

```
WITH t0
  AS (SELECT /*+ parallel */ *
      FROM   noop(dept)),
```

```
t1
AS (SELECT *
    FROM noop(t0)),
t2
AS (SELECT *
    FROM noop(t1)),
t3
AS (SELECT *
    FROM noop(t2)),
t4
AS (SELECT *
    FROM noop(t3)),
t5
AS (SELECT *
    FROM noop(t4)),
t6
AS (SELECT *
    FROM noop(t5)),
t7
AS (SELECT *
    FROM noop(t6)),
t8
AS (SELECT *
    FROM noop(t7)),
t9
AS (SELECT *
    FROM noop(t8))
SELECT *
FROM noop(t9)
WHERE deptno = 10;
```

10 ACCOUNTING NEW YORK

182.7 DBMS_TF Examples

These examples use DBMS_TF subprograms.

Summary of DBMS_TF Examples

These examples are incomplete and for demonstration purpose only.

182.7.1 Echo Polymorphic Table Function Example

The echo PTF takes in a table and a list of columns and produces new columns with same values.

This PTF returns all the columns in the input table `tab`, and adds to it the columns listed in `cols` but with the column names prefixed with "ECHO_".

Live SQL:

You can view and run this example on Oracle Live SQL at [Echo Polymorphic Table Function](#)

The echo PTF can appear in the FROM clause of the query. The COLUMNS operator is used to specify columns, for example:

```
SELECT *
FROM echo(scott.dept, COLUMNS(dname, loc));
```

| DEPTNO | DNAME | LOC | ECHO_DNAME | ECHO_LOC |
|--------|------------|----------|------------|----------|
| 10 | ACCOUNTING | NEW YORK | ACCOUNTING | NEW YORK |
| 20 | RESEARCH | DALLAS | RESEARCH | DALLAS |
| 30 | SALES | CHICAGO | SALES | CHICAGO |
| 40 | OPERATIONS | BOSTON | OPERATIONS | BOSTON |

A PTF consists of the following :

- PTF implementation package specification : The specification must have the DESCRIBE method. The OPEN, FETCH_ROWS and CLOSE methods are optional.

- PTF implementation package body: The DESCRIBE method may have a new-columns parameter (the additional columns created by this PTF), which is followed by the PTF functions parameters.
- PTF Function: The PTF function has a reference to the implementation package.

The echo_package package specification defines the DESCRIBE and FETCH_ROWS methods.

```
CREATE PACKAGE echo_package
AS
  prefix DBMS_ID := 'ECHO_';
  FUNCTION describe(
    tab IN OUT DBMS_TF.TABLE_T,
    cols IN DBMS_TF.COLUMNS_T)
  RETURN DBMS_TF.DESCRIBE_T;
  PROCEDURE fetch_rows;
END echo_package;
```

The echo_package package body contains the PTF implementation.

```
CREATE PACKAGE BODY echo_package
AS
  FUNCTION describe(tab IN OUT DBMS_TF.TABLE_T,
    cols IN DBMS_TF.COLUMNS_T)
  RETURN DBMS_TF.DESCRIBE_T
  AS
    new_cols DBMS_TF.COLUMNS_NEW_T;
    col_id PLS_INTEGER := 1;
  BEGIN
    FOR I IN 1 .. tab.COLUMN.COUNT LOOP
      FOR J IN 1 .. cols.COUNT LOOP
        IF ( tab.COLUMN(i).description.name = cols(j) ) THEN
          IF ( NOT
DBMS_TF.SUPPORTED_TYPE(tab.COLUMN(i).description.TYPE) )
          THEN
            RAISE_APPLICATION_ERROR(-20102, 'Unsupported column
type [' ||
              TAB.COLUMN(i).description.TYPE||']');
          END IF;

          TAB.COLUMN(i).for_read := TRUE;
          NEW_COLS(col_id) := TAB.COLUMN(i).description;
          NEW_COLS(col_id).name := prefix ||
TAB.COLUMN(i).description.name;
          col_id := col_id + 1;

          EXIT;
        END IF;
      END LOOP;
    END LOOP;

    /* Verify all columns were found */
    IF ( col_id - 1 != cols.COUNT ) THEN
      RAISE_APPLICATION_ERROR(-20101, 'Column mismatch ['||col_id -
```

```

1||'], ['||cols.COUNT||']');
    END IF;

    RETURN DBMS_TF.DESCRIBE_T(new_columns => new_cols);
END;
PROCEDURE FETCH_ROWS
AS
    ROWSET DBMS_TF.ROW_SET_T;
BEGIN
    DBMS_TF.GET_ROW_SET(rowset);
    DBMS_TF.PUT_ROW_SET(rowset);
END;
END echo_package;

```

The PTF echo references the implementation package echo_package.

```

CREATE FUNCTION echo(tab TABLE,
                    cols COLUMNS)
RETURN TABLE
PIPELINED ROW POLYMORPHIC USING echo_package;

```

Example 182-4 Using the Echo PTF in Queries

This example selects all employees in department 20. The resulting rows have three new columns ECHO_ENAME, ECHO_HIREDATE, and ECHO_SAL.

```

SELECT *
FROM   echo(scott.emp, COLUMNS(ename, sal, hiredate))
WHERE  deptno = 20;

```

| EMPNO | ENAME | JOB | MGR | HIREDATE | SAL | COMM | DEPTNO | ECHO_ENAME | ECHO_HIREDATE | ECHO_SAL |
|-------|-------|---------|------|-----------|------|------|--------|------------|---------------|----------|
| 7369 | SMITH | CLERK | 7902 | 17-DEC-80 | 800 | | 20 | SMITH | 17-DEC-80 | 800 |
| 7566 | JONES | MANAGER | 7839 | 02-APR-81 | 2975 | | 20 | JONES | 02-APR-81 | 2975 |
| 7788 | SCOTT | ANALYST | 7566 | 19-APR-87 | 3000 | | 20 | SCOTT | 19-APR-87 | 3000 |
| 7876 | ADAMS | CLERK | 7788 | 23-MAY-87 | 1100 | | 20 | ADAMS | 23-MAY-87 | 1100 |
| 7902 | FORD | ANALYST | 7566 | 03-DEC-81 | 3000 | | 20 | FORD | 03-DEC-81 | 3000 |

Using subquery w, display ENAME, ECHO_LOC and DNAME columns for all employees in department 30 with a salary greater than 1000.

```

WITH w
AS (SELECT e.*,
         dname,
         loc
    FROM   scott.emp e,
         scott.dept d
   WHERE  e.deptno = d.deptno)
SELECT  ename,
        echo_loc,
        dname
FROM    echo(w, COLUMNS(sal, dname, loc, hiredate))

```

```
WHERE deptno = 30
      AND echo_sal > 1000;
```

| ENAME | ECHO_LOC | DNAME |
|--------|----------|-------|
| ALLEN | CHICAGO | SALES |
| WARD | CHICAGO | SALES |
| MARTIN | CHICAGO | SALES |
| BLAKE | CHICAGO | SALES |
| TURNER | CHICAGO | SALES |

Using subquery w, display ENAME and DNAME columns for all employees with a salary greater than 1000.

```
WITH w
     AS (SELECT e.*,
              dname,
              loc
          FROM scott.emp e,
              scott.dept d
          WHERE e.deptno = d.deptno)
SELECT echo_ename,
       dname
FROM   echo(w, COLUMNS(loc, deptno, dname, ename)) e
WHERE  ename IN (SELECT echo_ename
                FROM   echo(scott.emp, COLUMNS(sal, deptno, ename,
                                                hiredate))
                WHERE  deptno = e.echo_deptno
                    AND sal > 1000);
```

| ECHO_ENAME | DNAME |

182.8 DBMS_TF Data Structures

The DBMS_TF package defines these RECORD types, TABLE types and subtype.

RECORD Types

- [COLUMN_DATA_T Record Type](#)
- [COLUMN_METADATA_T Record Type](#)
- [COLUMN_T Record Type](#)

- [DESCRIBE_T Record Type](#)
- [ENV_T Record Type](#)
- [PARALLEL_ENV_T Record Type](#)
- [TABLE_T Record Type](#)

TABLE Types

- [Supported Types Collections \(TAB_<typ>_T\)](#)
- [COLUMNS_NEW_T Table Type](#)
- [COLUMNS_T Table Type](#)
- [COLUMNS_WITH_TYPE_T Table Type](#)
- [TABLE_COLUMNS_T Table Type](#)
- [ROW_SET_T Table Type](#)

Types

- [XID_T Subtype](#)

CSTORE and XSTORE Data Structures

The compilation and execution state management interfaces use data structures internally.

See [Collections For Compilation Storage](#) for more information.

182.8.1 Supported Types Collections

Each supported type has a corresponding predefined collection defined.

Syntax

```

TYPE TAB_BOOLEAN_T          IS TABLE OF BOOLEAN          INDEX BY PLS_INTEGER;
TYPE TAB_BINARY_FLOAT_T    IS TABLE OF BINARY_FLOAT    INDEX BY PLS_INTEGER;
TYPE TAB_BINARY_DOUBLE_T   IS TABLE OF BINARY_DOUBLE   INDEX BY PLS_INTEGER;
TYPE TAB_BLOB_T            IS TABLE OF BLOB             INDEX BY PLS_INTEGER;
TYPE TAB_CHAR_T            IS TABLE OF CHAR(32767)      INDEX BY PLS_INTEGER;
TYPE TAB_CLOB_T            IS TABLE OF CLOB             INDEX BY PLS_INTEGER;
TYPE TAB_DATE_T            IS TABLE OF DATE            INDEX BY PLS_INTEGER;
TYPE TAB_INTERVAL_YM_T     IS TABLE OF YMINTERVAL_UNCONSTRAINED INDEX BY PLS_INTEGER;
TYPE TAB_INTERVAL_DS_T     IS TABLE OF DSINTERVAL_UNCONSTRAINED INDEX BY PLS_INTEGER;
TYPE TAB_NATURALN_T        IS TABLE OF NATURALN        INDEX BY PLS_INTEGER;
TYPE TAB_NUMBER_T          IS TABLE OF NUMBER          INDEX BY PLS_INTEGER;
TYPE TAB_RAW_T             IS TABLE OF RAW(32767)      INDEX BY PLS_INTEGER;
TYPE TAB_ROWID_T           IS TABLE OF ROWID           INDEX BY PLS_INTEGER;

```

```

TYPE TAB_VARCHAR2_T      IS TABLE OF VARCHAR2(32767) INDEX BY PLS_INTEGER;

TYPE TAB_TIMESTAMP_T     IS TABLE OF TIMESTAMP_UNCONSTRAINED INDEX BY
PLS_INTEGER;

TYPE TAB_TIMESTAMP_TZ_T  IS TABLE OF TIMESTAMP_TZ_UNCONSTRAINED INDEX BY
PLS_INTEGER;

TYPE TAB_TIMESTAMP_LTZ_T IS TABLE OF TIMESTAMP_LTZ_UNCONSTRAINED INDEX BY
PLS_INTEGER;

```

See Also:

[Table 182-1](#) for more information about the DBMS_TF supported types

182.8.2 COLUMN_DATA_T Record Type

Data for a single column (variant record).

Exactly one variant field is active in the record. The description includes information about the column type that is active.

See [Table 182-1](#) for the list of supported types.

Syntax

```

TYPE COLUMN_DATA_T IS RECORD
( description          COLUMN_METADATA_T,
  tab_varchar2        TAB_VARCHAR2_T,
  tab_number          TAB_NUMBER_T,
  tab_date            TAB_DATE_T,
  tab_binary_float    TAB_BINARY_FLOAT_T,
  tab_binary_double   TAB_BINARY_DOUBLE_T,
  tab_raw             TAB_RAW_T,
  tab_char            TAB_CHAR_T,
  tab_clob            TAB_CLOB_T,
  tab_blob            TAB_BLOB_T,
  tab_timestamp       TAB_TIMESTAMP_T,
  tab_timestamp_tz    TAB_TIMESTAMP_TZ_T,
  tab_interval_ym     TAB_INTERVAL_YM_T,
  tab_interval_ds     TAB_INTERVAL_DS_T,
  tab_timestamp_ltz   TAB_TIMESTAMP_LTZ_T,
  tab_rowid           TAB_ROWID_T);

```

Fields

Table 182-7 COLUMN_DATA_T Fields

| Field | Description |
|--------------|---|
| description | The tag defines the metadata for the column indicating which variant field is active. |
| tab_varchar2 | Variant field |

Table 182-7 (Cont.) COLUMN_DATA_T Fields

| Field | Description |
|-------------------|---------------|
| tab_number | Variant field |
| tab_date | Variant field |
| tab_binary_float | Variant field |
| tab_binary_double | Variant field |
| tab_raw | Variant field |
| tab_char | Variant field |
| tab_clob | Variant field |
| tab_blob | Variant field |
| tab_timestamp | Variant field |
| tab_timestamp_tz | Variant field |
| tab_interval_ym | Variant field |
| tab_interval_ds | Variant field |
| tab_timestamp_ltz | Variant field |
| tab_rowid | Variant field |

182.8.3 COLUMN_METADATA_T Record Type

This type contains metadata about an existing table column or a new column produced by PTF.

Syntax

```
TYPE COLUMN_METADATA_T IS RECORD
( type          PLS_INTEGER,
  max_len       PLS_integer DEFAULT -1,
  name          VARCHAR2(32767),
  name_len      PLS_INTEGER,
  precision     PLS_INTEGER,
  scale         PLS_INTEGER,
  charsetid     PLS_INTEGER,
  charsetform   PLS_INTEGER,
  collation     PLS_INTEGER );
```

Fields

Table 182-8 COLUMN_METADATA_T Fields

| Field | Description |
|---------|---|
| type | Internal Oracle typecode for the column's type |
| max_len | Maximum length of a column. If it is less than the maximum allowed length then that value will be used, if it is NULL or zero, zero will be used. If it is less than zero, then maximum allowed length will be used. If types (like date,float), does not care about length, then this value will be ignored. |

Table 182-8 (Cont.) COLUMN_METADATA_T Fields

| Field | Description |
|-------------|---|
| name | Name of the column |
| name_len | Length of the name |
| precision | The precision, or the maximum number of significant decimal digits (for numeric data types) |
| scale | Scale, or the number of digits from the decimal point to the least significant digit (for numeric data types) |
| charsetid | Character set id (internal Oracle code, applies to string types) |
| charsetform | Character set form (internal Oracle code, applies to string types) |
| collation | Collation id (internal Oracle code, applies to string types) |

182.8.4 COLUMN_T Record Type

The column descriptor record for the type COLUMN_METADATA_T that contains PTF specific attributes.

Syntax

```
TYPE column_t IS RECORD (
    description          COLUMN_METADATA_T,
    pass_through        BOOLEAN,
    for_read            BOOLEAN);
```

Fields

Table 182-9 COLUMN_T Fields

| Field | Description |
|--------------|--------------------------------|
| description | Column metadata |
| pass_through | Is this a pass through column |
| for_read | Is this column read by the PTF |

182.8.5 DESCRIBE_T Record Type

The return type from the DESCRIBE method of PTF.

Syntax

```
TYPE DESCRIBE_T          IS RECORD
( NEW_COLUMNS           COLUMNS_NEW_T DEFAULT COLUMNS_NEW_T(),
  CSTORE_CHR            CSTORE_CHR_T  DEFAULT CSTORE_CHR_T(),
  CSTORE_NUM            CSTORE_NUM_T  DEFAULT CSTORE_NUM_T(),
  CSTORE_BOL            CSTORE_BOL_T  DEFAULT CSTORE_BOL_T(),
  CSTORE_DAT            CSTORE_DAT_T  DEFAULT CSTORE_DAT_T(),
  METHOD_NAMES          METHODS_T     DEFAULT METHODS_T());
```

Fields

Table 182-10 DESCRIBE_T Fields

| Field | Description |
|--------------|---|
| NEW_COLUMNS | New columns description that will be produced by the PTF |
| CSTORE_CHR | CStore array key type : VARCHAR2 (optional) |
| CSTORE_NUM | CStore array key type : NUMBER (optional) |
| CSTORE_BOL | CStore array key type : BOOLEAN (optional) |
| CSTORE_DAT | CStore array key type : DATE (optional) |
| METHOD_NAMES | Method names, if user wants to override OPEN, FETCH_ROWS, CLOSE methods |

182.8.6 ENV_T Record Type

This record contains metadata about the polymorphic table function execution state.

Syntax

```
TYPE ENV_T IS RECORD (
  get_columns      TABLE_METADATA_T,
  put_columns      TABLE_METADATA_T,
  ref_put_col      REFERENCED_COLS_T,
  parallel_env     PARALLEL_ENV_T,
  query_optim      BOOLEAN,
  row_count        PLS_INTEGER,
  row_replication  BOOLEAN,
  row_insertion    BOOLEAN);
```

Fields

Table 182-11 ENV_T Fields

| Field | Description |
|-----------------|--|
| get_columns | Metadata about the columns read by PTF GET_COL procedure |
| put_columns | Metadata about columns sent back to database by PUT_COL procedure |
| ref_put_col | TRUE if the put column was referenced in the query |
| parallel_env | Parallel execution information (when a query runs in parallel) |
| query_optim | Is this execution for query optimization? TRUE, if the query was running on behalf of optimizer |
| row_count | Number of rows in current row set |
| row_replication | Is Row Replication Enabled? |
| row_insertion | Is Row Insertion Enabled? |

182.8.7 PARALLEL_ENV_T Record Type

The record contains metadata specific to polymorphic table functions parallel execution.

Syntax

```

TYPE PARALLEL_ENV_T          IS RECORD
( instance_id                PLS_INTEGER,
  session_id                 PLS_INTEGER,
  slave_svr_grp              PLS_INTEGER,
  slave_set_no               PLS_INTEGER,
  no_slocal_slaves           PLS_INTEGER,
  global_slave_no            PLS_INTEGER,
  no_local_slaves            PLS_INTEGER,
  local_slave_no             PLS_INTEGER );

```

Fields**Table 182-12** PARALLEL_ENV_T Fields

| Field | Description |
|------------------|--|
| instance_id | QC instance ID |
| session_id | QC session ID |
| slave_svr_grp | Slave server group |
| slave_set_no | Slave server set number |
| no_slocal_slaves | Number of sibling slaves (including self) |
| global_slave_no | Global slave number (base 0) |
| no_local_slaves | Number of sibling slaves running on instance |
| local_slave_no | Local slave number (base 0) |

182.8.8 TABLE_T Record Type

The DESCRIBE function input table descriptor argument is of TABLE_T record type.

Syntax

```

TYPE TABLE_T IS RECORD(
  column                TABLE_COLUMNS_T,
  schema_name           DBMS_id,
  package_name           DBMS_id,
  ptf_name               DBMS_id);

```

Fields**Table 182-13** TABLE_T Fields

| Field | Description |
|--------------|-------------------------------------|
| column | Column information |
| schema_name | The PTF schema name |
| package_name | The PTF implementation package name |
| ptf_name | The PTF name invoked |

182.8.9 COLUMNS_NEW_T Table Type

Collection for new columns

Syntax

```
TYPE COLUMNS_NEW_T IS TABLE OF COLUMN_METADATA_T INDEX BY PLS_INTEGER;
```

182.8.10 COLUMNS_T Table Type

Collection containing column names

Syntax

```
TYPE COLUMNS_T IS TABLE OF DBMS_QUOTED_ID;
```

182.8.11 COLUMNS_WITH_TYPE_T Table Type

Collection containing columns metadata

Syntax

```
TYPE COLUMNS_WITH_TYPE_T IS TABLE OF COLUMN_METADATA_T;
```

182.8.12 TABLE_COLUMNS_T Table Type

A collection of columns(COLUMN_T)

Syntax

```
TYPE TABLE_COLUMNS_T IS TABLE OF COLUMN_T;
```

182.8.13 ROW_SET_T Table Type

Data for a rowset

Syntax

```
TYPE ROW_SET_T IS TABLE OF COLUMN_DATA_T INDEX BY PLS_INTEGER;
```

182.8.14 XID_T Subtype

The XID_T subtype is defined to store the execution unique ID returned by function GET_XID.

Syntax

```
SUBTYPE XID_T IS VARCHAR2(1024);
```

182.9 Summary of DBMS_TF Subprograms

This summary briefly describes the DBMS_TF package subprograms.

Table 182-14 DBMS_TF Subprograms

| Subprogram | Description |
|---------------------------|--|
| COLUMN_TYPE_NAME Function | Returns the type name of the specified column type |
| COL_TO_CHAR Function | Returns the string representation of the specified column |
| CSTORE_EXISTS Function | Returns TRUE if an item with a given key exists in the PTF Compilation State management Store |
| CSTORE_GET Procedure | Gets item(s) of specified type from the PTF Compilation State management Store |
| GET_COL Procedure | Gets read column values |
| GET_ENV Function | Returns information about the PTF runtime environment |
| GET_ROW_SET Procedure | Gets read set of column values in the collection |
| GET_XID Function | Returns a unique execution id that can be used by the PTF to index any cursor execution specific runtime state |
| PUT_COL Procedure | Puts column values in the database |
| PUT_ROW_SET Procedure | Puts the collection read set of column values in the database |
| ROW_REPLICATION Procedure | Sets the row replication factor |
| ROW_TO_CHAR Function | Returns the string representation of a row in a rowset |
| SUPPORTED_TYPE Function | Returns TRUE if a specified type is supported by PTF infrastructure |
| TRACE Procedure | Prints data structures to help development and problem diagnosis |
| XSTORE_CLEAR Procedure | Removes all key-value pairs from XStore |
| XSTORE_EXISTS Procedure | Returns TRUE if the key has an associated value |
| XSTORE_GET Procedure | Gets a key-value store for PTF Execution State Management |
| XSTORE_REMOVE Procedure | Removes any value associated with the given key |
| XSTORE_SET Procedure | Sets the value for the given key store for PTF Execution State Management |

182.9.1 COLUMN_TYPE_NAME Function

Returns the type name for the specified column type.

Syntax

```
FUNCTION COLUMN_TYPE_NAME(
    col COLUMN_METADATA_T)
RETURN VARCHAR2;
```

Parameters

Table 182-15 DBMS_TF.COLUMN_TYPE_NAME Function Parameters

| Parameter | Description |
|-----------|--|
| col | The column metadata. See COLUMN_METADATA_T Record Type |

Return Values

Returns the column type converted as text.

Example 182-5 DBMS_TF.COLUMN_TYPE_NAME Example

This example shows an application type check that invokes `COLUMN_TYPE_NAME` to compare the column type and raise an application error if the column type is not `VARCHAR2`.

```
FUNCTION describe(
    tab IN OUT DBMS_TF.table_t,
    cols IN DBMS_TF.columns_t)
RETURN DBMS_TF.describe_t
AS
    new_cols DBMS_TF.columns_new_t;
    col_id PLS_INTEGER := 1;
BEGIN
    FOR i IN 1 .. tab.count LOOP
        FOR j IN 1 .. cols.count LOOP
            IF (tab(i).description.name = cols(j)) THEN
                IF (DBMS_TF.column_type_name(tab(i).description.type) != 'VARCHAR2')
THEN
                    raise_application_error(-20102,
                        'Unsupported column type [||tab(i).description.type||]');
                END IF;
                tab(i).for_read := true;
                new_cols(col_id) := tab(i).description;
                new_cols(col_id).name := 'ECHO_' || tab(i).description.name;
                col_id := col_id + 1;
                EXIT;
            END IF;
        END LOOP;
    END LOOP;

    -- Verify all columns were found
    IF (col_id - 1 != cols.count) THEN
        raise_application_error(-20101,
            'Column mismatch [||col_id-1||], [||cols.count||]');
    END IF;

    RETURN DBMS_TF.describe_t(new_columns => new_cols);
END;
```

182.9.2 COL_TO_CHAR Function

Returns the string representation of the specified column.

Syntax

```
FUNCTION COL_TO_CHAR(  
    col    COLUMN_DATA_T,  
    rid    PLS_INTEGER,  
    quote  VARCHAR2 DEFAULT '')  
RETURN VARCHAR2;
```

Parameters

Table 182-16 DBMS_TF.COL_TO_CHAR Function Parameters

| Parameter | Description |
|-----------|--|
| col | The column whose value is to be converted |
| rid | Row number |
| quote | Quotation mark to use for non-numeric values |

Return Values

The string representation of a column data value.

Example 182-6

 DBMS_TF.COL_TO_CHAR Example

```
PROCEDURE Fetch_Rows AS  
    rowset DBMS_TF.rROW_SET_T;  
    str    VARCHAR2(32000);  
BEGIN  
    DBMS_TF.GET_ROW_SET(rowset);  
    str := DBMS_TF.COL_TO_CHAR(rowset(1), 1)  
END;
```

182.9.3 CSTORE_EXISTS Function

Returns TRUE if an item with a given key exists in the Store PTF Compilation State.

Syntax

```
FUNCTION CSTORE_EXISTS  
    (key    IN VARCHAR2,  
    key_type IN PLS_INTEGER default NULL)  
return BOOLEAN;
```

Parameters

Table 182-17 CSTORE_EXISTS Function Parameters

| Parameter | Description |
|-----------|---|
| key | A unique character key |
| key_type | The type of key (optional) Default : NULL |

Return Values

Returns TRUE if the key has an associated value. When the key_type is NULL (default), it returns TRUE if the key has an associated value of any of the supported type.

When a key_type parameter value is passed, it returns TRUE if the key and specified type of key has an associated value. Otherwise, it returns FALSE.

Example 182-7 DBMS_TF.CSTORE_EXISTS Example

This code excerpt checks if an item with the key exists before reading it from the compilation store.

```
IF (DBMS_TF.CSTORE_EXISTS('min'||j)) THEN
    DBMS_TF.CSTORE_GET('min'||j, min_col);
END IF;
```

182.9.4 CSTORE_GET Procedure

You can use the CSTORE_GET procedure to get the associated value for a given key stored for PTF Compilation State.

CSTORE is the PTF compilation state management interface. The CSTORE interface is used to set and store key-value pairs during cursor compilation through the DBMS_TF.DESCRIBE function.

You can get the PTF compilation state during runtime procedures such as OPEN, FETCH_ROWS and CLOSE.

This procedure is overloaded. The DESCRIBE_T supports specifying key-value pairs for these scalar types: VARCHAR2, NUMBER, DATE, BOOLEAN.

See [Table 182-3](#) for more information.

Syntax

Get the value associated with the key in the value out variable. The value type returned is one of the supported scalar types.

```
PROCEDURE CSTORE_GET(
    key    IN    VARCHAR2,
    value  IN OUT VARCHAR2);
```

```
PROCEDURE CSTORE_GET(
```

```

key    IN    VARCHAR2,
value  IN OUT NUMBER);

PROCEDURE CSTORE_GET(
  key    IN    VARCHAR2,
  value  IN OUT DATE);

PROCEDURE CSTORE_GET(
  key    IN    VARCHAR2,
  value  IN OUT BOOLEAN);

```

When no specific key is passed as an input parameter, the entire collection of key values for that type that exist in the CSTORE is returned.

```

PROCEDURE CSTORE_GET(key_value OUT CSTORE_CHR_T);

PROCEDURE CSTORE_GET(key_value OUT CSTORE_NUM_T);

PROCEDURE CSTORE_GET(key_value OUT CSTORE_BOL_T);

PROCEDURE CSTORE_GET(key_value OUT CSTORE_DAT_T);

```

Parameters

Table 182-18 DBMS_TF.CSTORE_GET Procedure Parameters

| Parameter | Description |
|-----------|--|
| key | A unique character key |
| value | Value corresponding to the key for supported types |
| key_value | Key value |

182.9.5 GET_COL Procedure

Get Read Column Values

Syntax

```

PROCEDURE GET_COL(
  columnId NUMBER,
  collection IN OUT NOCOPY <datatype>);

```

Where *<datatype>* can be any one of the supported types.

See [Table 182-1](#) for the list of supported types.

Parameters

Table 182-19 GET_COL Procedure Parameters

| Parameter | Description |
|-----------|-----------------------|
| columnid | The id for the column |

Table 182-19 (Cont.) GET_COL Procedure Parameters

| Parameter | Description |
|------------|-------------------------|
| collection | The data for the column |

Usage Notes

This procedure is used to get the read column values in the collection of scalar type.

The column numbers are in the get column order as created in DESCRIBE method of PTF.

For the same ColumnId, GET_COL and PUT_COL may correspond to different column.

Example 182-8 DBMS_TF.GET_COL Example

This example is an excerpt of a fetch_rows procedure defined in the PTF implementation package.

```
PROCEDURE fetch_rows
IS
  col1 DBMS_TF.TAB_CLOB_T;
  col2 DBMS_TF.TAB_CLOB_T;
  out1 DBMS_TF.TAB_CLOB_T;
  out2 DBMS_TF.TAB_CLOB_T;
BEGIN
  DBMS_TF.GET_COL(1, col1);
  DBMS_TF.GET_COL(2, col2);

  FOR I IN 1 .. col1.COUNT LOOP
    out1(i) := 'ECHO-' || col1(i);
  END LOOP;

  FOR I IN 1 .. col2.COUNT LOOP
    out2(i) := 'ECHO-' || col2(i);
  END LOOP;

  DBMS_TF.PUT_COL(1, out1);
  DBMS_TF.PUT_COL(2, out2);
END;
```

Note, invoking the DBMS_TF APIs directly is not allowed. An error is raised if an attempt is made to execute these procedures out of context.

```
exec fetch_rows
```

```
ERROR at line 1:
ORA-62562: The API Get_Col can be called only during execution time of a polymorphic
table function.
```

182.9.6 GET_ENV Function

Returns information about the PTF runtime environment

Syntax

```
FUNCTION GET_ENV
    RETURN ENV_T;
```

Return Values

Returns information about the PTF runtime environment.

Example 182-9 DBMS_TF.GET_ENV Example

This line shows how you could initialize a local variable `env` of type `ENV_T` with the PTF execution information in a `FETCH_ROWS` implementation procedure.

```
env          DBMS_TF.ENV_T := DBMS_TF.GET_ENV();
```

182.9.7 GET_ROW_SET Procedure

Get Read Column Values

The `FETCH_ROW` procedure can call the `GET_ROW_SET` procedure to read the input rowset set of column values in the collection of supported scalar type. This procedure is overloaded.

Syntax

```
PROCEDURE GET_ROW_SET(
    rowset      OUT NOCOPY ROW_SET_T);

PROCEDURE GET_ROW_SET(
    rowset      OUT NOCOPY ROW_SET_T,
    row_count   OUT          PLS_INTEGER);

PROCEDURE GET_ROW_SET(
    rowset      OUT NOCOPY ROW_SET_T,
    row_count   OUT          PLS_INTEGER,
    col_count   OUT          PLS_INTEGER);
```

Parameters

Table 182-20 GET_ROW_SET Procedure Parameters

| Parameter | Description |
|------------------------|-------------------------------------|
| <code>rowset</code> | The collection of data and metadata |
| <code>row_count</code> | The number of rows in the columns |
| <code>col_count</code> | The number of columns |

Example 182-10 DBMS_TF.GET_ROW_SET Example

This example is an excerpt from a PTF implementation package for demonstration purpose.

```
PROCEDURE fetch_rows(new_name IN VARCHAR2 DEFAULT 'PTF_CONCATENATE')
AS
```

```

rowset      DBMS_TF.ROW_SET_T;
accumulator DBMS_TF.TAB_VARCHAR2_T;
row_count   PLS_INTEGER;

FUNCTION get_value(col  PLS_INTEGER,
                  ROW  PLS_INTEGER)
RETURN VARCHAR2
AS
    col_type PLS_INTEGER := rowset(col).description.TYPE;
BEGIN
    CASE col_type
        WHEN DBMS_TF.TYPE_VARCHAR2 THEN
            RETURN NVL(rowset(col).TAB_VARCHAR2 (ROW), 'empty');
        ELSE
            RAISE_APPLICATION_ERROR(-20201, 'Non-Varchar Type='||col_type);
    END CASE;
END;

BEGIN
    DBMS_TF.GET_ROW_SET(rowset, row_count);

    IF ( rowset.count = 0 ) THEN
        RETURN;
    END IF;

    FOR row_num IN 1 .. row_count LOOP
        accumulator(row_num) := 'empty';
    END LOOP;

    FOR col_num IN 1 .. rowset.count LOOP
        FOR row_num IN 1 .. row_count LOOP
            accumulator(row_num) := accumulator(row_num) ||
get_value(col_num, row_num);
        END LOOP;
    END LOOP;
    -- Pushout the accumulator
    DBMS_TF.PUT_COL(1, accumulator);
END;

```

182.9.7.1 Stack Polymorphic Table Function Example

The stack PTF example unpivots the non-null values of the specified numeric columns by converting each column value into a new row.

Example 182-11 Stack Polymorphic Table Function Example

Live SQL:

You can view and run this example on Oracle Live SQL at [Stack Polymorphic Table Function](#)

Create the PTF implementation package `stack_p`.

The parameters are :

- **tab** - Input table
- **col** - The names of numeric (input) table columns to stack

```
CREATE PACKAGE stack_p AS

    FUNCTION describe(tab IN OUT dbms_tf.table_t,
                     col      dbms_tf.columns_t)
        RETURN dbms_tf.describe_t;

    PROCEDURE fetch_rows;

END stack_p;
```

Create the PTF implementation package body `stack_p`.

This PTF produces two new columns, `COLUMN_NAME` and `COLUMN_VALUE`, where the former contains the name of the unpivoted column and the latter contains the numeric value of that column. Additionally, the unpivoted columns are removed from the PTF's output.

```
CREATE PACKAGE BODY stack_p AS

    FUNCTION describe(tab IN OUT dbms_tf.table_t,
                     col      dbms_tf.columns_t)
        RETURN dbms_tf.describe_t AS
    BEGIN
        FOR i IN 1 .. tab.column.count LOOP
            FOR j IN 1 .. col.count LOOP
                IF (tab.column(i).description.name = col(j) AND
                    tab.column(i).description.TYPE = dbms_tf.type_number) THEN
                    tab.column(i).pass_through := false;
                    tab.column(i).for_read    := true;
                END IF;
            END LOOP;
        END LOOP;

        RETURN dbms_tf.describe_t(
            new_columns => dbms_tf.columns_new_t(
                1 => dbms_tf.column_metadata_t(name => 'COLUMN_NAME',
                                               TYPE =>
dbms_tf.type_varchar2),
                2 => dbms_tf.column_metadata_t(name => 'COLUMN_VALUE',
                                               TYPE =>
dbms_tf.type_number)),
            row_replication => true);
    END;

    PROCEDURE fetch_rows AS
        env      dbms_tf.env_t := dbms_tf.get_env();
        rowset   dbms_tf.row_set_t;
        colcnt   PLS_INTEGER;
        rowcnt   PLS_INTEGER;
```

```

    repfac dbms_tf.tab_naturaln_t;
    namcol dbms_tf.tab_varchar2_t;
    valcol dbms_tf.tab_number_t;
BEGIN
    dbms_tf.get_row_set(rowset, rowcnt, colcnt);

    FOR i IN 1 .. rowcnt LOOP
        repfac(i) := 0;
    END LOOP;

    FOR r IN 1 .. rowcnt LOOP
        FOR c IN 1 .. colcnt LOOP
            IF rowset(c).tab_number(r) IS NOT NULL THEN
                repfac(r) := repfac(r) + 1;
                namcol(nvl(namcol.last+1,1)) :=
                    INITCAP(regex_replace(env.get_columns(c).name, '^"|"$'));
                valcol(NVL(valcol.last+1,1)) := rowset(c).tab_number(r);
            END IF;
        END LOOP;
    END LOOP;

    dbms_tf.row_replication(replication_factor => repfac);
    dbms_tf.put_col(1, namcol);
    dbms_tf.put_col(2, valcol);

END;

END stack_p;

```

Create the standalone PTF named `stack`. Specify exactly one formal argument of type `TABLE`, specify the return type of the PTF as `TABLE`, specify a Row Semantics PTF type, and indicate the PTF implementation package to use is `stack_p`.

```

CREATE FUNCTION stack(tab TABLE,
                    col columns)
    RETURN TABLE
PIPELINED ROW POLYMORPHIC USING stack_p;

```

For all employees in departments 10 and 30, report values of columns `MGR`, `SAL`, and `COMM` ordered by department number and employee name.

```

SELECT deptno, ename, column_name, column_value
FROM    stack(scott.emp, COLUMNS(mgr, sal, comm))
WHERE   deptno IN (10, 30)
ORDER BY deptno, ename;

```

| DEPTNO | ENAME | COLUMN_NAME | COLUMN_VALUE |
|--------|--------|-------------|--------------|
| 10 | CLARK | Mgr | 7839 |
| 10 | CLARK | Sal | 2450 |
| 10 | KING | Sal | 5000 |
| 10 | MILLER | Sal | 1300 |
| 10 | MILLER | Mgr | 7782 |
| 30 | ALLEN | Comm | 300 |

| | | |
|-----------|------|------|
| 30 ALLEN | Mgr | 7698 |
| 30 ALLEN | Sal | 1600 |

182.9.8 GET_XID Function

Returns a unique execution id that can be used by the PTF to index any cursor-execution specific runtime state.

Syntax

```
FUNCTION GET_XID
    RETURN XID_T;
```

Return Values

A unique execution id that can be used by the PTF to index any cursor-execution specific runtime state.

Example 182-12 DBMS_TF.GET_XID Example

This is an excerpt of code showing an invocation of GET_XID to initialize a local variable indexed using the execution id to a zero value.

```
PROCEDURE open IS
BEGIN
    xst(DBMS_TF.GET_XID()) := 0;
END;
```

182.9.9 PUT_COL Procedure

Put Column Values

Syntax

```
PROCEDURE PUT_COL(
    columnid NUMBER,
    collection IN <datatype>);
```

Where <datatype> can be any one of the supported types.

See [Table 182-1](#) for the list of supported types.

Parameters

Table 182-21 PUT_COL Procedure Parameters

| Parameter | Description |
|------------|-------------------------|
| columnid | The id for the column |
| collection | The data for the column |

Usage Notes

This procedure is used to put the read column values in the collection of scalar type.

The collection of scalar type should be of supported type only.

The column numbers are in the get column order as created in DESCRIBE method of PTF.

For the same columnid, GET_COL and PUT_COL may correspond to different column.

182.9.9.1 Rand_col Polymorphic Table Function Example

The rand_col PTF appends specified number of random-valued columns to the output.

Example 182-13 Rand_col Polymorphic Table Function Example

Live SQL:

You can view and run this example on Oracle Live SQL at [Rand_col Polymorphic Table Function](#)

This rand_col PTF example appends col_count number of random-valued columns to the output. Optionally, the caller can restrict the random values to a numeric range by specifying [low, high]. The new columns are named "RAND_<n>"

Create the PTF implementation package rand_col_p.

The parameters are :

- tab : Input table
- col_count (optional) : Number of random-valued columns to generate [Default = 1]
- low (optional) : Lower bound for the random numbers [Default = Null]
- high (optional) : Upper bound for the random numbers [Default = Null]

```
CREATE PACKAGE rand_col_p AS

    FUNCTION describe(tab          IN OUT DBMS_TF.table_t,
                     col_count    NATURALN DEFAULT 1,
                     low          NUMBER   DEFAULT NULL,
                     high         NUMBER   DEFAULT NULL)
    RETURN DBMS_TF.describe_t;
```

```
PROCEDURE fetch_rows(col_count NATURALN DEFAULT 1,  
                    low        NUMBER   DEFAULT NULL,  
                    high       NUMBER   DEFAULT NULL);  
  
END rand_col_p;
```

Create the PTF implementation package body `rand_col_p`.

The parameter `col_count` is a 'shape-determining' parameter and thus must be a constant (no binds, correlations, or expressions). By defining the type of `col_count` to be `NATURALN`, which has an implicit `NOT NULL` constraint, we guarantee that a cursor with non-constant value for this parameter will get a compilation error.

```
CREATE PACKAGE BODY rand_col_p AS  
  col_name_prefix CONSTANT dbms_id := 'RAND';  
  
  FUNCTION describe(tab          IN OUT DBMS_TF.table_t,  
                   col_count    NATURALN DEFAULT 1,  
                   low          NUMBER   DEFAULT NULL,  
                   high         NUMBER   DEFAULT NULL)  
    RETURN DBMS_TF.describe_t  
  AS  
    cols DBMS_TF.columns_new_t;  
  BEGIN  
    FOR i IN 1 .. col_count LOOP  
      cols(i) := DBMS_TF.column_metadata_t(name=>col_name_prefix||i,  
TYPE=>DBMS_TF.type_number);  
    END LOOP;  
  
    RETURN DBMS_TF.describe_t(new_columns => cols);  
  END;  
  
  PROCEDURE fetch_rows(col_count NATURALN DEFAULT 1,  
                      low        NUMBER   DEFAULT NULL,  
                      high       NUMBER   DEFAULT NULL)  
  AS  
    row_count CONSTANT PLS_INTEGER := DBMS_TF.get_env().row_count;  
    col       DBMS_TF.tab_number_t;  
  BEGIN  
    FOR c IN 1 .. col_count LOOP  
      FOR i IN 1 .. row_count LOOP  
        col(i) := CASE WHEN (low IS NULL OR high IS NULL)  
                     THEN dbms_random.VALUE  
                     ELSE dbms_random.VALUE(low,  
high)  
                     END;  
      END LOOP;  
      DBMS_TF.put_col(c, col);  
    END LOOP;  
  END;  
  
END rand_col_p;
```

Create the standalone `rand_col` PTF. Specify exactly one formal argument of type `TABLE`, specify the return type of the PTF as `TABLE`, specify a Row Semantics PTF type, and indicate the PTF implementation package to use is `rand_col_p`.

```
CREATE FUNCTION rand_col(tab TABLE,
                        col_count NATURALN DEFAULT 1,
                        low        NUMBER   DEFAULT NULL,
                        high       NUMBER   DEFAULT NULL)
RETURN TABLE
PIPELINED ROW POLYMORPHIC USING rand_col_p;
```

Invoke the `rand_col` PTF to display all columns of table `SCOTT.DEPT` with one produced `RAND_1` column.

```
SELECT *
FROM rand_col(scott.dept);
```

| DEPTNO | DNAME | LOC | RAND_1 |
|--------|------------|----------|------------|
| 10 | ACCOUNTING | NEW YORK | .738666262 |
| 20 | RESEARCH | DALLAS | .093256312 |
| 30 | SALES | CHICAGO | .992944835 |
| 40 | OPERATIONS | BOSTON | .397948124 |

Invoke the `rand_col` PTF to display all columns of table `SCOTT.DEPT` with two produced `RAND_1` and `RAND_2` columns.

```
SELECT *
FROM rand_col(scott.dept, col_count => 2);
```

| DEPTNO | DNAME | LOC | RAND_1 | RAND_2 |
|--------|------------|----------|------------|------------|
| 10 | ACCOUNTING | NEW YORK | .976521361 | .209802028 |
| 20 | RESEARCH | DALLAS | .899577891 | .10050334 |
| 30 | SALES | CHICAGO | .277238362 | .110736583 |
| 40 | OPERATIONS | BOSTON | .989839995 | .164822363 |

For all employees for which their job is not being a `SALESMAN`, display the employee name, job, and produce three `RAND` columns generating random values between `-10` and `10`.

```
SELECT ename, job, rand_1, rand_2, rand_3
FROM   rand_col(scott.emp, col_count => 3, low => -10, high => +10)
WHERE  job != 'SALESMAN';
```

| ENAME | JOB | RAND_1 | RAND_2 | RAND_3 |

```

182.9.10 PUT_ROW_SET Procedure

Writes a collection of new column values in the database.

You can use this procedure to write all new columns in a collection of rows in the database.

This procedure is overloaded. Rows are not replicated by default. You can use the `ROW_REPLICATION` procedure to set the replication factor.

Syntax

This syntax is used when rows are not replicated.

```
PROCEDURE PUT_ROW_SET(
    rowset IN ROW_SET_T);
```

This syntax is used when the replication factor is a constant.

```
PROCEDURE PUT_ROW_SET(
    rowset          IN  ROW_SET_T,
    replication_factor IN NATURALN);
```

This syntax is used when the replication factor is specified as an array with multiple values.

```
PROCEDURE PUT_ROW_SET(
    rowset          IN  ROW_SET_T,
    replication_factor IN TAB_NATURALN_T);
```

Parameters

Table 182-22 PUT_ROW_SET Procedure Parameters

| Parameter | Description |
|--------------------|-------------------------------------|
| rowset | The collection of data and metadata |
| replication_factor | The replication factor per row |

Example 182-14

 DBMS_TF.PUT_ROW_SET Example

This code excerpt fetches a collection of rows and writes all new columns back to the database without any processing.

```
PROCEDURE fetch_rows
AS
    rowset DBMS_TF.ROW_SET_T;
BEGIN
    DBMS_TF.GET_ROW_SET(rowset);
    DBMS_TF.PUT_ROW_SET(rowset);
END;
```

182.9.10.1 Split Polymorphic Table Function Example

The split PTF example splits each row of the input table into specified pieces.

Example 182-15 Split Polymorphic Table Function Example

This PTF example splits each row of the input table into cnt pieces dividing the values of the split columns.

Live SQL:

You can view and run this example on Oracle Live SQL at [Split Polymorphic Table Function](#)

Create the PTF implementation package split_p.

The parameters are :

- tab - Input table
- col - The names of numeric (input) table columns to split
- cnt - The number of times each input row is to be split

```
CREATE PACKAGE split_p AS

    FUNCTION describe(tab IN OUT DBMS_TF.table_t,
                     col      DBMS_TF.columns_t,
                     cnt      NATURALN)
        RETURN DBMS_TF.describe_t;

    PROCEDURE fetch_rows(cnt NATURALN);

END split_p;
```

Create the PTF implementation package body split_p. Each row of the input table is split into cnt pieces dividing the values of the split columns.

```
CREATE PACKAGE BODY split_p AS

    FUNCTION describe(tab IN OUT DBMS_TF.Table_t,
                     col      DBMS_TF.Columns_t,
                     cnt      NATURALN)
        RETURN DBMS_TF.describe_t
    AS
        new_cols DBMS_TF.columns_new_t;
        col_id   PLS_INTEGER := 1;
    BEGIN
        FOR i IN 1 .. tab.column.count LOOP
            FOR j IN 1 .. col.count LOOP
                IF (tab.column(i).description.name = col(j) AND
                    tab.column(i).description.TYPE = DBMS_TF.type_number) THEN
                    tab.column(i).pass_through := FALSE;
                END IF;
            END LOOP;
        END LOOP;
    END describe;

    PROCEDURE fetch_rows(cnt NATURALN)
    AS
        BEGIN
        END fetch_rows;
END split_p;
```

```

        tab.column(i).for_read      := TRUE;
        new_cols(col_id) := tab.column(i).description;
        col_id := col_id + 1;
    END IF;
END LOOP;
END LOOP;

RETURN DBMS_TF.describe_t(new_columns=>new_cols,
row_replication=>true);
END;
PROCEDURE fetch_rows(cnt NATURALN)
AS
    inp_rs DBMS_TF.row_set_t;
    out_rs DBMS_TF.row_set_t;
    rows   PLS_INTEGER;
BEGIN
    DBMS_TF.get_row_set(inp_rs, rows);

    FOR c IN 1 .. inp_rs.count() LOOP
        FOR r IN 1 .. rows LOOP
            FOR i IN 1 .. cnt LOOP
                out_rs(c).tab_number((r-1)*cnt+i) := inp_rs(c).tab_number(r)/
cnt;
            END LOOP;
        END LOOP;
    END LOOP;

    DBMS_TF.put_row_set(out_rs, replication_factor => cnt);
END;

END split_p;

```

Create the standalone PTF named `split`. Specify exactly one formal argument of type `TABLE`, specify the return type of the PTF as `TABLE`, specify a Row Semantics PTF type, and indicate the PTF implementation package to use is `split_p`.

```

CREATE FUNCTION split(tab TABLE, col columns, cnt NATURALN)
RETURN TABLE
PIPELINED ROW POLYMORPHIC USING split_p;

```

For all employees in department 30, display the `ENAME`, `SAL`, and `COMM` columns. Invoke the `split` PTF with the `COLUMNS` pseudo-operator to divide the value of `SAL` and `COMM` by 2 for each replicated row returned by the query. Each row is replicated twice.

```

SELECT ename, sal, comm
FROM   split(scott.emp, COLUMNS(sal, comm), cnt => 2)
WHERE  deptno=30;

```

| ENAME | SAL | COMM |
|-------|-----|------|
| ALLEN | 800 | 150 |
| ALLEN | 800 | 150 |
| WARD | 625 | 250 |
| WARD | 625 | 250 |

| | | |
|--------|------|-----|
| MARTIN | 625 | 700 |
| MARTIN | 625 | 700 |
| BLAKE | 1425 | |
| BLAKE | 1425 | |
| TURNER | 750 | 0 |
| TURNER | 750 | 0 |
| JAMES | 475 | |
| JAMES | 475 | |

182.9.11 ROW_REPLICATION Procedure

Sets the row replication factor either as a fixed value or as a value per row.

This procedure is overloaded. A `Row Semantics` polymorphic table function will either produce a single output row for a given input row (one-to-one), or it can produce more output rows for a given input rows (one-to-many), or it can produce no output rows (one-to-none).

Syntax

Sets the row replication factor as a fixed value.

```
PROCEDURE ROW_REPLICATION(
    replication_factor IN NATURALN);
```

Sets the row replication factor as a value per row.

```
PROCEDURE ROW_REPLICATION(
    replication_factor IN TAB_NATURALN_T);
```

Parameters

Table 182-23 ROW_REPLICATION Procedure Parameters

| Parameter | Description |
|---------------------------------|--------------------------------|
| <code>replication_factor</code> | The replication factor per row |

Example 182-16 Replicate Polymorphic Table Function Example

This example creates a PTF that replicates each input row by the `replication_factor` that is given as a parameter.

Live SQL:

You can view and run this example on Oracle Live SQL at [Replicate Polymorphic Table Function](#)

Create the PTF implementation package `replicate_p`.

```
CREATE PACKAGE replicate_p
AS

    FUNCTION Describe(tab IN OUT DBMS_TF.TABLE_T,
        replication_factor NATURAL)
        RETURN DBMS_TF.describe_t;
```

```

PROCEDURE Fetch_Rows(replication_factor NATURALN);

END replicate_p;

```

Create the PTF implementation package body replicate_p. The PTF replicates each input row by the replication_factor that is given as a parameter.

```

CREATE PACKAGE body replicate_p
AS

    FUNCTION Describe(tab IN OUT DBMS_TF.Table_t
                     , replication_factor NATURAL)
        RETURN DBMS_TF.describe_t AS
    BEGIN
        RETURN DBMS_TF.describe_t(row_replication => True);
    END;

    PROCEDURE Fetch_Rows(replication_factor NATURALN)
    AS
    BEGIN
        DBMS_TF.ROW_REPLICATION(replication_factor);
    END;
END replicate_p;

```

Create a standalone PTF named replicate. Specify exactly one formal argument of type TABLE, specify the return type of the PTF as TABLE, specify a Row Semantics PTF type, and indicate the PTF implementation package to use is replicate_p.

```

CREATE FUNCTION replicate(tab TABLE,
                         replication_factor NATURAL)
    RETURN TABLE PIPELINED ROW POLYMORPHIC USING replicate_p;

```

This example sets the replication_factor to 2 which results in doubling the number of rows.

```

SELECT *
FROM replicate(dept, replication_factor => 2);

```

| DEPTNO | DNAME | LOC |
|--------|------------|----------|
| 10 | ACCOUNTING | NEW YORK |
| 10 | ACCOUNTING | NEW YORK |
| 20 | RESEARCH | DALLAS |
| 20 | RESEARCH | DALLAS |
| 30 | SALES | CHICAGO |
| 30 | SALES | CHICAGO |
| 40 | OPERATIONS | BOSTON |
| 40 | OPERATIONS | BOSTON |

This example sets the `replication_factor` to zero.

```
SELECT *
FROM replicate(dept, replication_factor => 0);
```

no rows selected

Count the number of employees in each department. Invoke the replicate PTF to report from the `SCOTT.EMP` table to set the `replication_factor` to 1000000.

```
SELECT deptno, COUNT(*)
FROM replicate(scott.emp, 1e6)
GROUP BY deptno;
```

```
DEPTNO  COUNT(*)
-----  -
        30  6000000
        10  3000000
        20  5000000
```

This sets the `replication_factor` to 1000000000.

```
SELECT COUNT(*)
FROM replicate(dual, 1e9);
```

```
COUNT(*)
-----
1000000000
```

182.9.12 ROW_TO_CHAR Function

The `ROW_TO_CHAR` function converts a row data value to a string representation.

Syntax

```
FUNCTION ROW_TO_CHAR(
    rowset ROW_SET_T,
    rid    PLS_INTEGER,
    format PLS_INTEGER DEFAULT FORMAT_JSON)
RETURN VARCHAR2;
```

Parameters

Table 182-24 DBMS_TF.ROW_TO_CHAR Function Parameters

| Parameter | Description |
|---------------------|--|
| <code>rowset</code> | The rowset whose value is to be converted |
| <code>rid</code> | Row number |
| <code>format</code> | The string format (default is <code>FORMAT_JSON</code>) |

Usage Notes

Only the JSON format is supported.

Return Values

The string representation in JSON format.

Example 182-17 DBMS_TF.ROW_TO_CHAR Example

```

PROCEDURE Fetch_Rows as
  rowset DBMS_TF.ROW_SET_T;
  str    VARCHAR2(32000);
BEGIN
  DBMS_TF.GET_ROW_SET(rowset);
  str := DBMS_TF.ROW_TO_CHAR(rowset, 1)
END;

```

182.9.13 SUPPORTED_TYPE Function

This function tests if a specified type is supported with polymorphic table functions.

Syntax

```

FUNCTION SUPPORTED_TYPE(
  type_id PLS_INTEGER)
RETURN BOOLEAN;

```

Parameters

Table 182-25 DBMS_TF.SUPPORTED_TYPE Function Parameters

| Parameter | Description |
|-----------|-------------|
| type_id | The type |

Return Values

Returns TRUE if the type_id is a scalar supported by PUT_COL and GET_COL.

See Also:

[Echo Polymorphic Table Function Example](#) for an example of DBMS_TF.SUPPORTED_TYPE use.

182.9.14 TRACE Procedure

Prints data structures to help development and problem diagnosis.

This procedure is overloaded.

Syntax

```

PROCEDURE TRACE(
  msg          VARCHAR2,
  with_id      BOOLEAN   DEFAULT FALSE,
  separator    VARCHAR2  DEFAULT NULL,
  prefix       VARCHAR2  DEFAULT NULL);

```

```

PROCEDURE TRACE(
    rowset      IN ROW_SET_T);

PROCEDURE TRACE(
    env         IN ENV_T);

PROCEDURE TRACE(
    columns_new IN COLUMNS_NEW_T);

PROCEDURE trace(
    cols        IN COLUMNS_T);

PROCEDURE trace(
    columns_with_type IN COLUMNS_WITH_TYPE_T);

PROCEDURE trace(
    tab         IN TABLE_T);

PROCEDURE trace(
    col         IN COLUMN_METADATA_T);

```

Parameters

Table 182-26 TRACE Procedure Parameters

| Parameter | Description |
|-------------------|--|
| msg | Custom user tracing message |
| with_id | Include the unique execution ID in the trace? |
| separator | Specify a string to use to separate values |
| prefix | Specify a string to prefix the actual values |
| rowset | Data for a rowset |
| env | Metadata about the polymorphic table function execution state |
| columns_new | Collection for new columns |
| cols | Collection containing column names |
| columns_with_type | Collection containing columns metadata |
| tab | Table descriptor |
| col | Metadata about an existing table column or a new column produced |

Example 182-18 DBMS_TF.TRACE Example

This example adds tracing to a `fetch_rows` procedure.

```

PROCEDURE fetch_rows
AS
    rowset DBMS_TF.ROW_SET_T;
BEGIN
    DBMS_TF.TRACE('IDENTITY_PACKAGE.Fetch_Rows()', with_id => TRUE);
    DBMS_TF.TRACE(rowset);
    DBMS_TF.GET_ROW_SET(rowset);
    DBMS_TF.TRACE(rowset);
    DBMS_TF.PUT_ROW_SET(rowset);

```

```
DBMS_TF.TRACE(DBMS_TF.GET_ENV);
END;
```

182.9.15 XSTORE_CLEAR Procedure

Removes all key-value pairs from the XSTORE execution state.

Syntax

```
PROCEDURE XSTORE_CLEAR;
```

182.9.16 XSTORE_EXISTS Function

Returns TRUE if an item with a given key exists in the XSTORE.

Syntax

```
FUNCTION XSTORE_EXISTS(
    key      IN VARCHAR2,
    key_type IN PLS_INTEGER DEFAULT NULL)
RETURN BOOLEAN;
```

Parameters

Table 182-27 DBMS_TF.XSTORE_EXISTS Function Parameters

| Parameter | Description |
|-----------|--|
| key | A unique character key |
| key_type | The type of key (optional). Default : NULL |

Return Values

Returns TRUE if the key has an associated value. When the key_type is NULL (default), it returns TRUE if the key has an associated value of any of the supported type.

When a key_type parameter value is passed, it returns TRUE if the key and specified type of key has an associated value. Otherwise, it returns FALSE.

See Also:

[Table 182-6](#) for more information about supported key types.

182.9.17 XSTORE_GET Procedure

You can use the XSTORE_GET procedure to get the associated value for a given key stored for PTF Execution State Management.

XStore is the PTF execution state management interface. The XStore interface is used to set and store key-value pairs during PTF execution.

This procedure is overloaded. The XStore supports specifying key-value pairs for these scalar types: VARCHAR2, NUMBER, DATE, BOOLEAN.

See [Table 182-6](#) for more information about supported key types.

Syntax

```
PROCEDURE XSTORE_GET (
    key   IN VARCHAR2,
    value IN OUT VARCHAR2);

PROCEDURE XSTORE_GET (
    key   IN VARCHAR2,
    value IN OUT NUMBER);

PROCEDURE XSTORE_GET (
    key   IN VARCHAR2,
    value IN OUT DATE);

PROCEDURE XSTORE_GET (
    key   IN VARCHAR2,
    value IN OUT BOOLEAN);
```

Parameters

Table 182-28 DBMS_TF.XSTORE_GET Procedure Parameters

| Parameter | Description |
|-----------|--|
| key | A unique character key |
| value | Value corresponding to the key for supported types |

Usage Notes

If the key is not found, the value is unchanged.

182.9.17.1 Row_num Polymorphic Table Function Example

The row_num PTF example appends a sequence column to a table.

Example 182-19 Row_num Polymorphic Table Function Example

Live SQL:

You can view and run this example on Oracle Live SQL at [Row_num Polymorphic Table Function](#)

Create the PTF implementation package row_num_p.

The parameters are :

- tab - The input table
- ini - The initial value (Default = 1)

- `inc` - The amount to increment (Default = 1)

```
CREATE PACKAGE row_num_p IS
  FUNCTION describe(tab IN OUT dbms_tf.table_t,
                   ini NUMBER DEFAULT 1,
                   inc NUMBER DEFAULT 1)
    RETURN dbms_tf.describe_t;

  PROCEDURE fetch_rows(ini NUMBER DEFAULT 1, inc NUMBER DEFAULT 1);
END;
```

This PTF accepts any input table and appends the sequence column `ROW_ID` to the table. The sequence values start with the specified value (`ini`) and each time it is incremented by the specified value (`inc`).

```
CREATE PACKAGE BODY row_num_p IS
  FUNCTION describe(tab IN OUT dbms_tf.table_t,
                   ini NUMBER DEFAULT 1,
                   inc NUMBER DEFAULT 1)
    RETURN dbms_tf.describe_t AS
  BEGIN
    RETURN dbms_tf.describe_t(new_columns =>
                              dbms_tf.columns_new_t(1 =>
                                                    dbms_tf.column_metadata_t(name => 'ROW_ID',
                                                                              TYPE =>
dbms_tf.type_number)));
  END;

  PROCEDURE fetch_rows(ini NUMBER DEFAULT 1, inc NUMBER DEFAULT 1) IS
    row_cnt CONSTANT PLS_INTEGER := dbms_tf.get_env().row_count;
    rid      NUMBER              := ini;
    col      dbms_tf.tab_number_t;
  BEGIN
    dbms_tf.xstore_get('rid', rid);
    FOR i IN 1 .. row_cnt LOOP col(i) := rid + inc*(i-1); END LOOP;
    dbms_tf.put_col(1, col);
    dbms_tf.xstore_set('rid', rid + inc*row_cnt);
  END;
END;
```

Create a standalone polymorphic table function named `row_num`. Specify exactly one formal argument of type `TABLE`, specify the return type of the PTF as `TABLE`, specify a Table Semantics PTF type, and indicate the PTF implementation package to use is `row_num_p`.

```
CREATE FUNCTION row_num(tab TABLE,
                       ini NUMBER DEFAULT 1,
                       inc NUMBER DEFAULT 1)
  RETURN TABLE
PIPELINED TABLE POLYMORPHIC USING row_num_p;
```

The `row_num` PTF invocation reporting from the `SCOTT.DEPT` table produces a new column `ROW_ID` with value starting at 1 and incremented by 1 in the row set.

```
SELECT * FROM row_num(scott.dept);
```

| DEPTNO | DNAME | LOC | ROW_ID |
|--------|------------|----------|--------|
| 10 | ACCOUNTING | NEW YORK | 1 |
| 20 | RESEARCH | DALLAS | 2 |
| 30 | SALES | CHICAGO | 3 |
| 40 | OPERATIONS | BOSTON | 4 |

The `row_num` PTF invocation reporting from the `SCOTT.DEPT` table produces a new column `ROW_ID` with value starting at 100 and incremented by 1 in the row set.

```
SELECT * FROM row_num(scott.dept, 100);
```

| DEPTNO | DNAME | LOC | ROW_ID |
|--------|------------|----------|--------|
| 10 | ACCOUNTING | NEW YORK | 100 |
| 20 | RESEARCH | DALLAS | 101 |
| 30 | SALES | CHICAGO | 102 |
| 40 | OPERATIONS | BOSTON | 103 |

The `row_num` PTF invocation reporting from the `SCOTT.DEPT` table produces a new column `ROW_ID` with value starting at 0 and decremented by 1 in the row set.

```
SELECT * FROM row_num(scott.dept, ini => 0, inc => -1);
```

| DEPTNO | DNAME | LOC | ROW_ID |
|--------|------------|----------|--------|
| 10 | ACCOUNTING | NEW YORK | 0 |
| 20 | RESEARCH | DALLAS | -1 |
| 30 | SALES | CHICAGO | -2 |
| 40 | OPERATIONS | BOSTON | -3 |

The `row_num` PTF invocation reporting from the `SCOTT.EMP` table produces a new column `ROW_ID` with value starting at 0 and incremented by 0.25 in the row set which is partitioned by department number and ordered by employee name.

```
SELECT deptno, ename, job, sal, row_id
   FROM row_num(scott.emp PARTITION BY deptno ORDER BY ename, ini => 0, inc
=> 0.25)
 WHERE deptno IN (10, 30);
```

| DEPTNO | ENAME | JOB | SAL | ROW_ID |
|--------|--------|-----------|------|--------|
| 10 | CLARK | MANAGER | 2450 | 0 |
| 10 | KING | PRESIDENT | 5000 | .25 |
| 10 | MILLER | CLERK | 1300 | .5 |
| 30 | ALLEN | SALESMAN | 1600 | 0 |
| 30 | BLAKE | MANAGER | 2850 | .25 |
| 30 | JAMES | CLERK | 950 | .5 |
| 30 | MARTIN | SALESMAN | 1250 | .75 |

```

30 TURNER      SALESMAN      1500      1
30 WARD       SALESMAN      1250     1.25

```

182.9.18 XSTORE_REMOVE Procedure

Removes an item associated with the given key and key_type.

Syntax

```

PROCEDURE XSTORE_REMOVE (
    key      IN VARCHAR2,
    key_type IN PLS_INTEGER DEFAULT NULL);

```

Parameters

Table 182-29 DBMS_TF.XSTORE_REMOVE Function Parameters

| Parameter | Description |
|-----------|--------------------------------------|
| key | A unique character key |
| key_type | The type of key to remove (optional) |

Usage Notes

When a key_type parameter value is passed, it removes the associated item for the key and specified type of key.

182.9.19 XSTORE_SET Procedure

Sets the value for the given key for PTF Execution State Management.

You can use this procedure to store an item key-value pair in the XStore. This procedure is overloaded. The XStore supports specifying key-value pairs for these scalar types: VARCHAR2, NUMBER, DATE, BOOLEAN.

Syntax

```

PROCEDURE XSTORE_SET (
    key   IN VARCHAR2,
    value IN VARCHAR2);

```

```

PROCEDURE XSTORE_SET (
    key   IN VARCHAR2,
    value IN NUMBER);

```

```

PROCEDURE XSTORE_SET (
    key   IN VARCHAR2,
    value IN DATE);

```

```

PROCEDURE XSTORE_SET (
    key   IN VARCHAR2,
    value IN BOOLEAN);

```

Parameters

Table 182-30 DBMS_TF.XSTORE_SET Procedure Parameters

| Parameter | Description |
|-----------|--|
| key | A unique character key |
| value | Value corresponding to the key for supported types |

Usage Notes

If an item for a given key already exists, the value is replaced.

DBMS_TNS

The `DBMS_TNS` package provides the `RESOLVE_TNSNAME` function to resolve a TNS name and return the corresponding Oracle Net8 connection string.

This chapter contains the following topics:

- [DBMS_TNS Overview](#)
- [DBMS_TNS Security Model](#)
- [Summary of DBMS_TNS Subprograms](#)

183.1 DBMS_TNS Overview

The `DBMS_TNS` package contains one function, `RESOLVE_TNSNAME`, which returns the resolved connect string from configured sources that have been defined in the `names.directory_path` parameter in the `sqlnet.ora` file.

The `RESOLVE_TNSNAME` function in this package helps you to identify interconnected databases and trace the system change number (SCN) flow across distributed databases.

See Also:

- *Oracle Database Administrator's Guide* for more information about finding database link information
- *Oracle Database Reference* for information about the `ALL_DB_LINKS` data dictionary view

183.2 DBMS_TNS Security Model

You must be granted the `EXECUTE` privilege on the `DBMS_TNS` package.

183.3 Summary of DBMS_TNS Subprograms

This table lists the `DBMS_TNS` subprograms and briefly describes them.

Table 183-1 DBMS_TNS Parameters

| Subprogram | Description |
|--|--|
| RESOLVE_TNSNAME Function | Returns the resolved connect string from any configured source (tnsnames, LDAP, Easy Connect) as indicated in the <code>sqlnet.ora</code> <code>names.directory_path</code> parameter) |

183.3.1 RESOLVE_TNSNAME Function

This function returns the resolved connect string from any configured source (for example, TNS names, Lightweight Directory Access Protocol (LDAP), or Oracle Easy Connect) as indicated in the `sqlnet.ora` `names.directory_path` parameter.

Syntax

```
DBMS_TNS.RESOLVE_TNSNAME (
    tns_name VARCHAR2)
RETURN VARCHAR2;
```

RESOLVE_TNSNAME Function Parameters

| Parameter | Description |
|-----------------------|--|
| <code>tns_name</code> | Database address for establishing the connection |

Usage Notes

- Database administrators and system management tools can explicitly call the `DBMS_TNS.RESOLVE_TNSNAME` function to resolve a `tns_name`:
- Because the resolved value can change over time, Oracle does not recommend storing or caching this value, because these kinds of values can become invalid over time.
- You can use the `DBMS_TNS.RESOLVE_TNSNAME` function to resolve TNS names that were referred to by other data dictionary views such as `ALL_DB_LINKS` and `USER_DB_LINKS`. In addition, you can use it to find any TNS name entry in the `tnsnames.ora` file.

Example

```
SELECT DB_LINK, DBMS_TNS.RESOLVE_TNSNAME(HOST) FROM DBA_DB_LINKS;

DB_LINK
-----
-----
DBMS_TNS.RESOLVE_TNSNAME(HOST)
-----
-----
US.EXAMPLE.COM
(DESCRIPTION=(ADDRESS=(PROTOCOL=ipc)(KEY=may))
(CONNECT_DATA=(SERVICE_NAME=us.example.com)(CID=(PROGRAM=oracle)
(HOST=juno)(USER=psmith)
))
```

DBMS_TRACE

The `DBMS_TRACE` package contains the interface to trace PL/SQL functions, procedures, and exceptions.

This chapter contains the following topics:

- [Overview](#)
- [Security Model](#)
- [Constants](#)
- [Restrictions](#)
- [Operational Notes](#)
- [Summary of DBMS_TRACE Subprograms](#)

184.1 DBMS_TRACE Overview

`DBMS_TRACE` provides subprograms to start and stop PL/SQL tracing in a session. Oracle collects the trace data as the program executes and writes it to database tables.

A typical session involves:

1. (Optional) Limit tracing to specific subprograms and choose a tracing level.
Tracing all subprograms and exceptions in a large program can produce huge amounts of data that are difficult to manage.
2. Starting PL/SQL tracing in session (`DBMS_TRACE.SET_PLSQL_TRACE`).
3. Running an application to be traced.
4. Stopping PL/SQL tracing in session (`DBMS_TRACE.CLEAR_PLSQL_TRACE`).

After you have collected data with Trace, you can query the database tables that contain the performance data and analyze it in the same way that you analyze the performance data from Profiler.

184.2 DBMS_TRACE Security Model

This package must be created under `SYS`.

184.3 DBMS_TRACE Constants

`DBMS_TRACE` defines constants to use when specifying parameter values.

These constants are shown in the following table.

Table 184-1 DBMS_TRACE Event Constants

| Name | Type | Value | Description |
|-----------------------------|---------|-------|--|
| TRACE_ALL_CALLS | INTEGER | 1 | Traces calls or returns |
| TRACE_ENABLED_CALLS | INTEGER | 2 | |
| TRACE_ALL_EXCEPTIONS | INTEGER | 4 | Traces exceptions |
| TRACE_ENABLED_EXCEPTIONS | INTEGER | 8 | Traces exceptions and handlers |
| TRACE_LIMIT | INTEGER | 16 | Save only the last few records. This allows tracing up to a problem area, without filling the database up with masses of irrelevant information. If event 10940 is set, the limit is 1023*(the value of event 10940). This can be overridden by the use of "TRACE_LIMIT" flag. |
| TRACE_ALL_SQL | INTEGER | 32 | Traces SQL statements |
| TRACE_ENABLED_SQL | INTEGER | 64 | Traces SQL statements at PL/SQL level. This does not invoke SQL Trace |
| TRACE_ALL_LINES | INTEGER | 128 | Traces each line |
| TRACE_ENABLED_LINES | INTEGER | 256 | |
| TRACE_PAUSE | INTEGER | 4096 | Pauses tracing |
| TRACE_RESUME | INTEGER | 8192 | Resume tracing |
| TRACE_STOP | INTEGER | 16384 | Stops tracing |
| NO_TRACE_ADMINISTRATIVE | INTEGER | 32768 | Prevents tracing of 'administrative events such as <ul style="list-style-type: none"> • PL/SQL Trace Tool started • Trace flags changed • PL/SQL Virtual Machine started • PL/SQL Virtual Machine stopped |
| NO_TRACE_HANDLED_EXCEPTIONS | INTEGER | 65536 | Prevents tracing of handled exceptions |

Table 184-2 DBMS_TRACE Version Constants

| Name | Type | Value | Description |
|---------------------|---------|-------|-------------|
| TRACE_MINOR_VERSION | INTEGER | 0 | |
| TRACE_MAJOR_VERSION | INTEGER | 1 | |

Oracle recommends using the symbolic form for all these constants.

184.4 DBMS_TRACE Restrictions

You cannot use PL/SQL tracing in a shared server environment.

184.5 DBMS_TRACE Operational Notes

Certain operational notes apply to `DBMS_TRACE`.

These are described in the following sections:

- [Controlling Data Volume](#)
- [Creating Database Tables to Collect DBMS_TRACE Output](#)
- [Collecting Trace Data](#)
- [Collected Data](#)
- [Trace Control](#)

Controlling Data Volume

Profiling large applications may produce a large volume of data. You can control the volume of data collected by *enabling* specific program units for trace data collection.

You can enable a program unit by compiling it debug. This can be done in one of two ways:

```
alter session set plsql_debug=true;
create or replace ... /* create the library units - debug information will be
generated */
```

or:

```
/* recompile specific library unit with debug option */
alter [PROCEDURE | FUNCTION | PACKAGE BODY] <libunit-name> compile debug;
```

Note:

You cannot use the second method for anonymous blocks.

You can limit the amount of storage used in the database by retaining only the most recent 8,192 records (approximately) by including `TRACE_LIMIT` in the `TRACE_LEVEL` parameter of the `SET_PLSQL_TRACE` procedure.

Creating Database Tables to Collect DBMS_TRACE Output

You must create database tables into which the `DBMS_TRACE` package writes output. Otherwise, the data is not collected. To create these tables, run the script `TRACETAB.SQL`. The tables this script creates are owned by `SYS`.

Collecting Trace Data

The PL/SQL features you can trace are described in the script `DBMS_PBT.SQL`. Some of the key tracing features are:

- Tracing Calls
- Tracing Exceptions
- Tracing SQL
- Tracing Lines

Additional features of DBMS_TRACE also allow pausing and resuming trace, and limiting the output.

Tracing Calls

Two levels of call tracing are available:

- Level 1: Trace all calls. This corresponds to the constant `TRACE_ALL_CALLS`.
- Level 2: Trace calls to enabled program units only. This corresponds to the constant `TRACE_ENABLED_CALLS`.

Enabling cannot be detected for remote procedure calls (RPCs); hence, RPCs are only traced with level 1.

Tracing Exceptions

Two levels of exception tracing are available:

- Level 1: Trace all exceptions. This corresponds to `TRACE_ALL_EXCEPTIONS`.
- Level 2: Trace exceptions raised in enabled program units only. This corresponds to `TRACE_ENABLED_EXCEPTIONS`.

Tracing SQL

Two levels of SQL tracing are available:

- Level 1: Trace all SQL. This corresponds to the constant `TRACE_ALL_SQL`.
- Level 2: Trace SQL in enabled program units only. This corresponds to the constant `TRACE_ENABLED_SQL`.

Tracing Lines

Two levels of line tracing are available:

- Level 1: Trace all lines. This corresponds to the constant `TRACE_ALL_LINES`.
- Level 2: Trace lines in enabled program units only. This corresponds to the constant `TRACE_ENABLED_LINES`.

When tracing lines, Oracle adds a record to the database each time the line number changes. This includes line number changes due to procedure calls and returns.

 **Note:**

For all types of tracing, level 1 overrides level 2. For example, if both level 1 and level 2 are enabled, then level 1 takes precedence.

Collected Data

If tracing is requested only for enabled program units, and if the current program unit is not enabled, then no trace data is written.

When tracing calls, both the call and return are traced. The check for whether tracing is "enabled" passes if either the called routine or the calling routine is "enabled".

Call tracing will always output the program unit type, program unit name, and line number for both the caller and the callee. It will output the caller's stack depth. If the caller is enabled, the caller's name will also be output. If the callee is enabled, the callee's name will also be output.

Exception tracing writes out the line number. Raising the exception shows information on whether the exception is user-defined or pre-defined. It also shows the exception number in the case of pre-defined exceptions. Both the place where the exceptions are raised and their handler is traced. The check for tracing being "enabled" is done independently for the place where the exception is raised and the place where the exception is handled. Enabling `NO_TRACE_HANDLED_EXCEPTIONS` limits data collection to unhandled exceptions

All calls to `DBMS_TRACE.SET_PLSQL_TRACE` and `DBMS_TRACE.CLEAR_PLSQL_TRACE` place a special trace record in the database. Therefore, it is always possible to determine when trace settings were changed.

Trace Control

As well as determining which items are collected, you can pause and resume the trace process. No information is gathered between the time that tracing is paused and the time that it is resumed. The constants `TRACE_PAUSE` and `TRACE_RESUME` are used to accomplish this. Trace records are generated to indicate that the trace was paused/resumed.

It is also possible to retain only the last 8,192 trace events of a run by using the constant `TRACE_LIMIT`. This allows tracing to be turned on without filling up the database. When tracing stops, the last 8,192 records are saved. The limit is approximate, since it is not checked on every trace record. At least the requested number of trace records will be generated; up to 1,000 additional records may be generated. At least the requested number of trace records will be generated; up to 1,000 additional records may be generated. The 8,192 record limit can be changed. Setting event 10940 to level n changes the record limit to $1024 * n$.

Enabling `NO_TRACE_ADMINISTRATIVE` prevents the generation of such administrative event records as PL/SQL Trace Tool started, Trace flags changed, PL/SQL Virtual Machine started, and PL/SQL Virtual Machine stopped.

184.6 Summary of DBMS_TRACE Subprograms

This table lists the `DBMS_TRACE` subprograms and briefly describes them.

Table 184-3 DBMS_TRACE Package Subprograms

| Subprogram | Description |
|--|-------------------------------------|
| <code>CLEAR_PLSQL_TRACE</code> Procedure | Stops trace data dumping in session |
| <code>GET_PLSQL_TRACE_LEVEL</code> Function | Gets the trace level |

Table 184-3 (Cont.) DBMS_TRACE Package Subprograms

| Subprogram | Description |
|---|--|
| PLSQL_TRACE_VERSION Procedure | Gets the version number of the trace package |
| SET_PLSQL_TRACE Procedure | Starts tracing in the current session |

184.6.1 CLEAR_PLSQL_TRACE Procedure

This procedure disables trace data collection.

Syntax

```
DBMS_TRACE.CLEAR_PLSQL_TRACE;
```

184.6.2 GET_PLSQL_TRACE_LEVEL Function

This procedure returns the current trace level as the sum of one or more DBMS_TRACE constants.

See [Table 184-1](#) for a list of the constants.

Syntax

```
DBMS_TRACE.GET_PLSQL_TRACE_LEVEL  
RETURN BINARY_INTEGER;
```

184.6.3 PLSQL_TRACE_VERSION Procedure

This procedure gets the version number of the trace package. It returns the major and minor version number of the DBMS_TRACE package.

Syntax

```
DBMS_TRACE.PLSQL_TRACE_VERSION (  
    major OUT BINARY_INTEGER,  
    minor OUT BINARY_INTEGER);
```

Parameters

Table 184-4 PLSQL_TRACE_VERSION Procedure Parameters

| Parameter | Description |
|-----------|-------------------------------------|
| major | Major version number of DBMS_TRACE. |
| minor | Minor version number of DBMS_TRACE. |

184.6.4 SET_PLSQL_TRACE Procedure

This procedure enables PL/SQL trace data collection.

Syntax

```
DBMS_TRACE.SET_PLSQL_TRACE (  
    trace_level INTEGER);
```

Parameters

Table 184-5 *SET_PLSQL_TRACE Procedure Parameters*

| Parameter | Description |
|-------------|--|
| trace_level | You must supply one or more of the constants as listed in Table 184-1 . By summing the constants, you can enable tracing of multiple PL/SQL language features simultaneously. The control constants "TRACE_PAUSE", "TRACE_RESUME" and "TRACE_STOP" should not be used in combination with other constants. Also see DBMS_TRACE Operational Notes: Collecting Trace Data for more information. |

DBMS_TRANSACTION

The DBMS_TRANSACTION package provides access to SQL transaction statements from stored procedures.

See Also:

Oracle Database SQL Language Reference

This chapter contains the following topics:

- [DBMS_TRANSACTION Security Model](#)
- [Summary of DBMS_TRANSACTION Subprograms](#)

185.1 DBMS_TRANSACTION Security Model

This package runs with the privileges of calling user, rather than the package owner SYS.

185.2 Summary of DBMS_TRANSACTION Subprograms

This table lists the DBMS_TRANSACTION subprograms and briefly describes them.

Table 185-1 DBMS_TRANSACTION Package Subprograms

| Subprogram | Description |
|---|---|
| ADVISE_COMMIT Procedure | Equivalent to the SQL statement: ALTER SESSION ADVISE COMMIT |
| ADVISE_NOTHING Procedure | Equivalent to the SQL statement: ALTER SESSION ADVISE NOTHING |
| ADVISE_ROLLBACK Procedure | Equivalent to the SQL statement: ALTER SESSION ADVISE ROLLBACK |
| COMMIT Procedure | Equivalent to the SQL statement: COMMIT |
| COMMIT_COMMENT Procedure | Equivalent to the SQL statement: COMMIT COMMENT <text> |
| COMMIT_FORCE Procedure | Equivalent to the SQL statement: COMMIT FORCE <text>, <number>" |
| LOCAL_TRANSACTION_ID Function | Returns the local (to instance) unique identifier for the current transaction |

Table 185-1 (Cont.) DBMS_TRANSACTION Package Subprograms

| Subprogram | Description |
|--|--|
| PURGE_LOST_DB_ENTRY Procedure | Enables removal of incomplete transactions from the local site when the remote database is destroyed or re-created before recovery completes |
| PURGE_MIXED Procedure | Deletes information about a given mixed outcome transaction |
| READ_ONLY Procedure | Equivalent to the SQL statement: SET TRANSACTION READ ONLY |
| READ_WRITE Procedure | equivalent to the SQL statement: SET TRANSACTION READ WRITE |
| ROLLBACK Procedure | Equivalent to the SQL statement: ROLLBACK |
| ROLLBACK_FORCE Procedure | Equivalent to the SQL statement: ROLLBACK FORCE <text> |
| ROLLBACK_SAVEPOINT Procedure | Equivalent to the SQL statement: ROLLBACK TO SAVEPOINT <savepoint_name> |
| SAVEPOINT Procedure | Equivalent to the SQL statement: SAVEPOINT <savepoint_name> |
| STEP_ID Function | Returns local (to local transaction) unique positive integer that orders the DML operations of a transaction |
| USE_ROLLBACK_SEGMENT Procedure | Equivalent to the SQL statement: SET TRANSACTION USE ROLLBACK SEGMENT <rb_seg_name> |

185.2.1 ADVISE_COMMIT Procedure

This procedure is equivalent to the SQL statement: ALTER SESSION ADVISE COMMIT

Syntax

```
DBMS_TRANSACTION.ADVISE_COMMIT;
```

185.2.2 ADVISE_NOTHING Procedure

This procedure is equivalent to the SQL statement: ALTER SESSION ADVISE NOTHING

Syntax

```
DBMS_TRANSACTION.ADVISE_NOTHING;
```

185.2.3 ADVISE_ROLLBACK Procedure

This procedure is equivalent to the SQL statement: ALTER SESSION ADVISE ROLLBACK

Syntax

```
DBMS_TRANSACTION.ADVISE_ROLLBACK;
```

185.2.4 COMMIT Procedure

This procedure is equivalent to the SQL statement: COMMIT

This procedure is included for completeness, the functionality being already implemented as part of PL/SQL.

Syntax

```
DBMS_TRANSACTION.COMMIT;
```

185.2.5 COMMIT_COMMENT Procedure

This procedure is equivalent to the SQL statement: COMMIT COMMENT <text>

Syntax

```
DBMS_TRANSACTION.COMMIT_COMMENT (
    cmnt VARCHAR2);
```

Parameters

Table 185-2 COMMIT_COMMENT Procedure Parameters

| Parameter | Description |
|-----------|--|
| cmnt | Comment to associate with this commit. |

185.2.6 COMMIT_FORCE Procedure

This procedure is equivalent to the SQL statement: COMMIT FORCE <text>, <number>"

Syntax

```
DBMS_TRANSACTION.COMMIT_FORCE (
    xid VARCHAR2,
    scn VARCHAR2 DEFAULT NULL);
```

Parameters

Table 185-3 COMMIT_FORCE Procedure Parameters

| Parameter | Description |
|-----------|---------------------------------|
| xid | Local or global transaction ID. |

Table 185-3 (Cont.) COMMIT_FORCE Procedure Parameters

| Parameter | Description |
|-----------|-----------------------|
| scn | System change number. |

185.2.7 LOCAL_TRANSACTION_ID Function

This function returns the local (to instance) unique identifier for the current transaction. It returns null if there is no current transaction.

Syntax

```
DBMS_TRANSACTION.LOCAL_TRANSACTION_ID (
    create_transaction BOOLEAN := FALSE)
RETURN VARCHAR2;
```

Parameters

Table 185-4 LOCAL_TRANSACTION_ID Function Parameters

| Parameter | Description |
|--------------------|---|
| create_transaction | If true, then start a transaction if one is not currently active. |

185.2.8 PURGE_LOST_DB_ENTRY Procedure

Procedure `PURGE_LOST_DB_ENTRY` purges entries that control database recovery from a local site.

When a failure occurs during commit processing, automatic recovery consistently resolves the results at all sites involved in the transaction. However, if the remote database is destroyed or re-created before recovery completes, then the entries used to control recovery in `DBA_2PC_PENDING` and associated tables are never removed, and recovery will periodically retry. Procedure `PURGE_LOST_DB_ENTRY` enables removal of such transactions from the local site.

Syntax

```
DBMS_TRANSACTION.PURGE_LOST_DB_ENTRY (
    xid VARCHAR2);
```

Parameters

Table 185-5 PURGE_LOST_DB_ENTRY Procedure Parameters

| Parameter | Description |
|-----------|--|
| xid | Must be set to the value of the <code>LOCAL_TRAN_ID</code> column in the <code>DBA_2PC_PENDING</code> table. |

Usage Notes

⚠ WARNING:

PURGE_LOST_DB_ENTRY should *only* be used when the other database is lost or has been re-created. Any other use may leave the other database in an unrecoverable or inconsistent state.

Before automatic recovery runs, the transaction may show up in DBA_2PC_PENDING as state "collecting", "committed", or "prepared". If the DBA has forced an in-doubt transaction to have a particular result by using "commit force" or "rollback force", then states "forced commit" or "forced rollback" may also appear. Automatic recovery normally deletes entries in any of these states. The only exception is when recovery finds a forced transaction which is in a state inconsistent with other sites in the transaction; in this case, the entry is left in the table and the MIXED column has the value 'yes'.

However, under certain conditions, it may not be possible for automatic recovery to run. For example, a remote database may have been permanently lost. Even if it is re-created, it gets a new database ID, so that recovery cannot identify it (a possible symptom is ORA-02062). In this case, the DBA may use the procedure PURGE_LOST_DB_ENTRY to clean up the entries in any state other than "prepared". The DBA does not need to be in any particular hurry to resolve these entries, because they are not holding any database resources.

The following table indicates what the various states indicate about the transaction and what the DBA actions should be:

Table 185-6 PURGE_LOST_DB_ENTRY Procedure States

| State of Column | State of Global Transaction | State of Local Transaction | Normal DBA Action | Alternative DBA Action |
|-------------------------|-----------------------------|----------------------------|-------------------|----------------------------------|
| Collecting | Rolled back | Rolled back | None | PURGE_LOST_DB_ENTRY (See Note 1) |
| Committed | Committed | Committed | None | PURGE_LOST_DB_ENTRY (See Note 1) |
| Prepared | Unknown | Prepared | None | FORCE COMMIT or ROLLBACK |
| Forced commit | Unknown | Committed | None | PURGE_LOST_DB_ENTRY (See Note 1) |
| Forced rollback | Unknown | Rolled back | None | PURGE_LOST_DB_ENTRY (See Note 1) |
| Forced commit (mixed) | Mixed | Committed | (See Note 2) | |
| Forced rollback (mixed) | Mixed | Rolled back | (See Note 2) | |

 **Note:**

Use only if significant reconfiguration has occurred so that automatic recovery cannot resolve the transaction. Examples are total loss of the remote database, reconfiguration in software resulting in loss of two-phase commit capability, or loss of information from an external transaction coordinator such as a TP monitor.

 **Note:**

Examine and take any manual action to remove inconsistencies; then use the procedure `PURGE_MIXED`.

185.2.9 PURGE_MIXED Procedure

This procedure deletes information about a given mixed outcome transaction

When in-doubt transactions are forced to commit or rollback (instead of letting automatic recovery resolve their outcomes), there is a possibility that a transaction can have a mixed outcome; some sites commit, and others rollback. Such inconsistency cannot be resolved automatically by Oracle. However, Oracle flags entries in `DBA_2PC_PENDING` by setting the `MIXED` column to a value of 'yes'.

Oracle never automatically deletes information about a mixed outcome transaction. When the application or DBA is certain that all inconsistencies that might have arisen as a result of the mixed transaction have been resolved, this procedure can be used to delete the information about a given mixed outcome transaction.

Syntax

```
DBMS_TRANSACTION.PURGE_MIXED (
    xid VARCHAR2);
```

Parameters

Table 185-7 PURGE_MIXED Procedure Parameters

| Parameter | Description |
|------------------|--|
| <code>xid</code> | Must be set to the value of the <code>LOCAL_TRAN_ID</code> column in the <code>DBA_2PC_PENDING</code> table. |

185.2.10 READ_ONLY Procedure

This procedure is equivalent to the SQL statement `SET TRANSACTION READ ONLY`.

Syntax

```
DBMS_TRANSACTION.READ_ONLY;
```

185.2.11 READ_WRITE Procedure

This procedure is equivalent to the SQL statement:

```
SET TRANSACTION READ WRITE
```

Syntax

```
DBMS_TRANSACTION.READ_WRITE;
```

185.2.12 ROLLBACK Procedure

This procedure is equivalent to the SQL statement `ROLLBACK`.

This procedure is included for completeness, the functionality being already implemented as part of PL/SQL.

Syntax

```
DBMS_TRANSACTION.ROLLBACK;
```

185.2.13 ROLLBACK_FORCE Procedure

This procedure is equivalent to the SQL statement `ROLLBACK FORCE <text>`.

Syntax

```
DBMS_TRANSACTION.ROLLBACK_FORCE (  
    xid VARCHAR2);
```

Parameters

Table 185-8 ROLLBACK_FORCE Procedure Parameters

| Parameter | Description |
|------------------|---------------------------------|
| <code>xid</code> | Local or global transaction ID. |

185.2.14 ROLLBACK_SAVEPOINT Procedure

This procedure is equivalent to the SQL statement `ROLLBACK TO SAVEPOINT <savepoint_name>`.

This procedure is included for completeness, the functionality being already implemented as part of PL/SQL.

Syntax

```
DBMS_TRANSACTION.ROLLBACK_SAVEPOINT (  
    savept VARCHAR2);
```

Parameters

Table 185-9 ROLLBACK_SAVEPOINT Procedure Parameters

| Parameter | Description |
|-----------|-----------------------|
| savept | Savepoint identifier. |

185.2.15 SAVEPOINT Procedure

This procedure is equivalent to the SQL statement `SAVEPOINT <savepoint_name> .`

This procedure is included for completeness, the feature being already implemented as part of PL/SQL.

Syntax

```
DBMS_TRANSACTION.SAVEPOINT (  
    savept VARCHAR2);
```

Parameters

Table 185-10 SAVEPOINT Procedure Parameters

| Parameter | Description |
|-----------|-----------------------|
| savept | Savepoint identifier. |

185.2.16 STEP_ID Function

This function returns local (to local transaction) unique positive integer that orders the DML operations of a transaction.

Syntax

```
DBMS_TRANSACTION.STEP_ID  
    RETURN NUMBER;
```

185.2.17 USE_ROLLBACK_SEGMENT Procedure

This procedure is equivalent to the SQL statement `SET TRANSACTION USE ROLLBACK SEGMENT <rb_seg_name>.`

Syntax

```
DBMS_TRANSACTION.USE_ROLLBACK_SEGMENT (  
    rb_name VARCHAR2);
```

Parameters

Table 185-11 USE_ROLLBACK_SEGMENT Procedure Parameters

| Parameter | Description |
|-----------|----------------------------------|
| rb_name | Name of rollback segment to use. |

DBMS_TRANSFORM

The `DBMS_TRANSFORM` package provides an interface to the message format transformation features of Oracle Advanced Queuing.

This chapter contains the following topic:

- [Summary of DBMS_TRANSFORM Subprograms](#)

See Also:

Oracle Database Advanced Queuing User's Guide for more on message format transformations.

186.1 Summary of DBMS_TRANSFORM Subprograms

This table lists the `DBMS_TRANSFORM` subprograms and briefly describes them.

Table 186-1 DBMS_TRANSFORM Package Subprograms

| Subprograms | Description |
|---|--|
| CREATE_TRANSFORMATION Procedure | Creates a transformation that maps an object of the source type to an object of the destination type |
| DROP_TRANSFORMATION Procedure | Drops the given transformation |
| MODIFY_TRANSFORMATION Procedure | Modifies an existing transformation |

186.1.1 CREATE_TRANSFORMATION Procedure

This procedure creates a transformation that maps an object of the source type to an object of the target type. The transformation expression can be a SQL expression or a PL/SQL function. It must return an object of the target type.

Syntax

```
DBMS_TRANSFORM.CREATE_TRANSFORMATION (
  schema          VARCHAR2 (30),
  name            VARCHAR2 (30),
  from_schema     VARCHAR2 (30),
  from_type       VARCHAR2 (30),
  to_schema       VARCHAR2 (30),
  to_type         VARCHAR2 (30),
  transformation   VARCHAR2 (4000));
```

Parameters

Table 186-2 CREATE_TRANSFORM Procedure Parameters

| Parameter | Description |
|----------------|--|
| schema | Specifies the schema of the transformation. |
| name | Specifies the name of the transformation. |
| from_schema | Specifies the schema of the source type. |
| from_type | Specifies the source type. |
| to_schema | Specifies the target type schema. |
| to_type | Specifies the target type. |
| transformation | Specifies the transformation expression, returning an object of the target type. The expression must be a function returning an object of the target type or a constructor expression for the target type. You can choose not to specify a transformation expression and instead specify transformations for attributes of the target type using <code>MODIFY_TRANSFORM</code> . |

Usage Notes

- The transformation expression must be a SQL expression or a PL/SQL function returning the type of the specified attribute of the target type.
- To create, modify or drop transformations, a user must be granted execute privileges on `DBMS_TRANSFORM`. The user must also have execute privileges on the user defined types that are the source and destination types of the transformation. In addition, the user must also have execute privileges on any PLSQL function being used in the transformation function.
- The transformation cannot write database state (perform DML) or commit or rollback the current transaction.
- The transformation must be a SQL function with source type as input type, returning an object of the target type. It could also be a SQL expression of target type, referring to a source type. All references to the source type must be of the form `source.user_data`.
- Both source and target types must be non-scalar database types. A null transformation expression maps to a null target object.

For using the transformation at enqueue and dequeue time, the login user invoking the operation must have execute privileges on the PLSQL functions used by the transformation. For propagation, the owning schema of the queue must have these privileges.

186.1.2 DROP_TRANSFORM Procedure

This procedure drops the given transformation.

Syntax

```
DBMS_TRANSFORM.DROP_TRANSFORM (
    schema VARCHAR2(30),
```

```
name          VARCHAR2(30);
```

Parameters

Table 186-3 DROP_TRANSFORMATION Procedure Parameters

| Parameter | Description |
|-----------|---|
| schema | Specifies the schema of the transformation. |
| name | Specifies the name of the transformation. |

186.1.3 MODIFY_TRANSFORMATION Procedure

This procedure modifies the transformation expression for the given transformation.

Syntax

```
DBMS_TRANSFORM.MODIFY_TRANSFORMATION (
  schema          VARCHAR2(30),
  name            VARCHAR2(30),
  attribute_number INTEGER,
  transformation   VARCHAR2(4000));
```

Parameters

Table 186-4 MODIFY_TRANSFORMATION Procedure Parameters

| Parameter | Description |
|------------------|---|
| schema | Specifies the schema of the transformation. |
| name | Specifies the name of the transformation. |
| attribute_number | The attribute of the target type for which the new transformation expression is being specified. When specifying the new transformation as a single expression of the target type, specify a value of 0. |
| transformation | The transformation expression must be a SQL expression or a PL/SQL function returning the type of the specified attribute of the target type. If the attribute_number is 0, then the expression must be a PL/SQL function returning an object of the target type or a constructor expression for the target type. |

Usage Notes

- If the new transformation is a single expression of the target type, it may be specified with an `attribute_number` of 0. The new transformation may also be specified for each attribute of the target type.
- You can use this procedure to define the transformation as a separate expression for each attribute of the target type. For large transformations, this representation may be more readable and allow the application of fine grain control over the transformation. If the transformation expression was left unspecified for some of the attributes of the target type, they are evaluated to null when the transformation is applied.

DBMS_TSDP_MANAGE

The `DBMS_TSDP_MANAGE` package provides an interface to import and manage sensitive columns and sensitive column types in the database, and is used in conjunction with the `DBMS_TSDP_PROTECT` package with regard to transparent sensitive data protection (TSDP) policies.

`DBMS_TSDP_MANAGE` is available with the Enterprise Edition only.

This chapter contains the following topics:

- [Overview](#)
- [Security Model](#)
- [Summary of DBMS_TSDP_MANAGE Subprograms](#)

Related Topics

- [DBMS_TSDP_PROTECT](#)

The `DBMS_TSDP_PROTECT` package provides an interface to configure transparent sensitive data protection (TSDP) policies in conjunction with the `DBMS_TSDP_MANAGE` package.

See Also:

Oracle Database Security Guide

187.1 DBMS_TSDP_MANAGE Overview

The `DBMS_TSDP_MANAGE` package lets you manage sensitive columns and sensitive types in the Oracle database.

The identified sensitive columns are classified based on the sensitive types. By Using the [DBMS_TSDP_PROTECT](#) package to create a policy that protects data for a given class based on a column type rather than the data itself, you can then manage security for these types in a uniform fashion and modify the settings to accommodate changing compliance regulations.

You also can export the policies to other databases, when you perform a full export using Data Pump. You cannot export the policy itself, but an export of the database will include the TSDP policies.

187.2 DBMS_TSDP_MANAGE Security Model

All procedures are executed with invoker's rights. The `DBMS_TSDP_MANAGE` package is owned by `SYS`.

The `EXECUTE` privilege on this package should be granted as appropriate. Typically, an application database administrator should be granted the `EXECUTE` privilege for this package, while the `DBMS_TSDP_PROTECT` package would be governed by a security administrator.

187.3 Summary of DBMS_TSDP_MANAGE Subprograms

This table lists the `DBMS_TSDP_MANAGE` subprograms and briefly describes them.

Table 187-1 DBMS_TSDP_MANAGE Package Subprograms

| Subprogram | Description |
|---|---|
| <code>ADD_SENSITIVE_COLUMN Procedure</code> | Adds a column to the sensitive column list |
| <code>ADD_SENSITIVE_TYPE Procedure</code> | Creates and adds a sensitive column type to the list of sensitive column types in the database |
| <code>ALTER_SENSITIVE_COLUMN Procedure</code> | Alters the sensitive type and/or the comment of a column in the sensitive column list. |
| <code>DROP_SENSITIVE_COLUMN Procedure</code> | Removes columns from the sensitive column list |
| <code>DROP_SENSITIVE_TYPE Procedure</code> | Drops a sensitive column type from the list sensitive column types in the database |
| <code>DROP_SENSITIVE_TYPE_SOURCE Procedure</code> | Drops sensitive column types corresponding to a source from the list sensitive column types in the database |
| <code>IMPORT_DISCOVERY_RESULT Procedure</code> | Imports sensitive columns from an external source. This can be an Application Data Model (ADM) from an Oracle Enterprise Manager Cloud Control instance |
| <code>IMPORT_SENSITIVE_TYPES Procedure</code> | Imports a list of sensitive column types from a source |
| <code>REMOVE_DISCOVERY_RESULT Procedure</code> | Removes sensitive columns corresponding to an Application Data Model (ADM) from an Oracle Enterprise Manager Cloud Control instance. |

187.3.1 ADD_SENSITIVE_COLUMN Procedure

This procedure adds a column to the sensitive column list.

Syntax

```
DBMS_TSDP_MANAGE.ADD_SENSITIVE_COLUMN (
  schema_name      IN VARCHAR2,
  table_name       IN VARCHAR2,
  column_name      IN VARCHAR2,
  sensitive_type   IN VARCHAR2,
  user_comment     IN VARCHAR2 DEFAULT NULL);
```

Parameters

Table 187-2 ADD_SENSITIVE_COLUMN Procedure Parameters

| Parameter | Description |
|----------------|---|
| schema_name | Schema to which the column belongs |
| table_name | Table containing the column |
| column_name | Sensitive column name |
| sensitive_type | Identifier of the sensitive column type |
| user_comment | User comment regarding the sensitive column |

Examples

Add a column SAL in SCOTT.EMP:

```
DBMS_TSDP_MANAGE.ADD_SENSITIVE_COLUMN (
  schema_name      => 'SCOTT',
  table_name       => 'EMP',
  column_name      => 'SAL',
  sensitive_type   => 'SALARY_TYPE',
  user_comment     => 'Salary column');
```

187.3.2 ALTER_SENSITIVE_COLUMN Procedure

This procedure alters the Sensitive Type and/or the Comment of a Column in the sensitive column list.

Syntax

```
DBMS_TSDP_MANAGE.ALTER_SENSITIVE_COLUMN (
  schema_name      IN VARCHAR2,
  table_name       IN VARCHAR2,
  column_name      IN VARCHAR2,
  sensitive_type   IN VARCHAR2,
  user_comment     IN VARCHAR2 DEFAULT NULL);
```

Parameters

Table 187-3 ALTER_SENSITIVE_COLUMN Procedure Parameters

| Parameter | Description |
|----------------|---|
| schema_name | Schema to which the column belongs |
| table_name | Table containing the column |
| column_name | Sensitive column name |
| sensitive_type | Identifier of the sensitive column type |
| user_comment | User comment regarding the sensitive column |

Examples

Alter the column SAL in SCOTT.EMP that is listed in the sensitive column list:

```
DBMS_TSDP_MANAGE.ALTER_SENSITIVE_COLUMN (
  schema_name      => 'SCOTT',
  table_name       => 'EMP',
  column_name      => 'SAL',
  sensitive_type   => 'FINANCE_Type',
  user_comment     => 'Finance Type. Earlier categorized as Salary Type');
```

187.3.3 ADD_SENSITIVE_TYPE Procedure

This procedure creates and adds a sensitive column type to the list sensitive column types in the database.

Syntax

```
DBMS_TSDP_MANAGE.ADD_SENSITIVE_TYPE (
  sensitive_type   IN VARCHAR2,
  user_comment     IN VARCHAR2 DEFAULT NULL);
```

Parameters

Table 187-4 ADD_SENSITIVE_TYPE Procedure Parameters

| Parameter | Description |
|----------------|---|
| sensitive_type | Name of the sensitive column type |
| user_comment | User comment regarding the sensitive column |

Examples

Add a sensitive column type called SALARY_TYPE that is intended to be associated with columns containing salary data:

```
DBMS_TSDP_MANAGE.ADD_SENSITIVE_TYPE (
  sensitive_type   => 'SALARY_TYPE',
  user_comment     => 'Salary data');
```

187.3.4 DROP_SENSITIVE_COLUMN Procedure

This procedure removes columns from the sensitive column list.

Syntax

```
DBMS_TSDP_MANAGE.DROP_SENSITIVE_COLUMN (
  schema_name      IN VARCHAR2 DEFAULT '%',
  table_name       IN VARCHAR2 DEFAULT '%',
  column_name      IN VARCHAR2 DEFAULT '%');
```

Parameters

Table 187-5 DROP_SENSITIVE_COLUMN Procedure Parameters

| Parameter | Description |
|-------------|------------------------------------|
| schema_name | Schema to which the column belongs |
| table_name | Table containing the column |

Table 187-5 (Cont.) DROP_SENSITIVE_COLUMN Procedure Parameters

| Parameter | Description |
|-------------|-----------------------|
| column_name | Sensitive column name |

Examples

Remove column SAL in SCOTT.EMP from the sensitive column list:

```
DBMS_TSDP_MANAGE.DROP_SENSITIVE_COLUMN (
  schema_name => 'SCOTT',
  table_name  => 'EMP',
  column_name => 'SAL');
```

187.3.5 DROP_SENSITIVE_TYPE Procedure

This procedure drops a sensitive column type from the list sensitive column types in the database.

Syntax

```
DBMS_TSDP_MANAGE.DROP_SENSITIVE_TYPE (
  sensitive_type IN VARCHAR2);
```

Parameters**Table 187-6 DROP_SENSITIVE_TYPE Procedure Parameters**

| Parameter | Description |
|----------------|---|
| sensitive_type | Name of the sensitive column type to be dropped |

Examples

To drop SALARY_TYPE:

```
DBMS_TSDP_MANAGE.DROP_SENSITIVE_TYPE (
  sensitive_type => 'SALARY_TYPE');
```

187.3.6 DROP_SENSITIVE_TYPE_SOURCE Procedure

This procedure drops sensitive column types corresponding to a source from the list sensitive column types in the database.

Syntax

```
DBMS_TSDP_MANAGE.DROP_SENSITIVE_TYPE_SOURCE (
  source IN VARCHAR2);
```

Parameters

Table 187-7 *DROP_SENSITIVE_TYPE_SOURCE Procedure Parameters*

| Parameter | Description |
|-----------|--------------------|
| source | Name of the source |

Examples

To drop all sensitive column types corresponding to an Application Data Model (ADM) from an Oracle Enterprise Manager Cloud Control instance, ADM_DEMO:

```
DBMS_TSDP_MANAGE.DROP_SENSITIVE_TYPE_SOURCE (
  source      => 'ADM_DEMO');
```

187.3.7 IMPORT_DISCOVERY_RESULT Procedure

This procedure can be used to import sensitive columns, along with the associated sensitive types, from an external source. The external source can be an Application Data Model (ADM) instance from Oracle Enterprise Manager Cloud Control.

Syntax

```
DBMS_TSDP_MANAGE.IMPORT_DISCOVERY_RESULT (
  discovery_result      IN CLOB,
  discovery_source      IN VARCHAR2,
  force                 IN FORCE DEFAULT FALSE);

DBMS_TSDP_MANAGE.IMPORT_DISCOVERY_RESULT (
  discovery_result      IN XMLTYPE,
  discovery_source      IN VARCHAR2,
  force                 IN FORCE DEFAULT FALSE);
```

Parameters

Table 187-8 *IMPORT_DISCOVERY_RESULT Procedure Parameters*

| Parameter | Description |
|------------------|--|
| discovery_result | List of sensitive columns, along with the optional list of (the definitions of) the sensitive column types in XML format (possibly as a CLOB). |
| discovery_source | Source of the import. The discovery_sourcename identifies the list of imported sensitive columns. In case of ADM, this should be the ADM name. |

Table 187-8 (Cont.) IMPORT_DISCOVERY_RESULT Procedure Parameters

| Parameter | Description |
|-----------|--|
| force | <p>Specifies if the discovery result should be imported or not when the discovery result contains columns sensitive columns that are already identified as sensitive by another source.</p> <ul style="list-style-type: none"> FALSE (default) - the discovery result will not be imported in case of conflicting columns. None of the columns and the sensitive types are imported. TRUE - the discovery result is imported and the attributes of the conflicting columns is set based on the incoming discovery result |

Examples

Import the list of sensitive columns of ADM instance, ADM_Demo:

```
DBMS_TSDP_MANAGE.IMPORT_DISCOVERY_RESULT (
  discovery_results => xml_adm_result,
  discovery_source  => 'ADM_Demo');
```

187.3.8 IMPORT_SENSITIVE_TYPES Procedure

This procedure imports a list of sensitive column types from a source.

Syntax

```
DBMS_TSDP_MANAGE.IMPORT_SENSITIVE_TYPES (
  sensitive_types IN CLOB,
  source          IN VARCHAR2);
```

```
DBMS_TSDP_MANAGE.IMPORT_SENSITIVE_TYPES (
  sensitive_types IN XMLTYPE,
  source          IN VARCHAR2);
```

Parameters

Table 187-9 IMPORT_SENSITIVE_TYPES Procedure Parameters

| Parameter | Description |
|-----------------|---|
| sensitive_types | List of sensitive column types in XML Format (possibly as a CLOB) |
| source | Source of the import. The source identifies the list of imported sensitive column types. In case of Application Data Model (ADM) from an Oracle Enterprise Manager Cloud Control instance, this should be the ADM name. |

Examples

Import the list of sensitive column types of ADM instance, ADM_Demo:

```
DBMS_TSDP_MANAGE.IMPORT_SENSITIVE_TYPES (
  sensitive_types => xml_adm_result,
  source          => 'ADM_Demo');
```

187.3.9 REMOVE_DISCOVERY_RESULT Procedure

This procedure removes sensitive columns corresponding to an Application Data Model (ADM) from an Oracle Enterprise Manager Cloud Control instance.

Syntax

```
DBMS_TSDP_MANAGE.REMOVE_DISCOVERY_RESULT (  
    discovery_source    IN VARCHAR2);
```

Parameters

Table 187-10 REMOVE_DISCOVERY_RESULT Procedure Parameters

| Parameter | Description |
|------------------|---|
| discovery_source | Source of the import. In case of ADM, this should be the ADM name, the results of which is to be removed. |

Examples

Remove the sensitive columns corresponding to ADM instance, ADM_Demo:

```
DBMS_TSDP_MANAGE.REMOVE_DISCOVERY_RESULT (  
    discovery_source    => 'ADM_Demo');
```

DBMS_TSDP_PROTECT

The `DBMS_TSDP_PROTECT` package provides an interface to configure transparent sensitive data protection (TSDP) policies in conjunction with the `DBMS_TSDP_MANAGE` package.

`DBMS_TSDP_PROTECT` is available with the Enterprise Edition only.

This chapter contains the following topics:

- [Overview](#)
- [Security Model](#)
- [Constants](#)
- [Data Structures](#)
- [Summary of DBMS_TSDP_PROTECT Subprograms](#)

Related Topics

- [DBMS_TSDP_MANAGE](#)
The `DBMS_TSDP_MANAGE` package provides an interface to import and manage sensitive columns and sensitive column types in the database, and is used in conjunction with the `DBMS_TSDP_PROTECT` package with regard to transparent sensitive data protection (TSDP) policies.

See Also:

Oracle Database Security Guide

188.1 DBMS_TSDP_PROTECT Overview

Use the `DBMS_TSDP_PROTECT` package to create transparent sensitive data protection policies, configure protection by associating the policies with sensitive types, and to enable and disable the configured protection.

Sensitive types can be added using the `DBMS_TSDP_MANAGE` package.

188.2 DBMS_TSDP_PROTECT Security Model

All procedures are executed with invoker's rights. Typically, a security administrator should have the `EXECUTE` privilege for this package.

188.3 DBMS_TSDP_PROTECT Constants

DBMS_TSDP_PROTECT defines the TSDP_PARAM_MAX constant for use when specifying parameter values.

This constant is described in the following table.

Table 188-1 DBMS_TSDP_PROTECT Constants - Compression Types

| Constant | Type | Value | Description |
|----------------|---------|-------|--|
| TSDP_PARAM_MAX | INTEGER | 4000 | Maximum length of the parameter value that can be specified in FEATURE_OPTIONS |

188.4 DBMS_TSDP_PROTECT Data Structures

The DBMS_TSDP_PROTECT package defines two TABLE types.

Table Types

- [FEATURE_OPTIONS Table Type](#)
- [POLICY_CONDITIONS Table Type](#)

188.4.1 FEATURE_OPTIONS Table Type

The following type is an associative array of VARCHAR2 (TSDP_PARAM_MAX) that is indexed by VARCHAR2 (M_IDEN).

Syntax

```
TYPE FEATURE_OPTIONS IS TABLE OF VARCHAR2 (TSDP_PARAM_MAX)
INDEX BY VARCHAR2 (M_IDEN);
```

188.4.2 POLICY_CONDITIONS Table Type

The following type is an associative array of VARCHAR2 (TSDP_PARAM_MAX) that is indexed by PLS_INTEGER.

Syntax

```
TYPE POLICY_CONDITIONS IS TABLE OF VARCHAR2 (TSDP_PARAM_MAX)
INDEX BY PLS_INTEGER;
```

188.5 Summary of DBMS_TSDP_PROTECT Subprograms

This table lists the DBMS_TSDP_PROTECT subprograms and briefly describes them.

Table 188-2 DBMS_TSDP_PROTECT Package Subprograms

| Subprogram | Description |
|---|--|
| ADD_POLICY Procedure | Creates a TSDP policy |
| ALTER_POLICY Procedure | Alters a TSDP policy |
| ASSOCIATE_POLICY Procedure | Associates or disassociates a TSDP policy with a sensitive column type |
| DISABLE_PROTECTION_COLUMN Procedure | Disables protection for columns |
| DISABLE_PROTECTION_SOURCE Procedure | Disables protection based on the source of truth for the sensitive columns |
| DISABLE_PROTECTION_TYPE Procedure | Disables protection for a sensitive column type |
| DROP_POLICY Procedure | Removes a TSDP policy |
| ENABLE_PROTECTION_COLUMN Procedure | Enables protection for columns |
| ENABLE_PROTECTION_SOURCE Procedure | Enables protection based on the source of truth for the sensitive columns |
| ENABLE_PROTECTION_TYPE Procedure | Enables protection for a sensitive column type |

188.5.1 ADD_POLICY Procedure

This procedure creates a TSDP policy.

Syntax

```
DBMS_TSDP_PROTECT.ADD_POLICY (
  policy_name          IN VARCHAR2,
  security_feature     IN PLS_INTEGER,
  policy_enable_options IN FEATURE_OPTIONS,
  policy_apply_condition IN POLICY_CONDITION DEFAULT TSDP$default_condition);
```

Parameters

Table 188-3 ADD_POLICY Procedure Parameters

| Parameter | Description |
|------------------------------------|---|
| <code>policy_name</code> | Name of the policy being created. The maximum length for this identifier is <code>M_IDEN</code> . This follows the Oracle naming convention. |
| <code>security_feature</code> | Oracle security feature with which the policy is associated. Allowed values: <ul style="list-style-type: none"> <code>DBMS_TSDP_PROTECT.REDACT</code> <code>DBMS_TSDP_PROTECT.VPD</code> <code>DBMS_TSDP_PROTECT.UNIFIED_AUDIT</code> <code>DBMS_TSDP_PROTECT.FINE_GRAINED_AUDIT</code> <code>DBMS_TSDP_PROTECT.COLUMN_ENCRYPTION</code> |
| <code>policy_enable_options</code> | Initialized with the parameter-value pairs corresponding to the <code>security_feature</code> setting |

Table 188-3 (Cont.) ADD_POLICY Procedure Parameters

| Parameter | Description |
|------------------------|---|
| policy_apply_condition | <p>Initialized with the property-value pairs that must be satisfied in order to apply the corresponding policy_enable_options. This is an associative array with Property as the key (PLS_INTEGER).</p> <p>Example: example_policy_condition(Property)=property_value. Permissible values for Property:</p> <ul style="list-style-type: none"> • DBMS_TSDP_PROPERTY.DATATYPE • DBMS_TSDP_PROPERTY.LENGTH • DBMS_TSDP_PROPERTY.PARENT_SCHEMA • DBMS_TSDP_PROPERTY.PARENT_TABLE |

Usage Notes

To create the TDSP policy, you must include the procedure in an anonymous block that defines the type of security feature that will use the policy and conditions to test when the policy is enabled. For more information, see *Oracle Database Security Guide*.

Examples

Create a policy PARTIAL_MASK_POLICY:

```

DECLARE
  redact_feature_options DBMS_TSDP_PROTECT.FEATURE_OPTIONS;
  policy_conditions DBMS_TSDP_PROTECT.POLICY_CONDITIONS;
BEGIN
  redact_feature_options ('expression') :=
    'SYS_CONTEXT(''USERENV'', ''SESSION_USER'')          =' 'APPUSER'';
  redact_feature_options ('function_type')              := 'DBMS_REDACT.PARTIAL';
  redact_feature_options ('function_parameters')        := 'STR, VVVVVVVVV, VVVVVVVVV,
*, 1, 6';
  policy_conditions(DBMS_TSDP_PROTECT.DATATYPE)        := 'VARCHAR2';
  DBMS_TSDP_PROTECT.ADD_POLICY
    ('PARTIAL_MASK_POLICY', DBMS_TSDP_PROTECT.REDACT, redact_feature_options,
policy_conditions);
END;

```

188.5.2 ALTER_POLICY Procedure

This procedure alters an existing TDSP policy

Syntax

```

DBMS_TSDP_PROTECT.ALTER_POLICY (
  policy_name           IN VARCHAR2,
  policy_enable_options IN FEATURE_OPTIONS,
  policy_apply_condition IN POLICY_CONDITION default TSDP$default_condition);

```

Parameters

Table 188-4 ALTER_POLICY Procedure Parameters

| Parameter | Description |
|-------------------------------------|--|
| <code>policy_name</code> | Name of the policy to alter |
| <code>policy_enable_options</code> | Initialized with the parameter-value pairs corresponding to the security feature |
| <code>policy_apply_condition</code> | <p>Initialized with the property-value pairs that must be satisfied in order to apply the corresponding <code>policy_enable_options</code>. This is an associative array with <code>Property</code> as the key (<code>PLS_INTEGER</code>).</p> <p>Example: <code>example_policy_condition(Property)=property_value</code>. Permissible values for <code>Property</code>:</p> <ul style="list-style-type: none"> • <code>DBMS_TSDP_PROPERTY.DATATYPE</code> • <code>DBMS_TSDP_PROPERTY.LENGTH</code> • <code>DBMS_TSDP_PROPERTY.PARENT_SCHEMA</code> • <code>DBMS_TSDP_PROPERTY.PARENT_TABLE</code> |

Usage Notes

- If the `policy_apply_condition` matches an existing condition for the policy, then the corresponding enable options are updated with `policy_enable_options`.
- If the `policy_apply_condition` does not match any existing condition for the policy, the combination of `policy_enable_options` and `policy_apply_condition` is added to the policy.

Examples

Add a new combination of `policy_apply_condition` and `policy_enable_options` to an existing policy `PARTIAL_MASK_POLICY`:

```
DECLARE
  redact_feature_options DBMS_TSDP_PROTECT.FEATURE_OPTIONS;
  policy_conditions DBMS_TSDP_PROTECT.POLICY_CONDITIONS;
BEGIN
  redact_feature_options ('expression') :=
    'SYS_CONTEXT(''USERENV'', 'SESSION_USER')='APPUSER'';
  redact_feature_options ('function_type') := 'DBMS_REDACT.PARTIAL';
  redact_feature_options ('function_parameters') := 'STR, VVVVVVVV, VVVVVVVV, *,
    1, 6';
  policy_conditions (DBMS_TSDP_PROTECT.DATATYPE) := 'VARCHAR2';
  DBMS_TSDP_PROTECT.ALTER_POLICY ('PARTIAL_MASK_POLICY', redact_feature_options,
  policy_conditions);
END;
```

188.5.3 ASSOCIATE_POLICY Procedure

This procedure associates or disassociates a TSDP policy with a sensitive column type.

Syntax

```
DBMS_TSDP_PROTECT.ASSOCIATE_POLICY (
  policy_name          IN VARCHAR2,
```

```
sensitive_type    IN VARCHAR2,
associate         IN BOOLEAN DEFAULT TRUE);
```

Parameters

Table 188-5 ASSOCIATE_POLICY Procedure Parameters

| Parameter | Description |
|----------------|---|
| policy_name | Name of the TDSP policy |
| sensitive_type | Name of the sensitive column type: |
| associate | Associate or Disassociate. TRUE implies Associate |

Usage Notes

Both the policy and the sensitive column type should exist in the database.

Examples

Associate PARTIAL_MASK_POLICY with SSN_TYPE:

```
DBMS_TSDP_PROTECT.ASSOCIATE_POLICY ('PARTIAL_MASK_POLICY', 'SSN_TYPE');
```

188.5.4 DISABLE_PROTECTION_COLUMN Procedure

This procedure disables protection for columns.

Syntax

```
DBMS_TSDP_PROTECT.DISABLE_PROTECTION_COLUMN (
  schema_name    IN VARCHAR2 DEFAULT '%',
  table_name     IN VARCHAR2 DEFAULT '%',
  column_name    IN VARCHAR2 DEFAULT '%',
  policy_name    IN VARCHAR2 DEFAULT NULL);
```

Parameters

Table 188-6 DISABLE_PROTECTION_COLUMN Procedure Parameters

| Parameter | Description |
|-------------|---|
| schema_name | Name of the schema containing the column |
| table_name | Table containing the column |
| column_name | Column name |
| policy_name | Optional policy name. If given, only this policy is disabled. |

Examples

Disable TSDP policies associated with the corresponding sensitive column types for columns that reside in schema with name like %PAYROLL%, table name like EMP%, and column name like SAL%:

```
EXEC DBMS_TSDP_PROTECT.DISABLE_PROTECTION_COLUMN ('%PAYROLL%', 'EMP%', 'SAL%');
```

188.5.5 DISABLE_PROTECTION_SOURCE Procedure

This procedure disables protection based on the source of truth for the sensitive columns.

Syntax

```
DBMS_TSDP_PROTECT.DISABLE_PROTECTION_SOURCE (
    discovery_sourcename    IN VARCHAR2);
```

Parameters

Table 188-7 *DISABLE_PROTECTION_SOURCE Procedure Parameters*

| Parameter | Description |
|----------------------|---|
| discovery_sourcename | Name of the discovery source. This could be the Application Data Model (ADM) name or the database user. |

Examples

Disable protection for all columns corresponding to ADM_Demo:

```
DBMS_TSDP_PROTECT.DISABLE_PROTECTION_SOURCE ('ADM_Demo');
```

188.5.6 DISABLE_PROTECTION_TYPE Procedure

This procedure disables protection for a sensitive column type.

Syntax

```
DBMS_TSDP_PROTECT.DISABLE_PROTECTION_TYPE (
    sensitive_type          IN VARCHAR2);
```

Parameters

Table 188-8 *DISABLE_PROTECTION_TYPE Procedure Parameters*

| Parameter | Description |
|----------------|-----------------------------------|
| sensitive_type | Name of the sensitive column type |

Examples

Disable protection for all columns identified by SSN_TYPE:

```
DBMS_TSDP_PROTECT.DISABLE_PROTECTION_TYPE ('SSN_TYPE');
```

188.5.7 DROP_POLICY Procedure

This procedure removes a TDSP policy or one of its condition-enable_options combinations.

Syntax

```
DBMS_TSDP_PROTECT.DROP_POLICY (
    policy_name            IN VARCHAR2,
```

```

policy_apply_condition IN POLICY_CONDITIONS);

DBMS_TSDP_PROTECT.DROP_POLICY (
  policy_name           IN VARCHAR2);

```

Parameters

Table 188-9 *DROP_POLICY Procedure Parameters*

| Parameter | Description |
|------------------------|---|
| policy_name | Name of the policy to drop |
| policy_apply_condition | To be initialized with the relevant condition |

Usage Notes

- The combination of `policy_conditions` and `policy_enable_options` can be dropped from a TSDP policy by giving the `policy_apply_condition` parameter. The default condition-default options combination can also be dropped (if it exists for the policy) by passing an empty associative array of type `DBMS_TSDP_PROTECT.POLICY_CONDITION`.
- If the condition-enable_options combination that is being dropped is the last condition-enable_options combination for the policy, the policy itself is dropped.
- A policy can be completely dropped by using the overloaded of the procedure that takes only `policy_name`.
- A policy or one of its conditions can be dropped only if the policy is not associated with any sensitive column type. This also means that a policy that is being dropped is not enabled on any column (object).

Examples

Dropping the condition-enable_options combination based on a specific condition:

```

DECLARE
  policy_conditions DBMS_TSDP_PROTECT.POLICY_CONDITIONS;
BEGIN
  policy_conditions (DBMS_TSDP_PROTECT.DATATYPE) := 'VARCHAR2';
  DBMS_TSDP_PROTECT.DROP_POLICY ('PARTIAL_MASK_POLICY', policy_conditions);
END;

```

The default condition-enable_options combination can be dropped by passing an empty associative array of type `DBMS_TSDP_PROTECT.POLICY_CONDITIONS` for the `policy_apply_condition` parameter:

```

DECLARE
  policy_conditions DBMS_TSDP_PROTECT.POLICY_CONDITIONS;
BEGIN
  DBMS_TSDP_PROTECT.DROP_POLICY ('redact_partial_cc', policy_conditions);
END;

```

Dropping a TSDP policy:

```

BEGIN
  DBMS_TSDP_PROTECT.DROP_POLICY(
    policy_name => 'PARTIAL_MASK_POLICY');
END;

```

188.5.8 ENABLE_PROTECTION_COLUMN Procedure

This procedure enables protection for columns.

Syntax

```
DBMS_TSDP_PROTECT.ENABLE_PROTECTION_COLUMN (
  schema_name      IN VARCHAR2 DEFAULT '%',
  table_name       IN VARCHAR2 DEFAULT '%',
  column_name      IN VARCHAR2 DEFAULT '%',
  policy_name      IN VARCHAR2 DEFAULT NULL);
```

Parameters

Table 188-10 *ENABLE_PROTECTION_COLUMN Procedure Parameters*

| Parameter | Description |
|-------------|--|
| schema_name | Name of the schema containing the column |
| table_name | Table containing the column |
| column_name | Column name |
| policy_name | Optional policy name. If given, only this policy is enabled. |

Usage Notes

- Only a TSDP Policy that is associated with the sensitive column type of the sensitive column can be enabled using this Procedure.
- LIKE condition is used for schema_name, table_name and column_name. AND semantics is followed.

Examples

Enable TSDP policies associated with the corresponding sensitive column types for columns that reside in schema with name like %PAYROLL%, table name like EMP%, and column name like SAL%:

```
DBMS_TSDP_PROTECT.ENABLE_PROTECTION_COLUMN ('%PAYROLL%', 'EMP%', 'SAL%');
```

188.5.9 ENABLE_PROTECTION_SOURCE Procedure

This procedure enables protection based on the source of truth for the sensitive columns.

Syntax

```
DBMS_TSDP_PROTECT.ENABLE_PROTECTION_SOURCE (
  discovery_sourcename IN VARCHAR2);
```

Parameters

Table 188-11 *ENABLE_PROTECTION_SOURCE Procedure Parameters*

| Parameter | Description |
|----------------------|---|
| discovery_sourcename | Name of the discovery source. This could be the Application Data Model (ADM) name or the database user. |

Examples

Enable protection for all columns corresponding to ADM_Demo:

```
DBMS_TSDP_PROTECT.ENABLE_PROTECTION_SOURCE ('ADM_Demo');
```

188.5.10 ENABLE_PROTECTION_TYPE Procedure

This procedure enables protection for a sensitive column type.

Syntax

```
DBMS_TSDP_PROTECT.ENABLE_PROTECTION_TYPE (
    sensitive_type      IN VARCHAR2);
```

Parameters

Table 188-12 *ENABLE_PROTECTION_TYPE Procedure Parameters*

| Parameter | Description |
|----------------|-----------------------------------|
| sensitive_type | Name of the sensitive column type |

Examples

Enable protection for all columns identified by SSN_TYPE:

```
DBMS_TSDP_PROTECT.ENABLE_PROTECTION_TYPE ('SSN_TYPE');
```

DBMS_TTS

The DBMS_TTS package checks if the transportable set is self-contained. All violations are inserted into a temporary table that can be selected from the view TRANSPORT_SET_VIOLATIONS.

This chapter contains the following topics:

- [Security Model](#)
- [Exceptions](#)
- [Operational Notes](#)
- [Summary of DBMS_TTS Subprograms](#)

See Also:

- *Oracle Database Administrator's Guide*
- *Oracle Database Upgrade Guide*

189.1 DBMS_TTS Security Model

Only users having the `execute_catalog_role` can execute this procedure. This role is initially only assigned to user SYS.

189.2 DBMS_TTS Exceptions

The DBMS_TTS package creates exceptions for missing or invalid transportable tablespaces.

```
ts_not_found EXCEPTION;
PRAGMA exception_init(ts_not_found, -29304);
ts_not_found_num NUMBER := -29304;

invalid_ts_list EXCEPTION;
PRAGMA exception_init(invalid_ts_list, -29346);
invalid_ts_list_num NUMBER := -29346;

sys_or_tmp_ts EXCEPTION;
PRAGMA exception_init(sys_or_tmp_ts, -29351);
sys_or_tmp_ts_num NUMBER := -29351;
```

189.3 DBMS_TTS Operational Notes

With respect to transportable tablespaces, disabled and enabled referential integrity constraints are handled differently.

- A disabled referential integrity constraint does not violate the transportability rules and is dropped during the import phase.
- An enabled referential integrity constraint violates the transportability rules if it references a table in a tablespace outside the transportable set.

189.4 Summary of DBMS_TTS Subprograms

The two procedures listed in the table are designed to be called by database administrators.

Table 189-1 DBMS_TTS Package Subprograms

| Subprogram | Description |
|---|--|
| DOWNGRADE Procedure | Downgrades transportable tablespace-related data |
| TRANSPORT_SET_CHECK Procedure | Checks if a set of tablespaces (to be transported) is self-contained |

189.4.1 DOWNGRADE Procedure

This procedure downgrades transportable tablespace related data.

Syntax

```
DBMS_TTS.DOWNGRADE;
```

189.4.2 TRANSPORT_SET_CHECK Procedure

This procedure checks if a set of tablespaces (to be transported) is self-contained. After calling this procedure, the user may select from a view to see a list of violations, if there are any.

Syntax

```
DBMS_TTS.TRANSPORT_SET_CHECK (
    ts_list          IN CLOB,
    incl_constraints IN BOOLEAN DEFAULT FALSE,
    full_check      IN BOOLEAN DEFAULT FALSE);
```

Parameters

Table 189-2 TRANSPORT_SET_CHECK Procedure Parameters

| Parameter | Description |
|----------------------|--|
| <code>ts_list</code> | List of one or more tablespaces, separated by comma. |

Table 189-2 (Cont.) TRANSPORT_SET_CHECK Procedure Parameters

| Parameter | Description |
|-------------------------------|--|
| <code>incl_constraints</code> | TRUE if you want to count in referential integrity constraints when examining if the set of tablespaces is self-contained. (The <code>incl_constraints</code> parameter is a default so that <code>TRANSPORT_SET_CHECK</code> will work if it is called with only the <code>ts_list</code> argument.) |
| <code>full_check</code> | Indicates whether a full or partial dependency check is required. If TRUE, treats all IN and OUT pointers (dependencies) and captures them as violations if they are not self-contained in the transportable set. The parameter should be set to TRUE for TSPITR or if a strict version of transportable is desired. By default the parameter is set to FALSE. It will only consider OUT pointers as violations. |

Examples

If the view does not return any rows, then the set of tablespaces is self-contained. For example,

```
SQLPLUS> EXECUTE DBMS_TTS.TRANSPORT_SET_CHECK('foo,bar', TRUE);  
SQLPLUS> SELECT * FROM TRANSPORT_SET_VIOLATIONS;
```

DBMS_TYPES

The `DBMS_TYPES` package consists of constants, which represent the built-in and user-defined types.

This chapter contains the following topics:

- [Constants](#)
- [Exceptions](#)

190.1 DBMS_TYPES Constants

The `DBMS_TYPES` package defines several constants to use when specifying parameter values.

These constants are listed in following table .

Table 190-1 *DBMS_TYPES Constants*

| Constant | Description |
|---------------------------------------|--|
| <code>NO_DATA</code> | Is only relevant if PieceWise is called, for a collection or any dataset. Denotes the end of collection/any dataset when all the elements have been accessed |
| <code>SUCCESS</code> | The operation succeeded |
| <code>TYPECODE_BDOUBLE</code> | A <code>NUMBER</code> type |
| <code>TYPECODE_BFILE</code> | A <code>BFILE</code> type |
| <code>TYPECODE_BFLOAT</code> | A <code>NUMBER</code> type |
| <code>TYPECODE_BLOB</code> | A <code>BLOB</code> type |
| <code>TYPECODE_CFILE</code> | A <code>CFILE</code> type |
| <code>TYPECODE_CHAR</code> | A <code>CHAR</code> type |
| <code>TYPECODE_CLOB</code> | A <code>CLOB</code> type |
| <code>TYPECODE_DATE</code> | A <code>DATE</code> type |
| <code>TYPECODE_INTERVAL_DS</code> | An <code>INTERVAL_DS</code> type |
| <code>TYPECODE_INTERVAL_YM</code> | A <code>INTERVAL_YM</code> type |
| <code>TYPECODE_MLSLABEL</code> | An <code>MLSLABEL</code> type |
| <code>TYPECODE_NAMEDCOLLECTION</code> | A named collection (<code>VARRAY</code> /nested table) type |
| <code>TYPECODE_NCHAR</code> | A <code>NCHAR</code> type |
| <code>TYPECODE_NCLOB</code> | A <code>NCLOB</code> type |
| <code>TYPECODE_NUMBER</code> | A <code>NUMBER</code> type |
| <code>TYPECODE_NVARCHAR2</code> | A <code>NVARCHAR2</code> type |
| <code>TYPECODE_OBJECT</code> | An <code>OBJECT</code> type |

Table 190-1 (Cont.) DBMS_TYPES Constants

| Constant | Description |
|------------------------|--------------------------------|
| TYPECODE_OPAQUE | An OPAQUE type |
| TYPECODE_RAW | A RAW type |
| TYPECODE_REF | A REF type |
| TYPECODE_TABLE | A nested table collection type |
| TYPECODE_TIMESTAMP | A TIMESTAMP type |
| TYPECODE_TIMESTAMP_LTZ | A TIMESTAMP_LTZ type |
| TYPECODE_TIMESTAMP_TZ | A TIMESTAMP_TZ type |
| TYPECODE_UROWID | A UROWID type |
| TYPECODE_VARCHAR2 | A VARCHAR2 type |
| TYPECODE_VARCHAR | A VARCHAR type |
| TYPECODE_VARRAY | A VARRAY collection type |

190.2 DBMS_TYPES Exceptions

DBMS_TYPES throws these exceptions.

- INVALID_PARAMETERS
- INCORRECT_USAGE
- TYPE_MISMATCH

DBMS_UMF

The `DBMS_UMF` package provides an interface for deploying the Remote Management Framework (RMF) for an Oracle Database. The RMF is used for collecting performance statistics for an Oracle Database.

See Also:

Oracle Database Performance Tuning Guide for more information about configuring the RMF for an Oracle Database.

This chapter contains the following topic:

- [Summary of DBMS_UMF Subprograms](#)

191.1 Summary of DBMS_UMF Subprograms

This topic lists the `DBMS_UMF` subprograms in alphabetical order and briefly describes them.

Table 191-1 DBMS_UMF Package Subprograms

| Subprogram | Description |
|--|---|
| CONFIGURE_NODE Procedure | Configures a node in the RMF topology |
| CREATE_LINK Procedure | Creates a database link between two nodes in the RMF topology |
| CREATE_TOPOLOGY Procedure | Creates the RMF topology |
| DROP_LINK Procedure | Removes a database link between two nodes in the RMF topology |
| DROP_TOPOLOGY Procedure | Deletes the RMF topology |
| ENABLE_SERVICE Procedure | Enables a service on a node in the RMF topology |
| GET_NODE_ID_LOCAL Function | Returns the node ID of a node in the RMF topology |
| GET_NODE_NAME_LOCAL Function | Returns the node name of a node in the RMF topology |
| GET_TARGET_ID Function | Returns the destination ID in the RMF topology |
| GET_TOPOLOGY_NAME_LOCAL Function | Returns the RMF topology name of the local node |
| QUERY_LINK_INFO Procedure | Returns the information about a database link in the RMF topology |
| QUERY_NODE_INFO Procedures | Returns the information about a node in the RMF topology |
| REGISTER_NODE Function and Procedure | Registers a node in the RMF topology |

Table 191-1 (Cont.) DBMS_UMF Package Subprograms

| Subprogram | Description |
|--|--|
| SWITCH_DESTINATION Procedure | Designates a source node as a destination node in the RMF topology |
| UNCONFIGURE_NODE Procedure | Resets the configuration of a node in the RMF topology |
| UNREGISTER_NODE Procedure | Removes the registration of a node in the RMF topology |

191.1.1 CONFIGURE_NODE Procedure

This procedure configures a node that needs to be registered with the RMF topology. This procedure must be executed on the node that needs to be configured.

Syntax

```
DBMS_UMF.CONFIGURE_NODE (
  node_name          IN VARCHAR2 DEFAULT NULL,
  dblink_to_target  IN VARCHAR2 DEFAULT NULL);
```

Parameters

Table 191-2 CONFIGURE_NODE Procedure Parameters

| Parameter | Description |
|------------------|--|
| node_name | Name of the node. Each node in the RMF topology must be assigned a unique name. If a name is not provided for a node in this procedure, then the value of the initialization parameter <code>DB_UNIQUE_NAME</code> is assigned as the name for the node by default. |
| dblink_to_target | Database link from this node to the destination node. |

Security Model

Only the database users `SYS` and `SYS$UMF` can execute this procedure.

191.1.2 CREATE_LINK Procedure

This procedure creates database links between two nodes in the RMF topology. This procedure must be executed only on the destination node.

Syntax

```
DBMS_UMF.CREATE_LINK (
  topology_name     IN VARCHAR2,
  node_a_name       IN VARCHAR2,
```

```

node_b_name      IN VARCHAR2,
dblink_a_to_b    IN VARCHAR2,
dblink_b_to_a    IN VARCHAR2);

```

Parameters

Table 191-3 CREATE_LINK Procedure Parameters

| Parameter | Description |
|---------------|---|
| topology_name | Name of the RMF topology. |
| node_a_name | Name of the first node. |
| node_b_name | Name of the second node. |
| dblink_a_to_b | Database link from the first node to the second node. |
| dblink_b_to_b | Database link from the second node to the first node. |

Security Model

Only the database users `SYS` and `SYS$UMF` can execute this procedure.

191.1.3 CREATE_TOPOLOGY Procedure

This procedure creates the RMF topology and designates the node on which it is executed as the destination node for that topology.

Syntax

```

DBMS_UMF.CREATE_TOPOLOGY(
  topology_name IN VARCHAR2);

```

Parameters

Table 191-4 CREATE_TOPOLOGY Procedure Parameters

| Parameter | Description |
|---------------|---------------------------|
| topology_name | Name of the RMF topology. |

Security Model

Only the database users `SYS` and `SYS$UMF` can execute this procedure.

191.1.4 DROP_LINK Procedure

This procedure removes the database links between two nodes in the RMF topology. This procedure must be executed only on the destination node.

Syntax

```
DBMS_UMF.DROP_LINK(  
    topology_name IN VARCHAR2,  
    node_a_name   IN VARCHAR2,  
    node_b_name   IN VARCHAR2);
```

Parameters

Table 191-5 DROP_LINK Procedure Parameters

| Parameter | Description |
|---------------|---------------------------|
| topology_name | Name of the RMF topology. |
| node_a_name | Name of the first node. |
| node_b_name | Name of the second node. |

Security Model

Only the database users `SYS` and `SYS$UMF` can execute this procedure.

191.1.5 DROP_TOPOLOGY Procedure

This procedure deletes the RMF topology. This procedure must be executed only on the destination node.

Syntax

```
DBMS_UMF.DROP_TOPOLOGY(  
    topology_name IN VARCHAR2);
```

Parameters

Table 191-6 DROP_TOPOLOGY Procedure Parameters

| Parameter | Description |
|---------------|---------------------------------|
| topology_name | Name of the topology to delete. |

Security Model

Only the database users `SYS` and `SYS$UMF` can execute this procedure.

191.1.6 ENABLE_SERVICE Procedure

This procedure enables a service, such as the AWR service, on a node in the RMF topology. This procedure must be executed only on the destination node.

Syntax

```
DBMS_UMF.ENABLE_SERVICE(  
    topology_name    IN VARCHAR2,  
    node_name        IN VARCHAR2,  
    service_type     IN NUMBER);
```

Parameters

Table 191-7 ENABLE_SERVICE Procedure Parameters

| Parameter | Description |
|---------------|--|
| topology_name | Name of the RMF topology. |
| node_name | Name of the node on which a specific service needs to be enabled. |
| service_type | Numeric constant identifying the service. The only allowed value for this parameter is UMF_SERVICE_TYPE_AWR, which is Automatic Workload Repository (AWR) service. |

Security Model

Only the database users SYS and SYS\$UMF can execute this procedure.

191.1.7 GET_NODE_ID_LOCAL Function

This function returns the node ID of the node in the RMF topology on which this function is executed.

Syntax

```
DBMS_UMF.GET_NODE_ID_LOCAL(  
    topology_name IN VARCHAR2 DEFAULT NULL)  
RETURN NUMBER;
```

Parameters

Table 191-8 GET_NODE_ID_LOCAL Function Parameters

| Parameter | Description |
|---------------|---|
| topology_name | Name of the RMF topology with which the node is registered. |

Return Value

Returns the node ID of the node in the RMF topology on which this function is executed.

Security Model

Only the database users `SYS` and `SYS$UMF` can execute this function.

191.1.8 GET_NODE_NAME_LOCAL Function

This function returns the name of the node in the RMF topology on which this function is executed.

Syntax

```
DBMS_UMF.GET_NODE_NAME_LOCAL RETURN VARCHAR2;
```

Return Value

Returns the name of the node in the RMF topology on which this function is executed.

Security Model

Only the database users `SYS` and `SYS$UMF` can execute this procedure.

191.1.9 GET_TARGET_ID Function

This function returns the ID of the destination node in the RMF topology. This function can be executed on any node in the RMF topology.

Syntax

```
DBMS_UMF.GET_TARGET_ID(  
    topology_name IN VARCHAR2)  
RETURN NUMBER;
```

Parameters

Table 191-9 GET_TARGET_ID Function Parameters

| Parameter | Description |
|----------------------------|---------------------------|
| <code>topology_name</code> | Name of the RMF topology. |

Return Value

Returns the ID of the destination node in the RMF topology.

Security Model

Only the database users `SYS` and `SYS$UMF` can execute this procedure.

191.1.10 GET_TOPOLOGY_NAME_LOCAL Function

This function returns the name of the active RMF topology of the node on which this function is executed.

Syntax

```
DBMS_UMF.GET_TOPOLOGY_NAME_LOCAL RETURN VARCHAR2;
```

Return Value

Returns the name of the active RMF topology of the node on which this function is executed.

Security Model

Only the database users `SYS` and `SYS$UMF` can execute this procedure.

191.1.11 QUERY_LINK_INFO Procedure

This procedure returns the name of the database link between two nodes in the RMF topology. This procedure can be executed on any node in the RMF topology.

Syntax

```
DBMS_UMF.QUERY_LINK_INFO(  
    topology_name    IN    VARCHAR2,  
    from_node_id     IN    NUMBER,  
    to_node_id       IN    NUMBER,  
    link_name        OUT   VARCHAR2);
```

Parameters

Table 191-10 QUERY_LINK_INFO Procedure Parameters

| Parameter | Description |
|----------------------------|---|
| <code>topology_name</code> | Name of the RMF topology. |
| <code>from_node_id</code> | Node ID of the first node. |
| <code>to_node_id</code> | Node ID of the second node. |
| <code>link_name</code> | Name of the database link from the first node to the second node returned by the procedure. |

Security Model

Only the database users `SYS` and `SYS$UMF` can execute this procedure.

191.1.12 QUERY_NODE_INFO Procedures

This procedure returns information about a node in the RMF topology. This procedure can be executed on any node in the RMF topology.

Syntax

```
DBMS_UMF.QUERY_NODE_INFO (
  topology_name      IN   VARCHAR2  DEFAULT NULL,
  node_name          IN   VARCHAR2,
  node_id            OUT  NUMBER);
```

```
DBMS_UMF.QUERY_NODE_INFO (
  node_id            IN   NUMBER,
  topology_name      OUT  VARCHAR2,
  node_name          OUT  VARCHAR2);
```

Parameters

Table 191-11 QUERY_NODE_INFO Procedure Parameters

| Parameter | Description |
|---------------|---|
| topology_name | Name of the RMF topology with which the node is registered. |
| node_name | Name of the node. |
| node_id | Identifier of the node. |

Security Model

Only the database users `SYS` and `SYS$UMF` can execute this procedure.

191.1.13 REGISTER_NODE Function and Procedure

This function and procedure registers a node with the RMF topology. This procedure and function must be executed only on the destination node in the RMF topology.

Syntax

```
DBMS_UMF.REGISTER_NODE (
  topology_name      IN   VARCHAR2,
  node_name          IN   VARCHAR2,
  dblink_to_node     IN   VARCHAR2  DEFAULT NULL,
  dblink_from_node   IN   VARCHAR2  DEFAULT NULL,
  as_source           IN   VARCHAR2  DEFAULT 'TRUE',
  as_candidate_target IN   VARCHAR2  DEFAULT 'FALSE');
```

```
DBMS_UMF.REGISTER_NODE (
  topology_name      IN   VARCHAR2,
  node_name          IN   VARCHAR2,
  dblink_to_node     IN   VARCHAR2  DEFAULT NULL,
  dblink_from_node   IN   VARCHAR2  DEFAULT NULL,
```

```

as_source          IN VARCHAR2 DEFAULT 'TRUE',
as_candidate_target IN VARCHAR2 DEFAULT 'FALSE');
node_id           OUT VARCHAR2);

DBMS_UMF.REGISTER_NODE(
  topology_name    IN VARCHAR2,
  node_name        IN VARCHAR2,
  dblink_to_node   IN VARCHAR2 DEFAULT NULL,
  dblink_from_node IN VARCHAR2 DEFAULT NULL,
  as_source        IN VARCHAR2 DEFAULT 'TRUE',
  as_candidate_target IN VARCHAR2 DEFAULT 'FALSE')
RETURN NUMBER;
```

Parameters

Table 191-12 REGISTER_NODE Function and Procedure Parameters

| Parameter | Description |
|---------------------|---|
| topology_name | Name of the RMF topology. |
| node_name | Name of the node to register. |
| dblink_to_node | Name for the database link from the destination to the node. |
| dblink_from_node | Name for the database link from the node to the destination. |
| as_source | Set to TRUE, if the node is a source, else set to FALSE. |
| as_candidate_target | Set to TRUE, if the node is a candidate destination, else set to FALSE. |
| node_id | Node ID returned by the procedure. |

Return Value

Returns the node ID of the registered node.

Security Model

Only the database users `SYS` and `SYS$UMF` can execute this procedure.

191.1.14 SWITCH_DESTINATION Procedure

This procedure makes the candidate destination as the new destination in the RMF topology. This procedure must be executed only on the candidate destination node.

Syntax

```

DBMS_UMF.SWITCH_DESTINATION(
  topology_name    IN VARCHAR2,
  force_switch     IN BOOLEAN DEFAULT TRUE);
```

Parameters

Table 191-13 SWITCH_DESTINATION Procedure Parameters

| Parameter | Description |
|---------------|---|
| topology_name | Name of the RMF topology. |
| force_switch | If set to <code>FALSE</code> , the execution of this procedure fails in the following situations: <ul style="list-style-type: none">• Candidate destination is a read-only database, and hence it cannot become the new destination.• Candidate destination does not have database links to one or more sources in the topology.• Candidate destination is unable to get the latest AWR data from the old destination. If set to <code>TRUE</code> , the execution of this procedure fails in the following situation: <ul style="list-style-type: none">• Candidate destination is a read-only database, and hence it cannot become the new destination. |

Security Model

Only the database users `SYS` and `SYS$UMF` can execute this procedure.

191.1.15 UNCONFIGURE_NODE Procedure

This procedure removes the configuration details of the node on which this procedure is executed.

Syntax

```
DBMS_UMF.UNCONFIGURE_NODE;
```

Security Model

Only the database users `SYS` and `SYS$UMF` can execute this procedure.

191.1.16 UNREGISTER_NODE Procedure

This procedure removes a node for the RMF topology. This procedure must be executed only on the destination node.

Syntax

```
DBMS_UMF.UNREGISTER_NODE(  
    topology_name    IN VARCHAR2,  
    node_name        IN VARCHAR2);
```

Parameters

Table 191-14 UNREGISTER_NODE Procedure Parameters

| Parameter | Description |
|---------------|---|
| topology_name | Name of the RMF topology. |
| node_name | Name of the node which needs to be removed from the topology. |

Security Model

Only the database users `SYS` and `SYS$UMF` can execute this procedure.

DBMS_UNDO_ADV

The Undo Advisor assists in correctly sizing the undo tablespace and sets the low threshold value of the Undo Retention Period for any Oracle Flashback requirements. The Undo Advisor can also be used to estimate the undo tablespace required for migration from manual to automatic undo management before actually creating the new undo tablespace.

The `DBMS_UNDO_ADVISOR` package provides subprograms to manage the execution of the Undo Advisor feature.

The Undo Advisor relies for its analysis on data collected in the Automatic Workload Repository (AWR). Thus, it is important that the AWR have adequate workload statistics available so that the Undo Advisor can make accurate recommendations. For newly created databases, adequate statistics may not be available immediately. In such cases, continue to use the default auto-extending undo tablespace until at least one workload cycle completes.

This chapter contains the following topic:

- [Summary of DBMS_UNDO_ADV Subprograms](#)

192.1 Summary of DBMS_UNDO_ADV Subprograms

This topic lists the `DBMS_UNDO_ADV` subprograms in alphabetical order and briefly describes them.

Table 192-1 DBMS_UNDO_ADV Package Subprograms

| Subprogram | Description |
|--|---|
| BEST_POSSIBLE_RETENTION Function | Returns the best possible value for the <code>undo_retention</code> parameter that the current undo tablespace can satisfy in order to maximize the usage of the current undo tablespace based on the historical information of the given period. |
| LONGEST_QUERY Function | This function returns the duration of the longest query, in seconds, for a given period. |
| RBU_MIGRATION Function | Estimates the undo tablespace needed for migration from manual to automatic undo management. |
| REQUIRED_RETENTION Function | Returns the required value for the <code>undo_retention</code> parameter to satisfy the longest query based on undo statistics available for a given period. |
| REQUIRED_UNDO_SIZE Function | Returns the required undo tablespace size in MB to satisfy a certain undo retention value based on undo statistics available for a given period. |
| UNDO_ADVISOR Function | Uses the advisor framework to check if there is any problem with the current instance. It also provides recommendations. |

Table 192-1 (Cont.) DBMS_UNDO_ADV Package Subprograms

| Subprogram | Description |
|--|--|
| UNDO_AUTOTUNE Function | Determines whether auto-tuning of undo retention is enabled for the current undo tablespace. |
| UNDO_HEALTH Function | Checks whether there is any problem with the current setting of undo retention and undo tablespace size based on the historical information of a given period and provides recommendations to fix the problem. |
| UNDO_INFO Function | Retrieves information about the undo tablespace of the current instance. |

192.1.1.1 BEST_POSSIBLE_RETENTION Function

This function returns the best possible value for the `undo_retention` parameter that the current undo tablespace can satisfy in order to maximize the usage for the current undo tablespace based on the historical information of a given period.

Syntax

Viewing the output using the historical information in memory:

```
DBMS_UNDO_ADV.BEST_POSSIBLE_RETENTION()
RETURN NUMBER;
```

Viewing the output using start time and end time:

```
DBMS_UNDO_ADV.BEST_POSSIBLE_RETENTION(
    start_time IN DATE,
    end_time   IN DATE)
RETURN NUMBER;
```

Viewing the output using begin and end AWR snapshot ID:

```
DBMS_UNDO_ADV.BEST_POSSIBLE_RETENTION(
    begin_snap IN NUMBER,
    end_snap   IN NUMBER)
RETURN NUMBER;
```

Parameters

Table 192-2 BEST_POSSIBLE_RETENTION Function Parameters

| Parameter | Description |
|-------------------------|---------------------------------|
| <code>start_time</code> | Start time of the given period. |
| <code>end_time</code> | End time of the given period. |

Table 192-2 (Cont.) BEST_POSSIBLE_RETENTION Function Parameters

| Parameter | Description |
|-------------------------|--|
| <code>begin_snap</code> | Begin snapshot identifier. It is based on historical information in AWR from the <code>begin_snap</code> identifier. |
| <code>end_snap</code> | End snapshot identifier. It is based on historical information in AWR until the <code>end_snap</code> identifier. |

192.1.2 RBU_MIGRATION Function

This function estimates the undo tablespace needed for migration from manual to automatic undo management.

If you are currently using manual undo management (rollback segments) to manage undo space, then Oracle recommends migrating to automatic undo management. You must first create an undo tablespace, before opening a newly upgraded database. The required size of undo tablespace depends on the system workload and Flashback requirements.

Note:

The `RBU_MIGRATION` function should be called only when `undo_management = manual`.

Syntax

Viewing the output using the historical information in memory:

```
DBMS_UNDO_ADV.RBU_MIGRATION ()
RETURN NUMBER;
```

Viewing the output using the Start Time and End Time:

```
DBMS_UNDO_ADV.RBU_MIGRATION (
    START_TIME IN DATE,
    END_TIME   IN DATE)
RETURN NUMBER;
```

Parameters

Table 192-3 RBU_MIGRATION Function Parameters

| Parameter | Description |
|-------------------------|---------------------------------|
| <code>START_TIME</code> | Start time of the given period. |
| <code>END_TIME</code> | End time of the given period. |

192.1.3 LONGEST_QUERY Function

This function returns the duration of the longest query, in seconds, for a given period.

Syntax

Viewing the output using the historical information in memory:

```
DBMS_UNDO_ADV.LONGEST_QUERY()  
RETURN NUMBER;
```

Viewing the output using start time and end time:

```
DBMS_UNDO_ADV.LONGEST_QUERY(  
    start_time IN DATE,  
    end_time   IN DATE)  
RETURN NUMBER;
```

Viewing the output using begin and end AWR snapshot ID:

```
DBMS_UNDO_ADV.LONGEST_QUERY(  
    begin_snap IN NUMBER,  
    end_snap   IN NUMBER)  
RETURN NUMBER;
```

Parameters

Table 192-4 LONGEST_QUERY Function Parameters

| Parameter | Description |
|------------|---|
| start_time | Start time for the specified period. |
| end_time | End time for the specified period. |
| begin_snap | Begin snapshot identifier. It is based on historical information in AWR from the begin_snap identifier. |
| end_snap | End snapshot identifier. It is based on historical information in AWR until the end_snap identifier. |

192.1.4 REQUIRED_RETENTION Function

This function returns the required value for the `undo_retention` parameter to satisfy the longest query based on undo statistics available for a given period.

Syntax

Viewing the output using the historical information in memory:

```
DBMS_UNDO_ADV.REQUIRED_RETENTION()
RETURN NUMBER;
```

Viewing the output using start time and end time:

```
DBMS_UNDO_ADV.REQUIRED_RETENTION(
    start_time IN DATE,
    end_time   IN DATE)
RETURN NUMBER;
```

Viewing the output using begin and end AWR snapshot ID:

```
DBMS_UNDO_ADV.REQUIRED_RETENTION(
    begin_snap IN NUMBER,
    end_snap   IN NUMBER)
RETURN NUMBER;
```

Parameters

Table 192-5 REQUIRED_RETENTION Function Parameters

| Parameter | Description |
|-------------------------|--|
| <code>start_time</code> | Start time of the given period. |
| <code>end_time</code> | End time of the given period. |
| <code>begin_snap</code> | Begin snapshot identifier. It is based on historical information in AWR from the <code>begin_snap</code> identifier. |
| <code>end_snap</code> | End snapshot identifier. It is based on historical information in AWR until the <code>end_snap</code> identifier. |

192.1.5 REQUIRED_UNDO_SIZE Function

This function returns the required undo tablespace size (in MB) to satisfy certain undo retention value based on undo statistics available for a given period.

Note:

Zero will be returned if the information about the given period is not available.

Syntax

Viewing the output using the historical information in memory:

```
DBMS_UNDO_ADV.REQUIRED_UNDO_SIZE(  
    retention IN NUMBER)  
RETURN NUMBER;
```

Viewing the output using start time and end time:

```
DBMS_UNDO_ADV.REQUIRED_UNDO_SIZE(  
    retention IN NUMBER,  
    start_time IN DATE,  
    end_time IN DATE)  
RETURN NUMBER;
```

Viewing the output using begin and end AWR snapshot ID:

```
DBMS_UNDO_ADV.REQUIRED_UNDO_SIZE(  
    retention IN NUMBER,  
    begin_snap IN NUMBER,  
    end_snap IN NUMBER)  
RETURN NUMBER;
```

Parameters

Table 192-6 REQUIRED_UNDO_SIZE Function Parameters

| Parameter | Description |
|------------|--|
| retention | Retention value you want to set for the <code>undo_retention init.ora</code> parameter. |
| start_time | Start time of the given period. |
| end_time | End time of the given period. |
| begin_snap | Begin snapshot identifier. It is based on historical information in AWR from the <code>begin_snap</code> identifier. |
| end_snap | End snapshot identifier. It is based on historical information in AWR until the <code>end_snap</code> identifier. |

192.1.6 UNDO_ADVISOR Function

This function uses the advisor framework to check if there is any problem with the current instance and provide recommendations.

Note:

This function should be used when `undo_management` is set to `auto`.

Syntax

Viewing the output using the historical information in memory:

```
DBMS_UNDO_ADV.UNDO_ADVISOR(  
    instance_id IN NUMBER)  
RETURN VARCHAR2;
```

Viewing the output using start time and end time:

```
DBMS_UNDO_ADV.UNDO_ADVISOR(  
    start_time IN DATE,  
    end_time   IN DATE,  
    instance_id IN NUMBER)  
RETURN VARCHAR2;
```

Viewing the output using begin and end AWR snapshot ID:

```
DBMS_UNDO_ADV.UNDO_ADVISOR(  
    begin_snap IN NUMBER,  
    end_snap   IN NUMBER,  
    instance_id IN NUMBER)  
RETURN VARCHAR2;
```

Parameters

Table 192-7 UNDO_ADVISOR Function Parameters

| Parameter | Description |
|--------------------------|--|
| <code>start_time</code> | Start time of the given period. |
| <code>end_time</code> | End time of the given period. |
| <code>begin_snap</code> | Begin snapshot identifier. It is based on historical information in AWR from the <code>begin_snap</code> identifier. |
| <code>end_snap</code> | End snapshot identifier. It is based on historical information in AWR until the <code>end_snap</code> identifier. |
| <code>instance_id</code> | Instance ID of the current instance. |

192.1.7 UNDO_AUTOTUNE Function

This function finds out whether the auto-tuning of undo retention is enabled for the current undo tablespace.

Syntax

```
DBMS_UNDO_ADV.UNDO_AUTOTUNE (
    chk OUT BOOLEAN)
RETURN BOOLEAN;
```

Parameters

Table 192-8 UNDO_AUTOTUNE Function Parameters

| Parameter | Description |
|-----------|--|
| chk | TRUE if auto-tuning of undo retention is enabled, FALSE otherwise. |

192.1.8 UNDO_HEALTH Function

Checks whether there is any problem with the current setting of undo retention and undo tablespace size based on the historical information of a given period and provides recommendations to fix the problem.

If the return value is 0, no problem is found. Otherwise, parameter `prob` and `reco` are the problem and recommendation on fixing the problem.

Syntax

Viewing the output using the historical information in memory:

```
DBMS_UNDO_ADV.UNDO_HEALTH (
    prob OUT VARCHAR2,
    reco OUT VARCHAR2,
    rtn1 OUT VARCHAR2,
    retn OUT NUMBER,
    utbs OUT NUMBER);
```

Viewing the output using start time and end time:

```
DBMS_UNDO_ADV.UNDO_HEALTH (
    prob OUT VARCHAR2,
    reco OUT VARCHAR2,
    rtn1 OUT VARCHAR2,
    retn OUT NUMBER,
    utbs OUT NUMBER)
RETURN NUMBER;
```

Viewing the output using begin and end AWR snapshot ID:

```
DBMS_UNDO_ADV.UNDO_HEALTH (
  begin_snap IN NUMBER,
  end_snap   IN NUMBER,
  prob       OUT VARCHAR2,
  reco       OUT VARCHAR2,
  rtn1       OUT VARCHAR2,
  retn       OUT NUMBER,
  utbs       OUT NUMBER)
RETURN NUMBER;
```

Parameters

Table 192-9 UNDO_HEALTH Function Parameters

| Parameter | Description |
|------------|--|
| start_time | Start time of the given period. |
| end_time | End time of the given period. |
| begin_snap | Begin snapshot identifier. It is based on historical information in AWR from the <code>begin_snap</code> identifier. |
| end_snap | End snapshot identifier. It is based on historical information in AWR until the <code>end_snap</code> identifier. |
| prob | Problem that is being diagnosed. For example, long running query may fail or undo tablespace cannot satisfy <code>undo_retention</code> . |
| reco | Recommendation for fixing the problem. |
| rtn1 | Rationale for the recommendation. |
| retn | The numerical value of retention if the recommendation is to change retention. |
| utbs | The numerical value of undo tablespace size (in MB) if the recommendation is to change undo tablespace size. |

192.1.9 UNDO_INFO Function

This function retrieves information about the undo tablespace of the current instance.

This function returns the undo tablespace name, maximum possible size for the undo tablespace, current undo retention value, and boolean values to verify if it is auto-extensible or if the undo tablespace has guaranteed undo retention.

Syntax

```
DBMS_UNDO_ADV.UNDO_INFO (
  tbs_name       OUT VARCHAR2,
  tbs_size       OUT NUMBER,
  tbs_autoextend OUT BOOLEAN,
  tbs_retention  OUT NUMBER,
```

```

        tbs_guarantee OUT BOOLEAN)
RETURN BOOLEAN;

```

Parameters

Table 192-10 UNDO_INFO Function Parameters

| Parameter | Description |
|----------------|---|
| tbs_name | Name of the current undo tablespace the instance is using. |
| tbs_size | The size of the undo tablespace in MB, if the undo tablespace is <i>fixed-sized</i> . If the tablespace is <i>auto_extensible</i> , it is the maximum possible size of the undo tablespace in MB. |
| tbs_autoextend | TRUE if the undo tablespace is extensible, FALSE otherwise. |
| tbs_retention | The value of the <i>undo_retentioninit.ora</i> parameter. |
| tbs_guarantee | TRUE if the undo tablespace has guaranteed retention, FALSE otherwise. |

DBMS_USER_CERTS

The `DBMS_USER_CERTS` package allows you add and delete certificates.

This chapter contains the following topics:

- [DBMS_USER_CERTS Overview](#)
- [DBMS_USER_CERTS Security Model](#)
- [Summary of DBMS_USER_CERTS Subprograms](#)

See Also:

- *Oracle Database Administrator's Guide*
- *Oracle Database Concepts*
- *Oracle Database SQL Language Reference*
- *Oracle Database Reference*
- For information on hidden columns in blockchain tables, see *Hidden Columns in Blockchain Tables*

193.1 DBMS_USER_CERTS Overview

The `DBMS_USER_CERTS` package allows you add and delete certificates.

The `DBMS_USER_CERTS` package allows you to:

- add certificates
- delete certificates

One use case is to attach a digital signature to a row in a blockchain table and be able to verify the digital signature later. A certificate used to sign one or more rows in blockchain tables and which has since expired should remain in the database until all those rows have been deleted from the blockchain tables.

193.2 DBMS_USER_CERTS Security Model

The `DBMS_USER_CERTS` package is owned by `SYS` and is installed as part of database installation.

- Both `ADD_CERTIFICATE()` and `DROP_CERTIFICATE()` sub-programs can be executed by any database user. The `EXECUTE` privilege on `DBMS_USER_CERTS` package is granted to `PUBLIC` role.

- Using `ADD_CERTIFICATE()`, a database user can add multiple certificates, each one would be identified uniquely using a GUID.
- Only SYSDBA or the user who owns the certificate, can drop it using `DROP_CERTIFICATE()`.

193.3 Summary of DBMS_USER_CERTS Subprograms

The `DBMS_USER_CERTS` package uses `ADD_CERTIFICATE` and `DROP_CERTIFICATE` subprograms to add and delete X.509 certificates which are used for signature verification for blockchain tables by the current user.

Table 193-1 DBMS_USER_CERTS Package Subprograms

| Subprogram | Description |
|--|---|
| ADD_CERTIFICATE Procedure | Adds X.509 certificates which are used for signature verification of blockchain tables. |
| DROP_CERTIFICATE Procedure | Drops a certificate that is used for signature verification of blockchain tables. |

193.3.1 ADD_CERTIFICATE Procedure

This procedure can be used by the current user to add an X.509 certificate that is used for signature verification of blockchain tables.

Syntax

```
DBMS_USER_CERTS.ADD_CERTIFICATE (
    x509_cert          IN BLOB,
    cert_id            OUT RAW);
```

Parameters

Table 193-2 ADD_CERTIFICATE Procedure Parameters

| Parameter | Description |
|------------------------|---|
| <code>x509_cert</code> | The X.509 certificate used for signature verification of blockchain tables. |
| <code>cert_id</code> | The Global Unique Identifier (GUID) for the certificate. |

193.3.2 DROP_CERTIFICATE Procedure

This procedure can be used by the current user to drop a certificate that is used for signature verification of blockchain tables.

Syntax

```
DBMS_USER_CERTS.DROP_CERTIFICATE (
    cert_id            IN RAW);
```

Parameters

Table 193-3 DROP_CERTIFICATE Procedure Parameters

| Parameter | Description |
|----------------------|---|
| <code>cert_id</code> | The Global Unique Identifier (GUID) of the certificate. |

DBMS_UTILITY

The `DBMS_UTILITY` package provides various utility subprograms.

This chapter contains the following topics:

- [DBMS_UTILITY Deprecated Subprograms](#)
- [Security Model](#)
- [Constants](#)
- [Exceptions](#)
- [Data Structures](#)
- [Summary of DBMS_UTILITY Subprograms](#)

194.1 DBMS_UTILITY Deprecated Subprograms

These `DBMS_UTILITY` subprograms are deprecated in Oracle Database 12c release 12.2.

Note:

Oracle recommends that you do not use deprecated procedures in new applications. Support for deprecated features is for backward compatibility only.

- [GET_PARAMETER_VALUE Function](#)
Query `v$_parameter` directly to find the value of an `init.ora` parameter.
- [ANALYZE_PART_OBJECT Procedure](#)
Use `DBMS_STATS` to gather statistics.
- [GET_DEPENDENCY Procedure](#)
There is no replacement for this subprogram. However, you can directly query the dictionary views.

There are no replacements for these subprograms.

194.2 DBMS_UTILITY Security Model

`DBMS_UTILITY` runs with the privileges of the calling user for the `NAME_RESOLVE` procedure and the `COMPILE_SCHEMA` procedure. This is necessary so that the SQL works correctly.

The package does not run as `SYS`. The privileges are checked using `DBMS_DDL`.

Related Topics

- [NAME_RESOLVE Procedure](#)
This procedure resolves the given name, including synonym translation and authorization checking as necessary.
- [COMPILE_SCHEMA Procedure](#)
This procedure compiles all procedures, functions, packages, views and triggers in the specified schema.

194.3 DBMS_UTILITY Constants

The `DBMS_UTILITY` package defines one constant to use when specifying parameter values.

This constant is shown in the following table.

Table 194-1 DBMS_UTILITY Constants

| Name | Type | Value | Description |
|--|--------------------------|-------|---|
| <code>INV_ERROR_ON_RESTRICTIONS</code> | <code>PLS_INTEGER</code> | 1 | This constant is the only legal value for the <code>p_option_flags</code> parameter of the <code>INVALIDATE</code> subprogram |

194.4 DBMS_UTILITY Exceptions

This table lists the exceptions raised by `DBMS_UTILITY`.

Table 194-2 Exceptions Raised by DBMS_UTILITY

| Exception | Error Code | Description |
|---------------------------------------|------------|--|
| <code>INV_NOT_EXIST_OR_NO_PRIV</code> | -24237 | Raised by the <code>INVALIDATE</code> subprogram when the <code>object_id</code> argument is <code>NULL</code> or invalid, or when the caller does not have <code>CREATE</code> privileges on the object being invalidated |
| <code>INV_MALFORMED_SETTINGS</code> | -24238 | Raised by the <code>INVALIDATE</code> subprogram if a compiler setting is specified more than once in the <code>p_plsql_object_settings</code> parameter |
| <code>INV_RESTRICTED_OBJECT</code> | -24239 | Raised by the <code>INVALIDATE</code> subprogram when different combinations of conditions pertaining to the <code>p_object_id</code> parameter are contravened |

194.5 DBMS_UTILITY Data Structures

The `DBMS_UTILITY` package defines a single `RECORD` type and `TABLE` types.

Record Types

- [INSTANCE_RECORD Record Type](#)

Table Types

- [DBLINK_ARRAY TABLE Type](#)
- [INDEX_TABLE_TYPE Table Type](#)
- [INSTANCE_TABLE Table Type](#)
- [LNAME_ARRAY Table Type](#)
- [NAME_ARRAY Table Type](#)
- [NUMBER_ARRAY Table Type](#)
- [UNCL_ARRAY Table Type](#)

194.5.1 DBMS_UTILITY INSTANCE_RECORD Record Type

This type describes a list of active instance number-name pairs.

Syntax

```
TYPE INSTANCE_RECORD IS RECORD (  
    inst_number    NUMBER,  
    inst_name      VARCHAR2(60));
```

Fields

Table 194-3 INSTANCE_RECORD Record Type Fields

| Field | Description |
|-------------|------------------------|
| inst_number | Active instance number |
| inst_name | Instance name |

194.5.2 DBMS_UTILITY DBLINK_ARRAY TABLE Type

This type stores a list of database links.

Syntax

```
TYPE DBLINK_ARRAY IS TABLE OF VARCHAR2(128) INDEX BY BINARY_INTEGER;
```

194.5.3 DBMS_UTILITY INDEX_TABLE_TYPE Table Type

This type describes the order in which generated objects are returned to a user.

Syntax

```
TYPE INDEX_TABLE_TYPE IS TABLE OF BINARY_INTEGER INDEX BY BINARY_INTEGER;
```

194.5.4 DBMS_UTILITY INSTANCE_TABLE Table Type

This type describes a table of `INSTANCE_RECORD` Record Type.

Syntax

```
TYPE INSTANCE_TABLE IS TABLE OF INSTANCE_RECORD INDEX BY BINARY_INTEGER;
```

Usage Notes

The starting index of `INSTANCE_TABLE` is 1; `INSTANCE_TABLE` is Dense.

Related Topics

- [DBMS_UTILITY INSTANCE_RECORD Record Type](#)
This type describes a list of active instance number-name pairs.

194.5.5 DBMS_UTILITY LNAME_ARRAY Table Type

This type stores lists of `LONG NAME` including fully qualified attribute names.

Syntax

```
TYPE LNAME_ARRAY IS TABLE OF VARCHAR2(4000) INDEX BY BINARY_INTEGER;
```

194.5.6 DBMS_UTILITY NAME_ARRAY Table Type

This type stores lists of `NAME`.

Syntax

```
TYPE NAME_ARRAY IS TABLE OF VARCHAR2(30) INDEX BY BINARY_INTEGER;
```

194.5.7 DBMS_UTILITY NUMBER_ARRAY Table Type

This type describes the order in which generated objects are returned to users.

Syntax

```
TYPE NUMBER_ARRAY IS TABLE OF NUMBER INDEX BY BINARY_INTEGER;
```

194.5.8 DBMS_UTILITY UNCL_ARRAY Table Type

This type stores lists of "user"."name"."column"@link

Syntax

```
TYPE UNCL_ARRAY IS TABLE OF VARCHAR2(227) INDEX BY BINARY_INTEGER;
```

194.6 Summary of DBMS_UTILITY Subprograms

This table lists the `DBMS_UTILITY` subprograms and briefly describes them.

Table 194-4 DBMS_UTILITY Package Subprograms

| Subprogram | Description |
|---|---|
| ACTIVE_INSTANCES Procedure | Returns the active instance |
| ANALYZE_DATABASE Procedure | Analyzes all the tables, clusters and indexes in a database |
| ANALYZE_PART_OBJECT Procedure | Analyzes the given tables and indexes This procedure is deprecated from the <code>DBMS_UTILITY</code> package with Oracle Database 12c release 12.2 and later. Use <code>DBMS_STATS</code> to gather statistics. |
| ANALYZE_SCHEMA Procedure | Analyzes all the tables, clusters and indexes in a schema |
| CANONICALIZE Procedure | Canonicalizes a given string |
| COMMA_TO_TABLE Procedures | Converts a comma-delimited list of names into a PL/SQL table of names |
| COMPILE_SCHEMA Procedure | Compiles all procedures, functions, packages, views and triggers in the specified schema |
| CREATE_ALTER_TYPE_ERROR_TABLE Procedure | Creates an error table to be used in the <code>EXCEPTION</code> clause of the <code>ALTER TYPE</code> statement |
| CURRENT_INSTANCE Function | Returns the current connected instance number |
| DATA_BLOCK_ADDRESS_BLOCK Function | Gets the block number part of a data block address |
| DATA_BLOCK_ADDRESS_FILE Function | Gets the file number part of a data block address |
| DB_VERSION Procedure | Returns version information for the database |
| EXEC_DDL_STATEMENT Procedure | Executes the DDL statement in <code>parse_string</code> |
| EXPAND_SQL_TEXT Procedure | Recursively replaces any view references in the input SQL query with the corresponding view subquery |
| FORMAT_CALL_STACK Function | Formats the current call stack |
| FORMAT_ERROR_BACKTRACE Function | Formats the backtrace from the point of the current error to the exception handler where the error has been caught |
| FORMAT_ERROR_STACK Function | Formats the current error stack |
| GET_CPU_TIME Function | Returns the current CPU time in 100th's of a second |
| GET_DEPENDENCY Procedure | Shows the dependencies on the object passed in. This procedure is deprecated from the <code>DBMS_UTILITY</code> package with Oracle Database 12c release 12.2 and later. There is no replacement for this subprogram. |
| GET_ENDIANNESNESS Function | Gets the endianness of the database platform |
| GET_HASH_VALUE Function | Computes a hash value for the given string |
| GET_PARAMETER_VALUE Function | Gets the value of specified init.ora parameter. This function is deprecated from the <code>DBMS_UTILITY</code> package with Oracle Database 12c release 12.2 and later. You can query <code>v\$_parameter</code> directly. |
| GET_SQL_HASH Function | Computes a hash value for the given string using MD5 algorithm |
| GET_TIME Function | Returns the current time in 100th's of a second |
| GET_TZ_TRANSITIONS Procedure | Returns time zone transitions by <code>regionid</code> from the <code>timezone.dat</code> file |

Table 194-4 (Cont.) DBMS_UTILITY Package Subprograms

| Subprogram | Description |
|--|--|
| INVALIDATE Procedure | Invalidates a database object and (optionally) modifies its PL/SQL compiler parameter settings |
| IS_BIT_SET Function | Checks the bit setting for the given bit in the given RAW value |
| IS_CLUSTER_DATABASE Function | Determines if the database is running in cluster database mode |
| MAKE_DATA_BLOCK_ADDRESS Function | Creates a data block address given a file number and a block number |
| NAME_RESOLVE Procedure | Resolves the given name |
| NAME_TOKENIZE Procedure | Calls the parser to parse the given name |
| OLD_CURRENT_SCHEMA Function | Returns the session value from SYS_CONTEXT ('USERENV', 'CURRENT_SCHEMA') |
| OLD_CURRENT_USER Function | Returns the session value from SYS_CONTEXT ('USERENV', 'CURRENT_USER') |
| PORT_STRING Function | Returns a string that uniquely identifies the version of Oracle and the operating system |
| SQLID_TO_SQLHASH Function | Converts a SQL ID into a hash value |
| TABLE_TO_COMMA Procedures | Converts a PL/SQL table of names into a comma-delimited list of names |
| VALIDATE Procedure | Makes invalid database objects valid |
| WAIT_ON_PENDING_DML Function | Waits until all transactions (other than the caller's own) that have locks on the listed tables and began prior to the specified SCN have either committed or been rolled back |

194.6.1 ACTIVE_INSTANCES Procedure

This procedure returns the active instance.

Syntax

```
DBMS_UTILITY.ACTIVE_INSTANCES (
    instance_table OUT INSTANCE_TABLE,
    instance_count OUT NUMBER);
```

Parameters

Table 194-5 ACTIVE_INSTANCES Procedure Parameters

| Procedure | Description |
|----------------|--|
| instance_table | Contains a list of the active instance numbers and names. When no instance is up, the list is empty. |
| instance_count | Number of active instances |

194.6.2 ANALYZE_DATABASE Procedure

This procedure analyzes all the tables, clusters and indexes in a database.

Syntax

```
DBMS_UTILITY.ANALYZE_DATABASE (
  method          IN  VARCHAR2,
  estimate_rows   IN  NUMBER DEFAULT NULL,
  estimate_percent IN  NUMBER DEFAULT NULL,
  method_opt      IN  VARCHAR2 DEFAULT NULL);
```

Parameters

Table 194-6 ANALYZE_DATABASE Procedure Parameters

| Parameter | Description |
|------------------|--|
| method | One of ESTIMATE, COMPUTE or DELETE. If ESTIMATE then either estimate_rows or estimate_percent must be nonzero. |
| estimate_rows | Number of rows to estimate |
| estimate_percent | Percentage of rows to estimate. If estimate_rows is specified ignore this parameter. |
| method_opt | Method options of the following format: [FOR TABLE] [FOR ALL [INDEXED] COLUMNS] [SIZE n] [FOR ALL INDEXES] |

Exceptions

ORA-20000: Insufficient privileges for some object in this database

194.6.3 ANALYZE_PART_OBJECT Procedure

This procedure is equivalent to SQL: "ANALYZE TABLE|INDEX [<schema>.]<object_name> PARTITION <pname> [<command_type>] [<command_opt>] [<sample_clause>]"

Note:

This subprogram has been deprecated and replaced by improved technology. It is maintained only for purposes of backward compatibility. As an alternative, you can use [DBMS_STATS](#) to gather statistics.

Syntax

```
DBMS_UTILITY.ANALYZE_PART_OBJECT (
  schema          IN  VARCHAR2 DEFAULT NULL,
  object_name     IN  VARCHAR2 DEFAULT NULL,
  object_type     IN  CHAR      DEFAULT 'T',
  command_type    IN  CHAR      DEFAULT 'E',
```

```
command_opt IN VARCHAR2 DEFAULT NULL,
sample_clause IN VARCHAR2 DEFAULT 'sample 5 percent ');
```

Parameters

Table 194-7 ANALYZE_PART_OBJECT Procedure Parameters

| Parameter | Description |
|---------------|---|
| schema | Schema of the object_name |
| object_name | Name of object to be analyzed, must be partitioned |
| object_type | Type of object, must be T (table) or I (index) |
| command_type | Must be V (validate structure) |
| command_opt | Other options for the command type. For C, E it can be FOR table, FOR all LOCAL indexes, FOR all columns or combination of some of the 'for' options of analyze statistics (table). For V, it can be CASCADE when object_type is T. |
| sample_clause | Sample clause to use when command_type is 'E' |

Usage Notes

For each partition of the object, run in parallel using job queues.

194.6.4 ANALYZE_SCHEMA Procedure

This procedure analyzes all the tables, clusters and indexes in a schema.

Syntax

```
DBMS_UTILITY.ANALYZE_SCHEMA (
  schema          IN VARCHAR2,
  method          IN VARCHAR2,
  estimate_rows   IN NUMBER DEFAULT NULL,
  estimate_percent IN NUMBER DEFAULT NULL,
  method_opt      IN VARCHAR2 DEFAULT NULL);
```

Parameters

Table 194-8 ANALYZE_SCHEMA Procedure Parameters

| Parameter | Description |
|------------------|--|
| schema | Name of the schema |
| method | One of ESTIMATE, COMPUTE or DELETE. If ESTIMATE then either estimate_rows or estimate_percent must be nonzero. |
| estimate_rows | Number of rows to estimate |
| estimate_percent | Percentage of rows to estimate. If estimate_rows is specified ignore this parameter. |

Table 194-8 (Cont.) ANALYZE_SCHEMA Procedure Parameters

| Parameter | Description |
|------------|--|
| method_opt | Method options of the following format: [FOR TABLE] [FOR ALL [INDEXED] COLUMNS] [SIZE n] [FOR ALL INDEXES] |

Exceptions

ORA-20000: Insufficient privileges for some object in this schema

194.6.5 CANONICALIZE Procedure

This procedure canonicalizes the given string. The procedure handles a single reserved or key word (such as 'table'), and strips off white spaces for a single identifier so that ' table ' becomes TABLE.

Syntax

```
DBMS_UTILITY.CANONICALIZE (
    name          IN   VARCHAR2,
    canon_name    OUT  VARCHAR2,
    canon_len     IN   BINARY_INTEGER);
```

Parameters**Table 194-9 CANONICALIZE Procedure Parameters**

| Parameter | Description |
|------------|---|
| name | String to be canonicalized |
| canon_name | Canonicalized string |
| canon_len | Length of the string (in bytes) to canonicalize |

Return Values

Returns the first canon_len bytes in canon_name.

Usage Notes

- If name is NULL, canon_name becomes NULL.
- If name is not a dotted name, and if name begins and ends with a double quote, remove both quotes. Alternatively, convert to upper case with NLS_UPPER. Note that this case does not include a name with special characters, such as a space, but is not doubly quoted.
- If name is a dotted name (such as a."b".c), for each component in the dotted name in the case in which the component begins and ends with a double quote, no transformation will be performed on this component. Alternatively, convert to upper case with NLS_UPPER and apply begin and end double quotes to the capitalized form of this component. In such

a case, each canonicalized component will be concatenated together in the input position, separated by ".".

- Any other character after a[b]* will be ignored.
- The procedure does not handle cases like 'A B.'

Examples

- a becomes A
- "a" becomes a
- "a".b becomes "a"."B"
- "a".b,c.f becomes "a"."B" with ",c.f" ignored.

194.6.6 COMMA_TO_TABLE Procedures

These procedures convert a comma-delimited list of names into a PL/SQL table of names. The second version supports fully-qualified attribute names.

Syntax

```
DBMS_UTILITY.COMMA_TO_TABLE (
    list IN VARCHAR2,
    tablen OUT BINARY_INTEGER,
    tab OUT uncl_array);
```

```
DBMS_UTILITY.COMMA_TO_TABLE (
    list IN VARCHAR2,
    tablen OUT BINARY_INTEGER,
    tab OUT lname_array);
```

Parameters

Table 194-10 COMMA_TO_TABLE Procedure Parameters

| Parameter | Description |
|-----------|---|
| list | Comma separated list of list of 'names', where a name should have the following format for the first overloading: a [. b [. c]][@ d] and the following format for the second overloading: a [. b]* where a, b, c, d are simple identifiers (quoted or unquoted). |
| tablen | Number of tables in the PL/SQL table |
| tab | PL/SQL table which contains list of names |

Return Values

A PL/SQL table is returned, with values 1..n and n+1 is null.

Usage Notes

- The list must be a non-empty comma-delimited list: Anything other than a comma-delimited list is rejected. Commas inside double quotes do not count.
- Entries in the comma-delimited list cannot include multibyte characters.

- The values in `tab` are copied from the original list, with no transformations.
- The procedure fails if the string between separators is longer than 30 bytes.

194.6.7 COMPILE_SCHEMA Procedure

This procedure compiles all procedures, functions, packages, views and triggers in the specified schema.

Syntax

```
DBMS_UTILITY.COMPILE_SCHEMA (
    schema          IN VARCHAR2,
    compile_all     IN BOOLEAN DEFAULT TRUE,
    reuse_settings  IN BOOLEAN DEFAULT FALSE);
```

Parameters

Table 194-11 COMPILE_SCHEMA Procedure Parameters

| Parameter | Description |
|-----------------------------|---|
| <code>schema</code> | Name of the schema |
| <code>compile_all</code> | If <code>TRUE</code> , will compile everything within the schema regardless of whether it is <code>VALID</code> If <code>FALSE</code> , will compile only <code>INVALID</code> objects |
| <code>reuse_settings</code> | Indicates whether the session settings in the objects should be reused, or whether the current session settings should be adopted instead |

Exceptions

Table 194-12 COMPILE_SCHEMA Procedure Exceptions

| Exception | Description |
|-----------|---|
| ORA-20000 | Insufficient privileges for some object in this schema |
| ORA-20001 | Cannot recompile <code>SYS</code> objects |
| ORA-20002 | Maximum iterations exceeded. Some objects may not have been recompiled. |

Usage Notes

- Note that this subprogram is a wrapper for the [RECOMP_SERIAL Procedure](#) included with the [UTL_RECOMP](#) package.
- After calling this procedure, you should select from view `ALL_OBJECTS` for items with status of `INVALID` to see if all objects were successfully compiled.
- To see the errors associated with `INVALID` objects, you may use the Enterprise Manager command:

```
SHOW ERRORS <type> <schema>.<name>
```

194.6.8 CREATE_ALTER_TYPE_ERROR_TABLE Procedure

This procedure creates an error table to be used in the `EXCEPTION` clause of the `ALTER TYPE` statement.

Syntax

```
DBMS_UTILITY.CREATE_ALTER_TYPE_ERROR_TABLE(  
    schema_name    IN    VARCHAR2,  
    table_name     IN    VARCHAR2);
```

Parameters

Table 194-13 CREATE_ALTER_TYPE_ERROR_TABLE Procedure Parameters

| Parameter | Description |
|-------------|---------------------------|
| schema_name | Name of the schema |
| table_name | Name of the table created |

Exceptions

An error is returned if the table already exists.

194.6.9 CURRENT_INSTANCE Function

This function returns the current connected instance number. It returns `NULL` when connected instance is down.

Syntax

```
DBMS_UTILITY.CURRENT_INSTANCE  
    RETURN NUMBER;
```

194.6.10 DATA_BLOCK_ADDRESS_BLOCK Function

This function gets the block number part of a data block address.

Syntax

```
DBMS_UTILITY.DATA_BLOCK_ADDRESS_BLOCK (  
    dba NUMBER)  
    RETURN NUMBER;
```

Parameters

Table 194-14 DATA_BLOCK_ADDRESS_BLOCK Function Parameters

| Parameter | Description |
|-----------|--------------------|
| dba | Data block address |

Pragmas

```
pragma restrict_references(data_block_address_block, WNDS, RNDS, WNPS, RNPS);
```

Return Values

Block offset of the block.

Usage Notes

This function should not be used with datablocks which belong to bigfile tablespaces.

194.6.11 DATA_BLOCK_ADDRESS_FILE Function

This function gets the file number part of a data block address.

Syntax

```
DBMS_UTILITY.DATA_BLOCK_ADDRESS_FILE (  
    dba NUMBER)  
    RETURN NUMBER;
```

Parameters**Table 194-15 DATA_BLOCK_ADDRESS_FILE Function Parameters**

| Parameter | Description |
|-----------|--------------------|
| dba | Data block address |

Pragmas

```
pragma restrict_references (data_block_address_file, WNDS, RNDS, WNPS, RNPS);
```

Return Values

File that contains the block.

Usage Notes

This function should not be used with datablocks which belong to bigfile tablespaces.

194.6.12 DB_VERSION Procedure

This procedure returns version information for the database.

Syntax

```
DBMS_UTILITY.DB_VERSION (  
    version      OUT VARCHAR2,  
    compatibility OUT VARCHAR2);
```

Parameters

Table 194-16 DB_VERSION Procedure Parameters

| Parameter | Description |
|---------------|--|
| version | A string which represents the internal software version of the database (for example, 7.1.0.0.0). The length of this string is variable and is determined by the database version. |
| compatibility | The compatibility setting of the database determined by the "compatible" <code>init.ora</code> parameter. If the parameter is not specified in the <code>init.ora</code> file, then NULL is returned. |

194.6.13 EXEC_DDL_STATEMENT Procedure

This procedure executes the DDL statement in `parse_string`.

Syntax

```
DBMS_UTILITY.EXEC_DDL_STATEMENT (
    parse_string IN VARCHAR2);
```

Parameters

Table 194-17 EXEC_DDL_STATEMENT Procedure Parameters

| Parameter | Description |
|---------------------------|------------------------------|
| <code>parse_string</code> | DDL statement to be executed |

194.6.14 EXPAND_SQL_TEXT Procedure

This procedure recursively replaces any view references in the input SQL query with the corresponding view subquery.

Syntax

```
DBMS_UTILITY.EXPAND_SQL_TEXT (
    input_sql_text    IN          CLOB,
    output_sql_text   OUT NOCOPY CLOB);
```

Parameters

Table 194-18 EXPAND_SQL_TEXT Procedure Parameters

| Parameter | Description |
|------------------------------|--------------------------|
| <code>input_sql_text</code> | Input SQL query text |
| <code>output_sql_text</code> | View-expanded query text |

Exceptions

Table 194-19 EXPAND_SQL_TEXT Procedure Exceptions

| Exception | Description |
|-----------|--|
| ORA-00942 | Current user does not have select privileges on all the views and tables recursively referenced in the <code>input_sql_text</code> |
| ORA-24251 | <code>input_sql_text</code> is not a <code>SELECT</code> statement |
| ORA-00900 | Input is not valid |
| ORA-29477 | Input LOB size exceeds maximum size of 4GB -1 |

Usage Notes

The expanded and merged SQL statement text is copied to `output_sql_text` on successful completion. The resulting query text only contains references to underlying tables and is semantically equivalent with some caveats:

- If there are invoker rights functions called from any of the views, they may be called as a different user in the resulting query text if the view owner is different from the user who will eventually compile/run the expanded SQL text.
- The VPD policy expands differently if there is a function supplied to generate the dynamic `WHERE` clause. This function would return differently, for example, if the `userid` caused the expansion to be different.
- If there are references to remote objects, results are undetermined.

194.6.15 FORMAT_CALL_STACK Function

This function formats the current call stack. This can be used on any stored procedure or trigger to access the call stack. This can be useful for debugging.

Syntax

```
DBMS_UTILITY.FORMAT_CALL_STACK
RETURN VARCHAR2;
```

Pragmas

```
pragma restrict_references(format_call_stack,WNDS);
```

Return Values

This returns the call stack, up to 2000 bytes.

194.6.16 FORMAT_ERROR_BACKTRACE Function

This function displays the call stack at the point where an exception was raised, even if the subprogram is called from an exception handler in an outer scope.

The output is similar to the output of the `SQLERRM` function, but not subject to the same size limitation.

Syntax

```
DBMS_UTILITY.FORMAT_ERROR_BACKTRACE  
RETURN VARCHAR2;
```

Return Values

The backtrace string. A NULL string is returned if no error is currently being handled.

Examples

```
CREATE OR REPLACE PROCEDURE Log_Errors ( i_buff in varchar2 ) IS  
  g_start_pos integer := 1;  
  g_end_pos integer;  
  
  FUNCTION Output_One_Line RETURN BOOLEAN IS  
  BEGIN  
    g_end_pos := Instr ( i_buff, Chr(10), g_start_pos );  
  
    CASE g_end_pos > 0  
      WHEN true THEN  
        DBMS_OUTPUT.PUT_LINE ( Substr ( i_buff, g_start_pos,  
g_end_pos-g_start_pos ) );  
        g_start_pos := g_end_pos+1;  
        RETURN TRUE;  
  
      WHEN FALSE THEN  
        DBMS_OUTPUT.PUT_LINE ( Substr ( i_buff, g_start_pos,  
(Length(i_buff)-g_start_pos)+1 ) );  
        RETURN FALSE;  
      END CASE;  
    END Output_One_Line;  
  
  BEGIN  
    WHILE Output_One_Line() LOOP NULL;  
    END LOOP;  
  END Log_Errors;  
/  
  
Set Doc Off  
Set Feedback off  
Set Echo Off  
  
CREATE OR REPLACE PROCEDURE P0 IS

  or write an exception handler for this condition.
  Or you may need to contact your application administrator
  or database administrator.
*/
```

194.6.17 FORMAT_ERROR_STACK Function

This function formats the current error stack. This can be used in exception handlers to look at the full error stack.

Syntax

```
DBMS_UTILITY.FORMAT_ERROR_STACK
RETURN VARCHAR2;
```

Return Values

This returns the error stack, up to 2000 bytes.

194.6.18 GET_CPU_TIME Function

This function returns a measure of current CPU processing time in hundredths of a second. The difference between the times returned from two calls measures the CPU processing time (not the total elapsed time) between those two points.

Syntax

```
DBMS_UTILITY.GET_CPU_TIME
RETURN NUMBER;
```

Return Values

Time is the number of 100th's of a second from some arbitrary epoch.

Usage Notes

The amount of work performed is calculated by measuring the difference between a start point and end point for a particular operation.

194.6.19 GET_DEPENDENCY Procedure

This **deprecated procedure** shows the dependencies on the object passed in.

Note:

This subprogram has been deprecated and replaced in Oracle Database 12c release 12.2 and later. Oracle recommends that you do not use deprecated subprograms. It is maintained only for purposes of backward compatibility.

Syntax

```
DBMS_UTILITY.GET_DEPENDENCY
type          IN          VARCHAR2,
schema        IN          VARCHAR2,
name          IN          VARCHAR2);
```

Parameters

Table 194-20 GET_DEPENDENCY Procedure Parameters

| Parameter | Description |
|-----------|---|
| type | Type of the object, for example if the object is a table give the type as 'TABLE' |
| schema | Schema name of the object |
| name | Name of the object |

Usage Notes

This procedure uses the [DBMS_OUTPUT](#) package to display results, and so you must declare `SET SERVEROUTPUT ON` if you wish to view dependencies. Alternatively, any application that checks the `DBMS_OUTPUT` output buffers can invoke this subprogram and then retrieve the output by means of `DBMS_OUTPUT` subprograms such as `GET_LINES`.

194.6.20 GET_ENDIANNES Function

This function gets the endianness of the database platform.

Syntax

```
DBMS_UTILITY.GET_ENDIANNES
RETURN NUMBER;
```

Return Values

A `NUMBER` value indicating the endianness of the database platform: 1 for big-endian or 2 for little-endian.

194.6.21 GET_HASH_VALUE Function

This function computes a hash value for the given string.

Syntax

```
DBMS_UTILITY.GET_HASH_VALUE (
    name      VARCHAR2,
    base      NUMBER,
    hash_size NUMBER)
RETURN NUMBER;
```

Parameters**Table 194-21** GET_HASH_VALUE Function Parameters

| Parameter | Description |
|-----------|--|
| name | String to be hashed. |
| base | Base value for the returned hash value at which to start |
| hash_size | Desired size of the hash table |

Pragmas

```
pragma restrict_references(get_hash_value, WNDS, RNDS, WNPS, RNPS);
```

Return Values

A hash value based on the input string. For example, to get a hash value on a string where the hash value should be between 1000 and 3047, use 1000 as the base value and 2048 as the `hash_size` value. Using a power of 2 for the `hash_size` parameter works best.

194.6.22 GET_PARAMETER_VALUE Function

This deprecated function gets the value of specified `init.ora` parameter.

**Note:**

This subprogram has been deprecated and replaced by improved technology. It is maintained only for purposes of backward compatibility. As an alternative, you can query `v$_parameter` directly.

Syntax

```
DBMS_UTILITY.GET_PARAMETER_VALUE (
    parnam    IN      VARCHAR2,
```

```

    intval    IN OUT    BINARY_INTEGER,
    strval    IN OUT    VARCHAR2,
    listno    IN        BINARY_INTEGER DEFAULT 1)
RETURN BINARY_INTEGER;

```

Parameters

Table 194-22 GET_PARAMETER_VALUE Function Parameters

| Parameter | Description |
|-----------|--|
| parnam | Parameter name |
| intval | Value of an integer parameter or the value length of a string parameter |
| strval | Value of a string parameter |
| listno | List item number. If retrieving parameter values for a parameter that can be specified multiple times to accumulate values, use this parameter to get each individual parameter. |

Return Values

Parameter type:

- 0 if parameter is an INTEGER/BOOLEAN parameter
- 1 if parameter is a string/file parameter

Usage Notes

- To execute the this function, you must have the SELECT privilege on the V\$PARAMETER dynamic view.

Examples

```

DECLARE
    parnam VARCHAR2(256);
    intval BINARY_INTEGER;
    strval VARCHAR2(256);
    partyp BINARY_INTEGER;
BEGIN
    partyp := dbms_utility.get_parameter_value('max_dump_file_size',
                                              intval, strval);

    dbms_output.put('parameter value is: ');
    IF partyp = 1 THEN
        dbms_output.put_line(strval);
    ELSE
        dbms_output.put_line(intval);
    END IF;
    IF partyp = 1 THEN
        dbms_output.put('parameter value length is: ');
        dbms_output.put_line(intval);
    END IF;
    dbms_output.put('parameter type is: ');
    IF partyp = 1 THEN
        dbms_output.put_line('string');
    ELSE
        dbms_output.put_line('integer');
    END IF;
END;

```

194.6.23 GET_SQL_HASH Function

This function computes a hash value for the given string using MD5 algorithm.

Syntax

```
Dbms_utility.get_sql_hash (
    name          IN  VARCHAR2,
    hash          OUT RAW,
    pre10ihash   OUT  NUMBER)
RETURN NUMBER;
```

Pragmas

Pragma Restrict_references(Get_sql_hash, Wnds, Rnds, Wnps, Rnps);

Parameters

Table 194-23 GET_SQL_HASH Procedure Parameters

| Parameter | Description |
|------------|--|
| name | String to be hashed |
| hash | Stores all 16 bytes of returned hash value |
| pre10ihash | Stores the pre 10i database version hash value |

Return Values

A hash value (last 4 bytes) based on the input string. the MD5 hash algorithm computes a 16 byte hash value, but we only return the last 4 bytes so that we can return an actual number. Use the `hash` parameter to get all 16 bytes and `pre10i` hash parameter to store the pre 10i hash value of 4 bytes.

194.6.24 GET_TIME Function

This function determines the current time in hundredths of a second. This subprogram is primarily used for determining elapsed time. The subprogram is called twice – at the beginning and end of some process – and then the first (earlier) number is subtracted from the second (later) number to determine the time elapsed.

Syntax

```
DBMS_UTILITY.GET_TIME
RETURN NUMBER;
```

Return Values

Time is the number of hundredths of a second from the point in time at which the subprogram is invoked.

Usage Notes

Numbers are returned in the range -2147483648 to 2147483647 depending on platform and machine, and your application must take the sign of the number into account in determining the interval. For instance, in the case of two negative numbers,

application logic must allow that the first (earlier) number will be larger than the second (later) number which is closer to zero. By the same token, your application should also allow that the first (earlier) number be negative and the second (later) number be positive.

194.6.25 GET_TZ_TRANSITIONS Procedure

This procedure returns time zone transitions by `regionid` from the `timezone.dat` file.

Syntax

```
DBMS_UTILITY.GET_TZ_TRANSITIONS
  regionid      IN      NUMBER,
  transitions   OUT    MAXRAW);
```

Parameters

Table 194-24 GET_TZ_TRANSITIONS Procedure Parameters

| Parameter | Description |
|--------------------------|---|
| <code>regionid</code> | Number corresponding to the region |
| <code>transitions</code> | Raw bytes from the <code>timezone.dat</code> file |

Exceptions

Table 194-25 GET_TZ_TRANSITIONS Procedure Exceptions

| Exception | Description |
|--|--------------------------------------|
| ORA-6502: PL/SQL: NUMERIC OR VALUE ERROR | For an invalid <code>regionid</code> |

194.6.26 INVALIDATE Procedure

This procedure invalidates a database object and (optionally) modifies its PL/SQL compiler parameter settings. It also invalidates any objects that (directly or indirectly) depend on the object being invalidated.

Syntax

```
DBMS_UTILITY.INVALIDATE (
  p_object_id          NUMBER,
  p_plsql_object_settings VARCHAR2 DEFAULT NULL,
  p_option_flags       PLS_INTEGER DEFAULT 0);
```

Parameters

Table 194-26 INVALIDATE Procedure Parameters

| Parameter | Description |
|--------------------------------------|---|
| <code>p_object_id</code> | ID number of object to be invalidated. This is the same as the value of the <code>OBJECT_ID</code> column from <code>ALL_OBJECTS</code> . If the <code>object_id</code> argument is <code>NULL</code> or invalid then the exception <code>inv_not_exist_or_no_priv</code> is raised. The caller of this procedure must have create privileges on the object being invalidated else the <code>inv_not_exist_or_no_priv</code> exception is raised. |
| <code>p_plsql_object_settings</code> | Optional parameter that ignored if the object specified by <code>p_object_id</code> is not a PL/SQL object. If no value is specified for this parameter then the PL/SQL compiler settings are left unchanged, that is, equivalent to <code>REUSE SETTINGS</code> . If a value is provided, it must specify the values of the PL/SQL compiler settings separated by one or more spaces. Each setting can be specified only once else <code>inv_malformed_settings</code> exception will be raised. The setting values are changed only for the object specified by <code>p_object_id</code> and do not affect dependent objects that may be invalidated. The setting names and values are case insensitive. If a setting is omitted and <code>REUSE SETTINGS</code> is specified, then if a value was specified for the compiler setting in an earlier compilation of this library unit, Oracle Database uses that earlier value. If a setting is omitted and <code>REUSE SETTINGS</code> was not specified or no value has been specified for the parameter in an earlier compilation, then the database will obtain the value for that setting from the session environment. |
| <code>p_option_flags</code> | Optional parameter defaults to zero (no flags). Option flags supported by <code>invalidate</code> . <ul style="list-style-type: none"> <code>inv_error_on_restrictions</code> (see Constants): The subprogram imposes various restrictions on the objects that can be invalidated. For example, the object specified by <code>p_object_id</code> cannot be a table. By default, <code>invalidate</code> quietly returns on these conditions (and does not raise an exception). If the caller sets this flag, the exception <code>inv_restricted_object</code> is raised. |

Exceptions

Table 194-27 INVALIDATE Exceptions

| Exception | Description |
|---------------------------------------|--|
| <code>INV_NOT_EXIST_OR_NO_PRIV</code> | Raised when the <code>object_id</code> argument is <code>NULL</code> or invalid, or when the caller does not have <code>CREATE</code> privileges on the object being invalidated |
| <code>INV_MALFORMED_SETTINGS</code> | Raised if a compiler setting is specified more than once in the <code>p_plsql_object_settings</code> parameter |
| <code>INV_RESTRICTED_OBJECT</code> | Raised when different combinations of conditions pertaining to the <code>p_object_id</code> parameter are contravened |

Usage Notes

The object type (`object_type` column from `ALL_OBJECTS`) of the object specified by `p_object_id` must be a `PROCEDURE`, `FUNCTION`, `PACKAGE`, `PACKAGE BODY`, `TRIGGER`, `TYPE`, `TYPE BODY`, `LIBRARY`, `VIEW`, `OPERATOR`, `SYNONYM`, or `JAVA CLASS`. If the object is not one of these types and the flag `inv_error_on_restrictions` is specified in `p_option_flags` then the exception `inv_restricted_object` is raised, else no action is taken.

If the object specified by `p_object_id` is the package specification of `STANDARD`, `DBMS_STANDARD`, or specification or body of `DBMS_UTILITY` and the flag `inv_error_on_restrictions` is specified in `p_option_flags` then the exception `inv_restricted_object` is raised, else no action is taken.

If the object specified by `p_object_id` is an object type specification and there exist tables which depend on the type and the flag `inv_error_on_restrictions` is specified in `p_option_flags` then the exception `inv_restricted_object` is raised, else no action is taken.

Examples

Example 1

```
DBMS_UTILITY.INVALIDATE (1232, 'PLSQL_OPTIMIZE_LEVEL = 2 REUSE SETTINGS');
```

Assume that the `object_id` 1232 refers to the procedure `remove_emp` in the `HR` schema. Then the above call will mark the `remove_emp` procedure invalid and change its `PLSQL_OPTIMIZE_LEVEL` compiler setting to 2. The values of other compiler settings will remain unchanged since `REUSE SETTINGS` is specified.

Objects that depend on `hr.remove_emp` will also get marked invalid. Their compiler parameters will not be changed.

Example 2

```
DBMS_UTILITY.INVALIDATE (40775, 'plsql_code_type = native');
```

Assume that the `object_id` 40775 refers to the type body `leaf_category_typ` in the `OE` schema. Then the above call will mark the type body invalid and change its `PLSQL_CODE_TYPE` compiler setting to `NATIVE`. The values of other compiler settings will be picked up from the current session environment since `REUSE SETTINGS` has not been specified.

Since no objects can depend on bodies, there are no cascaded invalidations.

Example 3

```
DBMS_UTILITY.INVALIDATE (40796);
```

Assume that the `object_id` 40796 refers to the view `oc_orders` in the `OE` schema. Then the above call will mark the `oc_orders` view invalid.

Objects that depend on `oe.oc_orders` will also get marked invalid.

194.6.27 IS_BIT_SET Function

This function checks the bit setting for the given bit in the given RAW value.

Syntax

```
DBMS_UTILITY.IS_BIT_SET (
    r      IN RAW,    n      IN NUMBER)
RETURN NUMBER;
```

Parameters

Table 194-28 IS_BIT_SET Function Parameters

| Parameter | Description |
|-----------|-------------------|
| r | RAW source |
| n | Bit in r to check |

Return Values

This function returns 1 if bit n in raw r is set, zero otherwise. Bits are numbered high to low with the lowest bit being bit number 1.

194.6.28 IS_CLUSTER_DATABASE Function

This function finds out if this database is running in cluster database mode.

Syntax

```
DBMS_UTILITY.IS_CLUSTER_DATABASE
RETURN BOOLEAN;
```

Return Values

This function returns TRUE if this instance was started in cluster database mode; FALSE otherwise.

194.6.29 MAKE_DATA_BLOCK_ADDRESS Function

This function creates a data block address given a file number and a block number.

A data block address is the internal structure used to identify a block in the database. This function is useful when accessing certain fixed tables that contain data block addresses.

Syntax

```
DBMS_UTILITY.MAKE_DATA_BLOCK_ADDRESS (
    file NUMBER,
    block NUMBER)
RETURN NUMBER;
```

Parameters

Table 194-29 MAKE_DATA_BLOCK_ADDRESS Function Parameters

| Parameter | Description |
|-----------|--|
| file | File that contains the block |
| block | Offset of the block within the file in terms of block increments |

Pragmas

```
pragma restrict_references (make_data_block_address, WNDS, RNDS, WNPS, RNPS);
```

Return Values

Data block address.

194.6.30 NAME_RESOLVE Procedure

This procedure resolves the given name, including synonym translation and authorization checking as necessary.

Syntax

```
DBMS_UTILITY.NAME_RESOLVE (
    name          IN VARCHAR2,
    context       IN NUMBER,
    schema        OUT VARCHAR2,
    part1         OUT VARCHAR2,
    part2         OUT VARCHAR2,
    dblink        OUT VARCHAR2,
    part1_type    OUT NUMBER,
    object_number OUT NUMBER);
```

Parameters

Table 194-30 NAME_RESOLVE Procedure Parameters

| Parameter | Description |
|-----------|---|
| name | <p>Name of the object.</p> <p>This can be of the form [[a.]b.]c[@d], where a, b, c are SQL identifier and d is a dblink. No syntax checking is performed on the dblink. If a dblink is specified, or if the name resolves to something with a dblink, then object is not resolved, but the schema, part1, part2 and dblink OUT parameters are filled in.</p> <p>a, b and c may be delimited identifiers, and may contain Globalization Support (NLS) characters (single and multibyte).</p> |

Table 194-30 (Cont.) NAME_RESOLVE Procedure Parameters

| Parameter | Description |
|---------------|---|
| context | Must be an integer between 0 and 9. <ul style="list-style-type: none"> • 0 - table • 1 - PL/SQL (for 2 part names) • 2 - sequences • 3 - trigger • 4 - Java Source • 5 - Java resource • 6 - Java class • 7 - type • 8 - Java shared data • 9 - index |
| schema | Schema of the object: c. If no schema is specified in name, then the schema is determined by resolving the name. |
| part1 | First part of the name. The type of this name is specified part1_type (synonym or package). |
| part2 | If this is non-NULL, then this is a subprogram name. If part1 is non-NULL, then the subprogram is within the package indicated by part1. If part1 is NULL, then the subprogram is a top-level subprogram. |
| dblink | If this is non-NULL, then a database link was either specified as part of name or name was a synonym which resolved to something with a database link. In this case, if further name translation is desired, then you must call the DBMS_UTILITY.NAME_RESOLVE procedure on this remote node. |
| part1_type | Type of part1 is: <ul style="list-style-type: none"> • 5 - synonym • 7 - procedure (top level) • 8 - function (top level) • 9 - package |
| object_number | Object identifier |

Exceptions

All errors are handled by raising exceptions. A wide variety of exceptions are possible, based on the various syntax error that are possible when specifying object names.

194.6.31 NAME_TOKENIZE Procedure

This procedure calls the parser to parse the given name as a [. b [. c]][@ dblink].

It strips double quotes, or converts to uppercase if there are no quotes. It ignores comments of all sorts, and does no semantic analysis. Missing values are left as NULL.

Syntax

```
DBMS_UTILITY.NAME_TOKENIZE (
  name      IN VARCHAR2,
  a         OUT VARCHAR2,
  b         OUT VARCHAR2,
```

```

c      OUT VARCHAR2,
dblink OUT VARCHAR2,
nextpos OUT BINARY_INTEGER);

```

Parameters

Table 194-31 NAME_RESOLVE Procedure Parameters

| Parameter | Description |
|-----------|---|
| name | Input name, consisting of SQL identifiers (for example, scott.foo@dblink) |
| a | Output for the first token of the name |
| b | Output for the second token of the name (if applicable) |
| c | Output for the third token of the name (if applicable) |
| dblink | Output for the dblink of the name |
| nextpos | Next position after parsing the input name |

194.6.32 OLD_CURRENT_SCHEMA Function

This function returns the session value from `sys_context('userenv', 'current_schema')`.

Syntax

```

DBMS_UTILITY.OLD_CURRENT_SCHEMA
RETURN VARCHAR2;

```

194.6.33 OLD_CURRENT_USER Function

This function returns the session value from `sys_context('userenv', 'current_user')`.

Syntax

```

DBMS_UTILITY.OLD_CURRENT_USER
RETURN VARCHAR2;

```

194.6.34 PORT_STRING Function

This function returns a string that identifies the operating system and the TWO TASK PROTOCOL version of the database. For example, "VAX/VMX-7.1.0.0"

The maximum length is port-specific.

Syntax

```

DBMS_UTILITY.PORT_STRING
RETURN VARCHAR2;

```

Pragmas

```

pragma restrict_references(port_string, WNDS, RNDS, WNPS, RNPS);

```

194.6.35 SQLID_TO_SQLHASH Function

This function converts a SQL ID into a hash value.

Syntax

```
DBMS_UTILITY.SQLID_TO_SQLHASH (  
    sql_id    IN    VARCHAR2)  
RETURN NUMBER;
```

Parameters

Table 194-32 SQLID_TO_SQLHASH Function Parameters

| Parameter | Description |
|-----------|---|
| sql_id | SQL ID of a SQL statement. Must be VARCHAR2 (13). |

194.6.36 TABLE_TO_COMMA Procedures

This procedure converts a PL/SQL table of names into a comma-delimited list of names.

This takes a PL/SQL table, 1..n, terminated with n+1 null. The second version supports fully-qualified attribute names.

Syntax

```
DBMS_UTILITY.TABLE_TO_COMMA (  
    tab    IN    UNCL_ARRAY,  
    tablen OUT BINARY_INTEGER,  
    list   OUT  VARCHAR2);
```

```
DBMS_UTILITY.TABLE_TO_COMMA (  
    tab    IN    lname_array,  
    tablen OUT BINARY_INTEGER,  
    list   OUT  VARCHAR2);
```

Parameters

Table 194-33 TABLE_TO_COMMA Procedure Parameters

| Parameter | Description |
|-----------|---|
| tab | PL/SQL table which contains list of table names |
| tablen | Number of tables in the PL/SQL table |
| list | Comma separated list of tables |

Return Values

A comma-delimited list and the number of elements found in the table.

194.6.37 VALIDATE Procedure

This procedure makes invalid database objects valid.

Syntax

```
DBMS_UTILITY.VALIDATE (
    object_id      NUMBER);

DBMS_UTILITY.VALIDATE (
    owner          VARCHAR2,
    objname        VARCHAR2,
    namespace      NUMBER,  edition_name  := SYS_CONTEXT ('USERENV',
    'CURRENT_EDITION'));
```

Parameters

Table 194-34 VALIDATE Procedure Parameters

| Parameter | Description |
|--------------|---|
| owner | Name of the user who owns the object. Same as the OWNER field in ALL_OBJECTS. |
| objname | Name of the object to be validated. Same as the OBJECT_NAME field in ALL_OBJECTS. |
| namespace | Namespace of the object. Same as the namespace field in obj\$. Equivalent numeric values are as follows: <ul style="list-style-type: none"> • 1 — TABLE/PROCEDURE/TYP • 2 — BODY • 3 — TRIGGER • 4 — INDEX • 5 — CLUSTER • 8 — LOB • 9 — DIRECTORY • 10 — QUEUE • 11 — REPLICATION OBJECT GROUP • 12 — REPLICATION PROPAGATOR • 13 — JAVA SOURCE • 14 — JAVA RESOURCE • 58 — (Data Mining) MODEL |
| edition_name | [Note: Currently not operable. Reserved for future use] |

Usage Notes

- No errors are raised if the object does not exist or is already valid or is an object that cannot be validated.
- If the object being validated is not actual in the specified edition, the subprogram automatically switches into the edition in which the object is actual prior to validation. That is, a call to VALIDATE will not actualize the object in the specified edition.
- The [INVALIDATE Procedure](#) invalidates a database object and optionally changes its PL/SQL compiler parameter settings. The object to be invalidated is specified by its

`object_id`. The subprogram automatically switches to the edition in which the object is actual prior to invalidation. That is, a call to `INVALIDATE` will not actualize the object in the current edition.

194.6.38 WAIT_ON_PENDING_DML Function

This function waits until all transactions (other than the caller's own) that have locks on the listed tables and began prior to the specified `scn` have either committed or been rolled back.

Syntax

```
DBMS_UTILITY.WAIT_ON_PENDING_DML (
    tables      IN      VARCHAR2,
    timeout     IN      BINARY_INTEGER,
    scn         IN OUT  NUMBER)
RETURN BOOLEAN;
```

Parameters

Table 194-35 WAIT_ON_PENDING_DML Function Parameters

| Parameter | Description |
|----------------------|--|
| <code>tables</code> | Comma-separated list of one or more table names. The list must be valid for COMMA_TO_TABLE Procedures , and each item valid to the NAME_RESOLVE Procedure . Neither column specifiers nor DBLINK (database link) specifiers are allowed in the names, and each name must resolve to an existing table in the local database. |
| <code>timeout</code> | Maximum number of seconds to wait, totalled across all tables/transactions. A <code>NULL</code> or negative value will cause a very long wait. |
| <code>scn</code> | SCN prior to which transactions must have begun to be considered relevant to this request. If the value is <code>NULL</code> or not recognized as a meaningful <code>scn</code> on input, the most current SCN across all instances will be used and will be set into the passed argument as an output. If a meaningful value is passed in, its value will be preserved in the output. |

Return Values

`TRUE` if all relevant transactions have committed or been rolled back, `FALSE` if the timeout occurred prior to all relevant transactions committing or being rolled back

DBMS_WARNING

The `DBMS_WARNING` package provides a way to manipulate the behavior of PL/SQL warning messages, in particular by reading and changing the setting of the `PLSQL_WARNINGS` initialization parameter to control what kinds of warnings are suppressed, displayed, or treated as errors. This package provides the interface to query, modify and delete current system or session settings.

This chapter contains the following topics:

- [Security Model](#)
- [Summary of DBMS_WARNING Subprograms](#)

195.1 DBMS_WARNING Security Model

Note that for all the following interfaces, if value of the scope parameter is `SYSTEM`, then the user must have `ALTER SYSTEM` privilege.

195.2 Summary of DBMS_WARNING Subprograms

This table lists the `DBMS_WARNING` subprograms and briefly describes them.

Table 195-1 *DBMS_WARNING Package Subprograms*

| Subprogram | Description |
|--|---|
| ADD_WARNING_SETTING_CAT Procedure | Modifies the current <code>session</code> or <code>system</code> warning settings of the <code>warning_category</code> previously supplied |
| ADD_WARNING_SETTING_NUM Procedure | Modifies the current <code>session</code> or <code>system</code> warning settings of the or <code>warning_number</code> previously supplied |
| GET_CATEGORY Function | Returns the category name, given the message number |
| GET_WARNING_SETTING_CAT Function | Returns the specific warning category in the session |
| GET_WARNING_SETTING_NUM Function | Returns the specific warning number in the session |
| GET_WARNING_SETTING_STRING Function | Returns the entire warning string for the current session |
| SET_WARNING_SETTING_STRING Procedure | Replaces previous settings with the new value |

195.2.1 ADD_WARNING_SETTING_CAT Procedure

You can modify the current session's or system's warning settings with the value supplied in this procedure. The value will be added to the existing parameter setting if the value for the `warning_category` or `warning_value` has not been set, or override the existing value.

The effect of calling this function is same as adding the qualifier (`ENABLE/DISABLE/ERROR`) on the category specified to the end of the current session or system setting.

Syntax

```
DBMS_WARNING.ADD_WARNING_SETTING_CAT (
    warning_category    IN    VARCHAR2,
    warning_value       IN    VARCHAR2,
    scope               IN    VARCHAR2);
```

Parameters

Table 195-2 ADD_WARNING_SETTING_CAT Procedure Parameters

| Parameter | Description |
|-------------------------------|--|
| <code>warning_category</code> | Name of the category. Allowed values are ALL, INFORMATIONAL, SEVERE and PERFORMANCE. |
| <code>warning_value</code> | Value for the category. Allowed values are ENABLE, DISABLE, and ERROR. |
| <code>scope</code> | Specifies if the changes are being performed in the session context or the system context. Allowed values are SESSION or SYSTEM. |

195.2.2 ADD_WARNING_SETTING_NUM Procedure

You can modify the current `session` or `system` warning settings with the value supplied in this procedure. If the value was already set, you will override the existing value.

The effect of calling this function is same as adding the qualifier (`ENABLE / DISABLE/ERROR`) on the category specified to the end of the current session or system setting.

Syntax

```
DBMS_WARNING.ADD_WARNING_SETTING_NUM (
    warning_number      IN    NUMBER,
    warning_value       IN    VARCHAR2,
    scope               IN    VARCHAR2);
```

Parameters

Table 195-3 ADD_WARNING_SETTING_NUM Procedure Parameters

| Parameter | Description |
|-----------------------------|---|
| <code>warning_number</code> | The warning number. Allowed values are all valid warning numbers. |

Table 195-3 (Cont.) ADD_WARNING_SETTING_NUM Procedure Parameters

| Parameter | Description |
|---------------|--|
| warning_value | Value for the category. Allowed values are ENABLE, DISABLE, and ERROR. |
| scope | Specifies if the changes are being performed in the session context or the system context. Allowed values are SESSION or SYSTEM. |

Example 195-1 Enabling the Deprecation Warnings

This example shows how to enable the DEPRECATE pragma warnings using the DBMS_WARNING package for the session.

```
BEGIN
  DBMS_WARNING.ADD_WARNING_SETTING_NUM (6019,
                                         'ENABLE',
                                         'SESSION');

  DBMS_WARNING.ADD_WARNING_SETTING_NUM (6020,
                                         'ENABLE',
                                         'SESSION');

  DBMS_WARNING.ADD_WARNING_SETTING_NUM (6021,
                                         'ENABLE',
                                         'SESSION');

  DBMS_WARNING.ADD_WARNING_SETTING_NUM (6022,
                                         'ENABLE',
                                         'SESSION');

END;
```

195.2.3 GET_CATEGORY Function

This function returns the category name, given the message number.

Syntax

```
DBMS_WARNING.GET_CATEGORY (
  warning_number IN pls_integer)
RETURN VARCHAR2;
```

Parameters**Table 195-4 GET_CATEGORY Function Parameters**

| Parameter | Description |
|----------------|-----------------------------|
| warning_number | The warning message number. |

195.2.4 GET_WARNING_SETTING_CAT Function

This function returns the specific warning category setting for the current session.

Syntax

```
DBMS_WARNING.GET_WARNING_SETTING_CAT (  
    warning_category IN VARCHAR2)  
RETURN warning_value;
```

Parameters

Table 195-5 GET_WARNING_SETTING_CAT Function Parameters

| Parameter | Description |
|------------------|---|
| warning_category | Name of the category. Allowed values are all valid category names (ALL, INFORMATIONAL, SEVERE and PERFORMANCE). |

195.2.5 GET_WARNING_SETTING_NUM Function

This function returns the specific warning number setting for the current session.

Syntax

```
DBMS_WARNING.GET_WARNING_SETTING_NUM (  
    warning_number IN NUMBER)  
RETURN warning_value;
```

Parameters

Table 195-6 GET_WARNING_SETTING_NUM Function Parameters

| Parameter | Description |
|----------------|---|
| warning_number | Warning number. Allowed values are all valid warning numbers. |

195.2.6 GET_WARNING_SETTING_STRING Function

This function returns the entire warning string for the current session.

Syntax

```
DBMS_WARNING.GET_WARNING_SETTING_STRING  
RETURN VARCHAR2;
```

Usage Notes

Use this function when you do not have `SELECT` or `READ` privilege on `v$parameter` or `v$parameter2` fixed tables, or if you want to parse the warning string yourself and then modify and set the new value using `SET_WARNING_SETTING_STRING`.

195.2.7 SET_WARNING_SETTING_STRING Procedure

This procedure replaces previous settings with the new value.

The warning string may contain mix of category and warning numbers using the same syntax as used on the right hand side of '=' when issuing an ALTER SESSION or SYSTEM SET PLSQL_WARNINGS command. This will have same effect as ALTER SESSION or ALTER SYSTEM command.

Syntax

```
DBMS_WARNING.SET_WARNING_SETTING_STRING (  
    warning_value  IN  VARCHAR2,  
    scope         IN  VARCHAR2);
```

Parameters

Table 195-7 SET_WARNING_SETTING_STRING Procedure Parameters

| Parameter | Description |
|---------------|--|
| warning_value | The new string that will constitute the new value. |
| scope | This will specify if the changes are being done in the session context, or system context. Allowed values are SESSION or SYSTEM. |

DBMS_WM

The `DBMS_WM` package provides an interface to Oracle Database Workspace Manager (often referred to as Workspace Manager).

For a complete description of this package, see `DBMS_WM` in the *Oracle Database Workspace Manager Developer's Guide*.

DBMS_WORKLOAD_CAPTURE

The `DBMS_WORKLOAD_CAPTURE` package configures the Workload Capture system and produce the workload capture data.

Replay of this capture is implemented by way of the `DBMS_WORKLOAD_REPLAY` package.

This chapter contains the following topics:

- [Overview](#)
- [Security Model](#)
- [Summary of DBMS_WORKLOAD_CAPTURE Subprograms](#)

See Also:

Oracle Database Testing Guide for more information about database replay

197.1 DBMS_WORKLOAD_CAPTURE Overview

Since the capture infrastructure is instance wide (and also within an Oracle Real Application Clusters (Oracle RAC)), only one workload capture is being produced at any point in time. Thus capture interfaces do not need a state object passed in as a parameter since there is one single state at any point in time. This means that all subprograms cannot be methods of an object but are package wide PL/SQL subprograms.

197.2 DBMS_WORKLOAD_CAPTURE Security Model

The security model describes the privileges needed for using `DBMS_WORKLOAD_CAPTURE`.

The following code describes the minimal set of privileges required to:

- Create directory objects
- Operate the interface provided by the `DBMS_WORKLOAD_CAPTURE` and `DBMS_WORKLOAD_REPLAY` packages
- Act as a replay client user (`wrc someuser/somepassword` or `wrc USER=someuser PASSWORD=somepassword`)

```
DROP USER rom1 CASCADE;
CREATE USER rom1 IDENTIFIED BY rom1;
```

```
GRANT EXECUTE ON DBMS_WORKLOAD_CAPTURE TO rom1;
GRANT EXECUTE ON DBMS_WORKLOAD_REPLAY TO rom1;
```

```
GRANT CREATE SESSION TO rom1;
GRANT CREATE ANY DIRECTORY TO rom1;
```

```
GRANT SELECT_CATALOG_ROLE TO rom1;
GRANT BECOME USER TO rom1;
```

Appropriate OS permissions are required to access and manipulate files and directories on both the capture and replay system. This means that the Oracle process(es) and the OS user performing the capture or replay must be able to access and manipulate at least one common directory accessible from the host where the instance is running. Additionally, the OS user performing the replay should be able to execute wrcc on hosts that are used for the replay clients and be able to access the file system appropriately to copy the capture to the replay clients' hosts if required.

197.3 Summary of DBMS_WORKLOAD_CAPTURE Subprograms

This table lists the DBMS_WORKLOAD_CAPTURE package subprograms in alphabetical order.

Table 197-1 DBMS_WORKLOAD_CAPTURE Package Subprograms

| Subprogram | Description |
|---|---|
| ADD_FILTER Procedure | Adds a specified filter |
| DECRYPT_CAPTURE Procedure | This procedure decrypts sensitive data in workload capture that was encrypted using various advanced encryption standards such as AES128, AES192, or AES256. |
| DELETE_CAPTURE_INFO Procedure | Deletes the rows in the DBA_WORKLOAD_CAPTURES and DBA_WORKLOAD_FILTERS views that corresponds to the given workload capture ID |
| DELETE_FILTER Procedure | Deletes a specified filter |
| ENCRYPT_CAPTURE Procedure | This procedure encrypts sensitive data in workload capture using various advanced encryption standards such as AES128, AES192, or AES256. |
| EXPORT_AWR Procedure | Exports the AWR snapshots associated with a given capture ID |
| FINISH_CAPTURE Procedure | Finalizes the workload capture by signaling all connected sessions to stop capture, and stops future requests to the database from being captured |
| GET_CAPTURE_INFO Function | Retrieves all the information regarding a workload capture present in the stipulated directory, imports the information into the DBA_WORKLOAD_CAPTURES and DBA_WORKLOAD_FILTERS views, and returns the appropriate DBA_WORKLOAD_CAPTURES.ID |
| IMPORT_AWR Function | Imports the AWR snapshots associated with a given capture ID |
| REPORT Function | Returns a report on the workload capture under consideration using one or more different sources |
| START_CAPTURE Procedure | Initiates workload capture on all instances |

197.3.1 ADD_FILTER Procedures

This procedure adds a filter to capture a subset of the workload.

Syntax

```
DBMS_WORKLOAD_CAPTURE.ADD_FILTER (
    fname          IN  VARCHAR2 NOT NULL,
    fattribute     IN  VARCHAR2 NOT NULL,
    fvalue         IN  VARCHAR2 NOT NULL);
```

```
DBMS_WORKLOAD_CAPTURE.ADD_FILTER (
    fname          IN  VARCHAR2 NOT NULL,
    fattribute     IN  VARCHAR2 NOT NULL,
    fvalue         IN  NUMBER NOT NULL);
```

Parameters

Table 197-2 ADD_FILTER Procedure Parameters

| Parameter | Description |
|------------|---|
| fname | Name for the filter to be added. Can be used to delete the filter later if it is not required. (Mandatory) |
| fattribute | Specifies the attribute on which the filter needs to be applied (Mandatory). The possible values are: <ul style="list-style-type: none"> INSTANCE_NUMBER - type NUMBER USER - type STRING MODULE - type STRING ACTION - type STRING PROGRAM - type STRING SERVICE - type STRING PDB_NAME - type STRING |
| fvalue | Specifies the value to which the given attribute should be equal to for the filter to be considered active. Wildcards like '%' are acceptable for all attributes that are of type STRING. This means that the filter for a NUMBER attribute is parsed as "attribute = value", with the filter for a STRING attribute parsed as "attribute like value" (Mandatory). |

Usage Notes

- The workload capture filters work in either the `DEFAULT INCLUSION` or the `DEFAULT EXCLUSION` mode as determined by the `default_action` input to the [START_CAPTURE Procedure](#).
- `ADD_FILTER` adds a new filter that affects the next workload capture, and whether the filters are considered as `INCLUSION` filters or `EXCLUSION` filters depends on the value of the `default_action` input to [START_CAPTURE Procedure](#).
- Filters once specified are valid only for the next workload capture. If the same set of filters need to be used for subsequent capture, they need to be specified each time before the [START_CAPTURE Procedure](#) is executed.
- All the filters are listed in the `DBA_WORKLOAD_FILTERS` view.

- You can capture the workload for a particular PDB by specifying a filter of PDB type.

Examples

- By default, a capture works in an `INCLUSION` mode, which records everything except for those requests that satisfy conditions of specified filters. For example, if you want to exclude all requests from `SCOTT`, you can add the following filter before starting a capture.

```
EXEC DBMS_WORKLOAD_CAPTURE.ADD_FILTER ('filter user1', 'USER', 'SCOTT');
```

- Multiple filters are evaluated according to the logical disjunction operator `OR`. Therefore, if you want to record workload for both `SCOTT` and `JOHN`, you add an additional filter:

```
EXEC DBMS_WORKLOAD_CAPTURE.ADD_FILTER ('filter user2', 'USER', 'JOHN');
```

- In a CDB, you exclude the workload of a particular PDB by the filter:

```
EXEC DBMS_WORKLOAD_CAPTURE.ADD_FILTER ('filter pdb workload', 'PDB_NAME', 'CDB1_PDB1');
```

- To use `DBMS_APPLICATION_INFO` to identify workload that is issued to the database:

```
DBMS_APPLICATION_INFO.SET_MODULE('ORDER_ENTRY', NULL);
-- run some SQL here
DBMS_APPLICATION_INFO.SET_ACTION('ORDER_ENTRY_LOG');
-- run logging SQL
```

- If having captured workload, you want to exclude the logging SQL from the captured, specify a filter for capture:

```
DBMS_WORKLOAD_CAPTURE.ADD_FILTER('filter logging operations', 'ACTION', 'ORDER_ENTRY_LOG');
```

- To filter out the full order entry transaction, define a filter:

```
DBMS_WORKLOAD_CAPTURE.ADD_FILTER('filter order entry', 'MODULE', 'ORDER_ENTRY');
```

197.3.2 DECRYPT_CAPTURE Procedure

This procedure decrypts sensitive data in workload capture that was encrypted using various advanced encryption standards such as AES128, AES192, or AES256.

Syntax

```
DBMS_WORKLOAD_CAPTURE.DECRYPT_CAPTURE (
  src_dir          IN  VARCHAR2,
  dst_dir          IN  VARCHAR2);
```

Parameters

Table 197-3 DECRYPT_CAPTURE Procedure Parameters

| Parameter | Description |
|-----------|--|
| src_dir | A directory object pointing to the workload capture to be decrypted. This parameter is case sensitive. |
| dst_dir | A directory object pointing to an OS path that has write permissions. The decrypted capture files will be written to this directory This parameter is case sensitive. |

Usage Notes

This procedure relies on a software keystore. The identifier is `oracle.rat.database_replay.encryption` (case-sensitive).

197.3.3 DELETE_CAPTURE_INFO Procedure

This procedure deletes the rows in the `DBA_WORKLOAD_CAPTURES` and `DBA_WORKLOAD_FILTERS` views that corresponds to the given workload capture ID.

Syntax

```
DBMS_WORKLOAD_CAPTURE.DELETE_CAPTURE_INFO
  (capture_id IN NUMBER);
```

Parameters

Table 197-4 DELETE_CAPTURE_INFO Procedure Parameters

| Parameter | Description |
|------------|---|
| capture_id | ID of the workload capture that needs to be deleted. Corresponds to <code>DBA_WORKLOAD_CAPTURES.ID</code> . (Mandatory) |

Usage Notes

Passing the ID of a capture that is in progress will first automatically stop that capture.

197.3.4 DELETE_FILTER Procedure

This procedure deletes a specified filter.

Syntax

```
DBMS_WORKLOAD_CAPTURE.DELETE_FILTER (
  filter_name IN VARCHAR2(40) NOT NULL);
```

Parameters

Table 197-5 DELETE_FILTER Procedure Parameters

| Parameter | Description |
|-------------|----------------------|
| filter_name | Filter to be deleted |

Usage Notes

The `DELETE_FILTER` Procedure only affects filters that have not been used by any previous capture. Consequently, filters can be deleted only if they have been added using the [ADD_FILTER Procedures](#) after any capture has been completed. Filters that have been added using `ADD_FILTER` before a `START_CAPTURE` and `FINISH_CAPTURE` cannot be deleted anymore using this subprogram.

197.3.5 ENCRYPT_CAPTURE Procedure

This procedure encrypts sensitive data in workload capture using various advanced encryption standards such as AES128, AES192, or AES256. To encrypt capture on the fly, use encryption parameter in `START_CAPTURE` procedure.

Syntax

```
DBMS_WORKLOAD_CAPTURE.ENCRYPT_CAPTURE
  src_dir      IN VARCHAR2,
  dst_dir      IN VARCHAR2,
  encryption   IN VARCHAR2 DEFAULT 'AES256');
```

Parameters

Table 197-6 ENCRYPT_CAPTURE Procedure Parameters

| Parameter | Description |
|------------|--|
| src_dir | A directory object pointing to the workload capture to be encrypted. The parameter value is case sensitive. |
| dst_dir | A directory object pointing to an OS path that has write permissions. The encrypted capture files will be written to this directory. The parameter value is case sensitive. |
| encryption | Specifies if sensitive data in workload capture is encrypted or not. The possible values are: AES128, AES192, and AES256. The default value is AES256. |

Usage Notes

For encrypted capture, the `ENCRYPT_CAPTURE` Procedure relies on a software keystore. The identifier is `oracle.rat.database_replay.encryption` (case-sensitive).

197.3.6 EXPORT_AWR Procedure

This procedure exports the AWR snapshots associated with a given capture ID.

Syntax

```
DBMS_WORKLOAD_CAPTURE.EXPORT_AWR (
    capture_id    IN NUMBER);
```

Parameters

Table 197-7 EXPORT_AWR Procedure Parameters

| Parameter | Description |
|------------|---|
| capture_id | ID of the capture whose AWR snapshots are to be exported. (Mandatory) |

Usage Notes

This procedure works only if the corresponding workload capture was performed in the current database (meaning that the corresponding row in `DBA_WORKLOAD_CAPTURES` was not created by calling the [GET_CAPTURE_INFO Function](#)) and the AWR snapshots that correspond to the original capture time period are still available.

197.3.7 FINISH_CAPTURE Procedure

This procedure signals all connected sessions to stop the workload capture and stops future requests to the database from being captured.

Syntax

```
DBMS_WORKLOAD_CAPTURE.FINISH_CAPTURE
    timeout    IN    NUMBER    DEFAULT 30
    reason     IN    VARCHAR2  DEFAULT NULL);
```

Parameters

Table 197-8 FINISH_CAPTURE Procedure Parameters

| Parameter | Description |
|-----------|--|
| timeout | Specifies in seconds for how long the procedure should wait before it times out. Pass 0 if you want to cancel the current workload capture and not wait for any sessions to flush its capture buffers. Default value: 30 seconds |
| reason | Specifies a reason for calling the procedure. The reason appears in the column <code>ERROR_MESSAGE</code> of the view <code>DBA_WORKLOAD_CAPTURES</code> . |

Usage Notes

- By default, `FINISH_CAPTURE` waits for 30 seconds to receive a successful acknowledgement from all sessions in the database cluster before timing out.

- All sessions that either were in the middle of executing a user request or received a new user request, while `FINISH_CAPTURE` was waiting for acknowledgements, flush their buffers and send back their acknowledgement to `FINISH_CAPTURE`.
- If a database session remains idle (waiting for the next user request) throughout the duration of `FINISH_CAPTURE`, the session might have unflushed capture buffers and does not send its acknowledgement to `FINISH_CAPTURE`.

To avoid this, do not have sessions that remain idle (waiting for the next user request) while invoking `FINISH_CAPTURE`. Either close the database session(s) before running `FINISH_CAPTURE` or send new database requests to those sessions during `FINISH_CAPTURE`.

197.3.8 GET_CAPTURE_INFO Function

This procedure retrieves all information regarding a workload capture present in the stipulated directory, imports the information into the `DBA_WORKLOAD_CAPTURES` and `DBA_WORKLOAD_FILTERS` views, and returns the appropriate `DBA_WORKLOAD_CAPTURES.ID`

Syntax

```
DBMS_WORKLOAD_CAPTURE.GET_CAPTURE_INFO
  dir      IN  VARCHAR2)
RETURN NUMBER;
```

Parameters

Table 197-9 GET_CAPTURE_INFO Function Parameters

| Parameter | Description |
|-----------|---|
| dir | Name of the <code>DIRECTORY</code> object (case sensitive) where all the workload capture files are located (Mandatory) |

Usage Notes

If an appropriate row describing the capture in the stipulated directory already exists in `DBA_WORKLOAD_CAPTURES`, the [GET_CAPTURE_INFO Function](#) simply returns that row's `DBA_WORKLOAD_CAPTURES.ID`. If no existing row matches the capture present in the stipulated directory a new row is inserted to `DBA_WORKLOAD_CAPTURES` and that row's `ID` is returned.

197.3.9 IMPORT_AWR Function

This procedure imports the AWR snapshots associated with a given capture ID provided those AWR snapshots were exported earlier from the original capture system using the `EXPORT_AWR` procedure.

Syntax

```
DBMS_WORKLOAD_CAPTURE.IMPORT_AWR (
  capture_id      IN  NUMBER,
  staging_schema  IN  VARCHAR2,
  force_cleanup   IN  BOOLEAN DEFAULT FALSE)
RETURN NUMBER;
```

Parameters

Table 197-10 IMPORT_AWR Function Parameters

| Parameter | Description |
|----------------|--|
| capture_id | ID of the capture whose AWR snapshots should be imported. (Mandatory) |
| staging_schema | Name of a valid schema in the current database which can be used as a staging area while importing the AWR snapshots from the capture directory to the SYS AWR schema. The SYS schema is not a valid input. (Mandatory, Case sensitive). |
| force_cleanup | <p>Values:</p> <ul style="list-style-type: none"> TRUE - any AWR data present in the given staging_schema are removed before the actual import operation. All tables with names that match any of the tables in AWR are dropped before the actual import. This typically is equivalent to dropping all tables returned by the following SQL: <pre>SELECT table_name FROM dba_tables WHERE owner = staging_schema AND table_name like 'WR_\$%';</pre> <p>Use this option only if you are sure that there are no important data in any such tables in the staging_schema.</p> FALSE - (default) no tables dropped from the staging_schema prior to the import operation |

Return Values

Returns the new randomly generated database ID that was used to import the AWR snapshots. The same value can be found in the AWR_DBID column in the DBA_WORKLOAD_CAPTURES view.

Usage Notes

IMPORT_AWR fails if the staging_schema provided as input contains any tables with the same name as any of the AWR tables, such as WRM\$_SNAPSHOT or WRH\$_PARAMETER. Please drop any such tables in the staging_schema before invoking IMPORT_AWR.

Related Topics

- [EXPORT_AWR Procedure](#)
This procedure exports the AWR snapshots associated with a given capture ID.

197.3.10 REPORT Function

This function generates a report on the stipulated workload capture.

Syntax

```
DBMS_WORKLOAD_CAPTURE.REPORT (
  capture_id      IN   NUMBER,
  format          IN   VARCHAR2)
RETURN CLOB;
```

Parameters

Table 197-11 REPORT Function Parameters

| Parameter | Description |
|------------|--|
| capture_id | ID of the workload capture whose capture report is required. (Mandatory) This relates to the directory that contains the workload capture on which the Report needs to be generated. Should be a valid DIRECTORY object that points to a valid directory in the host system that contains a workload capture. |
| format | Specifies the report format. Valid values are DBMS_WORKLOAD_CAPTURE.TYPE_TEXT and DBMS_WORKLOAD_CAPTURE.TYPE_HTML.(Mandatory) |

Return Values

The report body in the desired format returned as a CLOB.

Table 197-12 Constants Used by Report Function

| Constant | Type | Value | Description |
|-----------|--------------|--------|---|
| TYPE_HTML | VARCHAR2 (4) | 'HTML' | Generates the HTML version of the report |
| TYPE_TEXT | VARCHAR2 (4) | 'TEXT' | Used as input to the format argument to generate the text version of the report |

197.3.11 START_CAPTURE Procedure

This procedure initiates workload capture on all instances.

Syntax

```
DBMS_WORKLOAD_CAPTURE.START_CAPTURE (
  name          IN  VARCHAR2,
  dir           IN  VARCHAR2,
  duration      IN  NUMBER   DEFAULT NULL,
  default_action IN  VARCHAR2 DEFAULT 'INCLUDE',
  auto_unrestrict IN BOOLEAN DEFAULT TRUE,
  capture_sts   IN  BOOLEAN  DEFAULT FALSE,
  sts_cap_interval IN NUMBER  DEFAULT 300,
  plsql_mode    IN  VARCHAR2 DEFAULT 'TOP_LEVEL',
  encryption    IN  VARCHAR2 DEFAULT NULL);
```

Parameters

Table 197-13 START_CAPTURE Procedure Parameters

| Parameter | Description |
|------------------|---|
| name | Name of the workload capture. Allows the workload capture to be given a label, such as "Thanksgiving weekend" or "Christmas peak workload" for future reference. The workload capture's name is preserved along with the captured workload actions. (Mandatory) |
| dir | Name of the DIRECTORY object (case sensitive) where all the workload capture files are stored. Should contain enough space to hold all the workload capture files. (Mandatory) |
| duration | Optional input to specify the duration (in seconds) for which the workload needs to be captured. DEFAULT is NULL which means that workload capture continues until the user executes DBMS_WORKLOAD_CAPTURE.FINISH_CAPTURE. |
| default_action | Can be either INCLUDE or EXCLUDE. Determines whether, by default, every user request should be captured or not. Also determines whether the workload filters specified should be considered as INCLUSION filters or EXCLUSION filters. <ul style="list-style-type: none"> If INCLUDE, by default all user requests to the database are captured, except for the part of the workload defined by the filters. In this case, all the filters specified using the ADD_FILTER Procedures are treated as EXCLUSION filters, determining the workload that is not captured. (DEFAULT, and so all the filters specified are assumed to be EXCLUSION filters.) If EXCLUDE, by default no user request to the database is captured, except for the part of the workload defined by the filters. In this case, all the filters specified using the ADD_FILTER Procedures are treated as INCLUSION filters, determining the workload that is captured. |
| auto_unrestrict | Can be either TRUE or FALSE. <ul style="list-style-type: none"> If TRUE, all instances started up in RESTRICTED mode using STARTUP RESTRICT are automatically unrestricted upon a successful START_CAPTURE. (DEFAULT) If FALSE, no database instance is automatically unrestricted. |
| capture_sts | If this parameter is TRUE, a SQL tuning set capture is also started in parallel with workload capture. The resulting SQL tuning set can be exported using the EXPORT_AWR Procedure along with the AWR data. Currently, parallel STS capture is not supported in an Oracle RAC environment, so this parameter has no effect if used in that context. Capture filters defined using the DBMS_WORKLOAD_REPLAY interface do not apply to the SQL tuning set capture. The calling user must have the appropriate privileges ('ADMINISTER SQL TUNING SET'). If starting SQL set capture fails, workload capture is stopped. The reason is stored in DBA_WORKLOAD_CAPTURES.ERROR_MESSAGE. The default value is FALSE. |
| sts_cap_interval | Specifies the capture interval of the SQL set capture from the cursor cache in seconds. The default value is 300. |

Table 197-13 (Cont.) START_CAPTURE Procedure Parameters

| Parameter | Description |
|------------|---|
| plsql_mode | <p>Specifies the PL/SQL capture mode:</p> <ul style="list-style-type: none"> • TOP_LEVEL — only top-level PL/SQL calls are captured • EXTENDED — both top-level PL/SQL calls and SQL called from PL/SQL are captured |
| encryption | <p>Specify if sensitive data in workload capture is encrypted or not. The possible values are:</p> <ul style="list-style-type: none"> • NULL — capture files are not encrypted • AES128 — capture files are encrypted using AES128 • AES192 — capture files are encrypted using AES192 • AES256 — capture files is encrypted using AES256 <p>The default value is NULL.</p> |

Usage Notes

- All user requests sent to database after a successful invocation of `START_CAPTURE` are recorded in the given `dir` directory for the given duration provided that one was specified. If no duration was specified, the capture lasts indefinitely until the [FINISH_CAPTURE Procedure](#) is executed.
- A workload capture once started continues to record user requests across database instance shutdowns and startups for the specified duration, or until `FINISH_CAPTURE` is executed, whichever occurs first.
- One can use workload filters (as described with regard to the [ADD_FILTER Procedures](#)) to capture only a subset of the user requests sent to the database. By default, when no workload filters are defined, all user requests are captured.
- Workload that is initiated from Oracle Database background processes (such as `SMON`, `PMON`, `MMON`) and Oracle Database Scheduler Jobs (as detailed in the [DBMS_SCHEDULER](#) package) is not captured, no matter how the workload filters are defined. These activities should happen automatically on an appropriately configured replay system.
- By default, all database instances that were started up in `RESTRICTED` mode using `STARTUP RESTRICT` are `UNRESTRICTED` upon a successful invocation of `START_CAPTURE`. Use `FALSE` for the `auto_unrestrict` input parameter, if you do not want this behavior.
- It is important to have a well-defined starting point for the workload so that the replay system can be restored to that point before initiating a replay of the captured workload. To have a well-defined starting point for the workload capture, it is preferable not to have any active user sessions when `START_CAPTURE` is executed. If ongoing sessions have ongoing transactions, those transactions are not replayed properly in subsequent database replays, since only that part of the transaction whose calls were executed after `START_CAPTURE` are replayed.
- For encrypted capture, the `START_CAPTURE` Procedure relies on a software keystore. The identifier is `oracle.rat.database_replay.encryption` (case-sensitive).
- You must configure a software keystore in `auto-login` mode. Otherwise, if the database is bounced during capture, the capture is automatically terminated.

DBMS_WORKLOAD_REPLAY

The `DBMS_WORKLOAD_REPLAY` package provides a interface to replay a workload capture.

This chapter contains the following topics:

- [Overview](#)
- [Security Model](#)
- [Summary of DBMS_WORKLOAD_REPLAY Subprograms](#)

See Also:

Oracle Database Testing Guide for more information about database replay

198.1 DBMS_WORKLOAD_REPLAY Overview

The `DBMS_WORKLOAD_REPLAY` package provides an interface to replay a workload capture that was originally created by way of the `DBMS_WORKLOAD_CAPTURE` package.

Typically, the `DBMS_WORKLOAD_CAPTURE` package is used in the production system to capture a production workload, and the `DBMS_WORKLOAD_REPLAY` package is subsequently used in a test system to replay the captured production workload for testing purposes.

Related Topics

- [DBMS_WORKLOAD_CAPTURE](#)
The `DBMS_WORKLOAD_CAPTURE` package configures the Workload Capture system and produce the workload capture data.

198.2 DBMS_WORKLOAD_REPLAY Security Model

The security model describes the privileges needed for using `DBMS_WORKLOAD_REPLAY`.

The following code sample shows the minimum set of privileges required to:

- Create directory objects
- Operate the interface provided by the `DBMS_WORKLOAD_CAPTURE` and `DBMS_WORKLOAD_REPLAY` packages
- Act as a replay client user (`wrc someuser/somepassword` or `wrc USER=someuser PASSWORD=somepassword`)

```
DROP USER rom1 CASCADE;  
CREATE USER rom1 IDENTIFIED BY rom1;
```

```
GRANT EXECUTE ON DBMS_WORKLOAD_CAPTURE TO rom1;  
GRANT EXECUTE ON DBMS_WORKLOAD_REPLAY TO rom1;
```

```
GRANT CREATE SESSION TO rom1;
GRANT CREATE ANY DIRECTORY TO rom1;
GRANT SELECT_CATALOG_ROLE TO rom1;
GRANT BECOME USER TO rom1;
```

Appropriate OS permissions are required to access and manipulate files and directories on both the capture and replay system. The Oracle process(es) and the OS user performing the capture or replay must be able to access and manipulate at least one common directory accessible from the host where the instance is running.

The replay client is a multithreaded program (an executable named `wrc` located in the `$ORACLE_HOME/bin` directory) where each thread submits a workload from a captured session. The OS user performing the replay must be able to execute `wrc` on hosts that are used for the replay clients and be able to access the file system appropriately to be able to copy the capture to the replay clients' hosts if required.

198.3 Summary of DBMS_WORKLOAD_REPLAY Subprograms

This table lists the `DBMS_WORKLOAD_REPLAY` package subprograms in alphabetical order.

Table 198-1 DBMS_WORKLOAD_REPLAY Package Subprograms

| Subprogram | Description |
|--|---|
| ADD_CAPTURE Function | Adds the given capture to the current schedule |
| ADD_FILTER Procedure | Adds a filter to replay only a subset of the captured workload |
| ADD_SCHEDULE_ORDERING Function | Adds a schedule order between two captures |
| ASSIGN_GROUP_TO_INSTANCE Procedure | Modifies the view <code>DBA_WORKLOAD_GROUP_ASSIGNMENTS</code> |
| BEGIN_REPLAY_SCHEDULE Procedure | Initiates the creation of a reusable replay schedule |
| CALIBRATE Function | Operates on a processed workload capture directory to estimate the number of hosts and workload replay clients needed to faithfully replay the given workload |
| CANCEL_REPLAY Procedure | Cancels the workload replay in progress |
| COMPARE_PERIOD_REPORT Procedure | Generates a report comparing a replay to its capture or to another replay of the same capture |
| COMPARE_SQLSET_REPORT Function | Generates a report comparing a sqlset captured during replay to one captured during workload capture or to one captured during another replay of the same capture |
| CREATE_FILTER_SET Procedure | Uses the replay filters added to create a set of filters to use against the replay in <code>replay_dir</code> |
| DELETE_FILTER Procedure | Deletes the named filter |
| DELETE_REPLAY_INFO Procedure | Deletes the rows in <code>DBA_WORKLOAD_REPLAYS</code> that corresponds to the given workload replay ID |
| END_REPLAY_SCHEDULE Procedure | Wraps up the creation of the current schedule |

Table 198-1 (Cont.) DBMS_WORKLOAD_REPLAY Package Subprograms

| Subprogram | Description |
|--|--|
| EXPORT_AWR Procedure | Exports the Automatic Workload Repository (AWR) snapshots associated with a given replay ID |
| GENERATE_CAPTURE_SUBSET Procedure | Creates a new capture from an existing workload capture |
| GET_DIVERGING_STATEMENT Function | Exports the Automatic Workload Repository (AWR) snapshots associated with a given replay ID |
| GET_REPLAY_DIRECTORY Function | Returns the current replay directory set by the SET_REPLAY_DIRECTORY Procedure . |
| GET_REPLAY_INFO Function | Retrieves information about the workload capture and the history of all the workload replay attempts from the related directory |
| GET_REPLAY_TIMEOUT Procedure | Retrieves the replay timeout setting |
| IMPORT_AWR Function | Imports the Automatic Workload Repository (AWR) snapshots associated with a given replay ID |
| INITIALIZE_CONSOLIDATED_REPLAY Procedure | Puts the database state in <code>INIT</code> for a multiple-capture replay |
| INITIALIZE_REPLAY Procedure | Initializes replay, and loads specific data produced during processing into the database |
| IS_REPLAY_PAUSED Function | Reports whether the replay is currently paused |
| LOAD_LONG_SQLTEXT Procedure | Loads the captured SQL statements that are longer than 1000 characters to the <code>DBA_WORKLOAD_LONG_SQLTEXT</code> view |
| PAUSE_REPLAY Procedure | Pauses the in-progress workload replay |
| POPULATE_DIVERGENCE Procedure | Precomputes the divergence information for the given call, stream, or the whole replay so that the GET_DIVERGING_STATEMENT Function returns as quickly as possible for the precomputed calls |
| PREPARE_CONSOLIDATED_REPLAY Procedure | Puts the database in a special "Prepare" mode for a multiple-capture replay |
| PREPARE_REPLAY Procedure | Puts the database in a special "Prepare" mode |
| PROCESS_CAPTURE Procedure | Processes the workload capture found in <code>capture_dir</code> in place |
| REMAP_CONNECTION Procedure | Remaps the captured connection to a new one so that the user sessions can connect to the database in a desired way during workload replay |
| REMOVE_CAPTURE Procedure | Removes the given capture from the current schedule |
| REMOVE_SCHEDULE_ORDERING Procedure | Removes an existing schedule order from the current replay schedule |
| REPORT Function | Generates a report on the given workload replay |
| RESUME_REPLAY Procedure | Resumes a paused workload replay |
| REUSE_REPLAY_FILTER_SET Procedure | Reuses filters in the specified filter set as if each were added using the ADD_SCHEDULE_ORDERING Function |

Table 198-1 (Cont.) DBMS_WORKLOAD_REPLAY Package Subprograms

| Subprogram | Description |
|---|---|
| SET_ADVANCED_PARAMETER Procedure | Sets an advanced parameter for replay besides the ones used with the PREPARE_REPLAY Procedure |
| SET_REPLAY_DIRECTORY Procedure | Sets a directory that contains multiple workload captures as the current replay directory |
| SET_REPLAY_TIMEOUT Procedure | Sets the replay timeout setting |
| SET_SQL_MAPPING Procedure | Specifies SQL statements to be skipped or replaced during a database replay operation |
| SET_USER_MAPPING Procedure | Sets a new schema or user name to be used during replay instead of the captured user |
| START_CONSOLIDATED_REPLAY Procedure | Starts the replay of a multiple-capture capture |
| START_REPLAY Procedure | Starts the workload replay |
| USE_FILTER_SET Procedure | Uses the given filter set that has been created by calling the CREATE_FILTER_SET Procedure to filter the current replay |

198.3.1 ADD_CAPTURE Function

This function adds the given capture to the current schedule. The directory has to be a valid capture processed in the current database's version. It returns a unique ID that identifies this capture within this schedule.

Syntax

```
DBMS_WORKLOAD_REPLAY.ADD_CAPTURE (
    capture_dir_name      IN    VARCHAR2,
    start_delay_seconds   IN    NUMBER DEFAULT 0,
    stop_replay          IN    BOOLEAN FALSE,
    take_begin_snapshot  IN    BOOLEAN TRUE,
    take_end_snapshot    IN    BOOLEAN TRUE,
    query_only           IN    BOOLEAN DEFAULT FALSE)
RETURN NUMBER;
```

```
DBMS_WORKLOAD_REPLAY.ADD_CAPTURE (
    capture_dir_name      IN    VARCHAR2,
    start_delay_seconds   IN    NUMBER DEFAULT 0,
    stop_replay          IN    BOOLEAN FALSE,
    take_begin_snapshot  IN    BOOLEAN TRUE,
    take_end_snapshot    IN    BOOLEAN TRUE,
    query_only           IN    VARCHAR2 DEFAULT 'N')
RETURN NUMBER;
```

Parameters

Table 198-2 ADD_CAPTURE Function Parameters

| Parameter | Description |
|---------------------|--|
| capture_dir_name | Name of the OS directory containing the capture under the replay top-level directory |
| start_delay_seconds | Delay time in seconds before the replay of this capture starts |
| stop_replay | Stop the replay after it finishes |
| take_begin_snapshot | Take an AWR snapshot when the replay of this capture starts |
| take_end_snapshot | Take an AWR snapshot when the replay of this capture finishes |
| query_only | Replay only the read-only queries of this workload capture |

Usage Notes

The [SET_REPLAY_DIRECTORY Procedure](#) must have already been called.

198.3.2 ADD_FILTER Procedure

This procedure adds a filter to replay only a subset of the captured workload.

The procedure adds a new filter that is used in the next replay filter set created using the [CREATE_FILTER_SET Procedure](#). This filter will be considered an "INCLUSION" or "EXCLUSION" filter depending on the argument passed to `CREATE_FILTER_SET` when creating the filter set.

Syntax

```
DBMS_WORKLOAD_REPLAY.ADD_FILTER (
    fname          IN VARCHAR2,
    fattribute     IN VARCHAR2,
    fvalue         IN VARCHAR2);
```

```
DBMS_WORKLOAD_REPLAY.ADD_FILTER (
    fname          IN VARCHAR2,
    fattribute     IN VARCHAR2,
    fvalue         IN NUMBER);
```

Parameters

Table 198-3 ADD_FILTER Procedure Parameters

| Parameter | Description |
|-----------|---|
| fname | (Mandatory) Name of the filter. Can be used to delete the filter later if it is not required. |

Table 198-3 (Cont.) ADD_FILTER Procedure Parameters

| Parameter | Description |
|------------|--|
| fattribute | (Mandatory) Specifies the attribute on which the filter is defined as one of the following values of type <code>STRING</code> : <ul style="list-style-type: none"> • <code>USER</code> • <code>MODULE</code> • <code>ACTION</code> • <code>PROGRAM</code> • <code>SERVICE</code> • <code>CONNECTION_STRING</code> |
| fvalue | (Mandatory) Specifies the value to which the given 'attribute' must be equal to for the filter to be considered active. Wildcards such as '%' are acceptable for all attributes that are of type <code>STRING</code> . Currently all the listed values of <code>fattribute</code> are of type <code>STRING</code> . <code>INSTANCE_NUMBER</code> is a <code>NUMBER</code> attribute. It is currently only supported for capture. |

198.3.3 ADD_SCHEDULE_ORDERING Function

This function adds a schedule order between two captures.

Together, `schedule_capture_id` and `waitfor_capture_id` form a schedule ordering that previously added by the [ADD_SCHEDULE_ORDERING Function](#). The order is that replay of capture indicated by `schedule_capture_id` will not start unless the replay of capture indicated by `waiting_for_capture_id` finishes.

Syntax

```
DBMS_WORKLOAD_REPLAY.ADD_SCHEDULE_ORDERING (
    schedule_capture_id    IN VARCHAR2,
    waitfor_capture_id     IN VARCHAR2)
RETURN NUMBER;
```

Parameters

Table 198-4 ADD_SCHEDULE_ORDERING Function Parameters

| Parameter | Description |
|----------------------------------|--|
| <code>schedule_capture_id</code> | Points to a capture that has been added to the current replay schedule. According to the new schedule ordering added by this subprogram, its replay will not start until the replay of another capture specified by <code>waitfor_capture_id</code> runs to completion. |
| <code>waitfor_capture_id</code> | Points to a capture that has been added to the current replay schedule. According to the new schedule ordering added by this subprogram, the replay of capture specified by <code>schedule_capture_id</code> will not start until the replay of this capture runs to completion. |

Return Values

Returns a non-zero error code if the constraint cannot be added

Usage Notes

The two captures must have already been added to the replay schedule.

198.3.4 ASSIGN_GROUP_TO_INSTANCE Procedure

This procedure modifies the view `DBA_WORKLOAD_GROUP_ASSIGNMENTS`.

Syntax

```
DBMS_WORKLOAD_REPLAY.ASSIGN_GROUP_TO_INSTANCE (
    group_id          IN INTEGER,
    instance_number  IN INTEGER);
```

Parameters

Table 198-5 ASSIGN_GROUP_TO_INSTANCE Procedure Parameters

| Parameter | Description |
|------------------------------|---|
| <code>group_id</code> | The identifier of the specified group of capture files |
| <code>instance_number</code> | The number used for instance registration. It is equivalent to the <code>INSTANCE_NUMBER</code> column in <code>V\$INSTANCE</code> . |

See Also:

- `DBA_WORKLOAD_GROUP_ASSIGNMENTS` in *Oracle Database Reference*
- `V$INSTANCE` in *Oracle Database Reference*

198.3.5 BEGIN_REPLAY_SCHEDULE Procedure

This procedure initiates the creation of a reusable replay schedule.

Syntax

```
DBMS_WORKLOAD_REPLAY.BEGIN_REPLAY_SCHEDULE (
    replay_dir_obj  IN  VARCHAR2,
    schedule_name  IN  VARCHAR2);
```

Parameters

Table 198-6 BEGIN_REPLAY_SCHEDULE Procedure Parameters

| Parameter | Description |
|----------------|---|
| replay_dir_obj | Directory object that points to the replay directory that contains all the capture directories involved in the schedule |
| schedule_name | Name of the schedule to be replayed |

Usage Notes

- Only one schedule can be in creation mode at a time. Calling the subprogram again before `end_replay_schedule` will raise an error.
- Prerequisites:
 - The workload capture was already processed using the [PROCESS_CAPTURE Procedure](#) in the same database version.
 - The user must have copied the capture directory appropriately.
 - The database is not in replay mode.
 - The [SET_REPLAY_DIRECTORY Procedure](#) has already been called.

198.3.6 CALIBRATE Function

This function operates on a processed workload capture directory to estimate the number of hosts and workload replay clients needed to faithfully replay the given workload. This function returns the results as an XML CLOB.

Syntax

```
DBMS_WORKLOAD_REPLAY.CALIBRATE (
    capture_dir          IN VARCHAR2,
    process_per_cpu     IN BINARY_INTEGER DEFAULT 4,
    threads_per_process IN BINARY_INTEGER DEFAULT 50)
RETURN CLOB;
```

Parameters

Table 198-7 CALIBRATE Function Parameters

| Parameter | Description |
|---------------------|--|
| capture_dir | Name of the directory object that points to the (case sensitive) OS directory that contains processed capture data |
| process_per_cpu | Maximum number of processes allowed for each CPU (default is 4) |
| threads_per_process | Maximum number of threads allowed for each process (default is 50) |

Return Values

Returns a CLOB formatted as XML that contains:

- Information about the capture
- Current database version
- Input parameters to this function
- Number of CPUs and replay clients needed to replay the given workload
- Information about the sessions captured (total number and maximum concurrency)

Usage Notes

- Prerequisite: The input workload capture was already processed using the [PROCESS_CAPTURE Procedure](#) in the same database version.
- This procedure will return the same results as the workload replay client in calibrate mode, which can be run as follows.

```
$ wrc mode=calibrate replaydir=
```

198.3.7 CANCEL_REPLAY Procedure

This procedure cancels workload replay in progress. All the external replay clients (WRC) will automatically be notified to stop issuing the captured workload and exit.

Syntax

```
DBMS_WORKLOAD_REPLAY.CANCEL_REPLAY (
    error_msg    IN VARCHAR2 DEFAULT NULL);
```

Parameters

Table 198-8 CANCEL_REPLAY Procedure Parameters

| Parameter | Description |
|-----------|---|
| error_msg | An optional reason for cancelling the replay can be passed which is recorded into DBA_WORKLOAD_REPLAYS.ERROR_MESSAGE. |

Usage Notes

Prerequisite: A call to the [INITIALIZE_REPLAY Procedure](#), or [PREPARE_REPLAY Procedure](#), or [START_REPLAY Procedure](#) was already issued.

198.3.8 COMPARE_PERIOD_REPORT Procedure

This procedure generates a report comparing a replay to its capture or to another replay of the same capture.

Syntax

```
DBMS_WORKLOAD_REPLAY.COMPARE_PERIOD_REPORT (
    replay_id1    IN    NUMBER,
    replay_id2    IN    NUMBER,
    format        IN    VARCHAR2,
    result        OUT   CLOB );
```

Parameters

Table 198-9 COMPARE_PERIOD_REPORT Procedure Parameters

| Parameter | Description |
|------------|--|
| replay_id1 | First ID of the workload replay whose report is requested |
| replay_id2 | Second ID of the workload replay whose report is requested. If this is NULL, then the comparison is done with the capture. |
| format | Specifies the report format. Valid values are DBMS_WORKLOAD_CAPTURE.TYPE_HTML and DBMS_WORKLOAD_CAPTURE.TYPE_XML. |
| result | Output of the report (CLOB) |

198.3.9 COMPARE_SQLSET_REPORT Function

This procedure generates a report comparing a sqlset captured during replay to one captured during workload capture or to one captured during another replay of the same capture.

Syntax

```
DBMS_WORKLOAD_REPLAY.COMPARE_SQLSET_REPORT (
    replay_id1    IN NUMBER,
    replay_id2    IN NUMBER,
    format        IN VARCHAR2,
    r_level       IN VARCHAR2 DEFAULT 'ALL',
    r_sections    IN VARCHAR2 DEFAULT 'ALL',
    result        OUT CLOB )
RETURN VARCHAR2;
```

Parameters

Table 198-10 COMPARE_SQLSET_REPORT Function Parameters

| Parameter | Description |
|------------|--|
| replay_id1 | First ID of the workload replay after a change |
| replay_id2 | Second ID of the workload replay before a change. If this is NULL, then the comparison is done with the capture. |
| format | Specifies the report format. Valid values are DBMS_WORKLOAD_CAPTURE.TYPE_HTML, DBMS_WORKLOAD_CAPTURE.TYPE_XML and DBMS_WORKLOAD_CAPTURE.TYPE_TEXT. |
| r_level | See level parameter in the REPORT_ANALYSIS_TASK Function in the DBMS_SQLPA package |
| r_sections | See section parameter in the REPORT_ANALYSIS_TASK Function in the DBMS_SQLPA package |
| result | Output of the report (CLOB) |

198.3.10 CREATE_FILTER_SET Procedure

This procedure creates a new filter set for the replays at `replay_dir`.

It includes all the replay filters that have already been added by the [ADD_FILTER Procedure](#). After the procedure has completed and replay initiated, the newly-created filter set can be used to filter the replay in `replay_dir` by calling the [USE_FILTER_SET Procedure](#).

Syntax

```
DBMS_WORKLOAD_REPLAY.CREATE_FILTER_SET(  
    replay_dir      IN  VARCHAR2,  
    filter_set      IN  VARCHAR2,  
    default_action  IN  VARCHAR2 DEFAULT 'INCLUDE');
```

Parameters

Table 198-11 CREATE_FILTER_SET Procedure Parameters

| Parameter | Description |
|-----------------------------|---|
| <code>replay_dir</code> | Object directory of the replay to be filtered |
| <code>filter_set</code> | Name of the filter set to create (to use in USE_FILTER_SET Procedure) |
| <code>default_action</code> | <p>Can be either <code>INCLUDE</code> or <code>EXCLUDE</code>. Determines whether, by default, every captured call must be replayed or not. Also determines whether the workload filters specified must be considered as <code>INCLUSION</code> filters or <code>EXCLUSION</code> filters.)</p> <p>If it is <code>INCLUDE</code>, then by default all captured calls are replayed, except for the part of the workload defined by the filters. In this case, all the filters that were specified using the ADD_SCHEDULE_ORDERING Function are treated as <code>EXCLUSION</code> filters, and will determine the workload that will not be replayed.</p> <p>If it is <code>EXCLUDE</code>, then by default no captured call to the database is replayed, except for the part of the workload defined by the filters. In this case, all the filters that were specified using the ADD_SCHEDULE_ORDERING Function are treated as <code>INCLUSION</code> filters, and will determine the workload that is replayed.</p> <p>Default: <code>INCLUDE</code> and all the filters specified are assumed to be <code>EXCLUSION</code> filters</p> |

Usage Notes

This operation must be invoked when no replay is initialized, prepared, or in progress.

198.3.11 DELETE_FILTER Procedure

This procedure deletes the named filter.

Syntax

```
DBMS_WORKLOAD_REPLAY.DELETE_FILTER(  
    fname      IN  VARCHAR2);
```

Parameters

Table 198-12 DELETE_FILTER Procedure Parameters

| Parameter | Description |
|-----------|---|
| fname | (Mandatory) Name of the filter that must be deleted |

Usage Notes

The `DELETE_FILTER` Procedure only affects filters that have not been used by any previous capture. Consequently, filters can be deleted only if they have been added using the [ADD_FILTER Procedures](#) after any capture has been completed. Filters that have been added using `ADD_FILTER` before a `START_CAPTURE` and `FINISH_CAPTURE` cannot be deleted anymore using this subprogram.

198.3.12 DELETE_REPLAY_INFO Procedure

This procedure deletes the rows in `DBA_WORKLOAD_REPLAYS` that correspond to the given workload replay ID.

Syntax

```
DBMS_WORKLOAD_REPLAY.DELETE_REPLAY_INFO (
    replay_id    IN NUMBER);
```

Parameters

Table 198-13 DELETE_REPLAY_INFO Procedure Parameters

| Parameter | Description |
|-----------|---|
| replay_id | (Mandatory) ID of the workload replay that must be deleted. Corresponds to <code>DBA_WORKLOAD_REPLAYS.ID</code> |

198.3.13 END_REPLAY_SCHEDULE Procedure

This procedure wraps up the creation of the current schedule. The schedule is now saved and associated with the replay directory and can be used for a replay.

Syntax

```
DBMS_WORKLOAD_REPLAY.END_REPLAY_SCHEDULE;
```

Usage Notes

The [BEGIN_REPLAY_SCHEDULE Procedure](#) must have already been called.

198.3.14 EXPORT_AWR Procedure

This procedure exports the AWR snapshots associated with a stipulated replay ID.

Syntax

```
DBMS_WORKLOAD_REPLAY.EXPORT_AWR (
    replay_id    IN NUMBER);
```

Parameters

Table 198-14 EXPORT_AWR Function Parameters

| Parameter | Description |
|-----------|---|
| replay_id | (Mandatory) ID of the replay whose AWR snapshots are to be exported |

Usage Notes

- At the end of each replay, the corresponding AWR snapshots are automatically exported. Consequently, there is no need to do this manually after a workload replay is complete, unless the automatic `EXPORT_AWR` invocation failed.
- This procedure will work only if the corresponding workload replay was performed in the current database (meaning that the corresponding row in `DBA_WORKLOAD_REPLAYS` was not created by calling the [GET_REPLAY_INFO Function](#)) and the AWR snapshots that correspond to that replay time period are still available.

198.3.15 GENERATE_CAPTURE_SUBSET Procedure

This procedure creates a new capture from an existing workload capture.

Syntax

```
DBMS_WORKLOAD_REPLAY.GENERATE_CAPTURE_SUBSET (
    input_capture_dir    IN VARCHAR2,
    output_capture_dir   IN VARCHAR2,
    new_capture_name     IN VARCHAR2,
    begin_time           IN NUMBER,
    begin_include_incomplete IN BOOLEAN DEFAULT TRUE,
    end_time             IN NUMBER,
    end_include_incomplete IN BOOLEAN DEFAULT FALSE,
    parallel_level       IN NUMBER DEFAULT NULL);
```

Parameters

Table 198-15 GENERATE_CAPTURE_SUBSET Procedure Parameters

| Parameter | Description |
|--------------------|--|
| input_capture_dir | (Mandatory) Name of the directory object that points to an existing workload capture |
| output_capture_dir | (Mandatory) Name of the directory object that points to the new capture |

Table 198-15 (Cont.) GENERATE_CAPTURE_SUBSET Procedure Parameters

| Parameter | Description |
|---------------------------------------|---|
| <code>new_capture_name</code> | (Mandatory) Name of new capture |
| <code>begin_time</code> | Start of the time range - time offset in seconds from the start of a workload capture |
| <code>begin_include_incomplete</code> | Column to include incomplete calls caused by <code>begin_time</code> |
| <code>end_time</code> | End of the time range - time offset in seconds from the start of a workload capture. If <code>end_time</code> is zero or <code>end_time</code> is less or equal than <code>begin_time</code> , the time range is invalid. The new capture will use the whole duration of the input capture. |
| <code>end_include_incomplete</code> | Column to include incomplete calls caused by <code>end_time</code> |
| <code>parallel_level</code> | Number of Oracle processes used to process the input captures in a parallel fashion. The <code>NULL</code> default value will auto-compute the parallelism level based on number of CPUs, whereas a value of 1 will enforce serial execution. |

198.3.16 GET_DIVERGING_STATEMENT Function

This function retrieves information about a diverging call, including the statement text, the SQL ID, and the binds. If the replay of a recorded user call has data or error divergence, it is a diverging call.

Syntax

```
DBMS_WORKLOAD_REPLAY.GET_DIVERGING_STATEMENT (
    replay_id    IN NUMBER,
    stream_id    IN NUMBER,
    call_counter IN NUMBER)
RETURN CLOB;
```

Parameters

Table 198-16 GET_DIVERGING_STATEMENT Function Parameters

| Parameter | Description |
|---------------------------|--|
| <code>replay_id</code> | ID of the replay in which that call diverged |
| <code>stream_id</code> | Stream ID of the diverging call |
| <code>call_counter</code> | Call counter of the diverging call |

Usage Notes

- Returns a `CLOB` formatted as XML that contains:
 - SQL ID
 - SQL Text
 - Bind information: position, name and value
- This function will silently invoke the [POPULATE_DIVERGENCE Procedure](#) to read the information from the capture files. Therefore, if divergence has not been

populated, then the first call to this function for a particular diverging call might take longer, especially in very large captures.

198.3.17 GET_REPLAY_DIRECTORY Function

This function returns the current replay directory set by the SET_REPLAY_DIRECTORY Procedure. It returns NULL if no replay directory has been set.

Syntax

```
DBMS_WORKLOAD_REPLAY.GET_REPLAY_DIRECTORY
RETURN VARCHAR2;
```

Related Topics

- [SET_REPLAY_DIRECTORY Procedure](#)
This procedure sets a directory that contains multiple workload captures as the current replay directory.

198.3.18 GET_REPLAY_INFO Function

This function retrieves information about the workload capture and the history of all the workload replay attempts from the stipulated directory.

Syntax

```
DBMS_WORKLOAD_REPLAY.GET_REPLAY_INFO (
    replay_dir    IN VARCHAR2,
    load_details  IN BOOLEAN DEFAULT FALSE)
RETURN NUMBER;
```

Parameters

Table 198-17 GET_REPLAY_INFO Function Parameters

| Parameter | Description |
|--------------|--|
| replay_dir | (Mandatory) Name of the workload replay directory object (case sensitive). |
| load_details | Load the divergence and tracked commits data. The default value is FALSE. |

Return Values

The procedure returns the CAPTURE_ID, which can be associated with both DBA_WORKLOAD_CAPTURES.ID and DBA_WORKLOAD_REPLAYS.CAPTURE_ID to access the imported information.

Usage Notes

- The procedure first imports a row into DBA_WORKLOAD_CAPTURES which will contain information about the capture. It then imports a row for every replay attempt retrieved from the given replay directory into DBA_WORKLOAD_REPLAYS.

- The procedure will not insert new rows to DBA_WORKLOAD_CAPTURES and DBA_WORKLOAD_REPLAYS if these views already contain rows describing the capture and replay history present in the given directory.

198.3.19 GET_REPLAY_TIMEOUT Procedure

This procedure gets the replay timeout setting.

Syntax

```
DBMS_WORKLOAD_REPLAY.GET_REPLAY_TIMEOUT (
    enabled      OUT  BOOLEAN,
    min_delay    OUT  NUMBER,
    max_delay    OUT  NUMBER,
    delay_factor OUT  NUMBER);
```

Parameters

Table 198-18 GET_REPLAY_TIMEOUT Procedure Parameters

| Parameter | Description |
|--------------|--|
| enabled | TRUE if the timeout action is enabled, FALSE otherwise. |
| min_delay | Lower bound of call delay in minutes. The replay action is activated only when the delay is equal to or more than min_delay. |
| max_delay | Upper bound of call delay in minutes. The timeout action throws ORA-15569 when the delay is more than max_delay. |
| delay_factor | Factor for the call delay that is between min_delay and max_delay. The timeout action throws ORA-15569 when the current replay elapsed time is more than the product of capture elapsed time and delay_factor. |

Usage Notes

This procedure can be called anytime during replay.

198.3.20 IMPORT_AWR Function

This procedure imports the AWR snapshots from a given replay.

Syntax

```
DBMS_WORKLOAD_REPLAY.IMPORT_AWR (
    replay_id      IN  NUMBER,
    staging_schema IN  VARCHAR2)
RETURN NUMBER;
```

Parameters

Table 198-19 IMPORT_AWR Function Parameters

| Parameter | Description |
|----------------|--|
| replay_id | (Mandatory) ID of the replay whose AWR snapshots must be imported |
| staging_schema | (Mandatory) Name of a valid schema in the current database which can be used as a staging area while importing the AWR snapshots from the replay directory to the SYS AWR schema. The SYS schema is not a valid input. |

Return Values

Returns the new randomly generated database ID that was used to import the AWR snapshots. The same value can be found in the AWR_DBID column in the DBA_WORKLOAD_REPLAYS view.

Usage Notes

- This procedure will work provided those AWR snapshots were exported earlier from the original replay system using the [EXPORT_AWR Procedure](#).
- IMPORT_AWR will fail if the staging_schema provided as input contains any tables with the same name as any of the AWR tables, such as WRM\$_SNAPSHOT or WRH\$_PARAMETER. Drop any such tables in the staging_schema before invoking IMPORT_AWR.

198.3.21 INITIALIZE_CONSOLIDATED_REPLAY Procedure

This procedure puts the database state in INIT for a multiple-capture replay.

It uses the replay_dir which has already been defined by the [SET_REPLAY_DIRECTORY Procedure](#), pointing to a directory that contains all the capture directories involved in the schedule. It reads data about schedule schedule_name from the directory, and loads required connection data into the replay system.

Syntax

```
DBMS_WORKLOAD_REPLAY.INITIALIZE_CONSOLIDATED_REPLAY (
    replay_name      IN    VARCHAR2,
    schedule_name    IN    VARCHAR2,
    plsqli_mode      IN    VARCHAR2 DEFAULT 'TOP_LEVEL');
```

Parameters

Table 198-20 INITIALIZE_CONSOLIDATED_REPLAY Procedure Parameters

| Parameter | Description |
|---------------|---|
| replay_name | (Mandatory) Name of the workload replay. Every replay of a processed workload capture can be given a name. |
| schedule_name | Name of the schedule to be replayed. It must have been created through the BEGIN_REPLAY_SCHEDULE Procedure for the replay directory replay_dir. |

Table 198-20 (Cont.) INITIALIZE_CONSOLIDATED_REPLAY Procedure Parameters

| Parameter | Description |
|------------|--|
| plsql_mode | Specifies the replay options for PL/SQL calls: <ul style="list-style-type: none"> • TOP_LEVEL — only top-level PL/SQL calls are replayed • EXTENDED — SQL executed from PL/SQL or top-level SQL PL/SQL if there is no SQL recorded inside the PL/SQL are replayed. All captures must have been done in 'EXTENDED' PL/SQL mode. |

Usage Notes

Prerequisites:

- Workload capture was already processed using the [PROCESS_CAPTURE Procedure](#) in the same database version.
- Database state has been logically restored to what it was at the beginning of the original workload capture.
- The [SET_REPLAY_DIRECTORY Procedure](#) has been called.

198.3.22 INITIALIZE_REPLAY Procedure

This procedure puts the database state in INIT for REPLAY mode, and loads data into the replay system that is required before preparing for the replay (by executing the PAUSE_REPLAY Procedure).

Syntax

```
DBMS_WORKLOAD_REPLAY.INITIALIZE_REPLAY (
    replay_name      IN  VARCHAR2,
    replay_dir       IN  VARCHAR2,
    plsqli_mode      IN  VARCHAR2 DEFAULT 'TOP_LEVEL',
    rac_inst_list    IN  VARCHAR2 DEFAULT NULL);
```

Parameters

Table 198-21 INITIALIZE_REPLAY Procedure Parameters

| Parameter | Description |
|-------------|--|
| replay_name | (Mandatory) Name of the workload replay. Every replay of a processed workload capture can be given a name. |
| replay_dir | Name of the directory object that points to the OS directory (case sensitive) that contains processed capture data |
| plsqli_mode | Specifies the replay options for PL/SQL calls: <ul style="list-style-type: none"> • TOP_LEVEL — only top-level PL/SQL calls are replayed • EXTENDED — SQL executed from PL/SQL or top-level SQL PL/SQL if there is no SQL recorded inside the PL/SQL are replayed. All captures must have been done in 'EXTENDED' PL/SQL mode. |

Table 198-21 (Cont.) INITIALIZE_REPLAY Procedure Parameters

| Parameter | Description |
|----------------------------|--|
| <code>rac_inst_list</code> | Specifies a list of Oracle Real Application Clusters (Oracle RAC) instances that will be used for replay. The parameter is a string of instance numbers that are separated by commas. For example: <code>rac_inst_list='1,3,5'</code> |

Usage Notes

- Prerequisites:
 - Workload capture was already processed using the [PROCESS_CAPTURE Procedure](#) in the same database version.
 - Database state has been logically restored to what it was at the beginning of the original workload capture.
- The subprogram loads data into the replay system that is required before preparing for the replay by calling the `PAUSE_REPLAY` Procedure.

For instance, during capture the user may record the connection string each session used to connect to the server. The `INITIALIZE_REPLAY` Procedure loads this data and allows the user to re-map the recorded connection string to new connection strings or service points.

Elaborating on the example described in the `PROCESS_CAPTURE` Procedure, the user could invoke the following:

```
DBMS_WORKLOAD_REPLAY.INITIALIZE_REPLAY('replay foo #1', 'rec_dir');
```

This command will load up the connection map and by default will set all replay time connection strings to be equal to `NULL`. A `NULL` replay time connection string means that the workload replay clients (WRCs) will connect to the default host as determined by the replay client's runtime environment settings. The user can change a particular connection string to a new one (or a new service point) for replay by using the `REMAP_CONNECTION` Procedure.

- For encrypted capture, the `INITIALIZE_REPLAY` Procedure relies on Oracle wallet. The identifier is `oracle.rat.database_replay.encryption` (case-sensitive).

Related Topics

- [PAUSE_REPLAY Procedure](#)
This procedure pauses the in-progress workload replay.
- [INITIALIZE_REPLAY Procedure](#)
This procedure puts the database state in `INIT` for `REPLAY` mode, and loads data into the replay system that is required before preparing for the replay (by executing the `PAUSE_REPLAY` Procedure).
- [PROCESS_CAPTURE Procedure](#)
This procedure processes the workload capture found in `capture_dir` in place.
- [REMAP_CONNECTION Procedure](#)
This procedure remaps the captured connection to a new one so that the user sessions can connect to the database in a desired way during workload replay.

198.3.23 IS_REPLAY_PAUSED Function

This function reports whether the replay is currently paused.

Syntax

```
DBMS_WORKLOAD_REPLAY.IS_REPLAY_PAUSED  
    RETURN BOOLEAN;
```

Return Values

Returns `TRUE` if the [PAUSE_REPLAY Procedure](#) has been called successfully and the [RESUME_REPLAY Procedure](#) has not been called yet.

Usage Notes

A call to the [START_REPLAY Procedure](#) must have already been issued as a prerequisite.

198.3.24 LOAD_LONG_SQLTEXT Procedure

This procedure loads the captured SQL statements that are longer than 1000 characters to the `DBA_WORKLOAD_LONG_SQLTEXT` view.

Syntax

```
DBMS_WORKLOAD_REPLAY.LOAD_LONG_SQLTEXT (  
    capture_id    IN NUMBER);
```

Parameters

Table 198-22 LOAD_LONG_SQLTEXT Procedure Parameters

| Parameter | Description |
|------------|---------------------------------------|
| capture_id | Internal key for the workload capture |

Note:

This procedure is available starting with Oracle Database Release 18c.

See Also:

`DBA_WORKLOAD_LONG_SQLTEXT` in *Oracle Database Reference*

198.3.25 PAUSE_REPLAY Procedure

This procedure pauses the in-progress workload replay.

All subsequent user calls from the replay clients will be stalled until either a call to the [RESUME_REPLAY Procedure](#) is issued or the replay is cancelled.

Syntax

```
DBMS_WORKLOAD_REPLAY.PAUSE_REPLAY;
```

Usage Notes

- Prerequisite: A call to the [START_REPLAY Procedure](#) must have already been issued.
- User calls that were already in-progress when this procedure was invoked are allowed to run to completion. Only subsequent user calls, when issued, are paused.

198.3.26 POPULATE_DIVERGENCE Procedure

This procedure precomputes the divergence information for the given call, stream, or the whole replay so that the [GET_DIVERGING_STATEMENT](#) Function returns as quickly as possible for the precomputed calls.

Syntax

```
DBMS_WORKLOAD_REPLAY.POPULATE_DIVERGENCE (
  replay_id   IN   NUMBER,
  stream_id   IN   NUMBER DEFAULT NULL,
  call_counter IN  NUMBER DEFAULT NULL);
```

Parameters

Table 198-23 POPULATE_DIVERGENCE Procedure Parameters

| Parameter | Description |
|--------------|--|
| replay_id | ID of the replay |
| stream_id | Stream ID of the diverging call. If NULL is provided, then divergence information is precomputed for all diverging calls in the given replay. |
| call_counter | Call counter of the diverging call. If NULL is provided, then divergence information is precomputed for all diverging calls in the given stream. |

Related Topics

- [GET_DIVERGING_STATEMENT Function](#)
This function retrieves information about a diverging call, including the statement text, the SQL ID, and the binds. If the replay of a recorded user call has data or error divergence, it is a diverging call.

198.3.27 PREPARE_CONSOLIDATED_REPLAY Procedure

Similar to the `PREPARE_REPLAY` Procedure, this procedure puts the database in a special "Prepare" mode for a multiple-capture replay. The difference is that this subprogram should be used only for consolidated replays.

Syntax

```
DBMS_WORKLOAD_REPLAY.PREPARE_CONSOLIDATED_REPLAY (
    synchronization          IN BOOLEAN,
    connect_time_scale      IN NUMBER    DEFAULT 100,
    think_time_scale        IN NUMBER    DEFAULT 100,
    think_time_auto_correct IN BOOLEAN   DEFAULT TRUE,
    capture_sts             IN BOOLEAN   DEFAULT FALSE,
    sts_cap_interval        IN NUMBER    DEFAULT 300);
```

```
DBMS_WORKLOAD_REPLAY.PREPARE_CONSOLIDATED_REPLAY (
    synchronization          IN VARCHAR2  DEFAULT 'OBJECT_ID',,
    connect_time_scale      IN NUMBER    DEFAULT 100,
    think_time_scale        IN NUMBER    DEFAULT 100,
    think_time_auto_correct IN BOOLEAN   DEFAULT TRUE,
    capture_sts             IN BOOLEAN   DEFAULT FALSE,
    sts_cap_interval        IN NUMBER    DEFAULT 300);
```

Parameters

Table 198-24 PREPARE_CONSOLIDATED_REPLAY Procedure Parameters

| Parameter | Description |
|------------------------------|---|
| <code>synchronization</code> | <p>Sets the synchronization mode for replay:</p> <ul style="list-style-type: none"> <code>'TIME'</code> — The synchronization will be based on the time the action took place during capture (clock-based time). <code>'SCN'</code> — The synchronization will be based on the capture-time commits; the commit order will be preserved during replay. This is the default mode. <code>'OBJECT_ID'</code> — Every replayed action will be executed only <i>after</i> the relevant commits have finished execution. The relevant commits are those that were issued before the given action in the captured workload and that modified at least one of the database objects the given action is referencing (either implicitly or explicitly). This synchronization mode makes sure that any replay action will see the same data that the action saw during capture, but allows greater concurrency for the actions that do not touch the same objects/tables. <p>This value is deprecated.</p> <p>For compatibility, an overloaded version of this procedure uses <code>BOOLEAN</code> for this parameter:</p> <ul style="list-style-type: none"> <code>TRUE</code> means <code>'SCN'</code> <code>FALSE</code> means <code>'TIME'</code> |

Table 198-24 (Cont.) PREPARE_CONSOLIDATED_REPLAY Procedure Parameters

| Parameter | Description |
|--------------------------------------|--|
| <code>connect_time_scale</code> | Scales the time elapsed between the instant the workload capture was started and the session connects with the given value. The input is interpreted as a % value. Can potentially be used to increase or decrease the number of concurrent users during the workload replay. DEFAULT VALUE is 100. See " Example 198-1 ". |
| <code>think_time_scale</code> | Scales the time elapsed between two successive user calls " Example 198-1 " from the same session. The input is interpreted as a % value. Can potentially be used to increase or decrease the number of concurrent users during the workload replay. DEFAULT VALUE is 100. See " Example 198-2 ". |
| <code>think_time_auto_correct</code> | Auto corrects the think time between calls appropriately when user calls takes longer to complete during replay than during the original capture. DEFAULT is TRUE which is to reduce think time if replay goes slower than capture. See " Example 198-3 ". |
| <code>capture_sts</code> | If this parameter is TRUE, then a SQL tuning set capture is also started in parallel with workload replay. The resulting SQL tuning set can be exported using the EXPORT_AWR Procedure along with the Automatic Workload Repository (AWR) data. Currently, parallel SQL tuning set (STS) capture is not supported in an Oracle RAC environment. So, this parameter has no effect in that context. The calling user must have the appropriate privileges ('ADMINISTER SQL TUNING SET'). The default value is FALSE. |
| <code>sts_cap_interval</code> | Specifies the capture interval of the SQL set capture from the cursor cache in seconds. The default value is 300. |

Usage Notes

A consolidated replay replays multiple captures in one replay. Each capture records different system change number (SCN) values. For this reason SCN-based sync is not supported for consolidated replays. Consolidated replays only support non-sync mode and the Object-ID based synchronization, and SCN-based synchronization is currently not supported.

Related Topics

- [PREPARE_REPLAY Procedure](#)
This procedure puts the database state in `PREPARE FOR REPLAY` mode.

198.3.28 PREPARE_REPLAY Procedure

This procedure puts the database state in `PREPARE FOR REPLAY` mode.

Syntax

```
DBMS_WORKLOAD_REPLAY.PREPARE_REPLAY (
  synchronization          IN BOOLEAN   DEFAULT TRUE,
  connect_time_scale       IN NUMBER     DEFAULT 100,
  think_time_scale         IN NUMBER     DEFAULT 100,
  think_time_auto_correct  IN BOOLEAN   DEFAULT TRUE,
  scale_up_multiplier      IN NUMBER     DEFAULT 1,
```

```

capture_sts          IN BOOLEAN  DEFAULT FALSE,
sts_cap_interval     IN NUMBER   DEFAULT 300,
rac_mode            IN NUMBER   DEFAULT GLOBAL_SYNC,
query_only          IN BOOLEAN  DEFAULT FALSE);

DBMS_WORKLOAD_REPLAY.PREPARE_REPLAY (
synchronization     IN VARCHAR2  DEFAULT 'OBJECT_ID',
connect_time_scale  IN NUMBER   DEFAULT 100,
think_time_scale    IN NUMBER   DEFAULT 100,
think_time_auto_correct IN BOOLEAN  DEFAULT TRUE,
scale_up_multiplier IN NUMBER   DEFAULT 1,
capture_sts         IN BOOLEAN  DEFAULT FALSE,
sts_cap_interval     IN NUMBER   DEFAULT 300),
rac_mode            IN NUMBER   DEFAULT GLOBAL_SYNC,
query_only          IN BOOLEAN  DEFAULT FALSE);

```

Parameters

Table 198-25 PREPARE_REPLAY Procedure Parameters

| Parameter | Description |
|--------------------|---|
| synchronization | <p>Sets the synchronization mode for replay:</p> <ul style="list-style-type: none"> 'TIME' — The synchronization will be based on the time the action took place during capture (clock-based time). 'SCN' — The synchronization will be based on the capture-time commits; the commit order will be preserved during replay. This is the default mode. 'OBJECT_ID' — Every replayed action will be executed only <i>after</i> the relevant commits have finished execution. The relevant commits are those that were issued before the given action in the captured workload and that modified at least one of the database objects the given action is referencing (either implicitly or explicitly). This synchronization mode makes sure that any replay action will see the same data that the action saw during capture, but allows greater concurrency for the actions that do not touch the same objects/tables. <p>This value is deprecated.</p> <p>For compatibility, an overloaded version of this procedure uses BOOLEAN for this parameter:</p> <ul style="list-style-type: none"> TRUE means 'SCN' FALSE means 'TIME' |
| connect_time_scale | <p>Scales the time elapsed between the instant the workload capture was started and the session connects with the given value. The input is interpreted as a % value. Can potentially be used to increase or decrease the number of concurrent users during the workload replay. DEFAULT VALUE is 100. See "Example 198-1".</p> |
| think_time_scale | <p>Scales the time elapsed between two successive user calls from the same session. The input is interpreted as a % value. Can potentially be used to increase or decrease the number of concurrent users during the workload replay. DEFAULT VALUE is 100. See "Example 198-2".</p> |

Table 198-25 (Cont.) PREPARE_REPLAY Procedure Parameters

| Parameter | Description |
|--------------------------------------|--|
| <code>think_time_auto_correct</code> | Auto corrects the think time between calls appropriately when a user call takes longer to complete during replay than during the original capture. <code>DEFAULT</code> is <code>TRUE</code> which is to reduce think time if replay goes slower than capture. See "Example 198-3". |
| <code>scale_up_multiplier</code> | Defines the number of times the query workload is scaled up during replay. Each captured session is replayed concurrently as many times as the value of the <code>scale_up_multiplier</code> . However, only one of the sessions in each set of identical replay sessions executes both queries and updates. The remaining sessions only execute queries. |
| <code>capture_sts</code> | If this parameter is <code>TRUE</code> , then a SQL tuning set capture is also started in parallel with workload replay. The resulting SQL tuning set can be exported using the EXPORT_AWR Procedure along with the AWR data. Currently, parallel SQL tuning set (STS) capture is not supported in an Oracle RAC environment. So, this parameter has no effect in that context. The calling user must have the appropriate privileges (<code>ADMINISTER SQL TUNING SET</code>). The default value is <code>FALSE</code> . |
| <code>sts_cap_interval</code> | Specifies the capture interval of the SQL set capture from the cursor cache in seconds. The default value is 300. |
| <code>rac_mode</code> | Specifies replay options in an Oracle Real Application Cluster (Oracle RAC) environment. This parameter accepts the following values: <ul style="list-style-type: none"> <code>GLOBAL_SYNC</code> — Synchronization across all Oracle RAC instances. This is the default value. <code>PER_INSTANCE_CLIENT</code> — Synchronization is global and each WRC client handles part of the workload that is sent to only one instance. <code>PER_INSTANCE_SYNC</code> — Synchronization is local (within each instance only) and each WRC client handles part of the workload that is sent to only one instance |
| <code>query_only</code> | Replays only the read-only queries of the workload capture. The default value is <code>FALSE</code> . |

Usage Notes

- Prerequisites:
 - The database has been initialized for replay using the [INITIALIZE_REPLAY Procedure](#).
 - Any capture time connection strings that require remapping have been already done using the [REMAP_CONNECTION Procedure](#).
- One or more external replay clients (WRC) can be started once the `PREPARE_REPLAY` procedure has been executed.
- With regard to `scale_up_multiplier`:
 - One replay session (base session) of each set of identical sessions will replay every call from the capture as usual.

- The remaining sessions (scale-up sessions) will only replay calls that are read-only. Thus, DDL, DML, and PL/SQL calls that modified the database is skipped. `SELECT FOR UPDATE` statements are also skipped.
- Read-only calls from the scale-up are synchronized appropriately and obey the timings defined by `think_time_scale`, `connect_time_scale`, and `think_time_auto_correct`. Also, the queries are made to wait for the appropriate commits.
- No replay data or error divergence records are generated for the scale-up sessions.
- All base or scale-up sessions that replay the same capture file will connect from the same workload replay client.

Example 198-1 Application of the `connect_time_scale` Parameter

If the following was observed during the original workload capture:

```
12:00 : Capture was started
12:10 : First session connect (10m after)
12:30 : Second session connect (30m after)
12:42 : Third session connect (42m after)
```

If the `connect_time_scale` is 50, then the session connects will happen as follows:

```
12:00 : Replay was started with 50% connect time scale
12:05 : First session connect ( 5m after)
12:15 : Second session connect (15m after)
12:21 : Third session connect (21m after)
```

If the `connect_time_scale` is 200, then the session connects will happen as follows:

```
12:00 : Replay was started with 200% connect time scale
12:20 : First session connect (20m after)
13:00 : Second session connect (60m after)
13:24 : Third session connect (84m after)
```

Example 198-2 Application of the `think_time_scale` Parameter

If the following was observed during the original workload capture:

```
12:00 : User SCOTT connects
12:10 : First user call issued (10m after completion of prevcall)
12:14 : First user call completes in 4mins
12:30 : Second user call issued (16m after completion of prevcall)
12:40 : Second user call completes in 10m
12:42 : Third user call issued ( 2m after completion of prevcall)
12:50 : Third user call completes in 8m
```

If the `think_time_scale` is 50 during the workload replay, then the user calls will look something like below:

```
12:00 : User SCOTT connects
12:05 : First user call issued 5 mins (50% of 10m) after the completion of
       previous call
12:10 : First user call completes in 5m (takes a minute longer)
12:18 : Second user call issued 8 mins (50% of 16m) after the completion of prev
       call
12:25 : Second user call completes in 7m (takes 3 minutes less)
12:26 : Third user call issued 1 min (50% of 2m) after the completion of prev
```

```

call
12:35 : Third user call completes in 9m (takes a minute longer)

```

Example 198-3 Application of the think_time_auto_correct Parameter

If the following was observed during the original workload capture:

```

12:00 : User SCOTT connects
12:10 : First user call issued (10m after completion of prevcall)
12:14 : First user call completes in 4m
12:30 : Second user call issued (16m after completion of prevcall)
12:40 : Second user call completes in 10m
12:42 : Third user call issued ( 2m after completion of prevcall)
12:50 : Third user call completes in 8m

```

If the think_time_scale is 100 and the think_time_auto_correct is TRUE during the workload replay, then the user calls will look something like below:

```

12:00 : User SCOTT connects
12:10 : First user call issued 10 mins after the completion of prev call
12:15 : First user call completes in 5m (takes 1 minute longer)
12:30 : Second user call issued 15 mins (16m minus the extra time of 1m the prev
call took) after the completion of prev call
12:44 : Second user call completes in 14m (takes 4 minutes longer)
12:44 : Third user call issued immediately (2m minus the extra time of 4m the prev
call took) after the completion of prev call
12:52 : Third user call completes in 8m

```

198.3.29 PROCESS_CAPTURE Procedure

This procedure processes the workload capture found in capture_dir in place.

Syntax

```

DBMS_WORKLOAD_REPLAY.PROCESS_CAPTURE (
  capture_dir      IN  VARCHAR2,
  parallel_level   IN  NUMBER DEFAULT NULL,
  synchronization IN  VARCHAR2 DEFAULT 'SCN',
  plsql_mode       IN  VARCHAR2 DEFAULT 'TOP_LEVEL');

```

Parameters

Table 198-26 PROCESS_CAPTURE Procedure Parameters

| Parameter | Description |
|----------------|--|
| capture_dir | (Mandatory) Name of the workload capture directory object (case sensitive). The directory object must point to a valid OS directory that has the appropriate permissions. New files are added to this directory. |
| parallel_level | Number of Oracle processes used to process the capture in parallel. The NULL default value will auto-compute the parallelism level, whereas a value of 1 will enforce serial execution. |

Table 198-26 (Cont.) PROCESS_CAPTURE Procedure Parameters

| Parameter | Description |
|-----------------|---|
| synchronization | <p>Determines the synchronization mode that the user will be able to use for replay:</p> <ul style="list-style-type: none"> 'TIME' — When 'TIME' is selected, the replay can use 'TIME' synchronization mode only. When 'TIME' synchronization mode is used for replay, the synchronization will be based on the time the action took place during capture (clock-based time). 'SCN' — When 'SCN' is selected, the replay can use the 'TIME' or 'SCN' synchronization mode. This is the default. When 'SCN' synchronization mode is used for replay, the synchronization will be based on the capture-time commits; the commit order will be preserved during replay. This is the default mode. 'OBJECT_ID' — When 'OBJECT_ID' is selected, replay can use the 'TIME', 'SCN', or 'OBJECT_ID' synchronization mode. When 'OBJECT_ID' synchronization mode is used for replay, every replayed action will be executed only <i>after</i> the relevant commits have finished execution. The relevant commits are those that were issued before the given action in the captured workload and that modified at least one of the database objects the given action is referencing (either implicitly or explicitly). This synchronization mode makes sure that any replay action will see the same data that the action saw during capture, but allows greater concurrency for the actions that do not touch the same objects/tables. This synchronization mode is deprecated. |
| plsql_mode | <p>Specifies the processing mode for PL/SQL:</p> <ul style="list-style-type: none"> 'TOP_LEVEL' — metadata is generated for top-level PL/SQL calls only; 'TOP_LEVEL' will be the only option for replay. 'EXTENDED' — metadata is generated for both top-level PL/SQL calls and the SQL called from PL/SQL. A new directory ppe_X.X.X.X (where the Xs represent the current Oracle version) is created under the capture root directory. Capture must have been done with this same value for the plsql_mode parameter. Replay can use either 'TOP_LEVEL' or 'EXTENDED'. |

Usage Notes

- This subprogram analyzes the workload capture found in the `capture_dir` and creates new workload replay specific metadata files that are required to replay the given workload capture. It only creates new files and does not modify any files that were originally created during the workload capture. Therefore, this procedure can be run multiple times on the same capture directory, such as when the procedure encounters unexpected errors or is cancelled by the user.
- Once this procedure runs successfully, the `capture_dir` can be used as input to the [INITIALIZE_REPLAY Procedure](#) in order to replay the captured workload present in `capture_dir`.

- Before a workload capture can be replayed in a particular database version, the capture must be processed using `PROCESS_CAPTURE` in the same database version. Once created, a processed workload capture can be used to replay the captured workload multiple times in the same database version.

For example, suppose workload "foo" was captured in `rec_dir` in Oracle database version 10.2.0.5. In order to replay the workload "foo" in version 11.1.0.1 the workload must be processed in version 11.1.0.1. The following procedure must be executed in an 11.1.0.1 database in order to process the capture directory `rec_dir`:

```
DBMS_WORKLOAD_REPLAY.PROCESS_CAPTURE('rec_dir');
```

Now, `rec_dir` contains a valid 11.1.0.1 processed workload capture that can be used to replay the workload "foo" in 11.1.0.1 databases as many times as required.

- For encrypted capture, the `PROCESS_CAPTURE` procedure relies on Oracle wallet. The identifier is `oracle.rat.database_replay.encryption` (case-sensitive).

198.3.30 REMAP_CONNECTION Procedure

This procedure remaps the captured connection to a new one so that the user sessions can connect to the database in a desired way during workload replay.

Syntax

```
DBMS_WORKLOAD_REPLAY.REMAP_CONNECTION (
    connection_id      IN NUMBER,
    replay_connection  IN VARCHAR2);
```

```
DBMS_WORKLOAD_REPLAY.REMAP_CONNECTION (
    capture_number     IN VARCHAR2,
    connection_id      IN NUMBER,
    replay_connection  IN VARCHAR2);
```

Parameters

Table 198-27 REMAP_CONNECTION Procedure Parameters

| Parameter | Description |
|--------------------------------|--|
| <code>capture_number</code> | Pointing to a capture of the current replay schedule |
| <code>connection_id</code> | ID of the connection to be remapped. Corresponds to <code>DBA_WORKLOAD_CONNECTION_MAP.CONN_ID</code> . |
| <code>replay_connection</code> | New connection string to be used during replay |

Usage Notes

- Prior to calling `REMAP_CONNECTION` all replay connection strings are set to `NULL` by default. If a `replay_connection` is `NULL`, then the replay sessions will connect as determined by the replay client's runtime environment. For example, if the environment variable `TNS_ADMIN` is defined and the user does not call the [REMAP_CONNECTION Procedure](#), then the `wrc` executable will connect to the server specified in the `tnsnames.ora` file pointed to by `TNS_ADMIN`.
- A valid `replay_connection` must specify a connect identifier or a service point. See the *Oracle Database Net Services Reference* for ways to specify connect identifiers (such as

net service names, database service names, and net service aliases) and naming methods that can be used to resolve a connect identifier to a connect descriptor.

- An error is returned if no row matches the given `connection_id`.
- Use the `DBA_WORKLOAD_CONNECTION_MAP` view to review all the connection strings that are used by the subsequent workload replay, and also to examine connection string remappings used for previous workload replays.

198.3.31 REMOVE_CAPTURE Procedure

This procedure removes the given capture from the current schedule.

Syntax

```
DBMS_WORKLOAD_REPLAY.REMOVE_CAPTURE (
    schedule_capture_number    IN    NUMBER);
```

Parameters

Table 198-28 REMOVE_CAPTURE Procedure Parameters

| Parameter | Description |
|--------------------------------------|---|
| <code>schedule_capture_number</code> | Unique ID that identifies this capture within this schedule |

198.3.32 REMOVE_SCHEDULE_ORDERING Procedure

This procedure removes an existing schedule order from the current replay schedule.

Together, `schedule_capture_id` and `waitfor_capture_id` form a schedule ordering that previously added by the [ADD_SCHEDULE_ORDERING Function](#) (`schedule_capture_id, waitfor_capture_id`). The order is that replay of capture indicated by `schedule_capture_id` will not start unless the replay of capture indicated by `waitfor_capture_id` finishes.

Syntax

```
DBMS_WORKLOAD_REPLAY.REMOVE_SCHEDULE_ORDERING (
    schedule_capture_id    IN    NUMBER,
    waitfor_capture_id    IN    NUMBER);
```

Parameters

Table 198-29 REMOVE_SCHEDULE_ORDERING Procedure Parameters

| Parameter | Description |
|----------------------------------|---|
| <code>schedule_capture_id</code> | Points to a capture that has been added to the current replay schedule (see procedure description). |
| <code>waitfor_capture_id</code> | Points to a capture that has been added to the current replay schedule. |

Usage Notes

Prerequisites:

- The [BEGIN_REPLAY_SCHEDULE Procedure](#) must have been called.
- The replay schedule order should have already been added using the [ADD_SCHEDULE_ORDERING Function](#).

198.3.33 REPORT Function

This function generates a report on the stipulated workload replay.

Syntax

```
DBMS_WORKLOAD_REPLAY.REPORT (
    replay_id          IN NUMBER,
    format             IN VARCHAR2)
RETURN CLOB;
```

Parameters

Table 198-30 REPORT Function Parameters

| Parameter | Description |
|-----------|--|
| replay_id | (Mandatory) Specifies the ID of the workload replay whose report is requested. |
| format | (Mandatory) Specifies the report format. Valid values: <ul style="list-style-type: none"> • HTML - Generates the HTML version of the report • XML - Generates the XML version of the report • TEXT - Generates the text version of the report |

Return Values

The report body in the desired format returned as a CLOB

198.3.34 RESUME_REPLAY Procedure

This procedure resumes a paused workload replay.

Syntax

```
DBMS_WORKLOAD_REPLAY.RESUME_REPLAY;
```

Usage Notes

Prerequisite: A call to the [PAUSE_REPLAY Procedure](#) must have already been issued.

198.3.35 REUSE_REPLAY_FILTER_SET Procedure

This procedure reuses filters in the specified filter set as if each were added using the [ADD_SCHEDULE_ORDERING Function](#).

Each call adds one filter set, which is a collection of individual filters on various attributes. Also, a new filter rule can be added, and an existing filter can be deleted before invoking the [CREATE_FILTER_SET Procedure](#) to create a new filter set.

Syntax

```
DBMS_WORKLOAD_REPLAY.REUSE_REPLAY_FILTER_SET (
    replay_dir IN VARCHAR2,
    filter_set IN VARCHAR2);
```

Parameters

Table 198-31 REUSE_REPLAY_FILTER_SET Procedure Parameters

| Parameter | Description |
|------------|---|
| replay_dir | Capture ID of the existing filter set with which it is associated |
| filter_set | Name of the filter set to be reused |

Related Topics

- [ADD_SCHEDULE_ORDERING Function](#)
This function adds a schedule order between two captures.

198.3.36 SET_ADVANCED_PARAMETER Procedure

This procedure sets an advanced parameter for replay besides the ones used with the PREPARE_REPLAY Procedure.

The advanced parameters control aspects of the replay that are more specialized. The advanced parameters are reset to their default values after the replay has finished.

Syntax

```
DBMS_WORKLOAD_REPLAY.SET_ADVANCED_PARAMETER (
    pname IN VARCHAR2,
    pvalue IN VARCHAR2);
```

```
DBMS_WORKLOAD_REPLAY.SET_ADVANCED_PARAMETER (
    pname IN VARCHAR2,
    pvalue IN NUMBER);
```

```
DBMS_WORKLOAD_REPLAY.SET_ADVANCED_PARAMETER (
    pname IN VARCHAR2,
    pvalue IN BOOLEAN);
```

Parameters

Table 198-32 SET_ADVANCED_PARAMETER Procedure Parameters

| Parameter | Description |
|-----------|--|
| pname | Name of the parameter (case insensitive) |
| pvalue | Value of the parameter |

Usage Notes

The current parameters and values that can be used are:

'DO_NO_WAIT_COMMITS': (default: FALSE)

This parameter controls whether the `COMMIT` issued by replay sessions is `NOWAIT`. The default value for this parameter is `FALSE`. In this case all the `COMMITs` are issued with the mode they were captured (`wait`, `no-wait`, `batch`, `no-batch`). If the parameter is set to `TRUE`, then all `COMMITs` are issued in `no-wait` mode. This is useful in cases where the replay is becoming noticeably slow because of a high volume of concurrent `COMMITs`. Setting the parameter to `TRUE` will significantly decrease the waits on the 'log file sync' event during the replay with respect to capture.

Related Topics

- [PREPARE_REPLAY Procedure](#)
This procedure puts the database state in `PREPARE FOR REPLAY` mode.

198.3.37 SET_REPLAY_DIRECTORY Procedure

This procedure sets a directory that contains multiple workload captures as the current replay directory.

Syntax

```
DBMS_WORKLOAD_REPLAY.SET_REPLAY_DIRECTORY (
    replay_dir IN VARCHAR2);
```

Parameters

Table 198-33 SET_REPLAY_DIRECTORY Procedure Parameters

| Parameter | Description |
|-------------------------|---|
| <code>replay_dir</code> | Name of the OS directory containing the captures for a workload consolidation |

198.3.38 SET_REPLAY_TIMEOUT Procedure

This procedure sets the replay timeout setting. The purpose is to abort user calls that might make the replay much slower or even cause a replay hang.

Syntax

```
DBMS_WORKLOAD_REPLAY.SET_REPLAY_TIMEOUT (
    enabled OUT BOOLEAN DEFAULT TRUE,
    min_delay OUT NUMBER DEFAULT 10,
    max_delay OUT NUMBER DEFAULT 120,
    delay_factor OUT NUMBER DEFAULT 8);
```

Parameters

Table 198-34 SET_REPLAY_TIMEOUT Procedure Parameters

| Parameter | Description |
|------------------------|--|
| <code>enabled</code> | <code>TRUE</code> to enable the timeout action, and <code>FALSE</code> to disable. |
| <code>min_delay</code> | Lower bound of call delay in minutes. The replay action is activated only when the delay is equal to or more than <code>min_delay</code> . Default = 10. |

Table 198-34 (Cont.) SET_REPLAY_TIMEOUT Procedure Parameters

| Parameter | Description |
|--------------|---|
| max_delay | Upper bound of call delay in minutes. The timeout action throws ORA-15569 when the delay is more than max_delay. Default = 120. |
| delay_factor | Factor for the call delay that is between min_delay and max_delay. The timeout action throws ORA-15569 when the current replay elapsed time is more than the product of capture elapsed time and delay_factor. Default = 8. |

Usage Notes

- This procedure can be called anytime during replay.
- Call delay is defined as the difference between replay and capture if replay elapsed time is longer than call elapsed time.
- Once a replay timeout action is enabled, a user call will exit with ORA-15569 if it has been delayed more than the condition specified by the replay action. The call and its error are reported as error divergence.
- Replay timeout operates as follows:
 - The timeout action has no effect if it is not enabled.
 - If the call delay in minutes is less than a lower bound specified by parameter min_delay, then the timeout action is non-operational.
 - If the delay in minutes is more than an upper bound specified by parameter max_delay, the timeout action will abort the user call and throw ORA-15569.
 - For delay that is between the lower bound and upper bound, the user call will abort with ORA-15569 only when the current replay elapsed time is more than the product of capture elapsed time and parameter delay_factor.

198.3.39 SET_SQL_MAPPING Procedure

This procedure specifies SQL statements to be skipped or replaced during a database replay operation.

Syntax

```
PROCEDURE SET_SQL_MAPPING (
    schedule_cap_id    IN NUMBER,
    sql_id             IN VARCHAR2,
    operation          IN VARCHAR2,
    replacement_sql_text IN VARCHAR2 DEFAULT NULL);
```

```
PROCEDURE SET_SQL_MAPPING (
    sql_id             IN VARCHAR2,
    operation          IN VARCHAR2,
    replacement_sql_text IN VARCHAR2 DEFAULT NULL);
```

Parameters

Table 198-35 SET_SQL_MAPPING Procedure Parameters

| Parameter | Description |
|-----------------|---|
| schedule_cap_id | ID of a capture in the schedule |
| sql_id | SQL identifier of the SQL statement at the time of capture |
| operation | Directs that one of the following actions be performed for the specified statement during database replay: <ul style="list-style-type: none"> 'SKIP' — Skip the SQL statement identified by sql_id 'REPLACE' — Replace this SQL statement identified by sql_id with the SQL statement in the replacement_sql_text parameter |

Usage Notes

- replacement_sql_text: When 'SKIP' is specified for the operation parameter, this parameter is NULL. When 'REPLACE' is specified for the operation parameter, this parameter's value is the SQL statement to be used.
- schedule_cap_id is used for consolidated replay.

198.3.40 SET_USER_MAPPING Procedure

This procedure sets a new schema or user name to be used during replay instead of the captured user.

Syntax

```
DBMS_WORKLOAD_REPLAY.SET_USER_MAPPING (
    schedule_cap_id    IN NUMBER,
    capture_user       IN VARCHAR2,
    replay_user        IN VARCHAR2);
```

```
DBMS_WORKLOAD_REPLAY.SET_USER_MAPPING (
    capture_user       IN VARCHAR2,
    replay_user        IN VARCHAR2);
```

Parameters

Table 198-36 SET_USER_MAPPING Procedure Parameters

| Parameter | Description |
|-----------------|---|
| schedule_cap_id | ID of the a capture in the schedule |
| capture_user | User name during the time of the workload capture |
| replay_user | User name to which captured user is remapped during replay. |

Usage Notes

- A `schedule_cap_id` of `NULL` is used for regular non-consolidate replay.
- The replay must be initialized but not prepared in order to use this subprogram.
- If `replay_user` is set to `NULL`, then the mapping is disabled.
- After multiple calls with the same `capture_user`, the last call always takes effect.
- To list all the mappings that will be in effect during the subsequent replay execute the following:

```
SELECT * FROM DBA_WORKLOAD_ACTIVE_USER_MAP
```

- The overloaded version without the `schedule_cap_id` calls the one with the `schedule_cap_id` argument by passing in `NULL`.
- Mappings are stored in a table made public through the view `DBA_WORKLOAD_USER_MAP`. To remove old mappings execute

```
DELETE * FROM DBA_WORKLOAD_USER_MAP
```

198.3.41 START_CONSOLIDATED_REPLAY Procedure

This procedure starts the replay of a multiple-capture capture. It should be used only for consolidated replays.

Syntax

```
DBMS_WORKLOAD_REPLAY.START_CONSOLIDATED_REPLAY;
```

Usage Notes

Prerequisites:

- The call to the [PREPARE_REPLAY Procedure](#) was already issued.
- A sufficient number of external replay clients (WRC) that can faithfully replay the captured workload already started. The status of such external replay clients can be monitored using `V$WORKLOAD_REPLAY_CLIENTS`.

198.3.42 START_REPLAY Procedure

This procedure starts the workload replay.

All the external replay clients (WRC) that are currently connected to the replay database will automatically be notified, and those replay clients (WRC) will begin issuing the captured workload. It should only be used for consolidated replays.

Syntax

```
DBMS_WORKLOAD_REPLAY.START_REPLAY;
```

Usage Notes

- Prerequisites:
 - The call to the [PREPARE_REPLAY Procedure](#) was already issued.

- A sufficient number of external replay clients (WRC) that can faithfully replay the captured workload already started. The status of such external replay clients can be monitored using `V$WORKLOAD_REPLAY_CLIENTS`.
- Use the WRC's `CALIBRATE` mode to determine the number of replay clients that might be required to faithfully replay the captured workload. For example:

```
$ wrc mode=calibrate replaydir=.
```

198.3.43 USE_FILTER_SET Procedure

This procedure applies a filter set to a capture in the current replay schedule.

The filter set must have been created by calling the [CREATE_FILTER_SET Procedure](#).

Syntax

```
DBMS_WORKLOAD_REPLAY.USE_FILTER_SET (
    capture_number IN VARCHAR2,
    filter_set      IN VARCHAR2);
```

```
DBMS_WORKLOAD_REPLAY.USE_FILTER_SET (
    filter_set      IN VARCHAR2);
```

Parameters

Table 198-37 USE_FILTER_SET Procedure Parameters

| Parameter | Description |
|-----------------------------|--|
| <code>capture_number</code> | Pointing to a capture of the current replay schedule |
| <code>filter_set</code> | Name of the filter set |

Usage Notes

The filter set must have been created by calling the [CREATE_FILTER_SET Procedure](#).

DBMS_WORKLOAD_REPOSITORY

The `DBMS_WORKLOAD_REPOSITORY` package lets you manage the Automatic Workload Repository (AWR) by performing operations, such as, managing snapshots and baselines.

The chapter contains the following topics:

- [Examples](#)
- [Data Structures](#)
- [Summary of DBMS_WORKLOAD_REPOSITORY Subprograms](#)

See Also:

Oracle Database Performance Tuning Guide for more information about the Automatic Workload Repository

199.1 DBMS_WORKLOAD_REPOSITORY Examples

This example shows how to generate an AWR text report with the `DBMS_WORKLOAD_REPOSITORY` package for database ID 1557521192, instance ID 1, snapshot IDs 5390 and 5391, and with default options.

```
-- make sure to set line size appropriately
-- set linesize 152
SELECT output FROM TABLE(
  DBMS_WORKLOAD_REPOSITORY.AWR_REPORT_TEXT(
    1557521192, 1, 5390, 5392) );
```

You can call the `DBMS_WORKLOAD_REPOSITORY` packaged functions directly as in the example, but Oracle recommends you use the corresponding supplied SQL script (`awrrpt.sql` in this case) for the packaged function, which prompts the user for required information.

199.2 DBMS_WORKLOAD_REPOSITORY Data Structures

The `DBMS_WORKLOAD_REPOSITORY` package defines an object and associated table types.

OBJECT Types

- [AWR_BASELINE_METRIC_TYPE](#) Object Type

TABLE Types

- [AWR_BASELINE_METRIC_TYPE_TABLE](#) Table Type
- [AWRRPT_INSTANCE_LIST_TYPE](#) Table Type

199.2.1 DBMS_WORKLOAD_REPOSITORY AWR_BASELINE_METRIC_TYPE Object Type

This type shows the values of the metrics corresponding to a baseline.

Syntax

```
TYPE awr_baseline_metric_type AS OBJECT (  
    baseline_name      VARCHAR2(64),  
    dbid               NUMBER NOT NULL,  
    instance_number    NUMBER NOT NULL,  
    beg_time           DATE NOT NULL,  
    end_time           DATE NOT NULL,  
    metric_id          NUMBER NOT NULL,  
    metric_name        VARCHAR2(64) NOT NULL,  
    metric_unit        VARCHAR2(64) NOT NULL,  
    num_interval       NUMBER NOT NULL,  
    interval_size      NUMBER NOT NULL,  
    average            NUMBER NOT NULL,  
    minimum            NUMBER NOT NULL,  
    maximum            NUMBER NOT NULL);
```

Fields

Table 199-1 AWR_BASELINE_METRIC_TYPE Fields

| Field | Description |
|-----------------|---|
| baseline_name | Name of the Baseline |
| dbid | Database ID for the snapshot |
| instance_number | Instance number for the snapshot |
| beg_time | Begin time of the interval |
| end_time | End time of the interval |
| metric_id | Metric ID |
| metric_name | Metric name |
| metric_unit | Unit of measurement |
| num_interval | Number of intervals observed |
| interval_size | Interval size (in hundredths of a second) |
| average | Average over the period |
| minimum | Minimum value observed |
| maximum | Maximum value observed |

199.2.2 DBMS_WORKLOAD_REPOSITORY AWR_BASELINE_METRIC_TYPE_TABLE Table Type

This type is used by the SELECT_BASELINE_METRIC Function.

Syntax

```
CREATE TYPE awr_baseline_metric_type_table AS TABLE OF awr_baseline_metric_type;
```

Related Topics

- [SELECT_BASELINE_METRIC Function](#)
This table function shows the values of the metrics corresponding to a baseline for all the snapshots.

199.2.3 DBMS_WORKLOAD_REPOSITORY AWRRPT_INSTANCE_LIST_TYPE Table Type

This type provides an alternative to a comma-separated list.

Syntax

```
CREATE TYPE awrrpt_instance_list_type AS TABLE OF NUMBER;
```

199.3 Summary of DBMS_WORKLOAD_REPOSITORY Subprograms

This table lists the DBMS_WORKLOAD_REPOSITORY subprograms and briefly describes them.

Table 199-2 DBMS_WORKLOAD_REPOSITORY Package Subprograms

| Subprogram | Description |
|---|--|
| ADD_COLORED_SQL Procedure | Adds a colored SQL ID |
| ASH_GLOBAL_REPORT_HTML Function | Displays a global or Oracle Real Application Clusters (Oracle RAC) ASH Spot report in HTML format. |
| ASH_GLOBAL_REPORT_TEXT Function | Displays a global or Oracle Real Application Clusters (Oracle RAC) ASH Spot report in Text format. |
| ASH_REPORT_ANALYTICS Function | Displays the ASH Analytics active report |
| ASH_REPORT_HTML Function | Displays the ASH report in HTML |
| ASH_REPORT_TEXT Function | Displays the ASH report in text |
| AWR_DIFF_REPORT_HTML Function | Displays the AWR Diff-Diff report in HTML |
| AWR_DIFF_REPORT_TEXT Function | Displays the AWR Diff-Diff report in text |
| AWR_GLOBAL_DIFF_REPORT_HTML Functions | Displays the Global AWR Compare Periods Report in HTML |

Table 199-2 (Cont.) DBMS_WORKLOAD_REPOSITORY Package Subprograms

| Subprogram | Description |
|---|--|
| AWR_GLOBAL_DIFF_REPORT_TEXT Functions | Displays the Global AWR Compare Periods Report in text |
| AWR_EXP Procedure | Extracts AWR data from the AWR schema into a dump file. |
| AWR_GLOBAL_REPORT_HTML Functions | Displays the Global AWR report in HTML |
| AWR_GLOBAL_REPORT_TEXT Functions | Displays the Global AWR report in text |
| AWR_IMP Procedure | Loads the AWR data from a dump file into the SYS schema. |
| AWR_REPORT_HTML Function | Displays the AWR report in HTML |
| AWR_REPORT_TEXT Function | Displays the AWR report in text |
| AWR_SET_REPORT_THRESHOLD S Procedure | Configures specified report thresholds, including the number of rows in the report |
| AWR_SQL_REPORT_HTML Function | Displays the AWR SQL Report in HTML format |
| AWR_SQL_REPORT_TEXT Function | Displays the AWR SQL Report in text format |
| CONTROL_RESTRICTED_SNAPSHOT Procedure | Controls the AWR snapshot creation for a database in the <i>restricted session</i> mode. |
| CREATE_BASELINE Functions & Procedures | Creates a single baseline |
| CREATE_BASELINE_TEMPLATE Procedures | Creates a baseline template |
| CREATE_REMOTE_SNAPSHOT Function and Procedure | Creates a manual <i>remote</i> snapshot immediately using the Remote Management Framework (RMF) |
| CREATE_SNAPSHOT Function and Procedure | Creates a manual <i>local</i> snapshot immediately |
| DROP_BASELINE Procedure | Drops a previously-defined baseline |
| DROP_BASELINE_TEMPLATE Procedure | Removes a baseline template that is no longer needed |
| DROP_SNAPSHOT_RANGE Procedure | Drops a range of snapshots |
| LOCAL_AWR_DBID Function | Returns the database identifier for the local AWR database |
| MODIFY_BASELINE_WINDOW_SIZE Procedure | Modifies the window size for the Default Moving Window Baseline |
| MODIFY_SNAPSHOT_SETTINGS Procedures | Modifies the snapshot settings |
| PURGE_SQL_DETAILS Procedure | Purges SQL details, specifically rows from <code>WRH\$_SQLTEXT</code> and <code>WRH\$_SQL_PLAN</code> that do not have corresponding rows (DBID, SQL_ID) in <code>WRH\$_SQLSTAT</code> . |
| REGISTER_REMOTE_DATABASE Procedures | Registers a remote database in the AWR using the Remote Management Framework (RMF) |
| REMOVE_COLORED_SQL Procedure | Removes a colored SQL ID |
| RENAME_BASELINE Procedure | Renames a baseline |

Table 199-2 (Cont.) DBMS_WORKLOAD_REPOSITORY Package Subprograms

| Subprogram | Description |
|---|--|
| SELECT_BASELINE_DETAILS Function | Shows the values of the metrics corresponding to a baseline for a range of snapshots |
| SELECT_BASELINE_METRIC Function | Shows the values of the metrics corresponding to a baseline for all the snapshots |
| UNREGISTER_REMOTE_DATABASE Procedures | Removes all the statistics, metadata, and partitions of a remote database from the AWR using the Remote Management Framework (RMF) |
| UPDATE_DATAFILE_INFO Procedure | Updates the data file and tablespace information stored in the AWR with the current information in the database |
| UPDATE_OBJECT_INFO Procedure | Updates rows of WRH\$_SEG_STAT_OBJ table that represent objects in the local database |

199.3.1 ADD_COLORED_SQL Procedure

This procedure adds a colored SQL ID.

If an SQL ID is colored, it will be captured in every snapshot, independent of its level of activities (so that it does not have to be a *TOP SQL*). Capture occurs if the SQL is found in the cursor cache at snapshot time. To uncolor the SQL, invoke the [REMOVE_COLORED_SQL Procedure](#).

Syntax

```
DBMS_WORKLOAD_REPOSITORY.ADD_COLORED_SQL (
    sql_id          IN VARCHAR2,
    dbid            IN NUMBER DEFAULT NULL);
```

Parameters

Table 199-3 ADD_COLORED_SQL Procedure Parameters

| Parameter | Description |
|-----------|---------------------------------------|
| sql_id | 13-character external SQL ID |
| dbid | Optional DBID, defaults to Local DBID |

199.3.2 ASH_GLOBAL_REPORT_HTML Function

This table function displays a global or Oracle Real Application Clusters (Oracle RAC) ASH Spot report in HTML format.

Syntax

```
DBMS_WORKLOAD_REPOSITORY.ASH_GLOBAL_REPORT_HTML (
    l_dbid          IN NUMBER,
    l_inst_num      IN VARCHAR2 ((1023)),
    l_btime         IN DATE,
    l_etime         IN DATE,
    l_options       IN NUMBER    DEFAULT 0,
```

```

l_slot_width    IN NUMBER    DEFAULT 0,
l_sid           IN NUMBER    DEFAULT NULL,
l_sql_id        IN VARCHAR2  DEFAULT NULL,
l_wait_class    IN VARCHAR2  DEFAULT NULL,
l_service_hash  IN NUMBER    DEFAULT NULL,
l_module        IN VARCHAR2  DEFAULT NULL,
l_action        IN VARCHAR2  DEFAULT NULL,
l_client_id     IN VARCHAR2  DEFAULT NULL,
l_plsql_entry   IN VARCHAR2  DEFAULT NULL,
l_data_src      IN NUMBER    DEFAULT 0,
l_container     IN VARCHAR2  DEFAULT NULL)
RETURN awrrpt_html_type_table PIPELINED;
```

Parameters

Table 199-4 *ASH_GLOBAL_REPORT_HTML Parameters*

| Parameter | Description |
|-----------------------------|---|
| <code>l_dbid</code> | Database identifier |
| <code>l_inst_num</code> | List of instances (such as '1, 2, 3'), or NULL to report on all instances in the database |
| <code>l_btime</code> | The 'begin time' |
| <code>l_etime</code> | The 'end time' |
| <code>l_options</code> | Report level (currently not used) |
| <code>l_slot_width</code> | Specifies (in seconds) how wide the slots used in the "Top Activity" section of the report should be. This argument is optional, and if it is not specified the time interval between <code>l_btime</code> and <code>l_etime</code> is appropriately split into not more than 10 slots. |
| <code>l_sid</code> | Session ID (see Usage Notes) |
| <code>l_sql_id</code> | SQL ID (see Usage Notes) |
| <code>l_wait_class</code> | Wait class name (see Usage Notes) |
| <code>l_service_hash</code> | Service name hash (see Usage Notes) |
| <code>l_module</code> | Module name (see Usage Notes) |
| <code>l_action</code> | Action name (see Usage Notes) |
| <code>l_client_id</code> | Client ID for end-to-end backtracing (see Usage Notes) |
| <code>l_plsql_entry</code> | PL/SQL entry point (see Usage Notes) |
| <code>l_data_src</code> | Ignored since the report works off of data on disk only |
| <code>l_container</code> | Name of the container for which report activity is limited. Valid values other than NULL (default) should be taken from container names in <code>V\$CONTAINERS</code> . Behavior is as follows: <ul style="list-style-type: none"> • If NULL: When connected to a root container the report is on all containers. When connected to a PDB the report is on only that PDB. • If not NULL: When connected to a root container the report is on activity from the specified container. When connected to a PDB the report is the same as NULL value for <code>l_container</code> regarding the connected PDB. <p>Note: If while connected to a PDB you request information from another PDB this produces an empty report.</p> |

Return Values

The output will be one column of VARCHAR2 (1500).

Usage Notes

- You can call the function directly but Oracle recommends you use the `ashrpti.sql` script which prompts users for the required information.
- The unspecified optional arguments are used to generate an ASH Reports that specify 'report targets' such as a SQL statement, or a session, or a particular Service/Module combination. These arguments are specified to restrict the ASH rows that would be used to generate the report. For example, to generate an ASH report on a particular SQL statement, such as `SQL_ID 'abcdefghijkl123'` pass that `sql_id` value to the `l_sql_id` argument:

```
l_sql_id => 'abcdefghijkl123'
```

Any combination of those optional arguments can be passed in, and only rows in ASH that satisfy all of those 'report targets' will be used. If multiple 'report targets' are specified, AND conditional logic is used to connect them. For example, to generate an ASH report on `MODULE "PAYROLL"` and `ACTION "PROCESS"`, use the following predicate:

```
l_module => 'PAYROLL', l_action => 'PROCESS'
```

Valid SQL wildcards can be used in all the arguments that are of type VARCHAR2.

Table 199-5 ASH_REPORT_HTML: Wildcards Allowed (or Not) in Arguments

| Argument Name | Comment | Wildcard Allowed |
|-----------------------------|--|------------------|
| <code>l_sid</code> | Session ID (for example, <code>V\$SESSION.SID</code>) | No |
| <code>l_sql_id</code> | SQL ID (for example, <code>V\$SQL.SQL_ID</code>) | Yes |
| <code>l_wait_class</code> | Wait class name (for example, <code>V\$EVENT_NAME.WAIT_CLASS</code>) | Yes |
| <code>l_service_hash</code> | Service name hash (for example, <code>V\$ACTIVE_SERVICES.NAME_HASH</code>) | No |
| <code>l_module</code> | Module name (for example, <code>V\$SESSION.MODULE</code>) | Yes |
| <code>l_action</code> | Action name (for example, <code>V\$SESSION.ACTION</code>) | Yes |
| <code>l_client_id</code> | Client ID for end-to-end backtracing (for example, <code>V\$SESSION.CLIENT_IDENTIFIER</code>) | Yes |
| <code>l_data_src</code> | Wildcards are not allowed for <code>l_data_src</code> as it is of numeric datatype | No |

199.3.3 ASH_GLOBAL_REPORT_TEXT Function

This table function displays a global or Oracle Real Application Clusters (Oracle RAC) ASH Spot report in text format.

Syntax

```
DBMS_WORKLOAD_REPOSITORY.ASH_GLOBAL_REPORT_TEXT(
    l_dbid          IN VARCHAR2(1023),
    l_inst_num     IN NUMBER,
```

```

l_btime      IN DATE,
l_etime      IN DATE,
l_options    IN NUMBER    DEFAULT 0,
l_slot_width IN NUMBER    DEFAULT 0,
l_sid        IN NUMBER    DEFAULT NULL,
l_sql_id     IN VARCHAR2  DEFAULT NULL,
l_wait_class IN VARCHAR2  DEFAULT NULL,
l_service_hash IN NUMBER   DEFAULT NULL,
l_module     IN VARCHAR2  DEFAULT NULL,
l_action     IN VARCHAR2  DEFAULT NULL,
l_client_id  IN VARCHAR2  DEFAULT NULL,
l_plsql_entry IN VARCHAR2  DEFAULT NULL,
l_data_src   IN NUMBER    DEFAULT 0,
l_container  IN VARCHAR2  DEFAULT NULL)
RETURN awrrpt_text_type_table PIPELINED;
```

Parameters

Table 199-6 ASH_GLOBAL_REPORT_TEXT Parameters

| Parameter | Description |
|-----------------------------|---|
| <code>l_dbid</code> | Database identifier |
| <code>l_inst_num</code> | List of instances (such as '1,2,3'), or NULL to report on all instances in the database |
| <code>l_btime</code> | The 'begin time' |
| <code>l_etime</code> | The 'end time' |
| <code>l_options</code> | Report level (currently not used) |
| <code>l_slot_width</code> | Specifies (in seconds) how wide the slots used in the "Top Activity" section of the report should be. This argument is optional, and if it is not specified the time interval between <code>l_btime</code> and <code>l_etime</code> is appropriately split into not more than 10 slots. |
| <code>l_sid</code> | Session ID (see Usage Notes) |
| <code>l_sql_id</code> | SQL ID (see Usage Notes) |
| <code>l_wait_class</code> | Wait class name (see Usage Notes) |
| <code>l_service_hash</code> | Service name hash (see Usage Notes) |
| <code>l_module</code> | Module name (see Usage Notes) |
| <code>l_action</code> | Action name (see Usage Notes) |
| <code>l_client_id</code> | Client ID for end-to-end backtracing (see Usage Notes) |
| <code>l_plsql_entry</code> | PL/SQL entry point (see Usage Notes) |
| <code>l_data_src</code> | Ignored since the report works off of data on disk only |

Table 199-6 (Cont.) ASH_GLOBAL_REPORT_TEXT Parameters

| Parameter | Description |
|--------------------------|---|
| <code>l_container</code> | <p>Name of the container for which report activity is limited. Valid values other than <code>NULL</code> (default) should be taken from container names in <code>V\$CONTAINERS</code>. Behavior is as follows:</p> <ul style="list-style-type: none"> • If <code>NULL</code>: When connected to a root container the report is on all containers. When connected to a PDB the report is on only that PDB. • If not <code>NULL</code>: When connected to a root container the report is on activity from the specified container. When connected to a PDB the report is the same as <code>NULL</code> value for <code>l_container</code> regarding the connected PDB. <p>Note: If while connected to a PDB you request information from another PDB this produces an empty report.</p> |

Return Values

The output will be one column of `VARCHAR2 (320)`.

Usage Notes

- You can call the function directly but Oracle recommends you use the `ashrpti.sql` script which prompts users for the required information.
- The unspecified optional arguments are used to generate an ASH Reports that specify 'report targets' such as a SQL statement, or a session, or a particular Service/Module combination. These arguments are specified to restrict the ASH rows that would be used to generate the report. For example, to generate an ASH report on a particular SQL statement, such as `SQL_ID 'abcdefghij123'` pass that `SQL_ID` value to the `l_sql_id` argument:

```
l_sql_id => 'abcdefghij123'
```

Table 199-7 ASH_GLOBAL_REPORT_TEXT: Wildcards Allowed (or Not) in Arguments

| Argument Name | Comment | Wildcard Allowed |
|-----------------------------|--|------------------|
| <code>l_sid</code> | Session ID (for example, <code>V\$SESSION.SID</code>) | No |
| <code>l_sql_id</code> | SQL ID (for example, <code>V\$SQL.SQL_ID</code>) | Yes |
| <code>l_wait_class</code> | Wait class name (for example, <code>V\$EVENT_NAME.WAIT_CLASS</code>) | Yes |
| <code>l_service_hash</code> | Service name hash (for example, <code>V\$ACTIVE_SERVICES.NAME_HASH</code>) | No |
| <code>l_module</code> | Module name (for example, <code>V\$SESSION.MODULE</code>) | Yes |
| <code>l_action</code> | Action name (for example, <code>V\$SESSION.ACTION</code>) | Yes |
| <code>l_client_id</code> | Client ID for end-to-end backtracing (for example, <code>V\$SESSION.CLIENT_IDENTIFIER</code>) | Yes |

Table 199-7 (Cont.) ASH_GLOBAL_REPORT_TEXT: Wildcards Allowed (or Not) in Arguments

| Argument Name | Comment | Wildcard Allowed |
|----------------------------|--|------------------|
| <code>l_plsql_entry</code> | PL/SQL entry point (for example, "SYS.DBMS_LOB.*") | Yes |
| <code>l_data_src</code> | Wildcards are not allowed for <code>l_data_src</code> as it is of numeric datatype | No |

- Any combination of those optional arguments can be passed in, and only rows in ASH that satisfy all of those 'report targets' will be used. If multiple 'report targets' are specified, AND conditional logic is used to connect them. For example, to generate an ASH report on MODULE "PAYROLL" and ACTION "PROCESS", use the following predicate:

```
l_module => 'PAYROLL', l_action => 'PROCESS'
```

Valid SQL wildcards can be used in all the arguments that are of type VARCHAR2.

199.3.4 ASH_REPORT_ANALYTICS Function

This function returns the ASH Analytics active report.

Syntax

```
DBMS_WORKLOAD_REPOSITORY.ASH_REPORT_ANALYTICS(
  dbid          IN NUMBER DEFAULT NULL,
  inst_id       IN NUMBER DEFAULT NULL,
  begin_time    IN DATE,
  end_time      IN DATE,
  report_level  IN VARCHAR2 DEFAULT NULL,
  filter_list   IN VARCHAR2 DEFAULT NULL)
RETURN CLOB;
```

Parameters

Table 199-8 ASH_REPORT_ANALYTICS Parameters

| Parameter | Description |
|---------------------------|---|
| <code>dbid</code> | Database identifier. If its value is set to NULL, then the database identifier for the local database is used. Its default value is NULL. |
| <code>inst_id</code> | Instance number of the database for which the statistics are required. If its value is set to NULL, then the statistics for the local database are returned. Its default value is NULL. |
| <code>begin_time</code> | The start time of the interval for which the ASH report is required. |
| <code>end_time</code> | The end time of the interval for which the ASH report is required. |
| <code>report_level</code> | Describes the list of components to build. |
| <code>filter_list</code> | Describes the list of filters to apply. Its default value is NULL (no filters to apply). |

Return Values

Returns the ASH Analytics active report.

199.3.5 ASH_REPORT_HTML Function

This table function displays the ASH Spot report in HTML.

Syntax

```
DBMS_WORKLOAD_REPOSITORY.ASH_REPORT_HTML(
  l_dbid          IN NUMBER,
  l_inst_num      IN NUMBER,
  l_btime         IN DATE,
  l_etime         IN DATE,
  l_options       IN NUMBER    DEFAULT 0,
  l_slot_width    IN NUMBER    DEFAULT 0,
  l_sid           IN NUMBER    DEFAULT NULL,
  l_sql_id        IN VARCHAR2  DEFAULT NULL,
  l_wait_class    IN VARCHAR2  DEFAULT NULL,
  l_service_hash  IN NUMBER    DEFAULT NULL,
  l_module        IN VARCHAR2  DEFAULT NULL,
  l_action        IN VARCHAR2  DEFAULT NULL,
  l_client_id     IN VARCHAR2  DEFAULT NULL,
  l_plsql_entry   IN VARCHAR2  DEFAULT NULL,
  l_data_src      IN NUMBER    DEFAULT 0,
  l_container     IN VARCHAR2  DEFAULT NULL)
RETURN awrrpt_html_type_table PIPELINED;
```

Parameters

Table 199-9 *ASH_REPORT_HTML Parameters*

| Parameter | Description |
|-----------------------------|---|
| <code>l_dbid</code> | Database identifier |
| <code>l_inst_num</code> | Instance number |
| <code>l_btime</code> | The 'begin time' |
| <code>l_etime</code> | The 'end time' |
| <code>l_options</code> | Report level (currently not used) |
| <code>l_slot_width</code> | Specifies (in seconds) how wide the slots used in the "Top Activity" section of the report should be. This argument is optional, and if it is not specified the time interval between <code>l_btime</code> and <code>l_etime</code> is appropriately split into not more than 10 slots. |
| <code>l_sid</code> | Session ID (see Usage Notes) |
| <code>l_sql_id</code> | SQL ID (see Usage Notes) |
| <code>l_wait_class</code> | Wait class name (see Usage Notes) |
| <code>l_service_hash</code> | Service name hash (see Usage Notes) |
| <code>l_module</code> | Module name (see Usage Notes) |
| <code>l_action</code> | Action name (see Usage Notes) |
| <code>l_client_id</code> | Client ID for end-to-end backtracing (see Usage Notes) |
| <code>l_plsql_entry</code> | PL/SQL entry point (see Usage Notes) |

Table 199-9 (Cont.) ASH_REPORT_HTML Parameters

| Parameter | Description |
|--------------------------|--|
| <code>l_data_src</code> | <p>Can be used to specify a data source (see Usage Notes)</p> <ul style="list-style-type: none"> • 1 => memory (V\$ACTIVE_SESSION_HISTORY) • 2 => disk (DBA_HIST_ACTIVE_SESS_HISTORY) • 0 => both. This is the default value. Here, the begin and end time parameters are used to get the samples from the appropriate data source, which can be memory, disk, or both. |
| <code>l_container</code> | <p>Name of the container for which report activity is limited. Valid values other than NULL (default) should be taken from container names in V\$CONTAINERS. Behavior is as follows:</p> <ul style="list-style-type: none"> • If NULL: When connected to a root container the report is on all containers. When connected to a PDB the report is on only that PDB. • If not NULL: When connected to a root container the report is on activity from the specified container. When connected to a PDB the report is the same as NULL value for <code>l_container</code> regarding the connected PDB. <p>Note: If while connected to a PDB you request information from another PDB this produces an empty report.</p> |

Return Values

The output will be one column of VARCHAR2 (500).

Usage Notes

- You can call the function directly but Oracle recommends you use the `ashrpti.sql` script which prompts users for the required information.
- By default, the report uses the begin and end time parameters (`l_btime` and `l_etime`, respectively) to find all rows in that time range either from memory, or disk, or both. However, using `l_data_src`, one can explicitly specify one of those data sources. For example, to generate an ASH report on all rows between `l_btime` and `l_time` found in memory, use

```
l_data_src => 1
```

Similarly, to generate a report on samples found only on disk, use

```
l_data_src => 2
```

- The unspecified optional arguments are used to generate an ASH Reports that specify 'report targets' such as a SQL statement, or a session, or a particular Service/Module combination. These arguments are specified to restrict the ASH rows that would be used to generate the report. For example, to generate an ASH report on a particular SQL statement, such as `SQL_ID 'abcdefghij123'` pass that `sql_id` value to the `l_sql_id` argument:

```
l_sql_id => 'abcdefghij123'
```

Any combination of those optional arguments can be passed in, and only rows in ASH that satisfy all of those 'report targets' will be used. If multiple 'report targets' are specified, AND conditional logic is used to connect them. For example, to

generate an ASH report on MODULE "PAYROLL" and ACTION "PROCESS", use the following predicate:

```
l_module => 'PAYROLL', l_action => 'PROCESS'
```

Valid SQL wildcards can be used in all the arguments that are of type VARCHAR2.

Table 199-10 ASH_REPORT_HTML: Wildcards Allowed (or Not) in Arguments

| Argument Name | Comment | Wildcard Allowed |
|----------------|--|------------------|
| l_sid | Session ID (for example, V\$SESSION.SID) | No |
| l_sql_id | SQL ID (for example, V\$SQL.SQL_ID) | Yes |
| l_wait_class | Wait class name (for example, V\$EVENT_NAME.WAIT_CLASS) | Yes |
| l_service_hash | Service name hash (for example, V\$ACTIVE_SERVICES.NAME_HASH) | No |
| l_module | Module name (for example, V\$SESSION.MODULE) | Yes |
| l_action | Action name (for example, V\$SESSION.ACTION) | Yes |
| l_client_id | Client ID for end-to-end backtracing (for example, V\$SESSION.CLIENT_IDENTIFIER) | Yes |

199.3.6 ASH_REPORT_TEXT Function

This table function displays the ASH Spot report in text.

Syntax

```
DBMS_WORKLOAD_REPOSITORY.ASH_REPORT_TEXT (
  l_dbid          IN NUMBER,
  l_inst_num     IN NUMBER,
  l_btime        IN DATE,
  l_etime        IN DATE,
  l_options      IN NUMBER    DEFAULT 0,
  l_slot_width   IN NUMBER    DEFAULT 0,
  l_sid          IN NUMBER    DEFAULT NULL,
  l_sql_id       IN VARCHAR2  DEFAULT NULL,
  l_wait_class   IN VARCHAR2  DEFAULT NULL,
  l_service_hash IN NUMBER    DEFAULT NULL,
  l_module       IN VARCHAR2  DEFAULT NULL,
  l_action       IN VARCHAR2  DEFAULT NULL,
  l_client_id    IN VARCHAR2  DEFAULT NULL,
  l_plsql_entry  IN VARCHAR2  DEFAULT NULL,
  l_data_src     IN NUMBER    DEFAULT 0,
  l_container    IN VARCHAR2  DEFAULT NULL)
RETURN awrrpt_text_type_table PIPELINED;
```

Parameters

Table 199-11 ASH_REPORT_TEXT Parameters

| Parameter | Description |
|-----------|---------------------|
| l_dbid | Database identifier |

Table 199-11 (Cont.) ASH_REPORT_TEXT Parameters

| Parameter | Description |
|-----------------------------|---|
| <code>l_inst_num</code> | Instance number |
| <code>l_btime</code> | The 'begin time' |
| <code>l_etime</code> | The 'end time' |
| <code>l_options</code> | Report level (currently not used) |
| <code>l_slot_width</code> | Specifies (in seconds) how wide the slots used in the "Top Activity" section of the report should be. This argument is optional, and if it is not specified the time interval between <code>l_btime</code> and <code>l_etime</code> is appropriately split into not more than 10 slots. |
| <code>l_sid</code> | Session ID (see Usage Notes) |
| <code>l_sql_id</code> | SQL ID (see Usage Notes) |
| <code>l_wait_class</code> | Wait class name (see Usage Notes) |
| <code>l_service_hash</code> | Service name hash (see Usage Notes) |
| <code>l_module</code> | Module name (see Usage Notes) |
| <code>l_action</code> | Action name (see Usage Notes) |
| <code>l_client_id</code> | Client ID for end-to-end backtracing (see Usage Notes) |
| <code>l_plsql_entry</code> | PL/SQL entry point (see Usage Notes) |
| <code>l_data_src</code> | Can be used to specify a data source (see Usage Notes) <ul style="list-style-type: none"> • 1 => memory (<code>V\$ACTIVE_SESSION_HISTORY</code>) • 2 => disk (<code>DBA_HIST_ACTIVE_SESS_HISTORY</code>) • 0 => both. This is the default value. Here, the begin and end time parameters are used to get the samples from the appropriate data source, which can be memory, disk, or both. |
| <code>l_container</code> | Name of the container for which report activity is limited. Valid values other than <code>NULL</code> (default) should be taken from container names in <code>V\$CONTAINERS</code> . Behavior is as follows: <ul style="list-style-type: none"> • If <code>NULL</code>: When connected to a root container the report is on all containers. When connected to a PDB the report is on only that PDB. • If not <code>NULL</code>: When connected to a root container the report is on activity from the specified container. When connected to a PDB the report is the same as <code>NULL</code> value for <code>l_container</code> regarding the connected PDB. <p>Note: If while connected to a PDB you request information from another PDB this produces an empty report.</p> |

Return Values

The output will be one column of `VARCHAR2 (80)`.

Usage Notes

- You can call the function directly but Oracle recommends you use the `ashrpti.sql` script which prompts users for the required information.
- By default, the report uses the begin and end time parameters (`l_btime` and `l_etime`, respectively) to find all rows in that time range either from memory, or

disk, or both. However, using `l_data_src`, one can explicitly specify one of those data sources. For example, to generate an ASH report on all rows between `l_btime` and `l_time` found in memory, use

```
l_data_src => 1
```

Similarly, to generate a report on samples found only on disk, use

```
l_data_src => 2
```

- The unspecified optional arguments are used to generate an ASH Reports that specify 'report targets' such as a SQL statement, or a session, or a particular Service/Module combination. These arguments are specified to restrict the ASH rows that would be used to generate the report. For example, to generate an ASH report on a particular SQL statement, such as `SQL_ID 'abcdefghijkl123'` pass that `SQL_ID` value to the `l_sql_id` argument:

```
l_sql_id => 'abcdefghijkl123'
```

Table 199-12 ASH_REPORT_TEXT: Wildcards Allowed (or Not) in Arguments

| Argument Name | Comment | Wildcard Allowed |
|-----------------------------|--|------------------|
| <code>l_sid</code> | Session ID (for example, <code>V\$SESSION.SID</code>) | No |
| <code>l_sql_id</code> | SQL ID (for example, <code>V\$SQL.SQL_ID</code>) | Yes |
| <code>l_wait_class</code> | Wait class name (for example, <code>V\$EVENT_NAME.WAIT_CLASS</code>) | Yes |
| <code>l_service_hash</code> | Service name hash (for example, <code>V\$ACTIVE_SERVICES.NAME_HASH</code>) | No |
| <code>l_module</code> | Module name (for example, <code>V\$SESSION.MODULE</code>) | Yes |
| <code>l_action</code> | Action name (for example, <code>V\$SESSION.ACTION</code>) | Yes |
| <code>l_client_id</code> | Client ID for end-to-end backtracing (for example, <code>V\$SESSION.CLIENT_IDENTIFIER</code>) | Yes |
| <code>l_plsql_entry</code> | PL/SQL entry point (for example, <code>"SYS.DBMS_LOB.*"</code>) | Yes |
| <code>l_data_src</code> | Wildcards are not allowed for <code>l_data_src</code> as it is of numeric datatype | No |

- Any combination of those optional arguments can be passed in, and only rows in ASH that satisfy all of those 'report targets' will be used. If multiple 'report targets' are specified, `AND` conditional logic is used to connect them. For example, to generate an ASH report on `MODULE "PAYROLL"` and `ACTION "PROCESS"`, use the following predicate:

```
l_module => 'PAYROLL', l_action => 'PROCESS'
```

Valid SQL wildcards can be used in all the arguments that are of type `VARCHAR2`.

199.3.7 AWR_DIFF_REPORT_HTML Function

This table function displays the AWR Compare Periods report in HTML.

Syntax

```
DBMS_WORKLOAD_REPOSITORY.AWR_DIFF_REPORT_HTML(
    dbid1      IN NUMBER,
    inst_num1  IN NUMBER,
    bid1       IN NUMBER,
    eid1       IN NUMBER,
    dbid2      IN NUMBER,
    inst_num2  IN NUMBER,
    bid2       IN NUMBER,
    eid2       IN NUMBER)
RETURN awrdrpt_text_type_table PIPELINED;
```

Parameters

Table 199-13 *AWR_DIFF_REPORT_HTML Parameters*

| Parameter | Description |
|-----------|---------------------------|
| dbid1 | 1st database identifier |
| inst_num1 | 1st instance number |
| bid1 | 1st beginning snapshot ID |
| eid1 | 1st ending snapshot ID |
| dbid2 | 2nd database identifier |
| inst_num2 | 2nd instance number |
| bid2 | 2nd beginning snapshot ID |
| eid2 | 2nd ending snapshot ID |

Return Values

The output will be one column of VARCHAR2 (500).

Usage Notes

You can call the function directly but Oracle recommends you use the `awrddrpt.sql` script which prompts users for the required information.

199.3.8 AWR_DIFF_REPORT_TEXT Function

This table function displays the AWR Compare Periods report in text.

Syntax

```
DBMS_WORKLOAD_REPOSITORY.AWR_DIFF_REPORT_TEXT(
    dbid1      IN NUMBER,
    inst_num1  IN NUMBER,
    bid1       IN NUMBER,
    eid1       IN NUMBER,
    dbid2      IN NUMBER,
```

```

inst_num2 IN NUMBER,
bid2      IN NUMBER,
eid2      IN NUMBER)
RETURN awrrpt_text_type_table PIPELINED;

```

Parameters

Table 199-14 *AWR_DIFF_REPORT_TEXT Parameters*

| Parameter | Description |
|-----------|---------------------------|
| dbid1 | 1st database identifier |
| inst_num1 | 1st instance number |
| bid1 | 1st beginning snapshot ID |
| eid1 | 1st ending snapshot ID |
| dbid2 | 2nd database identifier |
| inst_num2 | 2nd instance number |
| bid2 | 2nd beginning snapshot ID |
| eid2 | 2nd ending snapshot ID |

Return Values

The output will be one column of VARCHAR2 (500).

Usage Notes

You can call the function directly but Oracle recommends you use the `awrrdrpt.sql` script which prompts users for the required information.

199.3.9 AWR_EXP Procedure

This procedure extracts AWR data from the AWR schema and dump the information into a file. You can specify the snapshot range for the data that you want to extract.

Syntax

```

DBMS_WORKLOAD_REPOSITORY.AWR_EXP (
  dmpfile      IN   VARCHAR2  DEFAULT 'awrdat',
  dmpdir       IN   VARCHAR2  DEFAULT 'DATA_PUMP_DIR',
  dbid         IN   NUMBER     DEFAULT NULL,
  bid          IN   NUMBER     DEFAULT 1,
  eid          IN   NUMBER     DEFAULT 1000000);

```

Parameters

Table 199-15 *AWR_EXP Procedure Parameters*

| Parameter | Description |
|-----------|--|
| dmpfile | The prefix for the name of the extract dump file and log file. The name of the dump file where all the data from the AWR table will be written is <code>dmpfile.dmp</code> . The <code>dmpfile.log</code> log file shows the status of the export job. The default value for the prefix is <code>awrdat</code> . |

Table 199-15 (Cont.) AWR_EXP Procedure Parameters

| Parameter | Description |
|-----------|---|
| dmpdir | Name of the Directory Object for the file system directory where the extract dump file will be written. The list of Directory Objects can be queried using the DBA_DIRECTORIES view, and a new directory object can be created using the following command: create directory dmpdir as '/directory/path'. The default value is DATA_PUMP_DIR. |
| dbid | The database ID for the snapshots that you want to export. The default value is NULL, for the local database ID. |
| bid | The begin snapshot ID for snapshots to be exported. The default value is 1. |
| eid | The end Snapshot Id for snapshots to be exported. The default value is 10000000. |

199.3.10 AWR_GLOBAL_DIFF_REPORT_HTML Functions

This table function displays Global AWR Compare Periods Report in HTML format.

The first overload accepts comma-separated lists of instance numbers for `inst_num1` and `inst_num2`. No leading zeroes are allowed and there is a limit of 1023 characters.

Syntax

```
DBMS_WORKLOAD_REPOSITORY.AWR_GLOBAL_DIFF_REPORT_HTML (
    dbid1      IN      NUMBER,
    inst_num1  IN      AWRRT_INSTANCE_LIST_TYPE,
    bid1       IN      NUMBER,
    eid1       IN      NUMBER,
    dbid2      IN      NUMBER,
    inst_num2  IN      AWRRT_INSTANCE_LIST_TYPE,
    bid2       IN      NUMBER,
    eid2       IN      NUMBER)
RETURN awrrpt_html_type_table PIPELINED;
```

```
DBMS_WORKLOAD_REPOSITORY.AWR_GLOBAL_DIFF_REPORT_HTML (
    dbid1      IN      NUMBER,
    inst_num1  IN      VARCHAR2,
    bid1       IN      NUMBER,
    eid1       IN      NUMBER,
    dbid2      IN      NUMBER,
    inst_num2  IN      VARCHAR2,
    bid2       IN      NUMBER,
    eid2       IN      NUMBER)
RETURN awrrpt_html_type_table PIPELINED;
```

Parameters

Table 199-16 *AWR_GLOBAL_DIFF_REPORT_HTML Function Parameters*

| Parameter | Description |
|-----------|--|
| dbid1 | 1st database identifier |
| inst_num1 | 1st list of instance numbers. If set to NULL, all instances for which begin and end snapshots are available, and which have not been restarted between snapshots, will be included in the report. |
| bid1 | 1st beginning snapshot ID |
| eid1 | 1st ending snapshot ID |
| dbid2 | 2nd database identifier |
| inst_num2 | 2nd list of instance numbers to be included in report. If set to NULL, all instances for which begin and end snapshots are available, and which have not been restarted between snapshots, will be included in the report. |
| bid2 | 2nd beginning snapshot ID |
| eid2 | 2nd ending snapshot ID |

Return Values

The output will be one column of VARCHAR2 (1500).

199.3.11 AWR_GLOBAL_DIFF_REPORT_TEXT Functions

This table function displays Global AWR Compare Periods Report in text format.

The first overload accepts comma-separated lists of instance numbers for inst_num1 and inst_num2. No leading zeroes are allowed and there is a limit of 1023 characters.

Syntax

```
DBMS_WORKLOAD_REPOSITORY.AWR_GLOBAL_DIFF_REPORT_TEXT (
    dbid1      IN      NUMBER,
    inst_num1  IN      AWRRPT_INSTANCE_LIST_TYPE,
    bid1       IN      NUMBER,
    eid1       IN      NUMBER,
    dbid2      IN      NUMBER,
    inst_num2  IN      AWRRPT_INSTANCE_LIST_TYPE,
    bid2       IN      NUMBER,
    eid2       IN      NUMBER)
RETURN awdrpt_text_type_table PIPELINED;
```

```
DBMS_WORKLOAD_REPOSITORY.AWR_GLOBAL_DIFF_REPORT_TEXT (
    dbid1      IN      NUMBER,
    inst_num1  IN      VARCHAR2,
    bid1       IN      NUMBER,
    eid1       IN      NUMBER,
    dbid2      IN      NUMBER,
    inst_num2  IN      VARCHAR2,
    bid2       IN      NUMBER,
    eid2       IN      NUMBER)
RETURN awdrpt_text_type_table PIPELINED;
```

Parameters

Table 199-17 AWR_GLOBAL_DIFF_REPORT_TEXT Functions Parameters

| Parameter | Description |
|-----------|--|
| dbid1 | 1st database identifier |
| inst_num1 | 1st list of instance numbers. If set to NULL, all instances for which begin and end snapshots are available, and which have not been restarted between snapshots, will be included in the report. |
| bid1 | 1st beginning snapshot ID |
| eid1 | 1st ending snapshot ID |
| dbid2 | 2nd database identifier |
| inst_num2 | 2nd list of instance numbers to be included in report. If set to NULL, all instances for which begin and end snapshots are available, and which have not been restarted between snapshots, will be included in the report. |
| bid2 | 2nd beginning snapshot ID |
| eid2 | 2nd ending snapshot ID |

Return Values

The output will be one column of VARCHAR2 (320).

199.3.12 AWR_GLOBAL_REPORT_HTML Functions

This table function displays the Global AWR report in HTML.

The first overload accepts a comma-separated list of instance numbers. No leading zeroes are allowed and there is a limit of 1023 characters.

Syntax

```
DBMS_WORKLOAD_REPOSITORY.AWR_GLOBAL_REPORT_HTML (
    l_dbid      IN    NUMBER,
    l_inst_num  IN    AWRRPT_INSTANCE_LIST_TYPE,
    l_bid       IN    NUMBER,
    l_eid       IN    NUMBER,
    l_options   IN    NUMBER DEFAULT 0)
RETURN awrrpt_html_type_table PIPELINED;
```

```
DBMS_WORKLOAD_REPOSITORY.AWR_GLOBAL_REPORT_HTML (
    l_dbid      IN    NUMBER,
    l_inst_num  IN    VARCHAR2,
    l_bid       IN    NUMBER,
    l_eid       IN    NUMBER,
    l_options   IN    NUMBER DEFAULT 0)
RETURN awrrpt_html_type_table PIPELINED;
```

Parameters

Table 199-18 *AWR_GLOBAL_REPORT_HTML Function Parameters*

| Parameter | Description |
|-------------------------|--|
| <code>l_dbid</code> | Database identifier |
| <code>l_inst_num</code> | List of instance numbers to be included in report. If set to <code>NULL</code> , all instances for which begin and end snapshots are available, and which have not been restarted between snapshots, will be included in the report. |
| <code>l_bid</code> | Beginning snapshot ID |
| <code>l_eid</code> | Ending snapshot ID |
| <code>l_options</code> | Report level (currently not used) |

Return Values

The output will be one column of `VARCHAR2(1500)`.

199.3.13 AWR_GLOBAL_REPORT_TEXT Functions

This table function displays the Global AWR report in text.

The first overload accepts a comma-separated list of instance numbers. No leading zeroes are allowed and there is a limit of 1023 characters

Syntax

```
DBMS_WORKLOAD_REPOSITORY.AWR_GLOBAL_REPORT_TEXT(
    l_dbid          IN    NUMBER,
    l_inst_num      IN    AWRRPT_INSTANCE_LIST_TYPE,
    l_bid           IN    NUMBER,
    l_eid           IN    NUMBER,
    l_options       IN    NUMBER DEFAULT 0)
RETURN awdrpt_text_type_table PIPELINED;
```

```
DBMS_WORKLOAD_REPOSITORY.AWR_GLOBAL_REPORT_TEXT(
    l_dbid          IN    NUMBER,
    l_inst_num      IN    VARCHAR2,
    l_bid           IN    NUMBER,
    l_eid           IN    NUMBER,
    l_options       IN    NUMBER DEFAULT 0)
RETURN awdrpt_text_type_table PIPELINED;
```

Parameters

Table 199-19 *AWR_GLOBAL_REPORT_TEXT Function Parameters*

| Parameter | Description |
|---------------------|---------------------|
| <code>l_dbid</code> | Database identifier |

Table 199-19 (Cont.) AWR_GLOBAL_REPORT_TEXT Function Parameters

| Parameter | Description |
|-------------------------|--|
| <code>l_inst_num</code> | List of instance numbers to be included in report. If set to <code>NULL</code> , all instances for which begin and end snapshots are available, and which have not been restarted between snapshots, will be included in the report. |
| <code>l_bid</code> | Beginning snapshot ID |
| <code>l_eid</code> | Ending snapshot ID |
| <code>l_options</code> | A flag to specify to control the output of the report. Currently, not used. |

Return Values

The output will be one column of `VARCHAR2 (320)`.

199.3.14 AWR_IMP Procedure

This procedure loads the AWR data from a dump file into the `SYS` schema.

Syntax

```
DBMS_WORKLOAD_REPOSITORY.AWR_IMP (
    dmpfile      IN   VARCHAR2   DEFAULT 'awrdat',
    dmpdir       IN   VARCHAR2   DEFAULT 'DATA_PUMP_DIR',
    new_dbid     IN   NUMBER     DEFAULT NULL);
```

Parameters

Table 199-20 AWR_IMP Procedure Parameters

| Parameter | Description |
|-----------------------|---|
| <code>dmpfile</code> | The prefix for the name of the dump file and log file. This file will be the source of the imported AWR data. The default value is <code>awrdat</code> . |
| <code>dmpdir</code> | The name of the Directory Object for the file system directory where the load dump file is located. The default value is <code>DATA_PUMP_DIR</code> . |
| <code>new_dbid</code> | The database ID to be used instead of existing database ID. |

199.3.15 AWR_REPORT_HTML Function

This table function displays the AWR report in HTML.

Syntax

```
DBMS_WORKLOAD_REPOSITORY.AWR_REPORT_HTML (
    l_dbid      IN   NUMBER,
    l_inst_num  IN   NUMBER,
    l_bid       IN   NUMBER,
    l_eid       IN   NUMBER,
```

```

l_options IN NUMBER DEFAULT 0)
RETURN awrrpt_text_type_table PIPELINED;

```

Parameters

Table 199-21 *AWR_REPORT_HTML Parameters*

| Parameter | Description |
|------------|--|
| l_dbid | Database identifier |
| l_inst_num | Instance number |
| l_bid | Beginning snapshot ID |
| l_eid | Ending snapshot ID |
| l_options | A flag to specify to control the output of the report. Currently, Oracle supports one value: <ul style="list-style-type: none"> l_options - 8. Displays the ADDM specific portions of the report. These sections include the Buffer Pool Advice, Shared Pool Advice, and PGA Target Advice. |

Return Values

The output will be one column of VARCHAR2 (1500).

Usage Notes

You can call the function directly but Oracle recommends you use the `awrrpt.sql` script which prompts users for the required information.

199.3.16 AWR_REPORT_TEXT Function

This table function displays the AWR report in text.

Syntax

```

DBMS_WORKLOAD_REPOSITORY.AWR_REPORT_TEXT (
  l_dbid      IN    NUMBER,
  l_inst_num  IN    NUMBER,
  l_bid       IN    NUMBER,
  l_eid       IN    NUMBER,
  l_options   IN    NUMBER DEFAULT 0)
RETURN awrrpt_text_type_table PIPELINED;

```

Parameters

Table 199-22 *AWR_REPORT_TEXT Parameters*

| Parameter | Description |
|------------|-----------------------|
| l_dbid | Database identifier |
| l_inst_num | Instance number |
| l_bid | Beginning snapshot ID |
| l_eid | Ending snapshot ID |

Table 199-22 (Cont.) AWR_REPORT_TEXT Parameters

| Parameter | Description |
|------------------------|---|
| <code>l_options</code> | A flag to specify to control the output of the report. Currently, Oracle supports one value: <ul style="list-style-type: none"> <code>l_options - 8</code>. Displays the ADDM specific portions of the report. These sections include the Buffer Pool Advice, Shared Pool Advice, and PGA Target Advice. |

Return Values

The output will be one column of `VARCHAR2 (80)`.

Usage Notes

You can call the function directly but Oracle recommends you use the `awrrpt.sql` script which prompts users for the required information.

199.3.17 AWR_SET_REPORT_THRESHOLDS Procedure

This procedure configure specified report thresholds, including the number of rows in the report.

Syntax

```
DBMS_WORKLOAD_REPOSITORY.AWR_SET_REPORT_THRESHOLDS (
  top_n_events      IN  NUMBER DEFAULT NULL,
  top_n_files       IN  NUMBER DEFAULT NULL,
  top_n_segments    IN  NUMBER DEFAULT NULL,
  top_n_services    IN  NUMBER DEFAULT NULL,
  top_n_sql          IN  NUMBER DEFAULT NULL,
  top_n_sql_max     IN  NUMBER DEFAULT NULL,
  top_sql_pct       IN  NUMBER DEFAULT NULL,
  shmem_threshold   IN  NUMBER DEFAULT NULL,
  versions_threshold IN  NUMBER DEFAULT NULL,
  top_n_disks       IN  NUMBER DEFAULT NULL,
  outlier_pct       IN  NUMBER DEFAULT NULL,
  outlier_cpu_pct   IN  NUMBER DEFAULT NULL);
```

Parameters

Table 199-23 AWR_SET_REPORT_THRESHOLDS Procedure Parameters

| Parameter | Description |
|-----------------------------|--|
| <code>top_n_events</code> | Number of most significant wait events to be included |
| <code>top_n_files</code> | Number of most active files to be included |
| <code>top_n_segments</code> | Number of most active segments to be included |
| <code>top_n_services</code> | Number of most active services to be included |
| <code>top_n_sql</code> | Number of most significant SQL statements to be included |
| <code>top_n_sql_max</code> | Number of SQL statements to be included if their activity is greater than that specified by <code>top_sql_pct</code> |

Table 199-23 (Cont.) AWR_SET_REPORT_THRESHOLDS Procedure Parameters

| Parameter | Description |
|--------------------|--|
| top_sql_pct | Significance threshold for SQL statements between top_n_sql and top_n_sql_max |
| shmem_threshold | Shared memory low threshold |
| versions_threshold | Plan version count low threshold |
| top_n_disks | Number of cell disks with most I/O |
| outlier_pct | Percentage of maximum capacity before displaying outliers for Exadata sections |
| outlier_cpu_pct | Threshold for mean percentage CPU to display outliers |

User Notes

- The effect of each setting depends on the type of report being generated as well as on the underlying AWR data. Not all settings are meaningful for each report type. Invalid settings (such as negative numbers) are ignored.
- Settings are effective only in the context of the session that executes the AWR_SET_REPORT_THRESHOLDS procedure. For example, to get a report that lists top 12 segments as compared to the default, one can invoke as follows:

```
DBMS_WORKLOAD_REPOSITORY.AWR_SET_REPORT_THRESHOLDS (top_n_segments=>12);
```

199.3.18 AWR_SQL_REPORT_HTML Function

This table function displays the AWR SQL Report in HTML format.

Syntax

```
DBMS_WORKLOAD_REPOSITORY.AWR_SQL_REPORT_HTML (
  l_dbid      IN    NUMBER,
  l_inst_num  IN    NUMBER,
  l_bid       IN    NUMBER,
  l_eid       IN    NUMBER,
  l_sqlid     IN    VARCHAR2,
  l_options   IN    NUMBER DEFAULT 0)
RETURN awrrpt_html_type_table PIPELINED;
```

Parameters**Table 199-24 AWR_SQL_REPORT_HTML Parameters**

| Parameter | Description |
|------------|------------------------------------|
| l_dbid | Database identifier |
| l_inst_num | Instance number |
| l_bid | Beginning snapshot ID |
| l_eid | Ending snapshot ID |
| l_sqlid | SQL ID of statement to be analyzed |

Table 199-24 (Cont.) AWR_SQL_REPORT_HTML Parameters

| Parameter | Description |
|------------------------|---|
| <code>l_options</code> | A flag to specify to control the output of the report. Currently, not used. |

Return Values

The output will be one column of `VARCHAR2 (500)`.

Usage Notes

You can call the function directly but Oracle recommends you use the `awrsqrpt.sql` script which prompts users for the required information.

199.3.19 AWR_SQL_REPORT_TEXT Function

This table function displays the AWR SQL Report in text format.

Syntax

```
DBMS_WORKLOAD_REPOSITORY.AWR_SQL_REPORT_TEXT (
    l_dbid      IN    NUMBER,
    l_inst_num  IN    NUMBER,
    l_bid       IN    NUMBER,
    l_eid       IN    NUMBER,
    l_sqlid     IN    VARCHAR2,
    l_options   IN    NUMBER DEFAULT 0)
RETURN awrrpt_text_type_table PIPELINED;
```

Parameters

Table 199-25 AWR_SQL_REPORT_TEXT Parameters

| Parameter | Description |
|-------------------------|---|
| <code>l_dbid</code> | Database identifier |
| <code>l_inst_num</code> | Instance number |
| <code>l_bid</code> | Beginning snapshot ID |
| <code>l_eid</code> | Ending snapshot ID |
| <code>l_sqlid</code> | SQL ID of statement to be analyzed |
| <code>l_options</code> | Flag to specify to control the output of the report. Currently, not used. |

Return Values

The output will be one column of `VARCHAR2 (120)`.

Usage Notes

You can call the function directly but Oracle recommends you use the `awrsqrpt.sql` script which prompts users for the required information.

199.3.20 CONTROL_RESTRICTED_SNAPSHOT Procedure

This procedure controls the AWR snapshot creation for a database in the *restricted session* mode. If this procedure is not used, then by default, the AWR snapshots cannot be created for a database in the *restricted session* mode. This procedure affects the local database on which it is executed.

Note:

To enable AWR snapshot creation for an Oracle RAC in the *restricted session* mode, this procedure must be executed on every database instance in the Oracle RAC.

Syntax

```
DBMS_WORKLOAD_REPOSITORY.CONTROL_RESTRICTED_SNAPSHOT (
    allow IN BOOLEAN);
```

Parameters

Table 199-26 CONTROL_RESTRICTED_SNAPSHOT Parameters

| Parameter | Description |
|-----------|---|
| allow | This parameter can have one of the following values: <ul style="list-style-type: none"> TRUE: AWR snapshots can be created for the database in the <i>restricted session</i> mode. FALSE: AWR snapshots cannot be created for the database in the <i>restricted session</i> mode. |

199.3.21 CREATE_BASELINE Functions and Procedures

This function and procedure creates a baseline.

Syntax

```
DBMS_WORKLOAD_REPOSITORY.CREATE_BASELINE (
    start_snap_id    IN NUMBER,
    end_snap_id      IN NUMBER,
    baseline_name    IN VARCHAR2,
    dbid              IN NUMBER DEFAULT NULL,
    expiration       IN NUMBER DEFAULT NULL);
```

```
DBMS_WORKLOAD_REPOSITORY.CREATE_BASELINE (
    start_snap_id    IN NUMBER,
    end_snap_id      IN NUMBER,
    baseline_name    IN VARCHAR2,
    dbid              IN NUMBER DEFAULT NULL,
    expiration       IN NUMBER DEFAULT NULL)
RETURN NUMBER;
```

```
DBMS_WORKLOAD_REPOSITORY.CREATE_BASELINE (
    start_time       IN DATE,
```

```

end_time          IN DATE,
baseline_name    IN VARCHAR2,
dbid              IN NUMBER DEFAULT NULL,
expiration       IN NUMBER DEFAULT NULL);

DBMS_WORKLOAD_REPOSITORY.CREATE_BASELINE(
  start_time      IN DATE,
  end_time        IN DATE,
  baseline_name   IN VARCHAR2,
  dbid            IN NUMBER DEFAULT NULL,
  expiration      IN NUMBER DEFAULT NULL);
RETURN NUMBER;
```

Parameters

Table 199-27 CREATE_BASELINE Function & Procedure Parameters

| Parameter | Description |
|---------------|---|
| start_snap_id | Start snapshot sequence number for the baseline. |
| end_snap_id | End snapshot sequence number for the baseline. |
| start_time | Start time for the baseline. |
| end_time | End time for the baseline. |
| baseline_name | Name of baseline. |
| dbid | Database Identifier for baseline. If NULL, this takes the database identifier for the local database. Defaults to NULL. |
| expiration | Expiration in number of days for the baseline. If NULL, then expiration is infinite, meaning do not drop baseline ever. Defaults to NULL. |

Exceptions

- An error will be returned if this baseline name already exists in the system.
- The snapshot range that is specified for this interface must be an existing pair of snapshots in the database. An error will be returned if the inputted snapshots do not exist in the system.

Examples

This example creates a baseline (named 'oltp_peakload_bl') between snapshots 105 and 107 for the local database:

```
EXECUTE DBMS_WORKLOAD_REPOSITORY.CREATE_BASELINE (start_snap_id => 105,
                                                    end_snap_id   => 107,
                                                    baseline_name =>
'oltp_peakload_bl');
```

If you query the DBA_HIST_BASELINE view after the CREATE BASELINE action, you will see the newly created baseline in the Workload Repository.

199.3.22 CREATE_BASELINE_TEMPLATE Procedures

This procedure specifies a template for how they would like baselines to be created for future time periods.

Syntax

Specifies a template for generating a baseline for a single time period in the future.

```
DBMS_WORKLOAD_REPOSITORY.CREATE_BASELINE_TEMPLATE (
  start_time          IN DATE,
  end_time            IN DATE,
  baseline_name       IN VARCHAR2,
  template_name       IN VARCHAR2,
  expiration          IN NUMBER,
  dbid                IN NUMBER  DEFAULT NULL);
```

Specifies a template for creating and dropping baseline based on repeating time periods:

```
DBMS_WORKLOAD_REPOSITORY.CREATE_BASELINE_TEMPLATE (
  day_of_week         IN VARCHAR2,
  hour_in_day         IN NUMBER,
  duration            IN NUMBER,
  start_time          IN DATE,
  end_time            IN DATE,
  baseline_name_prefix IN VARCHAR2,
  template_name       IN VARCHAR2,
  expiration          IN NUMBER,
  dbid                IN NUMBER  DEFAULT NULL);
```

Parameters

Table 199-28 CREATE_BASELINE_TEMPLATE Procedure Parameters

| Parameter | Description |
|----------------------|--|
| start_time | Start Time for the baseline to be created' |
| end_time | End Time for the baseline to be created |
| baseline_name | Name of baseline to be created |
| template_name | Name for the template |
| expiration | Expiration in number of days for the baseline. If NULL, then expiration is infinite, meaning do not drop baseline ever. Defaults to NULL |
| dbid | Database ID for which the baseline template needs to be used. If NULL, this takes the database identifier of the local database. Defaults to NULL. |
| day_of_week | Day of week that the baseline should repeat on. Specify one of the following values: SUNDAY, MONDAY, TUESDAY, WEDNESDAY, THURSDAY, FRIDAY, SATURDAY. |
| hour_in_day | Value of 0-23 to specify the Hour in the Day the baseline should start |
| duration | Duration (in number of hours) after hour in the day that the baseline should last |
| baseline_name_prefix | Name for baseline prefix. When creating the baseline, the name of the baseline will be the prefix appended with the date information. |

199.3.23 CREATE_REMOTE_SNAPSHOT Function and Procedure

This function and procedure create a remote snapshot using the Remote Management Framework (RMF). The function returns the snapshot ID.

Note:

A multitenant container database is the only supported architecture in Oracle Database 20c. While the documentation is being revised, legacy terminology may persist. In most cases, "database" and "non-CDB" refer to a CDB or PDB, depending on context. In some contexts, such as upgrades, "non-CDB" refers to a non-CDB from a previous release.

Syntax

```
DBMS_WORKLOAD_REPOSITORY.CREATE_REMOTE_SNAPSHOT(
    node_id      IN NUMBER,
    flush_level  IN VARCHAR2 DEFAULT 'BESTFIT');
```

```
DBMS_WORKLOAD_REPOSITORY.CREATE_REMOTE_SNAPSHOT(
    node_id      IN NUMBER,
    flush_level  IN VARCHAR2 DEFAULT 'BESTFIT')
RETURN NUMBER;
```

```
DBMS_WORKLOAD_REPOSITORY.CREATE_REMOTE_SNAPSHOT(
    node_name    IN VARCHAR2,
    topology_name IN VARCHAR2 DEFAULT NULL,
    flush_level  IN VARCHAR2 DEFAULT 'BESTFIT');
```

```
DBMS_WORKLOAD_REPOSITORY.CREATE_REMOTE_SNAPSHOT(
    node_name    IN VARCHAR2,
    topology_name IN VARCHAR2 DEFAULT NULL,
    flush_level  IN VARCHAR2 DEFAULT 'BESTFIT')
RETURN NUMBER;
```

Parameters

Table 199-29 CREATE_REMOTE_SNAPSHOT Parameters

| Parameter | Description |
|---------------|---|
| node_id | RMF node identifier of the database for which the snapshot needs to be created. |
| node_name | RMF node name of the database for which the snapshot needs to be created. |
| topology_name | RMF topology name of the database for which the snapshot needs to be created. |

Table 199-29 (Cont.) CREATE_REMOTE_SNAPSHOT Parameters

| Parameter | Description |
|-------------|--|
| flush_level | <p>The flush level can be one of the following:</p> <ul style="list-style-type: none"> • BESTFIT: Uses the default value depending on the type of snapshot being taken. • LITE: Lightweight snapshot. Only the most important statistics are collected. This is default for a pluggable database (PDB) and application container. • TYPICAL: Regular snapshot. Most of the statistics are collected. This is default for a container database root (CDB root) and non-CDB database. • ALL: Heavyweight snapshot. All the possible statistics are collected. This consumes a considerable amount of disk space and takes a long time to create. |

Examples

This example creates a remote snapshot of the database having the RMF node identifier of 10:

```
EXECUTE DBMS_WORKLOAD_REPOSITORY.CREATE_REMOTE_SNAPSHOT(10);
```

If you query the `DBA_HIST_SNAPSHOT` view after executing the above procedure, you will see a new snapshot record added to the Automatic Workload Repository (AWR).

199.3.24 CREATE_SNAPSHOT Function and Procedure

This function and procedure create a snapshot. The function returns the snapshot ID. If both, the database ID and the database name are not specified in this subprogram, then the snapshot is created for the local database on which the subprogram is executed.

Note:

A multitenant container database is the only supported architecture in Oracle Database 20c. While the documentation is being revised, legacy terminology may persist. In most cases, "database" and "non-CDB" refer to a CDB or PDB, depending on context. In some contexts, such as upgrades, "non-CDB" refers to a non-CDB from a previous release.

Syntax

```
DBMS_WORKLOAD_REPOSITORY.CREATE_SNAPSHOT(
  flush_level IN VARCHAR2 DEFAULT 'BESTFIT',
  dbid        IN NUMBER   DEFAULT NULL,
  source_name IN VARCHAR2 DEFAULT NULL);
```

```

DBMS_WORKLOAD_REPOSITORY.CREATE_SNAPSHOT(
    flush_level IN VARCHAR2 DEFAULT 'BESTFIT',
    dbid        IN NUMBER   DEFAULT NULL,
    source_name IN VARCHAR2 DEFAULT NULL)
RETURN NUMBER;

```

Parameters

Table 199-30 CREATE_SNAPSHOT Parameters

| Parameter | Description |
|-------------|--|
| flush_level | <p>The flush level can be one of the following:</p> <ul style="list-style-type: none"> • BESTFIT: Uses the default value depending on the type of snapshot being taken. • LITE: Lightweight snapshot. Only the most important statistics are collected. This is default for a pluggable database (PDB) and application container. • TYPICAL: Regular snapshot. Most of the statistics are collected. This is default for a container database root (CDB root) and non-CDB database. • ALL: Heavyweight snapshot. All the possible statistics are collected. This consumes a considerable amount of disk space and takes a long time to create. |
| dbid | Database ID of the database for which the snapshot needs to be created. |
| source_name | Name of the database for which the snapshot needs to be created. |

Examples

This example creates a snapshot of the local database with the flush level of `ALL`:

```
EXECUTE DBMS_WORKLOAD_REPOSITORY.CREATE_SNAPSHOT('ALL');
```

If you query the `DBA_HIST_SNAPSHOT` view after executing the above procedure, you will see a new snapshot record added to the Automatic Workload Repository (AWR).

199.3.25 DROP_BASELINE Procedure

This procedure drops a previously-defined baseline.

Syntax

```

DBMS_WORKLOAD_REPOSITORY.DROP_BASELINE(
    baseline_name IN VARCHAR2,
    cascade       IN BOOLEAN  DEFAULT FALSE,
    dbid          IN NUMBER   DEFAULT NULL);

```

Parameters

Table 199-31 DROP_BASELINE Parameters

| Parameter | Description |
|---------------|--|
| baseline_name | Name of baseline to drop from the system |
| cascade | If TRUE, the pair of snapshots associated with the baseline will also be dropped. Otherwise, only the baseline is removed. |
| dbid | Database ID for which the baseline needs to be dropped (defaults to local DBID). |

Examples

This example drops the baseline 'oltp_peakload_bl' without dropping the underlying snapshots:

```
EXECUTE DBMS_WORKLOAD_REPOSITORY.DROP_BASELINE (
    baseline_name => 'oltp_peakload_bl');
```

If you query the DBA_HIST_BASELINE view after the DROP_BASELINE action, you will see the specified baseline definition is removed. You can query the DBA_HIST_SNAPSHOT view to find that the underlying snapshots are left intact.

199.3.26 DROP_BASELINE_TEMPLATE Procedure

This procedure removes a template that is no longer needed.

Syntax

```
DBMS_WORKLOAD_REPOSITORY.DROP_BASELINE_TEMPLATE (
    template_name    IN VARCHAR2,
    dbid             IN NUMBER    DEFAULT NULL);
```

Parameters

Table 199-32 DROP_BASELINE_TEMPLATE Procedure Parameters

| Parameter | Description |
|---------------|---|
| template_name | Name of the template to remove |
| dbid | Database ID for which the baseline template needs to be dropped. If NULL, this takes the database identifier of the local database. Defaults to NULL. |

199.3.27 DROP_SNAPSHOT_RANGE Procedure

This procedure drops a range of snapshots.

Syntax

```
DBMS_WORKLOAD_REPOSITORY.DROP_SNAPSHOT_RANGE (
    low_snap_id     IN NUMBER,
```

```

high_snap_id IN NUMBER,
dbid         IN NUMBER  DEFAULT NULL);

```

Parameters

Table 199-33 DROP_SNAPSHOT_RANGE Procedure Parameters

| Parameter | Description |
|--------------|--|
| low_snap_id | Low snapshot id of snapshots to drop. |
| high_snap_id | High snapshot id of snapshots to drop. |
| dbid | Database id (defaults to local DBID). |

Examples

This example drops the range of snapshots between snapshot id 102 to 105 for the local database:

```
EXECUTE DBMS_WORKLOAD_REPOSITORY.DROP_SNAPSHOT_RANGE(102, 105);
```

If you query the `dba_hist_snapshot` view after the Drop Snapshot action, you will see that snapshots 102 to 105 are removed from the Workload Repository.

199.3.28 LOCAL_AWR_DBID Function

This function returns the database identifier for the local AWR database.

Syntax

```

DBMS_WORKLOAD_REPOSITORY.LOCAL_AWR_DBID()
RETURN NUMBER;

```

199.3.29 MODIFY_BASELINE_WINDOW_SIZE Procedure

This procedure modifies the window size for the Default Moving Window Baseline.

Syntax

```

DBMS_WORKLOAD_REPOSITORY.MODIFY_BASELINE_WINDOW_SIZE(
    window_size IN NUMBER,
    dbid         IN NUMBER  DEFAULT NULL);

```

Parameters

Table 199-34 MODIFY_BASELINE_WINDOW_SIZE Procedure Parameters

| Parameter | Description |
|-------------|--|
| window_size | New Window size for the default Moving Window Baseline, in number of days. |
| dbid | Database ID (defaults to local DBID). |

Usage Notes

The window size must be less than or equal to the AWR retention setting. If the window size needs to be greater than the retention setting, the [MODIFY_SNAPSHOT_SETTINGS Procedures](#) can be used to adjust the retention setting. A moving window can be set to a maximum of 13 weeks.

199.3.30 MODIFY_SNAPSHOT_SETTINGS Procedures

This procedure controls three aspects of snapshot generation.

- The `INTERVAL` setting affects how often snapshots are automatically captured.
- The `RETENTION` setting affects how long snapshots are retained in the Workload Repository.
- The number of SQL captured for each Top criteria. If the user manually specifies a value for Top N SQL, the AWR SQL collection will use the user-specified number for both automatic and manual snapshots.

There are two overloads. The first takes a `NUMBER` and the second takes a `VARCHAR2` for the `topnsql` argument. The differences are described under the Parameters description.

Syntax

```
DBMS_WORKLOAD_REPOSITORY.MODIFY_SNAPSHOT_SETTINGS (
    retention      IN NUMBER      DEFAULT NULL,
    interval       IN NUMBER      DEFAULT NULL,
    topnsql        IN NUMBER      DEFAULT NULL,
    dbid           IN NUMBER      DEFAULT NULL,
    export_option  IN VARCHAR2    DEFAULT NULL,
    tablespace     IN VARCHAR2    DEFAULT NULL);
```

```
DBMS_WORKLOAD_REPOSITORY.MODIFY_SNAPSHOT_SETTINGS (
    retention      IN NUMBER      DEFAULT NULL,
    interval       IN NUMBER      DEFAULT NULL,
    topnsql        IN VARCHAR2,
    dbid           IN NUMBER      DEFAULT NULL,
    export_option  IN VARCHAR2    DEFAULT NULL,
    tablespace     IN VARCHAR2    DEFAULT NULL);
```

Parameters

Table 199-35 MODIFY_SNAPSHOT_SETTINGS Procedure Parameters

| Parameter | Description |
|------------------------|---|
| <code>retention</code> | <p>New retention time (in minutes). The specified value must be in the range of <code>MIN_RETENTION</code> (1 day) to <code>MAX_RETENTION</code> (100 years).</p> <p>If <code>ZERO</code> is specified, snapshots will be retained forever. A large system-defined value will be used as the retention setting.</p> <p>If <code>NULL</code> is specified, the old value for retention is preserved.</p> <p>NOTE: The retention setting must be greater than or equal to the window size of the 'SYSTEM_MOVING_WINDOW' baseline. If the retention needs to be less than the window size, the MODIFY_BASELINE_WINDOW_SIZE Procedure can be used to adjust the window size.</p> |

Table 199-35 (Cont.) MODIFY_SNAPSHOT_SETTINGS Procedure Parameters

| Parameter | Description |
|---------------|---|
| interval | <p>New interval setting between each snapshot, in units of minutes. The specified value must be in the range MIN_INTERVAL (10 minutes) to MAX_INTERVAL (1 year).</p> <p>If ZERO is specified, automatic and manual snapshots will be disabled. A large system-defined value will be used as the retention setting.</p> <p>If NULL is specified, the current value is preserved.</p> |
| topnsql | <ul style="list-style-type: none"> • If NUMBER: Top N SQL size. The number of Top SQL to flush for each SQL criteria (Elapsed Time, CPU Time, Parse Calls, Shareable Memory, Version Count). The value for this setting will not be affected by the statistics/flush level and will override the system default behavior for the AWR SQL collection. The setting will have a minimum value of 30 and a maximum value of 50,000. Specifying NULL will keep the current setting. • If VARCHAR2: Users are allowed to specify the following values: (DEFAULT, MAXIMUM, N), where N is the number of Top SQL to flush for each SQL criteria. Specifying DEFAULT will revert the system back to the default behavior of Top 30 for statistics level TYPICAL and Top 100 for statistics level ALL. Specifying MAXIMUM will cause the system to capture the complete set of SQL in the cursor cache. Specifying the number N is equivalent to setting the Top N SQL with the NUMBER type. Specifying NULL for this argument will keep the current setting. |
| dbid | <p>Database identifier in AWR for which to modify the snapshot settings. If NULL is specified, the local dbid will be used. Defaults to NULL.</p> |
| export_option | <p>Specifies the AWR export option. The possible values are:</p> <ul style="list-style-type: none"> • NULL or ALL—all AWR tables • TYPICAL—typical set of AWR tables • SAFE_TYPICALtypical set of AWR tables without sensitive data • LITE—a minimal set of AWR tables • SAFE_LITE—a minimal set of AWR tables without sensitive data |
| tablespace | <p>Specify a user-defined tablespace for storing AWR data (snapshot data). If this parameter is not used, then AWR data is stored in the SYSAUX tablespace by default.</p> |

Examples

This example changes the `interval` setting to one hour and the `retention` setting to two weeks for the local database:

```
EXECUTE DBMS_WORKLOAD_REPOSITORY.MODIFY_SNAPSHOT_SETTINGS (
  interval => 60,
  retention => 20160);
```

If you query the `DBA_HIST_WR_CONTROL` table after this procedure is executed, you will see the changes to these settings.

199.3.31 PURGE_SQL_DETAILS Procedure

This procedure purges SQL details, specifically rows from WRH\$_SQLTEXT, WRH\$_SQL_PLAN, and WRH\$_SQL_BIND_METADATA that do not have corresponding rows (DBID, SQL_ID) in WRH\$_SQLSTAT.

The subprogram calls for the DBID for which to run the purge. If the DBID is not specified, the database DBID is used. You can constrain runtime by specifying the maximum number of rows to purge per table. If no maximum is specified, the subprograms tries to purge all applicable rows.

Syntax

```
DBMS_WORKLOAD_REPOSITORY.PURGE_SQL_DETAILS (
    numrows IN NUMBER DEFAULT NULL,
    dbid    IN NUMBER DEFAULT NULL);
```

Parameters

Table 199-36 PURGE_SQL_DETAILS Procedure Parameters

| Parameter | Description |
|-----------|-------------------------------------|
| numrows | Number of rows |
| dbid | Database ID (default to local DBID) |

199.3.32 REGISTER_REMOTE_DATABASE Procedures

This procedure registers a remote database in the Automatic Workload Repository (AWR) using the Remote Management Framework (RMF).

Syntax

```
DBMS_WORKLOAD_REPOSITORY.REGISTER_REMOTE_DATABASE (
    node_id IN NUMBER);

DBMS_WORKLOAD_REPOSITORY.REGISTER_REMOTE_DATABASE (
    node_name      IN VARCHAR2,
    topology_name  IN VARCHAR2 DEFAULT NULL);
```

Parameters

Table 199-37 REGISTER_REMOTE_DATABASE Parameters

| Parameter | Description |
|---------------|---|
| node_id | RMF node identifier of the database that needs to be registered in the AWR. |
| node_name | RMF node name of the database that needs to be registered in the AWR. |
| topology_name | RMF topology name of the database that needs to be registered in the AWR. |

Examples

This example registers the remote database having the RMF node identifier of 10 in the AWR:

```
EXECUTE DBMS_WORKLOAD_REPOSITORY.REGISTER_REMOTE_DATABASE(10);
```

199.3.33 REMOVE_COLORED_SQL Procedure

This procedure removes a colored SQL ID. After a SQL is uncolored, it will no longer be captured in a snapshot automatically, unless it makes the TOP list.

Syntax

```
DBMS_WORKLOAD_REPOSITORY.REMOVE_COLORED_SQL(
  sql_id      IN VARCHAR2,
  dbid       IN NUMBER DEFAULT NULL);
```

Parameters

Table 199-38 REMOVE_COLORED_SQL Procedure Parameters

| Parameter | Description |
|-----------|---------------------------------------|
| sql_id | 13-character external SQL ID |
| dbid | Optional dbid, defaults to Local DBID |

199.3.34 RENAME_BASELINE Procedure

This procedure renames a baseline.

Syntax

```
DBMS_WORKLOAD_REPOSITORY.RENAME_BASELINE(
  old_baseline_name  IN VARCHAR2,
  new_baseline_name  IN VARCHAR2,
  dbid              IN NUMBER  DEFAULT NULL);
```

Parameters

Table 199-39 RENAME_BASELINE Procedure Parameters

| Parameter | Description |
|-------------------|--|
| old_baseline_name | Old baseline name. |
| new_baseline_name | New baseline name. |
| dbid | Database ID for which the baseline needs to be renamed (defaults to local DBID). |

199.3.35 SELECT_BASELINE_DETAILS Function

This table function shows the values of the metrics corresponding to a baseline for a range of snapshots.

This table function returns an object of [AWR_BASELINE_METRIC_TYPE Object Type](#).

Syntax

```
DBMS_WORKLOAD_REPOSITORY.SELECT_BASELINE_DETAILS(  
    l_baseline_id    IN NUMBER,  
    l_begin_snap     IN NUMBER DEFAULT NULL,  
    l_end_snap       IN NUMBER DEFAULT NULL,  
    l_dbid           IN NUMBER DEFAULT NULL)  
RETURN awrbl_details_type_table PIPELINED;
```

Parameters

Table 199-40 SELECT_BASELINE_DETAILS Function Parameters

| Parameter | Description |
|---------------|--|
| l_baseline_id | ID of the baseline for which the statistics need to be retrieved. Specifying the value 0 returns the statistics for the moving window baseline. |
| l_begin_snap | Start snapshot sequence number for the baseline. |
| l_end_snap | End snapshot sequence number for the baseline. |
| l_dbid | Database identifier for the baseline. If its value is set to NULL, then the database identifier for the local database is used. Its default value is NULL. |

199.3.36 SELECT_BASELINE_METRIC Function

This table function shows the values of the metrics corresponding to a baseline for all the snapshots.

This table function returns an object of [AWR_BASELINE_METRIC_TYPE Object Type](#).

Syntax

```
DBMS_WORKLOAD_REPOSITORY.SELECT_BASELINE_METRIC(  
    l_baseline_name  IN VARCHAR2,  
    l_dbid           IN NUMBER DEFAULT NULL,  
    l_instance_num   IN NUMBER DEFAULT NULL)  
RETURN awr_metric_type_table PIPELINED;
```

Parameters

Table 199-41 SELECT_BASELINE_METRIC Function Parameters

| Parameter | Description |
|-----------------|---|
| l_baseline_name | Name of the baseline for which the metrics need to be viewed. |

Table 199-41 (Cont.) SELECT_BASELINE_METRIC Function Parameters

| Parameter | Description |
|-----------------------------|--|
| <code>l_dbid</code> | Database identifier for the baseline. If set to <code>NULL</code> , the database identifier for the local database is used. Default is <code>NULL</code> . |
| <code>l_instance_num</code> | The instance number for which the metrics need to be viewed. If set to <code>NULL</code> , metrics for the local database instance are shown. Default is <code>NULL</code> . |

199.3.37 UNREGISTER_REMOTE_DATABASE Procedures

This procedure removes all the statistics, metadata, partitions, and so on of a remote database from the Automatic Workload Repository (AWR). After executing this procedure, the remote database cannot be used for any AWR operations, such as creating remote snapshots.

Syntax

```
DBMS_WORKLOAD_REPOSITORY.UNREGISTER_REMOTE_DATABASE (
    node_id          IN NUMBER,
    remote_check     IN BOOLEAN  DEFAULT TRUE);
```

```
DBMS_WORKLOAD_REPOSITORY.UNREGISTER_REMOTE_DATABASE (
    node_name       IN VARCHAR2,
    topology_name   IN VARCHAR2  DEFAULT NULL,
    remote_check     IN BOOLEAN  DEFAULT TRUE);
```

Parameters

Table 199-42 UNREGISTER_REMOTE_DATABASE Parameters

| Parameter | Description |
|----------------------------|---|
| <code>node_id</code> | Identifier of the remote database whose data needs to be removed from the AWR. |
| <code>node_name</code> | Name of the remote database whose data needs to be removed from the AWR. |
| <code>topology_name</code> | RMF topology name of the remote database. |
| <code>remote_check</code> | If set to <code>TRUE</code> , the remote database's metadata is validated before removing its data from the AWR. This option requires the remote database to be available. If set to <code>FALSE</code> , the remote database's data is removed from the AWR without validating its metadata. This option must be selected to unregister a remote database that is not available (it is offline or there is a network outage). |

Examples

This example removes the AWR data related to the remote database having the database identifier of 10:

```
EXECUTE DBMS_WORKLOAD_REPOSITORY.UNREGISTER_REMOTE_DATABASE (10);
```

199.3.38 UPDATE_DATAFILE_INFO Procedure

This procedure updates the data file and tablespace information stored in the Automatic Workload Repository (AWR) with the current information in the database. This procedure is useful when a data file or a tablespace has been moved or renamed. As this change is not always captured in the next snapshot, AWR report may not show the most current information.

Syntax

```
DBMS_WORKLOAD_REPOSITORY.UPDATE_DATAFILE_INFO();
```

199.3.39 UPDATE_OBJECT_INFO Procedure

This procedure updates rows of WRH\$_SEG_STAT_OBJ table that represent objects in the local database. It attempts to determine the current names for all object belonging to the local database, except those with 'MISSING' and/or 'TRANSIENT' values in the name columns.

The amount of work performed at each invocation of this routine may be controlled by setting the input parameter.

Syntax

```
DBMS_WORKLOAD_REPOSITORY.UPDATE_OBJECT_INFO(  
    maxrows IN NUMBER DEFAULT 0);
```

Parameters

Table 199-43 UPDATE_OBJECT_INFO Procedure Parameters

| Parameter | Description |
|-----------|--|
| maxrows | Maximum number of rows to be updated. Default= 0, meaning there is no limit. |

The `DBMS_XA` package contains the XA/Open interface for applications to call XA interface in PL/SQL. Using this package, application developers can switch or share transactions across SQL*Plus sessions or processes using PL/SQL.

The chapter contains the following topics:

- [Overview](#)
- [Security Model](#)
- [Constants](#)
- [Operational Notes](#)
- [Data Structures](#)
- [Summary of DBMS_XA Subprograms](#)

See Also:

Oracle Database Advanced Application Developer's Guide for more information about "Developing Applications with Oracle XA"

200.1 DBMS_XA Overview

These subprograms allow a PL/SQL application to define a global transaction branch ID (`XID`) and associate or disassociate the current session with the transaction branch.

Subsequently, these transaction branches may be prepared and committed by following the two-phase commit protocol. A single-phase commit protocol is also supported if only one resource manager is involved.

Interfaces are also provided for a PL/SQL application to set the timeout values for any new global transaction branches that may start with the current session.

200.2 DBMS_XA Security Model

This package is created under `SYS`. Operations provided by this package are performed under the current calling user, not under the package owner `SYS`. Any `DBMS_XA` subprogram called from an anonymous PL/SQL block is executed using the privileges of the current user. Any `DBMS_XA` subprogram called from a stored procedure is executed using the privileges of the owner of the stored procedure.

`SELECT` or `READ` privilege on `SYS.DBA_PENDING_TRANSACTIONS` is required for users who need to execute `XA_RECOVER` subprogram.

FORCE ANY TRANSACTION privilege is required for users who need to manipulate XA transactions created by other users.

200.3 DBMS_XA Constants

The DBMS_XA package defines several constants that can be used for specifying parameter values.

The package uses the constants shown in [Table 200-1](#) for use in the flag field of the [XA_START Function](#) and the [XA_END Function](#).

Table 200-1 DBMS_XA Constants for Flag Field of XA_START & XA_END Functions

| Name | Type | Value | Description |
|-----------|-------------|--|---|
| TMNOFLAGS | PLS_INTEGER | 00000000 | Indicates no flag value is selected. |
| TMSUCCESS | PLS_INTEGER | UTL_RAW.CAST_TO_BINARY_INTEGER('04000000') | Dissociates caller from transaction branch |
| TMJOIN | PLS_INTEGER | UTL_RAW.CAST_TO_BINARY_INTEGER('00200000') | Caller is joining existing transaction branch. |
| TMSUSPEND | PLS_INTEGER | UTL_RAW.CAST_TO_BINARY_INTEGER('02000000') | Caller is suspending, not ending, association |
| TMRESUME | PLS_INTEGER | UTL_RAW.CAST_TO_BINARY_INTEGER('08000000') | Caller is resuming association with suspended transaction branch. |

The DBMS_XA package uses the constants shown in [Table 200-2](#) for Possible Return Values

Table 200-2 DBMS_XA Constants for Possible Return Values

| Name | Type | Value | Description |
|----------------|-------------|-------------|---|
| XA_RBBASE | PLS_INTEGER | 100 | Inclusive lower bound of the rollback codes |
| XA_RBROLLBACK | PLS_INTEGER | XA_RBBASE | Rollback was caused by an unspecified reason |
| XA_RBCOMMFAIL | PLS_INTEGER | XA_RBBASE+1 | Rollback was caused by a communication failure |
| XA_RBDEADLOCK | PLS_INTEGER | XA_RBBASE+2 | Deadlock was detected |
| XA_RBINTEGRITY | PLS_INTEGER | XA_RBBASE+3 | Condition that violates the integrity of the resources was detected |
| XA_RBOTHER | PLS_INTEGER | XA_RBBASE+4 | Resource manager rolled back the transaction for an unlisted reason |

Table 200-2 (Cont.) DBMS_XA Constants for Possible Return Values

| Name | Type | Value | Description |
|----------------|-------------|----------------|--|
| XA_RBPROTO | PLS_INTEGER | XA_RBBASE+5 | Protocol error occurred in the resource manager |
| XA_RBTIMEOUT | PLS_INTEGER | XA_RBBASE+6 | transaction branch took long |
| XA_RBTRANSIENT | PLS_INTEGER | XA_RBBASE+7 | May retry the transaction branch |
| XA_RBEND | PLS_INTEGER | XA_RBTRANSIENT | Inclusive upper bound of the rollback codes |
| XA_NOMIGRATE | PLS_INTEGER | 9 | Transaction branch may have been heuristically completed |
| XA_HEURHAZ | PLS_INTEGER | 8 | Transaction branch may have been heuristically completed |
| XA_HEURCOM | PLS_INTEGER | 7 | Transaction branch has been heuristically committed |
| XA_HEURRB | PLS_INTEGER | 6 | Transaction branch has been heuristically rolled back |
| XA_HEURMIX | PLS_INTEGER | 5 | Some of the transaction branches have been heuristically committed, others rolled back |
| XA_RETRY | PLS_INTEGER | 4 | Routine returned with no effect and may be re-issued |
| XA_RDONLY | PLS_INTEGER | 3 | Transaction was read-only and has been committed |
| XA_OK | PLS_INTEGER | 0 | Normal execution |
| XAER_ASYNC | PLS_INTEGER | -2 | Asynchronous operation already outstanding |
| XAER_RMERR | PLS_INTEGER | -3 | Resource manager error occurred in the transaction branch |
| XAER_NOTA | PLS_INTEGER | -4 | XID is not valid |
| XAER_INVALID | PLS_INTEGER | -5 | Invalid arguments were given |
| XAER_PROTO | PLS_INTEGER | -6 | Routine invoked in an improper context |
| XAER_RMFAIL | PLS_INTEGER | -7 | Resource manager unavailable |
| XAER_DUPID | PLS_INTEGER | -8 | XID already exists |
| XAER_OUTSIDE | PLS_INTEGER | -9 | Resource manager doing work outside global transaction |

200.4 DBMS_XA Operational Notes

In compliance with the XA specification of the X/Open CAE Standard for Distributed Transaction Processing, `XA_PREPARE/COMMIT/ROLLBACK/FORGET` may not be called when the transaction is still associated with the current session. Only after `XA_END` has been called so

that there is not any transaction associated with the current session, the application may call `XA_PREPARE/COMMIT/ROLLBACK/FORGET`.

`XAER_PROTO` error is returned from `XA_PREPARE/COMMIT/ROLLBACK/FORGET` if a transaction is being associated with the current session.

Prior to calling any of the package subprograms, a connection/session must have already been established to the Oracle database server backend, or a resource manager. Resource manager identifiers are not supported. If multiple resource managers are involved, multiple connections/sessions must be pre-established to each resource manager before calling any the package subprograms. If multiple connections/sessions are established during the course of global transaction processing, the caller must ensure that all of those connections/sessions associated with a specific global transaction branch identifier (XID) are established to the same resource manager.

200.5 DBMS_XA Data Structures

The `DBMS_XA` package uses this `OBJECT` type and associated `TABLE` type.

OBJECT Types

- [DBMS_XA_XID Object Type](#)

TABLE Types

- [DBMS_XA_XID_ARRAY Table Type](#)

200.5.1 DBMS_XA DBMS_XA_XID Object Type

The PL/SQL XA interface allows the PL/SQL application to define a global transaction branch id (XID) and associate/disassociate the current session with the transaction branch. XID is defined as a PL/SQL object type.

Note:

For more information, see "Distributed Transaction Processing: The XA Specification" in the public XA Standard.

Syntax

```
TYPE DBMS_XA_XID IS OBJECT (
  formatid      NUMBER,
  gtrid         RAW(64),
  bqual        RAW(64),
  constructor function DBMS_XA_XID(
    gtrid      IN  NUMBER)
    RETURN SELF AS RESULT,
  constructor function DBMS_XA_XID (
    gtrid      IN  RAW,
    bqual      IN  RAW)
    RETURN SELF AS RESULT,
  constructor function DBMS_XA_XID(
    formatid  IN  NUMBER,
```

```

gtrid      IN  RAW,
bqual     IN  RAW DEFAULT HEXTORAW('00000000000000000000000000000001'))
RETURN SELF AS RESULT)

```

Attributes

Table 200-3 DBMS_XA_XID Object Type

| Attribute | Description |
|-----------|--|
| formatid | Format identifier, a number identifying different transaction managers (TM) |
| gtrid | Global transaction identifier uniquely identifying a global transaction, of which the maximum size is 64 bytes |
| bqual | Branch qualifier, of which the maximum size is 64 bytes |

200.5.2 DBMS_XA DBMS_XA_XID_ARRAY Table Type

This type is used to define an array of `xid` that represent a list of global transaction branches.

Syntax

```
TYPE DBMS_XA_XID_ARRAY as TABLE of DBMS_XA_XID
```

200.6 Summary of DBMS_XA Subprograms

This table lists the DBMS_XA subprograms and briefly describes them.

Table 200-4 DBMS_XA Package Subprograms

| Subprogram | Description |
|---|---|
| DIST_TXN_SYNC Procedure | Used in recovery of synchronization when utilizing Oracle Real Application Clusters (Oracle RAC) |
| XA_COMMIT Function | Commits the global transaction specified by <code>xid</code> |
| XA_END Function | Disassociates the current session from the transaction branch specified by <code>xid</code> |
| XA_FORGET Function | Informs the resource manager to forget about a heuristically committed or rolled back transaction branch. |
| XA_GETLASTOER Function | Obtains the last Oracle error code, in case of failure of previous XA calls. |
| XA_PREPARE Function | Prepares the transaction branch specified in <code>xid</code> for committing the transaction subsequently if possible |
| XA_RECOVER Function | Obtains a list of prepared or heuristically completed transaction branches from a resource manager |
| XA_ROLLBACK Function | Informs the resource manager to roll back work done on behalf of a transaction branch |
| XA_SETTIMEOUT Function | Sets the transaction timeout in seconds for the current session |
| XA_START Function | Associates the current session with the transaction branch specified by <code>xid</code> |

200.6.1 DIST_TXN_SYNC Procedure

This procedure can be used to synchronize in-doubt transactions when one of the Oracle Real Application Clusters (Oracle RAC) instances fails.

Syntax

```
DBMS_XA.DIST_TXN_SYNC;
```

200.6.2 XA_COMMIT Function

This function commits the global transaction specified by `xid`.

Syntax

```
DBMS_XA.XA_COMMIT (
    xid          IN DBMS_XA_XID,
    onePhase    IN BOOLEAN)
RETURN PLS_INTEGER;
```

Parameters

Table 200-5 XA_COMMIT Function Parameters

| Parameter | Description |
|-----------------------|--|
| <code>xid</code> | See DBMS_XA_XID Object Type |
| <code>onePhase</code> | If <code>TRUE</code> , apply single phase commit |

Return Values

See [Table 200-2](#). Possible return values indicating error are: `XAER_RMERR`, `XAER_RMFAIL`, `XAER_NOTA`, `XAER_INVAL`, or `XAER_PROTO`. Other possible return values include: `XA_OK`, `XA_RB*`, `XA_HEURHAZ`, `XA_HEURCOM`, `XA_HEURRB`, and `XA_HEURMIX`.

Usage Notes

- An application must not call `COMMIT`, but instead must call `XA_COMMIT` to commit the global transaction specified by `xid`. If a user needs to commit a transaction branch that is created by other users, `FORCE ANY TRANSACTION` must be granted to the user.
- If `onePhase` is `TRUE`, the resource manager should use a one-phase commit protocol to commit the work done on behalf of `xid`. Otherwise, only if all branches of the global transaction have been prepared successfully and the preceding `XA_PREPARE` call has returned `XA_OK`, should `XA_COMMIT` be called.
- The application must make a separate `XA_COMMIT` call for each of the transaction branches of the global transaction for which `XA_PREPARE` has returned `XA_OK`.
- If the resource manager did not commit the transaction and the parameter `onePhase` is set to `TRUE`, the resource manager may return one of the `XA_RB*` code. Upon return, the resource manager has rolled back the branch's work and has released all held resources.

200.6.3 XA_END Function

This function disassociates the current session from the transaction branch specified by `xid`.

A transaction manager calls `XA_END` when a thread of control finishes, or needs to suspend work on, a transaction branch. This occurs when the application completes a portion of its work, either partially or in its entirety (for example, before blocking on some event in order to let other threads of control work on the branch). When `XA_END` successfully returns, the calling thread of control is no longer actively associated with the branch but the branch still exists

Syntax

```
DBMS_XA.XA_END (  
    xid    IN  DBMS_XA_XID,  
    flag  IN  PLS_INTEGER)  
RETURN PLS_INTEGER;
```

Parameters

Table 200-6 XA_END Function Parameters

| Parameter | Description |
|-------------------|---|
| <code>xid</code> | See DBMS_XA_XID Object Type |
| <code>flag</code> | See Table 200-1 . |

Return Values

See [Table 200-2](#). Possible return values in error are `XAER_RMERR`, `XAER_RMFAILED`, `XAER_NOTA`, `XAER_INVAL`, `XAER_PROTO`, or `XA_RB*`.

Usage Notes

- `TMSUCCESS` or `TMSUSPEND` may be specified in `flag`, and the transaction branch is disassociated with the current session in detached state if the return value is `XA_OK`. `TMFAIL` is not supported. `XA_END` may be called with either `TMSUCCESS` or `TMSUSPEND` to disassociate the transaction branch identified by `xid` from the current session.
- `XA_OK` is returned if `XA_END` succeeds. An application must check the return value and handle error cases. Only when `XA_OK` is returned, the application should proceed for other normal operations.
- Executing a `ROLLBACK` statement without calling `XA_END` first will rollback the changes made by the current transaction. However, the transaction context is still associated with the current session until `XA_END` is called.
- Executing a `COMMIT` statement without calling `XA_END` first will result in `ORA-02089: COMMIT is not allowed in a subordinate session`.
- Executing a `COMMIT` or a `ROLLBACK` statement after `XA_END` has no effect on the transaction identified by `xid`, since this transaction is no longer associated with the current session.

200.6.4 XA_FORGET Function

This function informs the resource manager to forget about a heuristically committed or rolled back transaction branch.

Syntax

```
DBMS_XA.XA_FORGET (  
    xid      IN DBMS_XA_XID)  
RETURN PLS_INTEGER;
```

Parameters

Table 200-7 XA_FORGET Function Parameters

| Parameter | Description |
|-----------|---|
| xid | See DBMS_XA_XID Object Type |

Return Values

See [Table 200-2](#). Possible return values are XA_OK, XAER_RMERR, XAER_RMFAIL, XAER_NOTA, XAER_INVAL, or XAER_PROTO.

200.6.5 XA_GETLASTOER Function

This function obtains the last Oracle error code, in case of failure of previous XA calls.

Syntax

```
DBMS_XA.XA_GETLASTOER  
RETURN PLS_INTEGER;
```

Return Values

The return value carries the last Oracle error code.

200.6.6 XA_PREPARE Function

This function prepares the transaction branch specified in xid for committing the transaction subsequently if possible.

Syntax

```
DBMS_XA.XA_PREPARE (  
    xid      IN DBMS_XA_XID)  
RETURN PLS_INTEGER;
```

Parameters

Table 200-8 XA_PREPARE Function Parameters

| Parameter | Description |
|-----------|---|
| xid | See DBMS_XA_XID Object Type |

Return Values

See [Table 200-2](#). Possible return codes include: XA_OK, XA_RDONLY, XA_RB*, XAER_RMERR, XAER_RMFAIL, XAER_NOTA, XAER_INVAL, or XAER_PROTO.

Usage Notes

- If a user needs to prepare a transaction branch that is created by other users, `FORCE ANY TRANSACTION` must be granted to the user.
- An application must keep track of all the branches of one global transaction, and prepare each transaction branch. Only if all branches of the global transaction have been prepared successfully and `XA_PREPARE` has returned `XA_OK`, the application may proceed to call `XA_COMMIT`.

200.6.7 XA_RECOVER Function

This function obtains a list of prepared or heuristically completed transaction branches from a resource manager.

Syntax

```
DBMS_XA.XA_RECOVER
RETURN DBMS_XA_XID_ARRAY;
```

Return Values

See [DBMS_XA_XID_ARRAY Table Type](#)

Usage Notes

- The flags `TMSTARTSCAN`, `TMENDSCAN`, `TMNOFLAGS` are not supported.
- The privilege `SELECT ON DBA_PENDING_TRANSACTIONS` must be granted to the user who needs to call `XA_RECOVER`.

200.6.8 XA_ROLLBACK Function

This function informs the resource manager to roll back work done on behalf of a transaction branch.

Syntax

```
DBMS_XA.XA_ROLLBACK (
xid          IN DBMS_XA_XID)
RETURN PLS_INTEGER;
```

Parameters

Table 200-9 *XA_ROLLBACK Function Parameters*

| Parameter | Description |
|-----------|---|
| xid | See DBMS_XA_XID Object Type |

Return Values

See [Table 200-2](#). Possible return values are: XA_OK, XA_RB*, XA_HEURHAZ, XA_HEURCOM, XA_HEURRB, or XA_HEURMIX.

Usage Notes

If a user needs to rollback a transaction branch that created by other users, the privilege `FORCE ANY TRANSACTION` must be granted to the user.

200.6.9 XA_SETTIMEOUT Function

This function sets the transaction timeout in seconds for the current session.

Syntax

```
DBMS_XA.XA_SETTIMEOUT (
    seconds IN PLS_INTEGER)
RETURN PLS_INTEGER;
```

Parameters

Table 200-10 *XA_SETTIMEOUT Function Parameters*

| Parameter | Description |
|-----------|--|
| seconds | The timeout value indicates the maximum time in seconds that a transaction branch may be disassociated from the session before the system automatically aborts the transaction. The default value is 60 seconds. |

Return Values

See [Table 200-2](#). Possible return values are XA_OK, XAER_RMERR, XAER_RMFAIL, or XAER_INVAL.

Usage Notes

Only if return value is XA_OK, is the timeout value successfully set.

200.6.10 XA_START Function

This function associates the current session with a transaction branch specified by the `xid`.

Syntax

```
DBMS_XA.XA_START (  
    xid IN DBMS_XA_XID,    flag IN PLS_INTEGER) RETURN PLS_INTEGER;
```

Parameters

Table 200-11 XA_START Function Parameters

| Parameter | Description |
|-------------------|---|
| <code>xid</code> | See DBMS_XA_XID Object Type |
| <code>flag</code> | See Table 200-1 . |

Return Values

See [Table 200-2](#)

Usage Notes

- If `TMJOIN` or `TMRESUME` is specified in `flag`, the start is for joining an existing transaction branch identified by the `xid`. `TMJOIN` flag should be used when the transaction is detached with `TMSUCCESS` flag. `TMRESUME` should be used when the transaction branch is detached with `TMSUSPEND` flag. `XA_START` may be called with either flag to join an existing transaction branch.
- If `TMNOFLAGS` is specified in `flag`, and neither `TMJOIN` nor `TMRESUME` is specified, a new transaction branch is to be started. If the transaction branch specified in `xid` already exists, `XA_START` returns an `XAER_DUPID` error code.
- Possible return values in error include: `XAER_RMERR`, `XAER_RMFAIL`, `XAER_DUPID`, `XAER_OUTSIDE`, `XAER_NOTA`, `XAER_INVAL`, and `XAER_PROTO`.
- `XA_OK` is returned if `XA_START` succeeds. An application must check the return value and handle error cases. Only when `XA_OK` is returned, the PL/SQL application should proceed for other normal operations. Transaction stacking is not supported. If there is an active transaction associated with the current session, may not be called to start or join another transaction. `XAER_PROTO` will be returned if `XA_START` is called with an active global transaction branch associated with the session. `XAER_OUTSIDE` will be returned if `XA_START` is called with a local transaction associated with the current session.

DBMS_XDB

The `DBMS_XDB` package supports the following features:

The `DBMS_XDB` package supports the following features:

- Resource Management subprograms which complement Resource Views
- The Access Control List (ACL)-based Security Mechanism
- Configuration Session Management
- Creation of the XDB username

This chapter contains the following topics:

- [DBMS_XDB Overview](#)
- [DBMS_XDB Security Model](#)
- [DBMS_XDB Constants](#)
- [Summary of DBMS_XDB Subprograms](#)

See Also:

- *Oracle XML DB Developer's Guide*
- *Oracle Database New Features Guide*

201.1 DBMS_XDB Overview

`DBMS_XDB` provides a range of management functions.

The `DBMS_XDB` package supports the following features:

- The Resource Management functionality provides [LINK Procedures](#), [EXISTSRESOURCE Function](#), [LOCKRESOURCE Function](#), [GETLOCKTOKEN Procedure](#), [UNLOCKRESOURCE Function](#), [CREATERESOURCE Functions](#), [RENAMERESOURCE Procedure](#), [DELETERESOURCE Procedure](#), [GETRESOID Function](#), [CREATEOIDPATH Function](#), and [CREATEFOLDER Function](#) subprograms which complement Resource Views.
- The Access Control List (ACL)-based Security Mechanism can be used with in-hierarchy ACLs stored by the database or in-memory ACLs that may be stored outside the database. Some of these methods can be used for both Oracle resources and arbitrary database objects. Use [CHECKPRIVILEGES Function](#), [GETACLDOCUMENT Function](#), and [CHANGEPRIVILEGES Function](#) for Oracle Resources. [ACLCHECKPRIVILEGES Function](#) provides access to Oracle's ACL-based Security mechanism without storing objects in the Hierarchy.

- The XDB username is created during XDB installation. This user owns a set of default tables and packages. [GETXDB_TABLESPACE Function](#) and the `DBMS_XDB_ADMIN.MOVEXDB_TABLESPACE` Procedure enable movement of schemas to a specified tablespace, and support the default `SYSAUX` tablespace introduction

201.2 DBMS_XDB Security Model

Owned by XDB, the `DBMS_XDB` package must be created by `SYS` or XDB. The `EXECUTE` privilege is granted to `PUBLIC`. Subprograms in this package are executed using the privileges of the current user. Subprograms that operate on the XDB Configuration will succeed only if the current user is `SYS` or XDB, or the current user has the `XDBADMIN` or `DBA` role.

201.3 DBMS_XDB Constants

All constants described in the following table are deprecated in Oracle Release 12c.

They are relocated to either the [DBMS_XDB_CONFIG](#) package or the [DBMS_XDB_REPOS](#) package. The specifics of transference in each case are detailed in the **Relocated** column.

Oracle recommends that you do not use constants in their `DBMS_XDB` context in new applications. Support for deprecated features is for backward compatibility only and may be terminated in future releases.

Table 201-1 DBMS_XDB Constants

| Constant | Type | Value | Description | Relocated |
|--|--------------------------|---------|---|-----------------------------|
| <code>DELETE_RESOURCE</code> | NUMBER | 1 | Deletes a resource; fails if the resource has children. | <code>DBMS_XDB_REPOS</code> |
| <code>DELETE_RECURSIVE</code> | NUMBER | 2 | Deletes a resource and its children, if any. | <code>DBMS_XDB_REPOS</code> |
| <code>DELETE_FORCE</code> | NUMBER | 3 | Deletes the resource, even if the object it contains is invalid. | <code>DBMS_XDB_REPOS</code> |
| <code>DELETE_RECURSIVE_FORCE</code> | NUMBER | 4 | Deletes a resource and its children, if any, even if the object it contains is invalid. | <code>DBMS_XDB_REPOS</code> |
| <code>DELETE_RES_METADATA_CASCADE</code> | NUMBER | 1 | Deletes the corresponding row in the metadata table | <code>DBMS_XDB_REPOS</code> |
| <code>DELETE_RES_METADATA_NOCASCADE</code> | NUMBER | 2 | Does not delete the row in the metadata table | <code>DBMS_XDB_REPOS</code> |
| <code>DEFAULT_LOCK_TIMEOUT CONSTANT</code> | <code>PLS_INTEGER</code> | (60*60) | Default time (in seconds) after which lock will expire | <code>DBMS_XDB_REPOS</code> |
| <code>LINK_TYPE_HARD</code> | NUMBER | 1 | Type of link to be created (default) | <code>DBMS_XDB_REPOS</code> |
| <code>LINK_TYPE_WEAK</code> | NUMBER | 2 | Type of link to be created | <code>DBMS_XDB_REPOS</code> |
| <code>LINK_TYPE_SYMBOLIC</code> | NUMBER | 3 | Type of link to be created | <code>DBMS_XDB_REPOS</code> |

Table 201-1 (Cont.) DBMS_XDB Constants

| Constant | Type | Value | Description | Relocated |
|---------------------|--------|-------|--|---------------------|
| ON_DENY_NEXT_CUSTOM | NUMBER | 1 | If access denied, the next custom authorization is tried | DBMS_XDB_C ONFIG |
| ON_DENY_BASIC | NUMBER | 2 | If access denied, basic authentication is used | DBMS_XDB_C ONFIG |

201.4 Summary of DBMS_XDB Subprograms

This table lists the DBMS_XDB subprograms and briefly describes them.

Table 201-2 DBMS_XDB Package Subprograms

| Subprogram | Description |
|--|---|
| ACLCHECKPRIVILEGES Function | Checks access privileges granted to the current user by specified ACL document on a resource whose owner is specified by the 'owner' parameter. |
| APPENDRESOURCEMETADATA Procedure | Takes in user-defined metadata either as a REF to XMLTYPE or an XMLTYPE and adds it to the desired resource |
| CHANGEOWNER Procedure | Changes the owner of the resource/s to the specified owner. |
| CHANGEPRIVILEGES Function | Adds a specified ACE to a specified resource's ACL |
| CHECKPRIVILEGES Function | Checks access privileges granted to the current user on the specified resource |
| CREATEFOLDER Function | Creates a new folder resource in the hierarchy |
| CREATEOIDPATH Function | Creates a virtual path to the resource based on object ID |
| CREATERESOURCE Functions | Creates a new resource |
| DELETERESOURCE Procedure | Deletes a resource from the hierarchy |
| DELETERESOURCEMETADATA Procedures | Deletes metadata from a resource (can be used for schema-based or nonschema-based metadata) |
| ENABLEDIGESTAUTHENTICATION Procedure | Enables digest authentication |
| EXISTSRESOURCE Function | Determines if a resource is in the hierarchy, based on its absolute path |
| GETACLDOCUMENT Function | Retrieves ACL document that protects resource given its path name |
| GETCONTENTBLOB Function | Retrieves the contents of a resource returned as a BLOB |
| GETCONTENTCLOB Function | Retrieves the contents of a resource returned as a CLOB |
| GETCONTENTVARCHAR2 Function | Retrieves the contents of a resource returned as a string |
| GETCONTENTXMLREF Function | Retrieves the contents of a resource returned as a REF to an XMLTYPE |
| GETCONTENTXMLTYPE Function | Retrieves the contents of a resource returned as an XMLTYPE |

Table 201-2 (Cont.) DBMS_XDB Package Subprograms

| Subprogram | Description |
|---|--|
| GETHTTPREQUESTHEADER Function | Gets the values of the passed header |
| GETLOCKTOKEN Procedure | Returns that resource's lock token for the current user given a path to a resource |
| GETPRIVILEGES Function | Gets all privileges granted to the current user on a specified resource |
| GETRESOID Function | Returns the object ID of the resource from its absolute path |
| GETXDB_TABLESPACE Function | Returns the current tablespace of the XDB (user) |
| HASBLOBCONTENT Function | Returns <code>TRUE</code> if the resource has BLOB content |
| HASCHARCONTENT Function | Returns <code>TRUE</code> if the resource has character content |
| HASXMLCONTENT Function | Returns <code>TRUE</code> if the resource has XML content |
| HASXMLREFERENCE Function | Returns <code>TRUE</code> if the resource has <code>REF</code> to XML content |
| ISFOLDER Function | Returns <code>TRUE</code> if the resource is a folder or container |
| LINK Procedures | Creates a link to an existing resource |
| LOCKRESOURCE Function | Gets a WebDAV-style lock on that resource given a path to that resource |
| PROCESSLINKS Procedure | Processes document links in the specified resource |
| PURGERESOURCEMETADATA Procedure | Deletes all user metadata from a resource |
| RENAMERESOURCE Procedure | Renames the XDB resource |
| SETACL Procedure | Sets the ACL on a specified resource |
| SPLITPATH Procedure | Splits the path into a parentpath and childpath |
| TOUCHRESOURCE Procedure | Changes the modification time of the resource to the current time |
| UNLOCKRESOURCE Function | Unlocks the resource given a lock token and resource path |
| UPDATERESOURCEMETADATA Procedures | Updates metadata for a resource |

201.4.1 ACLCHECKPRIVILEGES Function

This function checks access privileges granted to the current user by specified ACL document by the `OWNER` of the resource. Returns positive integer if all privileges are granted.

Note:

This procedure is deprecated in Release 12c. This functionality is replaced by a subprogram of the same name in the [DBMS_XDB_REPOS](#) package - the [ACLCHECKPRIVILEGES Function](#).

Syntax

```
DBMS_XDB.ACLCHECKPRIVILEGES (
  acl_path IN VARCHAR2,
  owner    IN VARCHAR2,
  privs    IN xmltype)
RETURN PLS_INTEGER;
```

Parameters

Table 201-3 *ACLCHECKPRIVILEGES Function Parameters*

| Parameter | Description |
|-----------|--|
| acl_path | Absolute path in the Hierarchy for ACL document |
| owner | Resource owner name; the pseudo user "DAV:owner" is replaced by this user during ACL privilege resolution |
| privs | An XMLType instance of the privilege element specifying the requested set of access privileges. See description for CHECKPRIVILEGES Function . |

201.4.2 APPENDRESOURCEMETADATA Procedure

This procedure takes in user-defined metadata either as a REF to XMLTYPE or an XMLTYPE and adds it to the desired resource.

Note:

This procedure is deprecated in Release 12c. This functionality is replaced by a subprogram of the same name in the [DBMS_XDB_REPOS](#) package - the [APPENDRESOURCEMETADATA Procedure](#).

Syntax

```
DBMS_XDB.APPENDRESOURCEMETADATA (
  abspath IN VARCHAR2,
  metadata IN XMLTYPE);
```

```
DBMS_XDB.APPENDRESOURCEMETADATA (
  abspath IN VARCHAR2,
  metadata IN REF SYS.XMLTYPE);
```

Parameters

Table 201-4 *APPENDRESOURCEMETADATA Procedure*

| Parameter | Description |
|-----------|--|
| abspath | Absolute path of the resource |
| metadata | Metadata can be schema based or nonschema-based. Schema-based metadata is stored in its own table. |

Usage Notes

- In the case in which a `REF` is passed in, the procedure stores the `REF` in the resource, and the metadata is stored in a separate table. In this case you are responsible for populating the `RESID` column for the metadata table. Note that the `REF` passed in must be unique. In other words, there must not be a `REF` with the same value in the resource metadata, as this would violate uniqueness of properties. An error is thrown if users attempt to add a `REF` that already exists.
- In the case where the `XMLTYPE` is passed in, the data is parsed to determine if it is schema-based or not and stored accordingly.

201.4.3 CHANGEOWNER Procedure

This procedure changes the owner of the resource/s to the specified owner. This procedure is deprecated in Release 12c.

Note:

This procedure is deprecated in Release 12c. This functionality is replaced by a subprogram of the same name in the `DBMS_XDB_REPOS` package - the [CHANGEOWNER Procedure](#).

Syntax

```
DBMS_XDB.CHANGEOWNER (
  abspath   IN   VARCHAR2,
  owner     IN   VARCHAR2,
  recurse   IN   BOOLEAN := FALSE);
```

Parameters

Table 201-5 CHANGEOWNER Procedure Parameters

| Parameter | Description |
|----------------------|---|
| <code>abspath</code> | Absolute path of the resource |
| <code>owner</code> | New owner for the resource |
| <code>recurse</code> | If <code>TRUE</code> , recursively change owner of all resources in the folder tree |

201.4.4 CHANGEPRIVILEGES Function

This function adds a specified ACE to a specified resource's ACL. This procedure is deprecated in Release 12c.

Note:

This procedure is deprecated in Release 12c. This functionality is replaced by a subprogram of the same name in the [DBMS_XDB_REPOS](#) package - the [CHANGEPRIVILEGES Function](#).

Syntax

```
DBMS_XDB.CHANGEPRIVILEGES (
    res_path  IN   VARCHAR2,
    ace       IN   xmltype)
RETURN PLS_INTEGER;
```

Parameters

Table 201-6 CHANGEPRIVILEGES Function Parameters

| Parameter | Description |
|-----------|--|
| res_path | Path name of the resource for which privileges need to be changed |
| ace | An XMLType instance of the <ace> element which specifies the <principal>, the operation <grant> and the list of privileges |

Return Values

A positive integer if the ACL was successfully modified.

Usage Notes

If no ACE with the same principal and the same operation (*grant/deny*) already exists in the ACL, the new ACE is added at the end of the ACL.

201.4.5 CHECKPRIVILEGES Function

This function checks access privileges granted to the current user on the specified resource.

Note:

This procedure is deprecated in Release 12c. This functionality is replaced by a subprogram of the same name in the [DBMS_XDB_REPOS](#) package - the [CHECKPRIVILEGES Function](#).

Syntax

```
DBMS_XDB.CHECKPRIVILEGES (
    res_path  IN VARCHAR2,
    privs     IN xmltype)
RETURN PLS_INTEGER;
```

Parameters

Table 201-7 CHECKPRIVILEGES Function Parameters

| Parameter | Description |
|-----------|--|
| res_path | Absolute path in the Hierarchy for resource |
| privs | An XMLType instance of the privilege element specifying the requested set of access privileges |

Return Values

A positive integer if all requested privileges granted.

201.4.6 CREATEFOLDER Function

This deprecated function creates a new folder resource in the hierarchy.

Note:

This procedure is deprecated in Release 12c. This functionality is replaced by a subprogram of the same name in the [DBMS_XDB_REPOS](#) package - the [CREATEFOLDER Function](#).

Syntax

```
DBMS_XDB.CREATEFOLDER (
    path  IN VARCHAR2)
RETURN BOOLEAN;
```

Parameters

Table 201-8 CREATEFOLDER Function Parameters

| Parameter | Description |
|-----------|------------------------------|
| path | Path name for the new folder |

Return Values

TRUE if operation successful; FALSE, otherwise.

Usage Notes

The given path name's parent folder must already exist in the hierarchy: if '/folder1/folder2' is passed as the path parameter, then '/folder1' must already exist.

201.4.7 CREATEOIDPATH Function

This deprecated function creates a virtual path to the resource based on object ID.

Note:

This function is deprecated in Release 12c. This functionality is replaced by a subprogram of the same name in the [DBMS_XDB_REPOS](#) package - the [CREATEOIDPATH Function](#).

Syntax

```
DBMS_XDB.CREATEOIDPATH(  
    oid IN RAW)  
RETURN VARCHAR2;
```

Parameters

Table 201-9 CREATEOIDPATH Function Parameters

| Parameter | Description |
|-----------|---------------------------|
| oid | Object ID of the resource |

201.4.8 CREATERESOURCE Functions

The deprecated function creates a new resource. The description of the overload options precede each version of the syntax

Note:

This procedure is deprecated in Release 12c. This functionality is replaced by a subprogram of the same name in the [DBMS_XDB_REPOS](#) package - the [CREATERESOURCE Functions](#).

Syntax

Given a REF to an existing XMLType row, creates a resource whose contents point to that row. That row should not already exist inside another resource:

```
DBMS_XDB.CREATERESOURCE(  
    abspath IN VARCHAR2,  
    datarow IN REF SYS.XMLTYPE,
```

```

    createfolders IN BOOLEAN := FALSE)
RETURN BOOLEAN;

```

Creates a resource with a specified BLOB as its contents, and specifies character set of the source BLOB:

```

DBMS_XDB.CREATERESOURCE (
    abspath      IN VARCHAR2,
    data         IN BLOB,
    csid         IN NUMBER :=0,
    createfolders IN BOOLEAN := FALSE)
RETURN BOOLEAN;

```

Creates a resource with a specified BFILE as its contents, and specifies character set of the source BFILE:

```

DBMS_XDB.CREATERESOURCE (
    abspath      IN VARCHAR2,
    data         IN BFILE,
    csid         IN NUMBER :=0,
    createfolders IN BOOLEAN := FALSE)
RETURN BOOLEAN;

```

Creates a resource with a specified CLOB as its contents:

```

DBMS_XDB.CREATERESOURCE (
    abspath      IN VARCHAR2,
    data         IN CLOB,
    createfolders IN BOOLEAN := FALSE)
RETURN BOOLEAN;

```

Given a string, inserts a new resource into the hierarchy with the string as the contents:

```

DBMS_XDB.CREATERESOURCE (
    abspath      IN VARCHAR2,
    data         IN VARCHAR2,
    schemaurl    IN VARCHAR2 := NULL,
    elem         IN VARCHAR2 := NULL)
RETURN BOOLEAN;

```

Given an XMLTYPE and a schema URL, inserts a new resource into the hierarchy with the XMLTYPE as the contents:

```

DBMS_XDB.CREATERESOURCE (
    abspath      IN VARCHAR2,
    data         IN SYS.XMLTYPE,
    schemaurl    IN VARCHAR2 := NULL,
    elem         IN VARCHAR2 := NULL)
RETURN BOOLEAN;

```

Parameters

Table 201-10 CREATERESOURCE Function Parameters

| Parameter | Description |
|-----------|--|
| abspath | Absolute path of the resource to create. The path name's parent folder must already exist in the hierarchy. In other words, if /foo/bar.txt is passed in, then folder /foo must already exist. |

Table 201-10 (Cont.) CREATERESOURCE Function Parameters

| Parameter | Description |
|---------------|---|
| data | String buffer containing new resource's contents. The data is parsed to check if it contains a schema-based XML document, and the contents are stored as schema-based in the schema's default table. Otherwise, it is saved as binary data. |
| datarow | REF to an XMLType row to be used as the contents |
| csid | Character set id of the document. Must be a valid Oracle ID; otherwise returns an error. If CSID is not specified, or if a zero CSID is specified, then the character set id of the document is determined as follows: <ul style="list-style-type: none"> From the abspath extension, determine the resource's MIME type. If the MIME type is */xml, then the encoding is detected based on Appendix F of the W3C XML 1.0 Reference at http://www.w3.org/TR/2000/REC-xml-20001006; Otherwise, it is defaulted to the database character set. |
| createfolders | If TRUE, create the parent folders if they do not exist |
| schemaur1 | For XML data, schema URL data conforms to (default NULL) |
| elem | Element name (default NULL) |

Return Values

TRUE if operation successful; FALSE, otherwise.

201.4.9 DELETERESOURCE Procedure

This **deprecated procedure** deletes a resource from the hierarchy.

**Note:**

This procedure is deprecated in Release 12c. This functionality is replaced by a subprogram of the same name in the [DBMS_XDB_REPOS](#) package - the [DELETERESOURCE Procedure](#).

Syntax

```
DBMS_XDB.DELETERESOURCE (
  path          IN          VARCHAR2,
  delete_option IN          PLS_INTEGER);
```

Parameters**Table 201-11 DELETERESOURCE Procedure Parameters**

| Parameter | Description |
|-----------|-------------------------------------|
| path | Path name of the resource to delete |

Table 201-11 (Cont.) DELETERESOURCE Procedure Parameters

| Parameter | Description |
|---------------|--|
| delete_option | The option that controls how a resource is deleted; defined in Table 201-1 : <ul style="list-style-type: none"> DELETE_RESOURCE DELETE_RECURSIVE DELETE_FORCE DELETE_RECURSIVE_FORCE |

201.4.10 DELETERESOURCEMETADATA Procedures

This **deprecated procedure** takes in a resource by absolute path and removes either the schema-based metadata identified by the REF, or the metadata identified by the namespace and name combination, which can be either schema-based or non-schema based. It also takes an additional (optional) parameter that specifies how to delete it. This parameter is only relevant for schema-based resource metadata that needs to be deleted. For non-schema based metadata, this parameter is ignored.

Note:

This procedure is deprecated in Release 12c. This functionality is replaced by a subprogram of the same name in the [DBMS_XDB_REPOS](#) package - the [DELETERESOURCEMETADATA Procedures](#).

Syntax

Can be used only for schema-based metadata:

```
DBMS_XDB.DELETERESOURCEMETADATA (
    abspath          IN  VARCHAR2,
    metadata         IN  REF SYS.XMLTYPE,
    delete_option   IN  pls_integer := dbms_xdb.DELETE_RESOURCE_METADATA_CASCADE);
```

Can be used for schema-based or nonschema-based metadata:

```
DBMS_XDB.DELETERESOURCEMETADATA (
    abspath          IN  VARCHAR2,
    metadatans       IN  VARCHAR2,
    metadataname     IN  VARCHAR2,
    delete_option   IN  pls_integer := dbms_xdb.DELETE_RESOURCE_METADATA_CASCADE);
```

Parameters

Table 201-12 DELETERESOURCEMETADATA Procedure Parameters

| Parameter | Description |
|-----------|---|
| abspath | Absolute path of the resource |
| metadata | REF to the piece of metadata (schema based) to be deleted |

Table 201-12 (Cont.) DELETERESOURCEMETADATA Procedure Parameters

| Parameter | Description |
|---------------|---|
| metadatans | Namespace of the metadata fragment to be removed |
| metadataname | Local name of the metadata fragment to be removed |
| delete_option | Only applicable for schema-based metadata, this can be one of the following: <ul style="list-style-type: none"> DELETE_RES_METADATA_CASCADE - deletes the corresponding row in the metadata table DELETE_RES_METADATA_NOCASCADE - does not delete the row in the metadata table |

201.4.11 ENABLEDIGESTAUTHENTICATION Procedure

This deprecated procedure enabling digest authentication. It will list digest as the first authentication mechanism to be used by the XML DB HTTP server.

Note:

This procedure is deprecated in Release 12c. This functionality is replaced by a subprogram of the same name in the [DBMS_XDB_CONFIG](#) package - the [ENABLEDIGESTAUTHENTICATION Procedure](#).

Syntax

```
DBMS_XDB.ENABLEDIGESTAUTHENTICATION;
```

201.4.12 EXISTSRESOURCE Function

This deprecated function indicates if a resource is in the hierarchy. Matches resource by a string that represents its absolute path.

Note:

This procedure is deprecated in Release 12c. This functionality is replaced by a subprogram of the same name in the [DBMS_XDB_REPOS](#) package - the [EXISTSRESOURCE Function](#).

Syntax

```
DBMS_XDB.EXISTSRESOURCE (
    abspath    IN    VARCHAR2)
RETURN BOOLEAN;
```

Parameters

Table 201-13 EXISTSRESOURCE Function Parameters

| Parameter | Description |
|-----------|--|
| abspath | Path name of the resource whose ACL document is required |

Return Values

TRUE if the resource is found.

201.4.13 GETACLDOCUMENT Function

This deprecated function retrieves ACL document that protects resource given its path name.

Note:

This procedure is deprecated in Release 12c. This functionality is replaced by a subprogram of the same name in the [DBMS_XDB_REPOS](#) package - the [GETACLDOCUMENT Function](#).

Syntax

```
DBMS_XDB.GETACLDOCUMENT(
    abspath IN VARCHAR2)
RETURN sys.xmltype;
```

Parameters

Table 201-14 GETACLDOCUMENT Function Parameters

| Parameter | Description |
|-----------|--|
| abspath | Path name of the resource whose ACL document is required |

Return Values

The XMLType for ACL document.

201.4.14 GETCONTENTBLOB Function

This deprecated function retrieves the contents of a resource returned as a BLOB.

Note:

This procedure is deprecated in Release 12c. This functionality is replaced by a subprogram of the same name in the [DBMS_XDB_REPOS](#) package - the [GETCONTENTBLOB Function](#).

Syntax

```
DBMS_XDB.GETCONTENTBLOB (  
    abspath    IN    VARCHAR2,  
    csid       OUT   PLS_INTEGER,  
    locksrc    IN    BOOLEAN := FALSE)  
RETURN BLOB;
```

Parameters

Table 201-15 GETCONTENTBLOB Function Parameters

| Parameter | Description |
|-----------|--|
| abspath | Absolute path of the resource |
| csid | If TRUE, lock and return the source LOB. If FALSE, return a temp LOB copy. |
| locksrc | Contents of the resource as a BLOB |

Return Values

The contents of the resource as a BLOB.

201.4.15 GETCONTENTCLOB Function

This deprecated function gets the contents of a resource returned as a CLOB.

Note:

This procedure is deprecated in Release 12c. This functionality is replaced by a subprogram of the same name in the [DBMS_XDB_REPOS](#) package - the [GETCONTENTCLOB Function](#).

Syntax

```
DBMS_XDB.GETCONTENTCLOB (  
    abspath    IN    VARCHAR2,  
    RETURN CLOB;
```

Parameters

Table 201-16 GETCONTENTCLOB Function Parameters

| Parameter | Description |
|-----------|-------------------------------|
| abspath | Absolute path of the resource |

Return Values

The contents of the resource as a CLOB.

201.4.16 GETCONTENTVARCHAR2 Function

This deprecated function gets the contents of a resource returned as a string.

Note:

This procedure is deprecated in Release 12c. This functionality is replaced by a subprogram of the same name in the [DBMS_XDB_REPOS](#) package - the [GETCONTENTVARCHAR2 Function](#).

Syntax

```
DBMS_XDB.GETCONTENTVARCHAR2 (
    abspath    IN    VARCHAR2,
    RETURN BLOB;
```

Parameters

Table 201-17 GETCONTENTVARCHAR2 Function Parameters

| Parameter | Description |
|-----------|-------------------------------|
| abspath | Absolute path of the resource |

Return Values

The contents of the resource as a string.

201.4.17 GETCONTENTXMLREF Function

This deprecated function retrieves the contents of a resource returned as a `REF` to an `XMLTYPE`.

 **Note:**

This procedure is deprecated in Release 12c. This functionality is replaced by a subprogram of the same name in the `DBMS_XDB_REPOS` package - the `GETCONTENTXMLREF` Function.

Syntax

```
DBMS_XDB.GETCONTENTXMLREF (  
    abspath    IN    VARCHAR2,  
    RETURN SYS.XMLTYPE;
```

Parameters

Table 201-18 GETCONTENTXMLREF Function Parameters

| Parameter | Description |
|-----------|-------------------------------|
| abspath | Absolute path of the resource |

Return Values

The contents of the resource as a `REF` to an `XMLTYPE`.

201.4.18 GETCONTENTXMLTYPE Function

This deprecated function retrieves the contents of a resource returned as an `XMLTYPE`.

 **Note:**

This procedure is deprecated in Release 12c. This functionality is replaced by a subprogram of the same name in the `DBMS_XDB_REPOS` package - the `GETCONTENTXMLTYPE` Function.

Syntax

```
DBMS_XDB.GETCONTENTXMLTYPE (  
    abspath    IN    VARCHAR2,  
    RETURN SYS.XMLTYPE;
```

Parameters

Table 201-19 GETCONTENTXMLTYPE Function Parameters

| Parameter | Description |
|-----------|-------------------------------|
| abspath | Absolute path of the resource |

Return Values

The contents of the resource as an XMLTYPE.

201.4.19 GETHTTPREQUESTHEADER Function

This deprecated function, if called during an HTTP request serviced by XDB, returns the values of the passed header. It is used by routines that implement custom authentication.

Note:

This procedure is deprecated in Release 12c.

Syntax

```
DBMS_XDB.GETHTTPREQUESTHEADER(
    header_name IN VARCHAR2)
RETURN VARCHAR2;
```

Parameters

Table 201-20 GETHTTPREQUESTHEADER Function Parameters

| Parameter | Description |
|-------------|---------------|
| header_name | Passed header |

Return Values

Returns NULL in case the header is not present in the request, or for AUTHENTICATION, for security reasons.

201.4.20 GETLOCKTOKEN Procedure

Given a path to a resource, this deprecated procedure returns that resource's lock token for the current user.

Note:

This procedure is deprecated in Release 12c. This functionality is replaced by a subprogram of the same name in the [DBMS_XDB_REPOS](#) package - the [GETLOCKTOKEN Procedure](#).

Syntax

```
DBMS_XDB.GETLOCKTOKEN (  
    path          IN      VARCHAR2,  
    locktoken    OUT     VARCHAR2);
```

Parameters

Table 201-21 GETLOCKTOKEN Procedure Parameters

| Parameter | Description |
|-----------|--|
| path | Path name to the resource |
| locktoken | Logged-in user's lock token for the resource |

Usage Notes

The user must have `READPROPERTIES` privilege on the resource.

201.4.21 GETPRIVILEGES Function

This deprecated function gets all privileges granted to the current user on a specified resource.

Note:

This procedure is deprecated in Release 12c. This functionality is replaced by a subprogram of the same name in the [DBMS_XDB_REPOS](#) package - the [GETPRIVILEGES Function](#).

Syntax

```
DBMS_XDB.GETPRIVILEGES (  
    res_path      IN      VARCHAR2)  
RETURN sys.xmltype;
```

Parameters

Table 201-22 GETPRIVILEGES Function Parameters

| Parameter | Description |
|-----------|--|
| res_path | Absolute path in the hierarchy of the resource |

Return Values

An XMLType instance of <privilege> element, which contains the list of all leaf privileges granted on this resource to the current user.

201.4.22 GETRESOID Function

This deprecated procedure returns the object ID of the resource from its absolute path.

 **Note:**

This procedure is deprecated in Release 12c. This functionality is replaced by a subprogram of the same name in the [DBMS_XDB_REPOS](#) package - the [GETRESOID Function](#).

Syntax

```
DBMS_XDB.GETRESOID(  
    abspath IN VARCHAR2)  
RETURN RAW;
```

Parameters

Table 201-23 GETRESOID Function Parameters

| Parameter | Description |
|--------------|-------------------------------|
| abspath_path | Absolute path of the resource |

Return Values

NULL if the resource is not present.

201.4.23 GETXDB_TABLESPACE Function

This deprecated function returns the current tablespace of the XDB (user).

Note:

This procedure is deprecated in Release 12c. This functionality is replaced by a subprogram of the same name in the [DBMS_XDB_REPOS](#) package - the [GETXDB_TABLESPACE](#) Function.

Syntax

```
DBMS_XDB.GETXDB_TABLESPACE  
RETURN VARCHAR2;
```

201.4.24 HASBLOBCONTENT Function

This deprecated function returns `TRUE` if the resource has BLOB content.

Note:

This procedure is deprecated in Release 12c. This functionality is replaced by a subprogram of the same name in the [DBMS_XDB_REPOS](#) package - the [HASBLOBCONTENT](#) Function.

Syntax

```
DBMS_XDB.HASBLOBCONTENT  
  abspath IN VARCHAR2)  
RETURN BOOLEAN;
```

Parameters

Table 201-24 HASBLOBCONTENT Function Parameters

| Parameter | Description |
|---------------------------|-------------------------------|
| <code>abspath_path</code> | Absolute path of the resource |

Return Values

`TRUE` if the resource has BOB content.

201.4.25 HASCHARCONTENT Function

This deprecated function returns `TRUE` if the resource has character content.

 **Note:**

This procedure is deprecated in Release 12c. This functionality is replaced by a subprogram of the same name in the [DBMS_XDB_REPOS](#) package - the [HASCHARCONTENT Function](#).

Syntax

```
DBMS_XDB.HASCHARCONTENT  
  (abspath IN VARCHAR2)  
  RETURN BOOLEAN;
```

Parameters

Table 201-25 HASCHARCONTENT Function Parameters

| Parameter | Description |
|---------------------------|-------------------------------|
| <code>abspath_path</code> | Absolute path of the resource |

Return Values

`TRUE` if the resource has character content.

201.4.26 HASXMLCONTENT Function

This deprecated function returns `TRUE` if the resource has XML content.

 **Note:**

This procedure is deprecated in Release 12c. This functionality is replaced by a subprogram of the same name in the [DBMS_XDB_REPOS](#) package - the [HASXMLCONTENT Function](#).

Syntax

```
DBMS_XDB.HASXMLCONTENT  
  (abspath IN VARCHAR2)  
  RETURN BOOLEAN;
```

Parameters

Table 201-26 HASXMLCONTENT Function Parameters

| Parameter | Description |
|--------------|-------------------------------|
| abspath_path | Absolute path of the resource |

Return Values

TRUE if the resource has XML content.

201.4.27 HASXMLREFERENCE Function

This deprecated function returns TRUE if the resource has a REF to XML content.

Note:

This procedure is deprecated in Release 12c. This functionality is replaced by a subprogram of the same name in the [DBMS_XDB_REPOS](#) package - the [HASXMLREFERENCE Function](#).

Syntax

```
DBMS_XDB.HASXMLREFERENCE
  (abspath IN VARCHAR2)
  RETURN BOOLEAN;
```

Parameters

Table 201-27 HASXMLREFERENCE Function Parameters

| Parameter | Description |
|--------------|-------------------------------|
| abspath_path | Absolute path of the resource |

Return Values

TRUE resource has a REF to XML content.

201.4.28 ISFOLDER Function

This deprecated function returns `TRUE` if the resource is a folder or container.

Note:

This procedure is deprecated in Release 12c. This functionality is replaced by a subprogram of the same name in the [DBMS_XDB_REPOS](#) package - the [ISFOLDER Function](#).

Syntax

```
DBMS_XDB.ISFOLDER
  abspath IN VARCHAR2)
RETURN BOOLEAN;
```

Parameters

Table 201-28 DBMS_XDB.ISFOLDER Function Parameters

| Parameter | Description |
|---------------------------|-------------------------------|
| <code>abspath_path</code> | Absolute path of the resource |

Return Values

`TRUE` if the resource is a folder or container.

201.4.29 LINK Procedures

This deprecated procedure creates a link from a specified folder to a specified resource.

Note:

This procedure is deprecated in Release 12c. This functionality is replaced by a subprogram of the same name in the [DBMS_XDB_REPOS](#) package - the [LINK Procedures](#).

Syntax

```
DBMS_XDB.LINK(
  srcpath IN VARCHAR2,
  linkfolder IN VARCHAR2,
  linkname IN VARCHAR2);

DBMS_XDB.LINK(
  srcpath IN VARCHAR2,
  linkfolder IN VARCHAR2,
```

```

linkname    IN    VARCHAR2,
linktype    IN    PLS_INTEGER := DBMS_XDB.LINK_TYPE_HARD);

```

Parameters

Table 201-29 LINK Procedure Parameters

| Parameter | Description |
|------------|---|
| srcpath | Path name of the resource to which a link is created |
| linkfolder | Folder in which the new link is placed |
| linkname | Name of the new link |
| linktype | Type of link to be created: <ul style="list-style-type: none"> • DBMS_XDB.LINK_TYPE_HARD (default) • DBMS_XDB.LINK_TYPE_WEAK • DBMS_XDB.LINK_TYPE_SYMBOLIC |

201.4.30 LOCKRESOURCE Function

Given a path to a resource, this deprecated function gets a WebDAV-style lock on that resource.

Note:

This procedure is deprecated in Release 12c. This functionality is replaced by a subprogram of the same name in the [DBMS_XDB_REPOS](#) package - the [LOCKRESOURCE Function](#).

Syntax

```

DBMS_XDB.LOCKRESOURCE (
  path      IN  VARCHAR2,
  depthzero IN  BOOLEAN,
  shared    IN  boolean)
RETURN BOOLEAN;

```

Parameters

Table 201-30 LOCKRESOURCE Function Parameters

| Parameter | Description |
|-----------|--|
| path | Path name of the resource to lock. |
| depthzero | Currently not supported |
| shared | Passing TRUE obtains a shared write lock |

Return Values

TRUE if successful.

Usage Notes

The user must have `UPDATE` privileges on the resource.

201.4.31 PROCESSLINKS Procedure

This deprecated procedure processes document links in the specified resource.

Note:

This procedure is deprecated in Release 12c. This functionality is replaced by a subprogram of the same name in the [DBMS_XDB_REPOS](#) package - the [PROCESSLINKS Procedure](#).

Syntax

```
DBMS_XDB.PURGERESOURCEMETADATA (  
  abspath IN VARCHAR2,  
  recurse IN BOOLEAN := FALSE);
```

Parameters

Table 201-31 PROCESSLINKS Procedure Parameters

| Parameter | Description |
|-----------|---|
| abspath | Absolute path of the resource. If the path is a folder, use the <code>recurse</code> flag. |
| recurse | Used only if <code>abspath</code> specifies a folder. If <code>TRUE</code> , process links of all resources in the folder hierarchy rooted at the specified resource. If <code>FALSE</code> , process links of all documents in this folder only. |

201.4.32 PURGERESOURCEMETADATA Procedure

This deprecated procedure deletes all user metadata from a resource. Schema-based metadata is removed in cascade mode, rows being deleted from the corresponding metadata tables.

Note:

This procedure is deprecated in Release 12c. This functionality is replaced by a subprogram of the same name in the [DBMS_XDB_REPOS](#) package - the [PURGERESOURCEMETADATA Procedure](#).

Syntax

```
DBMS_XDB.PURGERESOURCEMETADATA (  
  abspath IN VARCHAR2);
```

Parameters

Table 201-32 PURGERESOURCEMETADATA Procedure Parameters

| Parameter | Description |
|-----------|-------------------------------|
| abspath | Absolute path of the resource |

201.4.33 RENAMERESOURCE Procedure

This deprecated procedure renames the XDB resource.

Note:

This procedure is deprecated in Release 12c. This functionality is replaced by a subprogram of the same name in the [DBMS_XDB_REPOS](#) package - the [RENAMERESOURCE Procedure](#).

Syntax

```
DBMS_XDB.RENAMERESOURCE (
  srcpath   IN VARCHAR2,
  destfolder IN CARCHAR2,
  newname   IN VARCHAR2);
```

Parameters

Table 201-33 RENAMERESOURCE Procedure Parameters

| Parameter | Description |
|------------|---|
| srcpath | Absolute path in the Hierarchy for the source resource destination folder |
| destfolder | Absolute path in the Hierarchy for the destination folder |
| newname | Name of the child in the destination folder |

201.4.34 SETACL Procedure

This deprecated procedure set the ACL on a specified resource to be the ACL specified by path.

Note:

This procedure is deprecated in Release 12c. This functionality is replaced by a subprogram of the same name in the [DBMS_XDB_REPOS](#) package - the [SETACL Procedure](#).

Syntax

```
DBMS_XDB.SETACL(
    res_path IN VARCHAR2,
    acl_path IN VARCHAR2);
```

Parameters

Table 201-34 SETACL Procedure Parameters

| Parameter | Description |
|-----------|---|
| res_path | Absolute path in the Hierarchy for resource |
| acl_path | Absolute path in the Hierarchy for ACL |

Usage Notes

The user must have <write-acl> privileges on the resource.

201.4.35 SPLITPATH Procedure

This deprecated procedure splits the path into a parentpath and childpath.

Note:

This procedure is deprecated in Release 12c. This functionality is replaced by a subprogram of the same name in the [DBMS_XDB_REPOS](#) package - the [SPLITPATH Procedure](#).

Syntax

```
DBMS_XDB.SPLITPATH(
    abspath IN VARCHAR2,
    parentpath OUT VARCHAR2,
    childpath OUT VARCHAR2);
```

Parameters

Table 201-35 SPLITPATH Procedure Parameters

| Parameter | Description |
|------------|---------------------------|
| abspath | Absolute path to be split |
| parentpath | Parentpath |
| childpath | Childpath |

201.4.36 TOUCHRESOURCE Procedure

This **deprecated procedure** changes the modification time of the resource to the current time.

Note:

This procedure is deprecated in Release 12c. This functionality is replaced by a subprogram of the same name in the [DBMS_XDB_REPOS](#) package - the [TOUCHRESOURCE Procedure](#).

Syntax

```
DBMS_XDB.TOUCHRESOURCE
  (abspath IN VARCHAR2);
```

Parameters

Table 201-36 DBMS_XDB.TOUCHRESOURCE Procedure Parameters

| Parameter | Description |
|--------------|-------------------------------|
| abspath_path | Absolute path of the resource |

201.4.37 UNLOCKRESOURCE Function

This deprecated function unlocks the resource given a lock token and a path to the resource.

Note:

This procedure is deprecated in Release 12c. This functionality is replaced by a subprogram of the same name in the [DBMS_XDB_REPOS](#) package - the [UNLOCKRESOURCE Function](#).

Syntax

```
DBMS_XDB.UNLOCKRESOURCE (
  path IN VARCHAR2,
  deltoken IN VARCHAR2)
RETURN BOOLEAN;
```

Parameters

Table 201-37 UNLOCKRESOURCE Function Parameters

| Parameter | Description |
|-----------|---------------------------|
| path | Path name to the resource |

Table 201-37 (Cont.) UNLOCKRESOURCE Function Parameters

| Parameter | Description |
|-----------|--------------------------|
| deltoken | Lock token to be removed |

Return Values

TRUE if operation successful.

Usage Notes

The user must have UPDATE privileges on the resource.

201.4.38 UPDATERESOURCEMETADATA Procedures

This deprecated procedure updates metadata for a resource.

 **Note:**

This procedure is deprecated in Release 12c. This functionality is replaced by a subprogram of the same name in the [DBMS_XDB_REPOS](#) package - the [UPDATERESOURCEMETADATA Procedures](#).

The procedure takes in a resource identified by absolute path and the metadata in it to replace identified by its REF. It replaces that piece of metadata with user-defined metadata which is either in the form of a REF to XMLTYPE or an XMLTYPE.

Syntax

Can be used to update schema-based metadata only. The new metadata must be schema-based:

```
DBMS_XDB.UPDATERESOURCEMETADATA (
  abspath IN VARCHAR2,
  oldmetadata IN REF SYS.XMLTYPE,
  newmetadata IN REF SYS.XMLTYPE)
```

Can be used to update schema-based metadata only. The new metadata must be schema-based or nonschema-based:

```
DBMS_XDB.UPDATERESOURCEMETADATA (
  abspath IN VARCHAR2,
  oldmetadata IN REF SYS.XMLTYPE,
  newmetadata IN XMLTYPE);
```

Can be used for both schema-based and nonschema-based metadata:

```
DBMS_XDB.UPDATERESOURCEMETADATA (
  abspath IN VARCHAR2,
  oldns IN VARCHAR2,
  oldname IN VARCHAR,
```

```
newmetadata IN XMLTYPE);
```

Can be used for both schema-based or nonschema-based metadata. New metadata must be schema-based:

```
DBMS_XDB.UPDATERESOURCEMETADATA (  
  abspath      IN   VARCHAR2,  
  oldns       IN   VARCHAR2,  
  oldname     IN   VARCHAR,  
  newmetadata  IN   REF SYS.XMLTYPE);
```

Parameters

Table 201-38 UPDATERESOURCEMETADATA Procedure Parameters

| Parameter | Description |
|-------------|--|
| abspath | Absolute path of the resource |
| oldmetadata | REF to the old of metadata |
| newmetadata | REF to the new, replacement metadata (can be either schema-based or nonschema-based depending on the overload) |
| oldns | Namespace identifying old metadata |
| oldname | Local name identifying old metadata |

Usage Notes

In the case of REF, it stores the REF in the resource and the metadata is stored in a separate table. Uniqueness of REFs is enforced. In the case where the XMLTYPE is passed in, data is parsed to determine if it is schema-based or not and is stored accordingly.

DBMS_XDB_ADMIN

The `DBMS_XDB_ADMIN` package provides an interface to manage the Oracle XML DB repository.

This chapter contains the following topics:

- [DBMS_XDB_ADMIN Security Model](#)
- [Summary of DBMS_XDB_ADMIN Subprograms](#)

See Also:

Oracle XML DB Developer's Guide for information about Oracle XML DB Repository

202.1 DBMS_XDB_ADMIN Security Model

Owned by `XDB`, the `DBMS_XDB_ADMIN` package must be created by `SYS` or `XDB`. The `EXECUTE` privilege is granted to `SYS` or `XDB` or `DBA`. Subprograms in this package are executed using the privileges of the current user.

202.2 Summary of DBMS_XDB_ADMIN Subprograms

This table lists the package subprograms in alphabetical order.

Table 202-1 DBMS_XDB_ADM Package Subprograms

| Subprogram | Description |
|--|---|
| CREATENONCEKEY Procedure | Generates a nonce value for use in digest authentication |
| INSTALLDEFAULTWALLET Procedure | Installs the default XDB wallet in the default XDB wallet directory |
| MOVEXDB_TABLESPACE Procedure | Moves the XDB (user) to the specified tablespace |
| REBUILDHIERARCHICALINDEX Procedure | Rebuilds the hierarchical index after import or export operations |

202.2.1 CREATENONCEKEY Procedure

This procedure generates a nonce value for use in digest authentication.

Syntax

```
DBMS_XDB_ADMIN.CREATENONCEKEY;
```

202.2.2 INSTALLDEFAULTWALLET Procedure

This procedure installs the default XDB wallet in the default XDB wallet directory.

The directory name where the XDB wallet is stored is prefixed either by `ORACLE_BASE` when it is defined, or `ORACLE_HOME`. It is then followed by `/admin/db_name/xdb_wallet` where `db_name` is the unique database name.

Syntax

```
DBMS_XDB_ADMIN.INSTALLDEFAULTWALLET;
```

Usage Notes

Only `SYS` can install or replace the default wallet.

202.2.3 MOVEXDB_TABLESPACE Procedure

This procedure moves the XDB (user) to the specified tablespace.

Syntax

```
DBMS_XDB_ADMIN.MOVEXDB_TABLESPACE(  
    new_tablespace IN VARCHAR2);
```

Parameters

Table 202-2 MOVEXDB_TABLESPACE Procedure Parameters

| Parameter | Description |
|-----------------------------|--|
| <code>new_tablespace</code> | Name of the tablespace to where the XDB is moved |

Usage Notes

- This operation waits for all concurrent XDB sessions to exit.
- If `MOVEXDB_TABLESPACE` fails, the user should restart the database before issuing any further command. Failure to do so will result into unexpected behavior from the database.
- The XDB repository by default resides in the `SYSAUX` tablespace. Using this procedure it can be moved to another tablespace. As a best practice we recommend to create a dedicated tablespace for the XDB repository only and not share it with other objects (such as tables). The tablespace containing the XDB repository should never be set to `READ ONLY` because this might affect various XML operations being executed.

202.2.4 REBUILDHIERARCHICALINDEX Procedure

This procedure rebuilds the hierarchical index after import or export operations. This is necessary because data cannot be exported from index tables.

Syntax

```
DBMS_XDB_ADMIN.REBUILDHIERARCHICALINDEX;
```

DBMS_XDB_CONFIG

The `DBMS_XDB_CONFIG` package provides an interface for configuring Oracle XML DB and its repository.

This chapter contains the following topics:

- [Overview](#)
- [Security Model](#)
- [Constants](#)
- [Summary of DBMS_XDB_CONFIG Subprograms](#)

See Also:

Oracle XML DB Developer's Guide

203.1 DBMS_XDB_CONFIG Overview

PL/SQL package `DBMS_XDB_CONFIG` is the Oracle XML DB resource application program interface (API) for PL/SQL for DBAs to configure their system. This API provides functions and procedures to access and manage Oracle XML DB Repository resources using PL/SQL. It includes methods for managing resource security and Oracle XML DB configuration.

Oracle XML DB Repository is modeled on XML, and provides a database file system for any data. The repository maps path names (or URLs) onto database objects of XMLType and provides management facilities for these objects.

PL/SQL package `DBMS_XDB_CONFIG` is an API that you can use to manage all of the following:

- Oracle XML DB resources
- Oracle XML DB security based on access control lists (ACLs). An ACL is a list of access control entries (ACEs) that determines which principals (users and roles) have access to which resources.
- Oracle XML DB configuration

203.2 DBMS_XDB_CONFIG Security Model

Owned by `XDB`, the `DBMS_XDB_CONFIG` package must be created by `SYS` or `XDB`. The `EXECUTE` privilege is granted to `PUBLIC`. Subprograms in this package are executed using the privileges of the current user.

203.3 DBMS_XDB_CONFIG Constants

The `DBMS_XDB_CONFIG` package defines several enumerated constants that should be used for specifying parameter values.

These constants are shown in the following table.

Table 203-1 DBMS_XDB_CONFIG Constants

| Constant | Type | Value | Description |
|----------------------------------|--------|-------|---|
| <code>XDB_ENDPOINT_HTTP</code> | NUMBER | 1 | Defining listener for first HTTP port |
| <code>XDB_ENDPOINT_HTTP2</code> | NUMBER | 2 | Defining listener for second HTTP port |
| <code>XDB_ENDPOINT_RHTTP</code> | NUMBER | 3 | Defining listener for a remote HTTP port |
| <code>XDB_ENDPOINT_RHTTPS</code> | NUMBER | 4 | Defining listener for a remote HTTPS port |
| <code>XDB_PROTOCOL_TCP</code> | NUMBER | 1 | Defining listener for HTTP protocol |
| <code>XDB_PROTOCOL_TCPS</code> | NUMBER | 2 | Defining listener for HTTPS protocol |

203.4 Summary of DBMS_XDB_CONFIG Subprograms

The `DBMS_XDB_CONFIG` package uses subprograms for configuring Oracle XML DB and its repository.

These subprograms are listed in the following table.

Table 203-2 DBMS_XDB_CONFIG Package Subprograms

| Subprogram | Description |
|--|---|
| ADDHTTPEXPIREMAPPING Procedure | Adds to <code>XDB\$CONFIG</code> a mapping of the URL pattern to an expiration date. This will control the Expire headers for URLs matching the pattern. |
| ADDMIMEMAPPING Procedure | Adds a mime mapping to XDB configuration |
| ADDSCHEMALOCMAPPING Procedure | Adds a schema location mapping to the XDB configuration |
| ADDSERVLET Procedure | Adds a servlet to XDB configuration |
| ADDSERVLETMAPPING Procedure | Adds a servlet mapping to XDB configuration |
| ADDSERVLETSECROLE Procedure | Adds a security role <code>REF</code> to a specified servlet in XDB configuration |
| ADDXMLEXTENSION Procedure | Adds adds the following XML extension to the XDB configuration under <code><xml-extensions></code> : <code><extension>extension</extension></code> |
| CFG_GET Function | Retrieves the session's configuration information as an <code>XMLType</code> instance |

Table 203-2 (Cont.) DBMS_XDB_CONFIG Package Subprograms

| Subprogram | Description |
|--|--|
| CFG_REFRESH Procedure | Refreshes the session's configuration information to the latest configuration |
| CFG_UPDATE Procedure | Updates the configuration information and commits the change. |
| DELETEHTTPEXPIREMAPPING Procedure | Deletes from XDB\$CONFIG all mappings of the URL pattern to an expiration date |
| DELETEMIMEMAPPING Procedure | Deletes the mime mapping for a specified extension from the XDB configuration |
| DELETESCHEMALOCMAPPING Procedure | Deletes the schema location mapping for a specified schema URL from the XDB configuration |
| DELETESERVLET Procedure | Deletes a servlet from the XDB configuration |
| DELETESERVLETMAPPING Procedure | Deletes the servlet mapping for a specified servlet name from the XDB configuration |
| DELETESERVLETSECCROLE Procedure | Deletes the specified role from a servlet in the XDB configuration |
| DELETXMLEXTENSION Procedure | Deletes the specified XML extension from the XDB configuration |
| ENABLEDIGESTAUTHENTICATION Procedure | Enables enables digest authentication |
| GETFTPSPORT Function | Gets the value of the current FTP port |
| GETHTTPSPORT Function | Gets the value of the current HTTP port |
| GETHTTPCONFIGREALM Function | Gets the realm name |
| GETHTTPSPORT Function | Gets the value of the current HTTPS port |
| GETLISTENERENDPOINT Procedure | Gets the parameters of a listener end point corresponding to the XML DB HTTP server |
| GETREMOTEHTTPSPORT Function | Gets the value of a remote HTTP port |
| GETREMOTEHTTPSPORT Function | Gets the value of a remote HTTPS port |
| ISGLOBALPORTENABLED Function | Returns the value of the DBMS_XDB_CONFIG.SETGLOBALPORTENABLED procedure setting |
| SETGLOBALPORTENABLED Procedure | Enables the use of a global port for Oracle Enterprise Manager Database Express (EM Express) clients |
| SETFTPSPORT Procedure | Sets the FTP port to a new value |
| SETHTTPSPORT Procedure | Sets the HTTP port to a new value |
| SETHTTPCONFIGREALM Procedure | Sets the realm to a new value |
| SETHTTPSPORT Procedure | Sets the HTTPS port to a new value |
| SETLISTENERENDPOINT Procedure | Sets the parameters of a listener end point corresponding to the XML DB HTTP server |

Table 203-2 (Cont.) DBMS_XDB_CONFIG Package Subprograms

| Subprogram | Description |
|--|---|
| SETLISTENERLOCALACCESS Procedure | Restricts all listener end points of the XML DB HTTP server to listen either only on the localhost interface (when <code>l_access</code> is set to <code>TRUE</code>) or to listen on both localhost and non-localhost interfaces (when <code>l_access</code> is set to <code>FALSE</code>) |
| SETREMOTEHTTPPORT Procedure | Sets the remote HTTP port to a new value |
| SETREMOTEHTTPSPORT Procedure | Sets the remote HTTPS port to a new value |
| USEDPORT Procedure | Obtains the port numbers used by other pluggable databases in the same consolidation database |

203.4.1 ADDHTTPEXPIREMAPPING Procedure

This procedure adds to `XDB$CONFIG` a mapping of the URL pattern to an expiration date. This will control the Expire headers for URLs matching the pattern.

Syntax

```
DBMS_XDB_REPOS.ADDHTTPEXPIREMAPPING (
    pattern    IN    VARCHAR2,
    expire     IN    VARCHAR2);
```

Parameters

Table 203-3 ADDHTTPEXPIREMAPPING Procedure Parameters

| Parameter | Description |
|----------------------|---|
| <code>pattern</code> | URL pattern (only * accepted as wildcards) |
| <code>expire</code> | Expiration directive, follows the <code>ExpireDefault</code> in Apache's <code>mod_expires</code> : <code>base [plus] (num type)*</code> -- base: <code>now modification</code> -- type: <code>year years month months week weeks day days minute minutess second seconds</code> |

Examples

```
DBMS_XDB_REPOS.ADDHTTPEXPIREMAPPING ('/public/test1/*', 'now plus 4 weeks');
DBMS_XDB_REPOS.ADDHTTPEXPIREMAPPING ('/public/test2/*', 'modification plus 1 day 30 seconds');
```

203.4.2 ADDMIMEMAPPING Procedure

This procedure adds the following mime mapping to XDB configuration:

```
<mime-mapping>
<extension>extension</extension>
<mime-type>mime-type</mime-type>
</mime-mapping>
```

Syntax

```
DBMS_XDB_CONFIG.ADDMIMEMAPPING (
    extension    IN    VARCHAR2,
    mimetype     IN    VARCHAR2);
```

Parameters**Table 203-4** *ADDMIMEMAPPING Procedure Parameters*

| Parameter | Description |
|-----------|--|
| extension | Extension for which a mime type is being added |
| mimetype | Mime type |

203.4.3 ADDSCHEMALOCMAPPING Procedure

This procedure adds the following schema location mapping to the XDB configuration:

```
<schemaLocation-mapping>
  <namespace>namespace</namespace>
  <element>element</element>
  <schemaURL>schemaURL</schemaURL>
</schemaLocation-mapping>
```

Syntax

```
DBMS_XDB_CONFIG.ADDSCHEMALOCMAPPING (
    namespace    IN    VARCHAR2,
    element      IN    VARCHAR2,
    schemaURL    IN    VARCHAR2);
```

Parameters**Table 203-5** *ADDSCHEMALOCMAPPING Procedure Parameters*

| Parameter | Description |
|-----------|-------------|
| namespace | Namespace |
| element | Element |
| schemaURL | Schema URL |

203.4.4 ADDSERVLET Procedure

This procedure adds a servlet to XDB configuration.

IT adds the following servlet:

```
<servlet>
  <servlet-name>name</servlet-name>    <servlet-language>language</servlet-
language>
  <display-name>dispname</display-name>
  <description>descript</description>
  <servlet-class>class</servlet-class>
```

```
<ervlet-schema>schema</ervlet-schema>
</ervlet>
```

Syntax

```
DBMS_XDB_CONFIG.ADDSERVLET(
  name      IN  VARCHAR2,
  language  IN  VARCHAR2,
  dispname  IN  VARCHAR2,
  icon      IN  VARCHAR2 := NULL,
  descript  IN  VARCHAR2 := NULL,
  class     IN  VARCHAR2 := NULL,
  jspfile   IN  VARCHAR2 := NULL,
  plsqli    IN  VARCHAR2 := NULL,
  schema    IN  VARCHAR2 := NULL);
```

Parameters

Table 203-6 ADDSERVLET Procedure Parameters

| Parameter | Description |
|-----------|---|
| name | Servlet name |
| language | Must be one of "C", "Java", "PL/SQL" |
| dispname | Display name |
| icon | Icon |
| descript | Description |
| class | The class / jspfile / plsqli function corresponding to this servlet. The first non-NULL argument amongst these three is chosen, and the others are treated as NULL. |
| jspfile | This parameter is not supported. Always provide NULL value for this parameter. System throws an error if the value is not NULL. |
| plsqli | The class / jspfile / plsqli function corresponding to this servlet. The first non-NULL argument amongst these three is chosen, and the others are treated as NULL. |
| schema | Schema is used to specify <code>ervlet-schema</code> xml element name in <code>xdbconfig.xml</code> . It indicates the Oracle schema in which the Java class is loaded. If you do not specify any value, then the schema is searched using the default resolver specification. |

203.4.5 ADDSERVLETMAPPING Procedure

This procedure adds a servlet mapping to XDB configuration.

It adds the following servlet mapping:

```
<servlet-mapping>
  <servlet-pattern>pattern</servlet-pattern>
  <servlet-name>name</servlet-name>
</servlet-mapping>
```

Syntax

```
DBMS_XDB_CONFIG.ADDSERVLETMAPPING(
    pattern IN VARCHAR2,    name      IN VARCHAR2);
```

Parameters

Table 203-7 *ADDSERVLETMAPPING Procedure Parameters*

| Parameter | Description |
|-----------|-----------------|
| pattern | Servlet pattern |
| name | Servlet name |

203.4.6 ADDSERVLETSECROLE Procedure

This procedure adds the security role REF to a specified servlet in XDB configuration.

It adds the following security role as shown in the following:

```
<security-role-ref>
  <role-name>rolename</role-name>
  <role-link>rolelink</role-link>
  <description>descript</description>
</security-role-ref>
```

Syntax

```
DBMS_XDB_CONFIG.ADDSERVLETSECROLE(
    servname IN VARCHAR2,    rolename IN VARCHAR2,    rolelink IN
    VARCHAR2,    descript IN VARCHAR2 := NULL);
```

Parameters

Table 203-8 *ADDSERVLETSECROLE Procedure Parameters*

| Parameter | Description |
|-----------|--------------|
| servname | Servlet name |
| rolename | Role name |
| rolelink | Role link |
| descript | Description |

203.4.7 ADDXMLEXTENSION Procedure

This procedure adds an XML extension to the XDB configuration under <xml-extensions>.

It adds the following XML extension to the XDB configuration, under <xml-extensions>:

```
<extension>extension</extension>
```

Syntax

```
DBMS_XDB_CONFIG.ADDXMLEXTENSION(
    extension IN VARCHAR2);
```

Parameters

Table 203-9 ADDXMLEXTENSION Procedure Parameters

| Parameter | Description |
|-----------|---------------------------|
| extension | XML extension to be added |

203.4.8 CFG_GET Function

This function retrieves the session's configuration information as an XMLType instance.

Syntax

```
DBMS_XDB_CONFIG.CFG_GET
RETURN SYS.XMLType;
```

203.4.9 CFG_REFRESH Procedure

This procedure refreshes the session's configuration information to the latest configuration.

Syntax

```
DBMS_XDB_CONFIG.CFG_REFRESH;
```

203.4.10 CFG_UPDATE Procedure

This procedure updates the configuration information and commits the change.

Syntax

```
DBMS_XDB_CONFIG.CFG_UPDATE(
    xdbconfig IN SYS.XMLTYPE);
```

Parameters

Table 203-10 CFG_UPDATE Procedure Parameters

| Parameter | Description |
|-----------|----------------------------|
| xdbconfig | The new configuration data |

203.4.11 DELETEHTTPEXPIREMAPPING Procedure

This procedure deletes from XDB\$CONFIG all mappings of the URL pattern to an expiration date.

Syntax

```
DBMS_XDB_REPOS.DELETEHTTPEXPIREMAPPING(
    pattern IN VARCHAR2);
```

Parameters

Table 203-11 DELETEHTTPEXPIREMAPPING Procedure Parameters

| Parameter | Description |
|-----------|--|
| pattern | URL pattern (only * accepted as wildcards) |

203.4.12 DELETEMIMEMAPPING Procedure

This procedure deletes the mime mapping for a specified extension from the XDB configuration.

Syntax

```
DBMS_XDB_CONFIG.DELETEMIMEMAPPING(
    extension IN VARCHAR2);
```

Parameters

Table 203-12 DELETEMIMEMAPPING Procedure Parameters

| Parameter | Description |
|-----------|--|
| extension | Extension for which a mime type is to be deleted |

203.4.13 DELETESCHEMALOCMAPPING Procedure

This procedure deletes the schema location mapping for a specified schema URL from the XDB configuration.

Syntax

```
DBMS_XDB_CONFIG.DELETESCHEMALOCMAPPING(
    schemaURL IN VARCHAR2);
```

Parameters

Table 203-13 DELETESCHEMALOCMAPPING Procedure Parameters

| Parameter | Description |
|-----------|-------------|
| schemaURL | Schema URL |

203.4.14 DELETESERVLET Procedure

This procedure deletes a servlet from the XDB configuration.

Syntax

```
DBMS_XDB_CONFIG.DELETESERVLET (
    name          IN  VARCHAR2);
```

Parameters

Table 203-14 *DELETESERVLET Procedure Parameters*

| Parameter | Description |
|-----------|--------------|
| name | Servlet name |

203.4.15 DELETESERVLETMAPPING Procedure

This procedure deletes the servlet mapping for a specified servlet name from the XDB configuration.

Syntax

```
DBMS_XDB_CONFIG.DELETESERVLETMAPPING (
    name          IN  VARCHAR2);
```

Parameters

Table 203-15 *DELETESERVLETMAPPING Procedure Parameters*

| Parameter | Description |
|-----------|--------------|
| name | Servlet name |

203.4.16 DELETESERVLETSECROLE Procedure

This procedure deletes the specified role from a servlet in the XDB configuration.

Syntax

```
DBMS_XDB_CONFIG.DELETESERVLETSECROLE (
    servname      IN  VARCHAR2,    rolename      IN  VARCHAR2);
```

Parameters

Table 203-16 *DELETESERVLETSECROLE Procedure Parameters*

| Parameter | Description |
|-----------|--------------------------------|
| servname | Servlet name |
| rolename | Name of the role to be deleted |

203.4.17 DELETEXMLEXTENSION Procedure

This procedure deletes the specified XML extension from the XDB configuration.

Syntax

```
DBMS_XDB_CONFIG.DELETEXMLEXTENSION(  
    extension IN VARCHAR2);
```

Parameters

Table 203-17 *DELETEXMLEXTENSION Procedure Parameters*

| Parameter | Description |
|-----------|-----------------------------|
| extension | XML extension to be deleted |

203.4.18 ENABLEDIGESTAUTHENTICATION Procedure

This procedure enables digest authentication. It will list digest as the first authentication mechanism to be used by the XML DB HTTP server.

Syntax

```
DBMS_XDB_CONFIG.ENABLEDIGESTAUTHENTICATION;
```

203.4.19 GETFTPPORT Function

This procedure gets the value of the current FTP port.

Syntax

```
DBMS_XDB_CONFIG.GETFTPPORT  
RETURN NUMBER;
```

203.4.20 GETHTTPCONFIGREALM Function

This function gets the realm name. Definition of a realm is referenced in IETF's RFC2617.

Syntax

```
DBMS_XDB_CONFIG.GETHTTPCONFIGREALM  
RETURN VARCHAR2;
```

203.4.21 GETHTTPPORT Function

This function gets the value of the current HTTP port.

Syntax

```
DBMS_XDB_CONFIG.GETHTTPPORT  
RETURN NUMBER;
```

203.4.22 GETHTTPSPORT Function

This procedure gets the value of the current HTTPS port.

Syntax

```
DBMS_XDB_CONFIG.GETHTTPSPORT
RETURN NUMBER;
```

Usage Notes

Returns `NULL` if no port has been configured

203.4.23 GETLISTENERENDPOINT Procedure

This procedure retrieves the parameters of a listener end point corresponding to the XML DB HTTP server. The parameters of both HTTP and HTTP2 end points can be retrieved by invoking this procedure.

Syntax

```
DBMS_XDB_CONFIG.GETLISTENERENDPOINT (
  endpoint IN NUMBER,
  host     OUT VARCHAR2,  port     OUT NUMBER,
  protocol OUT NUMBER);
```

Parameters

Table 203-18 GETLISTENERENDPOINT Procedure Parameters

| Parameter | Description |
|-----------|---|
| endpoint | End point to be retrieved. Its value can be <code>XDB_ENDPOINT_HTTP</code> or <code>XDB_ENDPOINT_HTTP2</code> . |
| host | Interface on which the listener end point listens |
| port | Port on which the listener end point listens |
| protocol | Transport protocol accepted by the listener end point |

203.4.24 GETREMOTEHTTPPORT Function

This function gets the value of a remote HTTP port.

Syntax

```
DBMS_XDB_CONFIG.GETREMOTEHTTPPORT
RETURN NUMBER;
```

203.4.25 GETREMOTEHTTPSPORT Function

This function gets the value of a remote HTTPS port.

Syntax

```
DBMS_XDB_CONFIG.GETREMOTEHTTPSPORT  
RETURN NUMBER;
```

203.4.26 ISGLOBALPORTENABLED Function

This procedure returns the value of the `GlobalPortEnabled` setting.

Syntax

```
DBMS_XDB_CONFIG.ISGLOBALPORTENABLED RETURN BOOLEAN;
```

Usage Notes

- This procedure returns `TRUE` if `GlobalPortEnabled` has been set to `TRUE`; otherwise it returns `FALSE`.
- In a multitenant environment, you can execute this function in both the CDB root and PDBs.

203.4.27 SETFTPSPORT Procedure

This procedure sets the FTP port to a new value.

Syntax

```
DBMS_XDB_CONFIG.SETFTPSPORT(  
    new_port IN NUMBER);
```

Parameters

Table 203-19 SETFTPSPORT Procedure Parameters

| Parameter | Description |
|-----------------------|------------------------------------|
| <code>new_port</code> | Value to which the FTP port is set |

203.4.28 SETGLOBALPORTENABLED Procedure

This procedure enables Oracle Enterprise Manager Database Express (EM Express) clients to use a single port (called a global port), for the session rather than using a port dedicated to the PDB.

Note:

Starting from Oracle Database 21c Release, Oracle Enterprise Manager Database Express (EM Express) is deprecated. Oracle recommends that you do not use deprecated values in new applications. Support for deprecated features is for backward compatibility only.

Syntax

```
DBMS_XDB_CONFIG.SETGLOBALPORTENABLED (
    isenabled IN BOOLEAN);
```

Parameters

Table 203-20 SETGLOBALPORTENABLED Procedure Parameters

| Parameter | Description |
|-----------|---|
| isenabled | <p>TRUE enables the EM Express client to use a global port for the session rather than using the PDB that allocated the port.</p> <p>FALSE enables the port ID to determine the PDB to use.</p> <p>The default is TRUE for PDBs but FALSE for the CDB root.</p> |

Usage Notes

- Use the `DBMS_XDB_CONFIG.SETGLOBALPORTENABLED` procedure if you use EM Express to manage database ports in a multitenant environment.
- To use a global port, you must enable it in both the CDB and the PDB. PDBs have it enabled by default. For CDBs, you must run the `DBMS_XDB_CONFIG.SETGLOBALPORTENABLED` procedure in the CDB root.
- After you set `DBMS_XDB_CONFIG.SETGLOBALPORTENABLED` to TRUE, then you must specify a PDB to use for the global port. You can do so by specifying the PDB name in the **Container Name** field of the EM Express login page. For example, if you enter `hr_pdb`, then the EM Express URL becomes `http://server_name:5500/hr_pdb/em`. This example uses the port 5500 in the CDB root, which in turn routes messages to the EM Express in the PDB `hr_pdb`. The port can be an HTTP or HTTPS port.
- The PDB that you specify in the EM Express login page must be open in read/write mode before you can run `DBMS_XDB_CONFIG.SETGLOBALPORTENABLED`. You can check the read/write mode status of a PDB by connecting to the PDB and then querying the `OPEN_MODE` column of the `V$PDBS` dynamic view.
- The `DBMS_XDB_CONFIG.ISGLOBALPORTENABLED` function returns the value of the `DBMS_XDB_CONFIG.SETGLOBALPORTENABLED` setting.

- You can use the XDB_PROTOCOLS lockdown profile to control the security for the global port.

See Also:

Oracle Database Security Guide for information about lockdown profiles

203.4.29 SETHTTPPORT Procedure

This procedure sets the HTTP port to a new value.

Syntax

```
DBMS_XDB_CONFIG.SETHTTPPORT(
    new_port IN NUMBER);
```

Parameters

Table 203-21 SETHTTPPORT Procedure Parameters

| Parameter | Description |
|-----------|-------------------------------------|
| new_port | Value to which the HTTP port is set |

203.4.30 SETHTTPCONFIGREALM Procedure

This procedure modifies the realm value.

Syntax

```
DBMS_XDB_CONFIG.SETHTTPCONFIGREALM(
    realm IN VARCHAR2);
```

Parameters

Table 203-22 SETHTTPPORT Procedure Parameters

| Parameter | Description |
|-----------|------------------------------------|
| realm | Realm as defined in IETF's RFC2617 |

203.4.31 SETHTTPSPORT Procedure

This procedure sets the HTTPS port to a new value.

Syntax

```
DBMS_XDB_CONFIG.SETHTTPSPORT(
    new_port IN NUMBER);
```

Parameters

Table 203-23 SETHTTPSPORT Procedure Parameters

| Parameter | Description |
|-----------------------|--------------------------------------|
| <code>new_port</code> | Value to which the HTTPS port is set |

203.4.32 SETLISTENERENDPOINT Procedure

This procedure sets the parameters of a listener end point corresponding to the XML DB HTTP server.

Both HTTP and HTTP2 end points can be set by invoking this procedure.

Syntax

```
DBMS_XDB_CONFIG.SETLISTENERENDPOINT (
    endpoint IN NUMBER,
    host     IN VARCHAR2,    port     IN NUMBER,
    protocol IN NUMBER);
```

Parameters

Table 203-24 SETLISTENERENDPOINT Procedure Parameters

| Parameter | Description |
|-----------------------|---|
| <code>endpoint</code> | End point to be set. Its value can be <code>XDB_ENDPOINT_HTTP</code> or <code>XDB_ENDPOINT_HTTP2</code> . |
| <code>host</code> | Interface on which the listener end point is to listen. Its value can be 'LOCALHOST', NULL, or a hostname. If its value is 'LOCALHOST' the listener end point is permitted to only listen on the localhost interface. If its value is NULL or hostname, the listener end point is permitted to listen on both localhost and non-localhost interfaces. |
| <code>port</code> | Port on which the listener end point is to listen |
| <code>protocol</code> | Transport protocol that the listener end point is to accept. Its value can be <code>XDB_PROTOCOL_TCP</code> or <code>XDB_PROTOCOL_TCPS</code> |

203.4.33 SETLISTENERLOCALACCESS Procedure

This procedure restricts all listener end points of the XML DB HTTP server to listen either only on the localhost interface (when `l_access` is set to `TRUE`) or to listen on both localhost and non-localhost interfaces (when `l_access` is set to `FALSE`).

Syntax

```
DBMS_XDB_CONFIG.SETLISTENERLOCALACCESS (
    l_access BOOLEAN);
```

Parameters**Table 203-25 SETLISTENERLOCALACCESS Procedure Parameters**

| Parameter | Description |
|------------------------|----------------|
| <code>l_access.</code> | TRUE or FALSE. |

203.4.34 SETREMOTEHTTPPORT Procedure

This procedure sets a remote HTTP port to a new value.

Syntax

```
DBMS_XDB_CONFIG.SETREMOTEHTTPPORT(
    new_port IN NUMBER);
```

Parameters**Table 203-26 SETREMOTEHTTPPORT Procedure Parameters**

| Parameter | Description |
|-----------------------|--|
| <code>new_port</code> | Value to which the remote HTTP port is set |

203.4.35 SETREMOTEHTTPSPORT Procedure

This procedure sets a remote HTTPS port to a new value.

Syntax

```
DBMS_XDB_CONFIG.SETREMOTEHTTPSPORT (
    new_port IN NUMBER);
```

Parameters**Table 203-27 SETREMOTEHTTPSPORT Procedure Parameters**

| Parameter | Description |
|-----------------------|---|
| <code>new_port</code> | Value to which the remote HTTPS port is set |

203.4.36 USEDPORT Function

This function obtains the port numbers used by other pluggable databases in the same consolidation database.

Syntax

```
DBMS_XDB_CONFIG.USEDPORT RETURN XMLTYPE;
```

DBMS_XDB_CONSTANTS

The `DBMS_XDB_CONSTANTS` package provides an interface to commonly used constants. Users should use constants instead of dynamic strings to avoid typographical errors.

This chapter contains the following topics:

- [Security Model](#)
- [Summary of DBMS_XDB_CONSTANTS Subprograms](#)

204.1 DBMS_XDB_CONSTANTS Security Model

Owned by `XDB`, the `DBMS_XDB_CONSTANTS` package must be created by `SYS` or `XDB`. The `EXECUTE` privilege is granted to `PUBLIC`. Subprograms in this package are executed using the privileges of the current user.

204.2 Summary of DBMS_XDB_CONSTANTS Subprograms

This table lists the `DBMS_XDB_CONSTANTS` subprograms and briefly describes them.

Table 204-1 DBMS_XDB_CONSTANTS Package Subprograms

| Subprograms | Description |
|--|---|
| ENCODING_DEFAULT Function | Returns 'AL32UTF8' |
| ENCODING_ISOLATIN1 Function | Returns 'WE8ISO8859P1' |
| ENCODING_UTF8 Function | Returns 'AL32UTF8' |
| ENCODING_WIN1252 Function | Returns 'WE8MSWIN1252' |
| NAMESPACE_ACL Function | Returns 'http://xmlns.oracle.com/xdb/acl.xsd' |
| NAMESPACE_METADATA Function | Returns 'http://xmlns.oracle.com/xdbuserMetaData' |
| NAMESPACE_ORACLE Function | Returns 'http://xmlns.oracle.com' |
| NAMESPACE_ORACLE_XDB Function | Returns 'http://xmlns.oracle.com/xdb' |
| NAMESPACE_RESOURCE Function | Returns 'http://xmlns.oracle.com/xdb/XDBResource.xsd' |
| NAMESPACE_RESOURCE_EVENT Function | Returns 'http://xmlns.oracle.com/resourceEvent' |
| NAMESPACE_RESOURCE_CONFIG Function | Returns 'http://xmlns.oracle.com/XDBResConfig.xsd' |
| NAMESPACE_XDBSCHEMA Function | Returns 'http://xmlns.oracle.com/xdb/XDBSchema.xsd' |
| NAMESPACE_XMLDIFF Function | Returns 'http://xmlns.oracle.com/xdb/xdiff.xsd' |

Table 204-1 (Cont.) DBMS_XDB_CONSTANTS Package Subprograms

| Subprograms | Description |
|---|---|
| NAMESPACE_XMLINSTANCE Function | Returns 'http://www.w3.org/2001/XMLSchema-instance' |
| NAMESPACE_XMLSCHEMA Function | Returns 'http://www.w3.org/2001/XMLSchema' |
| NSPREFIX_ACL_ACL Function | Returns 'xmlns:acl= 'http://xmlns.oracle.com/acs.xsd' |
| NSPREFIX_RESCONFIG_RC Function | Returns 'xmlns:rc="http://xmlns.oracle.com/xdb/XDBResConfig.xsd"' |
| NSPREFIX_RESOURCE_R Function | Returns 'xmlns:r="http://xmlns.oracle.com/XDBResource.xsd' |
| NSPREFIX_XDB_XDB Function | Returns 'http://xmlns.oracle.com/xdb' |
| NSPREFIX_XMLINSTANCE_XSI Function | Returns 'xmlns:xsi="http://www.w3.org/2001/XMLSchema-instance"' |
| NSPREFIX_XMLDIFF_XD Function | Returns 'xmlns:xd="http://xmlns.oracle.com/xdb/xdiff.xsd"' |
| NSPREFIX_XMLSCHEMA_XSD Function | Returns 'xmlns:xsd="http://www.w3.org/2001/XMLSchema"' |
| SCHEMAURL_ACL Function | Returns 'http://xmlns.oracle.com/xdb/acl.xsd' |
| SCHEMAELEM_RES_ACL Function | Returns 'http://xmlns.oracle.com/xdb/acl.xsd#acl' |
| SCHEMAELEM_RESCONTENT_BINARY Function | Returns 'http://xmlns.oracle.com/xdb/XDBSchema.xsd#binary' |
| SCHEMAELEM_RESCONTENT_TEXT Function | Returns 'http://xmlns.oracle.com/xdb/XDBSchema.xsd#text' |
| SCHEMAURL_RESOURCE Function | Returns 'http://xmlns.oracle.com/xdb/XDBResource.xsd' |
| SCHEMAURL_XDBSCHEMA Function | Returns 'http://xmlns.oracle.com/xdb/XDBSchema.xsd' |
| XDBSCHEMA_PREFIXES Function | Returns 'xmlns:xsd="http://www.w3.org/2001/XMLSchema" xmlns:xdb="http://xmlns.oracle.com/xdb' |
| XSD_ATTRIBUTE Function | Returns 'attribute' |
| XSD_COMPLEX_TYPE Function | Returns 'complexType' |
| XSD_ELEMENT Function | Returns 'element' |
| XSD_GROUP Function | Returns 'group' |

204.2.1 ENCODING_DEFAULT Function

This function returns 'AL32UTF8'.

Syntax

```
DBMS_XDB_CONSTANTS.ENCODING_DEFAULT
RETURN VARCHAR2 DETERMINISTIC;
```

Return Value

'AL32UTF8'

204.2.2 ENCODING_ISOLATIN1 Function

This function returns 'WE8ISO8859P1'.

Syntax

```
DBMS_XDB_CONSTANTS.ENCODING_ISOLATIN1  
RETURN VARCHAR2 DETERMINISTIC;
```

Return Value

'WE8ISO8859P1'

204.2.3 ENCODING_UTF8 Function

This function returns 'AL32UTF8'.

Syntax

```
DBMS_XDB_CONSTANTS.ENCODING_UTF8  
RETURN VARCHAR2 DETERMINISTIC;
```

Return Value

'AL32UTF8'

204.2.4 ENCODING_WIN1252 Function

This function returns 'WE8MSWIN1252'.

Syntax

```
DBMS_XDB_CONSTANTS.ENCODING_WIN1252  
RETURN VARCHAR2 DETERMINISTIC;
```

Return Value

'WE8MSWIN1252'

204.2.5 NAMESPACE_ACL Function

This function returns 'http://xmlns.oracle.com/xdb/acl.xsd'.

Syntax

```
DBMS_XDB_CONSTANTS.NAMESPACE_ACL  
RETURN VARCHAR2 DETERMINISTIC;
```

Return Value

'http://xmlns.oracle.com/xdb/acl.xsd'

204.2.6 NAMESPACE_METADATA Function

This function returns 'http://xmlns.oracle.com/xduserMetaData'.

Syntax

```
DBMS_XDB_CONSTANTS.NAMESPACE_METADATA  
RETURN VARCHAR2 DETERMINISTIC;
```

Return Value

'http://xmlns.oracle.com/xduserMetaData'

204.2.7 NAMESPACE_ORACLE Function

This function returns 'http://xmlns.oracle.com'.

Syntax

```
DBMS_XDB_CONSTANTS.NAMESPACE_ORACLE  
RETURN VARCHAR2 DETERMINISTIC;
```

Return Value

'http://xmlns.oracle.com'

204.2.8 NAMESPACE_ORACLE_XDB Function

This function returns 'http://xmlns.oracle.com/xdb'.

Syntax

```
DBMS_XDB_CONSTANTS.NAMESPACE_ORACLE_XDB  
RETURN VARCHAR2 DETERMINISTIC;
```

Return Value

'http://xmlns.oracle.com/xdb'

204.2.9 NAMESPACE_RESOURCE Function

This function returns '/XDBResource.xsd'

Syntax

```
DBMS_XDB_CONSTANTS.NAMESPACE_RESOURCE  
RETURN VARCHAR2 DETERMINISTIC;
```

Return Value

'http://xmlns.oracle.com/xdb/XDBResource.xsd'

204.2.10 NAMESPACE_RESOURCE_EVENT Function

This function returns 'http://xmlns.oracle.com/resourceEvent'.

Syntax

```
DBMS_XDB_CONSTANTS.NAMESPACE_RESOURCE_EVENT  
RETURN VARCHAR2 DETERMINISTIC;
```

Return Value

'http://xmlns.oracle.com/resourceEvent'

204.2.11 NAMESPACE_RESOURCE_CONFIG Function

This function returns 'http://xmlns.oracle.com/XDBResConfig.xsd'.

Syntax

```
DBMS_XDB_CONSTANTS.NAMESPACE_RESOURCE_CONFIG  
RETURN VARCHAR2 DETERMINISTIC;
```

Return Value

'http://xmlns.oracle.com/XDBResConfig.xsd'

204.2.12 NAMESPACE_XDBSCHEMA Function

This function returns 'http://xmlns.oracle.com/xdb/XDBSchema.xsd'.

Syntax

```
DBMS_XDB_CONSTANTS.NAMESPACE_XDBSCHEMA  
RETURN VARCHAR2 DETERMINISTIC;
```

Return Value

'http://xmlns.oracle.com/xdb/XDBSchema.xsd'

204.2.13 NAMESPACE_XMLDIFF Function

This function returns 'http://xmlns.oracle.com/xdb/xdiff.xsd'.

Syntax

```
DBMS_XDB_CONSTANTS.NAMESPACE_XMLDIFF  
RETURN VARCHAR2 DETERMINISTIC;
```

Return Value

'http://xmlns.oracle.com/xdb/xdiff.xsd'

204.2.14 NAMESPACE_XMLINSTANCE Function

This function returns 'http://www.w3.org/2001/XMLSchema-instance'.

Syntax

```
DBMS_XDB_CONSTANTS.NAMESPACE_XMLINSTANCE  
RETURN VARCHAR2 DETERMINISTIC;
```

Return Value

'http://www.w3.org/2001/XMLSchema-instance'

204.2.15 NAMESPACE_XMLSCHEMA Function

This function returns 'http://www.w3.org/2001/XMLSchema'.

Syntax

```
DBMS_XDB_CONSTANTS.NAMESPACE_XMLSCHEMA  
RETURN VARCHAR2 DETERMINISTIC;
```

Return Value

'http://www.w3.org/2001/XMLSchema'

204.2.16 NSPREFIX_ACL_ACL Function

This function returns 'xmlns:acl= 'http://xmlns.oracle.com/acs.xsd'.

Syntax

```
DBMS_XDB_CONSTANTS.NSPREFIX_ACL_ACL  
RETURN VARCHAR2 DETERMINISTIC;
```

Return Value

'xmlns:acl= 'http://xmlns.oracle.com/acs.xsd'

204.2.17 NSPREFIX_RESCONFIG_RC Function

This function returns ''xmlns:rc="http://xmlns.oracle.com/xdb/XDBResConfig.xsd"'.
'

Syntax

```
DBMS_XDB_CONSTANTS.NSPREFIX_RESCONFIG_RC  
RETURN VARCHAR2 DETERMINISTIC;
```

Return Value

Returns ''xmlns:rc="http://xmlns.oracle.com/xdb/XDBResConfig.xsd"'

204.2.18 NSPREFIX_RESOURCE_R Function

This function returns 'xmlns:r="http://xmlns.oracle.com/XDBResource.xsd"'.

Syntax

```
DBMS_XDB_CONSTANTS.NSPREFIX_RESOURCE_R  
RETURN VARCHAR2 DETERMINISTIC;
```

Return Value

'xmlns:r="http://xmlns.oracle.com/XDBResource.xsd"'

204.2.19 NSPREFIX_XDB_XDB Function

This function returns 'http://xmlns.oracle.com/xdb'.

Syntax

```
DBMS_XDB_CONSTANTS.NSPREFIX_XDB_XDB  
RETURN VARCHAR2 DETERMINISTIC;
```

Return Value

'http://xmlns.oracle.com/xdb'

204.2.20 NSPREFIX_XMLINSTANCE_XSI Function

This function returns 'xmlns:xsi="http://www.w3.org/2001/XMLSchema-instance"'.

Syntax

```
DBMS_XDB_CONSTANTS.NSPREFIX_XMLINSTANCE_XSI  
RETURN VARCHAR2 DETERMINISTIC;
```

Return Value

'xmlns:xsi="http://www.w3.org/2001/XMLSchema-instance"'

204.2.21 NSPREFIX_XMLDIFF_XD Function

This function returns 'xmlns:xd="http://xmlns.oracle.com/xdb/xdiff.xsd"'.

Syntax

```
DBMS_XDB_CONSTANTS.NSPREFIX_XMLDIFF_XD  
RETURN VARCHAR2 DETERMINISTIC;
```

Return Value

'xmlns:xd="http://xmlns.oracle.com/xdb/xdiff.xsd"'

204.2.22 NSPREFIX_XMLSCHEMA_XSD Function

This function returns 'xmlns:xsd="http://www.w3.org/2001/XMLSchema" '.

Syntax

```
DBMS_XDB_CONSTANTS.NSPREFIX_XMLSCHEMA_XSD  
RETURN VARCHAR2 DETERMINISTIC;
```

Return Value

'xmlns:xsd="http://www.w3.org/2001/XMLSchema" '

204.2.23 SCHEMAURL_ACL Function

This function returns 'http://xmlns.oracle.com/xdb/acl.xsd'.

Syntax

```
DBMS_XDB_CONSTANTS.SCHEMAURL_ACL  
RETURN VARCHAR2 DETERMINISTIC;
```

Return Value

'http://xmlns.oracle.com/xdb/acl.xsd'

204.2.24 SCHEMAELEM_RES_ACL Function

This function returns 'http://xmlns.oracle.com/xdb/acl.xsd#acl'.

Syntax

```
DBMS_XDB_CONSTANTS.SCHEMAELEM_RES_ACL  
RETURN VARCHAR2 DETERMINISTIC;
```

Return Value

'http://xmlns.oracle.com/xdb/acl.xsd#acl'

204.2.25 SCHEMAELEM_RESCONTENT_BINARY Function

This function returns 'http://xmlns.oracle.com/xdb/XDBSchema.xsd#binary'.

Syntax

```
DBMS_XDB_CONSTANTS.SCHEMAELEM_RESCONTENT_BINARY  
RETURN VARCHAR2 DETERMINISTIC;
```

Return Value

'http://xmlns.oracle.com/xdb/XDBSchema.xsd#binary'

204.2.26 SCHEMAELEM_RESCONTENT_TEXT Function

This function returns 'http://xmlns.oracle.com/xdb/XDBSchema.xsd#text'.

Syntax

```
DBMS_XDB_CONSTANTS.SCHEMAELEM_RESCONTENT_TEXT  
RETURN VARCHAR2 DETERMINISTIC;
```

Return Value

'http://xmlns.oracle.com/xdb/XDBSchema.xsd#text'

204.2.27 SCHEMAURL_RESOURCE Function

This function returns 'http://xmlns.oracle.com/xdb/XDBResource.xsd'.

Syntax

```
DBMS_XDB_CONSTANTS.SCHEMAURL_RESOURCE  
RETURN VARCHAR2 DETERMINISTIC;
```

Return Value

'http://xmlns.oracle.com/xdb/XDBResource.xsd'

204.2.28 SCHEMAURL_XDBSCHEMA Function

This function returns 'http://xmlns.oracle.com/xdb/XDBSchema.xsd'.

Syntax

```
DBMS_XDB_CONSTANTS.SCHEMAURL_XDBSCHEMA  
RETURN VARCHAR2 DETERMINISTIC;
```

Return Value

'http://xmlns.oracle.com/xdb/XDBSchema.xsd'

204.2.29 XDBSCHEMA_PREFIXES Function

This function returns 'xmlns:xsd="http://www.w3.org/2001/XMLSchema"
xmlns:xdb="http://xmlns.oracle.com/xdb".'

Syntax

```
DBMS_XDB_CONSTANTS.XDBSCHEMA_PREFIXES  
RETURN VARCHAR2 DETERMINISTIC;
```

Return Value

'xmlns:xsd="http://www.w3.org/2001/XMLSchema" xmlns:xdb="http://
xmlns.oracle.com/xdb"'

204.2.30 XSD_ATTRIBUTE Function

This function returns 'attribute'.

Syntax

```
DBMS_XDB_CONSTANTS.XSD_ATTRIBUTE  
RETURN VARCHAR2 DETERMINISTIC;
```

Return Value

'attribute'

204.2.31 XSD_COMPLEX_TYPE Function

This function returns 'complexType'.

Syntax

```
DBMS_XDB_CONSTANTS.XSD_COMPLEX_TYPE  
RETURN VARCHAR2 DETERMINISTIC;
```

Return Value

'complexType'

204.2.32 XSD_ELEMENT Function

This function returns 'element'.

Syntax

```
DBMS_XDB_CONSTANTS.XSD_ELEMENT  
RETURN VARCHAR2 DETERMINISTIC;
```

Return Value

'element'

204.2.33 XSD_GROUP Function

This function returns 'group'.

Syntax

```
DBMS_XDB_CONSTANTS.XSD_GROUP  
RETURN VARCHAR2 DETERMINISTIC;
```

Return Value

'group'

DBMS_XDB_REPOS

The `DBMS_XDB_REPOS` package provides an interface to operate on the Oracle XML database Repository.

This chapter contains the following topics:

- [Overview](#)
- [Security Model](#)
- [Constants](#)
- [Summary of DBMS_XDB_REPOS Subprograms](#)

See Also:

Oracle XML DB Developer's Guide for more information regarding:

- Using and managing repository resources
- ACL-based security management (controlling access to repository resources)
- Managing XLink and XInclude links
- Loading documents into the repository
- Creating, deleting, and managing resource metadata

205.1 DBMS_XDB_REPOS Overview

The `DBMS_XDB_REPOS` package lets you operate on the Oracle XML DB Repository to create, modify and delete resources, including managing security based on access control lists (ACLs). The interface provides both query and DML functions.

Using a combination of PL/SQL packages - `DBMS_XDB_REPOS`, [DBMS_XDBZ](#), and [DBMS_XDB_VERSION](#) - you can create, delete, and rename documents and folders, move a file or folder within the folder hierarchy, set and change the access permissions on a file or folder, and initiate and manage versioning.

205.2 DBMS_XDB_REPOS Security Model

Owned by XDB, the `DBMS_XDB_REPOS` package must be created by `SYS` or `XDB`. The `EXECUTE` privilege is granted to `PUBLIC`. Subprograms in this package are executed using the privileges of the current user. Subprograms that operate on the XDB Configuration will succeed only if the current user is `SYS` or `XDB`, or the current user has the `XDBADMIN` or `DBA` role.

205.3 DBMS_XDB_REPOS Constants

The `DBMS_XDB_REPOS` package defines several constants that can be used for specifying parameter values.

These constants are shown in the following table.

Table 205-1 DBMS_XDB_REPOS Constants

| Constant | Type | Value | Description |
|--|-------------|---------|--|
| <code>DELETE_RESOURCE</code> | NUMBER | 1 | Deletes a resource; fails if the resource has children. |
| <code>DELETE_RECURSIVE</code> | NUMBER | 2 | Deletes a resource and its children, if any. |
| <code>DELETE_FORCE</code> | NUMBER | 3 | Deletes the resource, even if the object it contains is invalid |
| <code>DELETE_RECURSIVE_FORCE</code> | NUMBER | 4 | Deletes a resource and its children, if any, even if the object it contains is invalid |
| <code>DELETE_RES_METADATA_CASCADE</code> | NUMBER | 1 | Deletes the row in the metadata |
| <code>DELETE_RES_METADATA_NOCASCADE</code> | NUMBER | 2 | Does not delete the row |
| <code>DEFAULT_LOCK_TIMEOUT</code> | PLS_INTEGER | (60*60) | Timeout value (in seconds) of the webdav lock |
| <code>LINK_TYPE_HARD</code> | NUMBER | 1 | Hard link of a folder to a resource |
| <code>LINK_TYPE_WEAK</code> | NUMBER | 2 | Weak link of a folder to a resource |
| <code>LINK_TYPE_SYMBOLIC</code> | NUMBER | 3 | Symbolic link of a folder to a resource |

205.4 Summary of DBMS_XDB_REPOS Subprograms

This table lists the `DBMS_XDB_REPOS` subprograms and briefly describes them.

Table 205-2 DBMS_XDB_REPOS Package Subprograms

| Subprogram | Description |
|--|--|
| ACLCHECKPRIVILEGES Function | Checks access privileges granted to the current user by specified ACL document on a resource whose owner is specified by the 'owner' parameter. |
| APPENDRESOURCEMETADATA Procedure | Takes in user-defined metadata either as a <code>REF</code> to <code>XMLTYPE</code> or an <code>XMLTYPE</code> and adds it to the desired resource |
| CHANGEOWNER Procedure | Changes the owner of the resource/s to the specified owner. |
| CHANGEPRIVILEGES Function | Adds a specified ACE to a specified resource's ACL |
| CHECKPRIVILEGES Function | Checks access privileges granted to the current user on the specified resource |
| CREATEFOLDER Function | Creates a new folder resource in the hierarchy |

Table 205-2 (Cont.) DBMS_XDB_REPOS Package Subprograms

| Subprogram | Description |
|---|---|
| CREATEOIDPATH Function | Creates a virtual path to the resource based on object ID |
| CREATERESOURCE Functions | Creates a new resource |
| DELETERESOURCE Procedure | Deletes a resource from the hierarchy |
| DELETERESOURCEMETADATA Procedures | Deletes metadata from a resource (can be used for schema-based or nonschema-based metadata) |
| EXISTSRESOURCE Function | Determines if a resource is in the hierarchy, based on its absolute path |
| GETACLDOCUMENT Function | Retrieves ACL document that protects resource given its path name |
| GETCONTENTBLOB Function | Retrieves the contents of a resource returned as a BLOB |
| GETCONTENTCLOB Function | Retrieves the contents of a resource returned as a CLOB |
| GETCONTENTVARCHAR2 Function | Retrieves the contents of a resource returned as a string |
| GETCONTENTXMLREF Function | Retrieves the contents of a resource returned as a REF to an XMLTYPE |
| GETCONTENTXMLTYPE Function | Retrieves the contents of a resource returned as an XMLTYPE |
| GETLOCKTOKEN Procedure | Returns that resource's lock token for the current user given a path to a resource |
| GETPRIVILEGES Function | Gets all privileges granted to the current user on a specified resource |
| GETRESOID Function | Returns the object ID of the resource from its absolute path |
| GETXDB_TABLESPACE Function | Returns the current tablespace of the XDB (user) |
| HASBLOBCONTENT Function | Returns TRUE if the resource has BLOB content |
| HASCHARCONTENT Function | Returns TRUE if the resource has character content |
| HASXMLCONTENT Function | Returns TRUE if the resource has XML content |
| HASXMLREFERENCE Function | Returns TRUE if the resource has REF to XML content |
| ISFOLDER Function | Returns TRUE if the resource is a folder or container |
| LINK Procedures | Creates a link to an existing resource |
| LOCKRESOURCE Function | Gets a WebDAV-style lock on that resource given a path to that resource |
| PROCESSLINKS Procedure | Processes document links in the specified resource |
| PURGERESOURCEMETADATA Procedure | Deletes all user metadata from a resource |
| RENAMERESOURCE Procedure | Renames the XDB resource |
| SETACL Procedure | Sets the ACL on a specified resource |
| SPLITPATH Procedure | Splits the path into a parentpath and childpath |

Table 205-2 (Cont.) DBMS_XDB_REPOS Package Subprograms

| Subprogram | Description |
|---|---|
| TOUCHRESOURCE Procedure | Changes the modification time of the resource to the current time |
| UNLOCKRESOURCE Function | Unlocks the resource given a lock token and resource path |
| UPDATERESOURCEMETADATA Procedures | Updates metadata for a resource |

205.4.1 ACLCHECKPRIVILEGES Function

This function checks access privileges granted to the current user by specified ACL document by the `OWNER` of the resource. Returns positive integer if all privileges are granted.

Syntax

```
DBMS_XDB_REPOS.ACLCHECKPRIVILEGES (
    acl_path IN VARCHAR2,
    owner    IN VARCHAR2,
    privs    IN xmltype)
RETURN PLS_INTEGER;
```

Parameters

Table 205-3 ACLCHECKPRIVILEGES Function Parameters

| Parameter | Description |
|-----------------------|---|
| <code>acl_path</code> | Absolute path in the Hierarchy for ACL document |
| <code>owner</code> | Resource owner name; the pseudo user "DAV:owner" is replaced by this user during ACL privilege resolution |
| <code>privs</code> | An <code>XMLType</code> instance of the privilege element specifying the requested set of access privileges. See description for CHECKPRIVILEGES Function . |

205.4.2 APPENDRESOURCEMETADATA Procedure

This procedure takes in user-defined metadata either as a `REF` to `XMLTYPE` or an `XMLTYPE` and adds it to the desired resource.

Syntax

```
DBMS_XDB_REPOS.APPENDRESOURCEMETADATA (
    abspath IN VARCHAR2,
    metadata IN XMLTYPE);

DBMS_XDB_REPOS.APPENDRESOURCEMETADATA (
    abspath IN VARCHAR2,
    metadata IN REF SYS.XMLTYPE);
```

Parameters

Table 205-4 APPENDRESOURCEMETADATA Procedure

| Parameter | Description |
|-----------|--|
| abspath | Absolute path of the resource |
| metadata | Metadata can be schema based or nonschema-based. Schema-based metadata is stored in its own table. |

Usage Notes

- In the case in which a REF is passed in, the procedure stores the REF in the resource, and the metadata is stored in a separate table. In this case you are responsible for populating the RESID column for the metadata table. Note that the REF passed in must be unique. In other words, there must not be a REF with the same value in the resource metadata, as this would violate uniqueness of properties. An error is thrown if users attempt to add a REF that already exists.
- In the case where the XMLTYPE is passed in, the data is parsed to determine if it is schema-based or not and stored accordingly.

205.4.3 CHANGEOWNER Procedure

This procedure changes the owner of the resource/s to the specified owner.

Syntax

```
DBMS_XDB_REPOS.CHANGEOWNER (
    abspath    IN    VARCHAR2,
    owner      IN    VARCHAR2,
    recurse    IN    BOOLEAN := FALSE);
```

Parameters

Table 205-5 CHANGEOWNER Procedure Parameters

| Parameter | Description |
|-----------|---|
| abspath | Absolute path of the resource |
| owner | New owner for the resource |
| recurse | If TRUE, recursively change owner of all resources in the folder tree |

205.4.4 CHANGEPRIVILEGES Function

This function adds a specified ACE to a specified resource's ACL.

Syntax

```
DBMS_XDB_REPOS.CHANGEPRIVILEGES (
    res_path  IN    VARCHAR2,
    ace       IN    xmltype)
RETURN PLS_INTEGER;
```

Parameters

Table 205-6 CHANGEPRIVILEGES Function Parameters

| Parameter | Description |
|-----------|--|
| res_path | Path name of the resource for which privileges need to be changed |
| ace | An XMLType instance of the <ace> element which specifies the <principal>, the operation <grant> and the list of privileges |

Return Values

A positive integer if the ACL was successfully modified.

Usage Notes

If no ACE with the same principal and the same operation (*grant/deny*) already exists in the ACL, the new ACE is added at the end of the ACL.

205.4.5 CHECKPRIVILEGES Function

This function checks access privileges granted to the current user on the specified resource.

Syntax

```
DBMS_XDB_REPOS.CHECKPRIVILEGES (
    res_path IN VARCHAR2,
    privs    IN xmltype)
RETURN PLS_INTEGER;
```

Parameters

Table 205-7 CHECKPRIVILEGES Function Parameters

| Parameter | Description |
|-----------|--|
| res_path | Absolute path in the Hierarchy for resource |
| privs | An XMLType instance of the privilege element specifying the requested set of access privileges |

Return Values

A positive integer if all requested privileges granted.

205.4.6 CREATEFOLDER Function

This function creates a new folder resource in the hierarchy.

Syntax

```
DBMS_XDB_REPOS.CREATEFOLDER (
    path IN VARCHAR2)
RETURN BOOLEAN;
```

Parameters

Table 205-8 CREATEFOLDER Function Parameters

| Parameter | Description |
|-----------|------------------------------|
| path | Path name for the new folder |

Return Values

TRUE if operation successful; FALSE, otherwise.

Usage Notes

The given path name's parent folder must already exist in the hierarchy: if '/folder1/folder2' is passed as the path parameter, then '/folder1' must already exist.

205.4.7 CREATEOIDPATH Function

This function creates a virtual path to the resource based on object ID.

Syntax

```
DBMS_XDB_REPOS.CREATEOIDPATH(
    oid IN RAW)
RETURN VARCHAR2;
```

Parameters

Table 205-9 CREATEOIDPATH Function Parameters

| Parameter | Description |
|-----------|---------------------------|
| oid | Object ID of the resource |

205.4.8 CREATERESOURCE Functions

The functions create a new resource. The description of the overload options precede each version of the syntax

Syntax

Creates a new resource with a specified string as its contents:

```
DBMS_XDB_REPOS.CREATERESOURCE(
    abspath IN VARCHAR2,
    data IN VARCHAR2)
RETURN BOOLEAN;
```

Creates a new resource with a specified XMLType data as its contents:

```
DBMS_XDB_REPOS.CREATERESOURCE(
    abspath IN VARCHAR2,
    data IN SYS.XMLTYPE)
RETURN BOOLEAN;
```

Given a REF to an existing XMLType row, creates a resource whose contents point to that row. That row should not already exist inside another resource:

```
DBMS_XDB_REPOS.CREATERESOURCE (
    abspath      IN  VARCHAR2,
    datarow     IN  REF SYS.XMLTYPE)
RETURN BOOLEAN;
```

Creates a resource with a specified BLOB as its contents, and specifies character set of the source BLOB:

```
DBMS_XDB_REPOS.CREATERESOURCE (
    abspath      IN  VARCHAR2,
    data         IN  BLOB,
    csid         IN  NUMBER :=0)
RETURN BOOLEAN;
```

Creates a resource with a specified BFILE as its contents, and specifies character set of the source BFILE:

```
DBMS_XDB_REPOS.CREATERESOURCE (
    abspath      IN  VARCHAR2,
    data         IN  BFILE,
    csid         IN  NUMBER :=0)
RETURN BOOLEAN;
```

Creates a resource with a specified CLOB as its contents:

```
DBMS_XDB_REPOS.CREATERESOURCE (
    abspath      IN  VARCHAR2,
    data         IN  CLOB)
RETURN BOOLEAN;
```

Given a string, inserts a new resource into the hierarchy with the string as the contents:

```
DBMS_XDB_REPOS.CREATERESOURCE (
    abspath      IN  VARCHAR2,
    data         IN  VARCHAR2,
    schemaurl    IN  VARCHAR2 := NULL,
    elem         IN  VARCHAR2 := NULL)
RETURN BOOLEAN;
```

Given an XMLTYPE and a schema URL, inserts a new resource into the hierarchy with the XMLTYPE as the contents:

```
DBMS_XDB_REPOS.CREATERESOURCE (
    abspath      IN  VARCHAR2,
    data         IN  SYS.XMLTYPE,
    schemaurl    IN  VARCHAR2 := NULL,
    elem         IN  VARCHAR2 := NULL)
RETURN BOOLEAN;
```

Parameters

Table 205-10 CREATERESOURCE Function Parameters

| Parameter | Description |
|-----------|---|
| abspath | Absolute path of the resource to create. The path name's parent folder must already exist in the hierarchy. In other words, if <code>/foo/bar.txt</code> is passed in, then folder <code>/foo</code> must already exist. |
| data | String buffer containing new resource's contents. The data is parsed to check if it contains a schema-based XML document, and the contents are stored as schema-based in the schema's default table. Otherwise, it is saved as binary data. |
| datarow | REF to an <code>XMLType</code> row to be used as the contents |
| csid | Character set id of the document. Must be a valid Oracle ID; otherwise returns an error. If CSID is not specified, or if a zero CSID is specified, then the character set id of the document is determined as follows: <ul style="list-style-type: none"> From the abspath extension, determine the resource's MIME type. If the MIME type is <code>*/*xml</code>, then the encoding is detected based on Appendix F of the W3C XML 1.0 Reference at http://www.w3.org/TR/2000/REC-xml-20001006; Otherwise, it is defaulted to the database character set. |
| schemaur1 | For XML data, schema URL data conforms to (default NULL) |
| elem | Element name (default NULL) |

Return Values

TRUE if operation successful; FALSE, otherwise.

205.4.9 DELETERESOURCE Procedure

This procedure deletes a resource from the hierarchy.

Syntax

```
DBMS_XDB_REPOS.DELETERESOURCE (
  path          IN      VARCHAR2,
  delete_option IN      PLS_INTEGER);
```

Parameters

Table 205-11 DELETERESOURCE Procedure Parameters

| Parameter | Description |
|---------------|---|
| path | Path name of the resource to delete |
| delete_option | The option that controls how a resource is deleted: <ul style="list-style-type: none"> DELETE_RESOURCE DELETE_RECURSIVE DELETE_FORCE DELETE_RECURSIVE_FORCE |

205.4.10 DELETERESOURCEMETADATA Procedures

This procedure takes in a resource by absolute path and removes either the schema-based metadata identified by the REF, or the metadata identified by the namespace and name combination, which can be either schema-based or non-schema based. It also takes an additional (optional) parameter that specifies how to delete it. This parameter is only relevant for schema-based resource metadata that needs to be deleted. For non-schema based metadata, this parameter is ignored.

Syntax

Can be used only for schema-based metadata:

```
DBMS_XDB_REPOS.DELETERESOURCEMETADATA (
    abspath          IN VARCHAR2,
    metadata         IN REF SYS.XMLTYPE,
    delete_option   IN pls_integer :=
DBMS_XDB_REPOS.DELETE_RESOURCE_METADATA_CASCADE);
```

Can be used for schema-based or nonschema-based metadata:

```
DBMS_XDB_REPOS.DELETERESOURCEMETADATA (
    abspath          IN VARCHAR2,
    metadatans       IN VARCHAR2,
    metadataname     IN VARCHAR2,
    delete_option   IN pls_integer :=
DBMS_XDB_REPOS.DELETE_RESOURCE_METADATA_CASCADE);
```

Parameters

Table 205-12 DELETERESOURCEMETADATA Procedure Parameters

| Parameter | Description |
|---------------|---|
| abspath | Absolute path of the resource |
| metadata | REF to the piece of metadata (schema based) to be deleted |
| mettadatans | Namespace of the metadata fragment to be removed |
| mettadataname | Local name of the metadata fragment to be removed |
| delete_option | Only applicable for schema-based metadata, this can be one of the following: <ul style="list-style-type: none"> DELETE_RES_METADATA_CASCADE - deletes the corresponding row in the metadata table DELETE_RES_METADATA_NOCASCADE - does not delete the row in the metadata table |

205.4.11 EXISTSRESOURCE Function

This function indicates if a resource is in the hierarchy. It matches the resource by a string that represents its absolute path.

Syntax

```
DBMS_XDB_REPOS.EXISTSRESOURCE (
    abspath IN VARCHAR2)
RETURN BOOLEAN;
```

Parameters

Table 205-13 EXISTSRESOURCE Function Parameters

| Parameter | Description |
|-----------|--|
| abspath | Path name of the resource whose ACL document is required |

Return Values

TRUE if the resource is found.

205.4.12 GETACLDOCUMENT Function

This function retrieves ACL document that protects resource given its path name.

Syntax

```
DBMS_XDB_REPOS.GETACLDOCUMENT (
    abspath IN VARCHAR2)
RETURN sys.xmltype;
```

Parameters

Table 205-14 GETACLDOCUMENT Function Parameters

| Parameter | Description |
|-----------|--|
| abspath | Path name of the resource whose ACL document is required |

Return Values

The XMLType for ACL document.

205.4.13 GETCONTENTBLOB Function

This function retrieves the contents of a resource returned as a BLOB.

Syntax

```
DBMS_XDB_REPOS.GETCONTENTBLOB (
    abspath IN VARCHAR2,
    csid OUT PLS_INTEGER,
```

```
locksrc IN BOOLEAN := FALSE)
RETURN BLOB;
```

Parameters

Table 205-15 GETCONTENTBLOB Function Parameters

| Parameter | Description |
|-----------|--|
| abspath | Absolute path of the resource |
| csid | If TRUE, lock and return the source LOB. If FALSE, return a temp LOB copy. |
| locksrc | Contents of the resource as a BLOB |

Return Values

The contents of the resource as a BLOB.

205.4.14 GETCONTENTCLOB Function

This function gets the contents of a resource returned as a CLOB.

Syntax

```
DBMS_XDB_REPOS.GETCONTENTCLOB(
    abspath IN VARCHAR2,
    RETURN CLOB;
```

Parameters

Table 205-16 GETCONTENTCLOB Function Parameters

| Parameter | Description |
|-----------|-------------------------------|
| abspath | Absolute path of the resource |

Return Values

The contents of the resource as a CLOB.

205.4.15 GETCONTENTVARCHAR2 Function

This function gets the contents of a resource returned as a string.

Syntax

```
DBMS_XDB_REPOS.GETCONTENTVARCHAR2(
    abspath IN VARCHAR2,
    RETURN BLOB;
```

Parameters

Table 205-17 GETCONTENTVARCHAR2 Function Parameters

| Parameter | Description |
|-----------|-------------------------------|
| abspath | Absolute path of the resource |

Return Values

The contents of the resource as a string.

205.4.16 GETCONTENTXMLREF Function

This function retrieves the contents of a resource returned as a REF to an XMLTYPE.

Syntax

```
DBMS_XDB_REPOS.GETCONTENTXMLREF (  
    abspath IN VARCHAR2,  
    RETURN SYS.XMLTYPE;
```

Parameters

Table 205-18 GETCONTENTXMLREF Function Parameters

| Parameter | Description |
|-----------|-------------------------------|
| abspath | Absolute path of the resource |

Return Values

The contents of the resource as a REF to an XMLTYPE.

205.4.17 GETCONTENTXMLTYPE Function

This function retrieves the contents of a resource returned as an XMLTYPE.

Syntax

```
DBMS_XDB_REPOS.GETCONTENTXMLTYPE (  
    abspath IN VARCHAR2,  
    RETURN SYS.XMLTYPE;
```

Parameters

Table 205-19 GETCONTENTXMLTYPE Function Parameters

| Parameter | Description |
|-----------|-------------------------------|
| abspath | Absolute path of the resource |

Return Values

The contents of the resource as an XMLTYPE.

205.4.18 GETLOCKTOKEN Procedure

Given a path to a resource, this procedure returns that resource's lock token for the current user.

Syntax

```
DBMS_XDB_REPOS.GETLOCKTOKEN(  
    path          IN      VARCHAR2,  
    locktoken    OUT     VARCHAR2);
```

Parameters**Table 205-20 GETLOCKTOKEN Procedure Parameters**

| Parameter | Description |
|-----------|--|
| path | Path name to the resource |
| locktoken | Logged-in user's lock token for the resource |

Usage Notes

The user must have `READPROPERTIES` privilege on the resource.

205.4.19 GETPRIVILEGES Function

This function gets all privileges granted to the current user on a specified resource.

Syntax

```
DBMS_XDB_REPOS.GETPRIVILEGES(  
    res_path      IN      VARCHAR2)  
RETURN sys.xmltype;
```

Parameters**Table 205-21 GETPRIVILEGES Function Parameters**

| Parameter | Description |
|-----------|--|
| res_path | Absolute path in the hierarchy of the resource |

Return Values

An XMLType instance of `<privilege>` element, which contains the list of all leaf privileges granted on this resource to the current user.

205.4.20 GETRESOID Function

The `GETRESOID` function returns the object ID of the resource from its absolute path.

Syntax

```
DBMS_XDB_REPOS.GETRESOID(  
    abspath IN VARCHAR2)  
RETURN RAW;
```

Parameters

Table 205-22 GETRESOID Function Parameters

| Parameter | Description |
|---------------------------|-------------------------------|
| <code>abspath_path</code> | Absolute path of the resource |

Return Values

NULL if the resource is not present.

205.4.21 GETXDB_TABLESPACE Function

This function returns the current tablespace of the XDB (user).

Syntax

```
DBMS_XDB_REPOS.GETXDB_TABLESPACE  
RETURN VARCHAR2;
```

205.4.22 HASBLOBCONTENT Function

This function returns `TRUE` if the resource has BLOB content.

Syntax

```
DBMS_XDB_REPOS.HASBLOBCONTENT  
    abspath IN VARCHAR2)  
RETURN BOOLEAN;
```

Parameters

Table 205-23 HASBLOBCONTENT Function Parameters

| Parameter | Description |
|---------------------------|-------------------------------|
| <code>abspath_path</code> | Absolute path of the resource |

Return Values

`TRUE` if the resource has BOB content.

205.4.23 HASCHARCONTENT Function

This function returns `TRUE` if the resource has character content.

Syntax

```
DBMS_XDB_REPOS.HASCHARCONTENT  
  abspath IN VARCHAR2)  
RETURN BOOLEAN;
```

Parameters

Table 205-24 HASCHARCONTENT Function Parameters

| Parameter | Description |
|--------------|-------------------------------|
| abspath_path | Absolute path of the resource |

Return Values

`TRUE` if the resource has character content.

205.4.24 HASXMLCONTENT Function

This function returns `TRUE` if the resource has XML content.

Syntax

```
DBMS_XDB_REPOS.HASXMLCONTENT  
  abspath IN VARCHAR2)  
RETURN BOOLEAN;
```

Parameters

Table 205-25 HASXMLCONTENT Function Parameters

| Parameter | Description |
|--------------|-------------------------------|
| abspath_path | Absolute path of the resource |

Return Values

`TRUE` if the resource has XML content.

205.4.25 HASXMLREFERENCE Function

This function returns `TRUE` if the resource has a `REF` to XML content.

Syntax

```
DBMS_XDB_REPOS.HASXMLREFERENCE  
  abspath IN VARCHAR2)  
RETURN BOOLEAN;
```

Parameters

Table 205-26 HASXMLREFERENCE Function Parameters

| Parameter | Description |
|--------------|-------------------------------|
| abspath_path | Absolute path of the resource |

Return Values

TRUE resource has a REF to XML content.

205.4.26 ISFOLDER Function

This function returns TRUE if the resource is a folder or container.

Syntax

```
DBMS_XDB_REPOS.ISFOLDER
  abspath IN VARCHAR2)
  RETURN BOOLEAN;
```

Parameters

Table 205-27 ISFOLDER Function Parameters

| Parameter | Description |
|--------------|-------------------------------|
| abspath_path | Absolute path of the resource |

Return Values

TRUE if the resource is a folder or container.

205.4.27 LINK Procedures

This procedure creates from a specified folder to a specified resource.

Syntax

```
DBMS_XDB_REPOS.LINK(
  srcpath IN VARCHAR2,
  linkfolder IN VARCHAR2,
  linkname IN VARCHAR2);

DBMS_XDB_REPOS.LINK(
  srcpath IN VARCHAR2,
  linkfolder IN VARCHAR2,
  linkname IN VARCHAR2,
  linktype IN PLS_INTEGER := DBMS_XDB_REPOS.LINK_TYPE_HARD);
```

Parameters

Table 205-28 LINK Procedure Parameters

| Parameter | Description |
|------------|---|
| srcpath | Path name of the resource to which a link is created |
| linkfolder | Folder in which the new link is placed |
| linkname | Name of the new link |
| linktype | Type of link to be created: <ul style="list-style-type: none"> • DBMS_XDB.LINK_TYPE_HARD (default) • DBMS_XDB.LINK_TYPE_WEAK • DBMS_XDB.LINK_TYPE_SYMBOLIC |

205.4.28 LOCKRESOURCE Function

Given a path to a resource, this function gets a WebDAV-style lock on that resource.

Syntax

```
DBMS_XDB_REPOS.LOCKRESOURCE (
    path      IN  VARCHAR2,
    depthzero IN  BOOLEAN,
    shared    IN  boolean)
RETURN BOOLEAN;
```

Parameters

Table 205-29 LOCKRESOURCE Function Parameters

| Parameter | Description |
|-----------|--|
| path | Path name of the resource to lock. |
| depthzero | Currently not supported |
| shared | Passing TRUE obtains a shared write lock |

Return Values

TRUE if successful.

Usage Notes

The user must have UPDATE privileges on the resource.

205.4.29 PROCESSLINKS Procedure

This procedure processes document links in the specified resource.

Syntax

```
DBMS_XDB_REPOS.PURGERESOURCEMETADATA (
  abspath IN VARCHAR2,
  recurse IN BOOLEAN := FALSE);
```

Parameters

Table 205-30 PROCESSLINKS Procedure Parameters

| Parameter | Description |
|-----------|---|
| abspath | Absolute path of the resource. If the path is a folder, use the <code>recurse</code> flag. |
| recurse | Used only if <code>abspath</code> specifies a folder. If <code>TRUE</code> , process links of all resources in the folder hierarchy rooted at the specified resource. If <code>FALSE</code> , process links of all documents in this folder only. |

205.4.30 PURGERESOURCEMETADATA Procedure

This procedure deletes all user metadata from a resource. Schema-based metadata is removed in cascade mode, rows being deleted from the corresponding metadata tables.

Syntax

```
DBMS_XDB_REPOS.PURGERESOURCEMETADATA (
  abspath IN VARCHAR2);
```

Parameters

Table 205-31 PURGERESOURCEMETADATA Procedure Parameters

| Parameter | Description |
|-----------|-------------------------------|
| abspath | Absolute path of the resource |

205.4.31 RENAMERESOURCE Procedure

This procedure renames the XDB resource.

Syntax

```
DBMS_XDB_REPOS.RENAMERESOURCE (
  srcpath IN VARCHAR2,
  destfolder IN CARCHAR2,
  newname IN VARCHAR2);
```

Parameters

Table 205-32 RENAMERESOURCE Procedure Parameters

| Parameter | Description |
|------------|---|
| srcpath | Absolute path in the Hierarchy for the source resource destination folder |
| destfolder | Absolute path in the Hierarchy for the destination folder |
| newname | Name of the child in the destination folder |

205.4.32 SETACL Procedure

This procedure sets the ACL on a specified resource to be the ACL specified by path.

Syntax

```
DBMS_XDB_REPOS.SETACL(
    res_path IN VARCHAR2,
    acl_path IN VARCHAR2);
```

Parameters

Table 205-33 SETACL Procedure Parameters

| Parameter | Description |
|-----------|---|
| res_path | Absolute path in the Hierarchy for resource |
| acl_path | Absolute path in the Hierarchy for ACL |

Usage Notes

The user must have <write-acl> privileges on the resource.

205.4.33 SPLITPATH Procedure

This procedure splits the path into a parentpath and childpath.

Syntax

```
DBMS_XDB_REPOS.SPLITPATH(
    abspath IN VARCHAR2,
    parentpath OUT VARCHAR2,
    childpath OUT VARCHAR2);
```

Parameters

Table 205-34 SPLITPATH Procedure Parameters

| Parameter | Description |
|------------|---------------------------|
| abspath | Absolute path to be split |
| parentpath | Parentpath |

Table 205-34 (Cont.) SPLITPATH Procedure Parameters

| Parameter | Description |
|-----------|-------------|
| childpath | Childpath |

205.4.34 TOUCHRESOURCE Procedure

This procedure changes the modification time of the resource to the current time.

Syntax

```
DBMS_XDB_REPOS.TOUCHRESOURCE
  (abspath IN VARCHAR2);
```

Parameters

Table 205-35 TOUCHRESOURCE Procedure Parameters

| Parameter | Description |
|--------------|-------------------------------|
| abspath_path | Absolute path of the resource |

205.4.35 UNLOCKRESOURCE Function

This function unlocks the resource given a lock token and a path to the resource.

Syntax

```
DBMS_XDB_REPOS.UNLOCKRESOURCE (
  path IN VARCHAR2,
  deltoken IN VARCHAR2)
RETURN BOOLEAN;
```

Parameters

Table 205-36 UNLOCKRESOURCE Function Parameters

| Parameter | Description |
|-----------|---------------------------|
| path | Path name to the resource |
| deltoken | Lock token to be removed |

Return Values

TRUE if operation successful.

Usage Notes

The user must have UPDATE privileges on the resource.

205.4.36 UPDATERESOURCEMETADATA Procedures

This procedure updates metadata for a resource.

The procedure takes in a resource identified by absolute path and the metadata in it to replace identified by its REF. It replaces that piece of metadata with user-defined metadata which is either in the form of a REF to XMLTYPE or an XMLTYPE.

Syntax

Can be used to update schema-based metadata only. The new metadata must be schema-based:

```
DBMS_XDB_REPOS.UPDATERESOURCEMETADATA (
  abspath IN VARCHAR2,
  oldmetadata IN REF SYS.XMLTYPE,
  newmetadata IN REF SYS.XMLTYPE)
```

Can be used to update schema-based metadata only. The new metadata must be schema-based or nonschema-based:

```
DBMS_XDB_REPOS.UPDATERESOURCEMETADATA (
  abspath IN VARCHAR2,
  oldmetadata IN REF SYS.XMLTYPE,
  newmetadata IN XMLTYPE);
```

Can be used for both schema-based and nonschema-based metadata:

```
DBMS_XDB_REPOS.UPDATERESOURCEMETADATA (
  abspath IN VARCHAR2,
  oldns IN VARCHAR2,
  oldname IN VARCHAR,
  newmetadata IN XMLTYPE);
```

Can be used for both schema-based or nonschema-based metadata. New metadata must be schema-based:

```
DBMS_XDB_REPOS.UPDATERESOURCEMETADATA (
  abspath IN VARCHAR2,
  oldns IN VARCHAR2,
  oldname IN VARCHAR,
  newmetadata IN REF SYS.XMLTYPE);
```

Parameters

Table 205-37 UPDATERESOURCEMETADATA Procedure Parameters

| Parameter | Description |
|-------------|--|
| abspath | Absolute path of the resource |
| oldmetadata | REF to the old of metadata |
| newmetadata | REF to the new, replacement metadata (can be either schema-based or nonschema-based depending on the overload) |

Table 205-37 (Cont.) UPDATERESOURCEMETADATA Procedure Parameters

| Parameter | Description |
|-----------|-------------------------------------|
| oldns | Namespace identifying old metadata |
| oldname | Local name identifying old metadata |

Usage Notes

In the case of `REF`, it stores the `REF` in the resource and the metadata is stored in a separate table. Uniqueness of `REFs` is enforced. In the case where the `XMLTYPE` is passed in, data is parsed to determine if it is schema-based or not and is stored accordingly.

DBMS_XDB_VERSION

Oracle XML DB versioning interfaces are found in the `DBMS_XDB_VERSION` package. Functions and procedures of `DBMS_XDB_VERSION` help to create a VCR and manage the versions in the version history.

This chapter contains the following topic:

- [Security Model](#)
- [Summary of DBMS_XDB_VERSION Subprograms](#)

See Also:

Oracle XML DB Developer's Guide

206.1 DBMS_XDB_VERSION Security Model

Owned by `XDB`, the `DBMS_XDB_VERSION` package must be created by `SYS` or `XDB`. The `EXECUTE` privilege is granted to `PUBLIC`. Subprograms in this package are executed using the privileges of the current user.

206.2 Summary of DBMS_XDB_VERSION Subprograms

This table lists the `DBMS_XDB_VERSION` subprograms and briefly describes them.

Table 206-1 *DBMS_XDB_VERSION Package Subprograms*

| Method | Description |
|---|--|
| CHECKIN Function | Checks in a checked-out VCR and returns the resource id of the newly-created version |
| CHECKOUT Procedure | Checks out a VCR before updating or deleting it |
| GETCONTENTSLOBBYRESID Function | Obtain contents as a BLOB |
| GETCONTENTSCLOBBYRESID Function | Obtain contents as a CLOB |
| GETCONTENTSXMLBYRESID Function | Obtain contents as an XMLType |
| GETPREDECESSORS Function | Retrieves the list of predecessors by path name |
| GETPREDSBYRESID Function | Retrieves the list of predecessors by resource id |
| GETRESOURCEBYRESID Function | Obtains the resource as an XMLType, given the resource object ID |
| GETSUCCESSORS Function | Retrieves the list of successors by path name |

Table 206-1 (Cont.) DBMS_XDB_VERSION Package Subprograms

| Method | Description |
|--|---|
| GETSUCCSBYRESID Function | Retrieves the list of successors by resource id |
| MAKEVERSIONED Function | Turns a regular resource whose path name is given into a version-controlled resource |
| UNCHECKOUT Function | Checks in a checked-out resource, returns the resource id of the version before the resource is checked out |

206.2.1 CHECKIN Function

This function checks in a checked-out VCR and returns the resource id of the newly-created version.

Syntax

```
DBMS_XDB_VERSION.CHECKIN(
    pathname VARCHAR2)
RETURN DBMS_XDB.resid_type;
```

Parameters

Table 206-2 CHECKIN Function Parameters

| Parameter | Description |
|-----------|--|
| pathname | The path name of the checked-out resource. |

Usage Notes

This is not an auto-commit SQL operation. [CHECKIN Function](#) doesn't have to take the same path name that was passed to [CHECKOUT Procedure](#) operation. However, the [CHECKIN Function](#) path name and the [CHECKOUT Procedure](#) path name must be of the same resource for the operations to function correctly. If the resource has been renamed, the new name must be used to [CHECKIN Function](#) because the old name is either invalid or is currently bound with a different resource. Exception is raised if the path name does not exist. If the path name has been changed, the new path name must be used to [CHECKIN Function](#) the resource.

206.2.2 CHECKOUT Procedure

This procedure checks out a VCR before updating or deleting it.

Syntax

```
DBMS_XDB_VERSION.Checkout(
    pathname VARCHAR2);
```

Parameters

Table 206-3 CHECKOUT Procedure Parameters

| Parameter | Description |
|-----------|---|
| pathname | The path name of the VCR to be checked out. |

Usage Notes

This is not an auto-commit SQL operation. Two users of the same workspace cannot [CHECKOUT Procedure](#) the same VCR at the same time. If this happens, one user must rollback. As a result, it is good practice to commit the [CHECKOUT Procedure](#) operation before updating a resource and avoid loss of the update if the transaction is rolled back. An exception is raised if the given resource is not a VCR, if the VCR is already checked out, if the resource doesn't exist.

206.2.3 GETCONTENTSLOBBYRESID Function

This function obtain contents as a BLOB.

Syntax

```
DBMS_XDB_VERSION.GETCONTENTSLOBBYRESID(
    resid      DBMS_XDB.resid_type)
RETURN BLOB;
```

Parameters

Table 206-4 GETCONTENTSLOBBYRESID Function Parameters

| Parameter | Description |
|-----------|------------------|
| resid | The resource id. |

206.2.4 GETCONTENTSCLOBBYRESID Function

This function obtains contents as a CLOB.

Syntax

```
DBMS_XDB_VERSION.GETCONTENTSCLOBBYRESID(
    resid      DBMS_XDB.resid_type)
RETURN CLOB;
```

Parameters

Table 206-5 GETCONTENTSCLOBBYRESID Function Parameters

| Parameter | Description |
|-----------|------------------|
| resid | The resource id. |

206.2.5 GETCONTENTSXMLBYRESID Function

This function obtains contents as an XMLType.

Syntax

```
DBMS_XDB_VERSION.GETCONTENTSXMLBYRESID(
    resid      DBMS_XDB.resid_type)
RETURN XMLType;
```

Parameters

Table 206-6 GETCONTENTSXMLBYRESID Function Parameters

| Parameter | Description |
|-----------|------------------|
| resid | The resource id. |

Return Values

If the contents are not valid XML, returns NULL.

206.2.6 GETPREDECESSORS Function

This function retrieves the list of predecessors by the path name.

Syntax

```
DBMS_XDB_VERSION.GETPREDECESSORS(
    pathname    VARCHAR2)
RETURN resid_list_type;
```

Parameters

Table 206-7 GETPREDECESSORS Function Parameters

| Parameter | Description |
|-----------|--------------------------------|
| pathname | The path name of the resource. |

Return Values

An exception is raised if `pathname` is illegal.

206.2.7 GETPREDSBYRESID Function

This function retrieves the list of predecessors by resource id.

Syntax

```
DBMS_XDB_VERSION.GETPREDSBYRESID(
    resid      resid_type)
RETURN resid_list_type;
```

Parameters

Table 206-8 GETPREDSBYRESID Function Parameters

| Parameter | Description |
|-----------|------------------|
| resid | The resource id. |

Usage Notes

Getting predecessors by `RESID` is more efficient than by `pathname`.

Exceptions

An exception is raised if the `RESID` is illegal.

206.2.8 GETRESOURCEBYRESID Function

This function obtains the resource as an `XMLType`, given the resource object ID. Because the system does not create a path name for versions, this function is useful for retrieving the resource using its resource id.

Syntax

```
DBMS_XDB_VERSION.GETRESOURCEBYRESID(
    resid      resid_type)
RETURN XMLType;
```

Parameters

Table 206-9 GETRESOURCEBYRESID Function Parameters

| Parameter | Description |
|-----------|------------------|
| resid | The resource id. |

206.2.9 GETSUCCESSORS Function

Given a version resource or a VCR, this function retrieves the list of the successors of the resource by the path name.

Syntax

```
DBMS_XDB_VERSION.GETSUCCESSORS (
    pathname VARCHAR2)
RETURN resid_list_type;
```

Parameters

Table 206-10 GETSUCCESSORS Function Parameters

| Parameter | Description |
|-----------|--------------------------------|
| pathname | The path name of the resource. |

Usage Notes

Getting successors by `RESID` is more efficient than by `pathname`.

Exceptions

An exception is raised if the `pathname` is illegal.

206.2.10 GETSUCCSBYRESID Function

This function retrieves the list of the successors of the resource by resource id using version resource or VCR.

Syntax

```
DBMS_XDB_VERSION.GETSUCCSBYRESID(
    resid    resid_type)
RETURN resid_list_type;
```

Parameters

Table 206-11 GETSUCCSBYRESID Function Parameters

| Parameter | Description |
|--------------------|------------------|
| <code>resid</code> | The resource id. |

Usage Notes

Getting successors by `RESID` is more efficient than by `pathname`.

Exceptions

An exception is raised if the `pathname` is illegal.

206.2.11 MAKEVERSIONED Function

This function turns a regular resource whose path name is given into a version-controlled resource. This new resource is then put under version control. All other path names continue to refer to the original resource.

Syntax

```
DBMS_XDB_VERSION.MAKEVERSIONED(
    pathname  VARCHAR2)
RETURN DBMS_XDB.resid_type;
```

Parameters

Table 206-12 MAKEVERSIONED Function Parameters

| Parameter | Description |
|-----------------------|--|
| <code>pathname</code> | The path name of the resource to be put under version control. |

Return Values

This function returns the resource ID of the first version, or root, of the VCR.

Usage Notes

If two or more path names are bound with the same resource, a copy of the resource is created, and the given path name is bound with the newly-created copy.

This is not an auto-commit SQL operation. An exception is raised if the resource doesn't exist.

- This call is legal for VCR, and neither exception nor warning is raised.
- This call is illegal for folder, version history, version resource, and ACL.
- No support for Schema-based resources is provided.

206.2.12 UNCHECKOUT Function

This function checks-in a checked-out resource and returns the resource id of the version before the resource is checked out.

Syntax

```
DBMS_XDB_VERSION.UNCHECKOUT(  
    pathname    VARCHAR2)  
RETURN DBMS_XDB.resid_type;
```

Parameters

Table 206-13 UNCHECKOUT Function Parameters

| Parameter | Description |
|-----------|--|
| pathname | The path name of the checked-out resource. |

Usage Notes

This is not an auto-commit SQL operation. The [UNCHECKOUT Function](#) does not have to take the same path name that was passed to the operation by the [CHECKOUT Procedure](#). However, the [UNCHECKOUT Function](#) path name and the [CHECKOUT Procedure](#) path name must be of the same resource for the operations to function correctly. If the resource has been renamed, the new name must be used to [UNCHECKOUT Function](#), because the old name is either invalid or is currently bound with a different resource. If the path name has been changed, the new path name must be used to [UNCHECKOUT Function](#) the resource.

Exceptions

An exception is raised if the path name doesn't exist.

DBMS_XDBRESOURCE

The `DBMS_XDBRESOURCE` package provides the interface to operate on the resource's metadata and contents.

This chapter contains the following topics:

- [Overview](#)
- [Security Model](#)
- [Summary of DBMS_XDBRESOURCE Subprograms](#)

See Also:

Oracle XML DB Developer's Guide for examples of "Using `DBMS_XDBRESOURCE`"

207.1 DBMS_XDBRESOURCE Overview

The `DBMS_XDBRESOURCE` package provides routines to get and set the resource's metadata and contents. To take advantage of the DOM traversal facility, provided in `DBMS_XMLDOM` package, an `XDBResource` instance could be converted to a `DOMDocument` type by using `DBMS_XDBRESOURCE.MAKEDOCUMENT` routine.

207.2 DBMS_XDBRESOURCE Security Model

Owned by `XDB`, the `DBMS_XDBRESOURCE` package must be created by `SYS` or `XDB`. The `EXECUTE` privilege is granted to `PUBLIC`. Subprograms in this package are executed using the privileges of the current user.

207.3 Summary of DBMS_XDBRESOURCE Subprograms

This table lists the `DBMS_XDBRESOURCE` subprograms and briefly describes them.

Table 207-1 *DBMS_XDBRESOURCE Package Subprograms*

| Subprogram | Description |
|---|---|
| FREERESOURCE Procedure | Frees any memory associated with an <code>XDBResource</code> |
| GETACL Function | Given an <code>XDBResource</code> , returns its ACL as string |
| GETACLDOCFROMRES Function | Returns the ACL Document for the given resource as <code>XMLType</code> |
| GETAUTHOR Function | Given an <code>XDBResource</code> , returns its author |

Table 207-1 (Cont.) DBMS_XDBRESOURCE Package Subprograms

| Subprogram | Description |
|---|--|
| GETCHARACTERSET Function | Given an XDBResource, returns its character set |
| GETCOMMENT Function | Given an XDBResource, returns its comment |
| GETCONTENTBLOB Function | Returns the contents of the resource as a BLOB |
| GETCONTENTCLOB Function | Returns the contents of the resource as a CLOB |
| GETCONTENTREF Function | Returns the contents of the resource as an XMLTypeRef |
| GETCONTENTTYPE Function | Given an XDBResource, returns its content-type |
| GETCONTENTXML Function | Returns the contents of the resource as XML |
| GETCONTENTVARCHAR2 Function | Returns the contents of the resource as a string |
| GETCREATIONDATE Function | Given an XDBResource, returns its creation date |
| GETCREATOR Function | Given an XDBResource, returns its creator |
| GETCUSTOMMETADATA Function | Returns the requested custom metadata given the xpath and namespace to the metadata |
| GETDISPLAYNAME Function | Given an XDBResource, returns its display name |
| GETLANGUAGE Function | Given an XDBResource, returns its language |
| GETLASTMODIFIER Function | Given an XDBResource, returns its last modifier |
| GETMODIFICATIONDATE Function | Given an XDBResource, returns its modification date |
| GETOWNER Function | Given an XDBResource, returns its owner. |
| GETREFCOUNT Function | Given an XDBResource, returns its reference count |
| GETVERSIONID Function | Given an XDBResource, returns its version ID. |
| HASACLCHANGED Function | Returns TRUE if the ACL of the given resource has changed, FALSE otherwise |
| HASAUTHORCHANGED Function | Returns TRUE if the ACL of the given resource has changed FALSE otherwise |
| HASCHANGED Function | Returns TRUE if the element or attribute represented by the given XPath has changed, FALSE otherwise |
| HASCHARACTERSETCHANGED Function | Returns TRUE if the character set of the given resource has changed, FALSE otherwise |
| HASCOMMENTCHANGED Function | Returns TRUE if the comment of the given resource has changed, FALSE otherwise |
| HASCONTENTCHANGED Function | Returns TRUE if the contents of the given resource has changed, FALSE otherwise |
| HASCONTENTTYPECHANGED Function | Returns TRUE if the content-type of the given resource has changed, FALSE otherwise |
| HASCREATIONDATECHANGED Function | Returns TRUE if the creation date of the given resource has changed, FALSE otherwise |
| HASCREATORCHANGED Function | Returns TRUE if the creator of the given resource has changed, FALSE otherwise |
| HASCUSTOMMETADATACHANGED Function | Returns TRUE if custom-metadata for this XPath has changed, FALSE otherwise |

Table 207-1 (Cont.) *DBMS_XDBRESOURCE Package Subprograms*

| Subprogram | Description |
|---|--|
| HASDISPLAYNAMECHANGED Function | Returns <code>TRUE</code> if the display name of the given resource has changed, <code>FALSE</code> otherwise |
| HASLANGUAGECHANGED Function | Returns <code>TRUE</code> if the language of the given resource has changed, <code>FALSE</code> otherwise |
| HASLASTMODIFIERCHANGED Function | Returns <code>TRUE</code> if the last modifier of the given resource has changed, <code>FALSE</code> otherwise |
| HASMODIFICATIONDATECHANGED Function | Returns <code>TRUE</code> if the modification date of the given resource has changed, <code>FALSE</code> otherwise |
| HASOWNERCHANGED Function | Returns <code>TRUE</code> if the owner of the given resource has changed, <code>FALSE</code> otherwise |
| HASREFCOUNTCHANGED Function | Returns <code>TRUE</code> if the reference count of the given resource has changed, <code>FALSE</code> otherwise |
| HASVERSIONIDCHANGED Function | Returns <code>TRUE</code> if the version ID of the given resource has changed, <code>FALSE</code> otherwise |
| ISFOLDER Function | Returns <code>TRUE</code> if the given resource is a folder, <code>FALSE</code> otherwise |
| ISNULL Function | Returns <code>TRUE</code> if input resource is <code>NULL</code> , <code>FALSE</code> otherwise |
| MAKEDOCUMENT Function | Converts the <code>XDBResource</code> to a <code>DOMDocument</code> which can be operated on using the <code>XMLDOM</code> interface |
| SAVE Procedure | Updates the resource with any modifications |
| SETACL Procedure | Sets the ACL of the given <code>XDBResource</code> to the path specified |
| SETAUTHOR Procedure | Sets the author of the given <code>XDBResource</code> to the specified string |
| SETCHARACTERSET Procedure | Sets the character set of the given <code>XDBResource</code> to a specified character set |
| SETCOMMENT Procedure | Sets a comment associated with the given <code>XDBResource</code> |
| SETCONTENT Procedures | Replaces the contents of the given resource with the given <code>CLOB</code> |
| SETCONTENTTYPE Procedure | Sets the content-type of the given <code>XDBResource</code> |
| SETCUSTOMMETADATA Procedure | Sets the custom metadata specified by the XPath and namespace to new data |
| SETDISPLAYNAME Procedure | Sets the display name of the given <code>XDBResource</code> |
| SETLANGUAGE Procedure | Sets the language of the given <code>XDBResource</code> |
| SETOWNER Procedure | Sets the owner of the given <code>XDBResource</code> |

207.3.1 FREERESOURCE Procedure

This procedure frees any memory associated with an XDBResource.

Syntax

```
DBMS_XDBRESOURCE.FREERESOURCE (  
    res IN XDBResource)  
RETURN VARCHAR2;
```

Parameters

Table 207-2 FREERESOURCE Procedure Parameters

| Parameter | Description |
|-----------|---------------------|
| res | XDBResource to free |

207.3.2 GETACL Function

Given an XDBResource, this function returns its ACL as string.

Syntax

```
DBMS_XDBRESOURCE.GETACL (  
    res IN XDBResource)  
RETURN VARCHAR2;
```

Parameters

Table 207-3 GETACL Function Parameters

| Parameter | Description |
|-----------|-------------|
| res | XDBResource |

207.3.3 GETACLDOCFROMRES Function

This function returns the ACL Document for the given resource as XMLType.

Syntax

```
DBMS_XDBRESOURCE.GETACLDOCFROMRES (  
    res IN XDBResource)  
RETURN SYS.XMLTYPE;
```

Parameters

Table 207-4 GETACLDOCFROMRES Function Parameters

| Parameter | Description |
|-----------|-------------|
| res | XDBResource |

207.3.4 GETAUTHOR Function

Given an XDBResource, this function returns its author.

Syntax

```
DBMS_XDBRESOURCE.GETAUTHOR (  
    res IN XDBResource)  
RETURN VARCHAR2;
```

Parameters

Table 207-5 GETAUTHOR Function Parameters

| Parameter | Description |
|-----------|-------------|
| res | XDBResource |

207.3.5 GETCHARACTERSET Function

Given an XDBResource, this function returns its character set.

Syntax

```
DBMS_XDBRESOURCE.GETCHARACTERSET (  
    res IN XDBResource)  
RETURN VARCHAR2;
```

Parameters

Table 207-6 GETCHARACTERSET Function Parameters

| Parameter | Description |
|-----------|-------------|
| res | XDBResource |

207.3.6 GETCOMMENT Function

Given an XDBResource, this function returns its comment.

Syntax

```
DBMS_XDBRESOURCE.GETCOMMENT (  
    res IN XDBResource)  
RETURN VARCHAR2;
```

Parameters

Table 207-7 GETCOMMENT Function Parameters

| Parameter | Description |
|-----------|-------------|
| res | XDBResource |

207.3.7 GETCONTENTBLOB Function

This function returns the contents of the resource as a BLOB.

Syntax

```
DBMS_XDBRESOURCE.GETCONTENTBLOB (  
    res    IN    XDBResource,  
    csid   OUT   PLS_INTEGER)  
RETURN BLOB;
```

Parameters

Table 207-8 GETCONTENTBLOB Function Parameters

| Parameter | Description |
|-----------|---------------------------------------|
| res | XDBResource |
| csid | Character set ID of the BLOB returned |

207.3.8 GETCONTENTCLOB Function

This function returns the contents of the resource as a CLOB.

Syntax

```
DBMS_XDBRESOURCE.GETCONTENTCLOB (  
    res    IN    XDBResource)  
RETURN CLOB;
```

Parameters

Table 207-9 GETCONTENTCLOB Function Parameters

| Parameter | Description |
|-----------|-------------|
| res | XDBResource |

207.3.9 GETCONTENTREF Function

This function returns the contents of the resource as an XMLTypeRef.

Syntax

```
DBMS_XDBRESOURCE.GETCONTENTREF (  
    res    IN    XDBResource)  
RETURN VARCHAR2;
```

Parameters

Table 207-10 GETCONTENTREF Function Parameters

| Parameter | Description |
|-----------|-------------|
| res | XDBResource |

207.3.10 GETCONTENTTYPE Function

Given an XDBResource, this function returns its content-type.

Syntax

```
DBMS_XDBRESOURCE.GETCONTENTTYPE (  
  res IN XDBResource)  
RETURN VARCHAR2;
```

Parameters

Table 207-11 GETCONTENTTYPE Function Parameters

| Parameter | Description |
|-----------|-------------|
| res | XDBResource |

207.3.11 GETCONTENTXML Function

This function returns the contents of the resource as an XMLTypeRef.

Syntax

```
DBMS_XDBRESOURCE.GETCONTENTXML (  
  res IN XDBResource)  
RETURN XMLType;
```

Parameters

Table 207-12 GETCONTENTXML Function Parameters

| Parameter | Description |
|-----------|-------------|
| res | XDBResource |

207.3.12 GETCONTENTVARCHAR2 Function

This function returns the contents of the resource as a string.

Syntax

```
DBMS_XDBRESOURCE.GETCONTENTVARCHAR2 (  
  res IN XDBResource)  
RETURN VARCHAR2;
```

Parameters**Table 207-13 GETCONTENTVARCHAR2 Function Parameters**

| Parameter | Description |
|-----------|-------------|
| res | XDBResource |

207.3.13 GETCREATIONDATE Function

Given an XDBResource, this function returns its creation date.

Syntax

```
DBMS_XDBRESOURCE.GETCREATIONDATE (
  res IN XDBResource)
RETURN TIMESTAMP;
```

Parameters**Table 207-14 GETCREATIONDATE Function Parameters**

| Parameter | Description |
|-----------|-------------|
| res | XDBResource |

207.3.14 GETCREATOR Function

Given an XDBResource, this function returns its creator.

Syntax

```
DBMS_XDBRESOURCE.GETCREATOR (
  res IN XDBResource)
RETURN VARCHAR2;
```

Parameters**Table 207-15 GETCREATOR Function Parameters**

| Parameter | Description |
|-----------|-------------|
| res | XDBResource |

207.3.15 GETCUSTOMMETADATA Function

This function returns the requested custom metadata given the xpath and namespace to the metadata.

Syntax

```
DBMS_XDBRESOURCE.GETCUSTOMMETADATA (
  res IN XDBResource,
```

```

    xpath    IN    VARCHAR2,    namespace IN    VARCHAR2)
RETURN XMLType;

```

Parameters

Table 207-16 GETCUSTOMMETADATA Function Parameters

| Parameter | Description |
|-----------|---------------------------|
| res | XDBResource |
| xpath | XPath for custom metadata |
| namespace | Namespace |

Usage Notes

The first component of the XPath expression must be "Resource".

207.3.16 GETDISPLAYNAME Function

Given an XDBResource, this function returns its display name.

Syntax

```

DBMS_XDBRESOURCE.GETDISPLAYNAME (
    res    IN    XDBResource)
RETURN VARCHAR2;

```

Parameters

Table 207-17 GETDISPLAYNAME Function Parameters

| Parameter | Description |
|-----------|-------------|
| res | XDBResource |

207.3.17 GETLANGUAGE Function

Given an XDBResource, this function returns its language.

Syntax

```

DBMS_XDBRESOURCE.GETLANGUAGE (
    res    IN    XDBResource)
RETURN VARCHAR2;

```

Parameters

Table 207-18 GETLANGUAGE Function Parameters

| Parameter | Description |
|-----------|-------------|
| res | XDBResource |

207.3.18 GETLASTMODIFIER Function

Given an XDBResource, this function returns its last modifier.

Syntax

```
DBMS_XDBRESOURCE.GETLASTMODIFIER (  
    res IN XDBResource)  
RETURN VARCHAR2;
```

Parameters

Table 207-19 GETLASTMODIFIER Function Parameters

| Parameter | Description |
|-----------|-------------|
| res | XDBResource |

207.3.19 GETMODIFICATIONDATE Function

Given an XDBResource, this function returns its modification date.

Syntax

```
DBMS_XDBRESOURCE.GETMODIFICATIONDATE (  
    res IN XDBResource)  
RETURN TIMESTAMP;
```

Parameters

Table 207-20 GETMODIFICATIONDATE Function Parameters

| Parameter | Description |
|-----------|-------------|
| res | XDBResource |

207.3.20 GETOWNER Function

Given an XDBResource, this function returns its owner.

Syntax

```
DBMS_XDBRESOURCE.GETOWNER (  
    res IN XDBResource)  
RETURN VARCHAR2;
```

Parameters

Table 207-21 GETOWNER Function Parameters

| Parameter | Description |
|-----------|-------------|
| res | XDBResource |

207.3.21 GETREFCOUNT Function

Given an XDBResource, this function returns its reference count.

Syntax

```
DBMS_XDBRESOURCE.GETREFCOUNT (  
    res IN XDBResource)  
RETURN PLS_INTEGER;
```

Parameters

Table 207-22 GETREFCOUNT Function Parameters

| Parameter | Description |
|-----------|-------------|
| res | XDBResource |

207.3.22 GETVERSIONID Function

Given an XDBResource, this function returns its version ID.

Syntax

```
DBMS_XDBRESOURCE.GETVERSIONID (  
    res IN XDBResource)  
RETURN PLS_INTEGER;
```

Parameters

Table 207-23 GETVERSIONID Function Parameters

| Parameter | Description |
|-----------|-------------|
| res | XDBResource |

207.3.23 HASACLCHANGED Function

This function returns `TRUE` if the ACL of the given resource has changed, `FALSE` otherwise.

Syntax

```
DBMS_XDBRESOURCE.HASACLCHANGED (  
    res IN XDBResource)  
RETURN BOOLEAN;
```

Parameters

Table 207-24 HASACLCHANGED Function Parameters

| Parameter | Description |
|-----------|-------------|
| res | XDBResource |

207.3.24 HASAUTHORCHANGED Function

This function returns `TRUE` if the author of the given resource has changed, `FALSE` otherwise.

Syntax

```
DBMS_XDBRESOURCE.HASAUTHORCHANGED (
    res IN XDBResource)
RETURN BOOLEAN;
```

Parameters

Table 207-25 HASAUTHORCHANGED Function Parameters

| Parameter | Description |
|-----------|-------------|
| res | XDBResource |

207.3.25 HASCHANGED Function

Given an XPath, this function determines whether the element or attribute represented by the XPath has changed.

Syntax

```
DBMS_XDBRESOURCE.HASCHANGED (
    res IN XDBResource,
    xpath IN VARCHAR2,
    namespace IN VARCHAR2)
RETURN BOOLEAN;
```

Parameters

Table 207-26 HASCHANGED Function Parameters

| Parameter | Description |
|------------|------------------|
| res | XDBResource |
| xpath | XPath to check |
| bnamespace | Namespace to use |

207.3.26 HASCHARACTERSETCHANGED Function

This function returns `TRUE` if the character set of the given resource has changed, `FALSE` otherwise.

Syntax

```
DBMS_XDBRESOURCE.HASCHARACTERSETCHANGED (
    res IN XDBResource)
RETURN BOOLEAN;
```

Parameters

Table 207-27 HASCHARACTERSETCHANGED Function Parameters

| Parameter | Description |
|-----------|-------------|
| res | XDBResource |

207.3.27 HASCOMMENTCHANGED Function

This function returns `TRUE` if the comment of the given resource has changed, `FALSE` otherwise.

Syntax

```
DBMS_XDBRESOURCE.HASCOMMENTCHANGED (  
    res IN XDBResource)  
RETURN BOOLEAN;
```

Parameters

Table 207-28 HASCOMMENTCHANGED Function Parameters

| Parameter | Description |
|-----------|-------------|
| res | XDBResource |

207.3.28 HASCONTENTCHANGED Function

This function returns `TRUE` if the contents of the given resource has changed, `FALSE` otherwise.

Syntax

```
DBMS_XDBRESOURCE.HASCONTENTCHANGED (  
    res IN XDBResource)  
RETURN BOOLEAN;
```

Parameters

Table 207-29 HASCONTENTCHANGED Function Parameters

| Parameter | Description |
|-----------|-------------|
| res | XDBResource |

207.3.29 HASCONTENTTYPECHANGED Function

This function returns `TRUE` if the content-type of the given resource has changed, `FALSE` otherwise

Syntax

```
DBMS_XDBRESOURCE.HASCONTENTTYPECHANGED (
    res IN XDBResource)
RETURN BOOLEAN;
```

Parameters

Table 207-30 HASCONTENTTYPECHANGED Function Parameters

| Parameter | Description |
|-----------|-------------|
| res | XDBResource |

207.3.30 HASCREATIONDATECHANGED Function

This function returns `TRUE` if the creation date of the given resource has changed, `FALSE` otherwise

Syntax

```
DBMS_XDBRESOURCE.HASCREATIONDATECHANGED (
    res IN XDBResource)
RETURN BOOLEAN;
```

Parameters

Table 207-31 HASCREATIONDATECHANGED Function Parameters

| Parameter | Description |
|-----------|-------------|
| res | XDBResource |

207.3.31 HASCREATORCHANGED Function

This function returns `TRUE` if the creator of the given resource has changed, `FALSE` otherwise

Syntax

```
DBMS_XDBRESOURCE.HASCREATORCHANGED (
    res IN XDBResource)
RETURN BOOLEAN;
```

Parameters

Table 207-32 HASCREATORCHANGED Function Parameters

| Parameter | Description |
|-----------|-------------|
| res | XDBResource |

207.3.32 HASCUSTOMMETADATACHANGED Function

This function checks whether the custom-metadata for a given resource has changed.

Syntax

```
DBMS_XDBRESOURCE.HASCUSTOMMETADATACHANGED (  
    res IN XDBResource)  
RETURN BOOLEAN;
```

Parameters

Table 207-33 HASCUSTOMMETADATACHANGED Function Parameters

| Parameter | Description |
|-----------|-------------|
| res | XDBResource |

207.3.33 HASDISPLAYNAMECHANGED Function

This function returns `TRUE` if the display name of the given resource has changed, `FALSE` otherwise.

Syntax

```
DBMS_XDBRESOURCE.HASDISPLAYNAMECHANGED (  
    res IN XDBResource)  
RETURN BOOLEAN;
```

Parameters

Table 207-34 HASDISPLAYNAMECHANGED Function Parameters

| Parameter | Description |
|-----------|-------------|
| res | XDBResource |

207.3.34 HASLANGUAGECHANGED Function

This function returns `TRUE` if the language of the given resource has changed, `FALSE` otherwise.

Syntax

```
DBMS_XDBRESOURCE.HASLANGUAGECHANGED (  
    res IN XDBResource)  
RETURN BOOLEAN;
```

Parameters

Table 207-35 HASLANGUAGECHANGED Function Parameters

| Parameter | Description |
|-----------|-------------|
| res | XDBResource |

207.3.35 HASLASTMODIFIERCHANGED Function

This function returns `TRUE` if the last modifier of the given resource has changed, `FALSE` otherwise.

Syntax

```
DBMS_XDBRESOURCE.HASLASTMODIFIERCHANGED (  
    res IN XDBResource)  
RETURN BOOLEAN;
```

Parameters

Table 207-36 HASLASTMODIFIERCHANGED Function Parameters

| Parameter | Description |
|-----------|-------------|
| res | XDBResource |

207.3.36 HASMODIFICATIONDATECHANGED Function

This function returns `TRUE` if the modification date of the given resource has changed, `FALSE` otherwise.

Syntax

```
DBMS_XDBRESOURCE.HASMODIFICATIONDATECHANGED (  
    res IN XDBResource)  
RETURN BOOLEAN;
```

Parameters

Table 207-37 HASMODIFICATIONDATECHANGED Function Parameters

| Parameter | Description |
|-----------|-------------|
| res | XDBResource |

207.3.37 HASOWNERCHANGED Function

This function returns `TRUE` if the owner of the given resource has changed, `FALSE` otherwise.

Syntax

```
DBMS_XDBRESOURCE.HASOWNERCHANGED (  
    res IN XDBResource)  
RETURN BOOLEAN;
```

Parameters

Table 207-38 HASOWNERCHANGED Function Parameters

| Parameter | Description |
|-----------|-------------|
| res | XDBResource |

207.3.38 HASREFCOUNTCHANGED Function

This function returns `TRUE` if the reference count of the given resource has changed, `FALSE` otherwise.

Syntax

```
DBMS_XDBRESOURCE.HASREFCOUNTCHANGED (  
    res IN XDBResource)  
RETURN BOOLEAN;
```

Parameters

Table 207-39 HASREFCOUNTCHANGED Function Parameters

| Parameter | Description |
|-----------|-------------|
| res | XDBResource |

207.3.39 HASVERSIONIDCHANGED Function

This function returns `TRUE` if the version ID of the given resource has changed, `FALSE` otherwise.

Syntax

```
DBMS_XDBRESOURCE.HASVERSIONIDCHANGED (  
    res IN XDBResource)  
RETURN BOOLEAN;
```

Parameters

Table 207-40 HASVERSIONIDCHANGED Function Parameters

| Parameter | Description |
|-----------|-------------|
| res | XDBResource |

207.3.40 ISFOLDER Function

This function returns `TRUE` if the given resource is a folder, `FALSE` otherwise.

Syntax

```
DBMS_XDBRESOURCE.ISFOLDER (  
    res IN XDBResource)  
RETURN BOOLEAN;
```

Parameters

Table 207-41 ISFOLDER Function Parameters

| Parameter | Description |
|-----------|-------------|
| res | XDBResource |

207.3.41 ISNULL Function

This function returns `TRUE` if input resource is `NULL`.

Syntax

```
DBMS_XDBRESOURCE.ISNULL (  
    res IN XDBResource)  
RETURN BOOLEAN;
```

Parameters

Table 207-42 ISNULL Function Parameters

| Parameter | Description |
|-----------|----------------|
| res | Input resource |

207.3.42 MAKEDOCUMENT Function

This function converts the XDBResource to a DOMDocument which can be operated on using the XMLDOM interface.

See Also:

The [DBMS_XMLDOM](#) package

Syntax

```
DBMS_XDBRESOURCE.MAKEDOCUMENT (
    res IN XDBResource)
RETURN DBMS_XMLDOM.DOMDocument;
```

Parameters

Table 207-43 MAKEDOCUMENT Function Parameters

| Parameter | Description |
|-----------|-------------|
| res | XDBResource |

207.3.43 SAVE Procedure

This procedure updates the resource with any modifications.

Syntax

```
DBMS_XDBRESOURCE.SAVE (
    res IN XDBResource);
```

Parameters

Table 207-44 SAVE Procedure Parameters

| Parameter | Description |
|-----------|-------------|
| res | XDBResource |

207.3.44 SETACL Procedure

This procedure sets the ACL of the given XDBResource to the path specified.

Syntax

```
DBMS_XDBRESOURCE.SETACL (  
    res          IN OUT  XDBResource,  
    ACLPath     IN      VARCHAR2);
```

Parameters

Table 207-45 SETACL Procedure Parameters

| Parameter | Description |
|-----------|------------------------------|
| res | XDBResource |
| ACLPath | Absolute path of the new ACL |

207.3.45 SETAUTHOR Procedure

This procedure sets the author of the given XDBResource to the specified string.

Syntax

```
DBMS_XDBRESOURCE.SETAUTHOR (  
    res          IN OUT  XDBResource,  
    author       IN      VARCHAR2);
```

Parameters

Table 207-46 SETAUTHOR Procedure Parameters

| Parameter | Description |
|-----------|-------------|
| res | XDBResource |
| author | Author |

207.3.46 SETCHARACTERSET Procedure

This procedure sets the character set of the given XDBResource to a specified character set.

Syntax

```
DBMS_XDBRESOURCE.SETCHARACTERSET (  
    res          IN OUT  XDBResource,  
    charSet     IN      VARCHAR2);
```

Parameters

Table 207-47 SETCHARACTERSET Procedure Parameters

| Parameter | Description |
|-----------|-------------------|
| res | XDBResource |
| charset | New character set |

207.3.47 SETCOMMENT Procedure

This procedure sets a comment associated with the given XDBResource.

Syntax

```
DBMS_XDBRESOURCE.SETCOMMENT (
    res      IN OUT XDBResource,
    comment  IN      VARCHAR2);
```

Parameters

Table 207-48 SETCOMMENT Procedure Parameters

| Parameter | Description |
|-----------|-------------|
| res | XDBResource |
| comment | New comment |

207.3.48 SETCONTENT Procedures

This procedure replaces the contents of the given resource with the given datatype.

Syntax

```
DBMS_XDBRESOURCE.SETCONTENT (
    res      IN OUT XDBResource,
    data     IN      BFILE,
    csid     IN      NUMBER);
```

```
DBMS_XDBRESOURCE.SETCONTENT (
    res      IN OUT XDBResource,
    data     IN      BLOB,
    csid     IN      PLS_INTEGER);
```

```
DBMS_XDBRESOURCE.SETCONTENT (
    res      IN OUT XDBResource,
    data     IN      CLOB);
```

```
DBMS_XDBRESOURCE.SETCONTENT (
    res      IN OUT XDBResource,
    data     IN      REF SYS.XMLType,
    sticky   IN      BOOLEAN := TRUE);
```

```
DBMS_XDBRESOURCE.SETCONTENT (
    res      IN OUT XDBResource,
```

```

data      IN      VARCHAR2);

DBMS_XDBRESOURCE.SETCONTENT (
  res      IN OUT  XDBResource,
  data     IN      SYS.XMLType);

```

Parameters

Table 207-49 SETCONTENT Procedure Parameters

| Parameter | Description |
|-----------|--|
| res | XDBResource |
| data | Data input as BFILE, BLOB, CLOB, string, XMLType |
| csid | Character set ID of the BFILE, BLOB |
| sticky | If TRUE creates a sticky REF, otherwise non-sticky |

207.3.49 SETCONTENTTYPE Procedure

This procedure sets the content-type of the given XDBResource.

Syntax

```

DBMS_XDBRESOURCE.SETCONTENTTYPE (
  res      IN OUT  XDBResource,
  conttype IN      VARCHAR2);

```

Parameters

Table 207-50 SETCONTENTTYPE Procedure Parameters

| Parameter | Description |
|-----------|------------------|
| res | XDBResource |
| conttype | New content-type |

207.3.50 SETCUSTOMMETADATA Procedure

This procedure sets the custom metadata specified by the xpath and namespace to new data.

Syntax

```

DBMS_XDBRESOURCE.SETCUSTOMMETADATA (
  res      IN OUT  XDBResource,
  xpath    IN      VARCHAR2,
  namespace IN      VARCHAR2,
  newMetadata IN    XMLType);

```

Parameters

Table 207-51 SETCUSTOMMETADATA Procedure Parameters

| Parameter | Description |
|-------------|--|
| res | XDBResource |
| xpath | XPath to change |
| namespace | Namespace to use |
| newMetadata | New data that should replace the metadata at the given XPath |

Usage Notes

The first component of the XPath expression must be "Resource".

207.3.51 SETDISPLAYNAME Procedure

This procedure sets the display name of the given XDBResource.

Syntax

```
DBMS_XDBRESOURCE.SETDISPLAYNAME (
    res      IN OUT XDBResource,
    name     IN     VARCHAR2);
```

Parameters

Table 207-52 SETDISPLAYNAME Procedure Parameters

| Parameter | Description |
|-----------|------------------|
| res | XDBResource |
| name | New display name |

207.3.52 SETLANGUAGE Procedure

This procedure sets the language of the given XDBResource.

Syntax

```
DBMS_XDBRESOURCE.SETLANGUAGE (
    res      IN OUT XDBResource,
    ACLPath  IN     VARCHAR2);
```

Parameters

Table 207-53 SETLANGUAGE Procedure Parameters

| Parameter | Description |
|-----------|-------------|
| res | XDBResource |
| ACLPath | New path |

207.3.53 SETOWNER Procedure

This procedure sets the owner of the given XDBResource.

Syntax

```
DBMS_XDBRESOURCE.SETOWNER (  
    res      IN OUT XDBResource,  
    owner    IN     VARCHAR2);
```

Parameters

Table 207-54 SETOWNER Procedure Parameters

| Parameter | Description |
|-----------|-------------|
| res | XDBResource |
| owner | New owner |

Usage Notes

The user must have the `XDBADMIN` privilege to call this subprogram.

DBMS_XDBZ

The DBMS_XDBZ package controls the Oracle XML DB repository security, which is based on Access Control Lists (ACLs).

This chapter contains the following topics:

- [Security Model](#)
- [Constants](#)
- [Summary of DBMS_XDBZ Subprograms](#)

See Also:

Oracle XML DB Developer's Guide

208.1 DBMS_XDBZ Security Model

Owned by XDB, the DBMS_XDBZ package must be created by SYS or XDB. The EXECUTE privilege is granted to PUBLIC. Subprograms in this package are executed using the privileges of the current user.

208.2 DBMS_XDBZ Constants

The DBMS_XDBZ package defines several constants that can be used for specifying parameter values.

The package uses the constants shown in following tables.

Table 208-1 DBMS_XDBZ Constants - Name Format

| Constant | Type | Value | Description |
|---------------------------|-------------|-------|-------------------------------|
| NAME_FORMAT_SHORT | PLS_INTEGER | 1 | DB user name or LDAP nickname |
| NAME_FORMAT_DISTINGUISHED | PLS_INTEGER | 2 | LDAP distinguished name |

Table 208-2 DBMS_XDBZ Constants - Enable Option

| Constant | Type | Value | Description |
|-----------------|-------------|-------|---|
| ENABLE_CONTENTS | PLS_INTEGER | 1 | Enables hierarchy for contents and is used by users when calling the ENABLE_HIERARCHY Procedure |

Table 208-2 (Cont.) DBMS_XDBZ Constants - Enable Option

| Constant | Type | Value | Description |
|--------------------|-------------|-------|--|
| ENABLE_RESMETADATA | PLS_INTEGER | 2 | Enables hierarchy for resource metadata, that is, this table will store schema based custom metadata for resources |

Table 208-3 DBMS_XDBZ Constants - Enable Option Exercised

| Constant | Type | Value | Description |
|------------------------|-------------|-------|--|
| IS_ENABLED_CONTENTS | PLS_INTEGER | 1 | If hierarchy was enabled for contents, that is, the ENABLE_HIERARCHY Procedure was called with <code>hierarchy_type</code> as <code>ENABLE_CONTENTS</code> |
| IS_ENABLED_RESMETADATA | PLS_INTEGER | 2 | If hierarchy was enabled for resource metadata, that is, the ENABLE_HIERARCHY Procedure was called with <code>hierarchy_type</code> as <code>ENABLE_RESMETADATA</code> |

208.3 Summary of DBMS_XDBZ Subprograms

This table lists the DBMS_XDBZ subprograms and briefly describes them.

Table 208-4 DBMS_XDBZ Package Subprograms

| Method | Description |
|---|---|
| DISABLE_HIERARCHY Procedure | Disables repository support for the specified XMLTYPE table or view |
| ENABLE_HIERARCHY Procedure | Enables repository support for the specified XMLType table or view |
| GET_ACLOID Function | Retrieves the ACL Object ID for the specified resource |
| GET_USERID Function | Retrieves the user ID for the specified user |
| IS_HIERARCHY_ENABLED Function | Determines if repository support for the specified XMLType table or view is enabled |
| PURGELDAPCACHE Function | Purges the LDAP nickname cache |

208.3.1 CREATENONCEKEY Procedure

This procedure generates a nonce value for use in digest authentication.

Syntax

```
DBMS_XDBZ.CREATENONCEKEY;
```

208.3.2 DISABLE_HIERARCHY Procedure

This procedure disables repository support for a particular XMLType table or view.

Syntax

```
DBMS_XDBZ.DISABLE_HIERARCHY(  
    object_schema IN VARCHAR2,  
    object_name   IN VARCHAR2);
```

Parameters

Table 208-5 DISABLE_HIERARCHY Procedure Parameters

| Parameter | Description |
|---------------|--|
| object_schema | Schema name of the XMLType table or view |
| object_name | Name of the XMLType table or view |

208.3.3 ENABLE_HIERARCHY Procedure

This procedure enables repository support for a particular XMLType table or view. This allows the use of a uniform ACL-based security model across all documents in the repository.

See Also:

Oracle XML DB Developer's Guide for more information about

Syntax

```
DBMS_XDBZ.ENABLE_HIERARCHY(  
    object_schema IN VARCHAR2,  
    object_name   IN VARCHAR2,  
    hierarchy_type IN PLS_INTEGER := DBMS_XDBZ.ENABLE_CONTENTS);
```

Parameters

Table 208-6 ENABLE_HIERARCHY Procedure Parameters

| Parameter | Description |
|---------------|--|
| object_schema | Schema name of the XMLType table or view |
| object_name | Name of the XMLType table or view |

Table 208-6 (Cont.) ENABLE_HIERARCHY Procedure Parameters

| Parameter | Description |
|----------------|--|
| hierarchy_type | <p>How to enable the hierarchy.</p> <ul style="list-style-type: none"> ENABLE_CONTENTS - enable hierarchy for contents, that is, this table will store contents of resources in the repository ENABLE_RESMETADATA - enable hierarchy for resource metadata, that is, this table will store schema based custom metadata for resources <p>If this subprogram is called on a table, another call will have no effect. Note that you cannot enable hierarchy for both contents and resource metadata.</p> |

208.3.4 GET_ACLOID Function

This function retrieves the ACL Object ID for the specified resource, if the repository path is known.

Syntax

```
DBMS_XDBZ.GET_ACLOID(
    aclpath IN VARCHAR2,
    acloid OUT RAW)
RETURN BOOLEAN;
```

Parameters

Table 208-7 GET_ACLOID Function Parameters

| Parameter | Description |
|-----------|--------------------------------------|
| aclpath | ACL resource path for the repository |
| acloid | Returned Object ID |

Return Values

Returns TRUE if successful.

208.3.5 GET_USERID Function

This function retrieves the user ID for the specified user name. The local database is searched first, and if found, the USERID is returned in 4-byte database format. Otherwise, the LDAP directory is searched, if available, and if found, the USERID is returned in 4-byte database format.

Syntax

```
DBMS_XDBZ.GET_USERID(
    username IN VARCHAR2,
    userid OUT RAW,
    format IN BINARY_INTEGER := NAME_FORMAT_SHORT)
RETURN BOOLEAN;
```

Parameters

Table 208-8 GET_USERID Function Parameters

| Parameter | Description |
|-----------|---|
| username | Name of the database or LDAP user. |
| userid | Return parameter for the matching user id. |
| format | Format of the specified user name; valid options are: <ul style="list-style-type: none"> DBMS_XDBZ.NAME_FORMAT_SHORT (default) -- DB user name or LDAP nickname DBMS_XDBZ.NAME_FORMAT_DISTINGUISHED -- LDAP distinguished name. |

Return Values

Returns `TRUE` if successful.

208.3.6 IS_HIERARCHY_ENABLED Function

This function determines if repository support for the specified `XMLType` table or view is enabled.

Syntax

```
DBMS_XDBZ.IS_HIERARCHY_ENABLED(
  object_schema IN VARCHAR2,
  object_name   IN VARCHAR2,
  hierarchy_type IN PLS_INTEGER := IS_ENABLED_CONTENTS)
RETURN BOOLEAN;
```

Parameters

Table 208-9 IS_HIERARCHY_ENABLED Function Parameters

| Parameter | Description |
|----------------|---|
| object_schema | Schema name of the <code>XMLType</code> table or view |
| object_name | Name of the <code>XMLType</code> table or view |
| hierarchy_type | Type of hierarchy to check for: <ul style="list-style-type: none"> <code>IS_ENABLED_CONTENTS</code> - if hierarchy was enabled for contents, that is, the ENABLE_HIERARCHY Procedure was called with <code>hierarchy_type</code> as <code>ENABLE_CONTENTS</code> <code>IS_ENABLED_RESMETADATA</code> - if hierarchy was enabled for resource metadata, that is, the ENABLE_HIERARCHY Procedure was called with <code>hierarchy_type</code> as <code>ENABLE_RESMETADATA</code> |

Return Values

Returns `TRUE` if the given `XMLTYPE` table or view has the XDB Hierarchy enabled with the specified type.

208.3.7 PURGELDAPCACHE Function

This function purges the LDAP nickname cache.

It returns `TRUE` if successful.

Syntax

```
DBMS_XDBZ.PURGELDAPCACHE  
RETURN BOOLEAN;
```

DBMS_XEVENT

The `DBMS_XEVENT` package provides event-related types and supporting subprograms.

This chapter contains the following topics:

- [Security Model](#)
- [Constants](#)
- [Subprogram Groups](#)
- [Summary of DBMS_XEVENT Subprograms](#)

See Also:

Oracle XML DB Developer's Guide for more information about "Oracle XML DB Repository Events"

209.1 DBMS_XEVENT Security Model

Owned by `XDB`, the `DBMS_XEVENT` package must be created by `SYS` or `XDB`. The `EXECUTE` privilege is granted to `PUBLIC`. Subprograms in this package are executed using the privileges of the current user.

209.2 DBMS_XEVENT Constants

The `DBMS_XEVENT` package defines several constants that can be used for specifying parameter values.

The constants are defined in the following table.

Table 209-1 DBMS_XEVENT Constants

| Name | Type | Value | Description |
|--------------------------------|--------------------------|-------|-------------|
| <code>RENDER_EVENT</code> | <code>PLS_INTEGER</code> | 1 | |
| <code>PRE_CREATE_EVENT</code> | <code>PLS_INTEGER</code> | 2 | |
| <code>POST_CREATE_EVENT</code> | <code>PLS_INTEGER</code> | 3 | |
| <code>PRE_DELETE_EVENT</code> | <code>PLS_INTEGER</code> | 4 | |
| <code>POST_DELETE_EVENT</code> | <code>PLS_INTEGER</code> | 5 | |
| <code>PRE_UPDATE_EVENT</code> | <code>PLS_INTEGER</code> | 6 | |
| <code>POST_UPDATE_EVENT</code> | <code>PLS_INTEGER</code> | 7 | |
| <code>PRE_LOCK_EVENT</code> | <code>PLS_INTEGER</code> | 8 | |

Table 209-1 (Cont.) DBMS_XEVENT Constants

| Name | Type | Value | Description |
|--------------------------------|-------------|-------|-------------|
| POST_LOCK_EVENT | PLS_INTEGER | 9 | |
| PRE_UNLOCK_EVENT | PLS_INTEGER | 10 | |
| POST_UNLOCK_EVENT | PLS_INTEGER | 11 | |
| PRE_LINKIN_EVENT | PLS_INTEGER | 12 | |
| POST_LINKIN_EVENT | PLS_INTEGER | 13 | |
| PRE_LINKTO_EVENT | PLS_INTEGER | 14 | |
| POST_LINKTO_EVENT | PLS_INTEGER | 15 | |
| PRE_UNLINKIN_EVENT | PLS_INTEGER | 16 | |
| POST_UNLINKIN_EVENT | PLS_INTEGER | 17 | |
| PRE_UNLINKFROM_EVENT | PLS_INTEGER | 18 | |
| POST_UNLINKFROM_EVENT | PLS_INTEGER | 19 | |
| PRE_CHECKIN_EVENT | PLS_INTEGER | 20 | |
| POST_CHECKIN_EVENT | PLS_INTEGER | 21 | |
| PRE_CHECKOUT_EVENT | PLS_INTEGER | 22 | |
| POST_CHECKOUT_EVENT | PLS_INTEGER | 23 | |
| PRE_UNCHECKOUT_EVENT | PLS_INTEGER | 24 | |
| POST_UNCHECKOUT_EVENT | PLS_INTEGER | 25 | |
| PRE_VERSIONCONTROL_EVENT | PLS_INTEGER | 26 | |
| POST_VERSIONCONTROL_EVENT | PLS_INTEGER | 27 | |
| PRE_OPEN_EVENT | PLS_INTEGER | 28 | |
| POST_OPEN_EVENT | PLS_INTEGER | 29 | |
| PRE_INCONSISTENT_UPDATE_EVENT | PLS_INTEGER | 30 | |
| POST_INCONSISTENT_UPDATE_EVENT | PLS_INTEGER | 21 | |
| POST_CHECKIN_EVENT | PLS_INTEGER | 21 | |

209.3 Subprogram Groups

The subprograms in the `DBMS_XEVENT` package can be divided in groups.

- [XDBEvent Type Subprograms](#)
- [XDBRepositoryEvent Type Subprograms](#)
- [XDBHandlerList Type Subprograms](#)
- [XDBHandler Type Subprograms](#)
- [XDBPath Type Subprograms](#)
- [XDBLink Type Subprograms](#)

209.3.1 DBMS_XEVENT XDBEvent Type Subprograms

This subprogram group provides an interface for use with the XDBEvent type.

Table 209-2 XDBEvent Subprograms

| Subprogram | Description |
|---|--|
| GETCURRENTUSER Function | Returns the name of the user executing the operation that triggers the event |
| GETEVENT Function | Returns a value identifying the triggering event |
| ISNULL Functions | Returns <code>TRUE</code> if input argument is <code>NULL</code> |

The [Summary of DBMS_XEVENT Subprograms](#) contains a complete listing of all subprograms in the package.

209.3.2 DBMS_XEVENT XDBRepositoryEvent Type Subprograms

This subprogram group provides an interface for use in conjunction with the XDBRepositoryEvent type.

Table 209-3 XDBRepositoryEvent Subprograms

| Subprogram | Description |
|---|---|
| GETAPPLICATIONDATA Function | Returns the <code><applicationData></code> element extracted from the resource configuration that defines the invoking handler |
| GETHANDLERLIST Function | Returns an <code>XDBHandlerList</code> object containing the list of handlers that will be executed after the currently executing handler |
| GETINTERFACE Function | Returns the top-level interface used to initiate the operation that triggered the event |
| GETLINK Function | Returns an <code>XDBLink</code> object for the target resource |
| GETLOCK Function | Returns the lock object corresponding to the current operation |
| GETOLDRESOURCE Function | Returns the original <code>XDBResource</code> object before the operation was executed |
| GETOPENACCESSMODE Function | Returns the access mode for the open operation |
| GETOPENDENYMODE Function | Returns the deny mode for the open operation |
| GETOUTPUTSTREAM Function | Returns the output BLOB in which the handler can write the rendered data |
| GETPARAMETER Function | Returns the value of a request or session-specific parameter |
| GETPARENT Function | Returns the resource object corresponding to a parent folder of the target resource |
| GETPATH Function | Returns the <code>XDBPath</code> object representing the path of the resource for which the event was fired |

Table 209-3 (Cont.) XDBRepositoryEvent Subprograms

| Subprogram | Description |
|--|--|
| GETRESOURCE Function | Returns an <code>XDBResource</code> object that provides methods to access and modify the contents and metadata of the target resource |
| GETUPDATEBYTECOUNT Function | If the current operation is a byte-range write, returns the byte count |
| GETUPDATEBYTEOFFSET Function | If the current operation is a byte-range write, function returns the byte offset at which the range begins |
| GETXDBeVENT Function | Converts an <code>XDBRepositoryEvent</code> object to an <code>XDBEvent</code> type |
| ISNULL Functions | Returns <code>TRUE</code> if input argument is <code>NULL</code> |
| SETRENDERPATH Procedure | Specifies the path of the resource that contains the rendered contents |
| SETRENDERSTREAM Procedure | sets the <code>BLOB</code> from which the rendered contents can be read |

The [Summary of DBMS_XEVENT Subprograms](#) contains a complete listing of all subprograms in the package.

209.3.3 DBMS_XEVENT XDBHandlerList Type Subprograms

This subprogram group provides an interface for use in conjunction with the `XDBHandlerList` type.

Table 209-4 XDBHandlerList Subprograms

| Subprogram | Description |
|-----------------------------------|--|
| CLEAR Procedure | Clears the handler list |
| GETFIRST Function | Returns the first handler in the list |
| GETNAME Function | Returns the next handler in the list |
| ISNULL Functions | Returns <code>TRUE</code> if input argument is <code>NULL</code> |
| REMOVE Procedure | Removes the specified handler from the handler list |

The [Summary of DBMS_XEVENT Subprograms](#) contains a complete listing of all subprograms in the package.

209.3.4 DBMS_XEVENT XDBHandler Type Subprograms

This subprogram group provides an interface for use in conjunction with the `XDBHandler` type.

Table 209-5 XDBHandler Type Subprograms

| Subprogram | Description |
|--------------------------------------|--|
| GETLANGUAGE Function | Returns the implementation language of the handler |

Table 209-5 (Cont.) XDBHandler Type Subprograms

| Subprogram | Description |
|------------------------------------|--|
| GETSCHEMA Function | Returns the schema of the handler's source |
| GETSOURCE Function | Returns the name of the Java class, PL/SQL package or object type implementing the handler |
| ISNULL Functions | Returns <code>TRUE</code> if input argument is <code>NULL</code> |

The [Summary of DBMS_XEVENT Subprograms](#) contains a complete listing of all subprograms in the package.

209.3.5 DBMS_XEVENT XDBPath Type Subprograms

This subprogram group provides an interface for use in conjunction with the XDBPath type.

Table 209-6 XDBPath Type Subprograms

| Subprogram | Description |
|--|--|
| GETNAME Function | Returns the string representation of the path |
| GETPARENTPATH Function | Returns the parent's path |
| ISNULL Functions | Returns <code>TRUE</code> if input argument is <code>NULL</code> |

The [Summary of DBMS_XEVENT Subprograms](#) contains a complete listing of all subprograms in the package.

209.3.6 DBMS_XEVENT XDblink Type Subprograms

This subprogram group provides an interface for use in conjunction with the XDblink type.

Table 209-7 XDblink Type Subprograms

| Subprogram | Description |
|--|--|
| GETCHILDID Function | Returns the OID of the resource to which the link is pointing |
| GETPARENTNAME Function | Returns the link's parent folder's name |
| GETPARENTOID Function | Returns the link's parent folder's OID |
| ISNULL Functions | Returns <code>TRUE</code> if input argument is <code>NULL</code> |

The [Summary of DBMS_XEVENT Subprograms](#) contains a complete listing of all subprograms in the package.

209.4 Summary of DBMS_XEVENT Subprograms

This table lists the DBMS_XEVENT subprograms and briefly describes them.

Table 209-8 DBMS_XEVENT Package Subprograms

| Subprogram | Description | Group |
|---|---|---|
| CLEAR Procedure | Clears the handler list | XDBHandlerList Type Subprograms |
| GETAPPLICATIONDATA Function | Returns the <applicationData> element extracted from the resource configuration that defines the invoking handler | XDBRepositoryEvent Type Subprograms |
| GETCHILDROID Function | Returns the OID of the resource to which the link is pointing | XDBLink Type Subprograms |
| GETCURRENTUSER Function | Returns the name of the user executing the operation that triggers the event | XDBEvent Type Subprograms |
| GETEVENT Function | Returns a value identifying the triggering event | XDBEvent Type Subprograms |
| GETFIRST Function | Returns the first handler in the list | XDBHandlerList Type Subprograms |
| GETHANDLERLIST Function | Returns an <code>XDBHandlerList</code> object containing the list of handlers that will be executed after the currently executing handler | XDBRepositoryEvent Type Subprograms |
| GETINTERFACE Function | Returns the top-level interface used to initiate the operation that triggered the event | XDBRepositoryEvent Type Subprograms |
| GETLANGUAGE Function | Returns the implementation language of the handler | XDBHandler Type Subprograms |
| GETLINK Function | Returns an <code>XDBLink</code> object for the target resource | XDBRepositoryEvent Type Subprograms |
| GETLOCK Function | Returns the lock object corresponding to the current operation | XDBRepositoryEvent Type Subprograms |
| GETNAME Function | Returns the string representation of the path | XDBPath Type Subprograms |
| GETNAME Function | Returns the next handler in the list | XDBHandlerList Type Subprograms |
| GETOLDRESOURCE Function | Returns the original <code>XDBResource</code> object before the operation was executed | XDBRepositoryEvent Type Subprograms |
| GETOPENACCESSMODE Function | Returns the access mode for the open operation | XDBRepositoryEvent Type Subprograms |
| GETOPENDENYMODE Function | Returns the deny mode for the open operation | XDBRepositoryEvent Type Subprograms |
| GETOUTPUTSTREAM Function | Returns the output BLOB in which the handler can write the rendered data | XDBRepositoryEvent Type Subprograms |
| GETPARAMETER Function | Returns the value of a request or session-specific parameter | XDBRepositoryEvent Type Subprograms |
| GETPARENT Function | Returns the resource object corresponding to a parent folder of the target resource | XDBRepositoryEvent Type Subprograms |

Table 209-8 (Cont.) DBMS_XEVENT Package Subprograms

| Subprogram | Description | Group |
|--|--|--|
| GETPARENTNAME Function | Returns the link's parent folder's name | XDBLink Type Subprograms |
| GETPARENTOID Function | Returns the link's parent folder's OID | XDBLink Type Subprograms |
| GETPARENTNAME Function | Returns the parent's path | XDBPath Type Subprograms |
| GETPATH Function | Returns the <code>XDBPath</code> object representing the path of the resource for which the event was fired | XDBRepositoryEvent Type Subprograms |
| GETRESOURCE Function | Returns an <code>XDBResource</code> object that provides methods to access and modify the contents and metadata of the target resource | XDBRepositoryEvent Type Subprograms |
| GETSCHEMA Function | Returns the schema of the handler's source | XDBHandler Type Subprograms |
| GETSOURCE Function | Returns the name of the Java class, PL/SQL package or object type implementing the handler | XDBHandler Type Subprograms |
| GETUPDATEBYTECOUNT Function | If the current operation is a byte-range write, returns the byte count | XDBRepositoryEvent Type Subprograms |
| GETUPDATEBYTEOFFSET Function | If the current operation is a byte-range write, function returns the byte offset at which the range begins | XDBRepositoryEvent Type Subprograms |
| GETXDBEVENT Function | Converts an <code>XDBRepositoryEvent</code> object to an <code>XDBEvent</code> type | XDBRepositoryEvent Type Subprograms |
| ISNULL Functions | Returns <code>TRUE</code> if input argument is <code>NULL</code> | XDBEvent Type Subprograms XDBRepositoryEvent Type Subprograms XDBHandlerList Type Subprograms XDBHandler Type Subprograms XDBPath Type Subprograms |
| REMOVE Procedure | Removes the specified handler from the handler list | XDBHandlerList Type Subprograms |
| SETRENDERPATH Procedure | Specifies the path of the resource that contains the rendered contents | XDBRepositoryEvent Type Subprograms |
| SETRENDERSTREAM Procedure | sets the <code>BLOB</code> from which the rendered contents can be read | XDBRepositoryEvent Type Subprograms |

209.4.1 CLEAR Procedure

This procedure clears the handler list.

See Also:

[XDBHandlerList Type Subprograms](#) for other subprograms in this group

Syntax

```
DBMS_XEVENT.CLEAR (
    hl          IN OUT  XDBHandlerList);
```

Parameters

Table 209-9 CLEAR Procedure Parameters

| Parameter | Description |
|-----------|--------------|
| hl | Handler list |

209.4.2 GETAPPLICATIONDATA Function

This function returns the <applicationData> element extracted from the resource configuration that defines the invoking handler.

See Also:

[XDBRepositoryEvent Type Subprograms](#) for other subprograms in this group

Syntax

```
DBMS_XEVENT.GETAPPLICATIONDATA (
    ev  IN  XDBRepositoryEvent)
RETURN XMLType;
```

Parameters

Table 209-10 GETAPPLICATIONDATA Function Parameters

| Parameter | Description |
|-----------|----------------------------------|
| ev | Event of XDBRepositoryEvent type |

209.4.3 GETCHILDROID Function

This function returns the OID of the resource to which the link is pointing.

See Also:

[XDBLink Type Subprograms](#) for other subprograms in this group

Syntax

```
DBMS_XEVENT.GETCHILDROID (  
    link IN XDBLink)  
    RETURN RAW;
```

Parameters

Table 209-11 GETCHILDROID Function Parameters

| Parameter | Description |
|-----------|-------------|
| link | Link |

209.4.4 GETCURRENTUSER Function

This function returns the name of the user executing the operation that triggers the event.

See Also:

[XDBevent Type Subprograms](#) for other subprograms in this group

Syntax

```
DBMS_XEVENT.GETCURRENTUSER (  
    ev IN XDBevent)  
    RETURN VARCHAR2;
```

Parameters

Table 209-12 GETCURRENTUSER Function Parameters

| Parameter | Description |
|-----------|------------------------|
| ev | Event of XDBevent type |

209.4.5 GETEVENT Function

This function returns the name of the user executing the operation that triggers the event.

See Also:

[XDBEvent Type Subprograms](#) for other subprograms in this group

Syntax

```
DBMS_XEVENT.GETEVENT (
    ev    IN    XDBEvent)
RETURN XDBEventID;
```

Parameters

Table 209-13 GETEVENT Function Parameters

| Parameter | Description |
|-----------|------------------------|
| ev | Event of XDBEvent type |

209.4.6 GETFIRST Function

This function returns the first handler in the list.

See Also:

[XDBHandlerList Type Subprograms](#) for other subprograms in this group

Syntax

```
DBMS_XEVENT.GETFIRST (
    hl    IN    XDBHandlerList)
RETURN XDBHandler;
```

Parameters

Table 209-14 GETFIRST Function Parameters

| Parameter | Description |
|-----------|--------------|
| hl | Handler list |

209.4.7 GETHANDLERLIST Function

This function returns an `XDBHandlerList` object containing the list of handlers that will be executed after the currently executing handler.

The current handler can then filter out some of the subsequent handlers if necessary, subject to security checks. An insufficient privilege exception is raised if the executing user does not have the required access privilege to any of the resource configuration associating with a handler in the list.

See Also:

[XDBRepositoryEvent Type Subprograms](#) for other subprograms in this group

Syntax

```
DBMS_XEVENT.GETHANDLERLIST (  
    ev IN XDBRepositoryEvent)  
    RETURN XDBHandlerList;
```

Parameters

Table 209-15 GETHANDLERLIST Function Parameters

| Parameter | Description |
|-----------|----------------------------------|
| ev | Event of XDBRepositoryEvent type |

209.4.8 GETINTERFACE Function

This function returns the top-level interface used to initiate the operation that triggered the event. This could be HTTP, FTP or SQL.

See Also:

[XDBRepositoryEvent Type Subprograms](#) for other subprograms in this group

Syntax

```
DBMS_XEVENT.GETINTERFACE (  
    ev IN XDBRepositoryEvent)  
    RETURN VARCHAR2;
```

Parameters

Table 209-16 GETINTERFACE Function Parameters

| Parameter | Description |
|-----------|----------------------------------|
| ev | Event of XDBRepositoryEvent type |

209.4.9 GETLANGUAGE Function

This function returns the implementation language of the handler.

**See Also:**

[XDBHandler Type Subprograms](#) for other subprograms in this group

Syntax

```
DBMS_XEVENT.GETLANGUAGE (
    handler IN XDBHandler)
RETURN VARCHAR2;
```

Parameters

Table 209-17 GETLANGUAGE Function Parameters

| Parameter | Description |
|-----------|-------------|
| handler | Handler |

209.4.10 GETLINK Function

This function returns an `XDBLink` object for the target resource.

For a `link*` or `unlink*` event, this will be the link involved in the operation. For other events, an error is returned. Using this object the handler can access link properties, such as, `ParentName`, `ParentOID`, `ChildOID` and `LinkName`.

**See Also:**

[XDBRepositoryEvent Type Subprograms](#) for other subprograms in this group

Syntax

```
DBMS_XEVENT.GETLINK (
    ev IN XDBRepositoryEvent)
RETURN XDBLink;
```

Parameters

Table 209-18 GETLINK Function Parameters

| Parameter | Description |
|-----------|----------------------------------|
| ev | Event of XDBRepositoryEvent type |

209.4.11 GETLINKNAME Function

This function returns the name of the link.

**See Also:**

[XDBLink Type Subprograms](#) for other subprograms in this group

Syntax

```
DBMS_XEVENT.GETLINKNAME (
    link IN XDBLink)
RETURN VARCHAR2;
```

Parameters

Table 209-19 GETLINKNAME Function Parameters

| Parameter | Description |
|-----------|-------------|
| link | Link |

209.4.12 GETLOCK Function

This function returns the lock object corresponding to the current operation. It is only valid for lock and unlock events.

**See Also:**

[XDBRepositoryEvent Type Subprograms](#) for other subprograms in this group

Syntax

```
DBMS_XEVENT.GETLOCK (
    ev IN XDBRepositoryEvent)
RETURN XDBLock;
```

Parameters

Table 209-20 GETLOCK Function Parameters

| Parameter | Description |
|-----------|----------------------------------|
| ev | Event of XDBRepositoryEvent type |

209.4.13 GETLANGUAGE Function

This function returns the implementation language of the handler.

See Also:

[XDBHandler Type Subprograms](#) for other subprograms in this group

Syntax

```
DBMS_XEVENT.GETLANGUAGE (
    handler IN XDBHandler)
RETURN VARCHAR2;
```

Parameters

Table 209-21 GETLANGUAGE Function Parameters

| Parameter | Description |
|-----------|-------------|
| handler | Handler |

209.4.14 GETNAME Function

This function returns the string representation of the path.

See Also:

[XDBPath Type Subprograms](#) for other subprograms in this group

Syntax

```
DBMS_XEVENT.GETNAME (
    path IN XDBPath)
RETURN VARCHAR2;
```

Parameters

Table 209-22 GETNAME Function Parameters

| Parameter | Description |
|-----------|-------------|
| path | Path |

209.4.15 GETNEXT Function

This function returns the next handler in the list.

**See Also:**

[XDBHandlerList Type Subprograms](#) for other subprograms in this group

Syntax

```
DBMS_XEVENT.GETNEXT (
    hl IN XDBHandlerList)
RETURN XDBHandler;
```

Parameters

Table 209-23 GETNEXT Function Parameters

| Parameter | Description |
|-----------|--------------|
| hl | Handler list |

209.4.16 GETOLDRESOURCE Function

This function returns the original `XDBResource` object before the operation was executed.

This method applies only to update event. For other events, an error is returned. This is a read-only object, and consequently none of the modifier methods will work on this object.

**See Also:**

[XDBRepositoryEvent Type Subprograms](#) for other subprograms in this group

Syntax

```
DBMS_XEVENT.GETOLDRESOURCE (
    ev IN XDBRepositoryEvent)
RETURN XDBResource;
```

Parameters

Table 209-24 GETOLDRESOURCE Function Parameters

| Parameter | Description |
|-----------|----------------------------------|
| ev | Event of XDBRepositoryEvent type |

209.4.17 GETOPENACCESSMODE Function

This function returns the access mode for the open operation.

See Also:

[XDBRepositoryEvent Type Subprograms](#) for other subprograms in this group

Syntax

```
DBMS_XEVENT.GETOPENACCESSMODE (
    ev IN XDBRepositoryEvent)
RETURN PLS_INTEGER;
```

Parameters

Table 209-25 GETOPENACCESSMODE Function Parameters

| Parameter | Description |
|-----------|----------------------------------|
| ev | Event of XDBRepositoryEvent type |

Return Values

- XDBRepositoryEvent.OPEN_ACCESS_READ (value 1)
- XDBRepositoryEvent.OPEN_ACCESS_WRITE (value 2)
- XDBRepositoryEvent.OPEN_ACCESS_READ_WRITE (value 3)

209.4.18 GETOPENDENYMODE Function

This function returns the deny mode for the open operation. It is only valid for the open event.

See Also:

[XDBRepositoryEvent Type Subprograms](#) for other subprograms in this group

Syntax

```
DBMS_XEVENT.GETOPENENYMODE (
    ev IN XDBRepositoryEvent)
RETURN PLS_INTEGER;
```

Parameters**Table 209-26** GETOPENENYMODE Function Parameters

| Parameter | Description |
|-----------|----------------------------------|
| ev | Event of XDBRepositoryEvent type |

Return Values

- XDBRepositoryEvent.OPEN_DENY_NONE (value 0)
- XDBRepositoryEvent.OPEN_DENY_READ (value 1)
- XDBRepositoryEvent.OPEN_DENY_READ_WRITE (value 2)

209.4.19 GETOUTPUTSTREAM Function

This function returns the output BLOB in which the handler can write the rendered data. It is only valid for the render event.

**See Also:**

[XDBRepositoryEvent Type Subprograms](#) for other subprograms in this group

Syntax

```
DBMS_XEVENT.GETOUTPUTSTREAM (
    ev IN XDBRepositoryEvent)
RETURN BLOB;
```

Parameters**Table 209-27** GETOUTPUTSTREAM Function Parameters

| Parameter | Description |
|-----------|----------------------------------|
| ev | Event of XDBRepositoryEvent type |

209.4.20 GETPARAMETER Function

This function returns the value of a request or session-specific parameter. The definition of the `key` parameter can be found in RFC 2616 (HTTP/1.1). They will be mapped to equivalent SQL session parameters (if any).

See Also:

[XDBRepositoryEvent Type Subprograms](#) for other subprograms in this group

Syntax

```
DBMS_XEVENT.GETPARAMETER (  
    ev    IN    XDBRepositoryEvent,  
    key   IN    VARCHAR2)  
RETURN VARCHAR2;
```

Parameters

Table 209-28 GETPARAMETER Function Parameters

| Parameter | Description |
|------------------|---|
| <code>ev</code> | Event of XDBRepositoryEvent type |
| <code>key</code> | Supported parameters: <ul style="list-style-type: none">• ACCEPT• ACCEPT-LANGUAGE• ACCEPT-CHARSET• ACCEPT_ENCODING |

209.4.21 GETPARENT Function

This function returns the resource object corresponding to a parent folder of the target resource. Note that this could be any folder that contains a link to the target resource. This is a read-only object, and consequently none of the modifier methods will work on this object. For a `link*` or `unlink*` event, this method returns the link's parent folder.

See Also:

[XDBRepositoryEvent Type Subprograms](#) for other subprograms in this group

Syntax

```
DBMS_XEVENT.GETPARENT (  
    ev    IN    XDBRepositoryEvent)  
RETURN XDBResource;
```

Parameters

Table 209-29 GETPARENT Function Parameters

| Parameter | Description |
|-----------|----------------------------------|
| ev | Event of XDBRepositoryEvent type |

209.4.22 GETPARENTNAME Function

This function returns the link's parent folder's name.

See Also:

[XDBLink Type Subprograms](#) for other subprograms in this group

Syntax

```
DBMS_XEVENT.GETPARENTNAME (  
    link IN XDBLink)  
    RETURN VARCHAR2;
```

Parameters

Table 209-30 GETPARENTNAME Function Parameters

| Parameter | Description |
|-----------|-------------|
| link | Link |

209.4.23 GETPARENTOID Function

This function returns the link's parent folder's OID.

See Also:

[XDBLink Type Subprograms](#) for other subprograms in this group

Syntax

```
DBMS_XEVENT.GETPARENTOID (  
    link IN XDBLink)  
    RETURN RAW;
```

Parameters

Table 209-31 GETPARENTOID Function Parameters

| Parameter | Description |
|-----------|-------------|
| link | Link |

209.4.24 GETPARENTPATH Function

This function returns the parent's path. The level indicates the number of levels up the hierarchy. This value must be greater than zero. Level 1 means the immediate parent. If level exceeds the height of the tree then a `NULL` is returned.

See Also:

[XDBPath Type Subprograms](#) for other subprograms in this group

Syntax

```
DBMS_XEVENT.GETPARENTPATH (  
    path IN XDBPath,  
    level IN INTEGER)  
RETURN XDBPath;
```

Parameters

Table 209-32 GETPARENTPATH Function Parameters

| Parameter | Description |
|-----------|-----------------------------------|
| path | Path |
| level | Number of levels up the hierarchy |

209.4.25 GETPATH Function

This function returns the `XDBPath` object representing the path of the resource for which the event was fired. From this object, functions are provided to get the different path segments.

See Also:

[XDBRepositoryEvent Type Subprograms](#) for other subprograms in this group

Syntax

```
DBMS_XEVENT.GETPATH (
    ev IN XDBRepositoryEvent)
RETURN XDBPath;
```

Parameters**Table 209-33** GETPATH Function Parameters

| Parameter | Description |
|-----------|----------------------------------|
| ev | Event of XDBRepositoryEvent type |

209.4.26 GETRESOURCE Function

This function returns an `XDBResource` object that provides methods to access and modify the contents and metadata of the target resource. This object reflects any changes made by previous handlers to the resource.

The modifier methods will work only in the pre-create and pre-update event handlers. For a `link*` or `unlink*` event, this method returns the resource that the link is pointing to. For a `create` event, this method returns the resource that is being created.

**See Also:**

[XDBRepositoryEvent Type Subprograms](#) for other subprograms in this group

Syntax

```
DBMS_XEVENT.GETRESOURCE (
    ev IN XDBRepositoryEvent)
RETURN XDBResource;
```

Parameters**Table 209-34** GETRESOURCE Function Parameters

| Parameter | Description |
|-----------|----------------------------------|
| ev | Event of XDBRepositoryEvent type |

209.4.27 GETSCHEMA Function

This function returns the schema of the handler's source.

**See Also:**

[XDBHandler Type Subprograms](#) for other subprograms in this group

Syntax

```
DBMS_XEVENT.GETSCHEMA (
    handler IN XDBHandler)
RETURN VARCHAR2;
```

Parameters

Table 209-35 GETSCHEMA Function Parameters

| Parameter | Description |
|-----------|-------------|
| handler | Handler |

209.4.28 GETSOURCE Function

This function returns the name of the Java class, PL/SQL package or object type implementing the handler.

See Also:

[XDBHandler Type Subprograms](#) for other subprograms in this group

Syntax

```
DBMS_XEVENT.GETSOURCE (
    handler IN XDBHandler)
RETURN VARCHAR2;
```

Parameters

Table 209-36 GETSOURCE Function Parameters

| Parameter | Description |
|-----------|-------------|
| handler | Handler |

209.4.29 GETUPDATEBYTECOUNT Function

If the current operation is a byte-range write, the `GETUPDATEBYTECOUNT` function returns the byte count. It is only valid for the inconsistent-update event.

See Also:

[XDBRepositoryEvent Type Subprograms](#) for other subprograms in this group

Syntax

```
DBMS_XEVENT.GETUPDATEBYTECOUNT (
  ev IN XDBRepositoryEvent)
RETURN NUMBER;
```

Parameters**Table 209-37** GETUPDATEBYTECOUNT Function Parameters

| Parameter | Description |
|-----------|----------------------------------|
| ev | Event of XDBRepositoryEvent type |

209.4.30 GETUPDATEBYTEOFFSET Function

If the current operation is a byte-range write, the `GETUPDATEBYTEOFFSET` function returns the byte offset at which the range begins. It is only valid for the inconsistent-update event.

**See Also:**

[XDBRepositoryEvent Type Subprograms](#) for other subprograms in this group

Syntax

```
DBMS_XEVENT.GETUPDATEBYTEOFFSET (
  ev IN XDBRepositoryEvent)
RETURN NUMBER;
```

Parameters**Table 209-38** GETUPDATEBYTEOFFSET Function Parameters

| Parameter | Description |
|-----------|----------------------------------|
| ev | Event of XDBRepositoryEvent type |

209.4.31 GETXDBEVENT Function

This function converts an `XDBRepositoryEvent` object to an `XDBEvent` type.

**See Also:**

[XDBRepositoryEvent Type Subprograms](#) for other subprograms in this group

Syntax

```
DBMS_XEVENT.GETXDBEVENT (
  ev IN XDBRepositoryEvent)
  RETURN XDBEvent;
```

Parameters**Table 209-39 GETXDBEVENT Function Parameters**

| Parameter | Description |
|-----------|----------------------------------|
| ev | Event of XDBRepositoryEvent type |

209.4.32 ISNULL Functions

This function returns `TRUE` if input argument is `NULL`.

 **See Also:**

- [XDBEvent Type Subprograms](#) for other subprograms in this group
- [XDBRepositoryEvent Type Subprograms](#) for other subprograms in this group
- [XDBHandlerList Type Subprograms](#) for other subprograms in this group
- [XDBHandler Type Subprograms](#) for other subprograms in this group
- [XDBPath Type Subprograms](#) for other subprograms in this group
- [XDBLink Type Subprograms](#) for other subprograms in this group

Syntax

```
DBMS_XEVENT.ISNULL (
  ev IN XDBEvent)
  RETURN BOOLEAN;
```

```
DBMS_XEVENT.ISNULL (
  ev IN XDBRepositoryEvent)
  RETURN BOOLEAN;
```

```
DBMS_XEVENT.ISNULL (
  hl IN XDBHandlerList)
  RETURN BOOLEAN;
```

```
DBMS_XEVENT.ISNULL (
  handler IN XDBHandler)
  RETURN BOOLEAN;
RETURN BOOLEAN;
```

```
DBMS_XEVENT.ISNULL (
  path IN XDBPath)
  RETURN BOOLEAN;
```

```
DBMS_XEVENT.ISNULL (
    link      IN  XDBLink)
RETURN BOOLEAN;
```

Parameters

Table 209-40 ISNULL Function Parameters

| Parameter | Description |
|-----------|-------------------------|
| ev | Event of specified type |
| hl | Handler list |
| handler | Handler |
| path | Path |

209.4.33 REMOVE Procedure

This procedure removes the specified handler from the handler list.

See Also:

[XDBHandlerList Type Subprograms](#) for other subprograms in this group

Syntax

```
DBMS_XEVENT.REMOVE (
    hl      IN OUT  XDBHandlerList,
    handler IN      XDBHandler);
```

Parameters

Table 209-41 REMOVE Procedure Parameters

| Parameter | Description |
|-----------|--------------|
| hl | Handler list |
| handler | Handler |

209.4.34 SETRENDERPATH Procedure

This procedure specifies the path of the resource that contains the rendered contents.

This should not be called after the stream returned by [GETOUTPUTSTREAM Function](#) is written to or after the [SETRENDERSTREAM Procedure](#) is called; doing so will result in an error. This is only valid for the render event.

Syntax

```
DBMS_XEVENT.SETRENDERPATH (
    ev      IN  XDBRepositoryEvent,
    path    IN  VARCHAR2);
```

Parameters

Table 209-42 SETRENDERPATH Procedure Parameters

| Parameter | Description |
|-----------|---|
| ev | XDB Repository Event object |
| path | Path of the resource containing the rendered contents |

209.4.35 SETRENDERSTREAM Procedure

This procedure sets the BLOB from which the rendered contents can be read.

This should not be called after the stream returned by GETOUTPUTSTREAM is written to or after SETRENDERPATH is called; doing so will result in an error. This is only valid for the render event.

Syntax

```
DBMS_XEVENT.SETRENDERSTREAM (
    ev    IN    XDBRepositoryEvent,
    istr  IN    BLOB);
```

Parameters

Table 209-43 SETRENDERSTREAM Procedure Parameters

| Parameter | Description |
|-----------|--|
| ev | XDBRepositoryEvent object |
| istr | Input stream from which to get the rendered contents |

DBMS_XMLDOM

The `DBMS_XMLDOM` package is used to access `XMLType` objects, and implements the Document Object Model (DOM), an application programming interface for HTML and XML documents.

This chapter contains the following topics:

- [Overview](#)
- [Security Model](#)
- [Constants](#)
- [Types](#)
- [Exceptions](#)
- [Subprogram Groups](#)
- [Subprogram Groups](#)
- [Summary of DBMS_XMLDOM Subprograms](#)

See Also:

Oracle XML Developer's Kit Programmer's Guide

210.1 DBMS_XMLDOM Overview

The Document Object Model (DOM) is an application programming interface (API) for HTML and XML documents. It defines the logical structure of documents, and the manner in which they are accessed and manipulated.

In the DOM specification, the term "document" is used in the broad sense. XML is being increasingly used to represent many different kinds of information that may be stored in diverse systems. This information has been traditionally be seen as "data"; nevertheless, XML presents this data as documents, and the `DBMS_XMLDOM` package allows you access to both schema-based and non schema-based documents.

Note:

Read-from and write-to files must be on the server file system.

With DOM, anything found in an HTML or XML document can be accessed, changed, deleted, or added using the Document Object Model, with a few exceptions. In particular, the DOM interfaces for the XML internal and external subsets have not yet been specified.

One important objective of the W3C DOM specification is to provide a standard programming interface that can be used in a wide variety of environments, programming languages, and applications. Because the DOM standard is object-oriented while PL/SQL is essentially a procedural language, some changes had to be made:

- Various DOM interfaces such as `Node`, `Element`, and others have equivalent PL/SQL types `DOMNode`, `DOMElement`, respectively.
- Various `DOMException` codes such as `WRONG_DOCUMENT_ERR`, `HIERARCHY_REQUEST_ERR`, and others, have similarly named PL/SQL exceptions.
- Various DOM Node type codes such as `ELEMENT_NODE`, `ATTRIBUTE_NODE`, and others, have similarly named PL/SQL constants.
- Subprograms defined on a DOM type become functions or procedures that accept it as a parameter. For example, to perform [APPENDCHILD Function](#) on a `DOMNode` `n`, the [APPENDCHILD Function](#) PL/SQL function is provided.
- To perform `setAttribute` on a `DOMElement` `elem` [SETATTRIBUTE Procedures](#), use PL/SQL procedure .

DOM defines an inheritance hierarchy. For example, `Document`, `Element`, and `Attr` are defined to be subtypes of `Node` (see [Figure 210-1](#)). Thus, a method defined in the `Node` interface should be available in these as well. Since such inheritance is not supported in PL/SQL, it is implemented through direct invocation of the `MAKENODE` function. Calling `MAKENODE` on various DOM types converts these types into a `DOMNode`. The appropriate functions or procedures that accept `DOMNodes` can then be called to operate on these types. If, subsequently, type specific functionality is desired, the `DOMNode` can be converted back into the original type by the `makeXXX` functions, where `DOMXXX` is the desired DOM type.

Figure 210-1 Inheritance Diagram for DOM Types

The implementation of this interface follows the REC-DOM-Level-1-19981001.

210.2 DBMS_XMLDOM Security Model

Owned by XDB, the DBMS_XMLDOM package must be created by SYS or XDB. The EXECUTE privilege is granted to PUBLIC.

Subprograms in this package are executed using the privileges of the current user.

210.3 DBMS_XMLDOM Constants

The DBMS_XMLDOM package defines several constants that can be used for specifying parameter values.

These constants are listed in the following table.

Table 210-1 Defined Constants for DBMS_XMLDOM

| Constant | Type | Value | Description |
|-----------------------------|-------------|-------|---|
| ELEMENT_NODE | PLS_INTEGER | 1 | The Node is an Element. |
| ATTRIBUTE_NODE | PLS_INTEGER | 2 | The Node is an Attribute. |
| TEXT_NODE | PLS_INTEGER | 3 | The Node is a Text node. |
| CDATA_SECTION_NODE | PLS_INTEGER | 4 | The Node is a CDataSection. |
| ENTITY_REFERENCE_NODE | PLS_INTEGER | 5 | The Node is an Entity Reference. |
| ENTITY_NODE | PLS_INTEGER | 6 | The Node is an Entity. |
| PROCESSING_INSTRUCTION_NODE | PLS_INTEGER | 7 | The Node is a Processing Instruction. |
| COMMENT_NODE | PLS_INTEGER | 8 | The Node is a Comment. |
| DOCUMENT_NODE | PLS_INTEGER | 9 | The Node is a Document. |
| DOCUMENT_TYPE_NODE | PLS_INTEGER | 10 | The Node is a Document Type Definition. |
| DOCUMENT_FRAGMENT_NODE | PLS_INTEGER | 11 | The Node is a Document fragment. |
| NOTATION_NODE | PLS_INTEGER | 12 | The Node is a Notation. |

210.4 DBMS_XMLDOM Types

This table lists and briefly describes the types for the DBMS_XMLDOM.DOMTYPE package.

Table 210-2 XDB_XMLDOM Types

| Type | Description |
|------------------|--|
| DOMATTR | Implements the DOM Attribute interface. |
| DOMCDATASECTION | Implements the DOM CDataSection interface. |
| DOMCHARACTERDATA | Implements the DOM Character Data interface. |
| DOMCOMMENT | Implements the DOM Comment interface. |

Table 210-2 (Cont.) XDB_XMLDOM Types

| Type | Description |
|--------------------------|--|
| DOMDOCUMENT | Implements the DOM Document interface. |
| DOMDOCUMENTFRAGMENT | Implements the DOM DocumentFragment interface. |
| DOMDOCUMENTTYPE | Implements the DOM Document Type interface. |
| DOMELEMENT | Implements the DOM Element interface. |
| DOMENTITY | Implements the DOM Entity interface. |
| DOMENTITYREFERENCE | Implements the DOM EntityReference interface. |
| DOMIMPLEMENTATION | Implements the DOM Implementation interface. |
| DOMNAMEDNODEMAP | Implements the DOM Named Node Map interface. |
| DOMNODE | Implements the DOM Node interface. |
| DOMNODELIST | Implements the DOM NodeList interface. |
| DOMNOTATION | Implements the DOM Notation interface. |
| DOMPROCESSINGINSTRUCTION | Implements the DOM Processing instruction interface. |
| DOMTEXT | Implements the DOM Text interface. |

210.5 DBMS_XMLDOM Exceptions

DBMS_XMLDOM generates an exception when it encounters an issue.

This table lists the exceptions defined for DBMS_XMLDOM:

Table 210-3 Exceptions for DBMS_XMLDOM

| Exception | Description |
|-----------------------------|---|
| DOMSTRING_SIZE_ERR | If the specified range of text does not fit into a DOMString. |
| HIERARCHY_REQUEST_ERR | If any node is inserted somewhere it doesn't belong. |
| INDEX_SIZE_ERR | If index or size is negative, or greater than the allowed value. |
| INUSE_ATTRIBUTE_ERR | If an attempt is made to add an attribute that is already in use elsewhere. |
| INVALID_CHARACTER_ERR | If an invalid or illegal character is specified, such as in a name. See production 2 in the XML specification for the definition of a legal character, and production 5 for the definition of a legal name character. |
| NO_DATA_ALLOWED_ERROR | If data is specified for a node that does not support data. |
| NOT_FOUND_ERR | If an attempt is made to reference a node in a context where it does not exist. |
| NO_MODIFICATION_ALLOWED_ERR | If an attempt is made to modify an object where modifications are not allowed. |
| NOT_SUPPORTED_ERR | If the implementation does not support the requested type of object or operation. |
| WRONG_DOCUMENT_ERR | If a node is used in a different document than the one that created it (that doesn't support it). |

210.6 DBMS_XMLDOM Subprogram Groups

DBMS_XMLDOM subprograms are divided into groups according to W3C Interfaces.

- [DOMNode Subprograms](#)
- [DOMAttr Subprograms](#)
- [DOMCDATASection Subprograms](#)
- [DOMCharacterData Subprograms](#)
- [DOMComment Subprograms](#)
- [DOMDocument Subprograms](#)
- [DOMDocumentFragment Subprograms](#)
- [DOMDocumentType Subprograms](#)
- [DOMElement Subprograms](#)
- [DOMEntity Subprograms](#)
- [DOMEntityReference Subprograms](#)
- [DOMImplementation Subprograms](#)
- [DOMNamedNodeMap Subprograms](#)
- [DOMNodeList Subprograms](#)
- [DOMNotation Subprograms](#)
- [DOMProcessingInstruction Subprograms](#)
- [DOMText Subprograms](#)

210.6.1 DBMS_XMLDOM DOMNode Subprograms

This table lists and briefly describes the `DOMNode` subprograms of `DBMS_XMLDOM`.

Table 210-4 Summary of DOMNode Subprograms; DBMS_XMLDOM

| Subprogram | Description |
|---|--|
| ADOPTNODE Function | Adopts a node from another document |
| APPENDCHILD Function | Appends a new child to the node |
| CLONENODE Function | Clones the node |
| FREENODE Procedure | Frees all resources associated with the node |
| GETATTRIBUTES Function | Retrieves the attributes of the node |
| GETCHILDNODES Function | Retrieves the children of the node |
| GETEXPANDEDNAME Procedure and Functions | Retrieves the expanded name of the node |
| GETFIRSTCHILD Function | Retrieves the first child of the node |
| GETLASTCHILD Function | Retrieves the last child of the node |
| GETLOCALNAME Procedure and Functions | Retrieves the local part of the qualified name |
| GETNAMESPACE Procedure and Functions | Retrieves the node's namespace URI |

Table 210-4 (Cont.) Summary of DOMNode Subprograms; DBMS_XMLDOM

| Subprogram | Description |
|--|--|
| GETNEXTSIBLING Function | Retrieves the next sibling of the node |
| GETNODENAME Function | Retrieves the Name of the Node |
| GETNODETYPE Function | Retrieves the Type of the node |
| GETNODEVALUE Function | Retrieves the Value of the Node |
| GETNODEVALUEASBINARYSTREAM Function & Procedure | Retrieves Node Value as binary stream |
| GETNODEVALUEASCHARACTERSTREAM Function & Procedure | Retrieves Node Value as character stream |
| GETOWNERDOCUMENT Function | Retrieves the owner document of the node |
| GETPARENTNODE Function | Retrieves the parent of this node |
| GETPREFIX Function | Retrieves the namespace prefix |
| GETPREVIOUSIBLING Function | Retrieves the previous sibling of the node |
| GETSCHEMANODE Function | Retrieves the associated schema URI |
| HASATTRIBUTES Function | Tests if the node has attributes |
| HASCHILDNODES Function | Tests if the node has child nodes |
| IMPORTNODE Function | Imports a node from another document |
| INSERTBEFORE Function | Inserts a child before the reference child |
| ISNULL Functions | Tests if the node is NULL |
| MAKEATTR Function | Casts the node to an Attribute |
| MAKECDATASECTION Function | Casts the node to a CData Section |
| MAKECHARACTERDATA Function | Casts the node to Character Data |
| MAKECOMMENT Function | Casts the node to a Comment |
| MAKEDOCUMENT Function | Casts the node to a DOM Document |
| MAKEDOCUMENTFRAGMENT Function | Casts the node to a DOM Document Fragment |
| MAKEDOCUMENTTYPE Function | Casts the node to a DOM Document Type |
| MAKEELEMENT Function | Casts the node to a DOM Element |
| MAKEENTITY Function | Casts the node to a DOM Entity |
| MAKEENTITYREFERENCE Function | Casts the node to a DOM Entity Reference |
| MAKENOTATION Function | Casts the node to a DOM Notation |
| MAKEPROCESSINGINSTRUCTION Function | Casts the node to a DOM Processing Instruction |
| MAKETEXT Function | Casts the node to a DOM Text |
| REMOVECHILD Function | Removes a specified child from a node |
| REPLACECHILD Function | Replaces the old child with a new child |
| SETNODEVALUE Procedure | Sets the Value of the node |
| SETNODEVALUEASBINARYSTREAM Function & Procedure | Sets the Node Value as binary stream |
| SETNODEVALUEASCHARACTERSTREAM Function & Procedure | Sets the Node Value as a character stream |
| SETPREFIX Procedure | Sets the namespace prefix |

Table 210-4 (Cont.) Summary of DOMNode Subprograms; DBMS_XMLDOM

| Subprogram | Description |
|--|---|
| USEBINARYSTREAM Function | Establishes that the stream is valid |
| WRITETOBUFFER Procedures | Writes the contents of the node to a buffer |
| WRITETOCLOB Procedures | Writes the contents of the node to a CLOB |
| WRITETOFILE Procedures | Writes the contents of the node to a file |

210.6.2 DBMS_XMLDOM DOMAttr Subprograms

This table lists the DOMAttr subprograms of DBMS_XMLDOM in alphabetical order and briefly describes them.

Table 210-5 Summary of DOMAttr Subprograms; DBMS_XMLDOM

| Method | Description |
|---|---|
| GETEXPANDEDNAME Procedure and Functions | Retrieves the expanded name of the attribute |
| GETLOCALNAME Procedure and Functions | Retrieves the local name of the attribute |
| GETNAME Functions | Retrieves the name of the attribute |
| GETNAMESPACE Procedure and Functions | Retrieves the NS URI of the attribute |
| GETOWNERELEMENT Function | Retrieves the Element node, parent of the attribute |
| GETQUALIFIEDNAME Functions | Retrieves the Qualified Name of the attribute |
| GETSPECIFIED Function | Tests if attribute was specified in the element |
| GETVALUE Function | Retrieves the value of the attribute |
| ISNULL Functions | Tests if the Attribute node is NULL |
| MAKENODE Functions | Casts the Attribute to a node |
| SETVALUE Procedure | Sets the value of the attribute |

210.6.3 DBMS_XMLDOM DOMCDataSection Subprograms

This table lists the DOMCdata subprograms of DBMS_XMLDOM in alphabetical order and briefly describes them.

Table 210-6 Summary of DOMCdata Subprograms; DBMS_XMLDOM

| Method | Description |
|------------------------------------|-----------------------------------|
| ISNULL Functions | Tests if the CDataSection is NULL |
| MAKENODE Functions | Casts the CDataSection to a node |

210.6.4 DBMS_XMLDOM DOMCharacterData Subprograms

This table lists the DOMCharacterData subprograms of DBMS_XMLDOM in alphabetical order and briefly describes them.

Table 210-7 Summary of DOMCharacterData Subprograms; DBMS_XMLDOM

| Method | Description |
|--|---|
| APPENDDATA Procedure | Appends the specified data to the node data |
| DELETEDATA Procedure | Deletes the data from the specified offSets |
| GETDATA Functions | Retrieves the data of the node |
| GETLENGTH Functions | Retrieves the length of the data |
| INSERTDATA Procedure | Inserts the data in the node at the specified offSets |
| ISNULL Functions | Tests if the CharacterData is NULL |
| MAKENODE Functions | Casts the CharacterData to a node |
| REPLACEDATA Procedure | Changes a range of characters in the node |
| SETDATA Procedures | Sets the data to the node |
| SUBSTRINGDATA Function | Retrieves the substring of the data |

210.6.5 DBMS_XMLDOM DOMComment Subprograms

The table lists the DOMComment subprograms of DBMS_XMLDOM in alphabetical order and briefly describes them.

Table 210-8 Summary of DOMComment Subprograms; DBMS_XMLDOM

| Method | Description |
|------------------------------------|------------------------------|
| ISNULL Functions | Tests if the comment is NULL |
| MAKENODE Functions | Casts the Comment to a node |

210.6.6 DBMS_XMLDOM DOMDocument Subprograms

This table lists the DOMDocument subprograms of DBMS_XMLDOM in alphabetical order and briefly describes them.

Table 210-9 Summary of DOMDocument Subprograms; DBMS_XMLDOM

| Method | Description |
|---|---------------------------------|
| CREATEATTRIBUTE Functions | Creates an Attribute |
| CREATECDATASECTION Function | Creates a CDataSection node |
| CREATECOMMENT Function | Creates a Comment node |
| CREATEDOCUMENT Function | Creates a new Document |
| CREATEDOCUMENTFRAGMENT Function | Creates a new Document Fragment |
| CREATEELEMENT Functions | Creates a new Element |

**Table 210-9 (Cont.) Summary of DOMDocument Subprograms;
DBMS_XMLDOM**

| Method | Description |
|--|--|
| CREATEENTITYREFERENCE Function | Creates an Entity reference |
| CREATEPROCESSINGINSTRUCTION Function | Creates a Processing Instruction |
| CREATETEXTNODE Function | Creates a Text node |
| FREEDOCFRAG Procedure | Frees the document fragment |
| FREEDOCUMENT Procedure | Frees the document |
| GETCHARSET Function | Retrieves the charset of the DOM document |
| GETDOCTYPE Function | Retrieves the DTD of the document |
| GETDOCUMENTELEMENT Function | Retrieves the root element of the document |
| GETELEMENTSBYTAGNAME Functions | Retrieves <ul style="list-style-type: none"> the elements in the DOMNODELIST by tag name elements in the subtree of a DOMNODELIST by tagname |
| GETIMPLEMENTATION Function | Retrieves the DOM implementation |
| GETSTANDALONE Function | Retrieves the standalone property of the document |
| GETVERSION Function | Retrieves the version of the document |
| GETXMLTYPE Function | Retrieves the XMLType associated with the DOM Document |
| ISNULL Functions | Tests if the document is NULL |
| MAKENODE Functions | Casts the document to a node |
| NEWDOMDOCUMENT Functions | Creates a new document |
| SETCHARSET Procedure | Sets the charset of the DOM document |
| SETDOCTYPE Procedure | Sets the DTD of the document |
| SETSTANDALONE Procedure | Sets the standalone property of the document |
| SETVERSION Procedure | Sets the version of the document |
| WRITETOBUFFER Procedures | Writes the document to a buffer |
| WRITETOCLOB Procedures | Writes the document to a CLOB |
| WRITETOFILE Procedures | Writes the document to a file |

210.6.7 DBMS_XMLDOM DOMDocumentFragment Subprograms

This table lists the DOMDocumentFragment subprograms of DBMS_XMLDOM in alphabetical order and briefly describes them.

**Table 210-10 Summary of DOMDocumentFragment Subprograms;
DBMS_XMLDOM**

| Method | Description |
|--|--|
| FREEDOCFRAG Procedure | Frees the specified document fragment |
| ISNULL Functions | Tests if the DocumentFragment is <code>NULL</code> |
| MAKENODE Functions | Casts the Document Fragment to a node |
| WRITETOBUFFER Procedures | Writes the contents of a document fragment into a buffer |

210.6.8 DBMS_XMLDOM DOMDocumentType Subprograms

This table lists the DOMDocumentType subprograms of DBMS_XMLDOM in alphabetical order and briefly describes them.

Table 210-11 Summary of DOMDocumentType Subprograms; DBMS_XMLDOM

| Method | Description |
|---------------------------------------|---|
| FINDENTITY Function | Finds the specified entity in the document type |
| FINDNOTATION Function | Finds the specified notation in the document type |
| GETENTITIES Function | Retrieves the nodemap of entities in the Document type |
| GETNAME Functions | Retrieves the name of the Document type |
| GETNOTATIONS Function | Retrieves the nodemap of the notations in the Document type |
| GETPUBLICID Functions | Retrieves the public ID of the document type |
| GETSYSTEMID Functions | Retrieves the system ID of the document type |
| ISNULL Functions | Tests if the Document Type is <code>NULL</code> |
| MAKENODE Functions | Casts the document type to a node |

210.6.9 DBMS_XMLDOM DOMElement Subprograms

This table lists the DOMElement subprograms of DBMS_XMLDOM in alphabetical order and briefly describes them.

Table 210-12 Summary of DOMElement Subprograms; DBMS_XMLDOM

| Method | Description |
|--|---|
| FREEELEMENT Procedure | Frees memory allocated to a DOMElement handle |
| GETATTRIBUTE Functions | Retrieves the attribute node by name |
| GETATTRIBUTENODE Functions | Retrieves the attribute node by name |
| GETCHILDRENBYTAGNAME Functions | Retrieves children of the element by tag name |

Table 210-12 (Cont.) Summary of DOMELEMENT Subprograms; DBMS_XMLDOM

| Method | Description |
|---|--|
| GETELEMENTSBYTAGNAME Functions | Retrieves <ul style="list-style-type: none"> the elements in the DOMNODELIST by tag name elements in the subtree of a DOMNODELIST by tagname |
| GETEXPANDEDNAME Procedure and Functions | Retrieves the expanded name of the element |
| GETLOCALNAME Procedure and Functions | Retrieves the local name of the element |
| GETNAMESPACE Procedure and Functions | Retrieves the NS URI of the element |
| GETQUALIFIEDNAME Functions | Retrieves the qualified name of the element |
| GETTAGNAME Function | Retrieves the Tag name of the element |
| HASATTRIBUTE Functions | Tests if an attribute exists |
| ISNULL Functions | Tests if the Element is NULL |
| MAKENODE Functions | Casts the Element to a node |
| NORMALIZE Procedure | Normalizes the text children of the element |
| REMOVEATTRIBUTE Procedures | Removes the attribute specified by the name |
| REMOVEATTRIBUTENODE Function | Removes the attribute node in the element |
| RESOLVENAMESPACEPREFIX Function | Resolve the prefix to a namespace URI |
| SETATTRIBUTE Procedures | Sets the attribute specified by the name |
| SETATTRIBUTENODE Functions | Sets the attribute node in the element |

210.6.10 DBMS_XMLDOM DOMEntity Subprograms

This table lists and briefly describes the `DOMEntity` subprograms of `DBMS_XMLDOM`.

Table 210-13 Summary of DOMEntity Subprograms; DBMS_XMLDOM

| Method | Description |
|--|---|
| GETNOTATIONNAME Function | Retrieves the notation name of the entity |
| GETPUBLICID Functions | Retrieves the public Id of the entity |
| GETSYSTEMID Functions | Retrieves the system Id of the entity |
| ISNULL Functions | Tests if the Entity is NULL |
| MAKENODE Functions | Casts the Entity to a node |

210.6.11 DBMS_XMLDOM DOMEntityReference Subprograms

This table lists and briefly describes the `DOMEntityReference` subprograms of `DBMS_XMLDOM`.

Table 210-14 Summary of DOMEntityReference Subprograms; DBMS_XMLDOM

| Method | Description |
|------------------------------------|---|
| ISNULL Functions | Tests if the <code>DOMEntityReference</code> is <code>NULL</code> |
| MAKENODE Functions | Casts the <code>DOMEntityReference</code> to <code>NULL</code> |

210.6.12 DBMS_XMLDOM DOMImplementation Subprograms

This table lists and briefly describes the `DOMImplementation` subprograms of `DBMS_XMLDOM`.

Table 210-15 Summary of DOMImplementation Subprograms; DBMS_XMLDOM

| Method | Description |
|-------------------------------------|---|
| ISNULL Functions | Tests if the <code>DOMImplementation</code> node is <code>NULL</code> |
| HASFEATURE Function | Tests if the <code>DOMImplementation</code> implements a feature |

210.6.13 DBMS_XMLDOM DOMNamedNodeMap Subprograms

This table lists and briefly describes the `DOMNamedNodeMap` subprograms of `DBMS_XMLDOM`.

Table 210-16 Summary of DOMNamedNodeMap Subprograms; DBMS_XMLDOM

| Method | Description |
|--|---|
| GETLENGTH Functions | Retrieves the number of items in the map |
| GETNAMEDITEM Function | Retrieves the item specified by the name |
| ISNULL Functions | Tests if the <code>NamedNodeMap</code> is <code>NULL</code> |
| ITEM Functions | Retrieves the item given the index in the map |
| REMOVENAMEDITEM Function | Removes the item specified by name |
| SETNAMEDITEM Function | Sets the item in the map specified by the name |

210.6.14 DBMS_XMLDOM DOMNodeList Subprograms

This table lists and briefly describes the `DOMNodeList` subprograms of `DBMS_XMLDOM`.

Table 210-17 Summary of DOMNodeList Subprograms; DBMS_XMLDOM

| Method | Description |
|--|---|
| FREENODELIST Procedure | Frees all resources associated with a nodelist |
| GETLENGTH Functions | Retrieves the number of items in the list |
| ISNULL Functions | Tests if the <code>NodeList</code> is <code>NULL</code> |
| ITEM Functions | Retrieves the item given the index in the list |

210.6.15 DBMS_XMLDOM DOMNotation Subprograms

This table lists and briefly describes the `DOMNotation` subprograms of `DBMS_XMLDOM`.

Table 210-18 Summary of DOMNotation Subprograms; DBMS_XMLDOM

| Method | Description |
|---------------------------------------|--|
| GETPUBLICID Functions | Retrieves the public Id of the notation |
| GETSYSTEMID Functions | Retrieves the system Id of the notation |
| ISNULL Functions | Tests if the Notation is <code>NULL</code> |
| MAKENODE Functions | Casts the notation to a node |

210.6.16 DBMS_XMLDOM DOMProcessingInstruction Subprograms

This table lists and briefly describes the `DOMProcessingInstruction` subprograms of `DBMS_XMLDOM`.

Table 210-19 Summary of DOMProcessingInstruction Subprograms; DBMS_XMLDOM

| Method | Description |
|------------------------------------|--|
| GETDATA Functions | Retrieves the data of the processing instruction |
| GETTARGET Function | Retrieves the target of the processing instruction |
| ISNULL Functions | Tests if the Processing Instruction is <code>NULL</code> |
| MAKENODE Functions | Casts the Processing Instruction to a node |
| SETDATA Procedures | Sets the data of the processing instruction |

210.6.17 DBMS_XMLDOM DOMText Subprograms

This table lists and briefly describes the `DOMText` subprograms of `DBMS_XMLDOM`.

Table 210-20 Summary of DOMText Subprograms; DBMS_XMLDOM

| Method | Description |
|------------------------------------|--|
| ISNULL Functions | Tests if the text is <code>NULL</code> |
| MAKENODE Functions | Casts the text to a node |
| SPLITTEXT Function | Splits the contents of the text node into 2 text nodes |

210.7 Summary of DBMS_XMLDOM Subprograms

This table lists the `DBMS_XMLDOM` subprograms and briefly describes them.

Table 210-21 Summary of DBMS_XMLDOM Package Subprogram

| Subprogram | Description | Group |
|--|--|---|
| ADOPTNODE Function | Adopts a node from another document | DOMNode Subprograms |
| APPENDCHILD Function | Appends a new child to the node | DOMNode Subprograms |
| APPENDDATA Procedure | Appends the specified data to the node data | DOMCharacterData Subprograms |
| CLONENODE Function | Clones the node | DOMNode Subprograms |
| CREATEATTRIBUTE Functions | Creates an Attribute | DOMDocument Subprograms |
| CREATECDATASECTION Function | Creates a <code>CDataSection</code> node | DOMDocument Subprograms |
| CREATECOMMENT Function | Creates a Comment node | DOMDocument Subprograms |
| CREATEDOCUMENT Function | Creates a new Document | DOMDocument Subprograms |
| CREATEDOCUMENTFRAGMENT Function | Creates a new Document Fragment | DOMDocument Subprograms |
| CREATEELEMENT Functions | Creates a new Element | DOMDocument Subprograms |
| CREATEENTITYREFERENCE Function | Creates an Entity reference | DOMDocument Subprograms |
| CREATEPROCESSINGINSTRUCTION Function | Creates a Processing Instruction | DOMDocument Subprograms |
| CREATETEXTNODE Function | Creates a Text node | DOMDocument Subprograms |
| DELETEDATA Procedure | Deletes the data from the specified offset | DOMCharacterData Subprograms |
| FINDENTITY Function | Finds the specified entity in the document type | DOMDocumentType Subprograms |
| FINDNOTATION Function | Finds the specified notation in the document type | DOMDocumentType Subprograms |
| FREEDOCFRAG Procedure | Frees the document fragment | DOMDocument Subprograms and DOMDocumentFragment Subprograms |
| FREEDOCUMENT Procedure | Frees the document | DOMDocument Subprograms |
| FREEELEMENT Procedure | Frees memory allocated to a <code>DOMElement</code> handle | DOMElement Subprograms |
| FREENODE Procedure | Frees all resources associated with the node | DOMNode Subprograms |
| FREENODELIST Procedure | Frees all resources associated with a nodelist | DOMNodeList Subprograms |
| GETATTRIBUTE Functions | Retrieves the attribute node by name | DOMElement Subprograms |
| GETATTRIBUTENODE Functions | Retrieves the attribute node by name | DOMElement Subprograms |

Table 210-21 (Cont.) Summary of DBMS_XMLDOM Package Subprogram

| Subprogram | Description | Group |
|---|---|--|
| GETATTRIBUTES Function | Retrieves the attributes of the node | DOMNode Subprograms |
| GETCHARSET Function | Retrieves the character set of the DOM document | DOMDocument Subprograms |
| GETCHILDNODES Function | Retrieves the children of the node | DOMNode Subprograms |
| GETCHILDRENBYTAGNAME Functions | Retrieves children of the element by tag name | DOMCharacterData Subprograms |
| GETDATA Functions | Retrieves <ul style="list-style-type: none"> the data of the node the data of the processing instruction | <ul style="list-style-type: none"> DOMCharacterData Subprograms DOMProcessingInstruction Subprograms |
| GETDOCTYPE Function | Retrieves the DTD of the document | DOMDocument Subprograms |
| GETDOCUMENTELEMENT Function | Retrieves the root element of the document | DOMDocument Subprograms |
| GETELEMENTSBYTAGNAME Functions | Retrieves <ul style="list-style-type: none"> the elements in the DOMNODELIST by tag name elements in the subtree of a DOMNODELIST by tagname | <ul style="list-style-type: none"> DOMDocument Subprograms DOMElement Subprograms |
| GETENTITIES Function | Retrieves the nodemap of entities in the Document type | DOMDocumentType Subprograms |
| GETEXPANDEDNAME Procedure and Functions | Retrieves <ul style="list-style-type: none"> the expanded name of the node the expanded name of the attribute the expanded name of the element | <ul style="list-style-type: none"> DOMNode Subprograms DOMAttr Subprograms DOMElement Subprograms |
| GETFIRSTCHILD Function | Retrieves the first child of the node | DOMNode Subprograms |
| GETIMPLEMENTATION Function | Retrieves the DOM implementation | DOMDocument Subprograms |
| GETLASTCHILD Function | Retrieves the last child of the node | DOMNode Subprograms |
| GETLENGTH Functions | Retrieves <ul style="list-style-type: none"> the length of the data the number of items in the map the number of items in the list | <ul style="list-style-type: none"> DOMCharacterData Subprograms DOMNamedNodeMap Subprograms DOMNodeList Subprograms |

Table 210-21 (Cont.) Summary of DBMS_XMLDOM Package Subprogram

| Subprogram | Description | Group |
|--|--|--|
| GETLOCALNAME Procedure and Functions | Retrieves <ul style="list-style-type: none"> the local part of the qualified name the local name of the attribute the local name of the element | <ul style="list-style-type: none"> DOMNode Subprograms DOMAttr Subprograms DOMElement Subprograms |
| GETNAME Functions | Retrieves <ul style="list-style-type: none"> the name of the attribute the name of the Document type | <ul style="list-style-type: none"> DOMAttr Subprograms DOMDocumentType Subprograms |
| GETNAMEDITEM Function | Retrieves <ul style="list-style-type: none"> an item specified by name and namespace URI) | <ul style="list-style-type: none"> DOMNamedNodeMap Subprograms DOMNamedNodeMap Subprograms |
| GETNAMESPACE Procedure and Functions | Retrieves <ul style="list-style-type: none"> the node's namespace URI the NS URI of the attribute the NS URI of the element | <ul style="list-style-type: none"> DOMNode Subprograms DOMAttr Subprograms DOMElement Subprograms |
| GETNEXTSIBLING Function | Retrieves the next sibling of the node | DOMNode Subprograms |
| GETNODENAME Function | Retrieves the Name of the Node | DOMNode Subprograms |
| GETNODETYPE Function | Retrieves the Type of the node | DOMNode Subprograms |
| GETNODEVALUE Function | Retrieves the Value of the Node | DOMNode Subprograms |
| GETNODEVALUEASBINARYSTREAM Function & Procedure | Retrieves the Node Value as binary stream | DOMNode Subprograms |
| GETNODEVALUEASCHARACTERSTREAM Function & Procedure | Retrieves the Node Value as character stream | DOMNode Subprograms |
| GETNOTATIONNAME Function | Retrieves the notation name of the entity | DOMEntity Subprograms |
| GETNOTATIONS Function | Retrieves the nodemap of the notations in the Document type | DOMDocumentType Subprograms |
| GETTARGET Function | Retrieves the target of the processing instruction | DOMProcessingInstruction Subprograms |
| GETOWNERDOCUMENT Function | Retrieves the owner document of the node | DOMNode Subprograms |
| GETOWNERELEMENT Function | Retrieves the Element node, parent of the attribute | DOMAttr Subprograms |
| GETPARENTNODE Function | Retrieves the parent of this node | DOMNode Subprograms |
| GETPREFIX Function | Retrieves the namespace prefix) | DOMNode Subprograms |
| GETPREVIOUSIBLING Function | Retrieves the previous sibling of the node | DOMNode Subprograms |

Table 210-21 (Cont.) Summary of DBMS_XMLDOM Package Subprogram

| Subprogram | Description | Group |
|----------------------------|--|---|
| GETPUBLICID Functions | Retrieves <ul style="list-style-type: none"> the public ID of the document type the public Id of the entity the public Id of the notation | <ul style="list-style-type: none"> DOMDocumentType Subprograms DOMEntity Subprograms DOMNotation Subprograms |
| GETQUALIFIEDNAME Functions | Retrieves <ul style="list-style-type: none"> the Qualified Name of the attribute the qualified name of the element | <ul style="list-style-type: none"> DOMAttr Subprograms DOMElement Subprograms |
| GETSCHEMANODE Function | Retrieves the associated schema URI | DOMNode Subprograms |
| GETSPECIFIED Function | Tests if attribute was specified in the element. | DOMAttr Subprograms |
| GETSTANDALONE Function | Retrieves the standalone property of the document | DOMDocument Subprograms |
| GETSYSTEMID Functions | Retrieves <ul style="list-style-type: none"> the system ID of the document type the system Id of the entity the system Id of the notation | <ul style="list-style-type: none"> DOMDocumentType Subprograms DOMEntity Subprograms DOMNotation Subprograms |
| GETTAGNAME Function | Retrieves the Tag name of the element | DOMElement Subprograms |
| GETVALUE Function | Retrieves the value of the attribute | DOMAttr Subprograms |
| GETVERSION Function | Retrieves the version of the document | DOMDocument Subprograms) |
| GETXMLTYPE Function | Retrieves the XMLType associated with the DOM Document | DOMDocument Subprograms |
| HASATTRIBUTES Function | Tests if the node has attributes | DOMNode Subprograms |
| HASATTRIBUTE Functions | Tests if an attribute exists | DOMElement Subprograms |
| HASCHILDNODES Function | Tests if the node has child nodes | DOMNode Subprograms |
| HASFEATURE Function | Tests if the DOMImplementation implements a feature | DOMImplementation Subprograms |
| IMPORTNODE Function | Imports a node from another document | DOMNode Subprograms |
| INSERTBEFORE Function | Inserts a child before the reference child | DOMNode Subprograms |
| INSERTDATA Procedure | Inserts the data in the node at the specified offSets | DOMCharacterData Subprograms |

Table 210-21 (Cont.) Summary of DBMS_XMLDOM Package Subprogram

| Subprogram | Description | Group |
|-------------------------------|---|--|
| ISNULL Functions | Tests <ul style="list-style-type: none"> • if the node is NULL • if the Attribute node is NULL • if the CDataSection is NULL • if the CharacterData is NULL • if the comment is NULL • if the document is NULL • if the DocumentFragment is NULL • if the Document Type is NULL • if the Element is NULL • if the Entity is NULL • if the DOMEntityReference is NULL • if the DOMImplementation node is NULL • if the NamedNodeMap is NULL • if the NodeList is NULL • if the Notation is NULL • if the Processing Instruction is NULL • if the text is NULL | <ul style="list-style-type: none"> • DOMNode Subprograms • DOMAttr Subprograms • DOMCDataSection Subprograms • DOMCharacterData Subprograms • DOMComment Subprograms • DOMDocument Subprograms • DOMDocumentFragment Subprograms • DOMDocumentType Subprograms • DOMELEMENT Subprograms • DOMEntity Subprograms • DOMEntityReference Subprograms • DOMImplementation Subprograms • DOMNamedNodeMap Subprograms • DOMNodeList Subprograms • DOMNotation Subprograms • DOMProcessingInstruction Subprograms • DOMText Subprograms |
| ITEM Functions | Retrieves <ul style="list-style-type: none"> • the item given the index in the map • the item given the index in the NodeList | <ul style="list-style-type: none"> • DOMNamedNodeMap Subprograms • DOMNodeList Subprograms |
| MAKEATTR Function | Casts the node to an Attribute | DOMNode Subprograms |
| MAKECDATASECTION Function | Casts the node to a CData Section | DOMNode Subprograms |
| MAKECHARACTERDATA Function | Casts the node to Character Data | DOMNode Subprograms |
| MAKECOMMENT Function | Casts the node to a Comment | DOMNode Subprograms |
| MAKEDOCUMENT Function | Casts the node to a DOM Document | DOMNode Subprograms |
| MAKEDOCUMENTFRAGMENT Function | Casts the node to a DOM Document Fragment | DOMNode Subprograms) |

Table 210-21 (Cont.) Summary of DBMS_XMLDOM Package Subprogram

| Subprogram | Description | Group |
|--|---|--|
| MAKEDOCUMENTTYPE Function | Casts the node to a DOM Document Type | DOMNode Subprograms |
| MAKEELEMENT Function | Casts the node to a DOM Element | DOMNode Subprograms |
| MAKEENTITY Function | Casts the node to a DOM Entity | DOMNode Subprograms |
| MAKEENTITYREFERENCE Function | Casts the node to a DOM Entity Reference | DOMNode Subprograms |
| MAKENODE Functions | Casts <ul style="list-style-type: none"> • the Attribute to a node • the CDatasection to a node • the CharacterData to a node • the Comment to a node • the document to a node • the Document Fragment to a node • the document type to a node • the Element to a node • the Entity to a node • • the DOMEntityReference to NULL • the notation to a node • the Processing Instruction to a node • the text to a node | <ul style="list-style-type: none"> • DOMAttr Subprograms • DOMCDataSection Subprograms • DOMCharacterData Subprograms • DOMComment Subprograms • DOMDocument Subprograms • DOMDocumentFragment Subprograms • DOMDocumentType Subprograms • DOMElement Subprograms • DOMEntity Subprograms • DOMEntityReference Subprograms • DOMNotation Subprograms • DOMProcessingInstruction Subprograms • DOMText Subprograms |
| MAKENOTATION Function | Casts the node to a DOM Notation | DOMNode Subprograms |
| MAKEPROCESSINGINSTRUCTION Function | Casts the node to a DOM Processing Instruction | DOMNode Subprograms |
| MAKETEXT Function | Casts the node to a DOM Text | DOMNode Subprograms |
| NEWDOMDOCUMENT Functions | Creates a new document | DOMDocument Subprograms |
| NORMALIZE Procedure | Normalizes the text children of the element | DOMElement Subprograms |
| REMOVEATTRIBUTE Procedures | Removes the attribute specified by the name | DOMElement Subprograms |
| REMOVEATTRIBUTENODE Function | Removes the attribute node in the element | DOMElement Subprograms |
| REMOVECHILD Function | Removes a specified child from a node | DOMNode Subprograms |

Table 210-21 (Cont.) Summary of DBMS_XMLDOM Package Subprogram

| Subprogram | Description | Group |
|--|---|--|
| REMOVENAMEITEM Function | Removes the item specified by name | DOMNamedNodeMap Subprograms |
| REPLACECHILD Function | Replaces the old child with a new child | DOMNode Subprograms |
| REPLACEDATA Procedure | Changes a range of characters in the node | DOMCharacterData Subprograms |
| RESOLVENAMESPACEPREFIX Function | Resolve the prefix to a namespace URI | DOMElement Subprograms |
| SETATTRIBUTE Procedures | Sets the attribute specified by the name | DOMElement Subprograms |
| SETATTRIBUTENODE Functions | Sets the attribute node in the element | DOMElement Subprograms |
| SETCHARSET Procedure | Sets the character set of the DOM document | DOMDocument Subprograms |
| SETDATA Procedures | Sets <ul style="list-style-type: none"> the data to the node the data of the processing instruction | <ul style="list-style-type: none"> DOMCharacterData Subprograms DOMProcessingInstruction Subprograms |
| SETDOCTYPE Procedure | Sets the DTD of the document. | DOMDocument Subprograms |
| SETNAMEITEM Function | Sets the item in the map specified by the name | DOMNamedNodeMap Subprograms |
| SETNODEVALUE Procedure | Sets the Value of the node | DOMNode Subprograms |
| SETNODEVALUEASBINARYSTREAM Function & Procedure | Sets the Node Value as a binary stream | DOMNode Subprograms |
| SETNODEVALUEASCHARACTERSTREAM Function & Procedure | Sets the Node Value as a character stream | DOMNode Subprograms |
| SETPREFIX Procedure | Sets the namespace prefix | DOMNode Subprograms |
| SETSTANDALONE Procedure | Sets the standalone property of the document | DOMDocument Subprograms |
| SETVALUE Procedure | Sets the value of the attribute | DOMAttr Subprograms |
| SETVERSION Procedure | Sets the version of the document | DOMDocument Subprograms |
| SPLITTEXT Function | Splits the contents of the text node into 2 text nodes | DOMText Subprograms |
| SUBSTRINGDATA Function | Retrieves the substring of the data | DOMCharacterData Subprograms |
| USEBINARYSTREAM Function | Strabismus that the stream is valid for use | DOMNode Subprograms |

Table 210-21 (Cont.) Summary of DBMS_XMLDOM Package Subprogram

| Subprogram | Description | Group |
|--|--|---|
| WRITETOBUFFER Procedures | Writes <ul style="list-style-type: none"> the contents of the node to a buffer the document to a buffer the contents of a document fragment into a buffer | <ul style="list-style-type: none"> DOMNode Subprograms DOMDocument Subprograms DOMDocumentFragment Subprograms |

| WRITETOFILE Procedures | Writes <ul style="list-style-type: none"> the contents of the node to a file the document to a file | <ul style="list-style-type: none"> DOMNode Subprograms DOMDocument Subprograms |

210.7.1 ADOPTNODE Function

This function adopts a node from another document, and returns this new node.

See Also:

[DOMNode Subprograms](#) for other subprograms in this group

Syntax

```
DBMS_XMLDOM.ADOPTNODE (
    doc          IN  DOMDocument,
    importedNode IN  DOMNode)
RETURN DOMNODE;
```

Parameters

Table 210-22 ADOPTNODE Function Parameters

| Parameter | Description |
|--------------|------------------------------------|
| doc | Document that is adopting the node |
| importedNode | Node to adopt |

Usage Notes

Note that the [ADOPTNODE Function](#) removes the node from the source document while the [IMPORTNODE Function](#) clones the node in the source document.

210.7.2 APPENDCHILD Function

This function adds the node `newchild` to the end of the list of children of this node, and returns the newly added node. If the `newchild` is already in the tree, it is first removed.

See Also:

[DOMNode Subprograms](#)

Syntax

```
DBMS_XMLDOM.APPENDCHILD(
  n          IN      DOMNode,
  newchild   IN      DOMNode)
RETURN DOMNODE;
```

Parameters

Table 210-23 APPENDCHILD Function Parameters

| Parameter | Description |
|-----------------------|---|
| <code>n</code> | DOMNode |
| <code>newchild</code> | The child to be appended to the list of children of node <code>n</code> |

210.7.3 APPENDDATA Procedure

This procedure appends the string to the end of the character data of the node. Upon success, data provides access to the concatenation of data and the specified string argument.

See Also:

[DOMCharacterData Subprograms](#)

Syntax

```
DBMS_XMLDOM.APPENDDATA(
  cd      IN      DOMCHARACTERDATA,
  arg     IN      VARCHAR2);
```

Parameters

Table 210-24 APPENDDATA Procedure Parameters

| Parameter | Description |
|-----------------|------------------|
| <code>cd</code> | DOMCHARACTERDATA |

Table 210-24 (Cont.) APPENDDATA Procedure Parameters

| Parameter | Description |
|-----------|---|
| arg | The data to append to the existing data |

210.7.4 CLONENODE Function

This function returns a duplicate of this node, and serves as a generic copy constructor for nodes. The duplicate node has no parent, its parent node is `NULL`.

See Also:

[DOMNode Subprograms](#)

Syntax

```
DBMS_XMLDOM.CLONENODE (
    n          IN    DOMNODE,
    deep      IN    BOOLEAN)
RETURN DOMNODE;
```

Parameters

Table 210-25 CLONENODE Function Parameters

| Parameter | Description |
|-----------|---|
| n | DOMNODE |
| deep | Determines if children are to be cloned |

Usage Notes

- Cloning an Element copies all attributes and their values, including those generated by the XML processor to represent defaulted attributes, but this method does not copy any text it contains unless it is a deep clone, since the text is contained in a child Text node.
- Cloning an Attribute directly, as opposed to be cloned as part of an Element cloning operation, returns a specified attribute (specified is `TRUE`).
- Cloning any other type of node simply returns a copy of this node.

210.7.5 CREATEATTRIBUTE Functions

This function creates a `DOMATTR` node.

See Also:

[DOMDocument Subprograms](#)

Syntax

Creates a `DOMATTR` with the specified name:

```
DBMS_XMLDOM.CREATEATTRIBUTE (
  doc      IN      DOMDOCUMENT,
  name     IN      VARCHAR2)
RETURN DOMATTR;
```

Creates a `DOMATTR` with the specified name and namespace URI:

```
DBMS_XMLDOM.CREATEATTRIBUTE (
  doc      IN      DOMDOCUMENT,
  qname    IN      VARCHAR2,
  ns       IN      VARCHAR2)
RETURN DOMATTR;
```

Parameters

Table 210-26 CREATEATTRIBUTE Function Parameters

| Parameter | Description |
|--------------------|------------------------------|
| <code>doc</code> | <code>DOMDOCUMENT</code> |
| <code>qname</code> | New attribute qualified name |
| <code>ns</code> | Namespace |

210.7.6 CREATECDATASECTION Function

This function creates a `DOMCDATASECTION` node.

See Also:

[DOMDocument Subprograms](#)

Syntax

```
DBMS_XMLDOM.CREATECDATASECTION (
  doc      IN      DOMDOCUMENT,
  data     IN      VARCHAR2)
RETURN DOMCDATASECTION;
```

Parameters

Table 210-27 CREATECDATASECTION Function Parameters

| Parameter | Description |
|-------------------|--|
| <code>doc</code> | <code>DOMDOCUMENT</code> |
| <code>data</code> | Content of the <code>DOMCDATASECTION</code> node |

210.7.7 CREATECOMMENT Function

This function creates a `DOMCOMMENT` node.

See Also:

[DOMDocument Subprograms](#)

Syntax

```
DBMS_XMLDOM.CREATECOMMENT (  
    doc      IN      DOMDOCUMENT,  
    data     IN      VARCHAR2)  
RETURN DOMCOMMENT;
```

Parameters

Table 210-28 CREATECOMMENT Function Parameters

| Parameter | Description |
|-----------|---|
| doc | DOMDOCUMENT |
| data | Content of the <code>DOMComment</code> node |

210.7.8 CREATEDOCUMENT Function

This function creates a `DOMDOCUMENT` with specified namespace URI, root element name, DTD.

See Also:

[DOMDocument Subprograms](#)

Syntax

```
DBMS_XMLDOM.CREATEDOCUMENT (  
    namespaceURI  IN  VARCHAR2,  
    qualifiedName IN  VARCHAR2,  
    doctype       IN  DOMTYPE := NULL)  
RETURN DOMDOCUMENT;
```

Parameters

Table 210-29 CREATEDOCUMENT Function Parameters

| Parameter | Description |
|--------------|---------------|
| namespaceURI | Namespace URI |

Table 210-29 (Cont.) CREATEDOCUMENT Function Parameters

| Parameter | Description |
|---------------|-------------------|
| qualifiedName | Root element name |
| doctype | Document type |

210.7.9 CREATEDOCUMENTFRAGMENT Function

This function creates a `DOMDOCUMENTFRAGMENT`.

See Also:

[DOMDocument Subprograms](#)

Syntax

```
DBMS_XMLDOM.CREATEDOCUMENTFRAGMENT (
    doc      IN      DOMDOCUMENT)
RETURN DOMDOCUMENTFRAGMENT;
```

Parameters

Table 210-30 CREATEDOCUMENTFRAGMENT Function Parameters

| Parameter | Description |
|-----------|-------------|
| doc | DOMDocument |

210.7.10 CREATEELEMENT Functions

This function creates a `DOMELEMENT`.

See Also:

[DOMDocument Subprograms](#)

Syntax

Creates a `DOMElement` with specified name:

```
DBMS_XMLDOM.CREATEELEMENT (
    doc      IN      DOMDOCUMENT,
    tagName  IN      VARCHAR2)
RETURN DOMELEMENT;
```

Creates a `DOMElement` with specified name and namespace URI:

```
DBMS_XMLDOM.CREATEELEMENT (
    doc          IN    DOMDOCUMENT,
    tagName     IN    VARCHAR2,
    ns          IN    VARCHAR2)
RETURN DOMELEMENT;
```

Parameters

Table 210-31 CREATEELEMENT Function Parameters

| Parameter | Description |
|-----------|----------------------------|
| doc | DOMDOCUMENT |
| tagName | Tagname for new DOMELEMENT |
| ns | Namespace |

210.7.11 CREATEENTITYREFERENCE Function

This function creates a DOMENTITYREFERENCE node.

See Also:

[DOMDocument Subprograms](#)

Syntax

```
DBMS_XMLDOM.CREATEENTITYREFERENCE (
    doc          IN    DOMDOCUMENT,
    name        IN    VARCHAR2)
RETURN DOMENTITYREFERENCE;
```

Parameters

Table 210-32 CREATEENTITYREFERENCE Function Parameters

| Parameter | Description |
|-----------|---------------------------|
| doc | DOMDOCUMENT |
| name | New entity reference name |

210.7.12 CREATEPROCESSINGINSTRUCTION Function

This function creates a DOMPROCESSINGINSTRUCTION node.

See Also:

[DOMDocument Subprograms](#)

Syntax

```
DBMS_XMLDOM.CREATEPROCESSINGINSTRUCTION (  
  doc      IN      DOMDocument,  
  target   IN      VARCHAR2,  
  data     IN      VARCHAR2)  
RETURN DOMPROCESSINGINSTRUCTION;
```

Parameters

Table 210-33 CREATEPROCESSINGINSTRUCTION Function Parameters

| Parameter | Description |
|-----------|--|
| doc | DOMDOCUMENT |
| target | Target of the new processing instruction |
| data | Content data of the new processing instruction |

210.7.13 CREATETEXTNODE Function

This function creates a DOMTEXT node.

See Also:

[DOMDocument Subprograms](#)

Syntax

```
DBMS_XMLDOM.CREATETEXTNODE (  
  doc      IN      DOMDocument,  
  data     IN      VARCHAR2)  
RETURN DOMTEXT;
```

Parameters

Table 210-34 CREATETEXTNODE Function Parameters

| Parameter | Description |
|-----------|-----------------------------|
| doc | DOMDOCUMENT |
| data | Content of the DOMText node |

210.7.14 DELETEDATA Procedure

This procedure removes a range of characters from the node. Upon success, data and length reflect the change.

See Also:

[DOMCharacterData Subprograms](#)

Syntax

```
DBMS_XMLDOM.DELETEDATA (  
  cd          IN      DOMCHARACTERDATA,  
  offset     IN      NUMBER,  
  cnt        IN      NUMBER);
```

Parameters

Table 210-35 DELETEDATA PROCEDURE Parameters

| Parameter | Description |
|-----------|---|
| cd | DOMCHARACTERDATA |
| offset | The offset from which to delete the data |
| cnt | The number of characters (starting from offset) to delete |

210.7.15 FINDENTITY Function

This function finds an entity in the specified DTD, and returns that entity if found.

See Also:

[DOMDocumentType Subprograms](#)

Syntax

```
DBMS_XMLDOM.FINDENTITY (  
  dt          IN      DOMDOCUMENTTYPE,  
  name       IN      VARCHAR2,  
  par        IN      BOOLEAN)  
RETURN DUMENTITY;
```

Parameters

Table 210-36 FINDENTITY Function Parameters

| Parameter | Description |
|-----------|--|
| dt | The DTD |
| name | Entity to find |
| par | Flag to indicate type of entity; TRUE for parameter entity and FALSE for normal entity |

210.7.16 FINDNOTATION Function

This function finds the notation in the specified DTD, and returns it, if found.

 **See Also:**
[DOMDocumentType Subprograms](#)

Syntax

```
DBMS_XMLDOM.FINDNOTATION (
    dt          IN      DOMDocumentType,
    name       IN      VARCHAR2)
RETURN DOMNOTATION;
```

Parameters

Table 210-37 FINDNOTATION Function Parameters

| Parameter | Description |
|-----------|----------------------|
| dt | The DTD |
| name | The notation to find |

210.7.17 FREEDOCFRAG Procedure

This procedure frees the specified document fragment.

 **See Also:**
[DOMDocument Subprograms](#) and [DOMDocumentFragment Subprograms](#)

Syntax

```
DBMS_XMLDOM.FREEDOCFRAG (
    df      IN      DOMDOCUMENTFRAGMENT);
```

Parameters

Table 210-38 FREEDOCFRAG Procedure Parameters

| Parameter | Description |
|-----------|-----------------------|
| df | DOM document fragment |

210.7.18 FREEDOCUMENT Procedure

This procedure frees `DOMDOCUMENT` object.

See Also:

[DOMDocument Subprograms](#)

Syntax

```
DBMS_XMLDOM.FREEDOCUMENT(  
    doc      IN      DOMDOCUMENT);
```

Parameters

Table 210-39 FREEDOCUMENT Procedure Parameters

| Parameter | Description |
|-----------|-------------|
| doc | DOMDOCUMENT |

210.7.19 FREEELEMENT Procedure

This procedure frees memory allocated to a `DOMElement` handle.

See Also:

[DBMS_XMLDOM DOMElement Subprograms](#)

Syntax

```
DBMS_XMLDOM.FREEELEMENT(  
    elem IN DOMELEMENT);
```

Parameters

Table 210-40 FREEELEMENT Procedure Parameters

| Parameter | Description |
|-----------|---------------------------------|
| elem | Of type <code>DOMELEMENT</code> |

210.7.20 FREENODE Procedure

This procedure frees all resources associated with a `DOMNODE`.

See Also:

[DOMNode Subprograms](#)

Syntax

```
DBMS_XMLDOM.FREENODE (
    n          IN      DOMNODE);
```

Parameters

Table 210-41 FREENODE Procedure Parameters

| Parameter | Description |
|-----------|----------------------|
| n | <code>DOMNODE</code> |

210.7.21 FREENODELIST Procedure

This procedure frees all resources associated with a `nodelist`.

See Also:

[DBMS_XMLDOM DOMNodeList Subprograms](#)

Syntax

```
DBMS_XMLDOM.FREENODELIST (
    n1 IN DOMNodeList);
```

Parameters

Table 210-42 FREENODELIST Procedure Parameters

| Parameter | Description |
|-----------|---------------------|
| nl | Of type DOMNODELIST |

210.7.22 GETATTRIBUTE Functions

This function returns the value of an attribute of an `DOMELEMENT` by name.

See Also:

[DOMElement Subprograms](#)

Syntax

Returns the value of a `DOMELEMENT`'s attribute by name:

```
DBMS_XMLDOM.GETATTRIBUTE (
    elem      IN      DOMELEMENT,
    name      IN      VARCHAR2)
RETURN VARCHAR2;
```

Returns the value of a `DOMELEMENT`'s attribute by name and namespace URI:

```
DBMS_XMLDOM.GETATTRIBUTE (
    elem      IN      DOMELEMENT,
    name      IN      VARCHAR2,
    ns        IN      VARCHAR2)
RETURN VARCHAR2;
```

Parameters

Table 210-43 GETATTRIBUTE Function Parameters

| Parameter | Description |
|-----------|-----------------------------|
| elem | The <code>DOMELEMENT</code> |
| name | Attribute name |
| ns | Namespace |

210.7.23 GETATTRIBUTENODE Functions

This function returns an attribute node from the `DOMELEMENT` by name. The function is overloaded. The specific forms of functionality are described along with the syntax declarations.

See Also:

[DOMElement Subprograms](#)

Syntax

Returns an attribute node from the `DOMELEMENT` by name:

```
DBMS_XMLDOM.GETATTRIBUTENODE (
  elem      IN      DOMElement,
  name      IN      VARCHAR2)
RETURN DOMATTR;
```

Returns an attribute node from the `DOMELEMENT` by name and namespace URI:

```
DBMS_XMLDOM.GETATTRIBUTENODE (
  elem      IN      DOMElement,
  name      IN      VARCHAR2,
  ns        IN      VARCHAR2)
RETURN DOMATTR;
```

Parameters

Table 210-44 GETATTRIBUTENODE Function Parameters

| Parameter | Description |
|-----------|---|
| elem | The <code>DOMELEMENT</code> |
| name | Attribute name; * matches any attribute |
| ns | Namespace |

210.7.24 GETATTRIBUTES Function

This function retrieves a `NAMEDNODEMAP` containing the attributes of this node (if it is an Element) or `NULL` otherwise.

See Also:

[DOMNode Subprograms](#)

Syntax

```
DBMS_XMLDOM.GETATTRIBUTES (
    n          IN          DOMNode)
RETURN DOMNAMEDNODEMAP;
```

Parameters**Table 210-45** GETATTRIBUTES Function Parameters

| Parameter | Description |
|-----------|-------------|
| n | DOMNode |

210.7.25 GETCHARSET Function

This function retrieves the character set of the DOM document.

**See Also:**

[DOMDocument Subprograms](#)

Syntax

```
DBMS_XMLDOM.GETCHARSET (
    doc IN    DOMDocument)
RETURN VARCHAR2;
```

Parameters**Table 210-46** GETCHARSET Function Parameters

| Parameter | Description |
|-----------|--------------|
| doc | DOM document |

Usage Notes

For a newly parsed document, we return the database character set. Once the `SETCHARSET` Procedure is called with a non-NULL value for `charset`, that `charset` is returned.

210.7.26 GETCHILDNODES Function

This function retrieves a `DOMNODELIST` that contains all children of this node. If there are no children, this is a `DOMNODELIST` containing no nodes.

**See Also:**

[DOMNode Subprograms](#)

Syntax

```
DBMS_XMLDOM.GETCHILDNODES (
    n          IN      DOMNode)
RETURN DOMNodeList;
```

Parameters

Table 210-47 GETCHILDNODES Function Parameters

| Parameter | Description |
|-----------|-------------|
| n | DOMNode |

210.7.27 GETCHILDRENBYTAGNAME Functions

This function returns the children of the `DOMELEMENT`.

See Also:

[DOMElement Subprograms](#)

Syntax

Returns children of the `DOMELEMENT` given the tag name:

```
DBMS_XMLDOM.GETCHILDRENBYTAGNAME (
    elem      IN      DOMELEMENT,
    name      IN      VARCHAR2)
RETURN DOMNODELIST;
```

Returns children of the `DOMELEMENT` given the tag name and namespace:

```
DBMS_XMLDOM.GETCHILDRENBYTAGNAME (
    elem      IN      DOMELEMENT,
    name      IN      VARCHAR2,
    ns        IN      VARCHAR2)
RETURN DOMNODELIST;
```

Parameters

Table 210-48 GETCHILDRENBYTAGNAME Function Parameters

| Parameter | Description |
|-----------|-------------|
| elem | DOMELEMENT |
| name | Tag name |
| ns | Namespace |

210.7.28 GETDATA Functions

This function is overloaded. The specific forms of functionality are described along with the syntax declarations.

Syntax

Gets the character data of the node that implements this interface (See Also: [DOMCharacterData Subprograms](#)):

```
DBMS_XMLDOM.GETDATA (
    cd      IN      DOMCHARACTERDATA)
RETURN VARCHAR2;
```

Returns the content data of the `DOMProcessingInstruction` (See Also: [DOMProcessingInstruction Subprograms](#)):

```
DBMS_XMLDOM.GETDATA (
    pi      IN      DOMPROCESSINGINSTRUCTION)
RETURN VARCHAR2;
```

Parameters

Table 210-49 GETDATA Function Parameters

| Parameter | Description |
|-----------|------------------------------|
| cd | DOMCHARACTERDATA |
| pi | The DOMPROCESSINGINSTRUCTION |

210.7.29 GETDOCTYPE Function

This function returns the DTD associated to the `DOMDOCUMENT`.

See Also:

[DOMDocument Subprograms](#)

Syntax

```
DBMS_XMLDOM.GETDOCTYPE (
    doc      IN      DOMDOCUMENT)
RETURN DOMDOCUMENTTYPE;
```

Parameters

Table 210-50 GETDOCTYPE Function Parameters

| Parameter | Description |
|-----------|-------------|
| doc | DOMDOCUMENT |

210.7.30 GETDOCUMENTELEMENT Function

This function returns the root element of the `DOMDOCUMENT`.

See Also:

[DOMDocument Subprograms](#)

Syntax

```
DBMS_XMLDOM.GETDOCUMENTELEMENT (
    doc      IN      DOMDOCUMENT)
RETURN DOMELEMENT;
```

Parameters

Table 210-51 GETDOCUMENTELEMENT Function Parameters

| Parameter | Description |
|-----------|-------------|
| doc | DOMDOCUMENT |

210.7.31 GETELEMENTSBYTAGNAME Functions

This function is overloaded. The specific forms of functionality are described along with the syntax declarations.

Syntax

Returns a `DOMNODELIST` of all the elements with a specified tagname (See Also: [DOMDocument Subprograms](#)):

```
DBMS_XMLDOM.GETELEMENTSBYTAGNAME (
    doc      IN      DOMDOCUMENT,
    tagname  IN      VARCHAR2)
RETURN DOMNODELIST;
```

Returns the element children of the `DOMELEMENT` given the tag name (See Also: [DOMELEMENT Subprograms](#)):

```
DBMS_XMLDOM.GETELEMENTSBYTAGNAME (
    elem     IN      DOMELEMENT,
    name     IN      VARCHAR2)
RETURN DOMNODELIST;
```

Returns the element children of the `DOMELEMENT` given the tag name and namespace (See Also: [DOMELEMENT Subprograms](#)):

```
DBMS_XMLDOM.GETELEMENTSBYTAGNAME (
    elem     IN      DOMELEMENT,
    name     IN      VARCHAR2,
    ns       IN      VARCHAR2)
RETURN DOMNODELIST;
```

Parameters

Table 210-52 GETELEMENTSBYTAGNAME Function Parameters

| Parameter | Description |
|-----------|---|
| doc | DOMDOCUMENT |
| tagname | Name of the tag to match on |
| elem | The DOMELEMENT |
| name | Tag name; using a wildcard(*) would match any tag |
| ns | Namespace |

210.7.32 GETENTITIES Function

This function retrieves a `DOMNAMEDNODEMAP` containing the general entities, both external and internal, declared in the DTD.

 **See Also:**
[DOMDocumentType Subprograms](#)

Syntax

```
DBMS_XMLDOM.GETENTITIES (
    dt      IN      DOMDocumentType)
RETURN DOMNAMEDNODEMAP;
```

Parameters

Table 210-53 GETENTITIES Function Parameters

| Parameter | Description |
|-----------|-----------------|
| dt | DOMDOCUMENTTYPE |

210.7.33 GETEXPANDEDNAME Procedure and Functions

This subprogram is overloaded as a procedure and two functions. The specific forms of functionality are described along with the syntax declarations.

Syntax

Retrieves the expanded name of the `Node` if it is in an `Element` or `Attribute` type; otherwise, returns `NULL` (See Also: [DOMNode Subprograms](#))

```
DBMS_XMLDOM.GETEXPANDEDNAME (
    n      IN      DOMNODE
    data   OUT     VARCHAR);
```

Returns the expanded name of the `DOMAttr` (See Also: [DOMAttr Subprograms](#)):

```
DBMS_XMLDOM.GETEXPANDEDNAME (
    a          IN      DOMAttr)
RETURN VARCHAR2;
```

Returns the expanded name of the `DOMElement` (See Also: [DOMElement Subprograms](#)):

```
DBMS_XMLDOM.GETEXPANDEDNAME (
    elem      IN      DOMELEMENT)
RETURN VARCHAR2;
```

Parameters

Table 210-54 GETEXPANDEDNAME Procedure and Function Parameters

| Parameter | Description |
|-----------|------------------------------------|
| n | DOMNODE |
| data | Returned expanded name of the Node |
| a | DOMATTR |
| elem | DOMELEMENT |

210.7.34 GETFIRSTCHILD Function

This function retrieves the first child of this node. If there is no such node, this returns NULL.

See Also:

[DOMNode Subprograms](#)

Syntax

```
DBMS_XMLDOM.GETFIRSTCHILD (
    n          IN      DOMNODE)
RETURN DOMNODE;
```

Parameters

Table 210-55 GETFIRSTCHILD Function Parameters

| Parameter | Description |
|-----------|-------------|
| n | DOMNODE |

210.7.35 GETIMPLEMENTATION Function

This function returns the `DOMIMPLEMENTATION` object that handles this `DOMDOCUMENT`.

See Also:

[DOMDocument Subprograms](#)

Syntax

```
DBMS_XMLDOM.GETIMPLEMENTATION (  
    doc      IN      DOMDOCUMENT)  
RETURN DOMIMPLEMENTATION;
```

Parameters

Table 210-56 GETIMPLEMENTATION Function Parameters

| Parameter | Description |
|-----------|-------------|
| doc | DOMDOCUMENT |

210.7.36 GETLASTCHILD Function

This function retrieves the last child of this node. If there is no such node, this returns `NULL`.

See Also:

[DOMNode Subprograms](#)

Syntax

```
DBMS_XMLDOM.GETLASTCHILD (  
    n      IN      DOMNODE)  
RETURN DOMNODE;
```

Parameters

Table 210-57 GETLASTCHILD Function Parameters

| Parameter | Description |
|-----------|-------------|
| n | DOMNODE |

210.7.37 GETLENGTH Functions

This function is overloaded. The specific forms of functionality are described along with the syntax declarations.

Syntax

Gets the number of characters in the data. This may have the value zero, because `CharacterData` nodes may be empty (See Also: [DOMCharacterData Subprograms](#)):

```
DBMS_XMLDOM.GETLENGTH (
    cd      IN      DOMCHARACTERDATA)
RETURN NUMBER;
```

Gets the number of nodes in this map. The range of valid child node indexes is 0 to `length-1`, inclusive (See Also: [DOMNamedNodeMap Subprograms](#)):

```
DBMS_XMLDOM.GETLENGTH (
    nnm     IN      DOMNAMEDNODEMAP)
RETURN NUMBER;
```

Gets the number of nodes in the list. The range of valid child node indexes is 0 to `length-1`, inclusive (See Also: [DOMNodeList Subprograms](#)):

```
DBMS_XMLDOM.GETLENGTH (
    nl      IN      DOMNODELIST)
RETURN NUMBER;
```

Parameters

Table 210-58 GETLENGTH Function Parameters

| Parameter | Description |
|------------------|-------------------------------|
| <code>cd</code> | <code>DOMCHARACTERDATA</code> |
| <code>nnm</code> | <code>DOMNAMEDNODEMAP</code> |
| <code>nl</code> | <code>DOMNODELIST</code> |

210.7.38 GETLOCALNAME Procedure and Functions

This function is overloaded as a procedure and two functions. The specific forms of functionality are described alongside the syntax declarations.

Syntax

Retrieves the local part of the node's qualified name (See Also: [DOMNode Subprograms](#)):

```
DBMS_XMLDOM.GETLOCALNAME (
    n       IN      DOMNODE,
    data    OUT     VARCHAR2);
```

Returns the local name of the `DOMAttr` (See Also: [DOMAttr Subprograms](#)):

```
DBMS_XMLDOM.GETLOCALNAME (
    a          IN      DOMATTR)
RETURN VARCHAR2;
```

Returns the local name of the `DOMElement` (See Also: [DOMElement Subprograms](#))

```
DBMS_XMLDOM.GETLOCALNAME (
    elem       IN      DOMELEMENT)
RETURN VARCHAR2;
```

Parameters

Table 210-59 GETLOCALNAME Procedure and Function Parameters

| Parameter | Description |
|-----------|----------------------|
| n | DOMNode |
| data | Returned local name. |
| a | DOMAttr. |
| elem | DOMElement. |

210.7.39 GETNAME Functions

This function is overloaded. The specific forms of functionality are described with the syntax declarations.

Syntax

Returns the name of this attribute (See Also: [DOMAttr Subprograms](#)):

```
DBMS_XMLDOM.GETNAME (
    a          IN      DOMATTR)
RETURN VARCHAR2;
```

Retrieves the name of DTD, or the name immediately following the `DOCTYPE` keyword (See Also: [DOMDocumentType Subprograms](#)):

```
DBMS_XMLDOM.GETNAME (
    dt         IN      DOMDOCUMENTTYPE)
RETURN VARCHAR2;
```

Parameters

Table 210-60 GETNAME Function Parameters

| Parameter | Description |
|-----------|-----------------|
| a | DOMATTR |
| dt | DOMDOCUMENTTYPE |

210.7.40 GETNAMEDITEM Function

GETNAMEDITEM retrieves a node specified by name.

See Also:

[DOMNamedNodeMap Subprograms](#)

Syntax

Retrieves a node specified by name:

```
DBMS_XMLDOM.GETNAMEDITEM(  
    nnm    IN  DOMNAMEDNODEMAP,  
    name   IN  VARCHAR2)  
RETURN DOMNODE;
```

Retrieves a node specified by name and namespace URI:

```
DBMS_XMLDOM.GETNAMEDITEM(  
    nnm    IN  DOMNAMEDNODEMAP,  
    name   IN  VARCHAR2,  
    ns     IN  VARCHAR2)  
RETURN DOMNODE;
```

Parameters

Table 210-61 GETNAMEDITEM Function Parameters

| Parameter | Description |
|-----------|----------------------------------|
| nnm | DOMNAMEDNODEMAP |
| name | Name of the item to be retrieved |
| ns | Namespace |

210.7.41 GETNAMESPACE Procedure and Functions

This subprogram is overloaded as a procedure and two functions. The specific forms of functionality are described alongside the syntax declarations.

Syntax

Retrieves the namespace URI associated with the node (See Also: [DOMNode Subprograms](#)):

```
DBMS_XMLDOM.GETNAMESPACE(  
    n      IN  DOMNODE,  
    data   OUT VARCHAR2);
```

Retrieves the namespace of the DOMATTR (See Also: [DOMAttr Subprograms](#)):

```
DBMS_XMLDOM.GETNAMESPACE (
    a          IN      DOMATTR)
RETURN VARCHAR2;
```

Retrieves the namespace of the `DOMELEMENT` (See Also: [DOMElement Subprograms](#)):

```
DBMS_XMLDOM.GETNAMESPACE (
    elem      IN      DOMELEMENT)
RETURN VARCHAR2;
```

Parameters

Table 210-62 GETNAMESPACE Procedure and Function Parameters

| Parameter | Description |
|-----------|------------------------|
| n | DOMNODE |
| data | Returned namespace URI |
| a | DOMATTR |
| elem | DOMELEMENT |

210.7.42 GETNEXTSIBLING Function

This function retrieves the node immediately following this node. If there is no such node, this returns `NULL`.

See Also:

[DOMNode Subprograms](#)

Syntax

```
DBMS_XMLDOM.GETNEXTSIBLING (
    n          IN      DOMNODE)
RETURN DOMNode;
```

Parameters

Table 210-63 GETNEXTSIBLING Function Parameters

| Parameter | Description |
|-----------|-------------|
| n | DOMNODE |

210.7.43 GETNODETYPE Function

This function retrieves a code representing the type of the underlying object.

See Also:

[DOMNode Subprograms](#)

Syntax

```
DBMS_XMLDOM.GETNODETYPE (  
    n          IN      DOMNODE)  
RETURN NUMBER;
```

Parameters

Table 210-64 GETNODETYPE Function Parameters

| Parameter | Description |
|-----------|-------------|
| n | DOMNODE |

210.7.44 GETNODENAME Function

This function gets the name of the node depending on its type.

See Also:

[DOMNode Subprograms](#)

Syntax

```
DBMS_XMLDOM.GETNODENAME (  
    n          IN      DOMNODE)  
RETURN VARCHAR2;
```

Parameters

Table 210-65 GETNODENAME Function Parameters

| Parameter | Description |
|-----------|-------------|
| n | DOMNODE |

210.7.45 GETNODEVALUE Function

This function gets the value of this node, depending on its type.

See Also:

[DOMNode Subprograms](#)

Syntax

```
DBMS_XMLDOM.GETNODEVALUE (
    n          IN      DOMNODE)
RETURN VARCHAR2;*
```

Parameters

Table 210-66 GETNODEVALUE Function Parameters

| Parameter | Description |
|-----------|-------------|
| n | DOMNODE |

210.7.46 GETNODEVALUEASBINARYSTREAM Function & Procedure

The operation of these subprograms is described with each syntax implementation.

See Also:

[DOMNode Subprograms](#)

Syntax

This function returns an instance of the PL/SQL `XMLBinaryInputStream`. The node datatype must be `RAW` or `BLOB` – if not an exception is raised.

```
DBMS_XMLDOM.GETNODEVALUEASBINARYSTREAM (
    n          IN      DOMNODE)
RETURN SYS.UTL_BINARYINPUTSTREAM;
```

Using this procedure, the application passes an implementation of `SYS.UTL_BINARYOUTPUTSTREAM` into which XDB writes the contents of the node. The datatype of the node must be `RAW` or `CLOB` – if not an exception is raised.

```
DBMS_XMLDOM.GETNODEVALUEASBINARYSTREAM (
    n          in      DOMNODE,
    value      in      SYS.UTL_BINARYOUTPUTSTREAM);
```

Parameters

Table 210-67 GETNODEVALUEASBINARYSTREAM Function & Procedure Parameters

| Parameter | Description |
|-----------|--------------------|
| n | DOMNODE |
| value | BINARYOUTPUTSTREAM |

210.7.47 GETNODEVALUEASCHARACTERSTREAM Function & Procedure

The operation of these subprograms is described with each syntax implementation.

See Also:

[DOMNode Subprograms](#)

Syntax

This function returns an instance of the PL/SQL `XMLCharacterInputStream`. If the node data is character it is converted to the current session character set. If the node data is not character data, it is first converted to character data.

```
DBMS_XMLDOM.GETNODEVALUEASCHARACTERSTREAM (
    n          IN      DOMNODE)
RETURN SYS.UTL_CHARACTERINPUTSTREAM;
```

Using this procedure, the node data is converted, as necessary, to the session character set and then "pushed" into the `SYS.UTL_CHARACTEROUTPUTSTREAM`.

```
DBMS_XMLDOM.GETNODEVALUEASCHARACTERSTREAM (
    n          IN      DOMNODE,
    value      IN      SYS.UTL_CHARACTEROUTPUTSTREAM);
```

Parameters

Table 210-68 GETNODEVALUEASCHARACTERSTREAM Function & Procedure Parameters

| Parameter | Description |
|-----------|-----------------------|
| n | DOMNODE |
| value | CHARACTEROUTPUTSTREAM |

210.7.48 GETNOTATIONNAME Function

This function returns the notation name of the `DOENTITY`.

See Also:

[DOMEntity Subprograms](#)

Syntax

```
DBMS_XMLDOM.GETNOTATIONNAME (  
    ent      IN      DOENTITY)  
RETURN VARCHAR2;
```

Parameters

Table 210-69 GETNOTATIONNAME Function Parameters

| Parameter | Description |
|-----------|-------------|
| ent | DOENTITY |

210.7.49 GETNOTATIONS Function

This function retrieves a `DOMNAMEDNODEMAP` containing the notations declared in the DTD.

See Also:

[DOMDocumentType Subprograms](#)

Syntax

```
DBMS_XMLDOM.GETNOTATIONS (  
    dt      IN      DOMDOCUMENTTYPE)  
RETURN DOMNAMEDNODEMAP;
```

Parameters

Table 210-70 GETNOTATIONS Function Parameters

| Parameter | Description |
|-----------|-----------------|
| dt | DOMDOCUMENTTYPE |

210.7.50 GETTARGET Function

This function returns the target of the `DOMPROCESSINGINSTRUCTION`.

See Also:

[DOMProcessingInstruction Subprograms](#)

Syntax

```
DBMS_XMLDOM.GETTARGET (  
    pi          IN      DOMPROCESSINGINSTRUCTION)  
RETURN VARCHAR2;
```

Parameters

Table 210-71 GETTARGET Function Parameters

| Parameter | Description |
|-----------|--------------------------|
| pi | DOMPROCESSINGINSTRUCTION |

210.7.51 GETOWNERDOCUMENT Function

This function retrieves the Document object associated with this node. This is also the Document object used to create new nodes. When this node is a Document or a Document Type that is not used with any Document yet, this is `NULL`.

See Also:

[DOMNode Subprograms](#)

Syntax

```
DBMS_XMLDOM.GETOWNERDOCUMENT (  
    n          IN      DOMNODE)  
RETURN DOMDOCUMENT;
```

Parameters

Table 210-72 GETOWNERDOCUMENT Function Parameters

| Parameter | Description |
|-----------|-------------|
| n | DOMNODE |

210.7.52 GETOWNERELEMENT Function

This function retrieves the Element node to which the specified Attribute is attached.

See Also:

[DOMAttr Subprograms](#)

Syntax

```
DBMS_XMLDOM.GETOWNERELEMENT (  
    a          IN      DOMATTR)  
RETURN DOMELEMENT;
```

Parameters

Table 210-73 GETOWNERELEMENT Function Parameters

| Parameter | Description |
|-----------|-------------|
| a | Attribute |

210.7.53 GETPARENTNODE Function

This function retrieves the parent of this node. All nodes, except `Attr`, `Document`, `DocumentFragment`, `Entity`, and `Notation` may have a parent. However, if a node has just been created and not yet added to the tree, or if it has been removed from the tree, this is `NULL`.

See Also:

[DOMNode Subprograms](#)

Syntax

```
DBMS_XMLDOM.GETPARENTNODE (  
    n          IN      DOMNODE)  
RETURN DOMNODE;
```

Parameters

Table 210-74 GETPARENTNODE Function Parameters

| Parameter | Description |
|-----------|-------------|
| n | DOMNODE |

210.7.54 GETPREFIX Function

This function retrieves the namespace prefix of the node.

See Also:

[DOMNode Subprograms](#)

Syntax

```
DBMS_XMLDOM.GETPREFIX (
    n          IN      DOMNODE)
RETURN VARCHAR2;
```

Parameters

Table 210-75 GETPREFIX Function Parameters

| Parameter | Description |
|-----------|-------------|
| n | DOMNODE |

210.7.55 GETPREVIOUSIBLING Function

This function retrieves the node immediately preceding this node. If there is no such node, this returns `NULL`.

See Also:

[DOMNode Subprograms](#)

Syntax

```
DBMS_XMLDOM.GETPREVIOUSIBLING (
    n          IN      DOMNODE)
RETURN DOMNODE;
```

Parameters

Table 210-76 GETPREVIOUSIBLING Function Parameters

| Parameter | Description |
|-----------|-------------|
| n | DOMNODE |

210.7.56 GETPUBLICID Functions

This function is overloaded. The specific forms of functionality are described along with the syntax declarations.

Syntax

Returns the public identifier of the specified DTD (See Also: [DOMDocumentType Subprograms](#)):

```
DBMS_XMLDOM.GETPUBLICID (
    dt          IN      DOMDOCUMENTTYPE)
RETURN VARCHAR2;
```

Returns the public identifier of the `DOMENTITY` (See Also: [DOMEntity Subprograms](#)):

```
DBMS_XMLDOM.GETPUBLICID (
    ent        IN      DOMENTITY)
RETURN VARCHAR2;
```

Returns the public identifier of the `DOMNOTATION` (See Also: [DOMNotation Subprograms](#)):

```
DBMS_XMLDOM.GETPUBLICID (
    n          IN      DOMNOTATION)
RETURN VARCHAR2;
```

Parameters

Table 210-77 GETPUBLICID Function Parameters

| Parameter | Description |
|-----------|-------------|
| dt | The DTD |
| ent | DOMENTITY |
| n | DOMNOTATION |

210.7.57 GETQUALIFIEDNAME Functions

This function is overloaded. The specific forms of functionality are described along with the syntax declarations.

Syntax

Returns the qualified name of the `DOMATTR` (See Also: [DOMAttr Subprograms](#)):

```
DBMS_XMLDOM.GETQUALIFIEDNAME (
    a          IN      DOMATTR)
RETURN VARCHAR2;
```

Returns the qualified name of the `DOMELEMENT` (See Also: [DOMElement Subprograms](#)):

```
DBMS_XMLDOM.GETQUALIFIEDNAME (
    elem      IN      DOMELEMENT)
RETURN VARCHAR2;
```

Parameters

Table 210-78 GETQUALIFIEDNAME Functions Parameters

| Parameter | Description |
|-----------|-------------|
| a | DOMATTR |
| elem | DOMELEMENT |

210.7.58 GETSCHEMANODE Function

This function retrieves the schema URI associated with the node.

 **See Also:**
[DOMNode Subprograms](#)

Syntax

```
DBMS_XMLDOM.GETSCHEMANODE (
  n      IN  DOMNODE)
RETURN DOMNODE;
```

Parameters

Table 210-79 GETSCHEMANODE Function Parameters

| Parameter | Description |
|-----------|-------------|
| n | DOMNODE |

210.7.59 GETSPECIFIED Function

If this attribute was explicitly specified, a value in the original document, this is true; otherwise, it is false.

 **See Also:**
[DOMAttr Subprograms](#)

Syntax

```
DBMS_XMLDOM.GETSPECIFIED (
  a      IN  DOMATTR)
RETURN BOOLEAN;
```

Parameters

Table 210-80 GETSPECIFIED Function Parameters

| Parameter | Description |
|-----------|-------------|
| a | DOMATTR |

210.7.60 GETSTANDALONE Function

This function returns the standalone property associated with the `DOMDOCUMENT`.

See Also:

[DOMDocument Subprograms](#)

Syntax

```
DBMS_XMLDOM.GETSTANDALONE (
    doc      IN      DOMDOCUMENT)
RETURN VARCHAR2;
```

Parameters

Table 210-81 GETSTANDALONE Function Parameters

| Parameter | Description |
|-----------|--------------|
| doc | DOMDOCUMENT. |

210.7.61 GETSYSTEMID Functions

This function is overloaded. The specific forms of functionality are described along with the syntax declarations.

Syntax

Returns the system id of the specified DTD (See Also: [DOMDocumentType Subprograms](#)):

```
DBMS_XMLDOM.GETSYSTEMID (
    dt      IN      DOMDOCUMENTTYPE)
RETURN VARCHAR2;
```

Returns the system identifier of the `DOMENTITY` (See Also: [DOMEntity Subprograms](#)):

```
DBMS_XMLDOM.GETSYSTEMID (
    ent     IN      DOMENTITY)
RETURN VARCHAR2;
```

Returns the system identifier of the `DOMNOTATION` (See Also: [DOMNotation Subprograms](#)):

```
DBMS_XMLDOM.GETSYSTEMID (
    n          IN      DOMNOTATION)
RETURN VARCHAR2;
```

Parameters

Table 210-82 GETSYSTEMID Function Parameters

| Parameter | Description |
|-----------|--------------|
| dt | The DTD. |
| ent | DOMEntity. |
| n | DOMNotation. |

210.7.62 GETTAGNAME Function

This function returns the name of the `DOMELEMENT`.

 **See Also:**
[DOMElement Subprograms](#)

Syntax

```
DBMS_XMLDOM.GETTAGNAME (
    elem      IN      DOMELEMENT)
RETURN VARCHAR2;
```

Parameters

Table 210-83 GETTAGNAME Function Parameters

| Parameter | Description |
|-----------|-----------------------------|
| elem | The <code>DOMELEMENT</code> |

210.7.63 GETVALUE Function

This function retrieves the value of the attribute.

 **See Also:**
[DOMAttr Subprograms](#)

Syntax

```
DBMS_XMLDOM.GETVALUE (
    a        IN      DOMATTR)
RETURN VARCHAR2;
```

Parameters

Table 210-84 GETVALUE Function Parameters

| Parameter | Description |
|-----------|-------------|
| a | DOMATTR |

210.7.64 GETVERSION Function

This function returns the version of the `DOMDOCUMENT`.

See Also:

[DOMDocument Subprograms](#)

Syntax

```
DBMS_XMLDOM.GETVERSION(  
    doc      IN      DOMDOCUMENT)  
RETURN VARCHAR2;
```

Parameters

Table 210-85 GETVERSION Function Parameters

| Parameter | Description |
|-----------|-------------|
| doc | DOMDOCUMENT |

210.7.65 GETXMLTYPE Function

This function returns the `XMLType` associated with the `DOMDOCUMENT`.

See Also:

[DOMDocument Subprograms](#)

Syntax

```
DBMS_XMLDOM.GETXMLTYPE(  
    doc      IN      DOMDOCUMENT)  
RETURN SYS.XMLTYPE;
```

Parameters

Table 210-86 GETXMLTYPE Function Parameters

| Parameter | Description |
|-----------|-------------|
| doc | DOMDOCUMENT |

210.7.66 HASATTRIBUTE Functions

Verifies whether an attribute has been defined for `DOMELEMENT`, or has a default value.

See Also:

[DOMElement Subprograms](#)

Syntax

Verifies whether an attribute with the specified name has been defined for `DOMElement`:

```
DBMS_XMLDOM.HASATTRIBUTE (
    elem      IN  DOMELEMENT,
    name      IN  VARCHAR2)
RETURN VARCHAR2;
```

Verifies whether an attribute with specified name and namespace URI has been defined for `DOMELEMENT`; namespace enabled:

```
DBMS_XMLDOM.HASATTRIBUTE (
    elem      IN  DOMELEMENT,
    name      IN  VARCHAR2,
    ns        IN  VARCHAR2)
RETURN VARCHAR2;
```

Parameters

Table 210-87 HASATTRIBUTE Function Parameters

| Parameter | Description |
|-----------|---|
| elem | The <code>DOMELEMENT</code> |
| name | Attribute name; * matches any attribute |
| ns | Namespace |

210.7.67 HASATTRIBUTES Function

This function returns whether this node has any attributes.

See Also:

[DOMNode Subprograms](#)

Syntax

```
DBMS_XMLDOM.HASATTRIBUTES (  
    n          IN      DOMNODE)  
RETURN BOOLEAN;
```

Parameters

Table 210-88 HASATTRIBUTES Function Parameters

| Parameter | Description |
|-----------|-------------|
| n | DOMNODE |

210.7.68 HASCHILDNODES Function

This function determines whether this node has any children.

See Also:

[DOMNode Subprograms](#)

Syntax

```
DBMS_XMLDOM.HASCHILDNODES (  
    n          IN      DOMNODE)  
RETURN BOOLEAN;
```

Parameters

Table 210-89 HASCHILDNODES Function Parameters

| Parameter | Description |
|-----------|-------------|
| n | DOMNODE |

210.7.69 HASFEATURE Function

This function tests if the `DOMIMPLEMENTATION` implements a specific feature.

See Also:

[DOMImplementation Subprograms](#)

Syntax

```
DBMS_XMLDOM.HASFEATURE (  
  di          IN      DOMIMPLEMENTATION,  
  feature     IN      VARCHAR2,  
  version     IN      VARCHAR2)  
RETURN BOOLEAN;
```

Parameters

Table 210-90 HASFEATURE Function Parameters

| Parameter | Description |
|-----------|------------------------------------|
| di | DOMIMPLEMENTATION |
| feature | The feature to check for |
| version | The version of the DOM to check in |

210.7.70 IMPORTNODE Function

This function imports a node from an external document and returns this new node.

See Also:

[DOMNode Subprograms](#)

Syntax

```
DBMS_XMLDOM.IMPORTNODE (  
  doc          IN      DOMDOCUMENT,  
  importedNode IN      DOMNODE,  
  deep         IN      BOOLEAN)  
RETURN DOMNODE;
```

Parameters

Table 210-91 IMPORTNODE Function Parameters

| Parameter | Description |
|--------------|---|
| doc | Document from which the node is imported |
| importedNode | Node to import |
| deep | Setting for recursive import. <ul style="list-style-type: none"> If this value is <code>TRUE</code>, the entire subtree of the node will be imported with the node. If this value is <code>FALSE</code>, only the node itself will be imported. |

Usage Notes

Note that the [ADOPTNODE Function](#) removes the node from the source document while the [IMPORTNODE Function](#) clones the node in the source document.

210.7.71 INSERTBEFORE Function

This function inserts the node `newchild` before the existing child node `refchild`. If `refchild` is `NULL`, insert `newchild` at the end of the list of children.

If `newchild` is a `DOCUMENTFRAGMENT` object, all of its children are inserted, in the same order, before `refchild`. If the `newchild` is already in the tree, it is first removed.

See Also:

[DOMNode Subprograms](#)

Syntax

```
DBMS_XMLDOM.INSERTBEFORE(
  n          IN      DOMNODE,
  newchild  IN      DOMNODE,
  refchild  IN      DOMNODE)
RETURN DOMNode;
```

Parameters

Table 210-92 INSERTBEFORE Function Parameters

| Parameter | Description |
|-----------|---|
| n | DOMNODE |
| newChild | The child to be inserted in the DOMNODE |
| refChild | The reference node before which the <code>newchild</code> is to be inserted |

210.7.72 INSERTDATA Procedure

This procedure inserts a string at the specified character offset.

See Also:

[DOMCharacterData Subprograms](#)

Syntax

```
DBMS_XMLDOM.INSERTDATA (
  cd      IN      DOMCHARACTERDATA,
  offset  IN      NUMBER,
  arg     IN      VARCHAR2);
```

Parameters

Table 210-93 INSERTDATA Procedure Parameters

| Parameter | Description |
|-----------|--|
| cd | DOMCHARACTERDATA |
| offset | The offset at which to insert the data |
| arg | The value to be inserted |

210.7.73 ISNULL Functions

This function is overloaded. The specific forms of functionality are described along with the syntax declarations.

Syntax

Checks if the specified `DOMNODE` is `NULL`. Returns `TRUE` if it is `NULL`, `FALSE` otherwise (See Also: [DOMNode Subprograms](#)):

```
DBMS_XMLDOM.ISNULL (
  n      IN      DOMNODE)
RETURN BOOLEAN;
```

Checks that the specified `DOMATTR` is `NULL`; returns `TRUE` if it is `NULL`, `FALSE` otherwise (See Also: [DOMAttr Subprograms](#)):

```
DBMS_XMLDOM.ISNULL (
  a      IN      DOMATTR)
RETURN BOOLEAN;
```

Checks that the specified `DOMCDATASECTION` is `NULL`; returns `TRUE` if it is `NULL`, `FALSE` otherwise (See Also: [DOMCDATASection Subprograms](#)):

```
DBMS_XMLDOM.ISNULL (
  cds   IN      DOMCDATASECTION)
RETURN BOOLEAN;
```

Checks that the specified DOMCHARACTERDATA is NULL; returns TRUE if it is NULL, FALSE otherwise (See Also: [DOMCharacterData Subprograms](#)):

```
DBMS_XMLDOM.ISNULL(  
    cd      IN      DOMCHARACTERDATA)  
RETURN BOOLEAN;
```

Checks that the specified DOMCOMMENT is NULL; returns TRUE if it is NULL, FALSE otherwise (See Also: [DOMComment Subprograms](#)):

```
DBMS_XMLDOM.ISNULL(  
    com     IN      DOMCOMMENT)  
RETURN BOOLEAN;
```

Checks that the specified DOMDOCUMENT is NULL; returns TRUE if it is NULL, FALSE otherwise (See Also: [DOMDocument Subprograms](#)):

```
DBMS_XMLDOM.ISNULL(  
    doc     IN      DOMDOCUMENT)  
RETURN BOOLEAN;
```

Checks that the specified DOMDOCUMENTFRAGMENT is NULL; returns TRUE if it is NULL, FALSE otherwise (See Also: [DOMDocumentFragment Subprograms](#)):

```
DBMS_XMLDOM.ISNULL(  
    df      IN      DOMDOCUMENTFRAGMENT)  
RETURN BOOLEAN;
```

Checks that the specified DOMDOCUMENTTYPE is NULL; returns TRUE if it is NULL, FALSE otherwise (See Also: [DOMDocumentType Subprograms](#)):

```
DBMS_XMLDOM.ISNULL(  
    dt      IN      DOMDOCUMENTTYPE)  
RETURN BOOLEAN;
```

Checks that the specified DOMELEMENT is NULL; returns TRUE if it is NULL, FALSE otherwise (See Also: [DOMElement Subprograms](#)):

```
DBMS_XMLDOM.ISNULL(  
    elem   IN      DOMELEMENT)  
RETURN BOOLEAN;
```

Checks that the specified DOMENTITY is NULL; returns TRUE if it is NULL, FALSE otherwise (See Also: [DOMEntity Subprograms](#)):

```
DBMS_XMLDOM.ISNULL(  
    ent    IN      DOMENTITY)  
RETURN BOOLEAN;
```

Checks that the specified DOMENTITYREFERENCE is NULL; returns TRUE if it is NULL, FALSE otherwise (See Also: [DOMEntityReference Subprograms](#)):

```
DBMS_XMLDOM.ISNULL(  
    EREF   IN      DOMENTITYREFERENCE)  
RETURN BOOLEAN;
```

Checks that the specified DOMIMPLEMENTATION is NULL; returns TRUE if it is NULL (See Also: [DOMImplementation Subprograms](#)):

```
DBMS_XMLDOM.ISNULL (
    di          IN      DOMIMPLEMENTATION)
RETURN BOOLEAN;
```

Checks that the specified DOMNAMEDNODEMAP is NULL; returns TRUE if it is NULL, FALSE otherwise (See Also: [DOMNamedNodeMap Subprograms](#)):

```
DBMS_XMLDOM.ISNULL (
    nnm        IN      DOMNAMEDNODEMAP)
RETURN BOOLEAN;
```

Checks that the specified DOMNODELIST is NULL; returns TRUE if it is NULL, FALSE otherwise (See Also: [DOMNodeList Subprograms](#)):

```
DBMS_XMLDOM.ISNULL (
    nl         IN      DOMNODELIST)
RETURN BOOLEAN;
```

Checks that the specified DOMNOTATION is NULL; returns TRUE if it is NULL, FALSE otherwise (See Also: [DOMNotation Subprograms](#)):

```
DBMS_XMLDOM.ISNULL (
    n          IN      DOMNOTATION)
RETURN BOOLEAN;
```

Checks that the specified DOMPROCESSINGINSTRUCTION is NULL; returns TRUE if it is NULL, FALSE otherwise (See Also: [DOMProcessingInstruction Subprograms](#)):

```
DBMS_XMLDOM.ISNULL (
    pi         IN      DOMPROCESSINGINSTRUCTION)
RETURN BOOLEAN;
```

Checks that the specified DOMTEXT is NULL; returns TRUE if it is NULL, FALSE otherwise (See Also: [DOMText Subprograms](#)):

```
DBMS_XMLDOM.ISNULL (
    t          IN      DOMTEXT)
RETURN BOOLEAN;
```

Parameters

Table 210-94 ISNULL Function Parameters

| Parameter | Description |
|-----------|------------------------------|
| n | DOMNODE to check |
| a | DOMATTR to check |
| cds | DOMCDATASECTION to check |

Table 210-94 (Cont.) ISNULL Function Parameters

| Parameter | Description |
|-----------|-----------------------------------|
| eref | DOMENTITYREFERENCE to check |
| di | DOMIMPLEMENTATION to check |
| nnm | DOMNAMENODEMAP to check |
| nl | DOMNODELIST to check |
| n | DOMNOTATION to check |
| pi | DOMPROCESSINGINSTRUCTION to check |
| t | DOMTEXT to check |

210.7.74 ITEM Functions

This function is overloaded. The specific forms of functionality are described along with the syntax declarations.

Syntax

Returns the item in the map which corresponds to the `INDEX` parameter. If `INDEX` is greater than or equal to the number of nodes in this map, this returns `NULL` (See Also: [DOMNamedNodeMap Subprograms](#)):

```
DBMS_XMLDOM.ITEM(
    nnm      IN      DOMNAMEDNODEMAP,
    index    IN      NUMBER)
RETURN DOMNODE;
```

Returns the item in the collection which corresponds to the `INDEX` parameter. If `index` is greater than or equal to the number of nodes in the list, this returns `NULL` (See Also: [DOMNodeList Subprograms](#)):

```
DBMS_XMLDOM.ITEM(
    nl       IN      DOMNODELIST,
    index    IN      NUMBER)
RETURN DOMNODE;
```

Parameters

Table 210-95 ITEM Function Parameters

| Parameter | Description |
|-----------|--|
| nnm | DOMNAMEDNODEMAP |
| index | The index in the node map at which the item is to be retrieved |
| nl | DOMNODELIST |
| index | The index in the <code>NodeList</code> used to retrieve the item |

210.7.75 MAKEATTR Function

This function casts a specified DOMNODE to a DOMATTR, and returns the DOMATTR.

See Also:

[DOMNode Subprograms](#)

Syntax

```
DBMS_XMLDOM.MAKEATTR (
    n          IN      DOMNODE)
RETURN DOMATTR;
```

Parameters

Table 210-96 MAKEATTR Function Parameters

| Parameter | Description |
|-----------|-----------------|
| n | DOMNODE to cast |

210.7.76 MAKECDATASECTION Function

This function casts a specified DOMNODE to a DOMCDATASECTION.

See Also:

[DOMNode Subprograms](#)

Syntax

```
DBMS_XMLDOM.MAKECDATASECTION (
    n          IN      DOMNODE)
RETURN DOMCDATASECTION;
```

Parameters

Table 210-97 MAKECDATASECTION Function Parameters

| Parameter | Description |
|-----------|-----------------|
| n | DOMNODE to cast |

210.7.77 MAKECHARACTERDATA Function

This function casts a specified DOMNODE to a DOMCHARACTERDATA, and returns the DOMCHARACTERDATA.

See Also:

[DOMNode Subprograms](#)

Syntax

```
DBMS_XMLDOM.MAKECHARACTERDATA (  
    n          IN      DOMNode)  
RETURN DOMCharacterData;
```

Parameters

Table 210-98 MAKECHARACTERDATA Function Parameters

| Parameter | Description |
|-----------|-----------------|
| n | DOMNODE to cast |

210.7.78 MAKECOMMENT Function

This function casts a specified DOMNODE to a DOMCOMMENT, and returns the DOMCOMMENT.

See Also:

[DOMNode Subprograms](#)

Syntax

```
DBMS_XMLDOM.MAKECOMMENT (  
    n          IN      DOMNODE)  
RETURN DOMCOMMENT;
```

Parameters

Table 210-99 MAKECOMMENT Function Parameters

| Parameter | Description |
|-----------|-----------------|
| n | DOMNODE to cast |

210.7.79 MAKEDOCUMENT Function

This function casts a specified `DOMNODE` to a `DOMDOCUMENT`, and returns the `DOMDOCUMENT`.

See Also:

[DOMNode Subprograms](#)

Syntax

```
DBMS_XMLDOM.MAKEDOCUMENT (
  n          IN      DOMNODE)
RETURN DOMDocument;
```

Parameters

Table 210-100 MAKEDOCUMENT Function Parameters

| Parameter | Description |
|-----------|-----------------|
| n | DOMNODE to cast |

210.7.80 MAKEDOCUMENTFRAGMENT Function

This function casts a specified `DOMNODE` to a `DOMDOCUMENTFRAGMENT`, and returns the `DOMDOCUMENTFRAGMENT`.

See Also:

[DOMNode Subprograms](#)

Syntax

```
DBMS_XMLDOM.MAKEDOCUMENTFRAGMENT (
  n          IN      DOMNODE)
RETURN DOMDOCUMENTFRAGMENT;
```

Parameters

Table 210-101 MAKEDOCUMENTFRAGMENT Function Parameters

| Parameter | Description |
|-----------|-----------------|
| n | DOMNODE to cast |

210.7.81 MAKEDOCUMENTTYPE Function

This function casts a specified `DOMNODE` to a `DOMDOCUMENTTYPE` and returns the `DOMDOCUMENTTYPE`.

See Also:

[DOMNode Subprograms](#)

Syntax

```
DBMS_XMLDOM.MAKEDOCUMENTTYPE (  
    n          IN      DOMNODE)  
RETURN DOMDOCUMENTTYPE;
```

Parameters

Table 210-102 MAKEDOCUMENTTYPE Function Parameters

| Parameter | Description |
|-----------|------------------|
| n | DOMNODE to cast. |

210.7.82 MAKEELEMENT Function

This function casts a specified `DOMNODE` to a `DOMELEMENT`, and returns the `DOMELEMENT`.

See Also:

[DOMNode Subprograms](#)

Syntax

```
DBMS_XMLDOM.MAKEELEMENT (  
    n          IN      DOMNODE)  
RETURN DOMELEMENT;
```

Parameters

Table 210-103 MAKEELEMENT Function Parameters

| Parameter | Description |
|-----------|-----------------|
| n | DOMNODE to cast |

210.7.83 MAKEENTITY Function

This function casts a specified `DOMNODE` to a `DOMENTITY`, and returns the `DOMENTITY`.

See Also:

[DOMNode Subprograms](#)

Syntax

```
DBMS_XMLDOM.MAKEENTITY (  
    n          IN      DOMNODE)  
RETURN DOENTITY;
```

Parameters

Table 210-104 MAKEENTITY Function Parameters

| Parameter | Description |
|-----------|-----------------|
| n | DOMNODE to cast |

210.7.84 MAKEENTITYREFERENCE Function

This function casts a specified `DOMNODE` to a `DOENTITYREFERENCE`, and returns the `DOENTITYREFERENCE`.

See Also:

[DOMNode Subprograms](#)

Syntax

```
DBMS_XMLDOM.MAKEENTITYREFERENCE (  
    n          IN      DOMNODE)  
RETURN DOENTITYREFERENCE;
```

Parameters

Table 210-105 MAKEENTITYREFERENCE Function Parameters

| Parameter | Description |
|-----------|-----------------|
| n | DOMNODE to cast |

210.7.85 MAKENODE Functions

This function is overloaded. The specific forms of functionality are described along with the syntax declarations.

Syntax

Casts specified DOMATTR to a DOMNODE, and returns the DOMNODE (See Also: [DOMAttr Subprograms](#)):

```
DBMS_XMLDOM.MAKENODE (  
    a          IN      DOMATTR)  
RETURN DOMNODE;
```

Casts the DOMCDATASECTION to a DOMNODE, and returns that DOMNODE (See Also: [DOMCDATASection Subprograms](#)):

```
DBMS_XMLDOM.MAKENODE (  
    cds       IN      DOMCDATASECTION)  
RETURN DOMNODE;
```

Casts the specified DOMCHARACTERDATA as a DOMNODE, and returns that DOMNODE (See Also: [DOMCharacterData Subprograms](#)):

```
DBMS_XMLDOM.MAKENODE (  
    cd        IN      DOMCHARACTERDATA)  
RETURN DOMNODE;
```

Casts the specified DOMCOMMENT to a DOMNODE, and returns that DOMNODE (See Also: [DOMComment Subprograms](#)):

```
DBMS_XMLDOM.MAKENODE (  
    com       IN      DOMCOMMENT)  
RETURN DOMNODE;
```

Casts the DOMDOCUMENT to a DOMNODE, and returns that DOMNODE (See Also: [DOMDocument Subprograms](#)):

```
DBMS_XMLDOM.MAKENODE (  
    doc       IN      DOMDOCUMENT)  
RETURN DOMNODE;
```

Casts the specified DOMDOCUMENTFRAGMENT to a DOMNODE, and returns that DOMNODE (See Also: [DOMDocumentFragment Subprograms](#)):

```
DBMS_XMLDOM.MAKENODE (  
    df        IN      DOMDOCUMENTFRAGMENT)  
RETURN DOMNode;
```

Casts the specified DOMDOCUMENTTYPE to a DOMNODE, and returns that DOMNODE (See Also: [DOMDocumentType Subprograms](#)):

```
DBMS_XMLDOM.MAKENODE (  
    dt        IN      DOMDOCUMENTTYPE)  
RETURN DOMNODE;
```

Casts the specified DOMELEMENT to a DOMNODE, and returns that DOMNODE (See Also: [DOMElement Subprograms](#)):

```
DBMS_XMLDOM.MAKENODE (
    elem      IN      DOMELEMENT)
RETURN DOMNODE;
```

Casts specified `DOMENTITY` to a `DOMNODE`, and returns that `DOMNODE` (See Also: [DOMEntity Subprograms](#)):

```
DBMS_XMLDOM.MAKENODE (
    ent      IN      DOMENTITY)
RETURN DOMNODE;
```

Casts the `DOMENTITYREFERENCE` to a `DOMNODE`, and returns that `DOMNODE` (See Also: [DOMEntityReference Subprograms](#)):

```
DBMS_XMLDOM.MAKENODE (
    eref     IN      DOMENTITYREFERENCE)
RETURN DOMNODE;
```

Casts the `DOMNOTATION` to a `DOMNODE`, and returns that `DOMNODE` (See Also: [DOMNotation Subprograms](#)):

```
DBMS_XMLDOM.MAKENODE (
    n      IN      DOMNOTATION)
RETURN DOMNODE;
```

Casts the `DOMPROCESSINGINSTRUCTION` to a `DOMNODE`, and returns the `DOMNODE` (See Also: [DOMProcessingInstruction Subprograms](#)):

```
DBMS_XMLDOM.MAKENODE (
    pi      IN      DOMPROCESSINGINSTRUCTION)
RETURN DOMNODE;
```

Casts the `DOMTEXT` to a `DOMNODE`, and returns that `DOMNODE` (See Also: [DOMText Subprograms](#)):

```
DBMS_XMLDOM.MAKENODE (
    t      IN      DOMTEXT)
RETURN DOMNODE;
```

Parameters

Table 210-106 MAKENODE Function Parameters

| Parameter | Description |
|-----------|-----------------------------|
| a | DOMATTR to cast |
| cds | DOMCDATASECTION to cast |
| cd | DOMCHARACTERDATA to cast |
| com | DOMCOMMENT to cast |
| doc | DOMDOCUMENT to cast |
| df | DOMDOCUMENTFRAGMENT to cast |
| dt | DOMDOCUMENTTYPE to cast |
| elem | DOMELEMENT to cast |
| ent | DOMENTITY to cast |
| eref | DOMENTITYREFERENCE to cast |

Table 210-106 (Cont.) MAKENODE Function Parameters

| Parameter | Description |
|-----------|----------------------------------|
| n | DOMNOTATION to cast |
| pi | DOMPROCESSINGINSTRUCTION to cast |
| t | DOMTEXT to cast |

210.7.86 MAKENOTATION Function

This function casts a specified DOMNODE to a DOMNOTATION, and returns the DOMNOTATION.

See Also:

[DOMNode Subprograms](#)

Syntax

```
DBMS_XMLDOM.MAKENOTATION (
    n          IN      DOMNODE)
RETURN DOMNOTATION;
```

Parameters

Table 210-107 MAKENOTATION Function Parameters

| Parameter | Description |
|-----------|-----------------|
| n | DOMNODE to cast |

210.7.87 MAKEPROCESSINGINSTRUCTION Function

This function casts a specified DOMNODE to a DOMPROCESSINGINSTRUCTION, and returns the Domprocessinginstruction.

See Also:

[DOMNode Subprograms](#)

Syntax

```
DBMS_XMLDOM.MAKEPROCESSINGINSTRUCTION (
    n          IN      DOMNODE)
RETURN DOMPROCESSINGINSTRUCTION;
```

Parameters

Table 210-108 MAKEPROCESSINGINSTRUCTION Function Parameters

| Parameter | Description |
|-----------|-----------------|
| n | DOMNODE to cast |

210.7.88 MAKETEXT Function

This function casts a specified DOMNODE to a DOMTEXT, and returns the DOMTEXT.

See Also:

[DOMNode Subprograms](#)

Syntax

```
DBMS_XMLDOM.MAKETEXT (
    n          IN      DOMNODE)
RETURN DOMTEXT;
```

Parameters

Table 210-109 MAKETEXT Function Parameters

| Parameter | Description |
|-----------|-----------------|
| n | DOMNODE to cast |

210.7.89 NEWDOMDOCUMENT Functions

This function returns a new DOMDOCUMENT instance.

See Also:

[DOMDocument Subprograms](#)

Syntax

Returns a new DOMDOCUMENT instance:

```
DBMS_XMLDOM.NEWDOMDOCUMENT
RETURN DOMDOCUMENT;
```

Returns a new DOMDOCUMENT instance created from the specified XMLType object:

```
DBMS_XMLDOM.NEWDOMDOCUMENT (
    xmldoc    IN SYS.XMLTYPE)
RETURN DOMDOCUMENT;
```

Returns a new DOMDOCUMENT instance created from the specified CLOB:

```
DBMS_XMLDOM.NEWDOMDOCUMENT (
    cl        IN    CLOB)
RETURN DOMDOCUMENT;
```

Parameters

Table 210-110 NEWDOMDOCUMENT Function Parameters

| Parameter | Description |
|-----------|------------------------------------|
| xmldoc | XMLType source for the DOMDOCUMENT |
| cl | CLOB source for the DOMDOCUMENT |

210.7.90 NORMALIZE Procedure

This procedure normalizes the text children of the DOMELEMENT.

 **See Also:**
[DOMELEMENT Subprograms](#)

Syntax

```
DBMS_XMLDOM.NORMALIZE (
    elem      IN    DOMELEMENT);
```

Parameters

Table 210-111 NORMALIZE Procedure Parameters

| Parameter | Description |
|-----------|----------------|
| elem | The DOMELEMENT |

210.7.91 REMOVEATTRIBUTE Procedures

This procedure removes an attribute from the DOMELEMENT by name.

 **See Also:**
[DOMELEMENT Subprograms](#)

Syntax

Removes the value of a `DOMELEMENT`'s attribute by name:

```
DBMS_XMLDOM.REMOVEATTRIBUTE (
  elem      IN   DOMELEMENT,
  name      IN   VARCHAR2);
```

Removes the value of a `DOMELEMENT`'s attribute by name and namespace URI.

```
DBMS_XMLDOM.REMOVEATTRIBUTE (
  elem      IN   DOMELEMENT,
  name      IN   VARCHAR2,
  ns        IN   VARCHAR2);
```

Parameters

Table 210-112 REMOVEATTRIBUTE Procedure Parameters

| Parameter | Description |
|-------------------|-----------------------------|
| <code>elem</code> | The <code>DOMELEMENT</code> |
| <code>name</code> | Attribute name |
| <code>ns</code> | Namespace |

210.7.92 REMOVEATTRIBUTENODE Function

This function removes the specified attribute node from the `DOMELEMENT`. The method returns the removed node.

See Also:

[DOMElement Subprograms](#)

Syntax

```
DBMS_XMLDOM.REMOVEATTRIBUTENODE (
  elem      IN   DOMELEMENT,
  oldAttr   IN   DOMATTR)
RETURN DOMAttr;
```

Parameters

Table 210-113 REMOVEATTRIBUTENODE Function Parameters

| Parameter | Description |
|----------------------|--------------------------------|
| <code>elem</code> | The <code>DOMELEMENT</code> . |
| <code>oldAttr</code> | The old <code>DOMATTR</code> . |

210.7.93 REMOVECHILD Function

This function removes the child node indicated by `oldchild` from the list of children, and returns it.

See Also:

[DOMNode Subprograms](#)

Syntax

```
DBMS_XMLDOM.REMOVECHILD(
  n          IN      DOMNode,
  oldchild  IN      DOMNode)
RETURN DOMNODE;
```

Parameters

Table 210-114 REMOVECHILD Function Parameters

| Parameter | Description |
|-----------------------|--|
| <code>n</code> | DOMNODE |
| <code>oldChild</code> | The child of the node <code>n</code> to be removed |

210.7.94 REMOVENAMEDITEM Function

This function removes a node, specified by name, from the map and returns this node.

When this map contains the attributes attached to an element, if the removed attribute is known to have a default value, an attribute immediately appears containing the default value as well as the corresponding namespace URI, local name, and prefix when applicable.

See Also:

[DOMNamedNodeMap Subprograms](#)

Syntax

Removes a node specified by name:

```
DBMS_XMLDOM.REMOVENAMEDITEM(
  nnm      IN      DOMNamedNodeMap,
  name     IN      VARCHAR2)
RETURN DOMNode;
```

Removes a node specified by name and namespace URI:

```
DBMS_XMLDOM.REMOVENAMEDITEM(
  nnm      IN      DOMNamedNodeMap,
```

```

name      IN      VARCHAR2,
ns        IN      VARCHAR2)
RETURN DOMNode;

```

Parameters

Table 210-115 REMOVE_NAMED_ITEM Function Parameters

| Parameter | Description |
|-----------|---|
| nnm | DOMNamedNodeMap |
| name | The name of the item to be removed from the map |
| ns | Namespace |

210.7.95 REPLACE_CHILD Function

This function replaces the child node `oldchild` with `newchild` in the list of children, and returns the `oldchild` node.

If `newchild` is a `DocumentFragment` object, `oldchild` is replaced by all of the `DocumentFragment` children, which are inserted in the same order. If the `newchild` is already in the tree, it is first removed.

See Also:

[DOMNode Subprograms](#)

Syntax

```

DBMS_XMLDOM.REPLACE_CHILD(
  n          IN      DOMNode,
  newchild   IN      DOMNode,
  oldchild   IN      DOMNode)
RETURN DOMNode;

```

Parameters

Table 210-116 REPLACE_CHILD Function Parameters

| Parameter | Description |
|-----------|---|
| n | DOMNode |
| newchild | The new child which is to replace the old child |
| oldchild | The child of the node n which is to be replaced |

210.7.96 REPLACEDATA Procedure

This procedure changes a range of characters in the node. Upon success, data and length reflect the change.

See Also:

[DOMCharacterData Subprograms](#)

Syntax

```
DBMS_XMLDOM.REPLACEDATA (  
    cd          IN      DOMCHARACTERDATA,  
    offset     IN      NUMBER,  
    cnt        IN      NUMBER,  
    arg        IN      VARCHAR2);
```

Parameters

Table 210-117 REPLACEDATA Procedure Parameters

| Parameter | Description |
|-----------|-------------------------------------|
| cd | DOMCHARACTERDATA |
| offset | The offset at which to replace |
| cnt | The number of characters to replace |
| arg | The value to replace with |

210.7.97 RESOLVENAMESPACEPREFIX Function

This function resolves the specified namespace prefix, and returns the resolved namespace.

See Also:

[DOMElement Subprograms](#)

Syntax

```
DBMS_XMLDOM.RESOLVENAMESPACEPREFIX (  
    elem      IN      DOMELEMENT,  
    prefix    IN      VARCHAR2)  
RETURN VARCHAR2;
```

Parameters

Table 210-118 RESOLVENAMESPACEPREFIX Function Parameters

| Parameter | Description |
|-----------|------------------|
| elem | The DOMELEMENT |
| prefix | Namespace prefix |

210.7.98 SETATTRIBUTE Procedures

This procedure sets the value of a DOMELEMENT's attribute by name.

See Also:

[DOMELEMENT Subprograms](#)

Syntax

Sets the value of a DOMELEMENT's attribute by name:

```
DBMS_XMLDOM.SETATTRIBUTE (
    elem      IN  DOMELEMENT,
    name      IN  VARCHAR2,
    newvalue  IN  VARCHAR2);
```

Sets the value of a DOMELEMENT's attribute by name and namespace URI:

```
DBMS_XMLDOM.SETATTRIBUTE (
    elem      IN  DOMELEMENT,
    name      IN  VARCHAR2,
    newvalue  IN  VARCHAR2,
    ns        IN  VARCHAR2);
```

Parameters

Table 210-119 SETATTRIBUTE Procedure Parameters

| Parameter | Description |
|-----------|-----------------|
| elem | The DOMELEMENT |
| name | Attribute name |
| newvalue | Attribute value |
| ns | Namespace |

210.7.99 SETATTRIBUTENODE Functions

This function adds a new attribute node to the `DOMELEMENT`.

See Also:

[DOMElement Subprograms](#)

Syntax

Adds a new attribute node to the `DOMELEMENT`:

```
DBMS_XMLDOM.SETATTRIBUTENODE (  
    elem      IN  DOMELEMENT,  
    newAttr   IN  DOMATTR)  
RETURN DOMATTR;
```

Adds a new attribute node to the `DOMElement`; namespace enabled:

```
DBMS_XMLDOM.SETATTRIBUTENODE (  
    elem      IN  DOMELEMENT,  
    newAttr   IN  DOMATTR,  
    ns        IN  VARCHAR2)  
RETURN DOMATTR;
```

Parameters

Table 210-120 SETATTRIBUTENODE Function Parameters

| Parameter | Description |
|----------------------|------------------------------|
| <code>elem</code> | The <code>DOMELEMENT</code> |
| <code>newAttr</code> | The new <code>DOMATTR</code> |
| <code>ns</code> | The namespace |

210.7.100 SETCHARSET Procedure

This function sets the character set of the DOM document.

See Also:

[DOMDocument Subprograms](#)

Syntax

```
DBMS_XMLDOM.SETCHARSET (  
    doc      IN  DOMDocument,  
    charset  IN  VARCHAR2);
```

Parameters

Table 210-121 SETCHARSET Procedure Parameters

| Parameter | Description |
|-----------|---------------|
| doc | DOM document |
| charset | Character set |

Usage Notes

This is used for [WRITETOFILE Procedures](#) if not explicitly specified at that time.

210.7.101 SETDATA Procedures

This overloaded procedure sets character data or DOMPROCESSINGINSTRUCTION content data. The specific functionality is described in the syntax declarations.

Syntax

Sets the character data of the node that implements this interface (See Also: [DOMCharacterData Subprograms](#)):

```
DBMS_XMLDOM.SETDATA (
    cd      IN      DOMCHARACTERDATA,
    data    IN      VARCHAR2);
```

Sets the content data of the DOMPROCESSINGINSTRUCTION (See Also: [DOMProcessingInstruction Subprograms](#)):

```
DBMS_XMLDOM.SETDATA (
    pi      IN      DOMPROCESSINGINSTRUCTION,
    data    IN      VARCHAR2);
```

Parameters

Table 210-122 SETDATA Procedure Parameters

| Parameter | Description |
|-----------|---|
| cd | DOMCHARACTERDATA |
| data | The data to which the node is set |
| pi | DOMPROCESSINGINSTRUCTION |
| data | New processing instruction content data |

210.7.102 SETDOCTYPE Procedure

Given a DOM document, this procedure creates a new DTD with the specified name, system id and public id and sets it in the document.

This DTD can later be retrieved using the [GETDOCTYPE Function](#).

Syntax

```
DBMS_XMLDOM.SETDOCTYPE (
  doc      IN   DOMDocument,
  name     IN   VARCHAR2,
  sysid   IN   VARCHAR2,
  pubid   IN   VARCHAR2);
```

Parameters

Table 210-123 SETDOCTYPE Procedure Parameters

| Parameter | Description |
|-----------|---|
| doc | The document whose DTD has to be set |
| name | The name that the doctype needs to be initialized with |
| sysid | The system ID that the doctype needs to be initialized with |
| pubid | The public ID that the doctype needs to be initialized with |

210.7.103 SETNAMEDITEM Function

This function adds a node using its `nodeName` attribute.

If a node with that name is already present in this map, it is replaced by the new one. The old node is returned on replacement; if no replacement is made, `NULL` is returned.

As the `nodeName` attribute is used to derive the name under which the node must be stored, multiple nodes of certain types, those that have a "special" string value, cannot be stored because the names would clash. This is seen as preferable to allowing nodes to be aliased.

See Also:

[DOMNamedNodeMap Subprograms](#)

Syntax

Adds a node using its `nodeName` attribute:

```
DBMS_XMLDOM.SETNAMEDITEM (
  nnm      IN   DOMNAMEDNODEMAP,
  arg      IN   DOMNODE)
RETURN DOMNode;
```

Adds a node using its `nodeName` attribute and namespace URI:

```
DBMS_XMLDOM.SETNAMEDITEM (
  nnm      IN   DOMNAMEDNODEMAP,
  arg      IN   DOMNODE,
  ns       IN   VARCHAR2)
RETURN DOMNode;
```

Parameters

Table 210-124 SETNAMEDITEM Function Parameters

| Parameter | Description |
|-----------|--|
| nrm | DOMNAMEDNODEMAP |
| arg | The Node to be added using its <code>nodeName</code> attribute |
| ns | Namespace |

210.7.104 SETNODEVALUE Procedure

This procedure sets the value of this node, depending on its type. When it is defined to be `NULL`, setting it has no effect.

**See Also:**[DOMNode Subprograms](#)

Syntax

```
DBMS_XMLDOM.SETNODEVALUE (
    n          IN      DOMNODE,
    nodeValue IN      VARCHAR2);
```

Parameters

Table 210-125 SETNODEVALUE Procedure Parameters

| Parameter | Description |
|-----------|--------------------------------|
| n | DOMNode |
| nodeValue | The value to which node is set |

210.7.105 SETNODEVALUEASBINARYSTREAM Function & Procedure

The operation of these subprograms is described in the syntax section.

**See Also:**[DOMNode Subprograms](#)

Syntax

This function returns an instance of the PL/SQL `XMLBINARYOUTPUTSTREAM` into which the caller can write the node value. The datatype of the node must be `RAW` or `BLOB` – if not, an exception is raised.

```
DBMS_XMLDOM.SETNODEVALUEASBINARYSTREAM (
  n      IN      DOMNODE)
RETURN SYS.UTL_BINARYOUTPUTSTREAM;
```

Using this procedure, the application passes in an implementation of `sys.utl_BinaryInputStream` from which XDB reads data to populate the node. The datatype of the node must be `RAW` or `BLOB` – if not an exception is raised.

```
DBMS_XMLDOM.SETNODEVALUEASBINARYSTREAM (
  n      in      DOMNODE,
  value  in      SYS.UTL_BINARYINPUTSTREAM);
```

Parameters

Table 210-126 SETNODEVALUEASBINARYSTREAM Function & Procedure Parameters

| Parameter | Description |
|-----------|-------------------|
| n | DOMNODE |
| value | BINARYINPUTSTREAM |

210.7.106 SETNODEVALUEASCHARACTERSTREAM Function & Procedure

The operation of these subprograms is described in the syntax section.

See Also:

[DOMNode Subprograms](#)

Syntax

This function returns an instance of the PL/SQL `XMLCHARACTEROUTPUTSTREAM` type into which the caller can write the node value. The datatype of the node can be any valid XDB datatype. If the type is not `character` or `CLOB`, the character data written to the stream is converted to the node datatype. If the datatype of the node is `character` or `CLOB`, then the character data written to the stream is converted from PL/SQL session character set to the character set of the node.

```
DBMS_XMLDOM.SETNODEVALUEASCHARACTERSTREAM (
  n      IN      DOMNODE)
RETURN SYS.UTL_CHARACTEROUTPUTSTREAM;
```

Using this procedure, the application passes in an implementation of `SYS.UTL_CHARACTERINPUTSTREAM` from which XDB reads to populate the node. The datatype of

the node may be any valid type supported by XDB. If a non-character datatype, the character data read from the stream is converted to the datatype of the node. If the datatype of the node is either character or CLOB, then no conversion occurs and the character set of the node becomes the character set of the PL/SQL session.

```
DBMS_XMLDOM.SETNODEVALUEASCHARACTERSTREAM (
  n          IN    DOMNODE,
  value     IN    SYS.UTL_CHARACTERINPUTSTREAM);
```

Parameters

Table 210-127 SETNODEVALUEASCHARACTERSTREAM Function & Procedure Parameters

| Parameter | Description |
|-----------|----------------------|
| n | DOMNODE |
| value | CHARACTERINPUTSTREAM |

210.7.107 SETPREFIX Procedure

This procedure sets the namespace prefix for this node to the specified value.

See Also:

[DOMNode Subprograms](#)

Syntax

```
DBMS_XMLDOM.SETPREFIX (
  n          IN    DOMNODE,
  prefix    IN    VARCHAR2);
```

Parameters

Table 210-128 SETPREFIX Procedure Parameters

| Parameter | Description |
|-----------|--|
| n | DOMNODE |
| prefix | The value for the namespace prefix of the node |

210.7.108 SETSTANDALONE Procedure

This procedure sets the standalone property of the DOMDOCUMENT.

See Also:

[DOMDocument Subprograms](#)

Syntax

```
DBMS_XMLDOM.SETSTANDALONE (
    doc          IN      DOMDOCUMENT,
    newvalue     IN      VARCHAR2);
```

Parameters

Table 210-129 SETSTANDALONE Procedure Parameters

| Parameter | Description |
|-----------|--|
| doc | DOMDOCUMENT |
| newvalue | Value of the standalone property of the document |

210.7.109 SETVALUE Procedure

This procedure sets the value of the attribute.

See Also:

[DOMAttr Subprograms](#)

Syntax

```
DBMS_XMLDOM.SETVALUE (
    a          IN      DOMATTR,
    value     IN      VARCHAR2);
```

Parameters

Table 210-130 SETVALUE Procedure Parameters

| Parameter | Description |
|-----------|---|
| a | DOMATTR |
| value | The value to which to set the attribute |

210.7.110 SETVERSION Procedure

This procedure sets the version of the DOMDOCUMENT.

See Also:

[DOMDocument Subprograms](#)

Syntax

```
DBMS_XMLDOM.SETVERSION (
  doc      IN   DOMDOCUMENT,
  version  IN   VARCHAR2);
```

Parameters**Table 210-131 SETVERSION Procedure Parameters**

| Parameter | Description |
|-----------|-----------------------------|
| doc | DOMDOCUMENT |
| version | The version of the document |

210.7.111 SPLITTEXT Function

This function breaks this `DOMTEXT` node into two `DOMTEXT` nodes at the specified offset.

**See Also:**

[DBMS_XMLDOM DOMText Subprograms](#)

Syntax

```
DBMS_XMLDOM.SPLITTEXT (
  t      IN   DOMTEXT,
  offset IN   NUMBER)
RETURN DOMText;
```

Parameters**Table 210-132 SPLITTEXT Function Parameters**

| Parameter | Description |
|-----------|--------------------------|
| t | DOMTEXT |
| offset | Offset at which to split |

210.7.112 SUBSTRINGDATA Function

This function extracts a range of data from the node.

**See Also:**

[DOMCharacterData Subprograms](#)

Syntax

```
DBMS_XMLDOM.SUBSTRINGDATA (
    cd          IN      DOMCHARACTERDATA,
    offset     IN      NUMBER,
    cnt        IN      NUMBER)
RETURN VARCHAR2;
```

Parameters

Table 210-133 SUBSTRINGDATA Function Parameters

| Parameter | Description |
|-----------|---|
| cd | DOMCHARACTERDATA |
| offset | The starting offset of the data from which to get the data |
| cnt | The number of characters (from the offset) of the data to get |

210.7.113 USEBINARYSTREAM Function

This function returns `TRUE` if the datatype of the node is `RAW` or `BLOB`, so that the node value may be read or written using an `UTL_BINARYINPUTSTREAM` or `UTL_BINARYOUTPUTSTREAM`.

If a value of `FALSE` is returned, the node value may only be accessed through an `UTL_CHARACTERINPUTSTREAM` or `UTL_CHARACTEROUTPUTSTREAM`.

See Also:

[DOMNode Subprograms](#)

Syntax

```
DBMS_XMLDOM.USEBINARYSTREAM (
    n          IN      DOMNODE)
RETURN BOOLEAN;
```

Parameters

Table 210-134 USEBINARYSTREAM Function Parameters

| Parameter | Description |
|-----------|-------------|
| n | DOMNODE |

210.7.114 WRITETOBUFFER Procedures

`WRITETOBUFFER` is an overloaded procedure that writes an XML node, XML document, or a document fragment to a specified buffer.

This procedure is overloaded. The specific forms of functionality are described along with the syntax declarations.

Syntax

Writes XML node to specified buffer using the database character set (See Also: [DOMNode Subprograms](#)):

```
DBMS_XMLDOM.WRITETOBUFFER (
  n          IN          DOMNODE,
  buffer     IN OUT     VARCHAR2);
```

Writes XML document to a specified buffer using database character set (See Also: [DOMDocument Subprograms](#)):

```
DBMS_XMLDOM.WRITETOBUFFER (
  doc        IN          DOMDOCUMENT,
  buffer     IN OUT     VARCHAR2);
```

Writes the contents of the specified document fragment into a buffer using the database character set (See Also: [DOMDocumentFragment Subprograms](#)):

```
DBMS_XMLDOM.WRITETOBUFFER (
  df         IN          DOMDOCUMENTFRAGMENT,
  buffer     IN OUT     VARCHAR2);
```

Parameters**Table 210-135 WRITETOBUFFER Procedure Parameters**

| Parameter | Description |
|-----------|--------------------------|
| n | DOMNODE |
| buffer | Buffer to which to write |
| doc | DOMDOCUMENT |
| df | DOM document fragment |

210.7.115 WRITETOCLOB Procedures

WRITETOCLOB is an overloaded procedure that writes an XML node or document to a specified CLOB.

The specific forms of functionality are described along with the syntax declarations.

Syntax

Writes XML node to specified CLOB using the database character set (See Also: [DOMNode Subprograms](#)):

```
DBMS_XMLDOM.WRITETOCLOB (
  n          IN          DOMNODE,
  cl        IN OUT     CLOB);
```

Writes XML document to a specified CLOB using database character set (See Also: [DOMDocument Subprograms](#)):

```
DBMS_XMLDOM.WRITETOCLOB (
  doc        IN          DOMDOCUMENT,
  cl        IN OUT     CLOB);
```

Parameters

Table 210-136 WRITETOCLOB Procedure Parameters

| Parameter | Description |
|-----------|------------------------|
| n | DOMNODE |
| clob | CLOB to which to write |
| doc | DOMDOCUMENT |

210.7.116 WRITETOFILE Procedures

This overloaded procedure writes an XML node or XML document to a specified node.

The specific forms of functionality are described along with the syntax declarations.

Syntax

Writes XML node to specified file using the database character set (See Also: [DOMNode Subprograms](#)):

```
DBMS_XMLDOM.WRITETOFILE (
  n          IN      DOMNODE,
  fileName  IN      VARCHAR2);
```

Writes XML node to specified file using the specified character set, which is passed in as a separate parameter (See Also: [DOMNode Subprograms](#)):

```
DBMS_XMLDOM.WRITETOFILE (
  n          IN      DOMNODE,
  fileName  IN      VARCHAR2,
  charset   IN      VARCHAR2);
```

Writes an XML document to a specified file using database character set (See Also: [DOMDocument Subprograms](#)):

```
DBMS_XMLDOM.WRITETOFILE (
  doc       IN      DOMDOCUMENT,
  filename  IN      VARCHAR2);
```

Writes an XML document to a specified file using specified character set (See Also: [DOMDocument Subprograms](#)):

```
DBMS_XMLDOM.WRITETOFILE (
  doc       IN      DOMDOCUMENT,
  fileName  IN      VARCHAR2,
  charset   IN      VARCHAR2);
```

Parameters

Table 210-137 WRITETOFILE Procedure Parameters

| Parameter | Description |
|-----------|-------------|
| n | DOMNODE |

Table 210-137 (Cont.) WRITETOFILE Procedure Parameters

| Parameter | Description |
|------------------|---|
| fileName | File to which to write. The filename should be in the format of database_directory_object_name/filename, for example mydir/filename (on windows, use \ instead of /). |
| charset | specified character set |
| doc | DOMDOCUMENT |
| charset | Character set |

DBMS_XMLGEN

The `DBMS_XMLGEN` package converts the results of a SQL query to a canonical XML format.

The package takes an arbitrary SQL query as input, converts it to XML format, and returns the result as a `CLOB`. This package is similar to the `DBMS_XMLQUERY` package, except that it is written in C and compiled into the kernel. This package can only be run on the database.

This chapter contains the following topic:

- [Security Model](#)
- [Summary of DBMS_XMLGEN Subprograms](#)

See Also:

Oracle XML DB Developer's Guide, for more information on XML support and on examples of using `DBMS_XMLGEN`

211.1 DBMS_XMLGEN Security Model

Owned by `XDB`, the `DBMS_XMLGEN` package must be created by `SYS` or `XDB`. The `EXECUTE` privilege is granted to `PUBLIC`. Subprograms in this package are executed using the privileges of the current user.

211.2 Summary of DBMS_XMLGEN Subprograms

This table lists the `DBMS_XMLGEN` subprograms and briefly describes them.

Table 211-1 Summary of DBMS_XMLGEN Package Subprograms

| Subprogram | Description |
|--|---|
| CLOSECONTEXT Procedure | Closes the context and releases all resources |
| CONVERT Functions | Converts the XML into the escaped or unescaped XML equivalent |
| GETNUMROWSPROCESSED Function | Gets the number of SQL rows that were processed in the last call to GETXML Functions |
| GETXML Functions | Gets the XML document |
| GETXMLTYPE Functions | Gets the XML document and returns it as <code>XMLType</code> |
| NEWCONTEXT Functions | Creates a new context handle |
| NEWCONTEXTFROMHIERARCHY Function | Obtains a handle to use in the GETXML Functions and other functions to get a hierarchical XML with recursive elements from the result |
| RESTARTQUERY Procedure | Restarts the query to start fetching from the beginning |

Table 211-1 (Cont.) Summary of DBMS_XMLGEN Package Subprograms

| Subprogram | Description |
|---|---|
| SETCONVERTSPECIALCHARS Procedure | Sets whether special characters such as \$, which are non-XML characters, should be converted or not to their escaped representation |
| SETMAXROWS Procedure | Sets the maximum number of rows to be fetched each time |
| SETNULLHANDLING Procedure | Sets NULL handling options |
| SETROWSETTAG Procedure | Sets the name of the element enclosing the entire result |
| SETROWTAG Procedure | Sets the name of the element enclosing each row of the result |
| SETSKIPROWS Procedure | Sets the number of rows to skip every time before generating the XML. |
| USEITEMTAGSFORCOLL Procedure | Forces the use of the collection column name appended with the tag <code>_ITEM</code> for collection elements |
| USENULLATTRIBUTEINDICATOR Procedure | Specifies whether to use an XML attribute to indicate NULLness, or to do it by omitting the inclusion of the particular entity in the XML document. |

211.2.1 CLOSECONTEXT Procedure

This procedure closes a given context and releases all resources associated with it, including the SQL cursor and bind and define buffers. After this call, the handle cannot be used for a subsequent function call.

Syntax

```
DBMS_XMLGEN.CLOSECONTEXT (
    ctx IN ctxHandle);
```

Parameters

Table 211-2 CLOSECONTEXT Procedure Parameters

| Parameter | Description |
|-----------|------------------------------|
| ctx | The context handle to close. |

211.2.2 CONVERT Functions

This function converts the XML data into the escaped or unescapes XML equivalent, and returns XML CLOB data in encoded or decoded format. There are several version of the function.

Syntax

Uses XMLDATA in string form (VARCHAR2):

```
DBMS_XMLGEN.CONVERT (
    xmlData IN VARCHAR2,
    flag IN NUMBER := ENTITY_ENCODE)
RETURN VARCHAR2;
```

Uses XMLDATA in CLOB form:

```
DBMS_XMLGEN.CONVERT (
  xmlData IN CLOB,
  flag    IN NUMBER := ENTITY_ENCODE)
RETURN CLOB;
```

Parameters

Table 211-3 CONVERT Function Parameters

| Parameter | Description |
|-----------|---|
| xmlData | The XML CLOB data to be encoded or decoded. |
| flag | The flag setting; ENTITY_ENCODE (default) for encode, and ENTITY_DECODE for decode. |

Usage Notes

This function escapes the XML data if the ENTITY_ENCODE is specified. For example, the escaped form of the character < is <. Unescaping is the reverse transformation.

211.2.3 GETNUMROWSPROCESSED Function

This function retrieves the number of SQL rows processed when generating the XML using the GETXML Functions call. This count does not include the number of rows skipped before generating the XML.

Note that GETXML Functions always generates an XML document, even if there are no rows present.

Syntax

```
DBMS_XMLGEN.GETNUMROWSPROCESSED (
  ctx    IN    ctxHandle)
RETURN NUMBER;
```

Parameters

Table 211-4 GETNUMROWSPROCESSED Function Parameters

| Parameter | Description |
|-----------|---|
| ctx | The context handle obtained from the NEWCONTEXT Functions call. |

Usage Notes

This function is used to determine the terminating condition if calling GETXML Functions in a loop.

Related Topics

- [GETXML Functions](#)
This function gets the XML document. The function is overloaded.

211.2.4 GETXML Functions

This function gets the XML document. The function is overloaded.

Syntax

Gets the XML document by fetching the maximum number of rows specified. It appends the XML document to the CLOB passed in. Use this version of [GETXML Functions](#) to avoid any extra CLOB copies and to reuse the same CLOB for subsequent calls. Because of the CLOB reuse, this [GETXML Functions](#) call is potentially more efficient:

```
DBMS_XMLGEN.GETXML (
    ctx          IN ctxHandle,
    tmpclob      IN OUT NCOPY CLOB,
    dtdOrSchema IN number := NONE)
RETURN BOOLEAN;
```

Generates the XML document and returns it as a temporary CLOB. The temporary CLOB obtained from this function must be freed using the `DBMS_LOB.FREETEMPORARY` call:

```
DBMS_XMLGEN.GETXML (
    ctx          IN ctxHandle,
    dtdOrSchema IN number := NONE)
RETURN CLOB;
```

Converts the results from the SQL query string to XML format, and returns the XML as a temporary CLOB, which must be subsequently freed using the `DBMS_LOB.FREETEMPORARY` call:

```
DBMS_XMLGEN.GETXML (
    sqlQuery     IN VARCHAR2,
    dtdOrSchema  IN number := NONE)
RETURN CLOB;
```

Parameters

Table 211-5 GETXML Function Parameters

| Parameter | Description |
|-------------|--|
| ctx | The context handle obtained from the <code>newContext</code> call. |
| tmpclob | The CLOB to which the XML document is appended. |
| sqlQuery | The SQL query string. |
| dtdOrSchema | Generate a DTD or a schema? Only <code>NONE</code> is supported. |

Usage Notes

When the rows indicated by the [SETSKIPROWS Procedure](#) call are skipped, the maximum number of rows as specified by the [SETMAXROWS Procedure](#) call (or the entire result if not specified) is fetched and converted to XML. Use the [GETNUMROWSPROCESSED Function](#) to check if any rows were retrieved.

211.2.5 GETXMLTYPE Functions

This function gets the XML document and returns it as an `XMLTYPE`. `XMLTYPE` operations can be performed on the results. This function is overloaded.

Syntax

Generates the XML document and returns it as a `sys.XMLType`:

```
DBMS_XMLGEN.GETXMLTYPE (
    ctx          IN ctxhandle,
    dtdOrSchema IN number := NONE)
RETURN sys.XMLType;
```

Converts the results from the SQL query string to XML format, and returns the XML as a `sys.XMLType`:

```
DBMS_XMLGEN.GETXMLTYPE (
    sqlQuery    IN VARCHAR2,
    dtdOrSchema IN number := NONE)
RETURN sys.XMLType
```

Parameters

Table 211-6 GETXMLTYPE Function Parameters

| Parameter | Description |
|--------------------------|--|
| <code>ctx</code> | The context handle obtained from the <code>newContext</code> call. |
| <code>sqlQuery</code> | The SQL query string. |
| <code>dtdOrSchema</code> | Generate a DTD or a schema? Only <code>NONE</code> is supported. |

211.2.6 NEWCONTEXT Functions

This function generates and returns a new context handle.

This context handle is used in [GETXML Functions](#) and other functions to get XML back from the result. There are several version of the function.

Syntax

Generates a new context handle from a query:

```
DBMS_XMLGEN.NEWCONTEXT (
    query    IN VARCHAR2)
RETURN ctxHandle;
```

Generates a new context handle from a query string in the form of a PL/SQL ref cursor:

```
DBMS_XMLGEN.NEWCONTEXT (
    queryString IN SYS_REFCURSOR)
RETURN ctxHandle;
```

Parameters

Table 211-7 NEWCONTEXT Function Parameters

| Parameter | Description |
|-------------|--|
| query | The query, in the form of a VARCHAR, the result of which must be converted to XML. |
| queryString | The query string in the form of a PL/SQL ref cursor, the result of which must be converted to XML. |

211.2.7 NEWCONTEXTFROMHIERARCHY Function

This function obtains a handle to use in the GETXML Functions and other functions to get a hierarchical XML with recursive elements from the result.

Syntax

```
DBMS_XMLGEN.NEWCONTEXTFROMHIERARCHY (
    queryString IN VARCHAR2)
RETURN ctxHandle;
```

Parameters

Table 211-8 NEWCONTEXTFROMHIERARCHY Function Parameters

| Parameter | Description |
|-------------|--|
| queryString | The query string, the result of which must be converted to XML. The query is a hierarchical query typically formed using a CONNECT BY clause, and the result must have the same property as the result set generated by a CONNECT BY query. The result set must have only two columns, the level number and an XML value. The level number is used to determine the hierarchical position of the XML value within the result XML document. |

Related Topics

- [GETXML Functions](#)
This function gets the XML document. The function is overloaded.

211.2.8 RESTARTQUERY Procedure

This procedure restarts the query and generates the XML from the first row.

It can be used to start executing the query again, without having to create a new context.

Syntax

```
DBMS_XMLGEN.RESTARTQUERY (
    ctx IN ctxHandle);
```

Parameters

Table 211-9 RESTARTQUERY Procedure Parameters

| Parameter | Description |
|-----------|--|
| ctx | The context handle corresponding to the current query. |

211.2.9 SETCONVERTSPECIALCHARS Procedure

This procedure sets whether or not special characters in the XML data must be converted into their escaped XML equivalent. For example, the < sign is converted to <.

The default is to perform conversions.

This function improves performance of XML processing when the input data cannot contain any special characters such as <, >, ", ', which must be escaped. It is expensive to scan the character data to replace the special characters, particularly if it involves a lot of data.

Syntax

```
DBMS_XMLGEN.SETCONVERTSPECIALCHARS (
  ctx    IN ctxHandle,
  conv   IN BOOLEAN);
```

Parameters

Table 211-10 SETCONVERTSPECIALCHARS Procedure Parameters

| Parameter | Description |
|-----------|--|
| ctx | The context handle obtained from one of the NEWCONTEXT Functions call. |
| conv | TRUE indicates that conversion is needed. |

211.2.10 SETMAXROWS Procedure

This procedure sets the maximum number of rows to fetch from the SQL query result for every invocation of the GETXML Functions call.

It is used when generating paginated results. For example, when generating a page of XML or HTML data, restrict the number of rows converted to XML or HTML by setting the `maxRows` parameter.

Syntax

```
DBMS_XMLGEN.SETMAXROWS (
  ctx      IN ctxHandle,
  maxRows  IN NUMBER);
```

Parameters

Table 211-11 SETMAXROWS Procedure Parameters

| Parameter | Description |
|-----------|---|
| ctx | The context handle corresponding to the query executed. |
| maxRows | The maximum number of rows to get for each call to GETXML Functions |

Related Topics

- [GETXML Functions](#)
This function gets the XML document. The function is overloaded.

211.2.11 SETNULLHANDLING Procedure

This procedure sets NULL handling options, handled through the `flag` parameter setting.

Syntax

```
DBMS_XMLGEN.SETNULLHANDLING (
  ctx IN ctx,
  flag IN NUMBER);
```

Parameters

Table 211-12 SETNULLHANDLING Procedure Parameters

| Parameter | Description |
|-----------|--|
| ctx | The context handle corresponding to the query executed. |
| flag | The NULL handling option set. <ul style="list-style-type: none"> • <code>DROP_NULLS CONSTANT NUMBER:= 0;</code> (Default) Leaves out the tag for NULL elements. • <code>NULL_ATTR CONSTANT NUMBER:= 1;</code> Sets <code>xsi:nil="true"</code>. • <code>EMPTY_TAG CONSTANT NUMBER:= 2;</code> Sets, for example, <code><foo/></code>. |

211.2.12 SETROWSETTAG Procedure

This procedure sets the name of the root element of the document. The default name is `ROWSET`.

Syntax

```
DBMS_XMLGEN.SETROWSETTAG (
  ctx          IN ctxHandle,
  rowSetTagName IN VARCHAR2);
```

Parameters

Table 211-13 SETROWSETTAG Procedure Parameters

| Parameter | Description |
|---------------|---|
| ctx | The context handle obtained from the NEWCONTEXT Functions call. |
| rowSetTagName | The name of the document element. Passing <code>NULL</code> indicates that you do not want the <code>ROWSET</code> element present. |

Usage Notes

The user can set the `rowSetTag` to `NULL` to suppress the printing of this element. However, an error is produced if both the row and the rowset are `NULL` and there is more than one column or row in the output. This is because the generated XML would not have a top-level enclosing tag, and so would be invalid.

211.2.13 SETROWTAG Procedure

This procedure sets the name of the element separating all the rows. The default name is `ROW`.

Syntax

```
DBMS_XMLGEN.SETROWTAG (
  ctx          IN ctxHandle,
  rowTagName  IN VARCHAR2);
```

Parameters

Table 211-14 SETROWTAG Procedure Parameters

| Parameter | Description |
|------------|--|
| ctx | The context handle obtained from the NEWCONTEXT Functions call. |
| rowTagName | The name of the <code>ROW</code> element. Passing <code>NULL</code> indicates that you do not want the <code>ROW</code> element present. |

Usage Notes

The user can set the name of the element to `NULL` to suppress the `ROW` element itself. However, an error is produced if both the row and the rowset are `NULL` and there is more than one column or row in the output. This is because the generated XML would not have a top-level enclosing tag, and so would be invalid.

211.2.14 SETSKIPROWS Procedure

This procedure skips a given number of rows before generating the XML output for every call to the GETXML Functions. It is used when generating paginated results for stateless Web pages using this utility.

For example, when generating the first page of XML or HTML data, set `skiprows` to zero. For the next set, set the `skiprows` to the number of rows obtained in the first case. See [GETNUMROWSPROCESSED Function](#).

Syntax

```
DBMS_XMLGEN.SETSKIPROWS (
  ctx          IN ctxHandle,
  skipRows    IN NUMBER);
```

Parameters

Table 211-15 SETSKIPROWS Procedure Parameters

| Parameter | Description |
|-----------------------|---|
| <code>ctx</code> | The context handle corresponding to the query executed. |
| <code>skipRows</code> | The number of rows to skip for each call to <code>getXML</code> . |

Related Topics

- [GETXML Functions](#)
This function gets the XML document. The function is overloaded.

211.2.15 USEITEMTAGSFORCOLL Procedure

This procedure overrides the default name of the collection elements. The default name for collection elements is the type name itself.

Syntax

```
DBMS_XMLGEN.USEITEMTAGSFORCOLL (
  ctx IN ctxHandle);
```

Parameters

Table 211-16 USEITEMTAGSFORCOLL Procedure Parameters

| Parameter | Description |
|------------------|---------------------|
| <code>ctx</code> | The context handle. |

Usage Notes

Using this procedure, you can override the default to use the name of the column with the `_ITEM` tag appended to it. If there is a collection of `NUMBER`, the default tag name for the collection elements is `NUMBER`.

211.2.16 USENULLATTRIBUTEINDICATOR Procedure

This procedure specifies whether to use an XML attribute to indicate `NULL`, or to do it by omitting the inclusion of the particular entity in the XML document.

It is used as a shortcut for the [SETNULLHANDLING Procedure](#).

Syntax

```
DBMS_XMLGEN.USENULLATTRIBUTEINDICATOR(  
  ctx          IN   ctxType,  
  attrind     IN   BOOLEAN := TRUE);
```

Parameters

Table 211-17 USENULLATTRIBUTEINDICATOR Procedure Parameters

| Parameter | Description |
|----------------------|---|
| <code>ctx</code> | Context handle. |
| <code>attrind</code> | Use attribute to indicate <code>NULL</code> ? |

DBMS_XMLINDEX

The `DBMS_XMLINDEX` package provides an interface to implement asynchronous indexing.

This chapter contains the following topics:

- [Overview](#)
- [Security Model](#)
- [Summary of DBMS_XMLINDEX Subprograms](#)

See Also:

Oracle XML DB Developer's Guide for more information about "XMLIndex"

212.1 DBMS_XMLINDEX Overview

`DBMS_XMLINDEX` provides a mechanism for asynchronous index maintenance.

Asynchronous Index Maintenance

The basic XMLIndex is maintained on every DML operation. However, given the computing costs, in many cases the availability of stale result is adequate. In such situations, it is desirable to defer index updates to a more convenient time, for example when the load on the database is low. `DBMS_XMLINDEX` provides this mechanism.

212.2 DBMS_XMLINDEX Security Model

Owned by `XDB`, the `DBMS_XMLINDEX` package must be created by `SYS` or `XDB`. The `EXECUTE` privilege is granted to `PUBLIC`.

Subprograms in this package are executed using the privileges of the current user.

212.3 Summary of DBMS_XMLINDEX Subprograms

This table lists the `DBMS_XMLINDEX` subprograms and briefly describes them.

Table 212-1 DBMS_XMLINDEX Package Subprograms

| Subprogram | Description |
|---|---|
| CREATEDATEINDEX Procedure | Creates a secondary index for date values in the <code>VALUE</code> column of a <code>PATH TABLE</code> which is the storage table of an XMLIndex |

Table 212-1 (Cont.) DBMS_XMLINDEX Package Subprograms

| Subprogram | Description |
|---|--|
| CREATENUMBERINDEX Procedure | Creates a secondary index for number values in the <code>VALUE</code> column of a <code>PATH TABLE</code> which is the storage table of an <code>XMLIndex</code> |
| DROPPARAMETER Procedure | Drops the <code>XMLIndex</code> parameter string that is associated with a given parameter identifier. |
| MODIFYPARAMETER Procedure | Modifies the <code>XMLIndex</code> parameter string that is associated with a given parameter name |
| PROCESS_PENDING Procedure | Processes pending rows for a <code>NONBLOCKING ALTER INDEX OPERATION</code> on an <code>XMLIndex</code> |
| REGISTERPARAMETER Procedure | Registers a parameter string and <code>XMLIndex</code> parameter string pair in XDB |
| SYNCINDEX Procedure | Synchronizes the index manually |

212.3.1 CREATEDATEINDEX Procedure

This procedure creates a secondary index for date values in the `VALUE` column of a `PATH TABLE` which is the storage table of an `XMLIndex`. The second form of the procedure allows for the `date_index_clause` to be set to an empty string.

Syntax

```
DBMS_XMLINDEX.CREATEDATEINDEX (
  xml_index_schema IN VARCHAR2,
  xml_index_name   IN VARCHAR2,
  date_index_name  IN VARCHAR2,
  xmltypename     IN VARCHAR2,
  date_index_clause IN VARCHAR2);
```

```
DBMS_XMLINDEX.CREATEDATEINDEX (
  xml_index_schema IN VARCHAR2,
  xml_index_name   IN VARCHAR2,
  date_index_name  IN VARCHAR2,
  xmltypename     IN VARCHAR2);
```

Parameters

Table 212-2 CREATEDATEINDEX Procedure Parameters

| Parameter | Description |
|-------------------------------|---|
| <code>xml_index_schema</code> | Name of the owner of the <code>XMLIndex</code> |
| <code>xml_index_name</code> | Name of the <code>XMLIndex</code> |
| <code>date_index_name</code> | Name of the secondary index to be created for date values in the <code>VALUE</code> column of the <code>PATH TABLE</code> of <code>XMLIndex</code> named <code>xml_index_name</code> and owned by <code>xml_index_schema</code> |

Table 212-2 (Cont.) CREATDATEINDEX Procedure Parameters

| Parameter | Description |
|-------------------|---|
| xmltypename | The type to which values in the VALUE column of the path table are to be cast. Acceptable values are the following strings: DATETIME, TIME, DATE, GDAY, GMONTH, GYEAR, GYEARMONTH, GMONTHDAY. |
| date_index_clause | Storage clause to be applied to the date index during its creation. This is a string argument appended to the CREATE INDEX statement for creating the date index |

212.3.2 CREATENUMBERINDEX Procedure

This procedure creates a secondary index for number values in the VALUE column of a PATH TABLE which is the storage table of an XMLIndex.

Syntax

```
DBMS_XMLINDEX.CREATENUMBERINDEX (
  xml_index_schema  IN  VARCHAR2,
  xml_index_name    IN  VARCHAR2,
  num_index_name    IN  VARCHAR2,
  num_index_clause  IN  VARCHAR2,
  xmltypename       IN  VARCHAR2);
```

Parameters

Table 212-3 CREATENUMBERINDEX Procedure Parameters

| Parameter | Description |
|------------------|--|
| xml_index_schema | Name of the owner of the XMLIndex |
| xml_index_name | Name of the XMLIndex |
| num_index_name | Name of the secondary index to be created for number values in the VALUE column of the PATH TABLE of XMLIndex named xml_index_name and owned by xml_index_schema |
| num_index_clause | Storage clause to be applied to the number index during its creation. This is a string argument appended to the CREATE INDEX statement for creating the number index. |
| xmltypename | The type to which values in the VALUE column of the path table are to be cast. Acceptable values are the following strings: FLOAT, DOUBLE, DECIMAL, INTEGER, NONPOSITIVEINTEGER, NEGATIVEINTEGER, LONG, INT, SHORT, BYTE, NONNEGATIVEINTEGER, UNSIGNEDLONG, UNSIGNEDINT, UNSIGNEDSHORT, UNSIGNEDBYTE, POSITIVEINTEGER. |

212.3.3 DROPPARAMETER Procedure

This procedure drops the `XMLIndex` parameter string that is associated with a given parameter identifier.

Syntax

```
DBMS_XMLINDEX.DROPPARAMETER (
    name          IN          VARCHAR2);
```

Parameters

Table 212-4 DROPPARAMETER Procedure Parameters

| Parameter | Description |
|-----------|---------------------------------|
| name | Identifier for parameter string |

Examples

```
DBMS_XMLINDEX.DROPPARAMETER (
    'myIndexParam');
```

212.3.4 MODIFYPARAMETER Procedure

This procedure modifies the `XMLIndex` parameter string that is associated with a given parameter identifier.

Syntax

```
DBMS_XMLINDEX.MODIFYPARAMETER (
    name          IN          VARCHAR2,
    parameter     IN          CLOB);
```

Parameters

Table 212-5 MODIFYPARAMETER Procedure Parameters

| Parameter | Description |
|-----------|---|
| name | Identifier for parameter string |
| parameter | XMLIndex parameter clause that can appear in a CREATE INDEX or an ALTER INDEX statement |

Examples

```
DBMS_XMLINDEX.MODIFYPARAMETER (
    'myIndexParam',
    'PATH TABLE po_ptab
    PATH ID INDEX po_pidx
    ORDER KEY INDEX po_oidx
    VALUE INDEX po_vidx');
```

212.3.5 PROCESS_PENDING Procedure

This procedure processes executes DMLs required to complete a `NONBLOCKING ALTER INDEX ADD_GROUP/ADD_COLUMN` operation on an XMLIndex.

Syntax

```
DBMS_XMLINDEX.PROCESS_PENDING (
  xml_index_schema IN VARCHAR2,
  xml_index_name   IN VARCHAR2,
  pending_row_count OUT BINARY_INTEGER,
  error_row_count  OUT BINARY_INTEGER);
```

Parameters

Table 212-6 PROCESS_PENDING Procedure Parameters

| Parameter | Description |
|-------------------|---|
| xml_index_schema | Name of the owner of the XMLIndex |
| xml_index_name | Name of the XMLIndex to be altered using <code>NONBLOCKING ALTER INDEX OPERATION</code> |
| pending_row_count | Number of pending rows to be processed |
| error_row_count | Number of rows for which indexing may have failed because of an error |

Usage Notes

- This procedure will iteratively attempt to index all necessary rows in small batches while skipping rows that are locked and rows for which index maintenance fails with an error. Therefore, it may have to be executed multiple times for an XMLIndex until all pending rows are processed. Once all pending rows are processed, user can complete the `NONBLOCKING ALTER INDEX OPERATION`.
- If it is not possible process all the pending rows after multiple trials, the user will have to manually triage the locking or error issues by examining unprocessed rows in `SYS_AIXSXI_#####_PENDINGTAB` and errors in `SYS_AIXSXI_#####_ERRORTAB`. Keeping track of rows and the errors is useful in triaging issues.

Examples

```
EXEC DBMS_XMLINDEX.PROCESS_PENDING(
  'SCOTT', 'PO_XMLINDEX_IX', out_param1, out_param2);
```

212.3.6 REGISTERPARAMETER Procedure

This procedure registers a parameter identifier and XMLIndex parameter string pair in XDB.

Syntax

```
DBMS_XMLINDEX.REGISTERPARAMETER (
  name          IN VARCHAR2,
  parameter     IN CLOB);
```

Parameters

Table 212-7 REGISTERPARAMETER Procedure Parameters

| Parameter | Description |
|-----------|---|
| name | Identifier for parameter string |
| parameter | XMLIndex parameter clause that can appear in a CREATE INDEX or an ALTER INDEX statement |

Examples

```
DBMS_XMLINDEX.REGISTERPARAMETER (
  'myIndexParam',
  'PATH TABLE po_ptab
  PATH ID INDEX po_pidx
  ORDER KEY INDEX po_oidx
  VALUE INDEX po_vidx
  PATHS (NAMESPACE MAPPING(xmlns:p="http://www.example.com/IPO"))
  GROUP MASTERGROUP XMLTABLE PO_TAB
  ('/p:PurchaseOrder'
   COLUMNS
     REFERENCE VARCHAR2(30) PATH 'p:Reference',
     REQUESTOR VARCHAR2(30) PATH 'p:Requestor' )
  GROUP ITEMGROUP XMLTABLE ITEMGROUP_TAB
  ('/p:PurchaseOrder/p:LineItems/p:LineItem'
   COLUMNS
     LINENUMBER NUMBER(38) PATH '@p:ItemNumber',
     QUANTITY NUMBER(38) PATH '@p:Quantity',
     DESCRIPTION VARCHAR2(256) PATH 'p:Description'));
```

212.3.7 SYNCINDEX Procedure

This function synchronizes an asynchronously maintained XMLIndex.

It applies to the XMLIndex changes that are logged in the pending table, and brings the path table up-to-date with the base XMLTYPE column.

Syntax

```
DBMS_XMLINDEX.SYNCINDEX (
  xml_index_schema    IN VARCHAR2,
  xml_index_name      IN VARCHAR2,
  partition_name      IN VARCHAR2 DEFAULT NULL,
  reindex             IN BOOLEAN DEFAULT FALSE);
```

Parameters

Table 212-8 SYNCINDEX Procedure Parameters

| Parameter | Description |
|------------------|-----------------------------------|
| xml_index_schema | Name of the owner of the XMLIndex |
| xml_index_name | Name of the XMLIndex |
| partition_name | [Currently not supported] |

Table 212-8 (Cont.) SYNCINDEX Procedure Parameters

| Parameter | Description |
|-----------|--|
| reindex | Default is FALSE. If set to TRUE, this drops the secondary indexes and recreates them later so that they can be bulk-loaded. |

Examples

```
EXEC DBMS_XMLINDEX.SYNCINDEX('USER1', 'SS_TAB_XMLI', REINDEX=>TRUE);
```

DBMS_XMLPARSER

Using `DBMS_XMLPARSER`, you can access the contents and structure of XML documents. XML describes a class of data XML document objects. It partially describes the behavior of computer programs which process them. By construction, XML documents are conforming SGML documents.

XML documents are made up of storage units called entities, which contain either parsed or unparsed data. Parsed data is made up of characters, some of which form character data, and some of which form markup. Markup encodes a description of the document's storage layout and logical structure. XML provides a mechanism to impose constraints on the storage layout and logical structure.

A software module called an XML processor is used to read XML documents and provide access to their content and structure. It is assumed that an XML processor is doing its work on behalf of another module, called the application. This PL/SQL implementation of the XML processor (or parser) follows the W3C XML specification REC-xml-19980210 and includes the required behavior of an XML processor in terms of how it must read XML data and the information it must provide to the application.

The default behavior for this PL/SQL XML parser is to build a parse tree that can be accessed by DOM APIs, validate it if a DTD is found (otherwise, it is non-validating), and record errors if an error log is specified. If parsing fails, an application error is raised.

This chapter contains the following topics:

- [Security Model](#)
- [Summary of DBMS_XMLPARSER Subprograms](#)

See Also:

Oracle XML DB Developer's Guide

213.1 DBMS_XMLPARSER Security Model

Owned by `XDB`, the `DBMS_XMLPARSER` package must be created by `SYS` or `XDB`. The `EXECUTE` privilege is granted to `PUBLIC`.

Subprograms in this package are executed using the privileges of the current user.

213.2 Summary of DBMS_XMLPARSER Subprograms

This table lists the `DBMS_XMLPARSER` subprograms and briefly describes them.

Table 213-1 DBMS_XMLPARSER Package Subprograms

| Method | Description |
|---------------------------------------|--|
| FREEPARSER | Frees a parser object. |
| GETDOCTYPE | Gets parsed DTD. |
| GETDOCUMENT | Gets DOM document. |
| GETRELEASEVERSION | Returns the release version of Oracle XML Parser for PL/SQL. |
| GETVALIDATIONMODE | Returns validation mode. |
| NEWPARSER | Returns a new parser instance |
| PARSE | Parses XML stored in the given url/file. |
| PARSEBUFFER | Parses XML stored in the given buffer |
| PARSECLOB | Parses XML stored in the given clob |
| PARSEDTD | Parses DTD stored in the given url/file |
| PARSEDTDBUFFER | Parses DTD stored in the given buffer |
| PARSEDTDCLOB | Parses DTD stored in the given clob |
| SETBASEDIR | Sets base directory used to resolve relative URLs. |
| SETDOCTYPE | Sets DTD. |
| SETERRORLOG | Sets errors to be sent to the specified file |
| SETPRESERVEWHITESPACE | Sets white space preserve mode |
| SETVALIDATIONMODE | Sets validation mode. |
| SHOWWARNINGS | Turns warnings on or off. |

213.2.1 FREEPARSER

This procedure frees a parser object.

Syntax

```
PROCEDURE freeParser(  
    p Parser);
```

Parameters

Table 213-2 FREEPARSER Procedure Parameters

| Parameter | IN / OUT | Description |
|-----------|----------|------------------|
| p | (IN) | Parser instance. |

213.2.2 GETDOCTYPE

The `GETDOCTYPE` function returns the parsed DTD. This function must be called only after a DTD is parsed.

Syntax

```
FUNCTION getDoctype(  
    p Parser)  
RETURN DOMDocumentType;
```

Parameters

Table 213-3 GETDOCTYPE Function Parameters

| Parameter | IN / OUT | Description |
|-----------|----------|------------------|
| p | (IN) | Parser instance. |

213.2.3 GETDOCUMENT

`GETDOCUMENT` returns the document node of a DOM tree document built by the parser. This function must be called only after a document is parsed.

Syntax

```
FUNCTION GETDOCUMENT(  
    p Parser)  
RETURN DOMDocument;
```

Parameters

Table 213-4 GETDOCUMENT Function Parameters

| Parameter | IN / OUT | Description |
|-----------|----------|------------------|
| p | (IN) | Parser instance. |

213.2.4 GETRELEASEVERSION

`GETRELEASEVERSION` returns the release version of the Oracle XML parser for PL/SQL.

Syntax

```
FUNCTION getReleaseVersion  
RETURN VARCHAR2;
```

213.2.5 GETVALIDATIONMODE

The `GETVALIDATIONMODE` function retrieves the validation mode: `TRUE` for validating, `FALSE` otherwise.

Syntax

```
FUNCTION GETVALIDATIONMODE (  
    p Parser)  
RETURN BOOLEAN;
```

Parameters

Table 213-5 GETVALIDATIONMODE Function Parameters

| Parameter | IN / OUT | Description |
|-----------|----------|------------------|
| p | (IN) | Parser instance. |

213.2.6 NEWPARSER

This function returns a new parser instance.

This function must be called before the default behavior of Parser can be changed and if other parse methods need to be used.

Syntax

```
FUNCTION newParser  
RETURN Parser;
```

213.2.7 PARSE

`PARSE` parses XML stored in the given URL or file. An application error is raised if parsing fails.

There are several versions of this method.

Syntax

Function. Use this when the default parser behavior is acceptable, and only a URL or file needs to be parsed. Returns the built DOM document.

```
FUNCTION parse(url VARCHAR2)  
RETURN DOMDocument;
```

Procedure. Any changes to the default parser behavior should be effected before calling this procedure.

```
PROCEDURE parse(
  p Parser,
  url VARCHAR2);
```

Parameters

Table 213-6 PARSE Subprogram Parameters

| Parameter | IN / OUT | Description |
|-----------|----------|---|
| url | (IN) | Complete path of the url/file to be parsed. |
| p | (IN) | Parser instance. |

213.2.8 PARSEBUFFER

PARSEBUFFER parses XML stored in the given buffer.

Any changes to the default parser behavior should be effected before calling this procedure. An application error is raised if parsing fails.

Syntax

```
PROCEDURE PARSEBUFFER (
  p Parser,
  doc VARCHAR2);
```

Parameters

Table 213-7 PARSEBUFFER Procedure Parameters

| Parameter | IN / OUT | Description |
|-----------|----------|-------------------------------|
| p | (IN) | Parser instance. |
| doc | (IN) | XML document buffer to parse. |

213.2.9 PARSECLOB

PARSECLOB parses XML stored in the given clob.

Any changes to the default parser behavior should be effected before calling this procedure. An application error is raised if parsing fails.

Syntax

```
PROCEDURE PARSECLOB (
  p Parser,
  doc CLOB);
```

Parameters

Table 213-8 PARSECLOB Procedure Parameters

| Parameter | IN / OUT | Description |
|-----------|----------|-------------------------------|
| p | (IN) | Parser instance. |
| doc | (IN) | XML document buffer to parse. |

213.2.10 PARSEDTD

PARSEDTD parses the DTD stored in the given URL or file.

Any changes to the default parser behavior should be effected before calling this procedure. An application error is raised if parsing fails.

Syntax

```
PROCEDURE PARSEDTD(  
    p      Parser,  
    url   VARCHAR2,  
    root  VARCHAR2);
```

Parameters

Table 213-9 PARSEDTD Procedure Parameters

| Parameter | IN / OUT | Description |
|-----------|----------|--|
| p | (IN) | Parser instance. |
| url | (IN) | Complete path of the URL or file to be parsed. |
| root | (IN) | Name of the root element. |

213.2.11 PARSEDTDBUFFER

PARSEDTDBUFFER parses the DTD stored in the given buffer.

Any changes to the default parser behavior should be effected before calling this procedure. An application error is raised if parsing fails.

Syntax

```
PROCEDURE PARSEDTDBUFFER(  
    p      Parser,  
    dtd   VARCHAR2,  
    root  VARCHAR2);
```

Parameters

Table 213-10 PARSEDTDBUFFER Procedure Parameters

| Parameter | IN / OUT | Description |
|-----------|----------|---------------------------|
| p | (IN) | Parser instance. |
| dtd | (IN) | DTD buffer to parse. |
| root | (IN) | Name of the root element. |

213.2.12 PARSEDTDCLOB

PARSEDTDCLOB parses the DTD stored in the given clob.

Any changes to the default parser behavior should be effected before calling this procedure. An application error is raised if parsing fails.

Syntax

```
PROCEDURE PARSEDTDCLOB(  
  p    Parser,  
  dtd  CLOB,  
  root VARCHAR2);
```

Parameters

Table 213-11 PARSEDTDCLOB Procedure Parameters

| Parameter | IN / OUT | Description |
|-----------|----------|---------------------------|
| p | (IN) | Parser instance. |
| dtd | (IN) | DTD Clob to parse. |
| root | (IN) | Name of the root element. |

213.2.13 SETBASEDIR

This procedure sets the base directory used to resolve relative URLs. An application error is raised if parsing fails.

Syntax

```
PROCEDURE setBaseDir(  
  p    Parser,  
  dir  VARCHAR2);
```

Parameters**Table 213-12 SETBASEDIR Procedure Parameters**

| Parameter | IN / OUT | Description |
|-----------|----------|-------------------------------------|
| p | (IN) | Parser instance. |
| dir | (IN) | Directory used as a base directory. |

213.2.14 SETDOCTYPE Procedure

This procedure sets a DTD to be used by the parser for validation. This call should be made before the document is parsed.

Syntax

```
PROCEDURE setDoctype(
  p   Parser,
  dtd DOMDocumentType);
```

Parameters**Table 213-13 SETDOCTYPE Procedure Parameters**

| Parameter | IN / OUT | Description |
|-----------|----------|------------------|
| p | (IN) | Parser instance. |
| dtd | (IN) | DTD to set. |

213.2.15 SETERRORLOG Procedure

This procedure sets errors to be sent to the specified file.

Syntax

```
PROCEDURE setErrorLog(
  p           Parser,
  fileName VARCHAR2);
```

Parameters**Table 213-14 SETERRORLOG Procedure Parameters**

| Parameter | IN / OUT | Description |
|-----------|----------|--|
| p | (IN) | Parser instance. |
| fileName | (IN) | Complete path of the file to use as the error log. |

213.2.16 SETPRESERVEWHITESPACE

This procedure sets whitespace preserving mode.

Syntax

```
PROCEDURE setPreserveWhitespace(  
    p Parser,  
    yes BOOLEAN);
```

Parameters

Table 213-15 SETPRESERVEWHITESPACE Procedure Parameters

| Parameter | IN / OUT | Description |
|-----------|----------|---|
| p | (IN) | Parser instance. |
| yes | (IN) | Mode to set: TRUE - preserve, FALSE - don't preserve. |

213.2.17 SETVALIDATIONMODE

This procedure sets the validation mode.

Syntax

```
PROCEDURE setValidationMode(  
    p Parser,  
    yes BOOLEAN);
```

Parameters

Table 213-16 SETVALIDATIONMODE Procedure Parameters

| Parameter | IN / OUT | Description |
|-----------|----------|---|
| p | (IN) | Parser instance. |
| yes | (IN) | Mode to set: TRUE - validate, FALSE - don't validate. |

213.2.18 SHOWWARNINGS

This procedure turns warnings on or off.

Syntax

```
PROCEDURE showWarnings(  
    p Parser,  
    yes BOOLEAN);
```

Parameters

Table 213-17 SHOWWARNINGS Procedure Parameters

| Parameter | IN / OUT | Description |
|-----------|----------|---|
| p | (IN) | Parser instance. |
| yes | (IN) | Mode to set: TRUE - show warnings, FALSE - don't show warnings. |

DBMS_XMLSCHEMA

DBMS_XMLSCHEMA package provides procedures to manage XML schemas.

It is created by script `dbmsxsch.sql` during Oracle database installation.

This chapter contains the following topics:

- [Overview](#)
- [Security Model](#)
- [Constants](#)
- [Views](#)
- [Operational Notes](#)
- [Summary of DBMS_XMLSCHEMA Subprograms](#)

See Also:

Oracle XML DB Developer's Guide

214.1 DBMS_XMLSCHEMA Overview

The DBMS_XMLSCHEMA package uses subprograms to manage XML schemas.

These subprograms provide the following XML schema management::

- Register an XML schema
- Delete a previously registered XML schema
- Re-compile a previously registered XML schema
- Generate an XML schema
- Evolves an XML schema

214.2 DBMS_XMLSCHEMA Security Model

Owned by XDB, the DBMS_XMLSCHEMA package must be created by SYS or XDB. The EXECUTE privilege is granted to PUBLIC. Subprograms in this package are executed using the privileges of the current user.

214.3 DBMS_XMLSCHEMA Constants

The `DBMS_XMLSCHEMA` package defines several constants to use when specifying parameter values.

These constants are shown in following tables.

- [Table 214-1](#)
- [Table 214-2](#)
- [Table 214-3](#)

Table 214-1 *DBMS_XMLSCHEMA Constants - Delete Option*

| Constant | Type | Value | Description |
|-----------------------------------|--------|-------|---|
| <code>DELETE_RESTRICT</code> | NUMBER | 1 | Deletion of an XML schema fails if there are any tables or XML schemas that depend on it |
| <code>DELETE_INVALIDATE</code> | NUMBER | 2 | Deletion of an XML schema does not fail if there are tables or XML schemas that depend on it. All dependent tables and schemas are invalidated. |
| <code>DELETE_CASCADE</code> | NUMBER | 3 | Deletion of an XML schema also drops all SQL types and default tables associated with it. SQL types are dropped only if <code>gentypes</code> argument was set to <code>TRUE</code> during registration of the XML schema. However, deletion of the XML schema fails if there are any instance documents conforming to the schema or any dependent XML schemas. |
| <code>DELETE_CASCADE_FORCE</code> | NUMBER | 4 | This option is similar to <code>DELETE_CASCADE</code> except that it does not check for any stored instance documents conforming to the schema or any dependent XML schemas. Also, it ignores any errors. |

Table 214-2 *DBMS_XMLSCHEMA Constants - Enable Hierarchy*

| Constant | Type | Value | Description |
|------------------------------------|-------------|-------|--|
| <code>ENABLE_HIERARCHY_NONE</code> | PLS_INTEGER | 1 | The <code>ENABLE_HIERARCHY</code> procedure of the <code>DBMS_XDBZ</code> package will not be called on any tables created while registering that schema |

Table 214-2 (Cont.) DBMS_XMLSCHEMA Constants - Enable Hierarchy

| Constant | Type | Value | Description |
|------------------------------|-------------|-------|---|
| ENABLE_HIERARCHY_CONTENTS | PLS_INTEGER | 2 | The ENABLE_HIERARCHY procedure of the DBMS_XDBZ package will be called for all tables created during schema registration with hierarchy_type as DBMS_XDBZ.ENABLE_CONTENTS |
| ENABLE_HIERARCHY_RESMETADATA | PLS_INTEGER | 3 | The ENABLE_HIERARCHY procedure of the DBMS_XDBZ package will be called on all tables created during schema registration with hierarchy_type as DBMS_XDBZ.ENABLE_RESMETADATA. Users should pass in DBMS_XMLSCHEMA.ENABLE_RESMETADATA for schemas they intend to use as resource metadata tables. |

Table 214-3 DBMS_XMLSCHEMA Constants - Register CSID

| Constant | Type | Value | Description |
|--------------------|--------|-------|--|
| REGISTER_NODOCID | NUMBER | 1 | If a schema is registered for metadata use (using the value ENABLE_HIER_RESMETADATA for parameter enablehierarchy during registration), a column named DOCID is added to all tables created during schema registration. This constant can be used in the options argument of REGISTERSCHEMA to prevent the creation of this column if the user wishes to optimize on storage |
| REGISTER_CSID_NULL | NUMBER | -1 | If user wishes to not specify the character set of the input schema document when invoking REGISTERSCHEMA, this value can be used for the csid parameter |

214.4 Views

This table lists the views used by the DBMS_XMLSCHEMA package

The columns of these views are described in detail in the *Oracle Database Reference*

Table 214-4 Summary of Views used by DBMS_XMLSCHEMA

| Schema | Description |
|--------------------|--|
| USER_XML_SCHEMAS | All registered XML Schemas owned by the user |
| ALL_XML_SCHEMAS | All registered XML Schemas usable by the current user |
| DBA_XML_SCHEMAS | All registered XML Schemas in the database |
| DBA_XML_TABLES | All XMLType tables in the system |
| USER_XML_TABLES | All XMLType tables owned by the current user |
| ALL_XML_TABLES | All XMLType tables usable by the current user |
| DBA_XML_TAB_COLS | All XMLType table columns in the system |
| USER_XML_TAB_COLS | All XMLType table columns in tables owned by the current user |
| ALL_XML_TAB_COLS | All XMLType table columns in tables usable by the current user |
| DBA_XML_VIEWS | All XMLType views in the system |
| USER_XML_VIEWS | All XMLType views owned by the current user |
| ALL_XML_VIEWS | All XMLType views usable by the current user |
| DBA_XML_VIEW_COLS | All XMLType view columns in the system |
| USER_XML_VIEW_COLS | All XMLType view columns in views owned by the current user |
| ALL_XML_VIEW_COLS | All XMLType view columns in views usable by the current user |

214.5 DBMS_XMLSCHEMA Operational Notes

There are guidelines for using in-place XML schema evolution.

Before you perform an in-place XML-schema evolution, you should follow these preparatory steps:

1. Back up all existing data (instance documents) for the XML schema that will be evolved.
2. Perform a dry run using trace only, that is, without actually evolving the XML schema or updating any instance documents, to produce a trace of the update operations that would be performed during evolution. To do this, set the flag parameter value to only `INPLACE_TRACE`. Do not also use `INPLACE_EVOLVE`. After performing the dry run, examine the trace file, verifying that the listed DDL operations are in fact those that you intend.

214.6 Summary of DBMS_XMLSCHEMA Subprograms

This table lists the `DBMS_XMLSCHEMA` subprograms and briefly describes them.

Table 214-5 DBMS_XMLSCHEMA Package Subprograms

| Method | Description |
|---|---|
| COMPILESCHEMA Procedure | Used to re-compile an already registered XML schema. This is useful for bringing a schema in an invalid state to a valid state. |
| COPYEVOLVE Procedure | Evolves registered schemas so that existing XML instances remain valid |
| DELETESCHEMA Procedure | Removes the schema from the database |
| INPLACEEVOLVE Procedure | Evolves registered schemas by propagating schema changes to object types and tables |
| PURGESCHEMA Procedure | Removes the XML schema |
| REGISTERSCHEMA Procedures | Registers the specified schema for use by Oracle. This schema can then be used to store documents conforming to this. |
| REGISTERURI Procedure | Registers an XML schema specified by a URI name |

214.6.1 COMPILESCHEMA Procedure

This procedure can be used to re-compile an already registered XML schema. This is useful for bringing a schema in an invalid state to a valid state. Can result in a `ORA-31001` exception: invalid resource handle or path name.

Syntax

```
DBMS_XMLSCHEMA.COMPILESCHEMA (
    schemaur1 IN VARCHAR2);
```

Parameters

Table 214-6 COMPILESCHEMA Procedure Parameters

| Parameter | Description |
|------------------------|----------------------------|
| <code>schemaur1</code> | URL identifying the schema |

214.6.2 COPYEVOLVE Procedure

This procedure evolves registered schemas so that existing XML instances remain valid.

This procedure is accomplished in according to the following basic scenario (alternative actions are controlled by the procedure's parameters):

- copies data in schema based `XMLType` tables to temporary table storage
- drops old tables
- deletes old schemas
- registers new schemas
- creates new `XMLType` tables
- Populates new tables with data in temporary storage; auxiliary structures (constraints, triggers, indexes, and others) are not preserved

- drops temporary tables

 **See Also:**

- "Schema Evolution" chapter of the *Oracle XML DB Developer's Guide* for examples on how to evolve existing schemas
- *Oracle Database Error Messages* for information on exceptions specific to schema evolution, ORA-30142 through ORA-30946.

Syntax

```
DBMS_XMLSCHEMA.COPYEVOLVE (
  schemaurls      IN  XDB$STRUBG_LIST_T,
  newschemas      IN  XMLSequenceType,
  transforms      IN  XMLSequenceType :=NULL,
  preserveolddocs IN  BOOLEAN :=FALSE,
  maptablename    IN  VARCHAR2 :=NULL,
  generatetables IN  BOOLEAN :=TRUE,
  force           IN  BOOLEAN :=FALSE,
  schemaowners    IN  XDB$STRING_LIST_T :=NULL
  parallelDegree IN  PLS_INTEGER := 0,
  options         IN  PLS_INTEGER := 0);
```

Parameters

Table 214-7 COPYEVOLVE Procedure Parameters

| Parameter | Description |
|-----------------|---|
| schemaurls | VARRAY of URLs of all schemas to be evolved. Should include the dependent schemas. Unless the FORCE parameter is TRUE, URLs should be in the order of dependency. |
| newschemas | VARRAY of new schema documents. Should be specified in same order as the corresponding URLs. |
| transforms | VARRAY of transforming XSL documents to be applied to schema-based documents. Should be specified in same order as the corresponding URLs. Optional if no transformations are required. |
| preserveolddocs | Default is FALSE, and temporary tables with old data are dropped. If TRUE, these table are still available after schema evolution is complete. |

Table 214-7 (Cont.) COPYEVOLVE Procedure Parameters

| Parameter | Description |
|----------------|---|
| maptabname | <p>Specifies the name of the table mapping permanent to temporary tables during the evolution process. Valid columns are:</p> <ul style="list-style-type: none"> • SCHEMA_URL - VARCHAR2 (700) - URL of schema to which this table conforms • SCHEMA_OWNER - VARCHAR2 (30) - Owner of the schema • ELEMENT_NAME - VARCHAR2 (256) - Element to which this table conforms • TAB_NAME - VARCHAR2 (65) - Qualified table name: <owner_name>.<table_name> • COL_NAME - VARCHAR2 (4000) - Name of the column (NULL for XMLType tables) • TEMP_TABNAME - VARCHAR2 (30) - Name of temporary tables which holds data for this table. |
| generatetables | <p>Default is TRUE, and new tables will be generated.</p> <p>If FALSE:</p> <ul style="list-style-type: none"> • new tables will not be generated after registration of new schemas • preserveolddocs must be TRUE • maptabname must be non-NULL |
| force | <p>Default is FALSE.</p> <p>If TRUE, ignores errors generated during schema evolution. Used when there are circular dependencies among schemas to ensure that all schemas are stored despite possible errors in registration.</p> |
| schemaowners | <p>VARRAY of names of schema owners. Should be specified in same order as the corresponding URLs. Default is NULL, assuming that all schemas are owned by the current user.</p> |
| paralleldegree | <p>Specifies the degree of parallelism to be used in a PARALLEL hint during the data copy stage of the evolution. If this is 0 (default), the PARALLEL hint will not be given in the data copy statements.</p> |
| options | <p>Currently, the only supported option is COPYEVOLVE_BINARY_XML which lets you register the new schemas for binary XML and create the new tables/columns with binary XML as the storage type.</p> |

Usage Notes

You should back up all schemas and documents prior to invocation because [COPYEVOLVE Procedure](#) deletes all conforming documents prior to implementing the schema evolution.

214.6.3 DELETESCHEMA Procedure

This procedure deletes the XML Schema specified by the URL.

Syntax

```
DBMS_XMLSCHEMA.DELETESCHEMA (
    schemaur1      IN VARCHAR2,
    delete_option  IN PLS_INTEGER := DELETE_RESTRICT);
```

See Also:

"XMLSCHEMA Storage and Query: Basic" chapter of the *Oracle XML DB Developer's Guide*

Parameters

Table 214-8 DELETESCHEMA Procedure Parameters

| Parameter | Description |
|---------------|---|
| schemaur1 | URL identifying the schema to be deleted |
| delete_option | Delete options: <ul style="list-style-type: none"> DELETE_RESTRICT - Schema deletion fails if there are any tables or schemas that depend on this schema DELETE_INVALIDATE - Schema deletion does not fail if there are any dependencies. Instead, it simply invalidates all dependent objects. DELETE_CASCADE - Schema deletion will also drop all default SQL types and default tables. However the deletion fails if there are any stored instances conforming to this schema. DELETE_CASCADE_FORCE - Similar to DELETE_CASCADE except that it does not check for any stored instances conforming to this schema. Also, it ignores any errors. |

Exceptions

Table 214-9 DELETESCHEMA Procedure Exceptions

| Exception | Description |
|-----------|--------------------------------------|
| ORA-31001 | Invalid resource handle or path name |

214.6.4 INPLACEEVOLVE Procedure

This procedure evolves registered schemas by propagating schema changes to object types and tables.

Syntax

```
DBMS_XMLSCHEMA.INPLACEEVOLVE (
    schemaURL    IN    VARCHAR2,
    diffXML      IN    XMLType,
    flags        IN    NUMBER);
```

Parameters

Table 214-10 INPLACEEVOLVE Procedure Parameters

| Parameter | Description |
|-----------|--|
| schemaurl | URL of the schema to evolve |
| diffXML | Changes to be applied to the schema. This is an XML document conforming to the XDIFF schema and specifies what changes need to be applied and the locations in the schema document where the changes are to be applied. |
| flags | <p>The following bits may be set in this parameter to control the behavior of this procedure:</p> <ul style="list-style-type: none"> INPLACE_EVOLVE (value 1, meaning that bit 1 is on) – Perform in-place XML schema evolution: construct a new XML schema and validate it (against the XML schema for XML schemas); construct the DDL statements needed to evolve the instance-document disk structures, execute the DDL statements, and replace the old XML schema with the new. INPLACE_TRACE (value 2, meaning that bit 2 is on) – Perform all steps necessary for in-place evolution, except executing the DDL statements and overwriting the old XML schema with the new, then write both the DDL statements and the new XML schema to a trace file. <p>That is, each of the bits constructs the new XML schema, validates it, and determines the steps needed to evolve the disk structures underlying the instance documents. In addition:</p> <ul style="list-style-type: none"> Bit INPLACE_EVOLVE carries out those evolution steps and replaces the old XML schema with the new. Bit INPLACE_TRACE saves the evolution steps and the new XML schema in a trace file (it does not carry out the evolution steps) |

Exceptions

The procedure raises exceptions in the following cases:

- An error will be raised for invalid XPATH expressions and for XDIFF documents that do not conform to the xdiff schema.
- Path expressions that are syntactically correct but result in an invalid node in the schema document will result in an error.
- If the schema change makes the schema an ill-formed XML document or an invalid XML schema, this will raise an error.

- Any errors resulting from `CREATE TYPE`, `ALTER TYPE` and like commands will generate error messages.

Usage Notes

- Users are required to backup all their data before attempting in-place evolution, as there is no rollback with this operation.
- A user must register their new XML schema with the database using the [REGISTERSHEMA Procedures](#) and the [REGISTERURI Procedure](#) at a schema URL that is different from that of the one to be evolved. If the new schema registers successfully and is usable, only then should the user attempt to evolve the existing schema to the new schema by means of this subprogram. If the registration of the new schema is successful, then the user must delete this schema (and all its dependent objects) before attempting to evolve the schema at the old schema URL.

214.6.5 PURGESHEMA Procedure

This procedure removes the XML schema.

See Also:

"XMLSCHEMA Storage and Query: Advanced" chapter of the *Oracle XML DB Developer's Guide*

Syntax

```
DBMS_XMLSCHEMA.PURGESHEMA (
    schemaid IN RAW);
```

Parameters

Table 214-11 PURGESHEMA Procedure Parameters

| Parameter | Description |
|-----------|-------------------------------|
| schemaid | ID of the schema to be purged |

Usage Notes

- The schema should have been originally registered for binary encoding and should have been deleted in the `HIDE` mode.
- Once a schema has been deleted in `HIDE` mode, it continues to exist in the XML DB dictionary and is used for decoding already encoded documents. The user invokes this interface when there are no stored instances encoded with this schema.
- Once the schema is purged, any space used by that schema will be reclaimed and documents encoded using the schema will raise an error if an attempt is made to decode them.
- The Schema ID can be obtained from the catalog views.

214.6.6 REGISTERSHEMA Procedures

This procedure registers the specified schema for use by the database.

The procedure is overloaded. The different functionality of each form of syntax is presented along with the definition.

Note:

As of Oracle Database 11g Release 2 (11.2) the `genbean` parameter is deprecated. Oracle recommends that you do not use this parameter in new applications. Support for this feature is for backward compatibility only.

See Also:

"XMLSCHEMA Storage and Query: Basic" chapter of the *Oracle XML DB Developer's Guide*

Syntax

Registers a schema specified as a `VARCHAR2`:

```
DBMS_XMLSCHEMA.REGISTERSCHEMA (
  schemaurl      IN  VARCHAR2,
  schemadoc      IN  VARCHAR2,
  local          IN  BOOLEAN := TRUE,
  gentypes       IN  BOOLEAN := TRUE,
  genbean        IN  BOOLEAN := FALSE,
  gentables      IN  BOOLEAN := TRUE,
  force          IN  BOOLEAN := FALSE,
  owner          IN  VARCHAR2 := NULL,
  enablehierarchy IN PLS_INTEGER := DBMS_XMLSCHEMA.ENABLE_CONTENTS,
  options        IN  PLS_INTEGER := 0);
```

Registers the schema specified as a `BFILE`. The contents of the schema document must be in the database character set:

```
DBMS_XMLSCHEMA.REGISTERSCHEMA (
  schemaurl      IN  VARCHAR2,
  schemadoc      IN  BFILE,
  local          IN  BOOLEAN := TRUE,
  gentypes       IN  BOOLEAN := TRUE,
  genbean        IN  BOOLEAN := FALSE,
  force          IN  BOOLEAN := FALSE,
  owner          IN  VARCHAR2 := NULL,
  enablehierarchy IN PLS_INTEGER := DBMS_XMLSCHEMA.ENABLE_CONTENTS,
  options        IN  PLS_INTEGER := 0);
```

Registers the schema specified as a `BFILE` and identifies the character set id of the schema document:

```

DBMS_XMLSCHEMA.REGISTERSCHEMA (
  schemaurl      IN  VARCHAR2,
  schemadoc      IN  BFILE,
  local          IN  BOOLEAN := TRUE,
  gentypes       IN  BOOLEAN := TRUE,
  genbean        IN  BOOLEAN := TRUE,
  gentables      IN  BOOLEAN := TRUE,
  force          IN  BOOLEAN := TRUE,
  owner          IN  VARCHAR2 := '',
  csid           IN  NUMBER,
  enablehierarchy IN PLS_INTEGER := DBMS_XMLSCHEMA.ENABLE_CONTENTS,
  options        IN  PLS_INTEGER := 0);

```

Registers the schema specified as a BLOB. The contents of the schema document must be in the database character set:

```

DBMS_XMLSCHEMA.REGISTERSCHEMA (
  schemaurl      IN  VARCHAR2,
  schemadoc      IN  BLOB,
  local          IN  BOOLEAN := TRUE,
  genTypes       IN  BOOLEAN := TRUE,
  genBean        IN  BOOLEAN := FALSE,
  force          IN  BOOLEAN := FALSE,
  owner          IN  VARCHAR2 := NULL,
  enablehierarchy IN PLS_INTEGER := DBMS_XMLSCHEMA.ENABLE_CONTENTS,
  options        IN  PLS_INTEGER := 0);

```

Registers the schema specified as a BLOB and identifies the character set id of the schema document:

```

DBMS_XMLSCHEMA.REGISTERSCHEMA (
  schemaurl      IN  VARCHAR2,
  schemadoc      IN  BLOB,
  local          IN  BOOLEAN := TRUE,
  gentypes       IN  BOOLEAN := TRUE,
  genbean        IN  BOOLEAN := TRUE,
  gentables      IN  BOOLEAN := TRUE,
  force          IN  BOOLEAN := TRUE,
  owner          IN  VARCHAR2 := '',
  csid           IN  NUMBER,
  enablehierarchy IN PLS_INTEGER := DBMS_XMLSCHEMA.ENABLE_CONTENTS,
  options        IN  PLS_INTEGER := 0);

```

Registers the schema specified as a CLOB

```

DBMS_XMLSCHEMA.REGISTERSCHEMA (
  schemaurl      IN  VARCHAR2,
  schemadoc      IN  CLOB,
  local          IN  BOOLEAN := TRUE,
  gentypes       IN  BOOLEAN := TRUE,
  genbean        IN  BOOLEAN := FALSE,
  force          IN  BOOLEAN := FALSE,
  owner          IN  VARCHAR2 := NULL,
  options        IN  PLS_INTEGER := 0);

```

Registers the schema specified as an XMLTYPE.

```
DBMS_XMLSCHEMA.REGISTERSCHEMA(
  schemaurl      IN VARCHAR2,
  schemadoc      IN SYS.XMLTYPE,
  local          IN BOOLEAN := TRUE,
  gentypes       IN BOOLEAN := TRUE,
  genbean        IN BOOLEAN := FALSE,
  force          IN BOOLEAN := FALSE,
  owner          IN VARCHAR2 := NULL,
  enablehierarchy IN PLS_INTEGER := DBMS_XMLSCHEMA.ENABLE_CONTENTS,
  options        IN PLS_INTEGER := 0);
```

Registers the schema specified as a BLOB. The contents of the schema document must be in the database character set:

```
DBMS_XMLSCHEMA.REGISTERSCHEMA(
  schemaurl      IN VARCHAR2,
  schemadoc      IN SYS.URITYPE,
  local          IN BOOLEAN := TRUE,
  gentypes       IN BOOLEAN := TRUE,
  genbean        IN BOOLEAN := FALSE,
  force          IN BOOLEAN := FALSE,
  owner          IN VARCHAR2 := NULL,
  enablehierarchy IN PLS_INTEGER := DBMS_XMLSCHEMA.ENABLE_CONTENTS,
  options        IN PLS_INTEGER := 0);
```

Parameters

Table 214-12 REGSITERSHEMA Procedure Parameters

| Parameter | Description |
|-----------|--|
| schemaurl | URL that uniquely identifies the schema document. This value is used to derive the path name of the schema document within the database hierarchy. Can be used inside <code>schemalocation</code> attribute of XML Schema import element. |
| schemadoc | A valid XML schema document |
| local | Is this a local or global schema? <ul style="list-style-type: none"> By default, all schemas are registered as local schemas, under <code>/sys/schemas/<username>/...</code> If a schema is registered as global, it is added under <code>/sys/schemas/PUBLIC/...</code> You need write privileges on the directory to be able to register a schema as global. |
| gentypes | Determines whether the schema compiler generates object types. By default, <code>TRUE</code> . If you use binary XML, you must be set <code>gentypes</code> to <code>FALSE</code> . |
| genbean | Determines whether the schema compiler generates Java beans. By default, <code>FALSE</code> . Oracle recommends that this parameter always be set to <code>FALSE</code> . |
| gentables | Determines whether the schema compiler generates default tables. By default, <code>TRUE</code> |
| force | If this parameter is set to <code>TRUE</code> , the schema registration will not raise errors. Instead, it creates an invalid XML schema object in case of any errors. By default, the value of this parameter is <code>FALSE</code> . |

Table 214-12 (Cont.) REGSITERSchema Procedure Parameters

| Parameter | Description |
|-----------------|---|
| owner | This parameter specifies the name of the database user owning the XML schema object. By default, the user registering the schema owns the XML schema object. This parameter can be used to register a XML schema to be owned by a different database user. |
| csid | Identifies the character set of the input schema document. If this value is 0, the schema document's encoding is determined by the current rule for "text/xml" MIME type. |
| enablehierarchy | <ul style="list-style-type: none"> ENABLE_HIERARCHY_NONE - enable hierarchy will not be called on any tables created while registering that schema ENABLE_HIERARCHY_CONTENTS - enable hierarchy will be called for all tables created during schema registration with <code>hierarchy_type as DBMS_XDBZ.ENABLE_CONTENTS</code>. This is the default. ENABLE_HIERARCHY_RESMETADATA - enable hierarchy will be called on all tables created during schema registration with <code>hierarchy_type as DBMS_XDBZ.ENABLE_RESMETADATA</code>. Users should pass in <code>DBMS_XMLSCHEMA.ENABLE_RESMETADATA</code> for schemas they intend to use as resource metadata tables. |
| options | <p>Additional options to specify how the schema should be registered. The various options are represented as bits of an integer and the options parameter should be constructed by doing a <code>BITOR</code> of the desired bits. Possible bits:</p> <ul style="list-style-type: none"> REGISTER_NODOCID - this will suppress the creation of the <code>DOCID</code> column for out of line tables. This is a storage optimization which might be desirable when we do not need to join back to the document table (for example if we do not care about rewriting certain queries that could be rewritten by making use of the <code>DOCID</code> column) REGISTER_BINARYXML - Register the schema for Binary XML REGISTER_NT_AS_IOT - Store nested tables created during schema registration as index organized tables. The default is to store nested tables as heap tables |

214.6.7 REGISTERURI Procedure

This procedure registers an XML Schema specified by a URI name.

Note:

As of Oracle Database 11g Release 2 (11.2) the `genbean` parameter is deprecated. Oracle recommends that you do not use this parameter in new applications. Support for this feature is for backward compatibility only.

Syntax

```
DBMS_XMLSCHEMA.REGISTERURI (
    schemaurl      IN  VARCHAR2,
    schemadocuri  IN  VARCHAR2,
```

```

local          IN BOOLEAN := TRUE,
gentypes      IN BOOLEAN := TRUE,
genbean       IN BOOLEAN := FALSE,
gentables     IN BOOLEAN := TRUE,
force         IN BOOLEAN := FALSE,
owner         IN VARCHAR2 := NULL,
options       IN PLS_INTEGER := 0);

```

Parameters

Table 214-13 REGISTERURI Procedure Parameters

| Parameter | Description |
|--------------|--|
| schemaurl | Uniquely identifies the schema document. Can be used inside <code>schemaLocation</code> attribute of XML Schema import element. |
| schemadocuri | Pathname (URI) corresponding to the physical location of the schema document. The URI path could be based on HTTP, FTP, DB or Oracle XML DB protocols. This function constructs a <code>URIType</code> instance using the <code>urifactory</code> , and invokes the REGISTERSHEMA Procedures . |
| local | Determines whether this is a local or global schema. By default, all schemas are registered as local schemas, under <code>/sys/schemas/<username>/...</code> . If a schema is registered as global, it is added under <code>/sys/schemas/PUBLIC/...</code> . The user needs write privileges on the directory to register a global schema. |
| gentypes | Determines whether the compiler generate object types. By default, TRUE. |
| genbean | Determines whether the compiler generate Java beans. By default, FALSE. |
| gentables | Determines whether the compiler generate default tables. TRUE by default. |
| force | TRUE: schema registration will not raise errors. Instead, it creates an invalid XML schema object in case of any errors. By default, the value of this parameter is FALSE. |
| owner | This parameter specifies the name of the database user owning the XML schema object. By default, the user registering the schema owns the XML schema object. This parameter can be used to register a XML schema to be owned by a different database user. |
| options | Additional options to specify how the schema should be registered. The various options are represented as bits of an integer and the options parameter should be constructed by doing a <code>BITOR</code> of the desired bits. Possible bits: <ul style="list-style-type: none"> REGISTER_NODOCID - this will suppress the creation of the <code>DOCID</code> column for out of line tables. This is a storage optimization which might be desirable when we do not need to join back to the document table (for example if we do not care about rewriting certain queries that could be rewritten by making use of the <code>DOCID</code> column) |

DBMS_XMLSCHEMA_ANNOTATE

The `DBMS_XMLSCHEMA_ANNOTATE` package provides an interface to manage and configure the structured storage model, mainly through the use of pre-registration schema annotations.

This chapter contains the following topics:

- [Overview](#)
- [Security Model](#)
- [Summary of DBMS_XMLSCHEMA_ANNOTATE Subprograms](#)

See Also:

Oracle XML DB Developer's Guide

215.1 DBMS_XMLSCHEMA_ANNOTATE Overview

The `DBMS_XMLSCHEMA_ANNOTATE` package contains procedures to manage and configure the structured storage model, mainly through the use of pre-registration schema annotations.

Schema annotations influence the way the XML data is stored. For example, the default table annotation assigns a user-provided name to an XML element instead of allowing the database to generate a system name. Consequently, query plans are more readable and it is easier to create constraints on that table.

215.2 DBMS_XMLSCHEMA_ANNOTATE Security Model

Owned by `XDB`, the `DBMS_XMLSCHEMA_ANNOTATE` package must be created by `SYS` or `XDB`. The `EXECUTE` privilege is granted to `PUBLIC`. Subprograms in this package are executed using the privileges of the current user.

215.3 Summary of DBMS_XMLSCHEMA_ANNOTATE Subprograms

This table lists and describes the `DBMS_XMLSCHEMA_ANNOTATE` package subprograms.

Table 215-1 DBMS_XMLSCHEMA_ANNOTATE Package Subprograms

| Subprogram | Description |
|---|--|
| ADDXDBNAMESPACE Procedure | Adds the XDB namespace required for XDB annotation |

Table 215-1 (Cont.) DBMS_XMLSCHEMA_ANNOTATE Package Subprograms

| Subprogram | Description |
|---|---|
| DISABLEDEFAULTTABLECREATION Procedure | Prevents the creation of a table for the top-level element by adding a default table attribute with an empty value to the element |
| DISABLEMAINTAINDOM Procedure | Sets the DOM fidelity attribute to <code>FALSE</code> |
| ENABLEDEFAULTTABLECREATION Procedure | Enables the creation of <code>ALL</code> top level tables by removing the empty default table name annotation |
| ENABLEMAINTAINDOM Procedure | Sets the DOM fidelity attribute to <code>TRUE</code> |
| GETSCHEMAANNOTATIONS Function | Creates a document containing the differences between the annotated XML schema and the original XML schema |
| GETSIDXDEFFROMVIEW Function | Takes a <code>XMLTABLE</code> view definition on a <code>xmltype</code> column or table and it returns a <code>CLOB</code> which can be used as parameter to create a structured <code>xmlindex</code> that backs up the <code>XMLTABLE</code> view as relational table |
| PRINTWARNINGS Procedure | Lets a user raise or suppress a warning if an annotation maps to zero nodes in the XML schema |
| REMOVEANYSTORAGE Procedure | Removes the setting of the SQL type from the <code>ANY</code> child of the complex type with the given name |
| REMOVEDEFAULTTABLE Procedure | Removes any default table attribute given for the element. After calling this procedure, the system generates table names |
| REMOVEMAINAINDOM Procedure | Removes all annotations used to maintain DOM from the given schema |
| REMOVEOUTOFFLINE Procedure | Removes any existing <code>SQLInline</code> attributes to prevent out-of-line storage |
| REMOVESQLCOLLTYPE Procedure | Removes a SQL collection type. |
| REMOVESQLNAME Procedure | Removes a <code>SQLNAME</code> from a global element |
| REMOVESQLTYPE Procedure | Removes a SQL type |
| REMOVESQLTYPE MAPPING Procedure | Removes the SQL type mapping for the given schema type. |
| REMOVETABLEPROPS Procedure | Removes the table storage properties from the <code>CREATE TABLE</code> statement |
| REMOVETIMESTAMPWITHTIMEZONE Procedure | Removes the setting of the <code>TimeStampWithTimeZone</code> datatype from all <code>dateTime</code> typed elements in the XML schema |
| SETANYSTORAGE Procedure | Assigns a SQL datatype to the <code>ANY</code> child of the complex type with the given name |
| SETDEFAULTTABLE Procedure | Sets the name of the table for the specified global element |
| SETOUTOFFLINE Procedure | Sets the <code>SQLInline</code> attribute to <code>FALSE</code> |
| SETSCHEMAANNOTATIONS Procedure | Takes the annotated differences resulting from a call to <code>DBMS_XMLSCHEMA_ANNOTATE.GETSCHEMAANNOTATIONS</code> and patches them into the provided XML schema |
| SETSQLCOLLTYPE Procedure | Assigns a SQL type name for a collection |
| SETSQLNAME Procedure | Assigns a name to the SQL attribute that corresponds to an element defined in the XML schema |
| SETSQLTYPE Procedure | Assigns a SQL type to a global object |

Table 215-1 (Cont.) DBMS_XMLSCHEMA_ANNOTATE Package Subprograms

| Subprogram | Description |
|--|---|
| SETSQLYPEMAPPING Procedure | Defines a mapping of schema type and SQL type |
| SETTABLEPROPS Procedure | Specifies properties in the TABLE storage clause that is appended to the default CREATE TABLE statement |
| SETTIMESTAMPWITHTIMEZONE Procedure | Sets the TIMESTAMPWITHTIMEZONE datatype to all dateTime typed elements in the XML schema |

215.3.1 ADDXDBNAMESPACE Procedure

This procedure adds the XDB namespace required for XDB annotation.

Syntax

```
DBMS_XMLSCHEMA_ANNOTATE.ADDXDBNAMESPACE (
    xmlschema      IN OUT XMLTYPE);
```

Parameters

Table 215-2 ADDXDBNAMESPACE Procedure Parameters

| Parameter | Description |
|-----------|---|
| xmlschema | Gets an XML Schema as XMLTYPE, performs the annotation and returns it |

Usage Notes

This procedure is called implicitly by any other procedure that adds a schema annotation. Since there is no reason to add an XDB namespace without other annotations, this procedure is most likely called by other annotations procedures and not by the user directly.

215.3.2 DISABLEDEFAULTTABLECREATION Procedure

This procedure prevents the creation of a table for the top-level element by adding a default table attribute with an empty value to the element. The first overload applies to a specified top-level element and the second applies to all top-level elements. The procedure always overwrites. This is equivalent to using the schema annotation `xdb:defaultTable=""` for the top-level element or elements.

Syntax

```
DBMS_XMLSCHEMA_ANNOTATE.DISABLEDEFAULTTABLECREATION (
    xmlschema      IN OUT XMLType,
    globalElementName IN VARCHAR2);
```

```
DBMS_XMLSCHEMA_ANNOTATE.DISABLEDEFAULTTABLECREATION (
    xmlschema      IN OUT XMLType);
```

Parameters

Table 215-3 DISABLEDEFAULTTABLECREATION Procedure Parameters

| Parameter | Description |
|-------------------|--|
| xmlschema | XML schema to be annotated |
| globalElementName | Name of the global element in the schema |

Example

The purchaseOrder element will have an annotation similar to `xdb:defaultTable=""`.

```
DECLARE
    xml_schema XMLTYPE;
BEGIN
    SELECT out INTO xml_schema FROM annotation_tab;
    DBMS_XMLSCHEMA_ANNOTATE.DISABLEDEFAULTTABLECREATION(xml_schema,
        'purchaseOrder');
    UPDATE annotation_tab SET out = xml_schema;
END;
/
```

215.3.3 DISABLEMAINTAINDOM Procedure

This procedure sets the DOM fidelity attribute to `FALSE`.

There are two overloads. The first sets DOM fidelity attribute to `FALSE` for all complex types, and the second sets it to `FALSE` for the named complex type. This is equivalent to adding `xdb:maintainDOM="false"` on all or specified complex types respectively.

Syntax

```
DBMS_XMLSCHEMA_ANNOTATE.DISABLEMAINTAINDOM (
    xmlschema          IN OUT XMLType,
    overwrite          IN BOOLEAN default TRUE);
```

```
DBMS_XMLSCHEMA_ANNOTATE.DISABLEMAINTAINDOM (
    xmlschema          IN OUT XMLType,
    complexTypeName   IN VARCHAR2,
    overwrite          IN BOOLEAN default TRUE);
```

Parameters

Table 215-4 DISABLEMAINTAINDOM Procedure Parameters

| Parameter | Description |
|------------------|---|
| xmlschema | The XML schema to be annotated |
| complexTypeNames | The name of the complex type |
| overwrite | A boolean that indicates whether or not the procedure overwrites element attributes. The default is <code>TRUE</code> |

215.3.4 ENABLEDEFAULTTABLECREATION Procedure

This procedure enables the creation of ALL top level tables by removing the empty default table name annotation.

Syntax

```
DBMS_XMLSCHEMA_ANNOTATE.ENABLEDEFAULTTABLECREATION (
    xmlschema          IN OUT  XMLTYPE);

DBMS_XMLSCHEMA_ANNOTATE.ENABLEDEFAULTTABLECREATION (
    xmlschema          IN OUT  XMLTYPE,
    globalelementName IN     VARCHAR2);;
```

Parameters

Table 215-5 ENABLEDEFAULTTABLECREATION Procedure Parameters

| Parameter | Description |
|-------------------|--|
| xmlschema | The XML schema to be annotated |
| gloablElementName | Name of the global element in the schema |

Usage Notes

This procedure does not affect elements that have a default table name.

215.3.5 ENABLEMAINTAINDOM Procedure

This overloaded procedure sets the DOM fidelity attribute to `TRUE`.

There are two overloads. The first sets DOM fidelity attribute to `TRUE` for all complex types, and the second sets it to `TRUE` for the named complex type.

Syntax

```
DBMS_XMLSCHEMA_ANNOTATE.ENABLEMAINTAINDOM (
    xmlschema          IN OUT XMLType,
    overwrite          IN BOOLEAN default TRUE);

DBMS_XMLSCHEMA_ANNOTATE.ENABLEMAINTAINDOM (
    xmlschema          IN OUT XMLType,
    complexTypeName    IN VARCHAR2,
    overwrite          IN BOOLEAN default TRUE);;
```

Parameters

Table 215-6 ENABLEMAINTAINDOM Procedure Parameters

| Parameter | Description |
|-----------------|--------------------------------|
| xmlschema | The XML schema to be annotated |
| complexTypename | The name of the complex type |

Table 215-6 (Cont.) ENABLEMAINTAINDOM Procedure Parameters

| Parameter | Description |
|-----------|--|
| overwrite | A boolean that indicates whether or not the procedure overwrites element attributes. The default is TRUE |

215.3.6 GETSCHEMAANNOTATIONS Function

This function creates a document containing the differences between the annotated XML schema and the original XML schema.

Syntax

```
DBMS_XMLSCHEMA_ANNOTATE.GETSCHEMAANNOTATIONS (
    xmlschema IN xmlType)
RETURN XMLType;
```

Parameters

Table 215-7 GETSCHEMAANNOTATIONS Function Parameters

| Parameter | Description |
|-----------|-------------------------|
| xmlschema | The original XML schema |

Return Values

This function returns the document `annotations.xml` as an XMLType.

Usage Notes

This function saves all annotations in one document, named `annotations`, and returns it. With this document, you can apply all annotations to a non-annotated schema, using `DBMS_XMLSCHEMA_ANNOTATE.GETSCHEMAANNOTATIONS`.

`DBMS_XMLSCHEMA_ANNOTATE.GETSCHEMAANNOTATIONS` is not available on Oracle Database release 10.2 (only Oracle Database release 11.x).

See Also:

[SETSCHEMAANNOTATIONS Procedure](#)

Example

For an example of `DBMS_XMLSCHEMA_ANNOTATE.GETSCHEMAANNOTATIONS`, see the example in [SETSCHEMAANNOTATIONS Procedure](#).

215.3.7 GETSIDXDEFFROMVIEW Function

This function takes a XMLTABLE view definition on a xmltype column or table and it returns a CLOB which can be used as parameter to create a structured xmlindex that backs up the XMLTABLE view as relational table.

Syntax

```
DBMS_XMLSCHEMA_ANNOTATE.GETSIDXDEFFROMVIEW (
    viewName    IN xmlType)
    RETURN CLOB;
```

Parameters

Table 215-8 GETSIDXDEFFROMVIEW Function Parameters

| Parameter | Description |
|-----------|-------------------------|
| viewName | The original XML schema |

Return Values

This function returns a CLOB which can be used as parameter to create a structured xmlindex that backs up the XMLTABLE view as relational table.

215.3.8 PRINTWARNINGS Procedure

This procedure lets a user raise or suppress a warning if an annotation maps to zero nodes in the XML schema.

Syntax

```
DBMS_XMLSCHEMA_ANNOTATE.PRINTWARNINGS (
    value      IN BOOLEAN DEFAULT TRUE);
```

Parameters

Table 215-9 PRINTWARNINGS Procedure Parameters

| Parameter | Description |
|-----------|--|
| val | For the NO MATCHING ELEMENTS FOUND error message to be raised val must be set to TRUE. In cases in which user wishes to suppress this warning, set to FALSE. |

Usage Notes

If an annotation maps to more than one node in the XML schema, this raise the error ANNOTATION MAPS TO MULTIPLE ELEMENTS. In this case no annotation is performed, and the user must correct the parameters to the procedure call to refer to a unique node in the XML schema.

215.3.9 REMOVEANYSTORAGE Procedure

This procedure removes the setting of the SQL type from the ANY child of the complex type with the given name.

Syntax

```
DBMS_XMLSCHEMA_ANNOTATE.REMOVEANYSTORAGE (
    xmlschema          IN OUT XMLType,
    complexTypeName IN VARCHAR2);
```

Parameters

Table 215-10 REMOVEANYSTORAGE Procedure Parameters

| Parameter | Description |
|-----------------|---------------------------------|
| xmlschema | The XML schema to be annotated. |
| complexTypeName | The name of the complex type. |

Usage Notes

This procedure reverses the [SETANYSTORAGE Procedure](#).

215.3.10 REMOVEDEFAULTTABLE Procedure

This procedure removes any default table attribute given for the element.

After calling this procedure, the system generates table names. This procedure always overwrites.

Syntax

```
DBMS_XMLSCHEMA_ANNOTATE.REMOVEDEFAULTTABLE (
    xmlschema          IN OUT XMLTYPE,
    globalElementName IN VARCHAR2);
```

Parameters

Table 215-11 REMOVEDEFAULTTABLE Procedure Parameters

| Parameter | Description |
|-------------------|--|
| xmlschema | XML schema to be annotated |
| globalElementName | Name of the global element in the schema |

Example

Annotations can be verified anytime using "select out from annotation_tab".

```
--The purchaseOrder element will have no annotation for defaultTable.
DECLARE
    xml_schema XMLTYPE;
```

```

BEGIN
  SELECT out INTO xml_schema FROM annotation_tab;
  DBMS_XMLSCHEMA_ANNOTATE.REMOVEDEFAULTTABLE(xml_schema,
                                             'purchaseOrder');
  UPDATE annotation_tab SET out = xml_schema;
END;
/

```

215.3.11 REMOVEMAINTAINDOM Procedure

This procedure removes all annotations used to maintain DOM from the given schema.

Syntax

```

DBMS_XMLSCHEMA_ANNOTATE.REMOVEMAINTAINDOM (
  xmlschema      IN OUT XMLType);

```

Parameters

Table 215-12 REMOVEMAINTAINDOM Procedure Parameters

| Parameter | Description |
|-----------|--------------------------------|
| xmlschema | The XML schema to be annotated |

215.3.12 REMOVEOUTOFLINE Procedure

This procedure removes any existing `SQLInline` attributes to prevent out-of-line storage.

There are three overloads.

Syntax

Removes the `SQLInline` attribute for the named element.

```

DBMS_XMLSCHEMA_ANNOTATE.REMOVEOUTOFLINE (
  xmlschema      IN OUT XMLType,
  elementName    IN      VARCHAR2,
  elementType    IN      VARCHAR2,
  overwrite      IN      BOOLEAN default TRUE);

```

Removes the `SQLInline` attribute for the object specified by its global object and local element names.

```

DBMS_XMLSCHEMA_ANNOTATE.REMOVEOUTOFLINE (
  xmlschema      IN OUT XMLType,
  globalObject   IN      VARCHAR2,
  globalObjectName IN    VARCHAR2,
  localElementName IN    VARCHAR2);

```

Removes the `SQLInline` attribute for the referenced global element.

```

DBMS_XMLSCHEMA_ANNOTATE.REMOVEOUTOFLINE (
  xmlschema      IN OUT XMLType,
  reference      IN      VARCHAR2);

```

Parameters

Table 215-13 REMOVEOUTOFFLINE Procedure Parameters

| Parameter | Description |
|------------------|---|
| xmlschema | The XML schema to be annotated |
| elementName | The element name |
| elementType | The element type |
| globalObject | The global object (global complex type or global element) |
| globalObjectName | The name of the global object |
| localElementName | The name of a local element that descends from the global element |
| reference | A reference to a global element |
| overwrite | A boolean that indicates whether or not the procedure overwrites element attributes. The default is <code>TRUE</code> . |

Usage Notes

This procedure reverses [SETOUTOFFLINE Procedure](#).

215.3.13 REMOVESQLCOLLTYPE Procedure

This procedure removes a SQL collection type.

The first overload removes the SQL collection type corresponding to the named element and the second overload removes the type from the XML element inside the complex type.

Syntax

```
DBMS_XMLSCHEMA_ANNOTATE.REMOVESQLCOLLTYPE (
    xmlschema IN OUT XMLType,
    elementName IN VARCHAR2);
```

```
DBMS_XMLSCHEMA_ANNOTATE.REMOVESQLCOLLTYPE (
    xmlschema IN OUT XMLType,
    globalObject IN VARCHAR2,
    globalName IN VARCHAR2,
    localElementName IN VARCHAR2);
```

Parameters

Table 215-14 REMOVESQLCOLLTYPE Procedure Parameters

| Parameter | Description |
|--------------|---|
| xmlschema | The XML schema to be annotated |
| elementName | The element name |
| globalObject | The global object (global complex type or global element) |
| globalName | The name of the global object |

Table 215-14 (Cont.) REMOVESQLCOLLTYPE Procedure Parameters

| Parameter | Description |
|------------------|---|
| localElementName | The name of a local element that descends from the global element |

Usage Notes

This procedure reverses the [SETSQLCOLLTYPE Procedure](#).

215.3.14 REMOVESQLNAME Procedure

This procedure removes a `SQLNAME` from a global element.

Syntax

```
DBMS_XMLSCHEMA_ANNOTATE.REMOVESQLNAME (
    xmlschema          IN OUT  XMLType,
    globalObject       IN      VARCHAR2,
    globalObjectName   IN      VARCHAR2,
    localObject        IN      VARCHAR2,
    localObjectName    IN      VARCHAR2,
    sqlName            IN      VARCHAR2,
    overwrite          IN      BOOLEAN DEFAULT TRUE);
```

Parameters**Table 215-15 REMOVESQLNAME Procedure Parameters**

| Parameter | Description |
|------------------|---|
| xmlschema | XML schema to be annotated |
| globalObject | Global object (global complex type or global element) |
| globalObjectName | Name of the global object |
| localObject | Object descended from the global object |
| localObjectName | Name of the local object |
| sqlName | Name of the SQL attribute that corresponds to the element defined in the XML schema |
| overwrite | Boolean that indicates whether or not the procedure overwrites element attributes. The default is <code>TRUE</code> . |

Example

The `shipTo` element will have an annotation similar to `xdb:SQLName="SHIPTO_SQLNAME"`.

```
DECLARE
    xml_schema  XMLTYPE;
BEGIN
    SELECT out INTO xml_schema FROM annotation_tab;
    DBMS_XMLSCHEMA_ANNOTATE.SETSQLNAME (xml_schema,
                                        'element', 'purchaseOrder',
                                        'element', 'shipTo',
                                        'SHIPTO_SQLNAME');
```

```

UPDATE annotation_tab SET out = xml_schema;
END;
/

```

215.3.15 REMOVESQLTYPE Procedure

This procedure removes a SQL type.

The first overload removes a SQL type from a global element and the second overload removes the type from a global element inside the complex type.

Syntax

```

DBMS_XMLSCHEMA_ANNOTATE.REMOVESQLTYPE (
  xmlschema in out XMLType,
  globalElementName IN VARCHAR2);

```

```

DBMS_XMLSCHEMA_ANNOTATE.REMOVESQLTYPE (
  xmlschema          IN OUT XMLType,
  globalObject       IN VARCHAR2,
  globalObjectName   IN VARCHAR2,
  localObject        IN VARCHAR2,
  localObjectName    IN VARCHAR2);

```

Parameters

Table 215-16 REMOVESQLTYPE Procedure Parameters

| Parameter | Description |
|-------------------|---|
| xmlschema | XML schema to be annotated. |
| globalObject | Global object (global complex type or global element) |
| globalElementName | Name of the global element. |
| globalObjectName | Name of the global object |
| localObject | Object descended from the global object |
| localObjectName | Name of the local object |

Usage Notes

This procedure reverses the [SETSQLTYPE Procedure](#).

215.3.16 REMOVESQLTYPEEMAPPING Procedure

This procedure removes the SQL type mapping for the given schema type.

Syntax

```

DBMS_XMLSCHEMA_ANNOTATE.REMOVESQLTYPEEMAPPING (
  xmlschema          IN OUT XMLType,
  schemaTypeName    IN VARCHAR2);

```

Parameters

Table 215-17 REMOVESQLTYPE MAPPING Procedure Parameters

| Parameter | Description |
|----------------|----------------------------|
| xmlschema | XML schema to be annotated |
| schemaTypeName | Name of the schema type |

Usage Notes

This procedure reverses the [SETSQLTYPE MAPPING Procedure](#).

215.3.17 REMOVETABLEPROPS Procedure

This procedure removes the table storage properties from the `CREATE TABLE` statement.

This procedure is overloaded. Each overload has different parameter requirements as indicated.

Syntax

```
DBMS_XMLSCHEMA_ANNOTATE.REMOVETABLEPROPS (
  xmlschema          IN OUT  XMLTYPE,
  globalElementName IN     VARCHAR2);
```

```
DBMS_XMLSCHEMA_ANNOTATE.REMOVETABLEPROPS (
  xmlschema          IN OUT  XMLTYPE,
  globalObject       IN     VARCHAR2,
  globalObjectName  IN     VARCHAR2,
  localElementName  IN     VARCHAR2);
```

Parameters

Table 215-18 REMOVETABLEPROPS Procedure Parameters

| Parameter | Description |
|-------------------|---|
| xmlschema | XML schema to be annotated |
| globalElementName | Name of the global element in the schema |
| globalObject | Global object (global complex type or global element) |
| globalObjectName | Name of the global object |
| localElementName | Name of a local element that descends from the global element |

Usage Notes

This procedure reverses the [SETTABLEPROPS Procedure](#).

215.3.18 REMOVETIMESTAMPWITHTIMEZONE Procedure

This procedure removes the setting of the `TimeStampWithTimeZone` datatype from all `dateTime` typed elements in the XML schema.

Syntax

```
DBMS_XMLSCHEMA_ANNOTATE.REMOVETIMESTAMPWITHTIMEZONE (
    xmlschema          IN OUT  XMLTYPE);
```

```
DBMS_XMLSCHEMA_ANNOTATE.REMOVETIMESTAMPWITHTIMEZONE (
    xmlschema          IN OUT  XMLTYPE,
    schemaTypeName     IN     VARCHAR2);
```

Parameters

Table 215-19 REMOVETIMESTAMPWITHTIMEZONE Procedure Parameters

| Parameter | Description |
|-----------------------------|----------------------------|
| <code>xmlschema</code> | XML schema to be annotated |
| <code>schemaTypeName</code> | Name of the schema type |

Usage Notes

This procedure reverses the [SETTIMESTAMPWITHTIMEZONE Procedure](#).

215.3.19 SETANYSTORAGE Procedure

This procedure assigns a SQL datatype to the `ANY` child of the complex type with the given name.

Syntax

```
DBMS_XMLSCHEMA_ANNOTATE.SETANYSTORAGE (
    xmlschema          IN OUT  XMLType,
    complexTypeName   IN     VARCHAR2,
    sqlTypeName       IN     VARCHAR2,
    overwrite         IN     BOOLEAN DEFAULT TRUE);
```

Parameters

Table 215-20 SETANYSTORAGE Procedure Parameters

| Parameter | Description |
|------------------------------|---|
| <code>xmlschema</code> | XML schema to be annotated |
| <code>complexTypeName</code> | Name of the complex type |
| <code>sqlTypeName</code> | Name of the SQL type |
| <code>overwrite</code> | Boolean that indicates whether or not the procedure overwrites element attributes. The default is <code>TRUE</code> . |

Example

The `xsd:any child of complex type Items` is assigned an annotation similar to `xdb:SQLType="VARCHAR"`.

```
DECLARE xml_schema XMLTYPE; BEGIN SELECT out INTO xml_schema FROM
annotation_tab; DBMS_XMLSCHEMA_ANNOTATE.setAnyStorage
(xml_schema,
'Items', 'VARCHAR'); UPDATE annotation_tab
SET out = xml_schema; END;
/
```

215.3.20 SETDEFAULTTABLE Procedure

This procedure sets the name of the table for the specified global element. This is equivalent to using the schema annotation `xdb:defaultTable="<default_table_name>"` for the top-level element.

Syntax

```
DBMS_XMLSCHEMA_ANNOTATE.SETDEFAULTTABLE (
xmlschema          IN OUT XMLTYPE,
globalElementName IN      VARCHAR2,
tableName          IN      VARCHAR2,
overwrite          IN      BOOLEAN  DEFAULT TRUE);
```

Parameters

Table 215-21 SETDEFAULTTABLE Procedure Parameters

| Parameter | Description |
|--------------------------------|---|
| <code>xmlschema</code> | XML schema to be annotated |
| <code>globalElementName</code> | Name of the global element in the schema |
| <code>tableName</code> | Name being assigned to the table |
| <code>overwrite</code> | Boolean that indicates whether or not the procedure overwrites element attributes. The default is <code>TRUE</code> . |

215.3.21 SETOUTOFFLINE Procedure

This procedure sets the `SQLInline` attribute to `FALSE`, that is, it sets `xdb:SQLInline=FALSE`.

This forces XDB to store the corresponding elements in the XML document out-of-line as rows in a separate `XMLType` table. XDB stores references to each row of the `XMLType` table in a link table that is maintained by the main table

This procedure can improve performance in some situations if the out-of-line table acts as the driver for the query. Storing elements in an out-of-line table also reduces the numbers of columns in the base table, thus avoiding '1000 column limit' errors during XML schema registration, when some elements have complex types with many elements.

Also See:

Oracle XML DB Developer's Guide

There are three overloads.

Syntax

Sets the `SQLInline` attribute to `FALSE`, forcing out-of-line storage for the named element.

```
DBMS_XMLSCHEMA_ANNOTATE.SETOUTOFFLINE (
  xmlschema          IN OUT XMLType,
  elementName        IN      VARCHAR2,
  elementType         IN      VARCHAR2,
  defaultTableName   IN      VARCHAR2,
  overwrite           IN      BOOLEAN DEFAULT TRUE);
```

Sets the `SQLInline` attribute to `FALSE`, forcing out-of-line storage for the element specified by its local and global name.

```
DBMS_XMLSCHEMA_ANNOTATE.SETOUTOFFLINE (
  xmlschema          IN OUT XMLType,
  globalObject        IN      VARCHAR2,
  globalObjectName   IN      VARCHAR2,
  localElementName   IN      VARCHAR2,
  defaultTableName   IN      VARCHAR2,
  overwrite           IN      BOOLEAN DEFAULT TRUE);
```

Sets the `SQLInline` attribute to `FALSE` to force out-of-line storage and sets the default table name for all references to a particular global element.

```
DBMS_XMLSCHEMA_ANNOTATE.SETOUTOFFLINE (
  xmlschema          IN OUT XMLType,
  reference           IN      VARCHAR2,
  defaultTableName   IN      VARCHAR2,
  overwrite           IN      BOOLEAN DEFAULT TRUE);
```

Parameters

Table 215-22 SETOUTOFFLINE Procedure Parameters

| Parameter | Description |
|-------------------------------|--|
| <code>xmlschema</code> | The XML schema to be annotated. |
| <code>elementName</code> | The element name |
| <code>elementType</code> | The element type |
| <code>defaultTableName</code> | The name of the default table. |
| <code>globalObject</code> | The global object (global complex type or global element) |
| <code>globalObjectName</code> | The name of the global object |
| <code>localElementName</code> | The name of a local element that descends from the global element. |
| <code>reference</code> | A reference to a global element |

Table 215-22 (Cont.) SETOUTOFLINE Procedure Parameters

| Parameter | Description |
|-----------|---|
| overwrite | A boolean that indicates whether or not the procedure overwrites element attributes. The default is TRUE. |

Usage Notes

After XML schema registration and before loading XML instance data, use `DBMS_XMLSTORAGE_MANAGE.SCOPEXMLREFERENCES()` to make these references scope to the out-of-line table only. This ensures better query performance later on.

Example

The following example illustrates the third overloaded method. The element comment will have an annotation similar to `xdb:defaultTable="CMMNT_DEFAULT_TABLE"`

```
DECLARE
    xml_schema xmltype;
BEGIN
    SELECT OUT INTO xml_schema FROM annotation_tab;

    DBMS_XMLSCHEMA_ANNOTATE.SETOUTOFLINE (xml_schema,
                                          'ipo:comment',
                                          'CMMNT_DEFAULT_TABLE');

    UPDATE annotation_tab SET OUT = xml_schema;
END;
/
```

215.3.22 SETSCHEMAANNOTATIONS Procedure

This procedure takes the annotated differences resulting from a call to `DBMS_XMLSCHEMA_ANNOTATE.GETSCHEMAANNOTATIONS` and patches them into the provided XML schema.

Syntax

```
DBMS_XMLSCHEMA_ANNOTATE.SETSCHEMAANNOTATIONS (
    xmlschema      IN OUT xmlType,
    annotations    IN VARCHAR2);
```

Parameters

Table 215-23 SETSCHEMAANNOTATIONS Procedure Parameters

| Parameter | Description |
|-------------|--|
| xmlschema | An XML schema to be patched. |
| annotations | The differences document produced by calling <code>DBMS_XMLSCHEMA_ANNOTATE.GETSCHEMAANNOTATIONS</code> on the original XML schema and an annotated XML schema. |

Usage Notes

DBMS_XMLSCHEMA_ANNOTATE.SETSCHEMAANNOTATIONS is not available on Oracle Database release 10.2 (only Oracle Database release 11.x).

See Also:

[GETSCHEMAANNOTATIONS Function](#)

Example

The following example illustrates DBMS_XMLSCHEMA_ANNOTATE.SETSCHEMAANNOTATIONS shown here and [GETSCHEMAANNOTATIONS Function](#).

```

-- test getannotations and apply them
declare
  xml_schema xmltype;
  xml_schema2 xmltype;
  annotations xmltype;
begin
  select out into xml_schema from annotation_tab;

  -- get the annotations from the schema
  annotations := DBMS_XMLSCHEMA_ANNOTATE.getSchemaAnnotations (xml_schema);

  -- apply the annotations to the schema
  select inp into xml_schema2 from annotation_tab;

  DBMS_XMLSCHEMA_ANNOTATE.setSchemaAnnotations(xml_schema2, annotations);

  update annotation_tab t set t.out = xml_schema2;
end;
/

```

215.3.23 SETSQLCOLLTYPE Procedure

This procedure assigns a SQL type name for a collection. A collection is a global or local element with `maxOccurs>1`.

Using this procedure, XDB creates SQLTypes with the user-defined names provided.

There are two overloads. The first sets the name of the SQL collection type corresponding to an XML element and the second to an XML element inside the specified complex type.

Syntax

```

DBMS_XMLSCHEMA_ANNOTATE.SETSQLCOLLTYPE (
  xmlschema          IN OUT  XMLTYPE,
  elementName       IN      VARCHAR2,
  sqlCollType       IN      VARCHAR2,
  overwrite         IN      BOOLEAN DEFAULT TRUE);

```

```

DBMS_XMLSCHEMA_ANNOTATE.SETSQLCOLLTYPE (
  xmlschema          IN OUT XMLType,
  globalObject       IN  VARCHAR2,

```

```

globalObjectName IN VARCHAR2,
localElementName IN VARCHAR2,
sqlCollType     IN VARCHAR2,
overwrite       IN BOOLEAN default TRUE );

```

Parameters

Table 215-24 SETSQLCOLLTYPE Procedure Parameters

| Parameter | Description |
|------------------|---|
| xmlschema | The XML schema to be annotated |
| elementName | The element name |
| sqlCollType | The SQL collection type |
| globalObject | The global object (global complex type or global element) |
| globalObjectName | The name of the global object |
| localElementName | The name of a local element that descends from the global element |
| overwrite | A boolean that indicates whether or not the procedure overwrites element attributes. The default is TRUE. |

Example

The `item` element will have an annotation similar to `xdb:SQLCollType="ITEM_SQL_COL_TYPE"`.

```

declare
  xml_schema xmltype;
begin
  SELECT out INTO xml_schema FROM annotation_tab;
  DBMS_XMLSCHEMA_ANNOTATE.setSQLCollType (xml_schema,
                                          'item',
                                          'ITEM_SQL_COL_TYPE',TRUE);
  UPDATE annotation_tab SET out = xml_schema;
end;

```

215.3.24 SETSQLNAME Procedure

This procedure assigns a name to the SQL attribute that corresponds to an element defined in the XML schema.

Syntax

```

DBMS_XMLSCHEMA_ANNOTATE.SETSQLNAME (
  xmlschema      IN OUT XMLType,
  globalObject   IN     VARCHAR2,
  globalObjectName IN   VARCHAR2,
  localObject    IN     VARCHAR2,
  localObjectName IN   VARCHAR2,
  sqlName        IN     VARCHAR2,
  overwrite      IN     BOOLEAN DEFAULT TRUE);

```

Parameters

Table 215-25 SETSQLNAME Procedure Parameters

| Parameter | Description |
|------------------|---|
| xmlschema | XML schema to be annotated |
| globalObject | Global object (global complex type or global element) |
| globalObjectName | Name of the global object |
| localObject | Object descended from the global object |
| localObjectName | Name of the local object |
| sqlName | Name of the SQL attribute that corresponds to the element defined in the XML schema |
| overwrite | Boolean that indicates whether or not the procedure overwrites element attributes. The default is TRUE. |

Example

The `shipTo` element will have an annotation similar to `xdb:SQLName="SHIPTO_SQLNAME"`.

```
DECLARE
    xml_schema XMLTYPE;
BEGIN
    SELECT out INTO xml_schema FROM annotation_tab;
    DBMS_XMLSCHEMA_ANNOTATE.SETSQLNAME (xml_schema,
                                        'element', 'purchaseOrder',
                                        'element', 'shipTo',
                                        'SHIPTO_SQLNAME');
    UPDATE annotation_tab SET out = xml_schema;
END;
/
```

215.3.25 SETSQLTYPE Procedure

This procedure assigns a SQL type to a global object.

There are two overloads. The first overload assigns a SQL Type to a global object, such as a global element or global complex type and the second to a local object.

Syntax

```
DBMS_XMLSCHEMA_ANNOTATE.SETSQLTYPE (
    xmlschema          IN OUT XMLTYPE,
    globalElementName IN   VARCHAR2,
    sqlType            IN   VARCHAR2,
    overwrite          IN   BOOLEAN DEFAULT TRUE);
```

```
DBMS_XMLSCHEMA_ANNOTATE.SETSQLTYPE (
    xmlschema          IN OUT XMLTYPE,
    globalObject       IN   VARCHAR2,
    globalObjectName  IN   VARCHAR2,
    localObject        IN   VARCHAR2,
    localObjectName    IN   VARCHAR2,
```

```

sqlType          IN          VARCHAR2,
overwrite        IN          BOOLEAN DEFAULT TRUE);

```

Parameters

Table 215-26 SETSQLTYPE Procedure Parameters

| Parameter | Description |
|-------------------|---|
| xmlschema | XML schema to be annotated |
| globalObject | Global object (global complex type or global element) |
| globalObjectName | Name of the global object |
| globalElementName | Name of the global element |
| localObject | Object descended from the global object |
| localObjectName | Name of the local object |
| sqlType | SQL type assigned to the named global element |
| overwrite | Boolean that indicates whether or not the procedure overwrites element attributes. The default is TRUE. |

Example

The `purchaseOrder` element will have an annotation similar to `xdb:SQLType="PO_SQLTYPE"` and the `shipTo` element has one similar to `xdb:SQLType="VARCHAR"`.

```

DECLARE
    xml_schema xmltype;
BEGIN
    SELECT out INTO xml_schema FROM annotation_tab;
    DBMS_XMLSCHEMA_ANNOTATE.setSQLType (xml_schema,
                                        'purchaseOrder',
                                        'PO_SQLTYPE');

    UPDATE annotation_tab SET out = xml_schema;
END;
/

DECLARE xml_schema xmltype;BEGIN SELECT out INTO xml_schema FROM annotation_tab;
DBMS_XMLSCHEMA_ANNOTATE.setSQLType
(xml_schema,
'element','purchaseOrder',
'element','shipTo',
'VARCHAR'); UPDATE
annotation_tab SET out = xml_schema;END;
/

```

215.3.26 SETSQLTYPE MAPPING Procedure

This procedure defines a mapping of schema type and SQL type.

If you use this procedure, you do not need to call the `SETSQLTYPE` procedure on all instances of the schema type; instead the procedure traverses the schema and assigns the SQL type automatically.

Syntax

```

DBMS_XMLSCHEMA_ANNOTATE.SETSQLTYPE MAPPING (
    xmlschema          IN OUT  XMLType,

```

```

schemaTypeName    IN      VARCHAR2,
sqlTypeName       IN      VARCHAR2,
overwrite         IN      BOOLEAN DEFAULT TRUE);

```

Parameters

Table 215-27 SETSQLTYPE_MAPPING Procedure Parameters

| Parameter | Description |
|----------------|--|
| xmlschema | XML schema to be annotated |
| schemaTypeName | Schema type |
| sqlTypeName | Name of the SQL type |
| overwrite | Boolean that indicates whether or not the procedure overwrites element attributes. The default is TRUE |

Example

The attribute `orderDate` will have an annotation similar to `xdb:SQLType="DATE"`.

```

declare  xml_schema xmltype;beginSELECT out INTO xml_schema FROM
annotation_tab;DBMS_XMLSCHEMA_ANNOTATE.setSQLTypeMapping
(xml_schema,
'date',
'DATE');UPDATE annotation_tab
SET out = xml_schema;end;
/

```

215.3.27 SETTABLEPROPS Procedure

This procedure specifies properties in the `TABLE` storage clause that is appended to the default `CREATE TABLE` statement.

There are two overloads with different parameter requirements, as indicated:

Syntax

```

DBMS_XMLSCHEMA_ANNOTATE.SETTABLEPROPS (
  xmlschema        IN OUT XMLType,
  globalelementName  IN  VARCHAR2,
  tableProps       IN  VARCHAR2,
  overwrite        IN  BOOLEAN DEFAULT TRUE);

```

```

DBMS_XMLSCHEMA_ANNOTATE.SETTABLEPROPS (
  xmlschema        IN OUT XMLTYPE,
  globalObject     IN  VARCHAR2,
  globalObjectName IN  VARCHAR2,
  localelementName IN  VARCHAR2,
  tableProps       IN  VARCHAR2,
  overwrite        IN  BOOLEAN DEFAULT TRUE);

```

Parameters

Table 215-28 SETTABLEPROPS Procedure Parameters

| Parameter | Description |
|-------------------|---|
| xmlschema | XML schema to be annotated |
| globalElementName | Name of the global element in the schema |
| tableProps | Table properties |
| globalObject | Global object (global complex type or global element) |
| globalObjectName | Name of the global object |
| localElementName | Name of a local element that descends from the global element |
| overwrite | Boolean that indicates whether or not the procedure overwrites element attributes. The default is TRUE. |

Example

The `purchaseOrder` element will have an annotation similar to `xdb:tableProps="CACHE"`.

```
DECLARE xml_schema XMLTYPE; BEGIN SELECT out INTO xml_schema FROM annotation_tab;
DBMS_XMLSCHEMA_ANNOTATE.SETTABLEPROPS(xml_schema,
'purchaseOrder' , 'CACHE'); UPDATE annotation_tab SET out = xml_schema; END;
/
```

215.3.28 SETTIMESTAMPWITHTIMEZONE Procedure

This procedure sets the `TIMESTAMPWITHTIMEZONE` datatype to all `dateTime` typed elements in the XML schema.

This is equivalent to adding `xdb:SQLType="TIMESTAMP WITH TIME ZONE"` to all `dateTime` objects.

Syntax

```
DBMS_XMLSCHEMA_ANNOTATE.SETTIMESTAMPWITHTIMEZONE (
xmlschema IN OUT XMLTYPE,
overwrite IN BOOLEAN DEFAULT TRUE);
```

Parameters

Table 215-29 SETTIMESTAMPWITHTIMEZONE Procedure Parameters

| Parameter | Description |
|-----------|---|
| xmlschema | XML schema to be annotated |
| overwrite | Boolean that indicates whether or not the procedure overwrites element attributes. The default is TRUE. |

DBMS_XMLSCHEMA_UTIL

The `DBMS_XMLSCHEMA_UTIL` package provides an interface for XML schema validation.

This chapter contains the following topics:

- [DBMS_XMLSCHEMA_UTIL Security Model](#)
- [Summary of DBMS_XMLSCHEMA_UTIL Subprograms](#)

See Also:

- [Oracle XML DB Developer's Guide](#)

216.1 DBMS_XMLSCHEMA_UTIL Security Model

Applications must have the `EXECUTE` privilege on the `DBMS_XMLSCHEMA_UTIL` package

216.2 Summary of DBMS_XMLSCHEMA_UTIL Subprograms

This topic lists the `DBMS_XMLSCHEMA_UTIL` subprograms in alphabetical order and briefly describes them.

Table 216-1 *DBMS_XMLSCHEMA_UTIL Package Subprograms*

| Subprogram | Description |
|-------------------------------------|--|
| CONFORMING Function | Validates an XML document against a schema |
| VALIDATE Procedure | Validates an XML document against a schema |

216.2.1 CONFORMING Function

This function is used to validate an XML document against a schema.

Syntax

```
DBMS_XMLSCHEMA_UTIL.CONFORMING (
  doc          IN NUMBER,
  sch          IN NUMBER)
RETURN NUMBER;
```

Parameters

Table 216-2 CONFORMING Function Parameters

| Parameter | Description |
|-----------|------------------|
| doc | The XML instance |
| sch | The XML schema |

Function Exceptions

The exceptions of DBMS_XMLSCHEMA_UTIL.CONFORMING function are as follows:

- The function returns zero if the schema is legal and the document conforms to the schema; otherwise it returns an LSX error code from the schema validation.

Note:

The function takes an xml data instance and xml schema instance. The user does not have to register the schema.

Example: The document conforms to the schema

```
SELECT DBMS_XMLSCHEMA_UTIL.CONFORMING(
    XMLType('<A/>'),
    XMLType(
        '<xs:schema xmlns:xs="http://www.w3.org/2001/XMLSchema">
        <xs:element name="A" type="xs:string"/>
        </xs:schema>')) "LSX CODE"
FROM DUAL;
```

216.2.2 VALIDATE Procedure

This procedure is used to validate an XML document against a schema.

Syntax

```
DBMS_XMLSCHEMA_UTIL.VALIDATE (
    doc          IN XMLTYPE,
    sch          IN XMLTYPE);
```

Parameters

Table 216-3 VALIDATE Procedure Parameters

| Parameter | Description |
|-----------|------------------|
| doc | The XML instance |
| sch | The XML schema |

Procedure Exceptions

The exceptions of `DBMS_XMLSCHEMA_UTIL.VALIDATE` procedure are as follows:

- The procedure raises `ORA-31154` if either the schema is not legal, or the document does not conform to the schema.

 **Note:**

The procedure takes an xml data instance and xml schema instance. The user does not have to register the schema.

Example: The document conforms to the schema

```
BEGIN
  DBMS_XMLSCHEMA_UTIL.VALIDATE (
    XMLType ('<A/>'),
    XMLType (
      '<xs:schema xmlns:xs="http://www.w3.org/2001/XMLSchema">
        <xs:element name="A" type="xs:string"/>
      </xs:schema>');
END;
/
```

DBMS_XMLSTORAGE_MANAGE

The `DBMS_XMLSTORAGE_MANAGE` package provides an interface to manage and modify XML storage after schema registration has been completed.

This chapter contains the following topics:

- [Overview](#)
- [Security Model](#)
- [Summary of DBMS_XMLSTORAGE_MANAGE Subprograms](#)

See Also:

Oracle XML DB Developer's Guide

217.1 DBMS_XMLSTORAGE_MANAGE Overview

`DBMS_XMLSTORAGE_MANAGE` contains procedures to manage and modify XML storage after schema registration has been completed.

Use subprograms from this package to improve the performance of bulk load operations. You can disable indexes and constraints before doing a bulk load process and to enable them afterwards.

217.2 DBMS_XMLSTORAGE_MANAGE Security Model

Owned by XDB, the `DBMS_XMLSTORAGE_MANAGE` package must be created by `SYS` or `XDB`. The `EXECUTE` privilege is granted to `PUBLIC`.

Subprograms in this package are executed using the privileges of the current user.

217.3 Summary of DBMS_XMLSTORAGE_MANAGE Subprograms

This table lists and describes the `DBMS_XML_STORAGE` package subprograms.

Table 217-1 DBMS_XMLSTORAGE_MANAGE Package Subprograms

| Subprogram | Description |
|--|---|
| DISABLEINDEXESANDCONSTRAINTS Procedure | Disables the indexes and constraints for XMLType tables and XMLType columns |

Table 217-1 (Cont.) DBMS_XMLSTORAGE_MANAGE Package Subprograms

| Subprogram | Description |
|---|---|
| ENABLEINDEXESANDCONSTRAINTS Procedure | Rebuilds all indexes and enables the constraints on an XMLType table including its child tables and out-of-line tables |
| EXCHANGEPOSTPROC Procedure | Enable constraints after exchange partition |
| EXCHANGEPREPROC Procedure | Disable constraints before exchange partition |
| INDEXXMLREFERENCES Procedure | Creates unique indexes on the REF columns of the given XML type table or the XML type column of a given table |
| REFPARTITIONEXCHANGEIN Procedure | This is an auxiliary procedure to load data through exchange partition operation into a partitioned table and its reference-partitioned child table provided the child table has an xmltype column with a local xmlindex. |
| REFPARTITIONEXCHANGEOUT Procedure | Auxiliary procedure to load data through exchange partition operation out of a partitioned table and its reference-partitioned child table provided that the child table has an xmltype column with a local xmlindex. |
| RENAMECOLLECTIONTABLE Procedure | Renames a collection table to the given table name |
| SCOPEXMLREFERENCES Procedure | Scopes all XML references. Scoped REF types require less storage space and allow more efficient access than unscoped REF types |
| XPATHT2TABCOLMAPPING Function | Maps a path expression (in XPath notation or DOT notations) to the corresponding table name and column name |

217.3.1 DISABLEINDEXESANDCONSTRAINTS Procedure

This procedure disables the indexes and constraints for XMLType tables and XMLType columns.

Syntax

```
DBMS_XMLSTORAGE_MANAGE.DISABLEINDEXESANDCONSTRAINTS (
    owner_name    IN  VARCHAR2 DEFAULT USER,
    table_name    IN  VARCHAR2,
    column_name   IN  VARCHAR2 DEFAULT NULL,
    clear         IN  BOOLEAN  DEFAULT FALSE);
```

Parameters

Table 217-2 DISABLEINDEXESANDCONSTRAINTS Procedure Parameters

| Parameter | Description |
|-------------|--|
| owner_name | Owner's name |
| table_name | Name of the XMLType table that the procedure is being performed on |
| column_name | XMLType column name |

Table 217-2 (Cont.) DISABLEINDEXESANDCONSTRAINTS Procedure Parameters

| Parameter | Description |
|-----------|---|
| clear | Boolean that when set to TRUE clears all stored index and constraint data for the table before the procedure executes. The default is FALSE, which does not clear them. |

Usage Notes

Passing XMLTYPE tables

For XMLType tables, you must pass the XMLType table name on which the bulk load operation is to be performed. For XMLType columns, you must pass the relational table name and the corresponding XMLType column name.

Using clear to Enable and Disable Indexes and Constraints

**Note:**

If the `DISABLEINDEXESANDCONSTRAINTS` procedure is called with `clear` set to `TRUE`, it removes any index or constraint information about the XMLTYPE table or column memorized during earlier executions of the procedure.

Therefore, you must ensure that all disabled indexes and constraints are re-enabled on the table or column before you call the `DISABLEINDEXESANDCONSTRAINTS` procedure with `clear` set to `TRUE`.

Ideally, it is recommended that you set `clear` set to `TRUE` for the first execution. For any subsequent executions (due to errors while disabling or enabling indexes) `clear` should be set to `FALSE`, the default value. Once you have successfully re-enabled all the indexes and constraints following the bulk load operation, you can call this procedure again with `clear` set to `TRUE` for the next bulk load operation.

Example

The following example illustrates the use of `clear` in the `DISABLEINDEXESANDCONSTRAINTS` procedure and the [ENABLEINDEXESANDCONSTRAINTS Procedure](#).

First, add a not-NULL constraint on `comment` element of the `PURCHASEORDER_TAB` table:

```
ALTER TABLE PURCHASEORDER_TAB ADD CONSTRAINT c1 check          ("XMLDATA"."comment"
IS NOT NULL);
```

Then, disable all the indexes and constraints by passing the `clear` as `TRUE`, by calling the `DISABLEINDEXESANDCONSTRAINTS` procedure:

```
BEGIN
  XDB.DBMS_XMLSTORAGE_MANAGE.DISABLEINDEXESANDCONSTRAINTS
    ( USER, 'PURCHASEORDER_TAB', NULL, TRUE );
END;
/
```

Next, perform a bulk load operation (such as datapump import) which violates constraint `c1` in the `ALTER` table statement. This does not raise an error because the constraint is disabled:

```
host impdp orexample/orexample directory=dir dumpfile=dmp.txt
  tables=OREXAMPLE.PURCHASEORDER_TAB content = DATA_ONLY;
```

NOTE: To view the disabled constraints and indexes use:

```
SELECT constraint_name,table_name,status FROM all_constraints
  WHERE owner = user;
```

Finally, try to enable the constraint using the `ENABLEINDEXESANDCONSTRAINTS` procedure. It raises an error because `c1`, the not null constraint, is violated by the bulk load operation:

```
BEGIN
  XDB.DBMS_XMLSTORAGE_MANAGE.ENABLEINDEXESANDCONSTRAINTS
    ( USER, 'PURCHASEORDER_TAB' );
END;
/
```

To disable all the indexes and constraints, again use `DISABLEINDEXESANDCONSTRAINTS`, but set `clear= FALSE` (because the `ENABLEINDEXESANDCONSTRAINTS` failed to complete successfully). Note: `clear = FALSE` by default, so we do not need to pass it explicitly in the next call.

```
BEGIN
  xdb.DBMS_XMLSTORAGE_MANAGE.DISABLEINDEXESANDCONSTRAINTS
    ( USER, 'PURCHASEORDER_TAB' );
END;
/
```

Then, delete the incorrect rows entered into the table

```
DELETE FROM purchaseorder_tab p
  WHERE p.xmldata."comment" IS NULL;
```

Re-enable the indexes and constraints using `ENABLEINDEXESANDCONSTRAINTS`, which completes successfully.

```
BEGIN
  xdb.DBMS_XMLSTORAGE_MANAGE.ENABLEINDEXESANDCONSTRAINTS
    ( USER, 'PURCHASEORDER_TAB' );
END;
/
```

217.3.2 ENABLEINDEXESANDCONSTRAINTS Procedure

This procedure rebuilds all indexes and enables the constraints on an `XMLType` table including its child tables and out-of-line tables.

When `column_name` is passed, it does the same for this `XMLType` column.

Syntax

```
DBMS_XMLSTORAGE_MANAGE.ENABLEINDEXESANDCONSTRAINTS (  
    owner_name    IN VARCHAR2 DEFAULT USER,  
    table_name    IN VARCHAR2,  
    column_name   IN VARCHAR2 DEFAULT NULL);
```

Parameters

Table 217-3 ENABLEINDEXESANDCONSTRAINTS Procedure Parameters

| Parameter | Description |
|-------------|---|
| owner_user | Owner's name |
| table_name | Name of the table that the indexes and constraints are being removed from |
| column_name | Column name |

Usage Notes

This procedure reverses [DISABLEINDEXESANDCONSTRAINTS Procedure](#).

Example

See [DISABLEINDEXESANDCONSTRAINTS Procedure](#)

217.3.3 EXCHANGEPOSTPROC Procedure

This procedure enable constraints after exchange partition.

Syntax

```
DBMS_XMLSTORAGE_MANAGE.EXCHANGEPOSTPROC (  
    owner_name    IN VARCHAR2 DEFAULT USER,  
    table_name    IN VARCHAR2);
```

Parameters

Table 217-4 EXCHANGEPOSTPROC Procedure Parameters

| Parameter | Description |
|------------|---|
| owner_user | Owner's name |
| table_name | Name of the table that the indexes and constraints are being removed from |

217.3.4 EXCHANGEPREPROC Procedure

This procedure disable constraints before exchange partition.

Syntax

```
DBMS_XMLSTORAGE_MANAGE.EXCHANGEPREPROC (
  owner_name  IN VARCHAR2 DEFAULT USER,
  table_name  IN VARCHAR2);
```

Parameters

Table 217-5 EXCHANGEPREPROC Procedure Parameters

| Parameter | Description |
|------------|---|
| owner_user | Owner's name |
| table_name | Name of the table that the indexes and constraints are being removed from |

217.3.5 INDEXXMLREFERENCES Procedure

This procedure creates unique indexes on the REF columns of the given XML type table or the XML type column of a given table.

If the procedure creates multiple REF columns, it appends `_1`, `_2`, and so on to their names.

Syntax

```
DBMS_XMLSTORAGE_MANAGE.INDEXXMLREFERENCES (
  owner_name  IN VARCHAR2 DEFAULT USER,
  table_name  IN VARCHAR2,
  column_name IN VARCHAR2 DEFAULT NULL);
```

Parameters

Table 217-6 INDEXXMLREFERENCES Procedure Parameters

| Parameter | Description |
|-------------|--|
| owner_name | The owner's name |
| table_name | The table being indexed |
| column_name | A column name. Not needed for XML type tables. |
| index_name | The name of the newly created index |

Usage Notes

This procedure is only used if the REFS are scoped. See [SCOPEXMLREFERENCES Procedure](#).

Indexed REFS lead to better performance when joins between the base table and a child table occur in the query plan.

- If the base table has a higher selectivity than the child table, there is no need to index the REFS.
- If the selectivity of the child table is higher than that of the base table and if no indexes are present, then the join of one row in the child table with the base table leads to a full table scan of the base table.

INDEXXMLREFERENCES does not index REFS recursively in child tables of a table it is called on. To do this, Oracle recommends calling the procedure from within a loop over the XML_OUT_OF_LINE_TABLES or XML_NESTED_TABLES view. This creates the index names from the current value of a column in the view.

Note:

This procedure is limited to the structured storage model.

217.3.6 REFPARTITIONEXCHANGEIN Procedure

This is an auxiliary procedure to load data through exchange partition operation into a partitioned table and its reference-partitioned child table provided that the child table has an xmltype column with a local xmlindex.

Syntax

```
DBMS_XMLSTORAGE_MANAGE.REFPARTITIONEXCHANGEIN (
  owner_name           IN VARCHAR2,
  parent_table_name    IN VARCHAR2,
  child_table_name     IN VARCHAR2,
  parent_exchange_table_name IN VARCHAR2,
  child_exchange_table_name IN VARCHAR2,
  parent_exchange_stmt IN CLOB,
  child_exchange_stmt  IN CLOB);
```

Parameters

Table 217-7 REFPARTITIONEXCHANGEIN Parameters

| Parameter | Description |
|----------------------------|--|
| owner_name | owner's name |
| parent_table_name | the partitioned base table |
| child_table_name | a partitioned table with reference partitioning based on the table named parent_table_name |
| parent_exchange_table_name | an exchange table for the partitioned base table |
| child_exchange_table_name | an exchange table for the table named child_table_name |
| parent_exchange_stmt | SQL statement to execute exchange partition operation between the table named parent_table_name and the table named parent_exchange_table_name |

Table 217-7 (Cont.) REFPARTITIONEXCHANGEIN Parameters

| Parameter | Description |
|---------------------|--|
| child_exchange_stmt | SQL statement to execute exchange partition operation between the table named child_table_name and the table named child_exchange_table_name |

217.3.7 REFPARTITIONEXCHANGEOUT Procedure

This is an auxiliary procedure to load data through exchange partition operation out of a partitioned table and its reference-partitioned child table provided that the child table has an xmltype column with a local xmlindex.

Syntax

```
DBMS_XMLSTORAGE_MANAGE.REFPARTITIONEXCHANGEOUT (
    owner_name           IN VARCHAR2,
    parent_table_name    IN VARCHAR2,
    child_table_name     IN VARCHAR2,
    parent_exchange_table_name IN VARCHAR2,
    child_exchange_table_name IN VARCHAR2,
    parent_exchange_stmt IN CLOB,
    child_exchange_stmt  IN CLOB);
```

Parameters

Table 217-8 REFPARTITIONEXCHANGEOUT Parameters

| Parameter | Description |
|----------------------------|--|
| owner_name | owner's name |
| parent_table_name | the partitioned base table |
| child_table_name | a partitioned table with reference partitioning based on the table named parent_table_name |
| parent_exchange_table_name | an exchange table for the partitioned base table |
| child_exchange_table_name | an exchange table for the table named child_table_name |
| parent_exchange_stmt | SQL statement to execute exchange partition operation between the table named parent_table_name and the table named parent_exchange_table_name |
| child_exchange_stmt | SQL statement to execute exchange partition operation between the table named child_table_name and the table named child_exchange_table_name |

217.3.8 RENAMECOLLECTIONTABLE Procedure

This procedure renames a collection table to the given table name.

An XPath expression specifies the collection table, starting from the XMLType base table or an XMLType column of the base table.

This procedure provides the only way to derive a collection table name from the corresponding collection type name because there is no direct schema annotation for the purpose.

Syntax

```
DBMS_XMLSTORAGE_MANAGE.RENAMECOLLECTIONTABLE (
  owner_name          IN VARCHAR2 DEFAULT USER,
  table_name          IN VARCHAR2,
  column_name         IN VARCHAR2 DEFAULT NULL,
  xpath               IN VARCHAR2,
  collection_table_name IN VARCHAR2
  namespaces          IN VARCHAR2 default NULL); // For release 11.2 only
```

Parameters

Table 217-9 RENAMECOLLECTIONTABLE Procedure Parameters

| Parameter | Description |
|-----------------------|---|
| owner_name | The name of the owner |
| table_name | The name of a base table that can be used as the starting point for specifying the collection table |
| column_name | An XMLType column that can be the starting point for specifying the collection table |
| xpath | The XPath expression that specifies the collection table |
| collection_table_name | The name of the collection table |
| namespaces | For Oracle Database 11g Release 2 (11.2) and higher. The namespaces used in XPath. |

Usage Notes

Call this procedure after registering the XML schema.

The table name serves as a prefix to the index names.

Oracle recommends using this function because it makes query execution plans more readable.

Report errors that occur while this procedure runs to the user that called the procedure.

Note:

This procedure is limited to the structured storage model.

For Oracle Database 11g Release 2 (11.2) and higher, only, this function accepts XPath notation as well as DOT notation. If XPath notation is used, a `namespaces` parameter may also be required.

Example

The collection table name will be `EMP_TAB_NAMELIST`. You can verify this using `SELECT * FROM user_nested_tables`.

Using DOT Notation:

```
call XDB.DBMS_XMLSTORAGE_MANAGE.RENAMECOLLECTIONTABLE (
    USER,
    'EMP_TAB',
    NULL,
    '"XMLDATA"."EMPLOYEE"."NAME"',
    'EMP_TAB_NAMELIST');
```

Using XPath Notation:

XPath notation is available with Oracle Database 11g Release 2 (11.2) and higher.

```
call XDB.DBMS_XMLSTORAGE_MANAGE.RENAMECOLLECTIONTABLE (
    USER,
    'EMP_TAB',
    NULL,
    '/e:Employee/Name',
    'EMP_TAB_NAMELIST',
    '''http://www.oracle.com/emp.xsd''' as "e");
```

217.3.9 SCOPEXMLREFERENCES Procedure

This procedure scopes all XML references. Scoped `REF` types require less storage space and allow more efficient access than unscoped `REF` types.

Syntax

```
DBMS_XMLSTORAGE_MANAGE.SCOPEXMLREFERENCES;
```

Usage Notes

- If you have used [SETOUTOFFLINE Procedure](#) in the `DBMS_XMLSTORAGE_MANAGE` package to avoid raising '1000 column limit' errors during XML schema registration, you should also use [SCOPEXMLREFERENCES Procedure](#).
- Using `SCOPEXMLREFERENCES` after XML schema registration and before loading XML instance data, makes these reference scoped to the out-of-line table only.

Note:

This procedure is limited to the structured storage model.

217.3.10 XPATH2TABCOLMAPPING Function

This function maps a path expression (in XPath notation or DOT notations) to the corresponding table name and column name. This is necessary in cases in which the user wants to create an index on this table, or to add a constraint, or to rename a table to make query execution plans more readable.

Syntax

```
DBMS_XMLSTORAGE_MANAGE.XPATH2TABCOLMAPPING (
  owner_name  IN  VARCHAR2 DEFAULT USER,
  table_name  IN  VARCHAR2,
  column_name IN  VARCHAR2 DEFAULT NULL,
  xpath       IN  VARCHAR2,
  namespaces  IN  VARCHAR2 DEFAULT NULL)
RETURN XMLTYPE;
```

Parameters

Table 217-10 XPATH2TABCOLMAPPING Procedure Parameters

| Parameter | Description |
|-------------|--|
| owner_user | Owner's name |
| table_name | Name of the base table |
| column_name | Optional name of the XML type column if table_name is not an XMLtype table. If table_name refers to XMLtype table then column_name should be NULL. |
| xpath | Path expression in DOT notation or XPath notation (see examples below) |
| namespaces | Optional namespace definitions for path expression |

Examples

XPath2TabColMapping evaluated on XMLType table with XPath Notation, namespaces provided

```
SELECT XDB.DBMS_XMLSTORAGE_MANAGE.XPATH2TABCOLMAPPING (
  USER, 'XML_TAB', '', '//n1:item/n1:location','xdbXmark' as "n1")
FROM DUAL;
```

This produces a result, for example:

```
<Result>
<Mapping TableName="SYS_NT12345" ColumnName="location"/>
</Result>
```

This allows us to define an index or constraint on table SYS_NT12345 and column location.

XPath2TabColMapping evaluated on table not of XMLType but with XMLType column by means of DOT notation

```
SELECT XDB.DBMS_XMLSTORAGE_MANAGE.XPATH2TABCOLMAPPING (
  USER, 'PurchaseOrderTab', 'XMLCOL', 'xmldata.LineItems.LineItem', '')
FROM DUAL;
```

218

DBMS_XMLSTORE

DBMS_XMLSTORE provides the ability to store XML data in relational tables.

This chapter contains the following sections:

- [Security Model](#)
- [Types](#)
- [Summary of DBMS_XMLSTORE Subprograms](#)

See Also:

Oracle XML DB Developer's Guide

218.1 DBMS_XMLSTORE Security Model

Owned by XDB, the DBMS_XMLSTORE package must be created by SYS or XDB. The EXECUTE privilege is granted to PUBLIC. Subprograms in this package are executed using the privileges of the current user.

218.2 Types

The DBMS_XMLSTORE subprograms use the ctxType Type.

Table 218-1 *Types of DBMS_XMLSTORE*

| Type | Description |
|---------|---|
| ctxType | The type of the query context handle. This is the return type of NEWCONTEXT . |

218.3 Summary of DBMS_XMLSTORE Subprograms

This table lists the DBMS_XMLSTORE subprograms and briefly describes them.

Table 218-2 *DBMS_XMLSTORE Package Subprograms*

| Method | Description |
|---------------------------------------|--|
| CLEARKEYCOLUMNLIST | Clears the key column list. |
| CLEARUPDATECOLUMNLIST | Clears the update column list. |
| CLOSECONTEXT | It closes/deallocates a particular save context. |

Table 218-2 (Cont.) DBMS_XMLSTORE Package Subprograms

| Method | Description |
|---------------------------------|---|
| DELETEXML | Deletes records specified by data from the XML document, from the table specified at the context creation time. |
| INSERTXML | Inserts the XML document into the table specified at the context creation time. |
| NEWCONTEXT | Creates a save context, and returns the context handle. |
| SETKEYCOLUMN | This method adds a column to the key column list. |
| SETROWTAG | Names the tag used in the XML document., to enclose the XML elements corresponding to the database. |
| SETUPDATECOLUMN | Adds a column to the "update column list". |
| UPDATEXML | Updates the table given the XML document. |

218.3.1 CLEARKEYCOLUMNLIST

This procedure clears the key column list.

Syntax

```
PROCEDURE clearKeyColumnList(
    ctxHdl IN ctxType);
```

Table 218-3 CLEARKEYCOLUMNLIST Procedure Parameters

| Parameter | IN / OUT | Description |
|-----------|----------|-----------------|
| ctxHdl | (IN) | Context handle. |

218.3.2 CLEARUPDATECOLUMNLIST

This procedure clears the update column list.

Syntax

```
PROCEDURE clearUpdateColumnList(
    ctxHdl IN ctxType);
```

Table 218-4 CLEARUPDATECOLUMNLIST Procedure Parameters

| Parameter | IN / OUT | Description |
|-----------|----------|-----------------|
| ctxHdl | (IN) | Context handle. |

218.3.3 CLOSECONTEXT

This procedure closes/deallocates a particular save context.

Syntax

```
PROCEDURE closeContext(ctxHdl IN ctxType);
```

Table 218-5 CLOSECONTEXT Procedure Parameters

| Parameter | IN / OUT | Description |
|-----------|----------|-----------------|
| ctxHdl | (IN) | Context handle. |

218.3.4 DELETEXML

DELETEXML deletes records specified by data from the XML document from the table specified at the context creation time, and returns the number of rows deleted.

Syntax

The following syntax uses a VARCHAR2 type for the xDoc parameter.

```
FUNCTION deleteXML(  
    ctxHdl IN ctxPType,  
    xDoc IN VARCHAR2)  
RETURN NUMBER;
```

The following syntax uses a CLOB type for the xDoc parameter.

```
FUNCTION deleteXML(  
    ctxHdl IN ctxType,  
    xDoc IN CLOB)  
RETURN NUMBER;
```

The following syntax uses an XMLType type for the xDoc parameter.

```
FUNCTION deleteXML(  
    ctxHdl IN ctxType,  
    xDoc IN XMLType)  
RETURN NUMBER;
```

Parameters

Table 218-6 DELETEXML Function Parameters

| Parameter | IN / OUT | Description |
|-----------|----------|-----------------|
| ctxHdl | (IN) | Context handle. |

Table 218-6 (Cont.) DELETXML Function Parameters

| Parameter | IN / OUT | Description |
|-----------|----------|-------------------------------------|
| xDoc | (IN) | String containing the XML document. |

218.3.5 INSERTXML

Inserts the XML document into the table specified at the context creation time, and returns the number of rows inserted.

Note that if a user passes an XML file for `insertXML` to `DBMS_XMLSTORE` that contains extra elements (elements that do not match any columns in the table), Oracle tries to insert into those columns unless `SETUPDATECOLUMN` is used. The use of `setUpdateColumn` is optional only if the elements in the XML file match up to the columns in the table.

Syntax

```
FUNCTION insertXML(
    ctxHdl IN ctxType,
    xDoc IN VARCHAR2)
RETURN NUMBER;
```

```
FUNCTION insertXML(
    ctxHdl IN ctxType,
    xDoc IN CLOB)
RETURN NUMBER;
```

```
FUNCTION insertXML(
    ctxHdl IN ctxType,
    xDoc IN XMLType)
RETURN NUMBER;
```

Parameters

Table 218-7 INSERTXML Function Parameters

| Parameter | IN / OUT | Description |
|-----------|----------|-------------------------------------|
| ctxHdl | (IN) | Context handle. |
| xDoc | (IN) | String containing the XML document. |

218.3.6 NEWCONTEXT

NEWCONTEXT creates a save context and returns the context handle.

Syntax

```
FUNCTION newContext(
    targetTable IN VARCHAR2)
RETURN ctxType;
```

Table 218-8 NEWCONTEXT Function Parameters

| Parameter | IN / OUT | Description |
|-------------|----------|---|
| targetTable | (IN) | The target table into which to load the XML document. |

218.3.7 SETKEYCOLUMN

This method adds a column to the "key column list".

The value for the column cannot be NULL. In case of update or delete, the columns in the key column list make up the WHERE clause of the statement. The key columns list must be specified before updates can complete; this is optional for delete operations

Syntax

```
PROCEDURE setKeyColumn(
    ctxHdl IN ctxType,
    colName IN VARCHAR2);
```

Table 218-9 SETKEYCOLUMN Procedure Parameters

| Parameter | IN / OUT | Description |
|-----------|----------|--|
| ctxHdl | (IN) | Context handle. |
| colName | (IN) | Column to be added to the key column list; cannot be NULL. |

218.3.8 SETROWTAG

This procedure names the tag used in the XML document, to enclose the XML elements corresponding to database records.

Syntax

```
PROCEDURE setRowTag(
    ctxHdl IN ctxType,
    tag IN VARCHAR2);
```

Table 218-10 SETROWTAG Procedure Parameters

| Parameter | IN / OUT | Description |
|-----------|----------|-----------------|
| ctxHdl | (IN) | Context handle. |

Table 218-10 (Cont.) SETROWTAG Procedure Parameters

| Parameter | IN / OUT | Description |
|-----------|----------|-------------|
| tag | (IN) | Tag name. |

218.3.9 SETUPDATECOLUMN

SETUPDATECOLUMN adds a column to the update column list.

In case of insert, the default is to insert values to all the columns in the table. In case of updates, the default is to only update the columns corresponding to the tags present in the `ROW` element of the XML document. When the update column list is specified, the columns making up this list alone will get updated or inserted into.

Note that if a user passes an XML file for `INSERTXML` to `DBMS_XMLSTORE` which contains extra elements (ones that do not match up to any columns in the table), Oracle will try to insert into those columns unless `setUpdateColumn` is used. The use of `setUpdateColumn` is optional only if the elements in the XML file match up to the columns in the table.

Syntax

```
PROCEDURE setUpdateColumn(
    ctxHdl IN ctxType,
    colName IN VARCHAR2);
```

Table 218-11 SETUPDATECOLUMN Procedure Parameters

| Parameter | IN / OUT | Description |
|-----------|----------|---|
| ctxHdl | (IN) | Context handle. |
| colName | (IN) | Column to be added to the update column list. |

218.3.10 UPDATEXML

Updates the table specified at the context creation time with data from the XML document, and returns the number of rows updated.

The options are described in the following table.

Syntax

The following syntax passes the `xDoc` parameter as a `VARCHAR2`.

```
FUNCTION updateXML(
    ctxHdl IN ctxType,
    xDoc IN VARCHAR2)
RETURN NUMBER;
```

The following syntax passes the `xDoc` parameter as a CLOB.

```
FUNCTION updateXML(  
  ctxHdl IN ctxType,  
  xDoc IN CLOB)  
RETURN NUMBER;
```

The following syntax passes the `xDoc` parameter as a XMLType.

```
FUNCTION updateXML(  
  ctxHdl IN ctxType,  
  xDoc IN XMLType)  
RETURN NUMBER;
```

Parameters

Table 218-12 UPDATEXML Function Parameters

| Parameter | IN / OUT | Description |
|---------------------|----------|-------------------------------------|
| <code>ctxHdl</code> | (IN) | Context handle. |
| <code>xDoc</code> | (IN) | String containing the XML document. |

DBMS_XPLAN

The `DBMS_XPLAN` package provides an easy way to display the output of the `EXPLAIN PLAN` command in several, predefined formats.

You can also use the `DBMS_XPLAN` package to display the plan of a statement stored in the Automatic Workload Repository (AWR) or stored in a SQL tuning set. It further provides a way to display the SQL execution plan and SQL execution runtime statistics for cached SQL cursors based on the information stored in the `V$SQL_PLAN` and `V$SQL_PLAN_STATISTICS_ALL` fixed views. Finally, it displays plans from a SQL plan baseline.

See Also:

- For more information on the `EXPLAIN PLAN` command, the AWR, and SQL tuning set, see *Oracle Database SQL Tuning Guide*.
- For more information on the `V$SQL_PLAN` fixed view, see *Oracle Database Reference*
- For more information on the `V$SQL_PLAN_STATISTICS` fixed view, see *Oracle Database Reference*

This chapter contains the following topics:

- [Overview](#)
- [Security Model](#)
- [Examples](#)
- [Summary of DBMS_XPLAN Subprograms](#)

219.1 DBMS_XPLAN Overview

The `DBMS_XPLAN` package supplies five table functions.

These functions are listed below:

- `DISPLAY` - to format and display the contents of a plan table.
- `DISPLAY_AWR` - to format and display the contents of the execution plan of a stored SQL statement in the AWR.
- `DISPLAY_CURSOR` - to format and display the contents of the execution plan of any loaded cursor.
- `DISPLAY_SQL_PLAN_BASELINE` - to display one or more execution plans for the SQL statement identified by SQL handle
- `DISPLAY_SQLSET` - to format and display the contents of the execution plan of statements stored in a SQL tuning set.

219.2 DBMS_XPLAN Security Model

This package runs with the privileges of the calling user, not the package owner (`SYS`). The table function `DISPLAY_CURSOR` requires `SELECT` or `READ` privileges on the following fixed views: `V$SQL_PLAN`, `V$SESSION` and `V$SQL_PLAN_STATISTICS_ALL`. This function also requires `SELECT/READ` permissions on `V$SQL`.

`DISPLAY_AWR` Function requires the user to have `SELECT` or `READ` privileges on `DBA_HIST_SQL_PLAN`, `AWR_ROOT_SQL_PLAN`, `AWR_PDB_SQL_PLAN`, `AWR_ROOT_SQLTEXT`, `DBA_HIST_SQLTEXT`, `AWR_PDB_SQLTEXT`, and `V$DATABASE`.

`DISPLAY_SQLSET` Function requires the user to have the `SELECT` or `READ` privilege on `ALL_SQLSET_STATEMENTS` and `ALL_SQLSET_PLANS`.

`DISPLAY_SQL_PLAN_BASELINE` Function requires the user to have the `SELECT` or `READ` privilege on `DBA_SQL_PLAN_BASELINES` as well as the privileges to execute the SQL statement for which the user is trying to get the plan.

The preceding privileges are granted automatically as part of `SELECT_CATALOG_ROLE`.

219.3 DBMS_XPLAN Data Structures

The `DBMS_XPLAN` package defines a `TABLE` type.

Table Types

- [DBMS_XPLAN PLAN_OBJECT_LIST Table Type](#)

219.3.1 DBMS_XPLAN PLAN_OBJECT_LIST Table Type

This type allows for a list of generic objects as input to the `COMPARE_PLANS` function.

Syntax

```
TYPE plan_object_list IS TABLE OF generic_plan_object;
```

The generic object abstracts the common attributes of plans from all plan sources. Every plan source is a subclass of the `plan_object_list` superclass. The following table summarizes the different plan sources. Note that when an optional parameter is null, it can correspond to multiple objects. For example, if you do not specify a child number for `cursor_cache_object`, then it matches all cursor cache statements with the specified SQL ID.

Table 219-1 Plan Sources for PLAN_OBJECT_LIST

| Plan Source | Specification | Description |
|---------------------|---|---|
| Plan table | <code>plan_table_object(owner, plan_table_name, statement_id, plan_id)</code> | The parameters are as follows: <ul style="list-style-type: none"> • <code>owner</code>—The owner of the plan table • <code>plan_table_name</code>—The name of the plan table • <code>statement_id</code>—The ID of the statement (optional) • <code>plan_id</code>—The ID of the plan (optional) |
| Cursor cache | <code>cursor_cache_object(sql_id, child_number)</code> | The parameters are as follows: <ul style="list-style-type: none"> • <code>sql_id</code>—The SQL ID of the plan • <code>child_number</code>—The child number of the plan in the cursor cache (optional) |
| AWR | <code>awr_object(sql_id, dbid, con_dbid, plan_hash_value)</code> | The parameters are as follows: <ul style="list-style-type: none"> • <code>sql_id</code>—The SQL ID of the plan • <code>dbid</code>—The database ID (optional) • <code>con_dbid</code>—The CDB ID (optional) • <code>plan_hash_value</code>—The hash value of the plan (optional) |
| SQL tuning set | <code>sqlset_object (sqlset_owner, sqlset_name, sql_id, plan_hash_value)</code> | The parameters are as follows: <ul style="list-style-type: none"> • <code>sqlset_owner</code>—The owner of the SQL tuning set • <code>sqlset_name</code>—The name of the SQL tuning set • <code>sql_id</code>—The SQL ID of the plan • <code>plan_hash_value</code>—The hash value of the plan (optional) |
| SQL plan management | <code>spm_object (sql_handle, plan_name)</code> | The parameters are as follows: <ul style="list-style-type: none"> • <code>sql_handle</code>—The SQL handle of plans protected by SQL plan management • <code>plan_name</code>—The name of the SQL plan baseline (optional) |
| SQL profile | <code>sql_profile_object (profile_name)</code> | The <code>profile_name</code> parameter specifies the name of the SQL profile. |
| Advisor | <code>advisor_object (task_name, execution_name, sql_id, plan_id)</code> | The parameters are as follows: <ul style="list-style-type: none"> • <code>task_name</code>—The name of the advisor task • <code>execution_name</code>—The name of the task execution • <code>sql_id</code>—The SQL ID of the plan • <code>plan_id</code>—The advisor plan ID (optional) |

219.4 Examples

These examples show sample uses of DBMS_XPLAN.

Displaying a Plan Table Using DBMS_XPLAN.DISPLAY

Execute an explain plan command on a SELECT statement:

```
EXPLAIN PLAN FOR
SELECT * FROM emp e, dept d
      WHERE e.deptno = d.deptno
      AND e.ename='benoit';
```

Display the plan using the DBMS_XPLAN.DISPLAY table function

```
SET LINESIZE 130
SET PAGESIZE 0
SELECT * FROM TABLE(DBMS_XPLAN.DISPLAY);
```

This query produces the following output:

Plan hash value: 3693697075

```
-----
| Id | Operation          | Name | Rows | Bytes | Cost (%CPU)| Time     |
-----
|  0 | SELECT STATEMENT   |      |      |      |  6  (34)| 00:00:01 |
|*  1 |  HASH JOIN         |      |      |      |  6  (34)| 00:00:01 |
|*  2 |    TABLE ACCESS FULL| EMP  |      |      |  3  (34)| 00:00:01 |
|  3 |    TABLE ACCESS FULL| DEPT |      |      |  3  (34)| 00:00:01 |
-----
```

Predicate Information (identified by operation id):

```
-----
  1 - access("E"."DEPTNO"="D"."DEPTNO")
  2 - filter("E"."ENAME"='benoit')
```

15 rows selected.

Displaying a Cursor Execution Plan Using DBMS_XPLAN.DISPLAY_CURSOR

By default, the table function DISPLAY_CURSOR formats the execution plan for the last SQL statement executed by the session. For example:

```
SELECT ename FROM emp e, dept d
      WHERE e.deptno = d.deptno
      AND e.empno=7369;
```

```
ENAME
-----
SMITH
```

To display the execution plan of the last executed statement for that session:

```
SET PAGESIZE 0
SELECT * FROM DBMS_XPLAN.DISPLAY_CURSOR();
```

This query produces the following output:

Plan hash value: 3693697075, SQL hash value: 2096952573, child number: 0

```
SELECT ename FROM emp e, dept d WHERE e.deptno = d.deptno
AND e.empno=7369
```

```
-----
```

| Id | Operation | Name | Rows | Bytes | Cost (%CPU) | Time |
|-----|-------------------|------|------|-------|-------------|----------|
| 0 | SELECT STATEMENT | | | | | |
| * 1 | HASH JOIN | | 1 | 16 | 6 (34) | 00:00:01 |
| * 2 | TABLE ACCESS FULL | EMP | 1 | 13 | 3 (34) | 00:00:01 |
| 3 | TABLE ACCESS FULL | DEPT | 4 | 12 | 3 (34) | 00:00:01 |

```
-----
```

```
Predicate Information (identified by operation id):
```

```
-----
```

- 1 - access("E"."DEPTNO"="D"."DEPTNO")
- 2 - filter("E"."EMPNO"=7369)

```
21 rows selected.
```

You can also use the table function `DISPLAY_CURSOR` to display the execution plan for any loaded cursor stored in the cursor cache. In that case, you must supply a reference to the child cursor to the table function. This includes the SQL ID of the statement and optionally the child number.

Run a query with a distinctive comment:

```
SELECT /* TOTO */ ename, dname
FROM dept d join emp e USING (deptno);
```

Get `sql_id` and `child_number` for the preceding statement:

```
SELECT sql_id, child_number
FROM v$sql
WHERE sql_text LIKE '%TOTO%';
```

```
SQL_ID          CHILD_NUMBER
-----
gwp663cqh5qbf      0
```

Display the execution plan for the cursor:

```
SELECT * FROM DBMS_XPLAN.DISPLAY_CURSOR('gwp663cqh5qbf',0);
```

```
Plan hash value: 3693697075, SQL ID: gwp663cqh5qbf, child number: 0
```

```
-----
```

```
SELECT /* TOTO */ ename, dname
FROM dept d JOIN emp e USING (deptno);
```

```
-----
```

| Id | Operation | Name | Rows | Bytes | Cost (%CPU) | Time |
|-----|-------------------|------|------|-------|-------------|----------|
| 0 | SELECT STATEMENT | | | | 7 (100) | |
| 1 | SORT GROUP BY | | 4 | 64 | 7 (43) | 00:00:01 |
| * 2 | HASH JOIN | | 14 | 224 | 6 (34) | 00:00:01 |
| 3 | TABLE ACCESS FULL | DEPT | 4 | 44 | 3 (34) | 00:00:01 |
| 4 | TABLE ACCESS FULL | EMP | 14 | 70 | 3 (34) | 00:00:01 |

```
-----
```

```
Predicate Information (identified by operation id):
```

```
-----
```

- 2 - access("E"."DEPTNO"="D"."DEPTNO")

Instead of issuing two queries, one to get the `sql_id` and `child_number` pair and one to display the plan, you can combine these in a single query:

Display the execution plan of all cursors matching the string 'TOTO':

```
SELECT t.*
FROM v$sql s, DBMS_XPLAN.DISPLAY_CURSOR(s.sql_id, s.child_number) t WHERE
sql_text LIKE '%TOTO%';
```

Displaying a Plan Table with Parallel Information

By default, only relevant information is reported by the `display` and `display_cursor` table functions. In [Displaying a Plan Table Using DBMS_XPLAN.DISPLAY](#), the query does not execute in parallel. Hence, information related to the parallelization of the plan is not reported. As shown in the following example, parallel information is reported only if the query executes in parallel.

```
ALTER TABLE emp PARALLEL;
EXPLAIN PLAN for
SELECT * FROM emp e, dept d
WHERE e.deptno = d.deptno
AND e.ename = 'hermann'
ORDER BY e.empno;
```

Display the plan using the `DBMS_XPLAN.DISPLAY` table function

```
SET LINESIZE 130
SET PAGESIZE 0
SELECT * FROM DBMS_XPLAN.DISPLAY();
Plan hash value: 3693697345
```

| Id | Operation | Name | Rows | Bytes | Cost (%CPU) | Time | TQ | INOUT | PQ Distrib |
|------|--------------------|----------|------|-------|-------------|----------|-------|-------|------------|
| 0 | SELECT STATEMENT | | 1 | 117 | 6 (50) | 00:00:01 | | | |
| 1 | PX COORDINATOR | | | | | | | | |
| 2 | PX SEND QC (ORDER) | :TQ10003 | 1 | 117 | 6 (50) | 00:00:01 | Q1,03 | P->S | QC (ORDER) |
| 3 | SORT ORDER BY | | 1 | 117 | 6 (50) | 00:00:01 | Q1,03 | PCWP | |
| 4 | PX RECEIVE | | 1 | 117 | 5 (40) | 00:00:01 | Q1,03 | PCWP | |
| 5 | PX SEND RANGE | :TQ10002 | 1 | 117 | 5 (40) | 00:00:01 | Q1,02 | P->P | RANGE |
| * 6 | HASH JOIN | | 1 | 117 | 5 (40) | 00:00:01 | Q1,02 | PCWP | |
| 7 | PX RECEIVE | | 1 | 87 | 2 (50) | 00:00:01 | Q1,02 | PCWP | |
| 8 | PX SEND HASH | :TQ10001 | 1 | 87 | 2 (50) | 00:00:01 | Q1,01 | P->P | HASH |
| 9 | PX BLOCK ITERATOR | | 1 | 87 | 2 (50) | 00:00:01 | Q1,01 | PCWC | |
| * 10 | TABLE ACCESS FULL | EMP | 1 | 87 | 2 (50) | 00:00:01 | Q1,01 | PCWP | |
| 11 | BUFFER SORT | | | | | | Q1,02 | PCWC | |
| 12 | PX RECEIVE | | 4 | 120 | 3 (34) | 00:00:01 | Q1,02 | PCWP | |
| 13 | PX SEND HASH | :TQ10000 | 4 | 120 | 3 (34) | 00:00:01 | | S->P | HASH |
| 14 | TABLE ACCESS FULL | DEPT | 4 | 120 | 3 (34) | 00:00:01 | | | |

Predicate Information (identified by operation id):

```
6 - access("E"."DEPTNO"="D"."DEPTNO")
10 - filter("E"."ENAME"='hermann')
```

When the query is parallel, information related to parallelism is reported: table queue number (TQ column), table queue type (INOUT) and table queue distribution method (PQ Distrib).

By default, if several plans in the plan table match the `statement_id` parameter passed to the display table function (default value is NULL), only the plan corresponding to the last EXPLAIN PLAN command is displayed. Hence, there is no

need to purge the plan table after each `EXPLAIN PLAN`. However, you should purge the plan table regularly to ensure good performance in the execution of the `DISPLAY` table function. If no plan table is created, Oracle uses a global temporary table to store any plan information for individual users and preserves its content throughout the lifespan of a session. Note that you cannot truncate the content of a global temporary table.

For ease of use, you can define a view on top of the display table function and then use that view to display the output of the `EXPLAIN PLAN` command:

Using a View to Display Last Explain Plan

```
# define plan view
CREATE VIEW PLAN AS SELECT * FROM TABLE(DBMS_XPLAN.DISPLAY);

# display the output of the last explain plan command
SELECT * FROM PLAN;
```

219.5 Summary of DBMS_XPLAN Subprograms

This table lists the DBMS_XPLAN subprograms and briefly describes them.

Table 219-2 *DBMS_XPLAN Package Subprograms*

| Subprogram | Description |
|--|--|
| COMPARE_PLANS Function | Compares each plan in a list with a reference plan and returns the report |
| DIFF_PLAN Function | Compares plans |
| DISPLAY Function | Displays the contents of the plan table |
| DISPLAY_AWR Function | Displays the contents of an execution plan stored in the AWR |
| DISPLAY_CURSOR Function | Displays the execution plan of any cursor in the cursor cache |
| DISPLAY_PLAN Function | Displays the contents of the plan table in a variety of formats with CLOB output type |
| DISPLAY_SQL_PLAN_BASELINE Function | Displays one or more execution plans for the specified SQL handle of a SQL plan baseline |
| DISPLAY_SQLSET Function | Displays the execution plan of a given statement stored in a SQL tuning set |

219.5.1 COMPARE_PLANS Function

This function compares each plan in a list with a reference plan and returns the report.

Syntax

```
DBMS_XPLAN.COMPARE_PLANS (
    reference_plan    IN generic_plan_object,
    compare_plan_list IN plan_object_list,
    type              IN VARCHAR2 := 'TEXT',
    level             IN VARCHAR2 := 'TYPICAL',
    section           IN VARCHAR2 := 'ALL')
RETURN CLOB;
```

Parameters

Table 219-3 COMPARE_PLANS Function Parameters

| Parameter | Description |
|--------------------------------|---|
| <code>reference_plan</code> | The reference plan. This plan should always evaluate to a single plan. |
| <code>compare_plan_list</code> | List of plans to compare with reference plan. The <code>compare_plan_list</code> is a list of <code>generic_object</code> and each <code>generic_object</code> could correspond to one or more plans. |
| <code>type</code> | Type of the report. Possible values are: <ul style="list-style-type: none"> • TEXT • HTML • XML |
| <code>level</code> | Format of the report. Possible values are: <ul style="list-style-type: none"> • BASIC • TYPICAL • ALL |
| <code>section</code> | A particular section in the report. Possible values are: <ul style="list-style-type: none"> • SUMMARY • FINDINGS • PLANS • INFORMATION • ERRORS |

Example 219-1 Examples

The following examples illustrate the usage of COMPARE_PLANS Function.

```
var report clob;
exec :report := dbms_xplan.compare_plans(cursor_cache_object('8mkxm7ur07za0',
2),
- plan_object_list (cursor_cache_object('8mkxm7ur07za0', 4)));

print report
```

The above example compares the plan of child cursor number 2 for the SQL ID '8mkxm7ur07za0' with that of the child cursor number 4 for the same SQL ID. Returns the report in the text format (default).

```
var report clob;
exec :report := dbms_xplan.compare_plans(cursor_cache_object('8mkxm7ur07za0',
2),
plan_object_list( spm_object('SQL_024d0f7d21351f5d',
'SQL_PLAN_sdfjkd')));

print report
```

The above example compares the plan of child cursor number 2 for the SQL ID '8mkxm7ur07za0' with that of the plan baseline captured by SPM for query whose SQL handle is 'SQL_024d0f7d21351f5d' and plan name is 'SQL_PLAN_sdfjkd'. Returns the report in the text format (default).

```

var report clob;
exec :report = dbms_xplan.compare_plans(cursor_cache_object('8mkxm7ur07za0', 2),
                                     plan_object_list(cursor_cache_object('8mkxm7ur07za0'),
                                     sqlset_object('SH', 'SQLT_WORKLOAD', '6vfvqvav0rgyad'),
awr_object('6vfvqvav0rgyad', 5), spm_object('SQL_024d0f7d21351f5d',
'SQL_PLAN_
                                     sdfjkd'), plan_table_object('SH', 'plan_table', NULL, 38),
sql_profile_object('pe3r3ejsfd'), a
                                     dvisor_object('TASK_1228',
'EXEC_1928', '8mkxm7ur07za0')), type => 'XML',
                                     level => 'ALL', section => 'SUMMARY');

```

The above example compares the plan of child cursor number 2 for the SQL ID '8mkxm7ur07za0' with each of the plans in the following list:

- cursor_cache_object('8mkxm7ur07za0'): All the plans in the cursor cache that are generated for the SQL ID '8mkxm7ur07za0'.
- sqlset_object('SH', 'SQLT_WORKLOAD', '6vfvqvav0rgyad'): All the plans generated in the SQL tuning set SH. SQLT_WORKLOAD for the SQL ID '6vfvqvav0rgyad'.
- awr_object('6vfvqvav0rgyad', 5): All the plans in AWR that are captured for database ID 5 and SQL ID '6vfvqvav0rgyad'.
- spm_object('SQL_024d0f7d21351f5d', 'SQL_PLAN_sdfjkd'): The plan baseline for the query with SQL handle 'SQL_024d0f7d21351f5d' with name 'SQL_PLAN_sdfjkd'.
- plan_table_object('SH', 'plan_table', NULL, 38): Plan stored in SH.plan_table identified by plan_id=38.
- sql_profile_object('pe3r3ejsfd'): Plan identified by the SQL profile name 'pe3r3ejsfd'.
- advisor_object('TASK_1228', 'EXEC_1928', '8mkxm7ur07za0'): All the plans stored in SQL advisor identified by task name 'TASK_1228', execution name 'EXEC_1928' and SQL ID '8mkxm7ur07za0'.

219.5.2 DIFF_PLAN Function

This function compares two sql plans, the reference plan and the target plan. This function returns a task_id that can be used to retrieve the report of findings.

Syntax

```

DBMS_XPLAN.DIFF_PLAN(
  sql_text      IN   CLOB,
  outline       IN   CLOB,
  user_name     IN   VARCHAR2 := 'NULL')
RETURN VARCHAR2;

```

Parameters

Table 219-4 DIFF_PLAN Function Parameters

| Parameter | Description |
|-----------|--|
| sql_text | The text of the SQL statement. |
| outline | Used to generate the target plan. |
| user_name | The parsing schema name default to current user. |

219.5.3 DISPLAY Function

This table function displays the contents of the plan table.

In addition, you can use this table function to display any plan (with or without statistics) stored in a table as long as the columns of this table are named the same as columns of the plan table (or `V$SQL_PLAN_STATISTICS_ALL` if statistics are included). You can apply a predicate on the specified table to select rows of the plan to display.

Syntax

```
DBMS_XPLAN.DISPLAY(  
  table_name      IN  VARCHAR2  DEFAULT 'PLAN_TABLE',  
  statement_id   IN  VARCHAR2  DEFAULT NULL,  
  format         IN  VARCHAR2  DEFAULT 'TYPICAL',  
  filter_preds   IN  VARCHAR2  DEFAULT NULL);
```

Parameters

Table 219-5 DISPLAY Function Parameters

| Parameter | Description |
|---------------------------|---|
| <code>table_name</code> | Specifies the table name where the plan is stored. This parameter defaults to <code>PLAN_TABLE</code> , which is the default plan table for the <code>EXPLAIN PLAN</code> command. If <code>NULL</code> is specified it also defaults to <code>PLAN_TABLE</code> . |
| <code>statement_id</code> | Specifies the <code>statement_id</code> of the plan to be displayed. This parameter defaults to <code>NULL</code> , which is the default when the <code>EXPLAIN PLAN</code> command is executed without a <code>set statement_id</code> clause. If no <code>statement_id</code> is specified, the function shows you the plan of the most recent explained statement. |

Table 219-5 (Cont.) DISPLAY Function Parameters

| Parameter | Description |
|-----------|---|
| format | <p>Controls the level of details for the plan. It accepts the following values:</p> <ul style="list-style-type: none"> • BASIC: Displays the minimum information in the plan—the operation ID, the operation name and its option. • TYPICAL: This is the default. Displays the most relevant information in the plan (operation id, name and option, #rows, #bytes and optimizer cost). Pruning, parallel and predicate information are only displayed when applicable. Excludes only PROJECTION, ALIAS, and REMOTE SQL information (see below). • SERIAL: Like TYPICAL except that the parallel information is not displayed, even if the plan executes in parallel. • ALL: Maximum user level. Includes information displayed with the TYPICAL level with additional information (PROJECTION, ALIAS and information about REMOTE SQL if the operation is distributed). <p>For finer control on the display output, the following keywords can be added to the above three standard format options to customize their default behavior. Each keyword either represents a logical group of plan table columns (such as PARTITION) or logical additions to the base plan table output (such as PREDICATE). Format keywords must be separated by either a comma or a space:</p> <ul style="list-style-type: none"> • ROWS - if relevant, shows the number of rows estimated by the optimizer • BYTES - if relevant, shows the number of bytes estimated by the optimizer • COST - if relevant, shows optimizer cost information • PARTITION - if relevant, shows partition pruning information • PARALLEL - if relevant, shows PX information (distribution method and table queue information) • PREDICATE - if relevant, shows the predicate section • PROJECTION -if relevant, shows the projection section • ALIAS - if relevant, shows the "Query Block Name / Object Alias" section • REMOTE - if relevant, shows the information for distributed query (for example, remote from serial distribution and remote SQL) • NOTE - if relevant, shows the note section of the explain plan <p>Format keywords can be prefixed by the sign '-' to exclude the specified information. For example, '-PROJECTION' excludes projection information.</p> <p>If the target plan table (see <code>table_name</code> parameter) also stores plan statistics columns (for example, it is a table used to capture the content of the fixed view <code>V\$SQL_PLAN_STATISTICS_ALL</code>), additional format keywords can be used to specify which class of statistics to display when using the DISPLAY Function. These additional format keywords are IOSTATS, MEMSTATS, ALLSTATS, and LAST (see the DISPLAY_CURSOR Function or the DISPLAY_SQLSET Function for a full description of these four keywords).</p> |

Table 219-5 (Cont.) DISPLAY Function Parameters

| Parameter | Description |
|---------------------------|---|
| <code>filter_preds</code> | SQL filter predicate(s) to restrict the set of rows selected from the table where the plan is stored. When value is <code>NULL</code> (the default), the plan displayed corresponds to the last executed explain plan. For example: <code>filter_preds=>'plan_id = 10'</code> Can reference any column of the table where the plan is stored and can contain any SQL construct (for example, sub-query, function calls (see WARNING under Usage Notes) |

Usage Notes

Here are some ways you might use variations on the `format` parameter:

- Use `'ALL -PROJECTION -NOTE'` to display everything except the projection and note sections.
- Use `'TYPICAL PROJECTION'` to display using the typical format with the additional projection section (which is normally excluded under the typical format). Since typical is default, using simply `'PROJECTION'` is equivalent.
- Use `'-BYTES -COST -PREDICATE'` to display using the typical format but excluding optimizer cost and byte estimates as well as the predicate section.
- Use `'BASIC ROWS'` to display basic information with the additional number of rows estimated by the optimizer.

WARNING:

Application developers should expose the `filter_preds` parameter to end-users only after careful consideration because this could expose the application to SQL injection. Indeed, `filter_preds` can potentially reference any table or execute any server function for which the database user invoking the table function has privileges.

Examples

To display the result of the last `EXPLAIN PLAN` command stored in the plan table:

```
SELECT * FROM TABLE (DBMS_XPLAN.DISPLAY);
```

To display from other than the default plan table, "my_plan_table":

```
SELECT * FROM table (DBMS_XPLAN.DISPLAY('my_plan_table'));
```

To display the minimum plan information:

```
SELECT * FROM table (DBMS_XPLAN.DISPLAY('plan_table', null, 'basic'));
```

To display the plan for a statement identified by 'foo', such as `statement_id='sales_query'`:

```
SELECT * FROM table (DBMS_XPLAN.DISPLAY('plan_table', 'sales_query'));
```

219.5.4 DISPLAY_AWR Function

This table function displays the contents of an execution plan stored in AWR.

Note:

This function is deprecated. Use `DISPLAY_WORKLOAD_REPOSITORY` instead. `DISPLAY_AWR` only works with snapshots for the local DBID, whereas `DISPLAY_WORKLOAD_REPOSITORY` supports all snapshots inside AWR, including remote and imported snapshots.

Syntax

```
DBMS_XPLAN.DISPLAY_AWR (
  sql_id          IN      VARCHAR2,
  plan_hash_value IN      NUMBER DEFAULT NULL,
  db_id           IN      NUMBER DEFAULT NULL,
  format          IN      VARCHAR2 DEFAULT TYPICAL);
```

Parameters

Table 219-6 DISPLAY_AWR Table Function Parameters

| Parameter | Description |
|------------------------------|--|
| <code>sql_id</code> | Specifies the <code>SQL_ID</code> of the SQL statement. You can retrieve the appropriate value for the SQL statement of interest by querying the column <code>SQL_ID</code> in <code>DBA_HIST_SQLTEXT</code> . |
| <code>plan_hash_value</code> | Specifies the <code>PLAN_HASH_VALUE</code> of a SQL statement. This parameter is optional. If omitted, the table function returns all stored execution plans for a given <code>SQL_ID</code> . |
| <code>db_id</code> | Specifies the <code>database_id</code> for which the plan of the SQL statement, identified by <code>SQL_ID</code> should be displayed. If not supplied, the <code>database_id</code> of the local database is used, as shown in <code>V\$DATABASE</code> . |

Table 219-6 (Cont.) DISPLAY_AWR Table Function Parameters

| Parameter | Description |
|-----------|--|
| format | <p>Controls the level of details for the plan. It accepts four values:</p> <ul style="list-style-type: none"> • BASIC: Displays the minimum information in the plan—the operation ID, the operation name and its option. • TYPICAL: This is the default. Displays the most relevant information in the plan (operation id, name and option, #rows, #bytes and optimizer cost). Pruning, parallel and predicate information are only displayed when applicable. Excludes only PROJECTION, ALIAS and REMOTE SQL information (see below). • SERIAL: Like TYPICAL except that the parallel information is not displayed, even if the plan executes in parallel. • ALL: Maximum user level. Includes information displayed with the TYPICAL level with additional information (PROJECTION, ALIAS and information about REMOTE SQL if the operation is distributed). <p>For finer control on the display output, the following keywords can be added to the above four standard format options to customize their default behavior. Each keyword either represents a logical group of plan table columns (such as PARTITION) or logical additions to the base plan table output (such as PREDICATE). Format keywords must be separated by either a comma or a space:</p> <ul style="list-style-type: none"> • ROWS - if relevant, shows the number of rows estimated by the optimizer • BYTES - if relevant, shows the number of bytes estimated by the optimizer • COST - if relevant, shows optimizer cost information • PARTITION - if relevant, shows partition pruning information • PARALLEL - if relevant, shows PX information (distribution method and table queue information) • PREDICATE - if relevant, shows the predicate section • PROJECTION -if relevant, shows the projection section • ALIAS - if relevant, shows the "Query Block Name / Object Alias" section • REMOTE - if relevant, shows the information for distributed query (for example, remote from serial distribution and remote SQL) • NOTE - if relevant, shows the note section of the explain plan <p>Format keywords can be prefixed by the sign '-' to exclude the specified information. For example, '-PROJECTION' excludes projection information.</p> |

Usage Notes

- To use the DISPLAY_AWR functionality, the calling user must have SELECT or READ privilege on DBA_HIST_SQL_PLAN, AWR_ROOT_SQL_PLAN, AWR_PDB_SQL_PLAN, DBA_HIST_SQLTEXT, AWR_ROOT_SQLTEXT, AWR_PDB_SQLTEXT, and V\$DATABASE, otherwise it shows an appropriate error message. By default, select privilege for these views is granted to the select_catalog role.
- The following examples show different ways of using the format parameter:
 - Use 'BASIC ROWS' to display basic information with the additional number of rows estimated by the optimizer.
 - Use 'ALL -PROJECTION -NOTE' to display everything except the projection and note sections.

- Use 'TYPICAL PROJECTION' to display using the typical format with the additional projection section (which is normally excluded under the typical format). Since typical is default, using simply 'PROJECTION' is equivalent.
- Use '-BYTES -COST -PREDICATE' to display using the typical format but excluding optimizer cost and byte estimates and the predicate section.

Examples

To display the different execution plans associated with the SQL ID 'atfwcg8anrykp':

```
SELECT * FROM table(DBMS_XPLAN.DISPLAY_AWR('atfwcg8anrykp'));
```

To display all execution plans of all stored SQL statements containing the string 'TOTO':

```
SELECT tf.*
FROM   DBA_HIST_SQLTEXT ht, table(DBMS_XPLAN.DISPLAY_AWR(ht.sql_id,null,
null, 'ALL' )) tf
WHERE  ht.sql_text like '%TOTO%';
```

219.5.5 DISPLAY_CURSOR Function

This table function displays the explain plan of any cursor loaded in the cursor cache. In addition to the explain plan, various plan statistics (such as I/O, memory and timing) can be reported (based on the V\$SQL_PLAN_STATISTICS_ALL VIEWS).

Syntax

```
DBMS_XPLAN.DISPLAY_CURSOR(
  sql_id          IN VARCHAR2  DEFAULT NULL,
  cursor_child_no IN NUMBER    DEFAULT 0,
  format          IN VARCHAR2  DEFAULT 'TYPICAL');
```

Parameters

Table 219-7 DISPLAY_CURSOR Function Parameters

| Parameter | Description |
|-----------------|---|
| sql_id | Specifies the SQL_ID of the SQL statement in the cursor cache. You can retrieve the appropriate value by querying the column SQL_ID in V\$SQL or V\$SQLAREA. Alternatively, you could choose the column PREV_SQL_ID for a specific session out of V\$SESSION. This parameter defaults to NULL in which case the plan of the last cursor executed by the session is displayed. |
| cursor_child_no | Child number of the cursor to display. If not supplied, the execution plan of the child_number=0 cursor matching the supplied sql_id parameter are displayed. The child_number can be specified only if sql_id is specified. |

Table 219-7 (Cont.) DISPLAY_CURSOR Function Parameters

| Parameter | Description |
|-----------|---|
| format | <p>Controls the level of details for the plan. It accepts five values:</p> <ul style="list-style-type: none"> • BASIC: Displays the minimum information in the plan—the operation ID, the operation name and its option. • TYPICAL: This is the default. Displays the most relevant information in the plan (operation id, name and option, #rows, #bytes and optimizer cost). Pruning, parallel and predicate information are only displayed when applicable. Excludes only PROJECTION, ALIAS and REMOTE SQL information (see below). • SERIAL: Like TYPICAL except that the parallel information is not displayed, even if the plan executes in parallel. • ALL: Maximum user level. Includes information displayed with the TYPICAL level with additional information (PROJECTION, ALIAS and information about REMOTE SQL if the operation is distributed). • ADAPTIVE: <ul style="list-style-type: none"> – Displays the final plan, or the current plan if the execution has not completed. This section includes notes about runtime optimizations that affect the plan, such as switching from a Nested Loops join to a Hash join. – Plan lineage. This section shows the plans that were run previously due to automatic reoptimization. It also shows the default plan, if the plan changed due to dynamic plans. – Recommended plan. In reporting mode, the plan is chosen based on execution statistics displayed. Note that displaying the recommended plan for automatic reoptimization requires re-compiling the query with the optimizer adjustments collected in the child cursor. Displaying the recommended plan for a dynamic plan does not require this. – Dynamic plans. This summarizes the portions of the plan that differ from the default plan chosen by the optimizer. <p>For finer control on the display output, you can add the following keywords to the preceding format options to customize their default behavior. Each keyword either represents a logical group of plan table columns (such as PARTITION) or logical additions to the base plan table output (such as PREDICATE).</p> <p>Format keywords must be separated by either a comma or a space:</p> <ul style="list-style-type: none"> • ROWS - if relevant, shows the number of rows estimated by the optimizer • BYTES - if relevant, shows the number of bytes estimated by the optimizer • COST - if relevant, shows optimizer cost information • PARTITION - if relevant, shows partition pruning information • PARALLEL - if relevant, shows PX information (distribution method and table queue information) • PREDICATE - if relevant, shows the predicate section • PROJECTION -if relevant, shows the projection section • ALIAS - if relevant, shows the "Query Block Name / Object Alias" section • REMOTE - if relevant, shows the information for distributed query (for example, remote from serial distribution and remote SQL) • NOTE - if relevant, shows the note section of the explain plan • IOSTATS - assuming that basic plan statistics are collected when SQL statements are executed (either by using the |

Table 219-7 (Cont.) DISPLAY_CURSOR Function Parameters

| Parameter | Description |
|-----------|--|
| | <p>gather_plan_statistics hint or by setting the parameter statistics_level to ALL), this format shows IO statistics for ALL (or only for the LAST as shown below) executions of the cursor.</p> <ul style="list-style-type: none"> MEMSTATS - Assuming that PGA memory management is enabled (that is, pga_aggregate_target parameter is set to a non 0 value), this format allows to display memory management statistics (for example, execution mode of the operator, how much memory was used, number of bytes spilled to disk, and so on). These statistics only apply to memory intensive operations like hash-joins, sort or some bitmap operators. ALLSTATS - A shortcut for 'IOSTATS MEMSTATS' LAST - By default, plan statistics are shown for all executions of the cursor. The keyword LAST can be specified to see only the statistics for the last execution. <p>The following formats are deprecated but supported for backward compatibility:</p> <ul style="list-style-type: none"> RUNSTATS_TOT - Same as IOSTATS, that is, displays IO statistics for all executions of the specified cursor. RUNSTATS_LAST - Same as IOSTATS LAST, that is, displays the runtime statistics for the last execution of the cursor <p>You can prefix format keywords with the sign '-' to exclude the specified information. For example, '-PROJECTION' excludes projection information.</p> |

Usage Notes

- To use the DISPLAY_CURSOR functionality, the calling user must have SELECT or READ privilege on the fixed views V\$SQL_PLAN_STATISTICS_ALL, V\$SQL and V\$SQL_PLAN, otherwise it shows an appropriate error message.
- Here are some ways you might use variations on the format parameter:
 - Use 'ALL -PROJECTION -NOTE' to display everything except the projection and note sections.
 - Use 'TYPICAL PROJECTION' to display using the typical format with the additional projection section (which is normally excluded under the typical format). Since typical is default, using simply 'PROJECTION' is equivalent.
 - Use '-BYTES -COST -PREDICATE' to display using the typical format but excluding optimizer cost and byte estimates as well as the predicate section.
 - Use 'BASIC ROWS' to display basic information with the additional number of rows estimated by the optimizer.

Examples

To display the execution plan of the last SQL statement executed by the current session:

```
SELECT * FROM table (
  DBMS_XPLAN.DISPLAY_CURSOR);
```

To display the execution plan of all children associated with the SQL ID 'atfwcg8anrykp':

```
SELECT * FROM table (
    DBMS_XPLAN.DISPLAY_CURSOR('atfwcg8anrykp'));
```

To display runtime statistics for the cursor included in the preceding statement:

```
SELECT * FROM table (
    DBMS_XPLAN.DISPLAY_CURSOR('atfwcg8anrykp', NULL, 'ALLSTATS LAST'));
```

219.5.6 DISPLAY_PLAN Function

This table function displays the contents of the plan table in a variety of formats with CLOB output type.

Syntax

```
DBMS_XPLAN.DISPLAY_PLAN (
    table_name      IN    VARCHAR2    DEFAULT 'PLAN_TABLE',
    statement_id    IN    VARCHAR2    DEFAULT NULL,
    format          IN    VARCHAR2    DEFAULT 'TYPICAL',
    filter_preds    IN    VARCHAR2    DEFAULT NULL,
    type           IN    VARCHAR2    DEFAULT 'TEXT')
RETURN CLOB;
```

Parameters

Table 219-8 DISPLAY_PLAN Function Parameters

| Parameter | Description |
|--------------|---|
| table_name | Specifies the table name where the plan is stored. This parameter defaults to <code>PLAN_TABLE</code> , which is the default plan table for the <code>EXPLAIN PLAN</code> command. If <code>NULL</code> is specified it also defaults to <code>PLAN_TABLE</code> . |
| statement_id | Specifies the <code>statement_id</code> of the plan to be displayed. This parameter defaults to <code>NULL</code> , which is the default when the <code>EXPLAIN PLAN</code> command is executed without a <code>set statement_id</code> clause. If no <code>statement_id</code> is specified, the function shows you the plan of the most recent explained statement. |
| filter_preds | SQL filter predicate(s) to restrict the set of rows selected from the table where the plan is stored. When value is <code>NULL</code> (the default), the plan displayed corresponds to the last executed explain plan. For example: <code>filter_preds=>'plan_id = 10'</code> Can reference any column of the table where the plan is stored and can contain any SQL construct (for example, sub-query, function calls (see WARNING under Usage Notes) |

Table 219-8 (Cont.) DISPLAY_PLAN Function Parameters

| Parameter | Description |
|-----------|--|
| format | <p>Controls the level of details for the plan. It accepts five values:</p> <ul style="list-style-type: none"> BASIC: Displays the minimum information in the plan—the operation ID, the operation name and its option. TYPICAL: This is the default. Displays the most relevant information in the plan (operation id, name and option, #rows, #bytes and optimizer cost). Pruning, parallel and predicate information are only displayed when applicable. Excludes only PROJECTION, ALIAS and REMOTE SQL information (see below). SERIAL: Like TYPICAL except that the parallel information is not displayed, even if the plan executes in parallel. ALL: Maximum user level. Includes information displayed with the TYPICAL level with additional information (PROJECTION, ALIAS and information about REMOTE SQL if the operation is distributed). ADAPTIVE: Displays the default plan, and for each dynamic subplan (if stipulated): <ul style="list-style-type: none"> - A list of the rowsources from the original which may be replaced, and the rowsources to replace them - If outline display is specified in the format argument, the hints for each option in the dynamic subplan are displayed <p>For finer control on the display output, the following keywords can be added to the above three standard format options to customize their default behavior. Each keyword either represents a logical group of plan table columns (such as PARTITION) or logical additions to the base plan table output (such as PREDICATE). Format keywords must be separated by either a comma or a space:</p> <ul style="list-style-type: none"> ROWS - if relevant, shows the number of rows estimated by the optimizer BYTES - if relevant, shows the number of bytes estimated by the optimizer COST - if relevant, shows optimizer cost information PARTITION - if relevant, shows partition pruning information PARALLEL - if relevant, shows PX information (distribution method and table queue information) PREDICATE - if relevant, shows the predicate section PROJECTION -if relevant, shows the projection section ALIAS - if relevant, shows the "Query Block Name / Object Alias" section REMOTE - if relevant, shows the information for distributed query (for example, remote from serial distribution and remote SQL) NOTE - if relevant, shows the note section of the explain plan <p>Format keywords can be prefixed by the sign '-' to exclude the specified information. For example, '-PROJECTION' excludes projection information.</p> <p>If the target plan table (see table_name parameter) also stores plan statistics columns (for example, it is a table used to capture the content of the fixed view V\$SQL_PLAN_STATISTICS_ALL), additional format keywords can be used to specify which class of statistics to display when using the DISPLAY Function. These additional format keywords are IOSTATS, MEMSTATS, ALLSTATS and LAST (see the</p> |

Table 219-8 (Cont.) DISPLAY_PLAN Function Parameters

| Parameter | Description |
|-----------|--|
| | DISPLAY_CURSOR Function or the DISPLAY_SQLSET Function for a full description of these four keywords). |
| type | Output type, one of: 'TEXT', 'ACTIVE', 'HTML', or 'XML' (see Usage Notes regarding type ACTIVE). |

Return Values

Returns the requested report as CLOB

Usage Notes

Active reports have a rich, interactive user interface akin to that found in Enterprise Manager while not requiring any EM installation. The report file built is in HTML format, so it can be interpreted by most modern browsers. The code powering the active report is downloaded transparently by the web browser when the report is first viewed, hence viewing it requires outside connectivity.

WARNING:

Application developers should expose the `filter_preds` parameter to end-users only after careful consideration because this could expose the application to SQL injection. Indeed, `filter_preds` can potentially reference any table or execute any server function for which the database user invoking the table function has privileges.

219.5.7 DISPLAY_SQL_PLAN_BASELINE Function

This table function displays one or more execution plans for the specified SQL handle of a SQL plan baseline.

Syntax

```
DBMS_XPLAN.DISPLAY_SQL_PLAN_BASELINE (
  sql_handle      IN VARCHAR2 := NULL,
  plan_name      IN VARCHAR2 := NULL,
  format         IN VARCHAR2 := 'TYPICAL')
RETURN dbms_xplan_type_table;
```

Parameters

Table 219-9 DISPLAY_SQL_PLAN_BASELINE Function Parameters

| Parameter | Description |
|------------|--|
| sql_handle | SQL statement handle. It identifies a SQL statement whose plans are to be displayed. |

Table 219-9 (Cont.) DISPLAY_SQL_PLAN_BASELINE Function Parameters

| Parameter | Description |
|-----------|---|
| plan_name | Plan name. It identifies a specific plan. Default NULL means all plans associated with identified SQL statement are explained and displayed. |
| format | Format string determines what information stored in the plan displayed. The following format values are possible, each representing a common use case: BASIC, TYPICAL, and ALL. |

Return Values

A PL/SQL type table

Usage Notes

This function uses plan information stored in the plan baseline to explain and display the plans. The plan_id stored in the SQL management base may not match the plan_id of the generated plan. A mismatch between the stored plan_id and generated plan_id means that it is a non-reproducible plan. Such a plan is deemed invalid and is bypassed by the optimizer during SQL compilation.

Examples

Display all plans of a SQL statement identified by the SQL handle

SYS_SQL_b1d49f6074ab95af using TYPICAL format

```
SET LINESIZE 150
SET PAGESIZE 2000
SELECT t.*
FROM TABLE(DBMS_XPLAN.DISPLAY_SQL_PLAN_BASELINE('SYS_SQL_b1d49f6074ab95af'))
t;
```

Display all plans of one or more SQL statements containing the string HR2 using BASIC format:

```
SET LINESIZE 150
SET PAGESIZE 2000
SELECT t.*
FROM (SELECT DISTINCT sql_handle FROM dba_sql_plan_baselines WHERE sql_text
LIKE '%HR2%') pb,
TABLE(DBMS_XPLAN.DISPLAY_SQL_PLAN_BASELINE(pb.sql_handle, NULL,
'BASIC')) t;
```

219.5.8 DISPLAY_SQLSET Function

This table function displays the execution plan of a given statement stored in a SQL tuning set.

Syntax

```
DBMS_XPLAN.DISPLAY_SQLSET(
    sqlset_name      IN VARCHAR2,
```

```

sql_id          IN VARCHAR2,
plan_hash_value IN NUMBER := NULL,
format         IN VARCHAR2 := 'TYPICAL',
sqlset_owner   IN VARCHAR2 := NULL)
RETURN DBMS_XPLAN_TYPE_TABLE PIPELINED;

```

Parameters

Table 219-10 DISPLAY_SQLSET Function Parameters

| Parameter | Description |
|-----------------|--|
| sqlset_name | Name of the SQL Tuning Set |
| sql_id | Specifies the sql_id value for a SQL statement having its plan stored in the SQL tuning set. You can find all stored SQL statements by querying table function <code>DBMS_SQLTUNE.SELECT_SQLSET</code> |
| plan_hash_value | Optional parameter. Identifies a specific stored execution plan for a SQL statement. If suppressed, all stored execution plans are shown. |

Table 219-10 (Cont.) DISPLAY_SQLSET Function Parameters

| Parameter | Description |
|-----------|---|
| format | <p>Controls the level of details for the plan. It accepts four values:</p> <ul style="list-style-type: none"> • BASIC: Displays the minimum information in the plan—the operation ID, the operation name and its option. • TYPICAL: This is the default. Displays the most relevant information in the plan (operation id, name and option, #rows, #bytes and optimizer cost). Pruning, parallel and predicate information are only displayed when applicable. Excludes only PROJECTION, ALIAS and REMOTE SQL information (see below). • SERIAL: Like TYPICAL except that the parallel information is not displayed, even if the plan executes in parallel. • ALL: Maximum user level. Includes information displayed with the TYPICAL level with additional information (PROJECTION, ALIAS and information about REMOTE SQL if the operation is distributed). <p>For finer control on the display output, the following keywords can be added to the above three standard format options to customize their default behavior. Each keyword either represents a logical group of plan table columns (such as PARTITION) or logical additions to the base plan table output (such as PREDICATE). Format keywords must be separated by either a comma or a space:</p> <ul style="list-style-type: none"> • ROWS - if relevant, shows the number of rows estimated by the optimizer • BYTES - if relevant, shows the number of bytes estimated by the optimizer • COST - if relevant, shows optimizer cost information • PARTITION - if relevant, shows partition pruning information • PARALLEL - if relevant, shows PX information (distribution method and table queue information) • PREDICATE - if relevant, shows the predicate section • PROJECTION -if relevant, shows the projection section • ALIAS - if relevant, shows the "Query Block Name / Object Alias" section • REMOTE - if relevant, shows the information for distributed query (for example, remote from serial distribution and remote SQL) • NOTE - if relevant, shows the note section of the explain plan • IOSTATS - assuming that basic plan statistics are collected when SQL statements are executed (either by using the gather_plan_statistics hint or by setting the parameter STATISTICS_LEVEL to ALL), this format shows IO statistics for ALL (or only for the LAST as shown below) executions of the cursor. • MEMSTATS - Assuming that PGA memory management is enabled (that is, pga_aggregate_target parameter is set to a non 0 value), this format allows to display memory management statistics (for example, execution mode of the operator, how much memory was used, number of bytes spilled to disk, and so on). These statistics only apply to memory intensive operations like hash-joins, sort or some bitmap operators. • ALLSTATS - A shortcut for 'IOSTATS MEMSTATS' |

Table 219-10 (Cont.) DISPLAY_SQLSET Function Parameters

| Parameter | Description |
|--------------|---|
| | <ul style="list-style-type: none"> LAST - By default, plan statistics are shown for all executions of the cursor. The keyword LAST can be specified to see only the statistics for the last execution. <p>The following two formats are deprecated but supported for backward compatibility:</p> <ul style="list-style-type: none"> RUNSTATS_TOT - Same as IOSTATS, that is, displays IO statistics for all executions of the specified cursor. RUNSTATS_LAST - Same as IOSTATS LAST, that is, displays the runtime statistics for the last execution of the cursor <p>Format keywords can be prefixed by the sign '-' to exclude the specified information. For example, '-PROJECTION' excludes projection information.</p> |
| sqlset_owner | The owner of the SQL tuning set. The default is the current user. |

Usage Notes

Here are some ways you might use variations on the `format` parameter:

- Use 'ALL -PROJECTION -NOTE' to display everything except the projection and note sections.
- Use 'TYPICAL PROJECTION' to display using the typical format with the additional projection section (which is normally excluded under the typical format). Since typical is default, using simply 'PROJECTION' is equivalent.
- Use '-BYTES -COST -PREDICATE' to display using the typical format but excluding optimizer cost and byte estimates as well as the predicate section.
- Use 'BASIC ROWS' to display basic information with the additional number of rows estimated by the optimizer.

Examples

To display the execution plan for the SQL statement associated with SQL ID 'gwp663cqh5qbf' and PLAN HASH 3693697075 in the SQL Tuning Set called 'OLTP_optimization_0405':

```
SELECT * FROM table
(DBMS_XPLAN.DISPLAY_SQLSET('OLTP_optimization_0405','gwp663cqh5qbf',
3693697075));
```

To display all execution plans of the SQL ID 'atfwcg8anrykp' stored in the SQL tuning set:

```
SELECT * FROM table
(DBMS_XPLAN.DISPLAY_SQLSET('OLTP_optimization_0405','gwp663cqh5qbf'));
```

To display runtime statistics for the SQL statement included in the preceding statement:

```
SELECT * FROM table (
  DBMS_XPLAN.DISPLAY_SQLSET(
    'OLTP_optimization_0405', 'gwp663cqh5qb', NULL, 'ALLSTATS LAST');
```

219.5.9 DISPLAY_WORKLOAD_REPOSITORY Function

This table function displays the contents of an execution plan stored in AWR.

Note:

This function replaces `DISPLAY_AWR`, which is deprecated.

Syntax

```
DBMS_XPLAN.DISPLAY_WORKLOAD_REPOSITORY(
  sql_id          IN          VARCHAR2,
  plan_hash_value IN          NUMBER  DEFAULT NULL,
  format          IN          VARCHAR2 DEFAULT 'TYPICAL',
  dbid            IN          NUMBER  DEFAULT NULL,
  con_dbid        IN          NUMBER  DEFAULT NULL,
  awr_location    IN          VARCHAR2 DEFAULT 'AWR_ROOT'
);
```

Parameters

Table 219-11 DISPLAY_WORKLOAD_REPOSITORY Table Function Parameters

| Parameter | Description |
|-----------------|---|
| sql_id | Specifies the <code>SQL_ID</code> of the SQL statement. You can retrieve the appropriate value for the SQL statement of interest by querying the column <code>SQL_ID</code> in <code>DBA_HIST_SQLTEXT</code> . |
| plan_hash_value | Specifies the <code>PLAN_HASH_VALUE</code> of a SQL statement. This parameter is optional. If omitted, the table function returns all stored execution plans for a given <code>SQL_ID</code> . |

Table 219-11 (Cont.) DISPLAY_WORKLOAD_REPOSITORY Table Function Parameters

| Parameter | Description |
|--------------|--|
| format | <p>Controls the level of details for the plan. It accepts four values:</p> <ul style="list-style-type: none"> BASIC: Displays the minimum information in the plan—the operation ID, the operation name and its option. TYPICAL: This is the default. Displays the most relevant information in the plan (operation id, name and option, #rows, #bytes and optimizer cost). Pruning, parallel and predicate information are only displayed when applicable. Excludes only PROJECTION, ALIAS and REMOTE SQL information (see below). SERIAL: Like TYPICAL except that the parallel information is not displayed, even if the plan executes in parallel. ALL: Maximum user level. Includes information displayed with the TYPICAL level with additional information (PROJECTION, ALIAS and information about REMOTE SQL if the operation is distributed). <p>For finer control on the display output, the following keywords can be added to the above four standard format options to customize their default behavior. Each keyword either represents a logical group of plan table columns (such as PARTITION) or logical additions to the base plan table output (such as PREDICATE). Format keywords must be separated by either a comma or a space:</p> <ul style="list-style-type: none"> ROWS - if relevant, shows the number of rows estimated by the optimizer BYTES - if relevant, shows the number of bytes estimated by the optimizer COST - if relevant, shows optimizer cost information PARTITION - if relevant, shows partition pruning information PARALLEL - if relevant, shows PX information (distribution method and table queue information) PREDICATE - if relevant, shows the predicate section PROJECTION -if relevant, shows the projection section ALIAS - if relevant, shows the "Query Block Name / Object Alias" section REMOTE - if relevant, shows the information for distributed query (for example, remote from serial distribution and remote SQL) NOTE - if relevant, shows the note section of the explain plan <p>Format keywords can be prefixed by the sign '-' to exclude the specified information. For example, '-PROJECTION' excludes projection information.</p> |
| dbid | <p>Identifies the plans for a specific database.</p> <p>If this parameter is omitted, then the value defaults to the DBID of the AWR repository pointed to by the initialization parameter AWR_LOCATION. In a CDB, if AWR_LOCATION is set to AWR_ROOT, then the value is set to the DBID of the CDB root. If it is set to AWR_PDB, then the value is set to the DBID of the container.</p> |
| con_dbid | <p>Identifies the plans for a specific container.</p> <p>If this parameter is omitted, then the value defaults to SYS_CONTEXT('userenv', 'con_id').</p> |
| awr_location | <p>Specifies the location of the AWR repository. Supported values are:</p> <ul style="list-style-type: none"> AWR_ROOT when the AWR to be accessed is in the root container. This is the default. 'AWR_PDB', if the AWR to be accessed is in the local container. |

Example 219-2 Querying an AWR Plan

Assume that you log in as an administrator and issue the following query:

```
select count(*) from sh.sAleS
```

You create an AWR snapshot as follows:

```
EXEC DBMS_WORKLOAD_REPOSITORY.CREATE_SNAPSHOT;
```

You query joint DBA_HIST_SQLTEXT to the function output as follows:

```
SET LINESIZE 150
SET PAGESIZE 5000

SELECT t.*
FROM   DBA_HIST_SQLTEXT ht,
       TABLE(DBMS_XPLAN.DISPLAY_WORKLOAD_REPOSITORY
              (ht.sql_id, null, '-PREDICATE +ALIAS',null,null,'AWR_ROOT')) t
WHERE  ht.SQL_TEXT LIKE '%sAleS%';
```

```
SQL_ID 2f4cx9qjnqd70
-----
select count(*) from sh.sAleS
```

Plan hash value: 1123225294

```
-----
```

| Id | Operation | Name | Rows | Cost |
|--------|-----------------------------|-----------------|-------|------|
| (%CPU) | Time | Pstart | Pstop | |
| 0 | SELECT STATEMENT | | | 27 |
| (100) | | | | |
| 1 | SORT AGGREGATE | | 1 | |
| | | | | |
| 2 | PARTITION RANGE ALL | | 918K | 27 |
| (0) | 00:00:01 | 1 | 28 | |
| 3 | BITMAP CONVERSION COUNT | | 918K | 27 |
| (0) | 00:00:01 | | | |
| 4 | BITMAP INDEX FAST FULL SCAN | SALES_PROMO_BIX | | |
| | | | 1 | 28 |

```
-----
```

Query Block Name / Object Alias (identified by operation id):

```
-----
1 - SEL$1
3 - SEL$1 / "SALES"@"SEL$1"
```

DBMS_XSLPROCESSOR

The `DBMS_XSLPROCESSOR` package provides an interface to manage the contents and structure of XML documents.

This chapter contains the following topics:

- [DBMS_XSLPROCESSOR Overview](#)
- [DBMS_XSLPROCESSOR Security Model](#)
- [Summary of DBMS_XSLPROCESSOR Subprograms](#)

 **See Also:**

- *Oracle XML DB Developer's Guide*

220.1 DBMS_XSLPROCESSOR Overview

The `DBMS_XSLPROCESSOR` package provides an interface to manage the contents and structure of XML documents.

Standards

This PL/SQL implementation of the XSL processor follows the W3C XSLT working draft rev WD-xslt-19990813 and includes the required behavior of an XSL processor in terms of how it must read XSLT stylesheets and the transformation it must effect.

Concepts

The Extensible Stylesheet Language Transformation (XSLT) describes rules for transforming a source tree into a result tree. A transformation expressed in XSLT is called a stylesheet. The transformation specified is achieved by associating patterns with templates defined in the stylesheet. A template is instantiated to create part of the result tree.

Implementation

The following is the default behavior for this PL/SQL XSL Processor:

- A result tree which can be accessed by DOM programmatic interface
- Errors are not recorded unless an error log is specified; however, an application error will be raised if parsing fails

220.2 DBMS_XSLPROCESSOR Security Model

Owned by XDB, the DBMS_XSLPROCESSOR package must be created by SYS or XDB. The EXECUTE privilege is granted to PUBLIC. Subprograms in this package are executed using the privileges of the current user.

220.3 Summary of DBMS_XSLPROCESSOR Subprograms

This table lists the DBMS_XSLPROCESSOR subprograms and briefly describes them.

Table 220-1 DBMS_XSLPROCESSOR Package Subprograms

| Method | Description |
|---|---|
| FREEPROCESSOR Procedure | Frees a processor object |
| FREESTYLESHEET Procedure | Frees a stylesheet object |
| NEWPROCESSOR Function | Returns a new processor instance |
| NEWSTYLESHEET Functions | Creates a new stylesheet from input and reference URLs |
| PROCESSXSL Functions and Procedures | Transforms an input XML document |
| REMOVEPARAM Procedure | Removes a top-level stylesheet parameter |
| RESETPARAMS Procedure | Resets the top-level stylesheet parameters |
| SELECTNODES Function | Selects nodes from a DOM tree that match a pattern |
| SELECTSINGLENODE Function | Selects the first node from the tree that matches a pattern |
| SETERRORLOG Procedure | Sets errors to be sent to the specified file |
| SETPARAM Procedure | Sets a top-level parameter in the stylesheet |
| SHOWWARNINGS Procedure | Turns warnings on or off |
| TRANSFORMNODE Function | Transforms a node in a DOM tree using a stylesheet |
| VALUEOF Function and Procedure | Gets the value of the first node that matches a pattern |

220.3.1 FREEPROCESSOR Procedure

This procedure frees a Processor object.

Syntax

```
DBMS_XSLPROCESSOR.FREEPROCESSOR(
  p IN Processor);
```

Parameters

Table 220-2 FREEPROCESSOR Procedure Parameters

| Parameter | Description |
|-----------|-------------|
| p | Processor |

220.3.2 FREESTYLESHEET Procedure

This procedure frees a `Stylesheet` object.

Syntax

```
DBMS_XSLPROCESSOR.FREESTYLESHEET(  
    ss IN Stylesheet);
```

Parameters

Table 220-3 FREESTYLESHEET Procedure Parameters

| Parameter | Description |
|-----------|-------------|
| ss | Stylesheet |

220.3.3 NEWPROCESSOR Function

This function returns a new `Processor` instance.

The function must be called before the default behavior of `Processor` can be changed and if other processor methods need to be used.

Syntax

```
DBMS_XSLPROCESSOR.NEWPROCESSOR  
RETURN Processor;
```

220.3.4 NEWSTYLESHEET Functions

This function creates and returns a new `Stylesheet` instance.

The options are described in the following table.

Syntax

Creates and returns a new stylesheet instance using the given `DOMDOCUMENT` and reference URLs:

```
DBMS_XSLPROCESSOR.NEWSTYLESHEET(  
    xmldoc IN DOMDOCUMENT,  
    ref    IN VARCHAR2)  
RETURN Stylesheet;
```

Creates and returns a new `Stylesheet` instance using the given input and reference URLs:

```
DBMS_XSLPROCESSOR.NEWSTYLESHEET(  
    inp    IN VARCHAR2,  
    ref    IN VARCHAR2)  
RETURN Stylesheet;
```

Parameters

Table 220-4 NEWSTYLESHEET Function Parameters

| Parameter | Description |
|-----------|-------------------------------------|
| xmlDoc | DOMDocument to use for construction |
| inp | Input URL to use for construction |
| ref | Reference URL |

220.3.5 PROCESSXSL Functions and Procedures

This function transforms input `XMLDocument`.

Any changes to the default processor behavior should be effected before calling this procedure. An application error is raised if processing fails.

Syntax

Transforms input `XMLDocument` using given `DOMDocument` and stylesheet, and returns the resultant document fragment:

```
DBMS_XSLPROCESSOR.PROCESSXSL(
  p      IN  Processor,
  ss     IN  Stylesheet,
  xmlDoc IN  DOMDOCUMENT),
RETURN DOMDOCUMENTFRAGMENT;
```

Transforms input `XMLDocument` using given document as URL and the `Stylesheet`, and returns the resultant document fragment:

```
DBMS_XSLPROCESSOR.PROCESSXSL(
  p      IN  Processor,
  ss     IN  Stylesheet,
  url    IN  VARCHAR2,
RETURN DOMDOCUMENTFRAGMENT;
```

Transforms input `XMLDocument` using given document as `CLOB` and the `Stylesheet`, and returns the resultant document fragment:

```
DBMS_XSLPROCESSOR.PROCESSXSL(
  p      IN  Processor,
  ss     IN  Stylesheet,
  clb    IN  CLOB)
RETURN DOMDOCUMENTFRAGMENT;
```

Transforms input `XMLDocument` using given `DOMDOCUMENT` and the stylesheet, and writes the output to the specified file:

```
DBMS_XSLPROCESSOR.DBMS_XSLPROCESSOR.(
  p          IN  Processor,
  ss         IN  Stylesheet,
  xmlDoc     IN  DOMDOCUMENT,
  dir        IN  VARCHAR2,
  fileName   IN  VARCHAR2);
```

Transforms input `XMLDocument` using given URL and the stylesheet, and writes the output to the specified file in a specified directory:

```
DBMS_XSLPROCESSOR.PROCESSXSL(  
  p          IN    Processor,  
  ss         IN    Stylesheet,  
  url        IN    VARCHAR2,  
  dir        IN    VARCHAR2,  
  fileName   IN    VARCHAR2);
```

Transforms input `XMLDocument` using given `DOMDOCUMENT` and the stylesheet, and writes the output to a CLOB:

```
DBMS_XSLPROCESSOR.PROCESSXSL(  
  p          IN    Processor,  
  ss         IN    Stylesheet,  
  xmldoc     IN    DOMDOCUMENT,  
  cl         IN OUT CLOB);
```

Transforms input `XMLDocument` using given `DOMDOCUMENTFRAGMENT` and the stylesheet, and returns the resultant document fragment:

```
DBMS_XSLPROCESSOR.PROCESSXSL(  
  p          IN    Processor,  
  ss         IN    Stylesheet,  
  xmldf      IN    DOMDOCUMENTFRAGMENT)  
RETURN DOMDOCUMENTFRAGMENT;
```

Transforms input `XMLDocumentFragment` using given `DOMDocumentFragment` and the stylesheet, and writes the output to the specified file in a specified directory:

```
DBMS_XSLPROCESSOR.PROCESSXSL(  
  p          IN    Processor,  
  ss         IN    Stylesheet,  
  xmldf      IN    DOMDOCUMENTFRAGMENT,  
  dir        IN    VARCHAR2,  
  filename   IN    VARCHAR2);
```

Transforms input `XMLDocumentFragment` using given `DOMDOCUMENTFRAGMENT` and the stylesheet, and writes the output to a buffer:

```
DBMS_XSLPROCESSOR.PROCESSXSL(  
  p          IN    Processor,  
  ss         IN    Stylesheet,  
  xmldf      IN    DOMDOCUMENTFRAGMENT,  
  buf        IN OUT VARCHAR2);
```

Transforms input `XMLDocumentFragment` using given `DOMDOCUMENTFRAGMENT` and the stylesheet, and writes the output to a CLOB:

```
DBMS_XSLPROCESSOR.PROCESSXSL(  
  p          IN    Processor,  
  ss         IN    Stylesheet,  
  xmldf      IN    DOMDOCUMENTFRAGMENT,  
  cl         IN OUT CLOB);
```

Parameters

Table 220-5 PROCESSXSL Function and Procedure Parameters

| Parameter | Description |
|-----------|---|
| p | Processor instance |
| ss | Stylesheet instance |
| xmlDoc | XML document being transformed |
| url | URL for the information being transformed |
| clb | CLOB containing information to be transformed |
| dir | Directory where processing output file is saved |
| filename | Processing output file |
| cl | CLOB to which the processing output is saved |
| xmlDf | XMLDocumentFragment being transformed |

220.3.6 REMOVEPARAM Procedure

This procedure removes a top level stylesheet parameter.

Syntax

```
DBMS_XSLPROCESSOR.REMOVEPARAM(
    ss      IN  Stylesheet,
    name    IN  VARCHAR2);
```

Parameters

Table 220-6 REMOVEPARAM Procedure Parameters

| Parameter | Description |
|-----------|-----------------------|
| ss | Stylesheet instance |
| name | Name of the parameter |

220.3.7 RESETPARAMS Procedure

This procedure resets the top-level stylesheet parameters.

Syntax

```
DBMS_XSLPROCESSOR.RESETPARAMS(
    ss IN  Stylesheet);
```

Parameters

Table 220-7 RESETPARAMS Procedure Parameters

| Parameter | Description |
|-----------|---------------------|
| ss | Stylesheet instance |

220.3.8 SELECTNODES Function

This function selects nodes which match the supplied path expression from a DOM tree, and returns the result of the selection.

Syntax

```
DBMS_XSLPROCESSOR.SELECTNODES (
  n          IN  DBMS_XMLDOM.DOMNODE,
  pattern    IN  VARCHAR2,
  namespace  IN  VARCHAR2 := NULL)
RETURN DBMS_XMLDOM.DOMNODELIST;
```

Parameters

Table 220-8 SELECTNODES Function Parameters

| Parameter | Description |
|-----------|--------------------------|
| n | Root DOMNode of the tree |
| pattern | Pattern to use |
| namespace | Namespace declared |

220.3.9 SELECTSINGLENODE Function

This function selects the first node from the tree that match the supplied path expression, and returns that node.

Syntax

```
DBMS_XSLPROCESSOR.SELECTSINGLENODE (
  n          IN  DBMS_XMLDOM.DOMNODE,
  pattern    IN  VARCHAR2,
  namespace  IN  VARCHAR2 := NULL)
RETURN DBMS_XMLDOM.DOMNODE;
```

Parameters

Table 220-9 SELECTSINGLENODE Function Parameters

| Parameter | Description |
|-----------|--------------------------|
| n | Root DOMNode of the tree |
| pattern | Pattern to use |

Table 220-9 (Cont.) SELECTSINGLENODE Function Parameters

| Parameter | Description |
|-----------|--------------------|
| namespace | Namespace declared |

220.3.10 SETERRORLOG Procedure

This deprecated procedure sets errors to be sent to the specified file.

Note:

This subprogram has been deprecated, and is included only for reasons of backward compatibility.

Syntax

```
DBMS_XSLPROCESSOR.SETERRORLOG(
    p          IN  Processor,
    fileName  IN  VARCHAR2);
```

Parameters

Table 220-10 SETERRORLOG Procedure Parameters

| Parameter | Description |
|-----------|---|
| p | Processor instance |
| fileName | Complete path of the file to use as the error log |

220.3.11 SETPARAM Procedure

This procedure sets a top level parameter in the stylesheet.

The parameter value must be a valid XPath expression. Literal string values must be quoted.

Syntax

```
DBMS_XSLPROCESSOR.SETPARAM(
    ss      IN  Stylesheet,
    name   IN  VARCHAR2,
    value  IN  VARCHAR2);
```

Parameters

Table 220-11 SETPARAM Procedure Parameters

| Parameter | Description |
|-----------|---------------------|
| ss | Stylesheet instance |

Table 220-11 (Cont.) SETPARAM Procedure Parameters

| Parameter | Description |
|-----------|------------------------|
| name | Name of the parameter |
| value | Value of the parameter |

220.3.12 SHOWWARNINGS Procedure

This procedure turns warnings on (TRUE) or off (FALSE).

Syntax

```
DBMS_XSLPROCESSOR.SHOWWARNINGS (
  p      IN  Processor,
  yes    IN  BOOLEAN);
```

Parameters

Table 220-12 SHOWWARNINGS Procedure Parameters

| Parameter | Description |
|-----------|---|
| p | Processor instance |
| yes | Mode to set: TRUE to show warnings, FALSE otherwise |

220.3.13 TRANSFORMNODE Function

This function transforms a node in a DOM tree using the given stylesheet, and returns the result of the transformation as a DOMDocumentFragment.

Syntax

```
DBMS_XSLPROCESSOR.TRANSFORMNODE (
  n      IN  DOMNODE,
  ss     IN  Stylesheet)
RETURN DOMDocumentFragment;
```

Parameters

Table 220-13 TRANSFORMNODE Function Parameters

| Parameter | Description |
|-----------|----------------------|
| n | DOMNode to transform |
| ss | Stylesheet to use |

220.3.14 VALUEOF Function and Procedure

This subprogram retrieves the value of the first node from the tree that matches the given pattern. You can use either a function or a procedure.

Syntax

```
DBMS_XSLPROCESSOR.VALUEOF (
    n           IN    DBMS_XMLDOM.DOMNODE,
    pattern     IN    VARCHAR2,
    namespace  IN    VARCHAR2 := NULL)
RETURN VARCHAR2;
```

```
DBMS_XSLPROCESSOR.VALUEOF (
    n           IN    DBMS_XMLDOM.DOMNODE,
    pattern     IN    VARCHAR2,
    val        OUT   VARCHAR2,
    namespace  IN    VARCHAR2 := NULL);
```

Parameters

Table 220-14 VALUEOF Function and Procedure Parameters

| Parameter | Description |
|-----------|-------------------------------------|
| n | Node whose value is being retrieved |
| pattern | Pattern to use |
| val | Retrieved value |
| namespace | Namespace to use |

DBMS_XSTREAM_ADM

This `DBMS_XSTREAM_ADM` package provides interfaces for streaming database changes between an Oracle database and other systems. XStream enables applications to stream out or stream in database changes.

This chapter contains the following topic:

- [Overview](#)
- [Security Model](#)
- [Operational Notes](#)
- [Summary of DBMS_XSTREAM_ADM Subprograms](#)

See Also:

- *Oracle Database XStream Guide*
- *Oracle Call Interface Programmer's Guide*
- *Oracle Database XStream Java API Reference*

221.1 DBMS_XSTREAM_ADM Overview

The package provides interfaces for configuring outbound servers that stream database changes from an Oracle database to other systems. The package also provides interfaces for configuring inbound servers that stream database changes from other systems to an Oracle database.

In both cases, the database changes are encapsulated in logical change records (LCRs). Also, the other systems can be Oracle systems or a non-Oracle systems, such as non-Oracle databases or file systems.

XStream outbound servers can stream out LCRs from an Oracle database programmatically using C or Java. After receiving the LCRs, the other system can process them in any customized way. For example, the other system can save the contents of the LCRs to a file, send the LCRs to an Oracle database through an XStream inbound server, or generate SQL statements and execute them on any Oracle or non-Oracle databases.

XStream inbound servers accept LCRs from another system and either apply them to an Oracle database or process them in a customized way using apply handlers.

XStream can be used in a multitenant container database (CDB). A CDB is an Oracle database that includes zero, one, or many user-created pluggable databases (PDBs).

 **See Also:**

- *Oracle Database XStream Guide*
- *Oracle Database Concepts* for more information about CDBs and PDBs

221.2 DBMS_XSTREAM_ADM Security Model

To ensure that the user who runs the subprograms in this package has the necessary privileges, configure an XStream administrator and connect as the XStream administrator when using this package.

An administrator must be granted the `DBA` role when the administrator is performing any of the following actions:

- Running the `ADD_OUTBOUND` procedure while connected as a user that is different from the configured connect user for an outbound server
- Running the `ALTER_OUTBOUND` procedure to change the capture user for a capture process or the connect user for an outbound server
- Running the `CREATE_OUTBOUND` procedure, because this procedure creates a capture process
- Running the `ALTER_INBOUND` procedure to change the apply user for an inbound server
- Running the `ADD_INBOUND` procedure while connected as a user that is different from the configured apply user for an inbound server

When the administrator does not need to perform the preceding tasks, the `DBA` role is not required.

 **See Also:**

- [GRANT_ADMIN_PRIVILEGE Procedure](#)
- *Oracle Database XStream Guide, Chapter 4, "XStream Out and Security"* for more information about XStream and security.

221.3 DBMS_XSTREAM_ADM Operational Notes

Some subprograms in the `DBMS_APPLY_ADM` package can manage XStream outbound servers, and some subprograms in the `DBMS_APPLY_ADM` package can manage XStream inbound servers.

See Also:

[DBMS_APPLY_ADM](#) for details about which subprograms can manage outbound servers and inbound servers

221.4 Summary of DBMS_XSTREAM_ADM Subprograms

This table lists the `DBMS_XSTREAM_ADM` subprograms and briefly describes them.

Table 221-1 DBMS_XSTREAM_ADM Package Subprograms

| Subprogram | Description |
|--|--|
| ADD_COLUMN Procedure | Either adds or removes a declarative rule-based transformation which adds a column to a row logical change record (row LCR) that satisfies the specified rule |
| ADD_GLOBAL_PROPAGATION_RULES Procedure | Either adds global rules to the positive rule set for a propagation, or adds global rules to the negative rule set for a propagation, and creates the specified propagation if it does not exist |
| ADD_GLOBAL_RULES Procedure | Adds global rules to either the positive or negative rule set of a capture process or apply process, and creates the specified capture process or apply process if it does not exist |
| ADD_OUTBOUND Procedure | Creates an XStream outbound server that dequeues LCRs from the specified queue |
| ADD_SCHEMA_PROPAGATION_RULES Procedure | Either adds schema rules to the positive rule set for a propagation, or adds schema rules to the negative rule set for a propagation, and creates the specified propagation if it does not exist |
| ADD_SCHEMA_RULES Procedure | Adds rules to a rule set of XStream clients. |
| ADD_SUBSET_OUTBOUND_RULES Procedure | Adds subset rules to an outbound server configuration |
| ADD_SUBSET_PROPAGATION_RULES Procedure | Adds subset rules to the positive rule set for a propagation, and creates the specified propagation if it does not exist |
| ADD_SUBSET_RULES Procedure | Adds subset rules to the positive rule set of a capture process or apply process, and creates the specified capture process or apply process if it does not exist |

Table 221-1 (Cont.) DBMS_XSTREAM_ADM Package Subprograms

| Subprogram | Description |
|---|---|
| ADD_TABLE_PROPAGATION_RULES Procedure | Either adds table rules to the positive rule set for a propagation, or adds table rules to the negative rule set for a propagation, and creates the specified propagation if it does not exist |
| ADD_TABLE_RULES Procedure | This procedure adds rules to a rule set of an XStream client. |
| ALTER_INBOUND Procedure | Modifies an XStream inbound server |
| ALTER_OUTBOUND Procedure | Modifies an XStream outbound server |
| CREATE_INBOUND Procedure | Creates an XStream inbound server and its queue |
| CREATE_OUTBOUND Procedure | Creates an XStream outbound server, queue, and capture process to enable XStream client applications to stream out Oracle database changes encapsulated in LCRs |
| DELETE_COLUMN Procedure | Either adds or removes a declarative rule-based transformation which deletes a column from a row LCR that satisfies the specified rule |
| DROP_INBOUND Procedure | Removes an inbound server configuration |
| DROP_OUTBOUND Procedure | Removes an outbound server configuration |
| ENABLE_GG_XSTREAM_FOR_STREAMS Procedure | Enables XStream performance optimizations for Oracle Replication components |
| GET_MESSAGE_TRACKING Function | Returns the tracking label for the current session |
| GET_TAG Function | Gets the binary tag for all redo entries generated by the current session |
| IS_GG_XSTREAM_FOR_STREAMS Function | Returns <code>TRUE</code> if XStream performance optimizations are enabled for Oracle Replication components, or returns <code>FALSE</code> if XStream performance optimizations are disabled for Oracle Replication components |
| KEEP_COLUMNS Procedure | Either adds or removes a declarative rule-based transformation which keeps a list of columns in a row LCR that satisfies the specified rule |
| MERGE_STREAMS Procedure | Merges a stream flowing from one capture process with a stream flowing from another capture process |
| MERGE_STREAMS_JOB Procedure | Determines whether the original capture process and the cloned capture are within the specified merge threshold and, if they are, runs the <code>MERGE_STREAMS</code> procedure to merge the two streams |
| PURGE_SOURCE_CATALOG Procedure | Removes all Oracle Replication data dictionary information at the local database for the specified object |
| RECOVER_OPERATION Procedure | Provides options for a split and merge operation that stopped because it encountered an error. This procedure either rolls forward the operation, rolls back the operation, or purges all of the metadata about the operation. |
| REMOVE_QUEUE Procedure | Removes the specified <code>ANYDATA</code> queue |

Table 221-1 (Cont.) DBMS_XSTREAM_ADM Package Subprograms

| Subprogram | Description |
|--|---|
| REMOVE_RULE Procedure | Removes the specified rule or all rules from the rule set associated with the specified capture process, apply process, or propagation. |
| REMOVE_SUBSET_OUTBOUND_RULES Procedure | Removes subset rules from an outbound server configuration |
| REMOVE_XSTREAM_CONFIGURATION Procedure | Removes the XStream configuration at the local database |
| RENAME_COLUMN Procedure | Either adds or removes a declarative rule-based transformation which renames a column in a row LCR that satisfies the specified rule |
| RENAME_SCHEMA Procedure | Either adds or removes a declarative rule-based transformation which renames a schema in a row LCR that satisfies the specified rule |
| RENAME_TABLE Procedure | Either adds or removes a declarative rule-based transformation which renames a table in a row LCR that satisfies the specified rule |
| SET_MESSAGE_TRACKING Procedure | Sets the tracking label for logical change records (LCRs) produced by the current session |
| SET_PARAMETER Procedure | Sets a parameter for an outbound server, an inbound server, or an outbound server's capture process |
| SET_TAG Procedure | Sets the binary tag for all redo entries subsequently generated by the current session |
| SET_UP_QUEUE Procedure | Creates a queue table and a queue for use with the capture, propagate, and apply functionality of XStream |
| SPLIT_STREAMS Procedure | Splits one stream flowing from a capture process off from all of the other streams flowing from the capture process |
| START_OUTBOUND Procedure | Starts an XStream outbound server |
| STOP_OUTBOUND Procedure | Stops an XStream outbound server |

**Note:**

All subprograms commit unless specified otherwise.

221.4.1 ADD_COLUMN Procedure

This procedure either adds or removes a declarative rule-based transformation which adds a column to a row logical change record (row LCR) that satisfies the specified rule.

For the transformation to be performed when the specified rule evaluates to `TRUE`, the rule must be in the positive rule set of an XStream client. XStream clients include capture processes, propagations, and apply processes.

This procedure is overloaded. The `column_value` and `column_function` parameters are mutually exclusive.

 **Note:**

- `ADD_COLUMN` transformations cannot add columns of the following data types: BLOB, CLOB, NCLOB, BFILE, LONG, LONG RAW, ROWID, user-defined types (including object types, REFS, varrays, nested tables), and Oracle-supplied types (including any types, XML types, spatial types, and media types).
- Declarative transformations can transform row LCRs only. Therefore, a DML rule must be specified when you run this procedure. If a DDL rule is specified, then the procedure raises an error.

 **See Also:**

Oracle Database XStream Guide for more information about declarative rule-based transformations

Syntax

```
DBMS_XSTREAM_ADM.ADD_COLUMN (
  rule_name      IN  VARCHAR2,
  table_name     IN  VARCHAR2,
  column_name    IN  VARCHAR2,
  column_value   IN  ANYDATA,
  value_type     IN  VARCHAR2      DEFAULT 'NEW',
  step_number    IN  NUMBER        DEFAULT 0,
  operation      IN  VARCHAR2      DEFAULT 'ADD');
```

```
DBMS_XSTREAM_ADM.ADD_COLUMN (
  rule_name      IN  VARCHAR2,
  table_name     IN  VARCHAR2,
  column_name    IN  VARCHAR2,
  column_function IN VARCHAR2,
  value_type     IN  VARCHAR2      DEFAULT 'NEW',
  step_number    IN  NUMBER        DEFAULT 0,
  operation      IN  VARCHAR2      DEFAULT 'ADD');
```

Parameters

Table 221-2 ADD_COLUMN Procedure Parameters

| Parameter | Description |
|------------------------|---|
| <code>rule_name</code> | The name of the rule, specified as <code>[schema_name.]rule_name</code> . If NULL, then the procedure raises an error. For example, to specify a rule in the <code>hr</code> schema named <code>employees12</code> , enter <code>hr.employees12</code> . If the schema is not specified, then the current user is the default. |

Table 221-2 (Cont.) ADD_COLUMN Procedure Parameters

| Parameter | Description |
|-----------------|---|
| table_name | The name of the table to which the column is added in the row LCR, specified as [schema_name.]object_name. For example, hr.employees. If the schema is not specified, then the current user is the default. |
| column_name | The name of the column added to each row LCR that satisfies the rule. |
| column_value | The value of the added column. Specify the appropriate ANYDATA function for the column datatype and the column value. For example, if the datatype of the column being added is NUMBER and the value is NULL, then specify the ANYDATA.ConvertNumber(NULL) function. This parameter cannot be specified if the column_function parameter is specified. |
| column_function | Either the 'SYSDATE' or the 'SYSTIMESTAMP' SQL function. The 'SYSDATE' SQL function places the current date and time set for the operating system on which the database resides. The datatype of the returned value is DATE, and the format returned depends on the value of the NLS_DATE_FORMAT initialization parameter. The 'SYSTIMESTAMP' SQL function returns the system date, including fractional seconds and time zone, of the system on which the database resides. The return type is TIMESTAMP WITH TIME ZONE. The function executes when the rule evaluates to TRUE. This parameter cannot be specified if the column_value parameter is specified. |
| value_type | Specify 'NEW' to add the column to the new values in the row LCR. Specify 'OLD' to add the column to the old values in the row LCR. |
| step_number | The order of execution of the transformation. See Also: <i>Oracle Database XStream Guide</i> for more information about transformation ordering |
| operation | Specify 'ADD' to add the transformation to the rule. Specify 'REMOVE' to remove the transformation from the rule. |

Usage Notes

When 'REMOVE' is specified for the operation parameter, all of the add column declarative rule-based transformations for the specified rule are removed that match the specified table_name, column_name, and step_number parameters. Nulls specified for these parameters act as wildcards. The following table lists the behavior of the ADD_COLUMN procedures when one or more of these parameters is NULL:

| table_name | column_name | step_number | Result |
|------------|-------------|-------------|--|
| NULL | NULL | NULL | Remove all add column transformations for the specified rule. |
| NULL | NULL | non-NULL | Remove all add column transformations with the specified step_number for the specified rule. |

| table_name | column_name | step_number | Result |
|------------|-------------|-------------|---|
| NULL | non-NULL | non-NULL | Remove all add column transformations with the specified column_name and step_number for the specified rule. |
| non-NULL | NULL | non-NULL | Remove all add column transformations with the specified table_name and step_number for the specified rule. |
| NULL | non-NULL | NULL | Remove all add column transformations with the specified column_name for the specified rule. |
| non-NULL | non-NULL | NULL | Remove all add column transformations with the specified table_name and column_name for the specified rule. |
| non-NULL | NULL | NULL | Remove all add column transformations with the specified table_name for the specified rule. |
| non-NULL | non-NULL | non-NULL | Remove all add column transformations with the specified table_name, column_name, and step_number for the specified rule. |

221.4.2 ADD_GLOBAL_PROPAGATION_RULES Procedure

This procedure either adds global rules to the positive rule set for a propagation, or adds global rules to the negative rule set for a propagation, and creates the specified propagation if it does not exist.

This procedure is overloaded. One version of this procedure contains two OUT parameters, and the other does not.

Syntax

```
DBMS_XSTREAM_ADM.ADD_GLOBAL_PROPAGATION_RULES (
    streams_name          IN  VARCHAR2  DEFAULT NULL,
    source_queue_name     IN  VARCHAR2,
    destination_queue_name IN  VARCHAR2,
    include_dml           IN  BOOLEAN   DEFAULT TRUE,
    include_ddl           IN  BOOLEAN   DEFAULT FALSE,
    include_tagged_lcr    IN  BOOLEAN   DEFAULT FALSE,
    source_database       IN  VARCHAR2  DEFAULT NULL,
    dml_rule_name        OUT VARCHAR2,
    ddl_rule_name        OUT VARCHAR2,
    inclusion_rule        IN  BOOLEAN   DEFAULT TRUE,
    and_condition         IN  VARCHAR2  DEFAULT NULL,
    queue_to_queue       IN  BOOLEAN   DEFAULT NULL);
```

```
DBMS_XSTREAM_ADM.ADD_GLOBAL_PROPAGATION_RULES (
    streams_name          IN  VARCHAR2  DEFAULT NULL,
    source_queue_name     IN  VARCHAR2,
    destination_queue_name IN  VARCHAR2,
    include_dml           IN  BOOLEAN   DEFAULT TRUE,
    include_ddl           IN  BOOLEAN   DEFAULT FALSE,
    include_tagged_lcr    IN  BOOLEAN   DEFAULT FALSE,
    source_database       IN  VARCHAR2  DEFAULT NULL,
```

```
inclusion_rule          IN  BOOLEAN  DEFAULT TRUE,
and_condition          IN  VARCHAR2  DEFAULT NULL,
queue_to_queue        IN  BOOLEAN  DEFAULT NULL);
```

Parameters

Table 221-3 ADD_GLOBAL_PROPAGATION_RULES Procedure Parameters

| Parameter | Description |
|------------------------|--|
| streams_name | <p>The name of the propagation. Do not specify an owner.</p> <p>If the specified propagation does not exist, then the procedure creates it automatically.</p> <p>If NULL and a propagation exists for the same source queue and destination queue (including database link), then the procedure uses this propagation.</p> <p>If NULL and no propagation exists for the same source queue and destination queue (including database link), then the procedure creates a propagation automatically with a system-generated name.</p> |
| source_queue_name | <p>The name of the source queue, specified as <code>[schema_name.]queue_name</code>. The current database must contain the source queue, and the queue must be ANYDATA type.</p> <p>For example, to specify a source queue named <code>streams_queue</code> in the <code>strmadmin</code> schema, enter <code>strmadmin.streams_queue</code> for this parameter.</p> <p>If the schema is not specified, then the current user is the default.</p> |
| destination_queue_name | <p>The name of the destination queue, including a database link, specified as <code>[schema_name.]queue_name[@dblink_name]</code>, if the destination queue is in a remote database. The queue must be ANYDATA type.</p> <p>For example, to specify a destination queue named <code>streams_queue</code> in the <code>strmadmin</code> schema and use a database link named <code>dbs2.net</code>, enter <code>strmadmin.streams_queue@dbs2.net</code> for this parameter.</p> <p>If the schema is not specified, then the current user is the default.</p> <p>If the database link is omitted, then the procedure uses the global name of the current database, and the source queue and destination queue must be in the same database.</p> <p>Note: Connection qualifiers are not allowed.</p> |
| include_dml | <p>If TRUE, then the procedure creates a rule for DML changes. If FALSE, then the procedure does not create a DML rule. NULL is not permitted.</p> |
| include_ddl | <p>If TRUE, then the procedure creates a rule for DDL changes. If FALSE, then the procedure does not create a DDL rule. NULL is not permitted.</p> |

Table 221-3 (Cont.) ADD_GLOBAL_PROPAGATION_RULES Procedure Parameters

| Parameter | Description |
|--------------------|---|
| include_tagged_lcr | <p>If TRUE, then the procedure does not add a condition regarding Oracle Replication tags to the generated rules. Therefore, these rules can evaluate to TRUE regardless of whether a logical change record (LCR) has a non-NULL tag. If the rules are added to the positive rule set for the propagation, then an LCR is always considered for propagation, regardless of whether it has a non-NULL tag. If the rules are added to a positive rule set, then setting this parameter to TRUE is appropriate for a full (for example, standby) copy of a database. If the rules are added to the negative rule set for the propagation, then whether an LCR is discarded does not depend on the tag for the LCR.</p> <p>If FALSE, then the procedure adds a condition to each generated rule that causes the rule to evaluate to TRUE only if an LCR has a NULL Oracle Replication tag. If the rules are added to the positive rule set for the propagation, then an LCR is considered for propagation only when the LCR contains a NULL tag. If the rules are added to a positive rule set, then setting this parameter to FALSE might be appropriate in update-anywhere configurations to avoid sending a change back to its source database. If the rules are added to the negative rule set for the propagation, then an LCR can be discarded only if it has a NULL tag.</p> <p>Usually, specify TRUE for this parameter if the <code>inclusion_rule</code> parameter is set to FALSE.</p> |
| source_database | <p>The global name of the source database. The source database is where the changes originated. If NULL, then the procedure does not add a condition regarding the source database to the generated rules.</p> <p>If you do not include the domain name, then the procedure appends it to the database name automatically. For example, if you specify <code>DBS1</code> and the domain is <code>.NET</code>, then the procedure specifies <code>DBS1.NET</code> automatically.</p> <p>Oracle recommends that you specify a source database for propagation rules.</p> |
| dml_rule_name | <p>If <code>include_dml</code> is TRUE, then this parameter contains the DML rule name.</p> <p>If <code>include_dml</code> is FALSE, then this parameter contains a NULL.</p> |
| ddl_rule_name | <p>If <code>include_ddl</code> is TRUE, then this parameter contains the DDL rule name.</p> <p>If <code>include_ddl</code> is FALSE, then this parameter contains a NULL.</p> |
| inclusion_rule | <p>If <code>inclusion_rule</code> is TRUE, then the procedure adds the rules to the positive rule set for the propagation.</p> <p>If <code>inclusion_rule</code> is FALSE, then the procedure adds the rules to the negative rule set for the propagation.</p> <p>In either case, the system creates the rule set if it does not exist.</p> |

Table 221-3 (Cont.) ADD_GLOBAL_PROPAGATION_RULES Procedure Parameters

| Parameter | Description |
|----------------|--|
| and_condition | <p>If non-NULL, appends the specified condition to the system-generated rule condition using an AND clause in the following way:</p> <pre>(system_condition) AND (and_condition)</pre> <p>The variable in the specified condition must be :lcr. For example, to specify that the global rules generated by the procedure evaluate to TRUE only if the Oracle Replication tag is the hexadecimal equivalent of '02', specify the following condition:</p> <pre>:lcr.get_tag() = HEXTORAW('02')</pre> <p>The :lcr in the specified condition is converted to :dml or :ddl, depending on the rule that is being generated. If you are specifying an LCR member subprogram that is dependent on the LCR type (row or DDL), then make sure the procedure only generates the appropriate rule.</p> <p>Specifically, if you specify an LCR member subprogram that is valid only for row LCRs, then specify TRUE for the include_dml parameter and FALSE for the include_ddl parameter. If you specify an LCR member subprogram that is valid only for DDL LCRs, then specify FALSE for the include_dml parameter and TRUE for the include_ddl parameter.</p> <p>See Also: Logical Change Record TYPEs</p> |
| queue_to_queue | <p>If TRUE or NULL, then a new propagation created by this procedure is a queue to queue propagation. A queue-to-queue propagation always has its own propagation job and uses a service for automatic failover when the destination queue is a buffered queue in an Oracle Real Application Clusters (Oracle RAC) database.</p> <p>If FALSE, then a new propagation created by this procedure is a queue-to-dblink propagation. A queue-to-dblink propagation can share a propagation job with other propagations that use the same database link and does not support automatic failover in an Oracle RAC environment.</p> <p>The procedure cannot change the queue to queue property of an exiting propagation. If the specified propagation exists, then the procedure behaves in the following way for each setting:</p> <ul style="list-style-type: none"> • If TRUE and the specified propagation is not a queue to queue propagation, then the procedure raises an error. • If FALSE and the specified propagation is a queue to queue propagation, then the procedure raises an error. • If NULL, then the procedure does not change the queue to queue property of the propagation. |

Usage Notes

This procedure configures propagation using the current user. Only one propagation is allowed between a particular source queue and destination queue.

This procedure creates DML and DDL rules automatically based on include_dml and include_ddl parameter values, respectively. Each rule has a system-generated rule name that consists of the database name with a sequence number appended to it. The sequence

number is used to avoid naming conflicts. If the database name plus the sequence number is too long, then the database name is truncated. A propagation uses the rules for filtering.

Examples

The following is an example of a global rule condition created for DML changes:

```
(:dml.is_null_tag() = 'Y' and :dml.get_source_database_name() = 'DBS1.NET' )
```

221.4.3 ADD_GLOBAL_RULES Procedure

This procedure adds rules to an XStream clients rule set.

It adds rules to a rule set of one of the following types of XStream clients:

- When the `streams_type` parameter is set to `capture`, this procedure adds capture process rules for capturing changes to an entire database.

This procedure creates the specified capture process if it does not exist.

- When the `streams_type` parameter is set to `apply` and the `streams_name` parameter specifies the name of an apply process, outbound server, or inbound server, this procedure adds apply rules for applying all logical change records (LCRs) it receives. The rules can specify that the LCRs must be from a particular source database.

This procedure creates an apply process if no apply process, outbound server, or inbound server exists with the specified `streams_name`. This procedure can add rules to an outbound server or inbound server, but it cannot create an outbound server or inbound server.

This procedure is overloaded. One version of this procedure contains two `OUT` parameters, and the other does not.

Note:

If you add global rules to the positive rule set for a capture process, then make sure you add rules to the negative capture process rule set to exclude database objects that are not supported by Oracle Replication. Query the `DBA_XSTREAM_OUT_SUPPORT_MODE` data dictionary view to determine which database objects are not supported by Oracle Replication. If unsupported database objects are not excluded, then capture errors will result.

Syntax

```
DBMS_XSTREAM_ADM.ADD_GLOBAL_RULES (
  streams_type          IN  VARCHAR2,
  streams_name         IN  VARCHAR2 DEFAULT NULL,
  queue_name           IN  VARCHAR2 DEFAULT 'streams_queue',
  include_dml          IN  BOOLEAN  DEFAULT TRUE,
  include_ddl          IN  BOOLEAN  DEFAULT FALSE,
  include_tagged_lcr   IN  BOOLEAN  DEFAULT FALSE,
  source_database      IN  VARCHAR2 DEFAULT NULL,
  dml_rule_name        OUT  VARCHAR2,
  ddl_rule_name        OUT  VARCHAR2,
```

```

inclusion_rule          IN   BOOLEAN   DEFAULT TRUE,
and_condition          IN   VARCHAR2   DEFAULT NULL,
source_root_name      IN   VARCHAR2   DEFAULT NULL,
source_container_name IN   VARCHAR2   DEFAULT NULL);

DBMS_XSTREAM_ADM.ADD_GLOBAL_RULES (
streams_type          IN   VARCHAR2,
streams_name         IN   VARCHAR2   DEFAULT NULL,
queue_name           IN   VARCHAR2   DEFAULT 'streams_queue',
include_dml          IN   BOOLEAN   DEFAULT TRUE,
include_ddl          IN   BOOLEAN   DEFAULT FALSE,
include_tagged_lcr   IN   BOOLEAN   DEFAULT FALSE,
source_database      IN   VARCHAR2   DEFAULT NULL,
inclusion_rule        IN   BOOLEAN   DEFAULT TRUE,
and_condition        IN   VARCHAR2   DEFAULT NULL,
source_root_name     IN   VARCHAR2   DEFAULT NULL,
source_container_name IN   VARCHAR2   DEFAULT NULL);

```

Parameters

Table 221-4 ADD_GLOBAL_RULES Procedure Parameters

| Parameter | Description |
|--------------|---|
| streams_type | <p>The type of XStream client:</p> <ul style="list-style-type: none"> Specify <code>capture</code> for a capture process. Specify <code>apply</code> for an apply process. |
| streams_name | <p>The name of the capture process or apply process. Do not specify an owner.</p> <p>If NULL, if <code>streams_type</code> is <code>capture</code>, and if one relevant capture process for the queue exists, then the relevant XStream client is used. If no relevant XStream client exists for the queue, then an XStream client is created automatically with a system-generated name. If NULL and multiple XStream clients of the specified <code>streams_type</code> for the queue exist, then the procedure raises an error.</p> <p>If NULL, if <code>streams_type</code> is <code>apply</code>, and if one relevant apply process exists, then the procedure uses the relevant apply process. The relevant apply process is identified in one of the following ways:</p> <ul style="list-style-type: none"> If one existing apply process has the source database specified in <code>source_database</code> and uses the queue specified in <code>queue_name</code>, then the procedure uses this apply process. If <code>source_database</code> is NULL and one existing apply process is using the queue specified in <code>queue_name</code>, then the procedure uses this apply process. <p>If NULL and no relevant apply process exists, then the procedure creates an apply process automatically with a system-generated name.</p> <p>If NULL and multiple relevant apply processes exist, then the procedure raises an error.</p> <p>Each apply process must have a unique name.</p> |

Table 221-4 (Cont.) ADD_GLOBAL_RULES Procedure Parameters

| Parameter | Description |
|--------------------|---|
| queue_name | <p>The name of the local queue, specified as [<i>schema_name</i>.] <i>queue_name</i>. The current database must contain the queue, and the queue must be ANYDATA type.</p> <p>For example, to specify a queue named <code>streams_queue</code> in the <code>strmadmin</code> schema, enter <code>strmadmin.streams_queue</code> for this parameter. If the schema is not specified, then the current user is the default.</p> <p>For capture process rules, this is the queue into which a capture process enqueues LCRs. For outbound server rules, this is the queue from which the outbound server dequeues LCRs. For inbound server rules, this is the queue into which an inbound server enqueues error transactions.</p> |
| include_dml | <p>If TRUE, then the procedure creates a rule for DML changes. If FALSE, then the procedure does not create a DML rule. NULL is not permitted.</p> |
| include_ddl | <p>If TRUE, then the procedure creates a rule for DDL changes. If FALSE, then the procedure does not create a DDL rule. NULL is not permitted.</p> |
| include_tagged_lcr | <p>If TRUE, then the procedure does not add a condition regarding Oracle Replication tags to the generated rules. Therefore, these rules can evaluate to TRUE regardless of whether a redo entry or LCR has a non-NULL tag. If the rules are added to the positive rule set for the process, then a redo entry is always considered for capture, and an LCR is always considered for apply, regardless of whether the redo entry or LCR has a non-NULL tag. If the rules are added to a positive rule set, then setting this parameter to TRUE is appropriate for a full (for example, standby) copy of a database. If the rules are added to the negative rule set for the process, then whether a redo entry or LCR is discarded does not depend on the tag.</p> <p>If FALSE, then the procedure adds a condition to each generated rule that causes the rule to evaluate to TRUE only if a redo entry or LCR has a NULL Oracle Replication tag. If the rules are added to the positive rule set for the process, then a redo entry is considered for capture, and an LCR is considered for apply, only when the redo entry or LCR contains a NULL tag. If the rules are added to a positive rule set, then setting this parameter to FALSE might be appropriate in update-anywhere configurations to avoid sending a change back to its source database. If the rules are added to the negative rule set for the process, then a redo entry or LCR can be discarded only if it has a NULL tag.</p> <p>Usually, specify TRUE for this parameter if the <code>inclusion_rule</code> parameter is set to FALSE.</p> |

Table 221-4 (Cont.) ADD_GLOBAL_RULES Procedure Parameters

| Parameter | Description |
|-----------------|---|
| source_database | <p>The global name of the source database. If <code>NULL</code>, then the procedure does not add a condition regarding the source database to the generated rules.</p> <p>For capture process rules, specify <code>NULL</code> or the global name of the local database if you are creating a capture process locally at the source database. If you are adding rules to a downstream capture process rule set at a downstream database, then specify the source database of the changes that will be captured.</p> <p>For apply process rules, specify the source database of the changes that will be applied by the apply process. The source database is the database where the changes originated. If an apply process applies captured LCRs, then the apply process can apply LCRs from only one capture process at one source database.</p> <p>In a CDB, specify the global name of the container to which the rules pertain. The container can be the root or a PDB. For example, <code>mycdb.example.com</code> or <code>hrpdb.example.com</code>. See <i>Oracle Database XStream Guide</i> for more information about setting this parameter in a CDB.</p> <p>If you do not include the domain name, then the procedure appends it to the database name automatically. For example, if you specify <code>DBS1</code> and the domain is <code>.NET</code>, then the procedure specifies <code>DBS1.NET</code> automatically.</p> |
| dml_rule_name | <p>If <code>include_dml</code> is <code>TRUE</code>, then this parameter contains the DML rule name.</p> <p>If <code>include_dml</code> is <code>FALSE</code>, then this parameter contains a <code>NULL</code>.</p> |
| ddl_rule_name | <p>If <code>include_ddl</code> is <code>TRUE</code>, then this parameter contains the DDL rule name.</p> <p>If <code>include_ddl</code> is <code>FALSE</code>, then this parameter contains a <code>NULL</code>.</p> |
| inclusion_rule | <p>If <code>inclusion_rule</code> is <code>TRUE</code>, then the procedure adds the rules to the positive rule set for the XStream client.</p> <p>If <code>inclusion_rule</code> is <code>FALSE</code>, then the procedure adds the rules to the negative rule set for the XStream client.</p> <p>In either case, the system creates the rule set if it does not exist.</p> |

Table 221-4 (Cont.) ADD_GLOBAL_RULES Procedure Parameters

| Parameter | Description |
|-----------------------|---|
| and_condition | <p>If non-NULL, appends the specified condition to the system-generated rule condition using an AND clause in the following way:</p> <pre>(system_condition) AND (and_condition)</pre> <p>The variable in the specified condition must be :lcr. For example, to specify that the global rules generated by the procedure evaluate to TRUE only if the Oracle Replication tag is the hexadecimal equivalent of '02', specify the following condition:</p> <pre>:lcr.get_tag() = HEXTORAW('02')</pre> <p>The :lcr in the specified condition is converted to :dml or :ddl, depending on the rule that is being generated. If you are specifying an LCR member subprogram that is dependent on the LCR type (row or DDL), then make sure this procedure only generates the appropriate rule. Specifically, if you specify an LCR member subprogram that is valid only for row LCRs, then specify TRUE for the include_dml parameter and FALSE for the include_ddl parameter. If you specify an LCR member subprogram that is valid only for DDL LCRs, then specify FALSE for the include_dml parameter and TRUE for the include_ddl parameter.</p> <p>See Also: Logical Change Record TYPES</p> |
| source_root_name | <p>The global name of the root in the source CDB. For example, mycdb.example.com.</p> <p>If this parameter is NULL, then the global name of the root in the local CDB is used. If you are configuring downstream capture, then this parameter must be a non-NULL value, and it must specify the global name of the root in the remote source CDB. See <i>Oracle Database XStream Guide</i> for more information about setting this parameter in a CDB.</p> <p>If you do not include the domain name, then the procedure appends it to the database name automatically. For example, if you specify DBS1 and the domain is EXAMPLE.COM, then the procedure specifies DBS1.EXAMPLE.COM automatically.</p> <p>Note: This parameter only applies to a CDB.</p> |
| source_container_name | <p>The short name of the source container. The container can be the root or a PDB. For example, CDB\$ROOT or hrpdb. See <i>Oracle Database XStream Guide</i> for more information about setting this parameter in a CDB.</p> <p>Note: This parameter only applies to a CDB.</p> |

Usage Notes

This procedure creates DML and DDL rules automatically based on include_dml and include_ddl parameter values, respectively. Each rule has a system-generated rule name that consists of the database name with a sequence number appended to it. The sequence number is used to avoid naming conflicts. If the database name plus the sequence number is too long, then the database name is truncated. A capture process or apply process uses the rules for filtering.

 **See Also:**

- "Operational Notes"
- "Security Model"

Examples

The following is an example of a global rule condition created for DML changes:

```
(:dml.is_null_tag() = 'Y' and :dml.get_source_database_name() = 'DBS1.NET' )
```

221.4.4 ADD_OUTBOUND Procedure

This procedure creates an XStream outbound server that dequeues LCRs from the specified queue. The outbound server streams out the LCRs to an XStream client application.

This procedure creates neither a capture process nor a queue. To create an outbound server, a capture process, and a queue with one procedure call, use the [CREATE_OUTBOUND Procedure](#).

To create the capture process individually, use one of the following packages:

- DBMS_XSTREAM_ADM
- DBMS_CAPTURE_ADM

To create a queue individually, use the `SET_UP_QUEUE` procedure in the `DBMS_XSTREAM_ADM` package.

This procedure is overloaded. One `table_names` parameter is type `VARCHAR2` and the other `table_names` parameter is type `DBMS_UTILITY.UNCL_ARRAY`. Also, one `schema_names` parameter is type `VARCHAR2` and the other `schema_names` parameter is type `DBMS_UTILITY.UNCL_ARRAY`. These parameters enable you to enter the lists of tables and schemas in different ways and are mutually exclusive.

 **Note:**

- A client application can create multiple sessions. Each session can attach to only one outbound server, and each outbound server can serve only one session at a time. However, different client application sessions can connect to different outbound servers. See *Oracle Call Interface Programmer's Guide* and *Oracle Database XStream Java API Reference* for information about attaching to an outbound server.
- This procedure enables the outbound server that it creates.
- Starting with Oracle Database 11g Release 2 (11.2.0.2), the `capture_name`, `start_scn`, and `start_time` parameters are included in this procedure.

Syntax

```
DBMS_XSTREAM_ADM.ADD_OUTBOUND (
  server_name          IN VARCHAR2,
  queue_name           IN VARCHAR2  DEFAULT NULL,
  source_database      IN VARCHAR2  DEFAULT NULL,
  table_names         IN DBMS_UTILITY.UNCL_ARRAY,
  schema_names        IN DBMS_UTILITY.UNCL_ARRAY,
  connect_user        IN VARCHAR2  DEFAULT NULL,
  comment             IN VARCHAR2  DEFAULT NULL,
  capture_name        IN VARCHAR2  DEFAULT NULL,
  start_scn           IN NUMBER    DEFAULT NULL,
  start_time          IN TIMESTAMP DEFAULT NULL,
  include_dml         IN BOOLEAN   DEFAULT TRUE,
  include_ddl         IN BOOLEAN   DEFAULT FALSE,
  source_root_name    IN VARCHAR2  DEFAULT NULL,
  source_container_name IN VARCHAR2  DEFAULT NULL,
  lcr_version         IN NUMBER    DEFAULT NULL);
```

```
DBMS_XSTREAM_ADM.ADD_OUTBOUND (
  server_name          IN VARCHAR2,
  queue_name           IN VARCHAR2  DEFAULT NULL,
  source_database      IN VARCHAR2  DEFAULT NULL,
  table_names         IN VARCHAR2  DEFAULT NULL,
  schema_names        IN VARCHAR2  DEFAULT NULL,
  connect_user        IN VARCHAR2  DEFAULT NULL,
  comment             IN VARCHAR2  DEFAULT NULL,
  capture_name        IN VARCHAR2  DEFAULT NULL,
  start_scn           IN NUMBER    DEFAULT NULL,
  start_time          IN TIMESTAMP DEFAULT NULL,
  include_dml         IN BOOLEAN   DEFAULT TRUE,

  source_container_name IN VARCHAR2  DEFAULT NULL,
  lcr_version         IN NUMBER    DEFAULT NULL);
```

Parameters

Table 221-5 ADD_OUTBOUND Procedure Parameters

| Parameter | Description |
|-------------|--|
| server_name | <p>The name of the outbound server being created. A NULL specification is not allowed. Do not specify an owner.</p> <p>The specified name must not match the name of an existing outbound server, inbound server, apply process, or messaging client.</p> <p>Note: The <code>server_name</code> setting cannot exceed 30 bytes, and it cannot be altered after the outbound server is created.</p> |
| queue_name | <p>The name of the local queue from which the outbound server dequeues LCRs, specified as [<code>schema_name.</code>]<code>queue_name</code>. The current database must contain the queue, and the queue must be ANYDATA type.</p> <p>For example, to specify a queue named <code>xstream_queue</code> in the <code>xstradmin</code> schema, enter <code>xstradmin.xstream_queue</code> for this parameter. If the schema is not specified, then the current user is the default.</p> <p>If NULL, the procedure raises an error.</p> |

Table 221-5 (Cont.) ADD_OUTBOUND Procedure Parameters

| Parameter | Description |
|-----------------|--|
| source_database | <p>The global name of the source database. If NULL, then the procedure does not add a condition regarding the source database to the generated rules.</p> <p>In a CDB, specify the global name of the container to which the rules pertain. The container can be the root or a PDB. For example, mycdb.example.com or hrpdb.example.com. See <i>Oracle Database XStream Guide</i> for more information about setting this parameter in a CDB.</p> <p>If you do not include the domain name, then the procedure appends it to the database name automatically. For example, if you specify DBS1 and the domain is .NET, then the procedure specifies DBS1.NET automatically.</p> |
| table_names | <p>The tables for which data manipulation language (DML) and data definition language (DDL) changes are streamed out to the XStream client application. The tables can be specified in the following ways:</p> <ul style="list-style-type: none"> Comma-delimited list of type VARCHAR2. A PL/SQL associative array of type DBMS_UTILITY.UNCL_ARRAY, where each element is the name of a table. Specify the first table in position 1. The last position must be NULL. <p>Each table should be specified as [<i>schema_name</i>.]<i>table_name</i>. For example, you can specify hr.employees. If the schema is not specified, then the current user is the default.</p> <p>See Also: "Usage Notes" for more information about this parameter</p> |
| schema_names | <p>The schemas for which DML and DDL changes are streamed out to the XStream client application. The schemas can be specified in the following ways:</p> <ul style="list-style-type: none"> Comma-delimited list of type VARCHAR2. A PL/SQL associative array of type DBMS_UTILITY.UNCL_ARRAY, where each element is the name of a schema. Specify the first schema in position 1. The last position must be NULL. <p>Note: This procedure does not concatenate the schema_names parameter with the table_names parameter. To specify tables, enter fully qualified table names in the table_names parameter (<i>schema_name.table_name</i>).</p> <p>See Also: "Usage Notes" for more information about this parameter</p> |
| connect_user | <p>The user who can attach to the specified outbound server to retrieve the LCR stream. The client application must attach to the outbound server as the specified connect user. See "CREATE_OUTBOUND Procedure" for information about the privileges required by a connect user.</p> <p>If NULL, then the current user is the default.</p> |
| comment | An optional comment associated with the outbound server. |

Table 221-5 (Cont.) ADD_OUTBOUND Procedure Parameters

| Parameter | Description |
|-----------------------|---|
| capture_name | <p>The name of the capture process configured to capture changes for the outbound server. Do not specify an owner.</p> <p>If the specified name matches the name of an existing capture process for another outbound server, then the procedure uses the existing capture process and adds the rules for capturing changes to the database to the positive capture process rule set.</p> <p>If the specified name matches the name of an existing capture process for an apply process, then an error is raised.</p> <p>If the specified name does not match the name of an existing capture process, then an error is raised.</p> <p>If NULL, then the outbound server is created without a capture process.</p> |
| start_scn | <p>A valid system change number (SCN) for the database from which the capture process starts capturing changes.</p> <p>If the capture_name parameter is NULL, then this parameter is ignored.</p> <p>If NULL and the capture_name parameter is non-NULL, then the start SCN of the capture process is not changed.</p> <p>An error is returned if an invalid SCN is specified.</p> <p>The start_scn and start_time parameters are mutually exclusive.</p> |
| start_time | <p>A valid time from which the capture process starts capturing changes.</p> <p>If the capture_name parameter is NULL, then this parameter is ignored.</p> <p>If NULL and the capture_name parameter is non-NULL, then the start SCN of the capture process is not changed.</p> <p>The start_scn and start_time parameters are mutually exclusive.</p> |
| include_dml | <p>If TRUE, then the procedure creates a rule for DML changes. If FALSE, then the procedure does not create a DML rule. NULL is not permitted.</p> |
| include_ddl | <p>If TRUE, then the procedure creates a rule for DDL changes. If FALSE, then the procedure does not create a DDL rule. NULL is not permitted.</p> |
| source_root_name | <p>The global name of the root in the source CDB. For example, mycdb.example.com.</p> <p>If this parameter is NULL, then the global name of the root in the local CDB is used. If you are configuring downstream capture, then this parameter must be a non-NULL value, and it must specify the global name of the root in the remote source CDB. See <i>Oracle Database XStream Guide</i> for more information about setting this parameter in a CDB.</p> <p>If you do not include the domain name, then the procedure appends it to the database name automatically. For example, if you specify DBS1 and the domain is EXAMPLE.COM, then the procedure specifies DBS1.EXAMPLE.COM automatically.</p> <p>Note: This parameter only applies to a CDB.</p> |
| source_container_name | <p>The short name of the source container. The container can be the root or a PDB. For example, CDB\$ROOT or hrpdb. See <i>Oracle Database XStream Guide</i> for more information about setting this parameter in a CDB.</p> <p>Note: This parameter only applies to a CDB.</p> |

Table 221-5 (Cont.) ADD_OUTBOUND Procedure Parameters

| Parameter | Description |
|----------------------------|--|
| <code>lcrld_version</code> | <p>The LCRID version for captured LCRs, either 1 or 2.</p> <p>If 2, then the LCRs are compatible with a database with its compatibility level at 12.2.0 or higher.</p> <p>If 1, then the LCRs are compatible with a database with its compatibility level at 12.1.0 or lower.</p> <p>If NULL, the default, and the database compatibility level is 12.2.0 or higher, then the <code>lcrld_version</code> is set to 2 internally. If the database compatibility level is 12.1.0 or lower, then the <code>lcrld_version</code> is set to 1 internally.</p> |

Usage Notes

The following list describes the behavior of the outbound server for various combinations of the `table_names` and `schema_names` parameters:

- If both the `table_names` and `schema_names` parameters are NULL or empty, then the outbound server streams all DML and DDL changes to the client application.
This procedure is overloaded. The `table_names` and `schema_names` parameters are defaulted to NULL. Do not specify NULL for both `table_names` and `schema_names` in the same call; otherwise, error PLS-00307 is returned.
- If both the `table_names` and `schema_names` parameters are specified, then the outbound server streams DML and DDL changes for the specified tables and schemas.
- If the `table_names` parameter is specified and the `schema_names` parameter is NULL or empty, then the outbound server streams DML and DDL changes for the specified tables.
- If the `table_names` parameter is NULL or empty and the `schema_names` parameter is specified, then the outbound server streams DML and DDL changes for the specified schemas.

For the procedure that uses the `DBMS_UTILITY.UNCL_ARRAY` type for the `table_names` and `schema_names` parameters, both parameters must be specified. To specify only tables, the `schema_names` parameter must be specified and empty. To specify only schemas, the `table_names` parameter must be specified and empty.

 **Note:**

An empty array includes one NULL entry.

221.4.5 ADD_SCHEMA_PROPAGATION_RULES Procedure

This procedure either adds schema rules to the positive rule set for a propagation, or adds schema rules to the negative rule set for a propagation, and creates the specified propagation if it does not exist.

This procedure is overloaded. One version of this procedure contains two `OUT` parameters, and the other does not.

Syntax

```
DBMS_XSTREAM_ADM.ADD_SCHEMA_PROPAGATION_RULES (
  schema_name          IN   VARCHAR2,
  streams_name         IN   VARCHAR2 DEFAULT NULL,
  source_queue_name    IN   VARCHAR2,
  destination_queue_name IN VARCHAR2,
  include_dml          IN   BOOLEAN  DEFAULT TRUE,
  include_ddl          IN   BOOLEAN  DEFAULT FALSE,
  include_tagged_lcr   IN   BOOLEAN  DEFAULT FALSE,
  source_database      IN   VARCHAR2 DEFAULT NULL,
  dml_rule_name        OUT  VARCHAR2,
  ddl_rule_name        OUT  VARCHAR2,
  inclusion_rule       IN   BOOLEAN  DEFAULT TRUE,
  and_condition        IN   VARCHAR2 DEFAULT NULL,
  queue_to_queue       IN   BOOLEAN  DEFAULT NULL);
```

```
DBMS_XSTREAM_ADM.ADD_SCHEMA_PROPAGATION_RULES (
  schema_name          IN   VARCHAR2,
  streams_name         IN   VARCHAR2 DEFAULT NULL,
  source_queue_name    IN   VARCHAR2,
  destination_queue_name IN VARCHAR2,
  include_dml          IN   BOOLEAN  DEFAULT TRUE,
  include_ddl          IN   BOOLEAN  DEFAULT FALSE,
  include_tagged_lcr   IN   BOOLEAN  DEFAULT FALSE,
  source_database      IN   VARCHAR2 DEFAULT NULL,
  inclusion_rule       IN   BOOLEAN  DEFAULT TRUE,
  and_condition        IN   VARCHAR2 DEFAULT NULL,
  queue_to_queue       IN   BOOLEAN  DEFAULT NULL);
```

Parameters

Table 221-6 ADD_SCHEMA_PROPAGATION_RULES Procedure Parameters

| Parameter | Description |
|-------------------|--|
| schema_name | The name of the schema. For example, hr. |
| streams_name | The name of the propagation. Do not specify an owner. If the specified propagation does not exist, then the procedure creates it automatically. If NULL and a propagation exists for the same source queue and destination queue (including database link), then the procedure uses this propagation. If NULL and no propagation exists for the same source queue and destination queue (including database link), then the procedure creates a propagation automatically with a system-generated name. |
| source_queue_name | The name of the source queue, specified as [schema_name.]queue_name. The current database must contain the source queue, and the queue must be ANYDATA type. For example, to specify a source queue named streams_queue in the strmadmin schema, enter strmadmin.streams_queue for this parameter. If the schema is not specified, then the current user is the default. |

Table 221-6 (Cont.) ADD_SCHEMA_PROPAGATION_RULES Procedure Parameters

| Parameter | Description |
|-------------------------------------|--|
| <code>destination_queue_name</code> | <p>The name of the destination queue, including a database link, specified as <code>[schema_name.]queue_name[@dblink_name]</code>, if the destination queue is in a remote database. The queue must be ANYDATA type.</p> <p>For example, to specify a destination queue named <code>streams_queue</code> in the <code>strmadmin</code> schema and use a database link named <code>db2.net</code>, enter <code>strmadmin.streams_queue@db2.net</code> for this parameter.</p> <p>If the schema is not specified, then the current user is the default.</p> <p>If the database link is omitted, then the procedure uses the global name of the current database, and the source queue and destination queue must be in the same database.</p> <p>Note: Connection qualifiers are not allowed.</p> |
| <code>include_dml</code> | <p>If <code>TRUE</code>, then the procedure creates a rule for DML changes. If <code>FALSE</code>, then the procedure does not create a DML rule. <code>NULL</code> is not permitted.</p> |
| <code>include_ddl</code> | <p>If <code>TRUE</code>, then the procedure creates a rule for DDL changes. If <code>FALSE</code>, then the procedure does not create a DDL rule. <code>NULL</code> is not permitted.</p> |
| <code>include_tagged_lcr</code> | <p>If <code>TRUE</code>, then the procedure does not add a condition regarding Oracle Replication tags to the generated rules. Therefore, these rules can evaluate to <code>TRUE</code> regardless of whether a logical change record (LCR) has a non-<code>NULL</code> tag. If the rules are added to the positive rule set for the propagation, then an LCR is always considered for propagation, regardless of whether it has a non-<code>NULL</code> tag. If the rules are added to a positive rule set, then setting this parameter to <code>TRUE</code> is appropriate for a full (for example, standby) copy of a database. If the rules are added to the negative rule set for the propagation, then whether an LCR is discarded does not depend on the tag for the LCR.</p> <p>If <code>FALSE</code>, then the procedure adds a condition to each generated rule that causes the rule to evaluate to <code>TRUE</code> only if an LCR has a <code>NULL</code> Oracle Replication tag. If the rules are added to the positive rule set for the propagation, then an LCR is considered for propagation only when the LCR contains a <code>NULL</code> tag. If the rules are added to a positive rule set, then setting this parameter to <code>FALSE</code> might be appropriate in update-anywhere configurations to avoid sending a change back to its source database. If the rules are added to the negative rule set for the propagation, then an LCR can be discarded only if it has a <code>NULL</code> tag.</p> <p>Usually, specify <code>TRUE</code> for this parameter if the <code>inclusion_rule</code> parameter is set to <code>FALSE</code>.</p> |

Table 221-6 (Cont.) ADD_SCHEMA_PROPAGATION_RULES Procedure Parameters

| Parameter | Description |
|-----------------|--|
| source_database | <p>The global name of the source database. The source database is where the change originated. If NULL, then the procedure does not add a condition regarding the source database to the generated rules.</p> <p>If you do not include the domain name, then the procedure appends it to the database name automatically. For example, if you specify DBS1 and the domain is .NET, then the procedure specifies DBS1.NET automatically.</p> <p>Oracle recommends that you specify a source database for propagation rules.</p> |
| dml_rule_name | <p>If include_dml is TRUE, then this parameter contains the DML rule name.</p> <p>If include_dml is FALSE, then this parameter contains a NULL.</p> |
| ddl_rule_name | <p>If include_ddl is TRUE, then this parameter contains the DDL rule name.</p> <p>If include_ddl is FALSE, then this parameter contains a NULL.</p> |
| inclusion_rule | <p>If inclusion_rule is TRUE, then the procedure adds the rules to the positive rule set for the propagation.</p> <p>If inclusion_rule is FALSE, then the procedure adds the rules to the negative rule set for the propagation.</p> <p>In either case, the system creates the rule set if it does not exist.</p> |

Table 221-6 (Cont.) ADD_SCHEMA_PROPAGATION_RULES Procedure Parameters

| Parameter | Description |
|----------------|---|
| and_condition | <p>If non-NULL, appends the specified condition to the system-generated rule condition using an AND clause in the following way:</p> <pre>(system_condition) AND (and_condition)</pre> <p>The variable in the specified condition must be :lcr. For example, to specify that the schema rules generated by the procedure evaluate to TRUE only if the Oracle Replication tag is the hexadecimal equivalent of '02', specify the following condition:</p> <pre>:lcr.get_tag() = HEXTORAW('02')</pre> <p>The :lcr in the specified condition is converted to :dml or :ddl, depending on the rule that is being generated. If you are specifying an LCR member subprogram that is dependent on the LCR type (row or DDL), then make sure this procedure only generates the appropriate rule.</p> <p>Specifically, if you specify an LCR member subprogram that is valid only for row LCRs, then specify TRUE for the include_dml parameter and FALSE for the include_ddl parameter. If you specify an LCR member subprogram that is valid only for DDL LCRs, then specify FALSE for the include_dml parameter and TRUE for the include_ddl parameter.</p> <p>See Also: Logical Change Record TYPES</p> |
| queue_to_queue | <p>If TRUE or NULL, then a new propagation created by this procedure is a queue to queue propagation. A queue-to-queue propagation always has its own propagation job and uses a service for automatic failover when the destination queue is a buffered queue in an Oracle Real Application Clusters (Oracle RAC) database.</p> <p>If FALSE, then a new propagation created by this procedure is a queue-to-dblink propagation. A queue-to-dblink propagation can share a propagation job with other propagations that use the same database link and does not support automatic failover in an Oracle RAC environment.</p> <p>This procedure cannot change the queue to queue property of an exiting propagation. If the specified propagation exists, then the procedure behaves in the following way for each setting:</p> <ul style="list-style-type: none"> • If TRUE and the specified propagation is not a queue to queue propagation, then the procedure raises an error. • If FALSE and the specified propagation is a queue to queue propagation, then the procedure raises an error. • If NULL, then the procedure does not change the queue to queue property of the propagation. |

Usage Notes

This procedure configures propagation using the current user. Only one propagation is allowed between a particular source queue and destination queue.

This procedure creates DML and DDL rules automatically based on `include_dml` and `include_ddl` parameter values, respectively. Each rule has a system-generated rule name that consists of the schema name with a sequence number appended to it. The sequence number is used to avoid naming conflicts. If the schema name plus the sequence number is too long, then the schema name is truncated. A propagation uses the rules for filtering.

Examples

The following is an example of a schema rule condition created for DML changes:

```
((:dml.get_object_owner() = 'HR') and :dml.is_null_tag() = 'Y'  
and :dml.get_source_database_name() = 'DBS1.NET' )
```

221.4.6 ADD_SCHEMA_RULES Procedure

This procedure adds rules to a rule set of one of the following types of XStream clients:

- When the `streams_type` parameter is set to `capture`, this procedure adds capture process rules for capturing changes to a specified schema.
This procedure creates the specified capture process if it does not exist.
- When the `streams_type` parameter is set to `apply` and the `streams_name` parameter specifies the name of an apply process, outbound server, or inbound server, this procedure adds apply rules for applying logical change records (LCRs) that contain changes to a specified schema. The rules can specify that the LCRs must be from a particular source database.

This procedure creates an apply process if no apply process, outbound server, or inbound server exists with the specified `streams_name`. This procedure can add rules to an outbound server or inbound server, but it cannot create an outbound server or inbound server.

This procedure is overloaded. One version of this procedure contains two `OUT` parameters, and the other does not.

Note:

If you add schema rules to the positive rule set for a capture process, then make sure you add rules to the negative capture process rule set to exclude database objects in the schema that are not supported by Oracle Replication. Query the `DBA_XSTREAM_OUT_SUPPORT_MODE` data dictionary view to determine which database objects are not supported by Oracle Replication. If unsupported database objects are not excluded, then capture errors will result.

Syntax

```
DBMS_XSTREAM_ADM.ADD_SCHEMA_RULES (
    schema_name          IN  VARCHAR2,
    streams_type         IN  VARCHAR2,
    streams_name        IN  VARCHAR2 DEFAULT NULL,
    queue_name          IN  VARCHAR2 DEFAULT 'streams_queue',
    include_dml         IN  BOOLEAN  DEFAULT TRUE,
    include_ddl         IN  BOOLEAN  DEFAULT FALSE,
    include_tagged_lcr  IN  BOOLEAN  DEFAULT FALSE,
    source_database     IN  VARCHAR2 DEFAULT NULL,
    dml_rule_name       OUT VARCHAR2,
    ddl_rule_name       OUT VARCHAR2,
    inclusion_rule      IN  BOOLEAN  DEFAULT TRUE,
    and_condition       IN  VARCHAR2 DEFAULT NULL,
    source_root_name    IN  VARCHAR2 DEFAULT NULL,
    source_container_name IN VARCHAR2 DEFAULT NULL);
```

```
DBMS_XSTREAM_ADM.ADD_SCHEMA_RULES (
    schema_name          IN  VARCHAR2,
    streams_type         IN  VARCHAR2,
    streams_name        IN  VARCHAR2 DEFAULT NULL,
    queue_name          IN  VARCHAR2 DEFAULT 'streams_queue',
    include_dml         IN  BOOLEAN  DEFAULT TRUE,
    include_ddl         IN  BOOLEAN  DEFAULT FALSE,
    include_tagged_lcr  IN  BOOLEAN  DEFAULT FALSE,
    source_database     IN  VARCHAR2 DEFAULT NULL,
    inclusion_rule      IN  BOOLEAN  DEFAULT TRUE,
    and_condition       IN  VARCHAR2 DEFAULT NULL,
    source_root_name    IN  VARCHAR2 DEFAULT NULL,
    source_container_name IN VARCHAR2 DEFAULT NULL);
```

Parameters

Table 221-7 ADD_SCHEMA_RULES Procedure Parameters

| Parameter | Description |
|--------------|---|
| schema_name | The name of the schema. For example, hr. You can specify a schema that does not yet exist, because Oracle Replication does not validate the existence of the schema. |
| streams_type | The type of XStream client: <ul style="list-style-type: none"> Specify capture for a capture process. Specify apply for an apply process. |

Table 221-7 (Cont.) ADD_SCHEMA_RULES Procedure Parameters

| Parameter | Description |
|--------------|--|
| streams_name | <p>The name of the capture process or apply process. Do not specify an owner.</p> <p>If NULL, if streams_type is capture, and if one relevant capture process for the queue exists, then the relevant XStream client is used. If no relevant XStream client exists for the queue, then an XStream client is created automatically with a system-generated name. If NULL and multiple XStream clients of the specified streams_type for the queue exist, then the procedure raises an error.</p> <p>If NULL, if streams_type is apply, and if one relevant apply process exists, then the procedure uses the relevant apply process. The relevant apply process is identified in one of the following ways:</p> <ul style="list-style-type: none"> • If one existing apply process has the source database specified in source_database and uses the queue specified in queue_name, then the procedure uses this apply process. • If source_database is NULL and one existing apply process is using the queue specified in queue_name, then the procedure uses this apply process. <p>If NULL and no relevant apply process exists, then the procedure creates an apply process automatically with a system-generated name.</p> <p>If NULL and multiple relevant apply processes exist, then the procedure raises an error.</p> <p>Each apply process must have a unique name.</p> |
| queue_name | <p>The name of the local queue, specified as [schema_name.]queue_name. The current database must contain the queue, and the queue must be ANYDATA type.</p> <p>For example, to specify a queue named streams_queue in the strmadmin schema, enter strmadmin.streams_queue for this parameter. If the schema is not specified, then the current user is the default.</p> <p>For capture process rules, this is the queue into which a capture process enqueues LCRs. For outbound server rules, this is the queue from which the outbound server dequeues LCRs. For inbound server rules, this is the queue into which an inbound server enqueues error transactions.</p> |
| include_dml | <p>If TRUE, then the procedure creates a rule for DML changes. If FALSE, then the procedure does not create a DML rule. NULL is not permitted.</p> |
| include_ddl | <p>If TRUE, then the procedure creates a rule for DDL changes. If FALSE, then the procedure does not create a DDL rule. NULL is not permitted.</p> |

Table 221-7 (Cont.) ADD_SCHEMA_RULES Procedure Parameters

| Parameter | Description |
|--------------------|--|
| include_tagged_lcr | <p>If <code>TRUE</code>, then the procedure does not add a condition regarding Oracle Replication tags to the generated rules. Therefore, these rules can evaluate to <code>TRUE</code> regardless of whether a redo entry or LCR has a non-<code>NULL</code> tag. If the rules are added to the positive rule set for the process, then a redo entry is always considered for capture, and an LCR is always considered for apply, regardless of whether the redo entry or LCR has a non-<code>NULL</code> tag. If the rules are added to a positive rule set, then setting this parameter to <code>TRUE</code> is appropriate for a full (for example, standby) copy of a database. If the rules are added to the negative rule set for the process, then whether a redo entry or LCR is discarded does not depend on the tag.</p> <p>If <code>FALSE</code>, then the procedure adds a condition to each generated rule that causes the rule to evaluate to <code>TRUE</code> only if a redo entry or LCR has a <code>NULL</code> Oracle Replication tag. If the rules are added to the positive rule set for the process, then a redo entry is considered for capture, and an LCR is considered for apply, only when the redo entry or LCR contains a <code>NULL</code> tag. If the rules are added to a positive rule set, then setting this parameter to <code>FALSE</code> might be appropriate in update-anywhere configurations to avoid sending a change back to its source database. If the rules are added to the negative rule set for the process, then a redo entry or LCR can be discarded only if it has a <code>NULL</code> tag.</p> <p>Usually, specify <code>TRUE</code> for this parameter if the <code>inclusion_rule</code> parameter is set to <code>FALSE</code>.</p> |
| source_database | <p>The global name of the source database. If <code>NULL</code>, then the procedure does not add a condition regarding the source database to the generated rules.</p> <p>For capture process rules, specify <code>NULL</code> or the global name of the local database if you are creating a capture process locally at the source database. If you are adding rules to a downstream capture process rule set at a downstream database, then specify the source database of the changes that will be captured.</p> <p>For apply process rules, specify the source database of the changes that will be applied by the apply process. The source database is the database where the changes originated. If an apply process applies captured LCRs, then the apply process can apply LCRs from only one capture process at one source database.</p> <p>In a CDB, specify the global name of the container to which the rules pertain. The container can be the root or a PDB. For example, <code>mycdb.example.com</code> or <code>hrpdb.example.com</code>. See <i>Oracle Database XStream Guide</i> for more information about setting this parameter in a CDB.</p> <p>If you do not include the domain name, then the procedure appends it to the database name automatically. For example, if you specify <code>DBS1</code> and the domain is <code>.NET</code>, then the procedure specifies <code>DBS1.NET</code> automatically.</p> |
| dml_rule_name | <p>If <code>include_dml</code> is <code>TRUE</code>, then this parameter contains the DML rule name.</p> <p>If <code>include_dml</code> is <code>FALSE</code>, then this parameter contains a <code>NULL</code>.</p> |
| ddl_rule_name | <p>If <code>include_ddl</code> is <code>TRUE</code>, then this parameter contains the DDL rule name.</p> <p>If <code>include_ddl</code> is <code>FALSE</code>, then this parameter contains a <code>NULL</code>.</p> |

Table 221-7 (Cont.) ADD_SCHEMA_RULES Procedure Parameters

| Parameter | Description |
|------------------------------------|---|
| <code>inclusion_rule</code> | <p>If <code>inclusion_rule</code> is <code>TRUE</code>, then the procedure adds the rules to the positive rule set for the XStream client.</p> <p>If <code>inclusion_rule</code> is <code>FALSE</code>, then the procedure adds the rules to the negative rule set for the XStream client.</p> <p>In either case, the system creates the rule set if it does not exist.</p> |
| <code>and_condition</code> | <p>If non-NULL, appends the specified condition to the system-generated rule condition using an <code>AND</code> clause in the following way:</p> <pre>(system_condition) AND (and_condition)</pre> <p>The variable in the specified condition must be <code>:lcr</code>. For example, to specify that the schema rules generated by the procedure evaluate to <code>TRUE</code> only if the Oracle Replication tag is the hexadecimal equivalent of '02', specify the following condition:</p> <pre>:lcr.get_tag() = HEXTORAW('02')</pre> <p>The <code>:lcr</code> in the specified condition is converted to <code>:dml</code> or <code>:ddl</code>, depending on the rule that is being generated. If you are specifying an LCR member subprogram that is dependent on the LCR type (row or DDL), then make sure this procedure only generates the appropriate rule. Specifically, if you specify an LCR member subprogram that is valid only for row LCRs, then specify <code>TRUE</code> for the <code>include_dml</code> parameter and <code>FALSE</code> for the <code>include_ddl</code> parameter. If you specify an LCR member subprogram that is valid only for DDL LCRs, then specify <code>FALSE</code> for the <code>include_dml</code> parameter and <code>TRUE</code> for the <code>include_ddl</code> parameter.</p> <p>See Also: Logical Change Record TYPES</p> |
| <code>source_root_name</code> | <p>The global name of the root in the source CDB. For example, <code>mycdb.example.com</code>.</p> <p>If this parameter is <code>NULL</code>, then the global name of the root in the local CDB is used. If you are configuring downstream capture, then this parameter must be a non-NULL value, and it must specify the global name of the root in the remote source CDB. See <i>Oracle Database XStream Guide</i> for more information about setting this parameter in a CDB.</p> <p>If you do not include the domain name, then the procedure appends it to the database name automatically. For example, if you specify <code>DBS1</code> and the domain is <code>EXAMPLE.COM</code>, then the procedure specifies <code>DBS1.EXAMPLE.COM</code> automatically.</p> <p>Note: This parameter only applies to a CDB.</p> |
| <code>source_container_name</code> | <p>The short name of the source container. The container can be the root or a PDB. For example, <code>CDB\$ROOT</code> or <code>hrpdb</code>. See <i>Oracle Database XStream Guide</i> for more information about setting this parameter in a CDB.</p> <p>Note: This parameter only applies to a CDB.</p> |

Usage Notes

This procedure creates DML and DDL rules automatically based on `include_dml` and `include_ddl` parameter values, respectively. Each rule has a system-generated rule name that consists of the schema name with a sequence number appended to it. The sequence number is used to avoid naming conflicts. If the schema name plus the

sequence number is too long, then the schema name is truncated. A capture process or apply process uses the rules for filtering.

- ["Operational Notes"](#)
- ["Security Model"](#)

Examples

The following is an example of a schema rule condition created for DML changes:

```
((:dml.get_object_owner() = 'HR') and :dml.is_null_tag() = 'Y'
and :dml.get_source_database_name() = 'DBS1.NET' )
```

221.4.7 ADD_SUBSET_OUTBOUND_RULES Procedure

This procedure adds subset rules to an outbound server configuration. Subset rules instruct the outbound server to stream out a subset of the changes to the specified tables. Outbound servers can stream out a subset of both rows and columns.

This procedure is overloaded. One `column_list` parameter is type `VARCHAR2` and the other `column_list` parameter is type `DBMS_UTILITY.LNAME_ARRAY`. These parameters enable you to enter the list of columns in different ways and are mutually exclusive.

Note:

This procedure does not add rules to the outbound server's capture process.

Syntax

```
DBMS_XSTREAM_ADM.ADD_SUBSET_OUTBOUND_RULES (
  server_name      IN VARCHAR2,
  table_name       IN VARCHAR2,
  condition        IN VARCHAR2  DEFAULT NULL,
  column_list      IN DBMS_UTILITY.LNAME_ARRAY,
  keep             IN BOOLEAN   DEFAULT TRUE,
  source_database  IN VARCHAR2  DEFAULT NULL);
```

```
DBMS_XSTREAM_ADM.ADD_SUBSET_OUTBOUND_RULES (
  server_name      IN VARCHAR2,
  table_name       IN VARCHAR2,
  condition        IN VARCHAR2  DEFAULT NULL,
  column_list      IN VARCHAR2  DEFAULT NULL,
  keep             IN BOOLEAN   DEFAULT TRUE,
  source_database  IN VARCHAR2  DEFAULT NULL);
```

Parameters

Table 221-8 ADD_SUBSET_OUTBOUND_RULES Procedure Parameters

| Parameter | Description |
|--------------------------|---|
| <code>server_name</code> | The name of the outbound server to which rules are being added. Specify an existing outbound server. Do not specify an owner. |
| <code>table_name</code> | <p>The name of the table specified as <code>[schema_name.]object_name</code>. For example, you can specify <code>hr.employees</code>. If the schema is not specified, then the current user is the default.</p> <p>If the outbound server configuration uses a local capture process, then the table must exist at the local source database. If the outbound server configuration uses a downstream capture process, then the table must exist at both the source database and at the downstream capture database.</p> <p>The specified table cannot have any LOB, LONG, or LONG RAW columns currently or in the future.</p> |
| <code>condition</code> | <p>The subset condition. Specify this condition similar to the way you specify conditions in a WHERE clause in SQL.</p> <p>For example, to specify rows in the <code>hr.employees</code> table where the <code>salary</code> is greater than 4000 and the <code>job_id</code> is <code>SA_MAN</code>, enter the following as the condition:</p> <pre>' salary > 4000 and job_id = 'SA_MAN' '</pre> <p>If NULL, then the procedure raises an error.</p> <p>Note: The quotation marks in the preceding example are all single quotation marks.</p> |
| <code>column_list</code> | <p>The list of columns either to include in the outbound server configuration or to exclude from the outbound server configuration. Whether the columns are included or excluded depends on the setting for the <code>keep</code> parameter.</p> <p>The columns can be specified in the following ways:</p> <ul style="list-style-type: none"> Comma-delimited list of type <code>VARCHAR2</code>. A PL/SQL associative array of type <code>DBMS_UTILITY.LNAME_ARRAY</code>, where each element is the name of a column. Specify the first column in position 1. The last position must be NULL. <p>To include or exclude all of the columns in a table, specify each column in the table in the list or array.</p> <p>If NULL, then the procedure raises an error.</p> |
| <code>keep</code> | <p>If TRUE, then the columns specified in the <code>column_list</code> parameter are kept as part of the outbound server configuration. Therefore, changes to these columns that satisfy the condition in the <code>condition</code> parameter are streamed to the outbound server's client application.</p> <p>If FALSE, then the columns specified in the <code>column_list</code> parameter are excluded from the outbound server configuration. Therefore, changes to these columns are not streamed to the outbound server's client application.</p> <p>See Also: "Usage Notes"</p> |

Table 221-8 (Cont.) ADD_SUBSET_OUTBOUND_RULES Procedure Parameters

| Parameter | Description |
|---------------------|---|
| source_datab ase | <p>The global name of the container where the specified <code>table_names</code> and <code>schema_names</code> are located.</p> <p>If non-NULL, then a condition is added to the outbound server's rules to filter the LCRs based on the global name of the source database. If NULL, then the procedure does not add a condition regarding the source database to the generated rules.</p> <p>In a CDB, specify the global name of the container to which the rules pertain. The container can be the root or a PDB. For example, <code>mycdb.example.com</code> or <code>hrpdb.example.com</code>. See <i>Oracle Database XStream Guide</i> for more information about setting this parameter in a CDB.</p> <p>If you do not include the domain name, then the procedure appends it to the database name automatically. For example, if you specify <code>DBS1</code> and the domain is <code>EXAMPLE.COM</code>, then the procedure specifies <code>DBS1.EXAMPLE.COM</code> automatically.</p> |

Usage Notes

When the `keep` parameter is set to `TRUE`, this procedure creates a keep columns declarative rule-based transformation for the columns listed in `column_list`.

When the `keep` parameter is set to `FALSE`, this procedure creates a delete column declarative rule-based transformation for each column listed in `column_list`.

See Also:

Oracle Database XStream Guide for information about declarative rule-based transformations

221.4.8 ADD_SUBSET_PROPAGATION_RULES Procedure

This procedure adds propagation rules that propagate the logical change records (LCRs) related to a subset of the rows in the specified table in a source queue to a destination queue, and creates the specified propagation if it does not exist.

This procedure is overloaded. One version of this procedure contains three `OUT` parameters, and the other does not.

Syntax

```
DBMS_XSTREAM_ADM.ADD_SUBSET_PROPAGATION_RULES (
  table_name          IN  VARCHAR2,
  dml_condition       IN  VARCHAR2,
  streams_name        IN  VARCHAR2  DEFAULT NULL,
  source_queue_name   IN  VARCHAR2,
  destination_queue_name IN  VARCHAR2,
  include_tagged_lcr  IN  BOOLEAN   DEFAULT FALSE,
  source_database     IN  VARCHAR2  DEFAULT NULL,
  insert_rule_name    OUT  VARCHAR2,
  update_rule_name    OUT  VARCHAR2,
```

```

delete_rule_name      OUT  VARCHAR2,
queue_to_queue        IN   BOOLEAN   DEFAULT NULL);

DBMS_XSTREAM_ADM.ADD_SUBSET_PROPAGATION_RULES (
  table_name           IN   VARCHAR2,
  dml_condition         IN   VARCHAR2,
  streams_name         IN   VARCHAR2   DEFAULT NULL,
  source_queue_name    IN   VARCHAR2,
  destination_queue_name IN  VARCHAR2,
  include_tagged_lcr   IN   BOOLEAN   DEFAULT FALSE,
  source_database      IN   VARCHAR2   DEFAULT NULL,
  queue_to_queue       IN   BOOLEAN   DEFAULT NULL);

```

Parameters

Table 221-9 ADD_SUBSET_PROPAGATION_RULES Procedure Parameters

| Parameter | Description |
|-------------------|---|
| table_name | <p>The name of the table specified as <code>[schema_name.]object_name</code>. For example, <code>hr.employees</code>. If the schema is not specified, then the current user is the default.</p> <p>The specified table must exist in the same database as the propagation. Also, the specified table cannot have any LOB, LONG, LONG RAW, or XMLType columns currently or in the future.</p> |
| dml_condition | <p>The subset condition. Specify this condition similar to the way you specify conditions in a WHERE clause in SQL.</p> <p>For example, to specify rows in the <code>hr.employees</code> table where the <code>salary</code> is greater than 4000 and the <code>job_id</code> is <code>SA_MAN</code>, enter the following as the condition:</p> <pre>' salary > 4000 and job_id = 'SA_MAN' '</pre> <p>Note: The quotation marks in the preceding example are all single quotation marks.</p> |
| streams_name | <p>The name of the propagation. Do not specify an owner.</p> <p>If the specified propagation does not exist, then the procedure creates it automatically.</p> <p>If <code>NULL</code> and a propagation exists for the same source queue and destination queue (including database link), then the procedure uses this propagation.</p> <p>If <code>NULL</code> and no propagation exists for the same source queue and destination queue (including database link), then the procedure creates a propagation automatically with a system-generated name.</p> |
| source_queue_name | <p>The name of the source queue, specified as <code>[schema_name.]queue_name</code>. The current database must contain the source queue, and the queue must be ANYDATA type.</p> <p>For example, to specify a source queue named <code>streams_queue</code> in the <code>strmadmin</code> schema, enter <code>strmadmin.streams_queue</code> for this parameter.</p> <p>If the schema is not specified, then the current user is the default.</p> |

Table 221-9 (Cont.) ADD_SUBSET_PROPAGATION_RULES Procedure Parameters

| Parameter | Description |
|-------------------------------------|--|
| <code>destination_queue_name</code> | <p>The name of the destination queue, including a database link, specified as <code>[schema_name.]queue_name[@dblink_name]</code>, if the destination queue is in a remote database. The queue must be ANYDATA type.</p> <p>For example, to specify a destination queue named <code>streams_queue</code> in the <code>strmadmin</code> schema and use a database link named <code>dbs2.net</code>, enter <code>strmadmin.streams_queue@dbs2.net</code> for this parameter.</p> <p>If the schema is not specified, then the current user is the default.</p> <p>If the database link is omitted, then the procedure uses the global name of the current database, and the source queue and destination queue must be in the same database.</p> <p>Note: Connection qualifiers are not allowed.</p> |
| <code>include_tagged_lcr</code> | <p>If <code>TRUE</code>, then an LCR is always considered for propagation, regardless of whether it has a non-NULL tag. This setting is appropriate for a full (for example, standby) copy of a database.</p> <p>If <code>FALSE</code>, then an LCR is considered for propagation only when the LCR contains a NULL tag. A setting of <code>FALSE</code> is often specified in update-anywhere configurations to avoid sending a change back to its source database.</p> |
| <code>source_database</code> | <p>The global name of the source database. The source database is where the change originated. If <code>NULL</code>, then the procedure does not add a condition regarding the source database to the generated rules.</p> <p>If you do not include the domain name, then the procedure appends it to the database name automatically. For example, if you specify <code>DBS1</code> and the domain is <code>.NET</code>, then the procedure specifies <code>DBS1.NET</code> automatically.</p> <p>Oracle recommends that you specify a source database for propagation rules.</p> |
| <code>insert_rule_name</code> | <p>Contains the system-generated <code>INSERT</code> rule name. This rule handles inserts and updates that must be converted into inserts.</p> |
| <code>update_rule_name</code> | <p>Contains the system-generated <code>UPDATE</code> rule name. This rule handles updates that remain updates.</p> |
| <code>delete_rule_name</code> | <p>Contains the system-generated <code>DELETE</code> rule name. This rule handles deletes and updates that must be converted into deletes</p> |

Table 221-9 (Cont.) ADD_SUBSET_PROPAGATION_RULES Procedure Parameters

| Parameter | Description |
|----------------|---|
| queue_to_queue | <p>If TRUE or NULL, then a new propagation created by this procedure is a queue to queue propagation. A queue-to-queue propagation always has its own propagation job and uses a service for automatic failover when the destination queue is a buffered queue in an Oracle Real Application Clusters (Oracle RAC) database.</p> <p>If FALSE, then a new propagation created by this procedure is a queue-to-dblink propagation. A queue-to-dblink propagation can share a propagation job with other propagations that use the same database link and does not support automatic failover in an Oracle RAC environment.</p> <p>This procedure cannot change the queue to queue property of an exiting propagation. If the specified propagation exists, then the procedure behaves in the following way for each setting:</p> <ul style="list-style-type: none"> • If TRUE and the specified propagation is not a queue to queue propagation, then the procedure raises an error. • If FALSE and the specified propagation is a queue to queue propagation, then the procedure raises an error. • If NULL, then the procedure does not change the queue to queue property of the propagation. |

Usage Notes

This procedure configures propagation using the current user. Only one propagation is allowed between a particular source queue and destination queue.

Running this procedure generates three rules for the specified propagation: one for **INSERT** statements, one for **UPDATE** statements, and one for **DELETE** statements. For **INSERT** and **DELETE** statements, only row LCRs that satisfy the condition specified for the **dml_condition** parameter are propagated. For **UPDATE** statements, the following variations are possible:

- If both the new and old values in a row LCR satisfy the specified **dml_condition**, then the row LCR is propagated without any changes.
- If neither the new or old values in a row LCR satisfy the specified **dml_condition**, then the row LCR is not propagated.
- If the old values for a row LCR satisfy the specified **dml_condition**, but the new values do not, then the update row LCR is converted into a delete row LCR.
- If the new values for a row LCR satisfy the specified **dml_condition**, but the old values do not, then the update row LCR is converted to an insert row LCR.

When an update is converted into an insert or a delete, it is called row migration.

A propagation uses the rules for filtering. If the propagation does not have a positive rule set, then the procedure creates a positive rule set automatically, and the rules for propagating changes to the table are added to the positive rule set. A subset rule can be added to positive rule set only, not to a negative rule set. Other rules in an existing positive rule set for the propagation are not affected. Additional rules can be added using either the **DBMS_XSTREAM_ADM** package or the **DBMS_RULE_ADM** package.

Rules for INSERT, UPDATE, and DELETE statements are created automatically when you run this procedure, and these rules are given a system-generated rule name. Each rule has a system-generated rule name that consists of the table name with a sequence number appended to it. The sequence number is used to avoid naming conflicts. If the table name plus the sequence number is too long, then the table name is truncated. The ADD_SUBSET_RULES procedure is overloaded, and the system-generated rule names for INSERT, UPDATE, and DELETE statements are returned.

When you create propagation subset rules for a table, you should create an unconditional supplemental log group at the source database with all the columns in the table. Supplemental logging is required if an update must be converted to an insert. The propagation rule must have all the column values to be able to perform this conversion correctly.

Note:

Subset rules should only reside in positive rule sets. You should not add subset rules to negative rule sets. Doing so might have unpredictable results because row migration would not be performed on LCRs that are not discarded by the negative rule set.

Examples

The following is an example of a rule condition created for filtering a row LCR containing an update operation when the dml_condition is region_id = 2, the table_name is hr.regions, and the source_database is dbs1.net:

```
:dml.get_object_owner()='HR' AND :dml.get_object_name()='REGIONS'
AND :dml.is_null_tag()='Y' AND :dml.get_source_database_name()='DBS1.NET'
AND :dml.get_command_type()='UPDATE'
AND (:dml.get_value('NEW','"REGION_ID"') IS NOT NULL)
AND (:dml.get_value('OLD','"REGION_ID"') IS NOT NULL)
AND (:dml.get_value('OLD','"REGION_ID"').AccessNumber()=2)
AND (:dml.get_value('NEW','"REGION_ID"').AccessNumber()=2)
```

221.4.9 ADD_SUBSET_RULES Procedure

This procedure adds rules to an XStream client.

It adds rules to a rule set of one of the following types of XStream clients:

- When the streams_type parameter is set to capture, this procedure adds capture process rules for capturing changes to a subset of rows in a specified table.
This procedure creates the specified capture process if it does not exist.
- When the streams_type parameter is set to apply and the streams_name parameter specifies the name of an apply process, outbound server, or inbound server, this procedure adds apply rules for applying logical change records (LCRs) that contain changes to a subset of rows in a specified table. The rules can specify that the LCRs must be from a particular source database.

This procedure creates an apply process if no apply process, outbound server, or inbound server exists with the specified streams_name. This procedure can add rules to

an outbound server or inbound server, but it cannot create an outbound server or inbound server.

This procedure is overloaded. One version of this procedure contains three OUT parameters, and the other does not.

Syntax

```
DBMS_XSTREAM_ADM.ADD_SUBSET_RULES (
    table_name          IN   VARCHAR2,
    dml_condition       IN   VARCHAR2,
    streams_type        IN   VARCHAR2 DEFAULT 'apply',
    streams_name        IN   VARCHAR2 DEFAULT NULL,
    queue_name          IN   VARCHAR2 DEFAULT 'streams_queue',
    include_tagged_lcr  IN   BOOLEAN  DEFAULT FALSE,
    source_database     IN   VARCHAR2 DEFAULT NULL,
    insert_rule_name    OUT  VARCHAR2,
    update_rule_name    OUT  VARCHAR2,
    delete_rule_name   OUT  VARCHAR2,
    source_root_name    IN   VARCHAR2  DEFAULT NULL,
    source_container_name IN VARCHAR2  DEFAULT NULL);
```

```
DBMS_XSTREAM_ADM.ADD_SUBSET_RULES (
    table_name          IN   VARCHAR2,
    dml_condition       IN   VARCHAR2,
    streams_type        IN   VARCHAR2 DEFAULT 'apply',
    streams_name        IN   VARCHAR2 DEFAULT NULL,
    queue_name          IN   VARCHAR2 DEFAULT 'streams_queue',
    include_tagged_lcr  IN   BOOLEAN  DEFAULT FALSE,
    source_database     IN   VARCHAR2 DEFAULT NULL,
    source_root_name    IN   VARCHAR2  DEFAULT NULL,
    source_container_name IN VARCHAR2  DEFAULT NULL);
```

Parameters

Table 221-10 ADD_SUBSET_RULES Procedure Parameters

| Parameter | Description |
|---------------|--|
| table_name | The name of the table specified as <code>[schema_name.]object_name</code> . For example, <code>hr.employees</code> . If the schema is not specified, then the current user is the default. The specified table must exist in the same database as the capture process or apply process. Also, the specified table cannot have any LOB, LONG, LONG RAW, or XMLType columns currently or in the future. |
| dml_condition | The subset condition. Specify this condition similar to the way you specify conditions in a WHERE clause in SQL. For example, to specify rows in the <code>hr.employees</code> table where the salary is greater than 4000 and the <code>job_id</code> is <code>SA_MAN</code> , enter the following as the condition: <code>' salary > 4000 and job_id = 'SA_MAN' '</code> Note: The quotation marks in the preceding example are all single quotation marks. |
| streams_type | The type of XStream client: <ul style="list-style-type: none"> Specify capture for a capture process. Specify apply for an apply process. |

Table 221-10 (Cont.) ADD_SUBSET_RULES Procedure Parameters

| Parameter | Description |
|--------------|---|
| streams_name | <p>The name of the capture process or apply process. Do not specify an owner.</p> <p>If <code>NULL</code>, if <code>streams_type</code> is <code>capture</code>, and if one relevant capture process for the queue exists, then the procedure uses the relevant XStream client. If no relevant XStream client exists for the queue, then the procedure creates an XStream client automatically with a system-generated name. If <code>NULL</code> and multiple XStream clients of the specified <code>streams_type</code> for the queue exist, then the procedure raises an error.</p> <p>If <code>NULL</code>, if <code>streams_type</code> is <code>apply</code>, and if one relevant apply process exists, then the procedure uses the relevant apply process. The relevant apply process is identified in one of the following ways:</p> <ul style="list-style-type: none"> • If one existing apply process has the source database specified in <code>source_database</code> and uses the queue specified in <code>queue_name</code>, then the procedure uses this apply process. • If <code>source_database</code> is <code>NULL</code> and one existing apply process is using the queue specified in <code>queue_name</code>, then the procedure uses this apply process. <p>If <code>NULL</code> and no relevant apply process exists, then the procedure creates an apply process automatically with a system-generated name.</p> <p>If <code>NULL</code> and multiple relevant apply processes exist, then the procedure raises an error.</p> <p>Each apply process must have a unique name.</p> |
| queue_name | <p>The name of the local queue, specified as <code>[schema_name.]queue_name</code>. The current database must contain the queue, and the queue must be <code>ANYDATA</code> type.</p> <p>For example, to specify a queue named <code>streams_queue</code> in the <code>strmadmin</code> schema, enter <code>strmadmin.streams_queue</code> for this parameter. If the schema is not specified, then the current user is the default.</p> <p>For capture process rules, this is the queue into which a capture process enqueues LCRs. For outbound server rules, this is the queue from which the outbound server dequeues LCRs. For inbound server rules, this is the queue into which an inbound server enqueues error transactions.</p> |

Table 221-10 (Cont.) ADD_SUBSET_RULES Procedure Parameters

| Parameter | Description |
|--------------------|---|
| include_tagged_lcr | <p>If TRUE, then the XStream client performs its action regardless of the tag:</p> <ul style="list-style-type: none"> • A redo entry is always considered for capture by a capture process, regardless of whether the redo entry has a non-NULL tag. • An LCR is always considered for apply by an apply process, regardless of whether redo entry or LCR has a non-NULL tag. <p>If FALSE, then an XStream client performs its action only when the tag is NULL:</p> <ul style="list-style-type: none"> • A redo entry is considered for capture by a capture process only when the redo entry contains a NULL tag. • An LCR is considered for apply by an apply process only if the LCR contains a NULL tag. <p>A setting of FALSE is often specified in update-anywhere configurations to avoid sending a change back to its source database.</p> |
| source_database | <p>The global name of the source database. If NULL, then the procedure does not add a condition regarding the source database to the generated rules.</p> <p>For capture process rules, specify NULL or the global name of the local database if you are creating a capture process locally at the source database. If you are adding rules to a downstream capture process rule set at a downstream database, then specify the source database of the changes that will be captured.</p> <p>For apply process rules, specify the source database of the changes that will be applied by the apply process. The source database is the database where the changes originated. If an apply process applies captured LCRs, then the apply process can apply LCRs from only one capture process at one source database.</p> <p>In a CDB, specify the global name of the container to which the rules pertain. The container can be the root or a PDB. For example, <code>mycdb.example.com</code> or <code>hrpdb.example.com</code>. See <i>Oracle Database XStream Guide</i> for more information about setting this parameter in a CDB.</p> <p>If you do not include the domain name, then the procedure appends it to the database name automatically. For example, if you specify <code>DBS1</code> and the domain is <code>.NET</code>, then the procedure specifies <code>DBS1.NET</code> automatically.</p> |
| insert_rule_name | Contains the system-generated INSERT rule name. This rule handles inserts and updates that must be converted into inserts. |
| update_rule_name | Contains the system-generated UPDATE rule name. This rule handles updates that remain updates. |
| delete_rule_name | Contains the system-generated DELETE rule name. This rule handles deletes and updates that must be converted into deletes |

Table 221-10 (Cont.) ADD_SUBSET_RULES Procedure Parameters

| Parameter | Description |
|-----------------------|---|
| source_root_name | <p>The global name of the root in the source CDB. For example, mycdb.example.com.</p> <p>If this parameter is NULL, then the global name of the root in the local CDB is used. If you are configuring downstream capture, then this parameter must be a non-NULL value, and it must specify the global name of the root in the remote source CDB. See <i>Oracle Database XStream Guide</i> for more information about setting this parameter in a CDB.</p> <p>If you do not include the domain name, then the procedure appends it to the database name automatically. For example, if you specify DBS1 and the domain is EXAMPLE.COM, then the procedure specifies DBS1.EXAMPLE.COM automatically.</p> <p>Note: This parameter only applies to a CDB.</p> |
| source_container_name | <p>The short name of the source container. The container can be the root or a PDB. For example, CDB\$ROOT or hrpdb. See <i>Oracle Database XStream Guide</i> for more information about setting this parameter in a CDB.</p> <p>Note: This parameter only applies to a CDB.</p> |

Usage Notes

Running this procedure generates three rules for the specified capture process or apply process: one for INSERT statements, one for UPDATE statements, and one for DELETE statements. For INSERT and DELETE statements, only DML changes that satisfy the condition specified for the dml_condition parameter are captured or applied. For UPDATE statements, the following variations are possible:

- If both the new and old values in a DML change satisfy the specified dml_condition, then the DML change is captured or applied without any changes.
- If neither the new or old values in a DML change satisfy the specified dml_condition, then the DML change is not captured or applied.
- If the old values for a DML change satisfy the specified dml_condition, but the new values do not, then the DML change is converted into a delete.
- If the new values for a DML change satisfy the specified dml_condition, but the old values do not, then the DML change is converted to an insert.

When an update is converted into an insert or a delete, it is called row migration.

A capture process or apply process uses the rules for filtering. If the XStream client does not have a positive rule set, then this procedure creates a positive rule set automatically, and adds the rules for the table to the positive rule set. A subset rule can be added to positive rule set only, not to a negative rule set. Other rules in an existing rule set for the process are not affected. Additional rules can be added using either the DBMS_XSTREAM_ADM package or the DBMS_RULE_ADM package.

Rules for INSERT, UPDATE, and DELETE statements are created automatically when you run this procedure, and these rules are given a system-generated rule name. Each rule has a system-generated rule name that consists of the table name with a sequence number appended to it. The sequence number is used to avoid naming conflicts. If the table name

plus the sequence number is too long, then the table name is truncated. The `ADD_SUBSET_RULES` procedure is overloaded, and the system-generated rule names for `INSERT`, `UPDATE`, and `DELETE` statements are returned.

 **Note:**

Subset rules should only reside in positive rule sets. You should not add subset rules to negative rule sets. Doing so might have unpredictable results because row migration would not be performed on LCRs that are not discarded by the negative rule set.

Examples

The following is an example of a rule condition created for filtering DML changes containing an update operation when the `dml_condition` is `region_id = 2`, the `table_name` is `hr.regions`, and the `source_database` is `dbs1.net`:

```
:dml.get_object_owner()='HR' AND :dml.get_object_name()='REGIONS'
AND :dml.is_null_tag()='Y' AND :dml.get_source_database_name()='DBS1.NET'
AND :dml.get_command_type()='UPDATE'
AND (:dml.get_value('NEW','REGION_ID') IS NOT NULL)
AND (:dml.get_value('OLD','REGION_ID') IS NOT NULL)
AND (:dml.get_value('OLD','REGION_ID').AccessNumber()=2)
AND (:dml.get_value('NEW','REGION_ID').AccessNumber()=2)
```

221.4.10 ADD_TABLE_PROPAGATION_RULES Procedure

This procedure adds table rules to the positive rule set for a propagation, or adds table rules to the negative rule set for a propagation, and creates the specified propagation if it does not exist.

This procedure is overloaded. One version of this procedure contains two `OUT` parameters, and the other does not.

Syntax

```
DBMS_XSTREAM_ADM.ADD_TABLE_PROPAGATION_RULES (
    table_name          IN    VARCHAR2,
    streams_name        IN    VARCHAR2  DEFAULT NULL,
    source_queue_name   IN    VARCHAR2,
    destination_queue_name IN  VARCHAR2,
    include_dml         IN    BOOLEAN  DEFAULT TRUE,
    include_ddl         IN    BOOLEAN  DEFAULT FALSE,
    include_tagged_lcr  IN    BOOLEAN  DEFAULT FALSE,
    source_database     IN    VARCHAR2  DEFAULT NULL,
    dml_rule_name       OUT   VARCHAR2,
    ddl_rule_name       OUT   VARCHAR2,
    inclusion_rule      IN    BOOLEAN  DEFAULT TRUE,
    and_condition       IN    VARCHAR2  DEFAULT NULL,
    queue_to_queue      IN    BOOLEAN  DEFAULT NULL);
```

```
DBMS_XSTREAM_ADM.ADD_TABLE_PROPAGATION_RULES (
    table_name          IN    VARCHAR2,
    streams_name        IN    VARCHAR2  DEFAULT NULL,
    source_queue_name   IN    VARCHAR2,
    destination_queue_name IN  VARCHAR2,
```

```

include_dml          IN    BOOLEAN    DEFAULT TRUE,
include_ddl          IN    BOOLEAN    DEFAULT FALSE,
include_tagged_lcr   IN    BOOLEAN    DEFAULT FALSE,
source_database      IN    VARCHAR2    DEFAULT NULL,
inclusion_rule        IN    BOOLEAN    DEFAULT TRUE,
and_condition        IN    VARCHAR2    DEFAULT NULL,
queue_to_queue       IN    BOOLEAN    DEFAULT NULL);

```

Parameters

Table 221-11 ADD_TABLE_PROPAGATION_RULES Procedure Parameters

| Parameter | Description |
|------------------------|---|
| table_name | The name of the table specified as <code>[schema_name.]table_name</code> . For example, <code>hr.employees</code> . If the schema is not specified, then the current user is the default. |
| streams_name | The name of the propagation. Do not specify an owner. If the specified propagation does not exist, then the procedure creates it automatically. If NULL and a propagation exists for the same source queue and destination queue (including database link), then the procedure uses this propagation. If NULL and no propagation exists for the same source queue and destination queue (including database link), then the procedure creates a propagation automatically with a system-generated name. |
| source_queue_name | The name of the source queue, specified as <code>[schema_name.]queue_name</code> . The current database must contain the source queue, and the queue must be ANYDATA type. For example, to specify a source queue named <code>streams_queue</code> in the <code>strmadmin</code> schema, enter <code>strmadmin.streams_queue</code> for this parameter. If the schema is not specified, then the current user is the default. |
| destination_queue_name | The name of the destination queue, including a database link, specified as <code>[schema_name.]queue_name[@dblink_name]</code> , if the destination queue is in a remote database. The queue must be ANYDATA type. For example, to specify a destination queue named <code>streams_queue</code> in the <code>strmadmin</code> schema and use a database link named <code>dbs2.net</code> , enter <code>strmadmin.streams_queue@dbs2.net</code> for this parameter. If the schema is not specified, then the current user is the default. If the database link is omitted, then the procedure uses the global name of the current database, and the source queue and destination queue must be in the same database. Note: Connection qualifiers are not allowed. |
| include_dml | If TRUE, then the procedure creates a rule for DML changes. If FALSE, then the procedure does not create a DML rule. NULL is not permitted. |

Table 221-11 (Cont.) ADD_TABLE_PROPAGATION_RULES Procedure Parameters

| Parameter | Description |
|--------------------|--|
| include_ddl | <p>If TRUE, then the procedure creates a rule for DDL changes. If FALSE, then the procedure does not create a DDL rule. NULL is not permitted.</p> <p>The generated rule evaluates to TRUE for any DDL change that operates on the table or on an object that is part of the table, such as an index or trigger on the table. The rule evaluates to FALSE for any DDL change that either does not refer to the table or refers to the table in a subordinate way. For example, the rule evaluates to FALSE for changes that create synonyms or views based on the table. The rule also evaluates to FALSE for a change to a PL/SQL subprogram that refers to the table.</p> |
| include_tagged_lcr | <p>If TRUE, then the procedure does not add a condition regarding Oracle Replication tags to the generated rules. Therefore, these rules can evaluate to TRUE regardless of whether a logical change record (LCR) has a non-NULL tag. If the rules are added to the positive rule set for the propagation, then an LCR is always considered for propagation, regardless of whether it has a non-NULL tag. If the rules are added to a positive rule set, then setting this parameter to TRUE is appropriate for a full (for example, standby) copy of a database. If the rules are added to the negative rule set for the propagation, then whether an LCR is discarded does not depend on the tag for the LCR.</p> <p>If FALSE, then the procedure adds a condition to each generated rule that causes the rule to evaluate to TRUE only if an LCR has a NULL Oracle Replication tag. If the rules are added to the positive rule set for the propagation, then an LCR is considered for propagation only when the LCR contains a NULL tag. If the rules are added to a positive rule set, then setting this parameter to FALSE might be appropriate in update-anywhere configurations to avoid sending a change back to its source database. If the rules are added to the negative rule set for the propagation, then an LCR can be discarded only if it has a NULL tag.</p> <p>Usually, specify TRUE for this parameter if the <code>inclusion_rule</code> parameter is set to FALSE.</p> |
| source_database | <p>The global name of the source database. The source database is where the change originated. If NULL, then the procedure does not add a condition regarding the source database to the generated rules.</p> <p>If you do not include the domain name, then the procedure appends it to the database name automatically. For example, if you specify <code>DBS1</code> and the domain is <code>.NET</code>, then the procedure specifies <code>DBS1.NET</code> automatically.</p> <p>Oracle recommends that you specify a source database for propagation rules.</p> |
| dml_rule_name | <p>If <code>include_dml</code> is TRUE, then this parameter contains the DML rule name.</p> <p>If <code>include_dml</code> is FALSE, then this parameter contains a NULL.</p> |

Table 221-11 (Cont.) ADD_TABLE_PROPAGATION_RULES Procedure Parameters

| Parameter | Description |
|----------------|--|
| ddl_rule_name | <p>If <code>include_ddl</code> is <code>TRUE</code>, then this parameter contains the DDL rule name.</p> <p>If <code>include_ddl</code> is <code>FALSE</code>, then this parameter contains a <code>NULL</code>.</p> |
| inclusion_rule | <p>If <code>inclusion_rule</code> is <code>TRUE</code>, then the procedure adds the rules to the positive rule set for the propagation.</p> <p>If <code>inclusion_rule</code> is <code>FALSE</code>, then the procedure adds the rules to the negative rule set for the propagation.</p> <p>In either case, the system creates the rule set if it does not exist.</p> |
| and_condition | <p>If non-<code>NULL</code>, appends the specified condition to the system-generated rule condition using an <code>AND</code> clause in the following way:</p> <pre>(system_condition) AND (and_condition)</pre> <p>The variable in the specified condition must be <code>:lcr</code>. For example, to specify that the table rules generated by the procedure evaluate to <code>TRUE</code> only if the Oracle Replication tag is the hexadecimal equivalent of '02', specify the following condition:</p> <pre>:lcr.get_tag() = HEXTORAW('02')</pre> <p>The <code>:lcr</code> in the specified condition is converted to <code>:dml</code> or <code>:ddl</code>, depending on the rule that is being generated. If you are specifying an LCR member subprogram that is dependent on the LCR type (row or DDL), then make sure this procedure only generates the appropriate rule.</p> <p>Specifically, if you specify an LCR member subprogram that is valid only for row LCRs, then specify <code>TRUE</code> for the <code>include_dml</code> parameter and <code>FALSE</code> for the <code>include_ddl</code> parameter. If you specify an LCR member subprogram that is valid only for DDL LCRs, then specify <code>FALSE</code> for the <code>include_dml</code> parameter and <code>TRUE</code> for the <code>include_ddl</code> parameter.</p> <p>See Also: Logical Change Record TYPES</p> |
| queue_to_queue | <p>If <code>TRUE</code> or <code>NULL</code>, then a new propagation created by this procedure is a queue to queue propagation. A queue-to-queue propagation always has its own propagation job and uses a service for automatic failover when the destination queue is a buffered queue in an Oracle Real Application Clusters (Oracle RAC) database.</p> <p>If <code>FALSE</code>, then a new propagation created by this procedure is a queue-to-dblink propagation. A queue-to-dblink propagation can share a propagation job with other propagations that use the same database link and does not support automatic failover in an Oracle RAC environment.</p> <p>This procedure cannot change the queue to queue property of an exiting propagation. If the specified propagation exists, then the procedure behaves in the following way for each setting:</p> <ul style="list-style-type: none"> • If <code>TRUE</code> and the specified propagation is not a queue to queue propagation, then the procedure raises an error. • If <code>FALSE</code> and the specified propagation is a queue to queue propagation, then the procedure raises an error. • If <code>NULL</code>, then the procedure does not change the queue to queue property of the propagation. |

Usage Notes

This procedure configures propagation using the current user. Only one propagation is allowed between a particular source queue and destination queue.

This procedure creates DML and DDL rules automatically based on `include_dml` and `include_ddl` parameter values, respectively. Each rule has a system-generated rule name that consists of the table name with a sequence number appended to it. The sequence number is used to avoid naming conflicts. If the table name plus the sequence number is too long, then the table name is truncated. A propagation uses the rules for filtering.

Examples

The following is an example of a table rule condition created for filtering DML statements:

```
((:dml.get_object_owner() = 'HR' and :dml.get_object_name() = 'LOCATIONS'))
and :dml.is_null_tag() = 'Y' and :dml.get_source_database_name() = 'DBS1.NET' )
```

221.4.11 ADD_TABLE_RULES Procedure

This procedure adds rules to an XStream client rule set.

It adds rules to a rule set of one of the following types of XStream clients:

- When the `streams_type` parameter is set to `capture`, this procedure adds capture process rules for capturing changes to a specified table.
This procedure creates the specified capture process if it does not exist.
- When the `streams_type` parameter is set to `apply` and the `streams_name` parameter specifies the name of an apply process, outbound server, or inbound server, this procedure adds apply rules for applying logical change records (LCRs) that contain changes to a specified table. The rules can specify that the LCRs must be from a particular source database.

This procedure creates an apply process if no apply process, outbound server, or inbound server exists with the specified `streams_name`. This procedure can add rules to an outbound server or inbound server, but it cannot create an outbound server or inbound server.

This procedure is overloaded. One version of this procedure contains two `OUT` parameters, and the other does not.

Syntax

```
DBMS_XSTREAM_ADM.ADD_TABLE_RULES (
    table_name           IN   VARCHAR2,
    streams_type         IN   VARCHAR2,
    streams_name         IN   VARCHAR2 DEFAULT NULL,
    queue_name          IN   VARCHAR2 DEFAULT 'streams_queue',
    include_dml         IN   BOOLEAN  DEFAULT TRUE,
    include_ddl         IN   BOOLEAN  DEFAULT FALSE,
    include_tagged_lcr  IN   BOOLEAN  DEFAULT FALSE,
    source_database     IN   VARCHAR2 DEFAULT NULL,
    dml_rule_name       OUT  VARCHAR2,
    ddl_rule_name       OUT  VARCHAR2,
    inclusion_rule      IN   BOOLEAN  DEFAULT TRUE,
```

```

and_condition          IN   VARCHAR2  DEFAULT NULL,
source_root_name       IN   VARCHAR2  DEFAULT NULL,
source_container_name  IN   VARCHAR2  DEFAULT NULL);

DBMS_XSTREAM_ADM.ADD_TABLE_RULES (
  table_name           IN   VARCHAR2,
  streams_type         IN   VARCHAR2,
  streams_name         IN   VARCHAR2  DEFAULT NULL,
  queue_name           IN   VARCHAR2  DEFAULT 'streams_queue',
  include_dml          IN   BOOLEAN   DEFAULT TRUE,
  include_ddl          IN   BOOLEAN   DEFAULT FALSE,
  include_tagged_lcr   IN   BOOLEAN   DEFAULT FALSE,
  source_database      IN   VARCHAR2  DEFAULT NULL,
  inclusion_rule       IN   BOOLEAN   DEFAULT TRUE,
  and_condition        IN   VARCHAR2  DEFAULT NULL,
  source_root_name     IN   VARCHAR2  DEFAULT NULL,
  source_container_name IN   VARCHAR2  DEFAULT NULL);

```

Parameters

Table 221-12 ADD_TABLE_RULES Procedure Parameters

| Parameter | Description |
|--------------|---|
| table_name | <p>The name of the table specified as <i>[schema_name.]object_name</i>. For example, <i>hr.employees</i>. If the schema is not specified, then the current user is the default.</p> <p>You can specify a table that does not yet exist, because Oracle Replication does not validate the existence of the table.</p> |
| streams_type | <p>The type of XStream client:</p> <ul style="list-style-type: none"> Specify <i>capture</i> for a capture process. Specify <i>apply</i> for an apply process. |
| streams_name | <p>The name of the capture process or apply process. Do not specify an owner.</p> <p>If <i>NULL</i>, if <i>streams_type</i> is <i>capture</i>, and if one relevant capture process for the queue exists, then the procedure uses the relevant XStream client. If no relevant XStream client exists for the queue, then the procedure creates an XStream client automatically with a system-generated name. If <i>NULL</i> and multiple XStream clients of the specified <i>streams_type</i> for the queue exist, then the procedure raises an error.</p> <p>If <i>NULL</i>, if <i>streams_type</i> is <i>apply</i>, and if one relevant apply process exists, then the procedure uses the relevant apply process. The relevant apply process is identified in one of the following ways:</p> <ul style="list-style-type: none"> If one existing apply process has the source database specified in <i>source_database</i> and uses the queue specified in <i>queue_name</i>, then the procedure uses this apply process. If <i>source_database</i> is <i>NULL</i> and one existing apply process is using the queue specified in <i>queue_name</i>, then the procedure uses this apply process. <p>If <i>NULL</i> and no relevant apply process exists, then the procedure creates an apply process automatically with a system-generated name.</p> <p>If <i>NULL</i> and multiple relevant apply processes exist, then the procedure raises an error.</p> <p>Each apply process must have a unique name.</p> |

Table 221-12 (Cont.) ADD_TABLE_RULES Procedure Parameters

| Parameter | Description |
|-------------|--|
| queue_name | <p>The name of the local queue, specified as <code>[schema_name.]queue_name</code>. The current database must contain the queue, and the queue must be <code>ANYDATA</code> type.</p> <p>For example, to specify a queue named <code>streams_queue</code> in the <code>strmadmin</code> schema, enter <code>strmadmin.streams_queue</code> for this parameter. If the schema is not specified, then the current user is the default.</p> <p>For capture process rules, this is the queue into which a capture process enqueues LCRs. For outbound server rules, this is the queue from which the outbound server dequeues LCRs. For inbound server rules, this is the queue into which an inbound server enqueues error transactions.</p> |
| include_dml | <p>If <code>TRUE</code>, then the procedure creates a DML rule for DML changes. If <code>FALSE</code>, then the procedure does not create a DML rule. <code>NULL</code> is not permitted.</p> |
| include_ddl | <p>If <code>TRUE</code>, then the procedure creates a DDL rule for DDL changes. If <code>FALSE</code>, then the procedure does not create a DDL rule. <code>NULL</code> is not permitted.</p> <p>The generated rule evaluates to <code>TRUE</code> for any DDL change that operates on the table or on an object that is part of the table, such as an index or trigger on the table. The rule evaluates to <code>FALSE</code> for any DDL change that either does not refer to the table or refers to the table in a subordinate way. For example, the rule evaluates to <code>FALSE</code> for changes that create synonyms or views based on the table. The rule also evaluates to <code>FALSE</code> for a change to a PL/SQL subprogram that refers to the table.</p> |

Table 221-12 (Cont.) ADD_TABLE_RULES Procedure Parameters

| Parameter | Description |
|--------------------|--|
| include_tagged_lcr | <p>If TRUE, then the procedure does not add a condition regarding Oracle Replication tags to the generated rules. Therefore, these rules can evaluate to TRUE regardless of whether a redo entry, session, or LCR has a non-NULL tag. If the rules are added to the positive rule set for the XStream client, then the XStream client performs its action regardless of the tag:</p> <ul style="list-style-type: none">• A redo entry is always considered for capture by a capture process, regardless of whether the redo entry has a non-NULL tag.• An LCR is always considered for apply by an apply process, regardless of whether redo entry or LCR has a non-NULL tag. <p>If the rules are added to a positive rule set, then setting this parameter to TRUE is appropriate for a full (for example, standby) copy of a database. If the rules are added to the negative rule set for the XStream client, then whether a database change is discarded does not depend on the tag.</p> <p>If FALSE, then the procedure adds a condition to each generated rule that causes the rule to evaluate to TRUE only if a redo entry, session, or LCR has a NULL Oracle Replication tag. If the rules are added to the positive rule set for an XStream client, then the XStream client performs its action only when the tag is NULL:</p> <ul style="list-style-type: none">• A redo entry is considered for capture by a capture process only when the redo entry contains a NULL tag.• An LCR is considered for apply by an apply process only if the LCR contains a NULL tag. <p>If the rules are added to a positive rule set, then setting this parameter to FALSE might be appropriate in update-anywhere configurations to avoid sending a change back to its source database. If the rules are added to the negative rule set for the XStream client, then a database change can be discarded only if it has a NULL tag.</p> <p>A setting of FALSE is often specified in update-anywhere configurations to avoid sending a change back to its source database.</p> <p>Usually, specify TRUE for this parameter if the <code>inclusion_rule</code> parameter is set to FALSE.</p> |

Table 221-12 (Cont.) ADD_TABLE_RULES Procedure Parameters

| Parameter | Description |
|-----------------|---|
| source_database | <p>The global name of the source database. If <code>NULL</code>, then the procedure does not add a condition regarding the source database to the generated rules.</p> <p>For capture process rules, specify <code>NULL</code> or the global name of the local database if you are creating a capture process locally at the source database. If you are adding rules to a downstream capture process rule set at a downstream database, then specify the source database of the changes that will be captured.</p> <p>For apply process rules, specify the source database of the changes that will be applied by the apply process. The source database is the database where the changes originated. If an apply process applies captured LCRs, then the apply process can apply LCRs from only one capture process at one source database.</p> <p>In a CDB, specify the global name of the container to which the rules pertain. The container can be the root or a PDB. For example, <code>mycdb.example.com</code> or <code>hrpdb.example.com</code>. See <i>Oracle Database XStream Guide</i> for more information about setting this parameter in a CDB.</p> <p>If you do not include the domain name, then the procedure appends it to the database name automatically. For example, if you specify <code>DBS1</code> and the domain is <code>.NET</code>, then the procedure specifies <code>DBS1.NET</code> automatically.</p> |
| dml_rule_name | <p>If <code>include_dml</code> is <code>TRUE</code>, then this parameter contains the DML rule name.</p> <p>If <code>include_dml</code> is <code>FALSE</code>, then this parameter contains a <code>NULL</code>.</p> |
| ddl_rule_name | <p>If <code>include_ddl</code> is <code>TRUE</code>, then this parameter contains the DDL rule name.</p> <p>If <code>include_ddl</code> is <code>FALSE</code>, then this parameter contains a <code>NULL</code>.</p> |
| inclusion_rule | <p>If <code>inclusion_rule</code> is <code>TRUE</code>, then the procedure adds the rules to the positive rule set for the XStream client.</p> <p>If <code>inclusion_rule</code> is <code>FALSE</code>, then the procedure adds the rules to the negative rule set for the XStream client.</p> <p>In either case, the system creates the rule set if it does not exist.</p> |

Table 221-12 (Cont.) ADD_TABLE_RULES Procedure Parameters

| Parameter | Description |
|-----------------------|--|
| and_condition | <p>If non-NULL, appends the specified condition to the system-generated rule condition using an AND clause in the following way:</p> <pre>(system_condition) AND (and_condition)</pre> <p>The variable in the specified condition must be :lcr. For example, to specify that the table rules generated by the procedure evaluate to TRUE only if the Oracle Replication tag is the hexadecimal equivalent of '02', specify the following condition:</p> <pre>:lcr.get_tag() = HEXTORAW('02')</pre> <p>The :lcr in the specified condition is converted to :dml or :ddl, depending on the rule that is being generated. If you are specifying an LCR member subprogram that is dependent on the LCR type (row or DDL), then make sure this procedure only generates the appropriate rule. Specifically, if you specify an LCR member subprogram that is valid only for row LCRs, then specify TRUE for the include_dml parameter and FALSE for the include_ddl parameter. If you specify an LCR member subprogram that is valid only for DDL LCRs, then specify FALSE for the include_dml parameter and TRUE for the include_ddl parameter.</p> <p>See Also: Logical Change Record TYPES</p> |
| source_root_name | <p>The global name of the root in the source CDB. For example, mycdb.example.com.</p> <p>If this parameter is NULL, then the global name of the root in the local CDB is used. If you are configuring downstream capture, then this parameter must be a non-NULL value, and it must specify the global name of the root in the remote source CDB. See <i>Oracle Database XStream Guide</i> for more information about setting this parameter in a CDB.</p> <p>If you do not include the domain name, then the procedure appends it to the database name automatically. For example, if you specify DBS1 and the domain is EXAMPLE.COM, then the procedure specifies DBS1.EXAMPLE.COM automatically.</p> <p>Note: This parameter only applies to a CDB.</p> |
| source_container_name | <p>The short name of the source container. The container can be the root or a PDB. For example, CDB\$ROOT or hrpdb. See <i>Oracle Database XStream Guide</i> for more information about setting this parameter in a CDB.</p> <p>Note: This parameter only applies to a CDB.</p> |

Usage Notes

This procedure creates DML and DDL rules automatically based on include_dml and include_ddl parameter values, respectively. Each rule has a system-generated rule name that consists of the table name with a sequence number appended to it. The sequence number is used to avoid naming conflicts. If the table name plus the sequence number is too long, then the table name is truncated. A capture process or apply process uses the rules for filtering.

- ["Security Model"](#)

Examples

The following is an example of a table rule condition created for DML changes:

```
((:dml.get_object_owner() = 'HR' and :dml.get_object_name() = 'LOCATIONS'))
and :dml.is_null_tag() = 'Y' and :dml.get_source_database_name() = 'DBS1.NET' )
```

221.4.12 ALTER_INBOUND Procedure

This procedure modifies an XStream inbound server.

Syntax

```
DBMS_XSTREAM_ADM.ALTER_INBOUND(
  server_name IN VARCHAR2,
  apply_user  IN VARCHAR2  DEFAULT NULL,
  comment     IN VARCHAR2  DEFAULT NULL);
```

Parameters**Table 221-13 ALTER_INBOUND Procedure Parameters**

| Parameter | Description |
|-------------|---|
| server_name | The name of the inbound server being altered. Specify an existing inbound server. Do not specify an owner. |
| apply_user | The user who applies all DML and DDL changes that satisfy the inbound server rule sets, who runs user-defined apply handlers, and who runs custom rule-based transformations configured for inbound server rules. The client application must attach to the inbound server as the apply user. Specify a user to change the apply user. In this case, the user who invokes the ALTER_INBOUND procedure must be granted the DBA role. Only the SYS user can set the apply_user to SYS. If NULL, then the apply user is not changed. See "CREATE_INBOUND Procedure" for information about the required privileges for an apply user. |
| comment | An optional comment associated with the inbound server. If non-NULL, then the specified comment replaces the existing comment. If NULL, then the existing comment is not changed. |

221.4.13 ALTER_OUTBOUND Procedure

This procedure modifies an XStream outbound server configuration.

This procedure always alters the specified outbound server. This procedure can also alter the outbound server's capture process when either of the following conditions is met:

- The capture process was created by the `CREATE_OUTBOUND` procedure in this package.
- The queue used by the capture process was created by the `CREATE_OUTBOUND` procedure.

To check whether this procedure can alter the outbound server's capture process, query the `CAPTURE_NAME` column in the `ALL_XSTREAM_OUTBOUND` view. When the name of the capture process appears in the `CAPTURE_NAME` column of this view, the `ALTER_OUTBOUND` procedure can manage the capture process's rules or change the capture user for the capture process. When the `CAPTURE_NAME` column of this view is `NULL`, the `ALTER_OUTBOUND` procedure cannot manage the capture process.

This procedure is overloaded. One `table_names` parameter is type `VARCHAR2` and the other `table_names` parameter is type `DBMS_UTILITY.UNCL_ARRAY`. Also, one `schema_names` parameter is type `VARCHAR2` and the other `schema_names` parameter is type `DBMS_UTILITY.UNCL_ARRAY`. These parameters enable you to enter the list of tables and schemas in different ways and are mutually exclusive.

Note:

Starting with Oracle Database 11g Release 2 (11.2.0.2), the `start_scn` and `start_time` parameters are included in this procedure.

Syntax

```
DBMS_XSTREAM_ADM.ALTER_OUTBOUND(
  server_name          IN VARCHAR2,
  table_names         IN DBMS_UTILITY.UNCL_ARRAY,
  schema_names        IN DBMS_UTILITY.UNCL_ARRAY,
  add                 IN BOOLEAN   DEFAULT TRUE,
  capture_user        IN VARCHAR2  DEFAULT NULL,
  connect_user        IN VARCHAR2  DEFAULT NULL,
  comment             IN VARCHAR2  DEFAULT NULL,
  inclusion_rule      IN BOOLEAN   DEFAULT TRUE,
  start_scn           IN NUMBER     DEFAULT NULL,
  start_time          IN TIMESTAMP  DEFAULT NULL,
  include_dml         IN BOOLEAN   DEFAULT TRUE,
  include_ddl         IN BOOLEAN   DEFAULT FALSE,
  source_database     IN VARCHAR2  DEFAULT NULL,
  source_container_name IN VARCHAR2  DEFAULT NULL);
```

```
DBMS_XSTREAM_ADM.ALTER_OUTBOUND(
  server_name          IN VARCHAR2,
  table_names         IN VARCHAR2  DEFAULT NULL,
  schema_names        IN VARCHAR2  DEFAULT NULL,
  add                 IN BOOLEAN   DEFAULT TRUE,
  capture_user        IN VARCHAR2  DEFAULT NULL,
  connect_user        IN VARCHAR2  DEFAULT NULL,
  comment             IN VARCHAR2  DEFAULT NULL,
```

```

inclusion_rule          IN BOOLEAN          DEFAULT TRUE,
start_scn              IN NUMBER            DEFAULT NULL,
start_time            IN TIMESTAMP         DEFAULT NULL,
include_dml           IN BOOLEAN          DEFAULT TRUE,
include_ddl           IN BOOLEAN          DEFAULT FALSE,
source_database       IN VARCHAR2         DEFAULT NULL,
source_container_name IN VARCHAR2         DEFAULT NULL);

```

Parameters

Table 221-14 ALTER_OUTBOUND Procedure Parameters

| Parameter | Description |
|--------------|---|
| server_name | The name of the outbound server being altered. Specify an existing outbound server. Do not specify an owner. |
| table_names | <p>The tables that are either added to or removed from the XStream Out configuration. Whether the tables are added or removed depends on the setting for the add parameter.</p> <p>The tables can be specified in the following ways:</p> <ul style="list-style-type: none"> Comma-delimited list of type VARCHAR2. A PL/SQL associative array of type DBMS_UTILITY.UNCL_ARRAY, where each element is the name of a table. Specify the first table in position 1. The last position must be NULL. <p>Each table should be specified as [schema_name.]table_name. For example, hr.employees. If the schema is not specified, then the current user is the default.</p> <p>See Also: "Usage Notes" for more information about this parameter</p> |
| schema_names | <p>The schemas that are either added to or removed from the XStream Out configuration. Whether the schemas are added or removed depends on the setting for the add parameter.</p> <p>The schemas can be specified in the following ways:</p> <ul style="list-style-type: none"> Comma-delimited list of type VARCHAR2. A PL/SQL associative array of type DBMS_UTILITY.UNCL_ARRAY, where each element is the name of a schema. Specify the first schema in position 1. The last position must be NULL. <p>Note: This procedure does not concatenate the schema_names parameter with the table_names parameter. To specify tables, enter fully qualified table names in the table_names parameter (schema_name.table_name).</p> <p>See Also: "Usage Notes" for more information about this parameter</p> |
| add | <p>If TRUE, then the procedure adds to the XStream Out configuration the tables specified in the table_names parameter and the schemas specified in the schema_names parameter.</p> <p>If FALSE, then the procedure removes from the XStream Out configuration the tables specified in the table_names parameter and the schemas specified in the schema_names parameter.</p> |

Table 221-14 (Cont.) ALTER_OUTBOUND Procedure Parameters

| Parameter | Description |
|--------------|--|
| capture_user | <p>The user in whose security domain a capture process captures changes that satisfy its rule sets and runs custom rule-based transformations configured for capture process rules.</p> <p>Specify a user to change the capture user. In this case, the user who invokes the ALTER_OUTBOUND procedure must be granted the DBA role. Only the SYS user can set the capture_user to SYS.</p> <p>If NULL, then the capture user is not changed.</p> <p>If you change the capture user, then this procedure grants the new capture user enqueue privilege on the queue used by the capture process and configures the user as a secure queue user.</p> <p>Ensure that the capture user is granted the other required privileges. See "CREATE_OUTBOUND Procedure" for information about the privileges required by a capture user.</p> <p>The capture process is stopped and restarted automatically when you change the value of this parameter.</p> <p>Note: If the capture user for a capture process is dropped using DROP USER . . . CASCADE, then the capture process is also dropped automatically.</p> |
| connect_user | <p>The user who can attach to the specified outbound server to retrieve the change stream. The XStream client application must attach to the outbound server as the specified connect user.</p> <p>Specify a user to change the connect user. In this case, the user who invokes the ALTER_OUTBOUND procedure must be granted the DBA role. Only the SYS user can set the connect_user to SYS.</p> <p>If NULL, then the connect user is not changed.</p> <p>If you change the connect user, then this procedure grants the new connect user dequeue privileges on the queue used by the outbound server and configures the user as a secure queue user.</p> <p>Ensure that the connect user is granted the other required privileges. See "CREATE_OUTBOUND Procedure" for information about the privileges required by a connect user.</p> |
| comment | <p>An optional comment associated with the outbound server.</p> <p>If non-NULL, then the specified comment replaces the existing comment.</p> <p>If NULL, then the existing comment is not changed.</p> |

Table 221-14 (Cont.) ALTER_OUTBOUND Procedure Parameters

| Parameter | Description |
|----------------|---|
| inclusion_rule | <p>If TRUE and the add parameter is set to TRUE, then the procedure adds rules for the tables specified in the table_names parameter and the schemas specified in the schema_names parameter to the positive rule sets in the XStream Out configuration. When rules for tables and schemas are in positive rule sets, the XStream Out configuration streams DML and DDL changes to the tables and schemas out to the client application.</p> <p>If TRUE and the add parameter is set to FALSE, then the procedure removes rules for the tables specified in the table_names parameter and the schemas specified in the schema_names parameter from the positive rule sets in the XStream Out configuration.</p> <p>If FALSE and the add parameter is set to TRUE, then the procedure adds rules for the tables specified in the table_names parameter and the schemas specified in the schema_names parameter to the negative rule sets in the XStream Out configuration. When rules for tables and schemas are in negative rule sets, the XStream Out configuration does not stream changes to the tables and schemas out to the client application.</p> <p>If FALSE and the add parameter is set to FALSE, then the procedure removes rules for the tables specified in the table_names parameter and the schemas specified in the schema_names parameter from the negative rule sets in the XStream Out configuration.</p> |
| start_scn | <p>A valid SCN for the database from which the capture process starts capturing changes. To be valid, the SCN value must be greater than or equal to the first SCN for the capture process.</p> <p>If a valid SCN is specified, then the capture process captures changes from the specified SCN when it is restarted.</p> <p>An error is returned if an invalid SCN is specified.</p> <p>If NULL and the start_time parameter is NULL, then the start SCN is not changed.</p> <p>If NULL and the start_time parameter is non-NULL, then the start SCN is changed to match the specified start time.</p> <p>The start_scn and start_time parameters are mutually exclusive.</p> <p>Note: If the capture process is enabled, then the ALTER_OUTBOUND procedure automatically stops and restarts the capture process when the start_scn parameter is non-NULL. If the capture process is disabled, then the ALTER_OUTBOUND procedure automatically starts the capture process when the start_scn parameter is non-NULL.</p> |

Table 221-14 (Cont.) ALTER_OUTBOUND Procedure Parameters

| Parameter | Description |
|-----------------------|---|
| start_time | <p>A valid time from which the capture process starts capturing changes. To be valid, the time must correspond to an SCN value that is greater than or equal to the first SCN for the capture process.</p> <p>If a valid time is specified, then the capture process captures changes from the specified time when it is restarted.</p> <p>An error is returned if an invalid time is specified.</p> <p>If NULL and the start_scn parameter is NULL, then the start time is not changed.</p> <p>If NULL and the start_scn parameter is non-NULL, then the start time is changed to match the specified start SCN.</p> <p>The start_scn and start_time parameters are mutually exclusive.</p> <p>Note: If the capture process is enabled, then the ALTER_OUTBOUND procedure automatically stops and restarts the capture process when the start_time parameter is non-NULL. If the capture process is disabled, then the ALTER_OUTBOUND procedure automatically starts the capture process when the start_time parameter is non-NULL.</p> |
| include_dml | <p>If TRUE, then the procedure creates a DML rule for DML changes. If FALSE, then the procedure does not create a DML rule. NULL is not permitted.</p> |
| include_ddl | <p>If TRUE, then the procedure creates a DDL rule for DDL changes. If FALSE, then the procedure does not create a DDL rule. NULL is not permitted.</p> |
| source_database | <p>The global name of the container where the specified table_names and schema_names are located.</p> <p>If source_database is non-NULL, then a condition is added to the outbound server's rules to filter the LCRs based on the global name of the source database.</p> |
| source_container_name | <p>The short name of the source container. The container can be the root or a PDB. For example, CDB\$ROOT or hrpdb. See <i>Oracle Database XStream Guide</i> for more information about setting this parameter in a CDB.</p> <p>Note: This parameter only applies to a CDB.</p> |

Usage Notes

The following list describes the behavior of the outbound server for various combinations of the table_names and schema_names parameters:

- If both the table_names and schema_names parameters are NULL or empty, then no rules are changed for the XStream Out configuration.

This procedure is overloaded. The table_names and schema_names parameters are defaulted to NULL. Do not specify NULL for both table_names and schema_names in the same call; otherwise, error PLS-00307 is returned.
- If both the table_names and schema_names parameters are specified, then the rules for the tables and schemas are added to or removed from the XStream Out configuration, depending on the setting of the add parameter.

- If the `table_names` parameter is specified and the `schema_names` parameter is `NULL` or empty, then the rules for the tables are added to or removed from the XStream Out configuration, depending on the setting of the `add` parameter. The existing rules for schemas are not changed for the XStream Out configuration.
- If the `table_names` parameter is `NULL` or empty and the `schema_names` parameter is specified, then the rules for the schemas are added to or removed from the XStream Out configuration, depending on the setting of the `add` parameter. The existing rules for tables are not changed for the XStream Out configuration.

For the procedure that uses the `DBMS_UTILITY.UNCL_ARRAY` type for the `table_names` and `schema_names` parameters, both parameters must be specified. To specify only tables, the `schema_names` parameter must be specified and empty. To specify only schemas, the `table_names` parameter must be specified and empty.

**Note:**

An empty array includes one `NULL` entry.

221.4.14 CREATE_INBOUND Procedure

This procedure creates an XStream inbound server and its queue.

**Note:**

A client application can create multiple sessions. Each session can attach to only one inbound server, and each inbound server can serve only one session at a time. However, different client application sessions can connect to different inbound servers. See *Oracle Call Interface Programmer's Guide* and *Oracle Database XStream Java API Reference* for information about attaching to an inbound server.

Syntax

```
DBMS_XSTREAM_ADM.CREATE_INBOUND(  
    server_name IN VARCHAR2,  
    queue_name  IN VARCHAR2,  
    apply_user  IN VARCHAR2  DEFAULT NULL,  
    comment     IN VARCHAR2  DEFAULT NULL);
```

Parameters

Table 221-15 CREATE_INBOUND Procedure Parameters

| Parameter | Description |
|-------------|---|
| server_name | <p>The name of the inbound server being created. A NULL specification is not allowed. Do not specify an owner.</p> <p>The specified name must not match the name of an existing outbound server, inbound server, apply process, or messaging client.</p> <p>Note: The <code>server_name</code> setting cannot exceed 30 bytes, and it cannot be altered after the inbound server is created.</p> |
| queue_name | <p>The name of the local queue used by the inbound server, specified as <code>[schema_name.]queue_name</code>.</p> <p>If the specified queue exists, then it is used. If the specified queue does not exist, then the procedure creates it.</p> <p>For example, to specify a queue named <code>xstream_queue</code> in the <code>xstrmadmin</code> schema, enter <code>xstrmadmin.xstream_queue</code> for this parameter. If the schema is not specified, then the current user is the default.</p> <p>Note: An inbound server's queue is used only to store error transactions.</p> |
| apply_user | <p>The apply user. If NULL, then the current user is the default.</p> <p>The client application must attach to the inbound server as the apply user.</p> <p>The apply user is the user in whose security domain an inbound server evaluates whether LCRs satisfy its rule sets, applies DML and DDL changes directly to database objects, runs custom rule-based transformations configured for inbound server rules, and runs apply handlers configured for the inbound server. This user must have the necessary privileges to perform these actions. This procedure grants the apply user dequeue privileges on the queue used by the inbound server and configures the user as a secure queue user.</p> <p>In addition to the privileges granted by this procedure, you must grant the following privileges to the apply user:</p> <ul style="list-style-type: none"> • The necessary privileges to perform DML and DDL changes on the apply objects • EXECUTE privilege on the rule sets used by the inbound server • EXECUTE privilege on all rule-based transformation functions used in the rule set • EXECUTE privilege on all apply handler procedures <p>You can grant these privileges directly to the apply user, or you can grant them through roles.</p> <p>In addition, the apply user must be granted EXECUTE privilege on all packages, including Oracle supplied packages, that are invoked in subprograms run by the inbound server. These privileges must be granted directly to the apply user. They cannot be granted through roles.</p> <p>Note: If the apply user for an inbound server is dropped using <code>DROP USER . . . CASCADE</code>, then the inbound server is also dropped automatically.</p> |
| comment | <p>An optional comment associated with the inbound server.</p> |

Usage Notes

By default, an inbound server does not use rules or rule sets. Therefore, an inbound server applies all of the LCRs sent to it by an XStream client application. However, to filter the LCRs

sent to an inbound server, you can add rules and rule sets to an inbound server using the `DBMS_XSTREAM_ADM` and `DBMS_RULE_ADM` packages.

In a CDB, you can execute the `CREATE_INBOUND` procedure from either the root or a PDB. The inbound server is restricted to receiving LCRs from one source database and only applying the changes to its local container. If the inbound server is at the root level, then the apply user must be a common user.

 **See Also:**

Oracle Database XStream Guide

221.4.15 CREATE_OUTBOUND Procedure

This procedure creates an XStream outbound server, queue, and capture process to enable client applications to stream out Oracle database changes.

 **Note:**

A multitenant container database is the only supported architecture in Oracle Database 20c. While the documentation is being revised, legacy terminology may persist. In most cases, "database" and "non-CDB" refer to a CDB or PDB, depending on context. In some contexts, such as upgrades, "non-CDB" refers to a non-CDB from a previous release.

This procedure is overloaded. One `table_names` parameter is type `VARCHAR2` and the other `table_names` parameter is type `DBMS_UTILITY.UNCL_ARRAY`. Also, one `schema_names` parameter is type `VARCHAR2` and the other `schema_names` parameter is type `DBMS_UTILITY.UNCL_ARRAY`. These parameters enable you to enter the list of tables and schemas in different ways and are mutually exclusive.

 **Note:**

- A client application can create multiple sessions. Each session can attach to only one outbound server, and each outbound server can serve only one session at a time. However, different client application sessions can connect to different outbound servers. See "OCIXStreamOutAttach()" in the *Oracle Call Interface Programmer's Guide* and *Oracle Database XStream Java API Reference* for information about attaching to an outbound server.
- If the `capture_name` parameter is `NULL`, then this procedure automatically generates a name for the capture process that it creates.
- This procedure automatically generates a name for the queue that it creates.
- This procedure enables both the capture process and outbound server that it creates.
- Starting with Oracle Database 11g Release 2 (11.2.0.2), the `capture_name` parameter is included in this procedure.

Syntax

```
DBMS_XSTREAM_ADM.CREATE_OUTBOUND(
  server_name          IN VARCHAR2,
  source_database     IN VARCHAR2  DEFAULT NULL,
  table_names         IN DBMS_UTILITY.UNCL_ARRAY,
  schema_names        IN DBMS_UTILITY.UNCL_ARRAY,
  capture_user        IN VARCHAR2  DEFAULT NULL,
  connect_user        IN VARCHAR2  DEFAULT NULL,
  comment             IN VARCHAR2  DEFAULT NULL,
  capture_name        IN VARCHAR2  DEFAULT NULL,
  include_dml         IN BOOLEAN    DEFAULT TRUE,
  include_ddl         IN BOOLEAN    DEFAULT FALSE,
  source_root_name    IN VARCHAR2  DEFAULT NULL,
  source_container_name IN VARCHAR2  DEFAULT NULL,
  lcrld_version       IN NUMBER     DEFAULT NULL);
```

```
DBMS_XSTREAM_ADM.CREATE_OUTBOUND(
  server_name          IN VARCHAR2,
  source_database     IN VARCHAR2  DEFAULT NULL,
  table_names         IN VARCHAR2  DEFAULT NULL,
  schema_names        IN VARCHAR2  DEFAULT NULL,
  capture_user        IN VARCHAR2  DEFAULT NULL,
  connect_user        IN VARCHAR2  DEFAULT NULL,
  comment             IN VARCHAR2  DEFAULT NULL,
  capture_name        IN VARCHAR2  DEFAULT NULL,
  include_dml         IN BOOLEAN    DEFAULT TRUE,
  include_ddl         IN BOOLEAN    DEFAULT FALSE,
  source_root_name    IN VARCHAR2  DEFAULT NULL,
  source_container_name IN VARCHAR2  DEFAULT NULL,
  lcrld_version       IN NUMBER     DEFAULT NULL);
```

Parameters

Table 221-16 CREATE_OUTBOUND Procedure Parameters

| Parameter | Description |
|------------------------------|--|
| <code>server_name</code> | <p>The name of the outbound server being created. A <code>NULL</code> specification is not allowed. Do not specify an owner.</p> <p>The specified name must not match the name of an existing outbound server, inbound server, apply process, or messaging client.</p> <p>Note: The <code>server_name</code> setting cannot exceed 30 bytes, and it cannot be altered after the outbound server is created.</p> |
| <code>source_database</code> | <p>The global name of the source database. The source database is where the changes to be captured originated.</p> <p>If non-<code>NULL</code>, then a condition is added to the outbound server's rules to filter the LCRs based on the global name of the source database. If <code>NULL</code>, then the procedure does not add a condition regarding the source database to the generated rules.</p> <p>In a CDB, specify the global name of the container to which the rules pertain. The container can be the root or a PDB. For example, <code>mycdb.example.com</code> or <code>hrpdb.example.com</code>. See <i>Oracle Database XStream Guide</i> for more information about setting this parameter in a CDB.</p> <p>In a non-CDB, if non-<code>NULL</code> and the specified name is different from the global name of the current database, then downstream capture is assumed. In this case, configure the transmission of redo data from the source database to the downstream database before running the <code>CREATE_OUTBOUND</code> procedure. See <i>Oracle Database XStream Guide</i> for instructions.</p> <p>If you do not include the domain name, then the procedure appends it to the database name automatically. For example, if you specify <code>DBS1</code> and the domain is <code>EXAMPLE.COM</code>, then the procedure specifies <code>DBS1.EXAMPLE.COM</code> automatically.</p> |
| <code>table_names</code> | <p>The tables for which DML and DDL changes are streamed out to the XStream client application. The tables can be specified in the following ways:</p> <ul style="list-style-type: none"> Comma-delimited list of type <code>VARCHAR2</code>. A PL/SQL associative array of type <code>DBMS_UTILITY.UNCL_ARRAY</code>, where each element is the name of a table. Specify the first table in position 1. The last position must be <code>NULL</code>. <p>Each table should be specified as <code>[schema_name.]table_name</code>. For example, <code>hr.employees</code>. If the schema is not specified, then the current user is the default.</p> <p>See Also: "Usage Notes" for more information about this parameter</p> |

Table 221-16 (Cont.) CREATE_OUTBOUND Procedure Parameters

| Parameter | Description |
|--------------|---|
| schema_names | <p>The schemas for which DML and DDL changes are streamed out to the XStream client application. The schemas can be specified in the following ways:</p> <ul style="list-style-type: none"> Comma-delimited list of type <code>VARCHAR2</code>. A PL/SQL associative array of type <code>DBMS_UTILITY.UNCL_ARRAY</code>, where each element is the name of a schema. Specify the first schema in position 1. The last position must be <code>NULL</code>. <p>Note: This procedure does not concatenate the <code>schema_names</code> parameter with the <code>table_names</code> parameter. To specify tables, enter fully qualified table names in the <code>table_names</code> parameter (<code>schema_name.table_name</code>).</p> <p>See Also: "Usage Notes" for more information about this parameter</p> |
| capture_user | <p>The user in whose security domain a capture process captures changes that satisfy its rule sets and runs custom rule-based transformations configured for capture process rules. If <code>NULL</code>, then the current user is the default.</p> <p>This procedure grants the capture user enqueue privilege on the queue used by the capture process and configures the user as a secure queue user.</p> <p>In addition, ensure that the capture user has the following privileges:</p> <ul style="list-style-type: none"> <code>EXECUTE</code> privilege on the rule sets used by the capture process <code>EXECUTE</code> privilege on all rule-based transformation functions used in the positive rule set <p>You can grant these privileges directly to the apply user, or you can grant them through roles.</p> <p>In addition, the capture user must be granted <code>EXECUTE</code> privilege on all packages, including Oracle supplied packages, that are invoked in rule-based transformations run by the capture process. These privileges must be granted directly to the capture user. They cannot be granted through roles.</p> <p>Only a user who is granted the <code>DBA</code> role can set a capture user. Only the <code>SYS</code> user can set the <code>capture_user</code> to <code>SYS</code>.</p> <p>A capture user does not require privileges on a database object to capture changes made to it. The capture process can pass these changes to a custom rule-based transformation function. Therefore, ensure that you consider security implications when you configure a capture process.</p> |

Table 221-16 (Cont.) CREATE_OUTBOUND Procedure Parameters

| Parameter | Description |
|--------------|---|
| connect_user | <p>The user who can attach to the specified outbound server to retrieve the change stream. The client application must attach to the outbound server as the specified connect user.</p> <p>If NULL, then the current user is the default.</p> <p>The connect user is the user in whose security domain an outbound server evaluates LCRs against its rule sets and runs custom rule-based transformations configured for outbound server rules. This user must have the necessary privileges to perform these actions. This procedure grants the connect user dequeue privileges on the queue used by the outbound server and configures the user as a secure queue user.</p> <p>In addition to the privileges granted by this procedure, grant the following privileges to the connect user:</p> <ul style="list-style-type: none"> EXECUTE privilege on the rule sets used by the outbound server EXECUTE privilege on all rule-based transformation functions used in the rule set <p>You can grant these privileges directly to the connect user, or you can grant them through roles.</p> <p>In addition, the connect user must be granted EXECUTE privilege on all packages, including Oracle supplied packages, that are invoked in subprograms run by the outbound server. These privileges must be granted directly to the apply user. They cannot be granted through roles.</p> |
| comment | <p>An optional comment associated with the outbound server.</p> |
| capture_name | <p>The name of the capture process configured to capture changes for the outbound server. Do not specify an owner.</p> <p>The capture process must not exist. If the specified name matches the name of an existing capture process, then an error is raised.</p> <p>If the name does not match the name of an existing capture process, then the procedure creates a new capture process with the specified name.</p> <p>If NULL, then the system creates a new capture process with a system-generated name.</p> <p>Note: The capture process name cannot be altered after the capture process is created.</p> |
| include_dml | <p>If TRUE, then the procedure creates a DML rule for DML changes. If FALSE, then the procedure does not create a DML rule. NULL is not permitted.</p> |
| include_ddl | <p>If TRUE, then the procedure creates a DDL rule for DDL changes. If FALSE, then the procedure does not create a DDL rule. NULL is not permitted.</p> |

Table 221-16 (Cont.) CREATE_OUTBOUND Procedure Parameters

| Parameter | Description |
|------------------------------------|---|
| <code>source_root_name</code> | <p>The global name of the root in the source CDB. For example, <code>mycdb.example.com</code>.</p> <p>If this parameter is <code>NULL</code>, then the global name of the root in the local CDB is used. If you are configuring downstream capture, then this parameter must be a non-<code>NULL</code> value, and it must specify the global name of the root in the remote source CDB. See <i>Oracle Database XStream Guide</i> for more information about setting this parameter in a CDB.</p> <p>If you do not include the domain name, then the procedure appends it to the database name automatically. For example, if you specify <code>DBS1</code> and the domain is <code>EXAMPLE.COM</code>, then the procedure specifies <code>DBS1.EXAMPLE.COM</code> automatically.</p> <p>Note: This parameter only applies to a CDB.</p> |
| <code>source_container_name</code> | <p>The short name of the source container. The container can be the root or a PDB. For example, <code>CDB\$ROOT</code> or <code>hrpdb</code>. See <i>Oracle Database XStream Guide</i> for more information about setting this parameter in a CDB.</p> <p>Note: This parameter only applies to a CDB.</p> |
| <code>lcrld_version</code> | <p>The LCRID version for captured LCRs, either 1 or 2.</p> <p>If 2, then the LCRs are compatible with a database with its compatibility level at 12.2.0 or higher.</p> <p>If 1, then the LCRs are compatible with a database with its compatibility level at 12.1.0 or lower.</p> <p>If <code>NULL</code>, the default, and the database compatibility level is 12.2.0 or higher, then the <code>lcrld_version</code> is set to 2 internally. If the database compatibility level is 12.1.0 or lower, then the <code>lcrld_version</code> is set to 1 internally.</p> |

Usage Notes

The following list describes the behavior of the outbound server for various combinations of the `table_names` and `schema_names` parameters:

- If both the `table_names` and `schema_names` parameters are `NULL` or empty, then the outbound server streams all DML and DDL changes to the client application.
This procedure is overloaded. The `table_names` and `schema_names` parameters are defaulted to `NULL`. Do not specify `NULL` for both `table_names` and `schema_names` in the same call; otherwise, error `PLS-00307` is returned.
- If both the `table_names` and `schema_names` parameters are specified, then the outbound server streams DML and DDL changes for the specified tables and schemas.
- If the `table_names` parameter is specified and the `schema_names` parameter is `NULL` or empty, then the outbound server streams DML and DDL changes for the specified tables.
- If the `table_names` parameter is `NULL` or empty and the `schema_names` parameter is specified, then the outbound server streams DML and DDL changes for the specified schema.

For the procedure that uses the `DBMS_UTILITY.UNCL_ARRAY` type for the `table_names` and `schema_names` parameters, both parameters must be specified. To specify only tables, the `schema_names` parameter must be specified and empty. To specify only schemas, the `table_names` parameter must be specified and empty.

 **Note:**

An empty array includes one `NULL` entry.

221.4.16 DELETE_COLUMN Procedure

This procedure either adds or removes a declarative rule-based transformation which deletes a column from a row logical change record (LCR) that satisfies the specified rule.

For the transformation to be performed when the specified rule evaluates to `TRUE`, the rule must be in the positive rule set of an XStream client. XStream clients include capture processes, propagations, and apply processes.

 **Note:**

- The `DELETE_COLUMN` procedure supports the same data types supported by Oracle Replication capture processes.
- The `DELETE_COLUMN` procedure is useful when you want to delete a relatively small number of columns in a row LCR. To delete most of the columns in a row LCR and keep a relatively small number of columns, consider using the `KEEP_COLUMNS` procedure in this package.
- Declarative transformations can transform row LCRs only. Therefore, a DML rule must be specified when you run this procedure. If a DDL rule is specified, then the procedure raises an error.

 **See Also:**

- *Oracle Database XStream Guide* for more information about declarative rule-based transformations and about the data types supported by capture processes
- [KEEP_COLUMNS Procedure](#)

Syntax

```
DBMS_XSTREAM_ADM.DELETE_COLUMN (  
  rule_name      IN  VARCHAR2,  
  table_name     IN  VARCHAR2,  
  column_name    IN  VARCHAR2,  
  value_type     IN  VARCHAR2  DEFAULT '*',
```

```

step_number IN NUMBER DEFAULT 0,
operation   IN VARCHAR2 DEFAULT 'ADD');

```

Parameters

Table 221-17 DELETE_COLUMN Procedure Parameters

| Parameter | Description |
|-------------|--|
| rule_name | The name of the rule, specified as <code>[schema_name.] rule_name</code> . If NULL, then the procedure raises an error. For example, to specify a rule in the <code>hr</code> schema named <code>employees12</code> , enter <code>hr.employees12</code> . If the schema is not specified, then the current user is the default. |
| table_name | The name of the table from which the column is deleted in the row LCR, specified as <code>[schema_name.] object_name</code> . For example, <code>hr.employees</code> . If the schema is not specified, then the current user is the default. |
| column_name | The name of the column deleted from each row LCR that satisfies the rule. |
| value_type | Specify 'NEW' to delete the column from the new values in the row LCR. Specify 'OLD' to delete the column from the old values in the row LCR. Specify '*' to delete the column from both the old and new values in the row LCR. |
| step_number | The order of execution of the transformation. See Also: <i>Oracle Database XStream Guide</i> for more information about transformation ordering |
| operation | Specify 'ADD' to add the transformation to the rule. Specify 'REMOVE' to remove the transformation from the rule. |

Usage Notes

When 'REMOVE' is specified for the `operation` parameter, all of the delete column declarative rule-based transformations for the specified rule are removed that match the specified `table_name`, `column_name`, and `step_number` parameters. Nulls specified for these parameters act as wildcards. The following table lists the behavior of the `DELETE_COLUMN` procedure when one or more of these parameters is NULL:

| table_name | column_name | step_number | Result |
|------------|-------------|-------------|---|
| NULL | NULL | NULL | Remove all delete column transformations for the specified rule. |
| NULL | NULL | non-NULL | Remove all delete column transformations with the specified <code>step_number</code> for the specified rule. |
| NULL | non-NULL | non-NULL | Remove all delete column transformations with the specified <code>column_name</code> and <code>step_number</code> for the specified rule. |
| non-NULL | NULL | non-NULL | Remove all delete column transformations with the specified <code>table_name</code> and <code>step_number</code> for the specified rule. |
| NULL | non-NULL | NULL | Remove all delete column transformations with the specified <code>column_name</code> for the specified rule. |

| table_name | column_name | step_number | Result |
|------------|-------------|-------------|--|
| non-NULL | non-NULL | NULL | Remove all delete column transformations with the specified table_name and column_name for the specified rule. |
| non-NULL | NULL | NULL | Remove all delete column transformations with the specified table_name for the specified rule. |
| non-NULL | non-NULL | non-NULL | Remove all delete column transformations with the specified table_name, column_name, and step_number for the specified rule. |

221.4.17 DROP_INBOUND Procedure

This procedure removes an inbound server configuration.

This procedure always removes the specified inbound server. This procedure also removes the queue for the inbound server if all of the following conditions are met:

- One call to the CREATE_INBOUND procedure created the queue.
- The inbound server is the only subscriber to the queue.

See Also:

"CREATE_INBOUND Procedure"

Syntax

```
DBMS_XSTREAM_ADM.DROP_INBOUND(
    server_name IN VARCHAR2);
```

Parameters

Table 221-18 DROP_INBOUND Procedure Parameters

| Parameter | Description |
|-------------|--|
| server_name | The name of the inbound server being removed. Specify an existing inbound server. Do not specify an owner. |

221.4.18 DROP_OUTBOUND Procedure

This procedure removes an outbound server configuration.

This procedure always drops the specified outbound server. This procedure also drops the queue used by the outbound server if both of the following conditions are met:

- The queue was created by the CREATE_OUTBOUND procedure in this package.
- The outbound server is the only subscriber to the queue.

If either one of the preceding conditions is not met, then the `DROP_OUTBOUND` procedure only drops the outbound server. It does not drop the queue.

This procedure also drops the capture process for the outbound server if both of the following conditions are met:

- The procedure can drop the outbound server's queue.
- The capture process was created by the `CREATE_OUTBOUND` procedure.

If the procedure can drop the queue but cannot manage the capture process, then it drops the queue without dropping the capture process.

See Also:

- ["ADD_OUTBOUND Procedure"](#)
- ["CREATE_OUTBOUND Procedure"](#)

Syntax

```
DBMS_XSTREAM_ADM.DROP_OUTBOUND (
    server_name IN VARCHAR2);
```

Parameters

Table 221-19 DROP_OUTBOUND Procedure Parameters

| Parameter | Description |
|--------------------------|--|
| <code>server_name</code> | The name of the outbound server being removed. Specify an existing outbound server. Do not specify an owner. |

221.4.19 ENABLE_GG_XSTREAM_FOR_STREAMS Procedure

This procedure enables XStream optimizations and performance optimizations for Oracle Replication components.

This procedure is intended for users of Oracle Replication who want to enable XStream optimizations and optimizations. For example, you can enable the optimizations for an Oracle Replication configuration that uses capture processes and apply processes to replicate changes between Oracle databases.

These capabilities and optimizations are enabled automatically for XStream components, such as outbound servers, inbound servers, and capture processes that send changes to outbound servers. It is not necessary to run this procedure for XStream components.

When XStream optimizations are enabled, Oracle Replication components can stream ID key LCRs and sequence LCRs. The XStream performance optimizations improve efficiency in various areas, including:

- LCR processing
- Handling large transactions
- DML execution during apply

- Dependency computation and scheduling
- Capture process parallelism

Syntax

```
DBMS_XSTREAM_ADM.ENABLE_GG_XSTREAM_FOR_STREAMS (
    enable IN BOOLEAN TRUE);
```

Parameters

Table 221-20 ENABLE_GG_XSTREAM_FOR_STREAMS Procedure Parameters

| Parameter | Description |
|-----------|--|
| enable | If TRUE, then enable XStream performance optimizations for Oracle Replication components. If FALSE, then disable XStream performance optimizations for Oracle Replication components. |

Usage Notes

The following usage notes apply to this procedure:

- When you run this procedure, all capture processes and apply processes are restarted.
- After you run this procedure, the `PURPOSE` column in the following views displays XStream Streams:
 - ALL_APPLY
 - DBA_APPLY
 - ALL_CAPTURE
 - DBA_CAPTURE
- A license for the Oracle GoldenGate product is required to enable XStream performance optimizations for Oracle Replication components.

See Also:

- [IS_GG_XSTREAM_FOR_STREAMS Function](#)
- *Oracle Database XStream Guide, Chapter 1, Prerequisites for XStream*

221.4.20 GET_MESSAGE_TRACKING Function

The `GET_MESSAGE_TRACKING` Function returns the tracking label for the current session.

See Also:

- [SET_MESSAGE_TRACKING Procedure](#)

Syntax

```
DBMS_XSTREAM_ADM.GET_MESSAGE_TRACKING  
RETURN VARCHAR2;
```

221.4.21 GET_TAG Function

This function gets the binary tag for all redo entries generated by the current session.

See Also:

["SET_TAG Procedure"](#)

Syntax

```
DBMS_XSTREAM_ADM.GET_TAG  
RETURN RAW;
```

Examples

The following example illustrates how to display the current logical change record (LCR) tag as output:

```
SET SERVEROUTPUT ON  
DECLARE  
    raw_tag RAW(2000);  
BEGIN  
    raw_tag := DBMS_XSTREAM_ADM.GET_TAG();  
    DBMS_OUTPUT.PUT_LINE('Tag Value = ' || RAWTOHEX(raw_tag));  
END;  
/
```

You can also display the value by querying the DUAL view:

```
SELECT DBMS_XSTREAM_ADM.GET_TAG FROM DUAL;
```

221.4.22 IS_GG_XSTREAM_FOR_STREAMS Function

This function returns `TRUE` if XStream performance optimizations are enabled for Oracle Replication components, or this function returns `FALSE` if XStream performance optimizations are disabled for Oracle Replication components.

See Also:

["ENABLE_GG_XSTREAM_FOR_STREAMS Procedure"](#)

Syntax

```
DBMS_XSTREAM_ADM.IS_GG_XSTREAM_FOR_STREAMS  
RETURN BOOLEAN;
```

221.4.23 KEEP_COLUMNS Procedure

This procedure either adds or removes a declarative rule-based transformation which keeps a list of columns in a row logical change record (LCR) that satisfies the specified rule. The transformation deletes columns that are not in the list from the row LCR.

For the transformation to be performed when the specified rule evaluates to `TRUE`, the rule must be in the positive rule set of an XStream client. XStream clients include capture processes, propagations, and apply processes.

This procedure is overloaded. The `column_list` parameter is type `VARCHAR2` and the `column_table` parameter is type `DBMS_UTILITY.LNAME_ARRAY`. These parameters enable you to enter the list of columns in different ways and are mutually exclusive.

Note:

- The `KEEP_COLUMNS` procedure supports the same data types supported by Oracle Replication capture processes.
- The `KEEP_COLUMNS` procedure is useful when you want to keep a relatively small number of columns in a row LCR. To keep most of the columns in a row LCR and delete a relatively small number of columns, consider using the `DELETE_COLUMN` procedure in this package.
- Declarative transformations can transform row LCRs only. Therefore, a DML rule must be specified when you run this procedure. If a DDL rule is specified, then the procedure raises an error.

See Also:

- *Oracle Database XStream Guide* for more information about declarative rule-based transformations and about the data types supported by Oracle Replication capture processes
- [DELETE_COLUMN Procedure](#)

Syntax

```
DBMS_XSTREAM_ADM.KEEP_COLUMNS (
  rule_name      IN  VARCHAR2,
  table_name     IN  VARCHAR2,
  column_list    IN  VARCHAR2,
  value_type     IN  VARCHAR2 DEFAULT '*',
  step_number    IN  NUMBER DEFAULT 0,
  operation      IN  VARCHAR2 DEFAULT 'ADD');
```

```
DBMS_XSTREAM_ADM.KEEP_COLUMNS (
  rule_name      IN  VARCHAR2,
  table_name     IN  VARCHAR2,
  column_table   IN  DBMS_UTILITY.LNAME_ARRAY,
  value_type     IN  VARCHAR2 DEFAULT '*',
```

```

step_number IN NUMBER DEFAULT 0,
operation   IN VARCHAR2 DEFAULT 'ADD');

```

Parameters

Table 221-21 KEEP_COLUMNS Procedure Parameters

| Parameter | Description |
|--------------|--|
| rule_name | The name of the rule, specified as <code>[schema_name.]rule_name</code> . If NULL, then the procedure raises an error. For example, to specify a rule in the <code>hr</code> schema named <code>employees12</code> , enter <code>hr.employees12</code> . If the schema is not specified, then the current user is the default. |
| table_name | The name of the table for which the columns are kept in the row LCR, specified as <code>[schema_name.]object_name</code> . For example, <code>hr.employees</code> . If the schema is not specified, then the current user is the default. |
| column_list | The names of the columns kept for each row LCR that satisfies the rule. Specify a comma-delimited list of type <code>VARCHAR2</code> . The transformation removes columns that are not in the list from the row LCR. If this parameter is set to NULL, and the <code>column_table</code> parameter is also set to NULL, then the procedure raises an error. |
| column_table | The names of the columns kept for each row LCR that satisfies the rule. Specify a PL/SQL associative array of type <code>DBMS_UTILITY.LNAME_ARRAY</code> , where each element is the name of a column. The first schema should be in position 1. The last position must be NULL. The transformation removes columns that are not in the table from the row LCR. If this parameter is set to NULL, and the <code>column_list</code> parameter is also set to NULL, then the procedure raises an error. |
| value_type | Specify 'NEW' to keep the columns in the new values in the row LCR. Specify 'OLD' to keep the columns in the old values in the row LCR. Specify '*' to keep the columns in both the old and new values in the row LCR. |
| step_number | The order of execution of the transformation. See Also: <i>Oracle Database XStream Guide</i> for more information about transformation ordering |
| operation | Specify 'ADD' to add the transformation to the rule. Specify 'REMOVE' to remove the transformation from the rule. |

Usage Notes

When 'REMOVE' is specified for the `operation` parameter, all of the keep columns declarative rule-based transformations for the specified rule are removed that match the specified `table_name`, `column_list`, `column_table`, and `step_number` parameters. Nulls specified for these parameters act as wildcards. The following table lists the behavior of the `KEEP_COLUMNS` procedure when one or more of these parameters is NULL:

| table_name | column_list/ column_table | step_number | Result |
|------------|------------------------------|-------------|---|
| NULL | NULL | NULL | Remove all keep columns transformations for the specified rule. |

| table_name | column_list/ column_table | step_number | Result |
|-------------------|--------------------------------------|--------------------|---|
| NULL | NULL | non-NULL | Remove all keep columns transformations with the specified <code>step_number</code> for the specified rule. |
| NULL | non-NULL | non-NULL | Remove all keep columns transformations with the specified <code>column_list/column_table</code> and <code>step_number</code> for the specified rule. |
| non-NULL | NULL | non-NULL | Remove all keep columns transformations with the specified <code>table_name</code> and <code>step_number</code> for the specified rule. |
| NULL | non-NULL | NULL | Remove all keep columns transformations with the specified <code>column_list/column_table</code> for the specified rule. |
| non-NULL | non-NULL | NULL | Remove all keep columns transformations with the specified <code>table_name</code> and <code>column_list/column_table</code> for the specified rule. |
| non-NULL | NULL | NULL | Remove all keep columns transformations with the specified <code>table_name</code> for the specified rule. |
| non-NULL | non-NULL | non-NULL | Remove all keep columns transformations with the specified <code>table_name</code> , <code>column_list/column_table</code> , and <code>step_number</code> for the specified rule. |

221.4.24 MERGE_STREAMS Procedure

This procedure merges a stream that is flowing from one capture process with a stream that is flowing from another capture process.

Typically, this procedure is used to merge two streams that were split using the `SPLIT_STREAMS` procedure in this package. The `SPLIT_STREAMS` procedure clones components of the original stream when it splits the streams. Therefore, the information in this section uses the following terminology:

- The stream before it was split off has the original queue, original capture process, and original propagation.
- The stream that was split off by the `SPLIT_STREAMS` procedure has a cloned queue, cloned capture process, and cloned propagation.

This procedure is called by the `MERGE_STREAMS_JOB` procedure. The `MERGE_STREAMS_JOB` procedure determines whether the streams are within a user-specified merge threshold so that the streams can be merged safely. If the streams are not within the merge threshold, then the `MERGE_STREAMS_JOB` procedure does nothing. Typically, it is best to run the `MERGE_STREAMS_JOB` procedure instead of running the `MERGE_STREAMS` procedure directly.

However, you can choose to run the `MERGE_STREAMS` procedure directly when the following conditions are met:

- The problem at the destination of the split stream has been corrected, and the destination queue can accept changes.
- The cloned capture process used by the split stream is started and is capturing changes.
- The apply process at the destination database is applying the changes captured by the cloned capture process.
- The `CAPTURE_MESSAGE_CREATE_TIME` in the `GV$XSTREAM_CAPTURE` view of the cloned capture process has caught up to, or nearly caught up to, the `CAPTURE_MESSAGE_CREATE_TIME` of the original capture process. The cloned capture process might never completely catch up to the original capture process. Therefore, you can merge the split stream when the cloned capture process has nearly caught up to the original capture process.

The `MERGE_STREAMS` procedure performs the following actions:

1. Stops the cloned capture process.
2. Stops the original capture process.
3. Copies the cloned propagation back to the original propagation. The propagation has the same name as the original propagation after it is copied back.
4. Starts the original capture process from the lower SCN value of these two SCN values:
 - The acknowledged SCN of the cloned propagation.
 - The lowest acknowledged SCN of the other propagations that propagate changes captured by the original capture process.

When the original capture process is started, it might recapture changes that it already captured, or it might capture changes that were already captured by the cloned capture process. In either case, the relevant apply processes will discard any duplicate changes they receive.

5. Drops the cloned propagation.
6. Drops the cloned capture process.
7. Drops the cloned queue.

See Also:

[SPLIT_STREAMS Procedure](#)

Syntax

```
DBMS_XSTREAM_ADM.MERGE_STREAMS (
  cloned_propagation_name  IN  VARCHAR2,
  propagation_name        IN  VARCHAR2  DEFAULT NULL,
  queue_name              IN  VARCHAR2  DEFAULT NULL,
  perform_actions         IN  BOOLEAN   DEFAULT TRUE,
  script_name             IN  VARCHAR2  DEFAULT NULL,
  script_directory_object IN  VARCHAR2  DEFAULT NULL);
```

Parameters

Table 221-22 MERGE_STREAMS Procedure Parameters

| Parameter | Description |
|--------------------------------------|---|
| <code>cloned_propagation_name</code> | <p>The name of the cloned propagation used by the stream that was split off from the original stream using the <code>SPLIT_STREAMS</code> procedure. The name of the cloned propagation also identifies the cloned queue and capture process used by the cloned propagation.</p> <p>You must specify an existing propagation name. Do not specify an owner.</p> |
| <code>propagation_name</code> | <p>The name of the propagation that is merged back to the original stream.</p> <p>If <code>NULL</code>, then the name of the original propagation in the original stream is used. Specify <code>NULL</code> only if the streams were split using the <code>SPLIT_STREAMS</code> procedure.</p> <p>Specify a non-<code>NULL</code> value to use a name that is different from the original propagation name or if you are merging two streams that were not split by the <code>SPLIT_STREAMS</code> procedure.</p> <p>If a non-<code>NULL</code> value is specified, then an error is raised under either of the following conditions:</p> <ul style="list-style-type: none"> • The queue specified in the <code>queue_name</code> parameter does not exist. • The queue specified in the <code>queue_name</code> parameter exists but is not used by a capture process. |
| <code>queue_name</code> | <p>The name of the queue that is the source queue for the propagation that is merged back.</p> <p>If <code>NULL</code>, then the existing, original queue is the source queue for the propagation that is merged back. Specify <code>NULL</code> only if the streams were split using the <code>SPLIT_STREAMS</code> procedure.</p> <p>Specify a non-<code>NULL</code> value if you are merging two streams that were not split by the <code>SPLIT_STREAMS</code> procedure. Specify the name of the existing queue used by the capture process that will capture changes in the merged stream.</p> |
| <code>perform_actions</code> | <p>If <code>TRUE</code>, then the procedure performs the necessary actions to merge the streams directly.</p> <p>If <code>FALSE</code>, then the procedure does not perform the necessary actions to merge the streams directly.</p> <p>Specify <code>FALSE</code> when this procedure is generating a script that you can edit and then run. The procedure raises an error if you specify <code>FALSE</code> and either of the following parameters is <code>NULL</code>:</p> <ul style="list-style-type: none"> • <code>script_name</code> • <code>script_directory_object</code> |

Table 221-22 (Cont.) MERGE_STREAMS Procedure Parameters

| Parameter | Description |
|--------------------------------------|---|
| <code>script_name</code> | <p>If non-NULL and the <code>perform_actions</code> parameter is FALSE, then specify the name of the script generated by this procedure. The script contains all of the statements used to merge the streams. If a file with the specified script name exists in the specified directory for the <code>script_directory_object</code> parameter, then the procedure appends the statements to the existing file.</p> <p>If non-NULL and the <code>perform_actions</code> parameter is TRUE, then the procedure generates the specified script and performs the actions to split the stream directly.</p> <p>If NULL and the <code>perform_actions</code> parameter is TRUE, then the procedure performs the actions to merge the streams directly and does not generate a script.</p> <p>If NULL and the <code>perform_actions</code> parameter is FALSE, then the procedure raises an error.</p> |
| <code>script_directory_object</code> | <p>The directory object for the directory on the local computer system into which the generated script is placed.</p> <p>If the <code>script_name</code> parameter is NULL, then the procedure ignores this parameter and does not generate a script.</p> <p>If NULL and the <code>script_name</code> parameter is non-NULL, then the procedure raises an error.</p> <p>Note: The specified directory object cannot point to an Oracle Automatic Storage Management (ASM) disk group.</p> |

Usage Notes

You can use the `MERGE_STREAMS` procedure to merge two streams that were not split using the `SPLIT_STREAMS` procedure. Merging streams in this way can save resources and improve performance when a single database is running two or more capture processes.

221.4.25 MERGE_STREAMS_JOB Procedure

This procedure determines whether the original capture process and the cloned capture process are within the specified merge threshold. If they are within the merge threshold, then this procedure runs the `MERGE_STREAMS` procedure to merge the two streams.

Typically, this procedure is used to merge two streams that were split using the `SPLIT_STREAMS` procedure in this package. The `SPLIT_STREAMS` procedure clones components of the original stream when it splits the streams. Therefore, the information in this section uses the following terminology:

- The stream before it was split off has the original queue, original capture process, and original propagation.
- The stream that was split off by the `SPLIT_STREAMS` procedure has a cloned queue, cloned capture process, and cloned propagation.

If the `auto_merge_threshold` parameter was set to a positive number in the `SPLIT_STREAMS` procedure that split the streams, then a merge job runs the `MERGE_STREAMS_JOB` procedure automatically according to its schedule. The schedule name is specified for the `schedule_name` parameter, and the merge job name is specified for the `merge_job_name`

parameter when the `MERGE_STREAMS_JOB` procedure is run automatically. The merge job and its schedule were created by the `SPLIT_STREAMS` procedure.

If the `auto_merge_threshold` parameter was set to `NULL` or 0 (zero) in the `SPLIT_STREAMS` procedure that split the streams, then you can run the `MERGE_STREAMS_JOB` procedure manually. In this case, it is not run automatically.

See Also:

- [MERGE_STREAMS Procedure](#)
- [SPLIT_STREAMS Procedure](#)

Syntax

```
DBMS_XSTREAM_ADM.MERGE_STREAMS_JOB (
    cloned_propagation_name IN VARCHAR2,
    propagation_name       IN VARCHAR2 DEFAULT NULL,
    queue_name              IN VARCHAR2 DEFAULT NULL,
    merge_threshold         IN NUMBER,
    schedule_name           IN VARCHAR2 DEFAULT NULL,
    merge_job_name          IN VARCHAR2 DEFAULT NULL);
```

Parameters

Table 221-23 MERGE_STREAMS_JOB Procedure Parameters

| Parameter | Description |
|--------------------------------------|---|
| <code>cloned_propagation_name</code> | <p>The name of the cloned propagation used by the stream that was split off from the original stream using the <code>SPLIT_STREAMS</code> procedure. The name of the cloned propagation also identifies the cloned queue and capture process used by the cloned propagation.</p> <p>You must specify an existing propagation name. Do not specify an owner.</p> |
| <code>propagation_name</code> | <p>The name of the propagation that is merged back to the original stream.</p> <p>If <code>NULL</code>, then the name of the original propagation in the original stream is used. Specify <code>NULL</code> only if the streams were split using the <code>SPLIT_STREAMS</code> procedure.</p> <p>Specify a non-<code>NULL</code> value to use a name that is different from the original propagation name or if you are merging two streams that were not split by the <code>SPLIT_STREAMS</code> procedure.</p> <p>If a non-<code>NULL</code> value is specified, then an error is raised under either of the following conditions:</p> <ul style="list-style-type: none"> • The queue specified in the <code>queue_name</code> parameter does not exist. • The queue specified in the <code>queue_name</code> parameter exists but is not used by a capture process. |

Table 221-23 (Cont.) MERGE_STREAMS_JOB Procedure Parameters

| Parameter | Description |
|-----------------|--|
| queue_name | <p>The name of the queue that is the source queue for the propagation that is merged back.</p> <p>If NULL, then the existing, original queue is the source queue for the propagation that is merged back. Specify NULL only if the streams were split using the SPLIT_STREAMS procedure.</p> <p>Specify a non-NULL value if you are merging two streams that were not split by the SPLIT_STREAMS procedure. Specify the name of the existing queue used by the capture process that will capture changes in the merged stream.</p> |
| merge_threshold | <p>The merge threshold in seconds.</p> <p>The value of the CAPTURE_MESSAGE_CREATE_TIME column for each capture process in the GV\$XSTREAM_CAPTURE dynamic performance view determines whether the streams are merged. Specifically, if the difference, in seconds, between the CAPTURE_MESSAGE_CREATE_TIME of the cloned capture process and the original capture process is less than or equal to the value specified for this parameter, then this procedure runs the MERGE_STREAMS procedure to merge the streams. If the difference is greater than the value specified by this parameter, then this procedure does nothing.</p> |
| schedule_name | <p>The name of the schedule for the merge job.</p> <p>If NULL, then no schedule name is specified. Typically, you set this parameter to NULL when the auto_merge_threshold parameter was set to NULL or 0 (zero) in the SPLIT_STREAMS procedure that split the streams.</p> <p>Specify NULL if you run this procedure manually.</p> |
| merge_job_name | <p>The name of the job that merges the streams.</p> <p>If NULL, then no merge job name is specified. Typically, you set this parameter to NULL when the auto_merge_threshold parameter was set to NULL or 0 (zero) in the SPLIT_STREAMS procedure that split the streams.</p> <p>Specify NULL if you run this procedure manually.</p> |

Usage Notes

You can use the MERGE_STREAMS_JOB procedure to merge two streams that were not split using the SPLIT_STREAMS procedure. Merging streams in this way can save resources and improve performance when a single database is running two or more capture processes.

After the MERGE_STREAMS_JOB procedure completes, you can query the DBA_CAPTURE and DBA_PROPAGATION views to determine whether the streams were merged. If the streams were merged, then the cloned capture process and cloned propagation do not appear in these views.

If the streams were merged and the schedule_name and merge_job_name parameters were non-NULL, then the specified schedule and merge job are deleted automatically.

221.4.26 PURGE_SOURCE_CATALOG Procedure

This procedure removes all Oracle Replication data dictionary information at the local database for the specified object.

Note:

A multitenant container database is the only supported architecture in Oracle Database 20c. While the documentation is being revised, legacy terminology may persist. In most cases, "database" and "non-CDB" refer to a CDB or PDB, depending on context. In some contexts, such as upgrades, "non-CDB" refers to a non-CDB from a previous release.

You can use this procedure to remove Oracle Replication metadata that is not needed currently and will not be needed in the future.

Syntax

```
DBMS_XSTREAM_ADM.PURGE_SOURCE_CATALOG (
  source_database      IN  VARCHAR2,
  source_object_name  IN  VARCHAR2,
  source_object_type   IN  VARCHAR2,
  source_root_name    IN  VARCHAR2);
```

Parameters

Table 221-24 PURGE_SOURCE_CATALOG Procedure Parameters

| Parameter | Description |
|--------------------|--|
| source_database | In a non-CDB, specify the global name of the source database containing the database object. In a CDB, specify the global name of the container containing the database object. The container can be the root or a PDB. If you do not include the domain name, then the procedure appends it to the database name automatically. For example, if you specify DBS1 and the domain is .NET, then the procedure specifies DBS1.NET automatically. |
| source_object_name | The name of the object specified as [<i>schema_name</i> .] <i>object_name</i> . For example, hr.employees. If the schema is not specified, then the current user is the default. |
| source_object_type | Type of the object. Currently, TABLE is the only possible object type. |

Table 221-24 (Cont.) PURGE_SOURCE_CATALOG Procedure Parameters

| Parameter | Description |
|-------------------------------|---|
| <code>source_root_name</code> | <p>The global name of the source root containing the object in a CDB. The source root is where the changes being captured originated in a CDB.</p> <p>If you do not include the domain name, then the procedure appends it to the database name automatically. For example, if you specify <code>DBS1</code> and the domain is <code>EXAMPLE.COM</code>, then the procedure specifies <code>DBS1.EXAMPLE.COM</code> automatically.</p> <p>If the <code>source_root_name</code> parameter is <code>NULL</code>, then the global name of the local root is the default.</p> <p>Note: This parameter only applies to a CDB.</p> |

Usage Notes

The global name of the source database containing the object must be specified for the `source_database` parameter. If the current database is not the source database for the object, then the procedure removes data dictionary information about the object from the current database, not the source database.

For example, suppose changes to the `hr.employees` table at the `dbs1.net` source database are being applied to the `hr.employees` table at the `dbs2.net` destination database. Also, suppose `hr.employees` at `dbs2.net` is not a source at all. In this case, specifying `dbs2.net` as the `source_database` for this table results in an error. However, specifying `dbs1.net` as the `source_database` for this table while running the `PURGE_SOURCE_CATALOG` procedure at the `dbs2.net` database removes data dictionary information about the table at `dbs2.net`.

Do not run this procedure at a database if either of the following conditions is true:

- Logical change records (LCRs) captured by the capture process for the object are or might be applied locally without reinstantiating the object.
- LCRs captured by the capture process for the object are or might be forwarded by the database without reinstantiating the object.

Note:

These conditions do not apply to LCRs that were not created by the capture process. That is, these conditions do not apply to user-created LCRs.

221.4.27 RECOVER_OPERATION Procedure

This procedure provides options for split and merge operations that stopped because they encountered an errors.

This procedure either rolls forward the operation, rolls back the operation, or purges all of the metadata about the operation. Split and merge operations might be run in an XStream Out environment in which multiple outbound servers use the same capture process.

This procedure only can perform these actions for split and merge operations using the `split_threshold` and `merge_threshold` capture process parameters set to non-NULL values to enable automatic split and merge.

Information about the operation is stored in the following data dictionary views when the operation is in process:

- `DBA_RECOVERABLE_SCRIPT`
- `DBA_RECOVERABLE_SCRIPT_PARAMS`
- `DBA_RECOVERABLE_SCRIPT_BLOCKS`
- `DBA_RECOVERABLE_SCRIPT_ERRORS`

The data dictionary views are populated at the database that contains the capture process.

When the operation completes successfully, metadata about the operation is moved from the `DBA_RECOVERABLE_SCRIPT` view to the `DBA_RECOVERABLE_SCRIPT_HIST` view. The other views, `DBA_RECOVERABLE_SCRIPT_PARAMS`, `DBA_RECOVERABLE_SCRIPT_BLOCKS`, and `DBA_RECOVERABLE_SCRIPT_ERRORS`, retain information about the operation until it is purged automatically after 30 days.

When one of these operations encounters an error and stops, metadata about the operation remains in these views. In this case, you can either roll forward, roll back, or purge the metadata about the operation using the `RECOVER_OPERATION` procedure. If you choose to roll forward the operation, then correct conditions that caused the errors reported in `DBA_RECOVERABLE_SCRIPT_ERRORS` before proceeding.

Run the `RECOVER_OPERATION` procedure at the database that contains the capture process.

Note:

To run the `RECOVER_OPERATION` procedure, both databases must be Oracle Database 10g Release 2 or later databases.

See Also:

- ["SPLIT_STREAMS Procedure"](#)
- ["MERGE_STREAMS Procedure"](#)
- ["MERGE_STREAMS_JOB Procedure"](#)

Syntax

```
DBMS_XSTREAM_ADM.RECOVER_OPERATION(  
    script_id      IN RAW,  
    operation_mode IN VARCHAR2 DEFAULT 'FORWARD');
```

Parameters

Table 221-25 RECOVER_OPERATION Procedure Parameters

| Parameter | Description |
|-----------------------------|---|
| <code>script_id</code> | The operation id of the operation that is being rolled forward, rolled back, or purged. Query the <code>SCRIPT_ID</code> column of the <code>DBA_RECOVERABLE_SCRIPT</code> data dictionary view to determine the operation id. |
| <code>operation_mode</code> | <p>If <code>FORWARD</code>, then the procedure rolls forward the operation. Specify <code>FORWARD</code> to try to complete the operation.</p> <p>If <code>ROLLBACK</code>, then the procedure rolls back all of the actions performed in the operation. If the rollback is successful, then this option also moves the metadata about the operation from the <code>DBA_RECOVERABLE_SCRIPT</code> view to the <code>DBA_RECOVERABLE_SCRIPT_HIST</code> view. The other views retain information about the operation for 30 days.</p> <p>If <code>PURGE</code>, then the procedure moves the metadata about the operation from the <code>DBA_RECOVERABLE_SCRIPT</code> view to the <code>DBA_RECOVERABLE_SCRIPT_HIST</code> view without rolling the operation back. The other views retain information about the operation for 30 days.</p> |

221.4.28 REMOVE_QUEUE Procedure

This procedure removes the specified `ANYDATA` queue.

Specifically, this procedure performs the following actions:

1. Waits until all current enqueue and dequeue transactions commit.
2. Stops the queue, which means that no further enqueues into the queue or dequeues from the queue are allowed.
3. Drops the queue.
4. If the `drop_unused_queue_table` parameter is set to `TRUE`, then drops the queue table if it is empty and no other queues are using it.
5. If the `cascade` parameter is set to `TRUE`, then drops all of the XStream clients that are using the queue.

 **Note:**

The specified queue must be a `ANYDATA` queue.

Syntax

```
DBMS_XSTREAM_ADM.REMOVE_QUEUE (
  queue_name          IN  VARCHAR2,
  cascade             IN  BOOLEAN  DEFAULT FALSE,
  drop_unused_queue_table IN  BOOLEAN  DEFAULT TRUE);
```

Parameters

Table 221-26 REMOVE_QUEUE Procedure Parameters

| Parameter | Description |
|-------------------------|--|
| queue_name | The name of the queue to remove, specified as [<i>schema_name</i> .] <i>queue_name</i> . For example, <code>strmadmin.streams_queue</code> . If the schema is not specified, then the current user is the default. |
| cascade | If <code>TRUE</code> , then the procedure drops any XStream clients that use the queue. If <code>FALSE</code> , then the procedure raises an error if there are any XStream clients that use the queue. Before you run this procedure with the <code>cascade</code> parameter set to <code>FALSE</code> , make sure no XStream clients are using the queue currently. |
| drop_unused_queue_table | If <code>TRUE</code> and the queue table for the queue is empty, then the procedure drops the queue table. The queue table is not dropped if it contains any messages or if it is used by another queue. If <code>FALSE</code> , then the procedure does not drop the queue table. |

221.4.29 REMOVE_RULE Procedure

This procedure removes the specified rule or all rules from the rule set associated with the specified capture process, apply process, or propagation.

Note:

If a rule was automatically created by the system, and you want to drop the rule, then you should use this procedure to remove the rule instead of the `DBMS_RULE_ADM.DROP_RULE` procedure. If you use the `DBMS_RULE_ADM.DROP_RULE` procedure, then some metadata about the rule might remain.

Syntax

```
DBMS_XSTREAM_ADM.REMOVE_RULE (
  rule_name          IN  VARCHAR2,
  streams_type       IN  VARCHAR2,
  streams_name       IN  VARCHAR2,
  drop_unused_rule   IN  BOOLEAN  DEFAULT TRUE,
  inclusion_rule     IN  BOOLEAN  DEFAULT TRUE);
```

Parameters

Table 221-27 REMOVE_RULE Procedure Parameters

| Parameter | Description |
|-------------------------------|---|
| <code>rule_name</code> | The name of the rule to remove, specified as <code>[schema_name.]rule_name</code> . If NULL, then the procedure removes all rules from the specified capture process, apply process, or propagation rule set. For example, to specify a rule in the <code>hr</code> schema named <code>prop_rule1</code> , enter <code>hr.prop_rule1</code> . If the schema is not specified, then the current user is the default. |
| <code>streams_type</code> | The type of XStream client: <ul style="list-style-type: none"> Specify <code>capture</code> for a capture process. Specify <code>propagation</code> for a propagation. Specify <code>apply</code> for an apply process. |
| <code>streams_name</code> | The name of the XStream client, which can be a capture process, propagation, or apply process. Do not specify an owner. If the specified XStream client does not exist, but there is metadata in the data dictionary that associates the rule with this client, then the procedure removes the metadata. If the specified XStream client does not exist, and there is no metadata in the data dictionary that associates the rule with this client, then the procedure raises an error. |
| <code>drop_unused_rule</code> | If TRUE and the rule is not in any rule set, then the procedure drops the rule from the database. If TRUE and the rule exists in any rule set, then the procedure does not drop the rule from the database. If FALSE, then the procedure does not drop the rule from the database. |
| <code>inclusion_rule</code> | If <code>inclusion_rule</code> is TRUE, then the procedure removes the rule from the positive rule set for the XStream client. If <code>inclusion_rule</code> is FALSE, then the procedure removes the rule from the negative rule set for the XStream client. |

221.4.30 REMOVE_SUBSET_OUTBOUND_RULES Procedure

This procedure removes subset rules from an outbound server configuration.

The names of the specified insert, update, and delete rules must match those generated by the `ADD_SUBSET_OUTBOUND_RULES` procedure. To view the rule names for subset rules, run the following query:

```
SELECT RULE_OWNER, SUBSETTING_OPERATION, RULE_NAME
FROM ALL_XSTREAM_RULES
WHERE SUBSETTING_OPERATION IS NOT NULL;
```

 **Note:**

- This procedure removes the declarative rule-based transformation associated with each rule it removes.
- This procedure does not remove rules from the outbound server's capture process.

 **See Also:**

"ADD_SUBSET_OUTBOUND_RULES Procedure"

Syntax

```
DBMS_XSTREAM_ADM.REMOVE_SUBSET_OUTBOUND_RULES(
  server_name      IN VARCHAR2,
  insert_rule_name IN VARCHAR2,
  update_rule_name IN VARCHAR2,
  delete_rule_name IN VARCHAR2);
```

221.4.31 REMOVE_XSTREAM_CONFIGURATION Procedure

This procedure removes the XStream configuration at the local database.

Syntax

```
DBMS_XSTREAM_ADM.REMOVE_XSTREAM_CONFIGURATION(
  container IN VARCHAR2 DEFAULT NULL);
```

Parameters

Table 221-28 REMOVE_XSTREAM_CONFIGURATION Procedure Parameters

| Parameter | Description |
|-----------|--|
| container | <p>If CURRENT, then the XStream configuration is removed from the current container. CURRENT can be specified while connected to the root or to a PDB in a CDB.</p> <p>If ALL, then the XStream configuration is removed from all of the containers in the CDB. To specify ALL, the procedure must be invoked in the root.</p> <p>If a container name, then the XStream configuration is removed from the specified container. To specify root, use CDB\$ROOT while connected to the root. To specify a PDB, the procedure must be invoked in the root.</p> <p>Note: This parameter only applies to a CDB.</p> |

Usage Notes

Specifically, this procedure performs the following actions at the local database:

- Drops all capture processes

- If any tables have been prepared for instantiation, then aborts preparation for instantiation for the table using the `ABORT_TABLE_INSTANTIATION` procedure in the `DBMS_CAPTURE_ADM` package
- If any schemas have been prepared for instantiation, then aborts preparation for instantiation for the schema using the `ABORT_SCHEMA_INSTANTIATION` procedure in the `DBMS_CAPTURE_ADM` package
- If the database has been prepared for instantiation, then aborts preparation for instantiation for the database using the `ABORT_GLOBAL_INSTANTIATION` procedure in the `DBMS_CAPTURE_ADM` package
- Drops propagations that were created using either the `DBMS_XSTREAM_ADM` package or the `DBMS_PROPAGATION_ADM` package. Before a propagation is dropped, its propagation job is disabled. Does not drop propagations that were created using the `DBMS_AQADM` package.
- Disables all propagation jobs used by propagations
- Drops all apply processes. If there are apply errors in the error queue for an apply process, then this procedure deletes these apply errors before it drops the apply process.
- Removes specifications for DDL handlers used by apply processes, but does not delete the PL/SQL procedures used by these handlers
- Removes specifications for message handlers used by apply processes, but does not delete the PL/SQL procedures used by these handlers
- Removes specifications for precommit handlers used by apply processes, but does not delete the PL/SQL procedures used by these handlers
- Removes the instantiation SCN and ignore SCN for each apply object and schema and for the entire database
- Removes messaging clients
- Unsets message notification specifications that were set using the `SET_MESSAGE_NOTIFICATION` procedure in the `DBMS_XSTREAM_ADM` package
- Removes specifications for procedure DML handlers and error handlers, but does not delete the PL/SQL procedures used by these handlers
- Removes update conflict handlers
- Removes specifications for substitute key columns for apply tables
- Drops rule sets and rules that were created using the `DBMS_XSTREAM_ADM` package.
- Drops unused rule sets that were used by capture processes, propagations, apply processes, and messaging clients, and removes the rules in these rule sets. These rules and rule sets are removed regardless of whether they were created using the `DBMS_XSTREAM_ADM` package or the `DBMS_RULE_ADM` package.

This procedure stops capture processes and apply processes before it drops them.

This procedure does not drop rule sets or rules if they meet both of the following conditions:

- The rule sets or rules were created using the `DBMS_RULE_ADM` package.
- The rule sets or rules were not used by a capture process, propagation, apply process, or messaging client.

 **Note:**

Running this procedure is dangerous. You should run this procedure only if you are sure you want to remove the entire XStream configuration at a database. If an Oracle Replication configuration exists at the database, then this procedure also removes the entire Oracle Replication configuration.

 **Note:**

- Running this procedure repeatedly does not cause errors. If the procedure fails to complete, then you can run it again.
- This procedure commits multiple times.

221.4.32 RENAME_COLUMN Procedure

This procedure either adds or removes a declarative rule-based transformation which renames a column in a row logical change record (LCR) that satisfies the specified rule.

For the transformation to be performed when the specified rule evaluates to `TRUE`, the rule must be in the positive rule set of an XStream client. XStream clients include capture processes, propagations, and apply processes.

 **Note:**

- The `RENAME_COLUMN` procedure supports the same data types supported by Oracle Replication capture processes.
- Declarative transformations can transform row LCRs only. Therefore, a DML rule must be specified when you run this procedure. If a DDL rule is specified, then the procedure raises an error.

 **See Also:**

Oracle Database XStream Guide for more information about declarative rule-based transformations and about the data types supported by Oracle Replication capture processes

Syntax

```
DBMS_XSTREAM_ADM.RENAME_COLUMN (  
    rule_name           IN  VARCHAR2,  
    table_name          IN  VARCHAR2,  
    from_column_name    IN  VARCHAR2,  
    to_column_name      IN  VARCHAR2,
```

```
value_type      IN VARCHAR2 DEFAULT '*',
step_number     IN NUMBER   DEFAULT 0,
operation       IN VARCHAR2 DEFAULT 'ADD');
```

Parameters

Table 221-29 RENAME_COLUMN Procedure Parameters

| Parameter | Description |
|------------------|---|
| rule_name | The name of the rule, specified as <code>[schema_name.]rule_name</code> . If NULL, then the procedure raises an error. For example, to specify a rule in the <code>hr</code> schema named <code>employees12</code> , enter <code>hr.employees12</code> . If the schema is not specified, then the current user is the default. |
| table_name | The name of the table in which the column is renamed in the row LCR, specified as <code>[schema_name.]object_name</code> . For example, <code>hr.employees</code> . If the schema is not specified, then the current user is the default. |
| from_column_name | The name of the column to be renamed in each row LCR that satisfies the rule. |
| to_column_name | The new name of the column in each row LCR that satisfies the rule. |
| value_type | Specify 'NEW' to rename the column in the new values in the row LCR. Specify 'OLD' to rename the column in the old values in the row LCR. Specify '*' to rename the column in both the old and new values in the row LCR. |
| step_number | The order of execution of the transformation. See Also: <i>Oracle Database XStream Guide</i> for more information about transformation ordering |
| operation | Specify 'ADD' to add the transformation to the rule. Specify 'REMOVE' to remove the transformation from the rule. |

Usage Notes

When 'REMOVE' is specified for the `operation` parameter, all of the rename column declarative rule-based transformations for the specified rule are removed that match the specified `table_name`, `column_name`, and `step_number` parameters. Nulls specified for these parameters act as wildcards. The following table lists the behavior of the `RENAME_COLUMN` procedure when one or more of these parameters is NULL:

| table_name | from_column_name | to_column_name | step_number | Result |
|------------|------------------|----------------|-------------|--|
| NULL | NULL | NULL | NULL | Remove all rename column transformations for the specified rule. |
| NULL | NULL | NULL | non-NULL | Remove all rename column transformations with the specified <code>step_number</code> for the specified rule. |

| table_name | from_column_name | to_column_name | step_number | Result |
|-------------------|-------------------------|-----------------------|--------------------|---|
| NULL | NULL | non-NULL | non-NULL | Remove all rename column transformations with the specified <code>to_column_name</code> and <code>step_number</code> for the specified rule. |
| NULL | non-NULL | non-NULL | non-NULL | Remove all rename column transformations with the specified <code>table_name</code> and <code>step_number</code> for the specified rule. |
| NULL | NULL | non-NULL | NULL | Remove all rename column transformations with the specified <code>column_name</code> for the specified rule. |
| non-NULL | NULL | non-NULL | NULL | Remove all rename column transformations with the specified <code>table_name</code> and <code>column_name</code> for the specified rule. |
| NULL | non-NULL | NULL | NULL | Remove all rename column transformations with the specified <code>table_name</code> for the specified rule. |
| NULL | non-NULL | non-NULL | NULL | Remove all rename column transformations with the specified <code>table_name</code> , <code>column_name</code> , and <code>step_number</code> for the specified rule. |
| non-NULL | NULL | non-NULL | NULL | Remove all rename column transformations with the specified <code>table_name</code> , <code>column_name</code> , and <code>step_number</code> for the specified rule. |
| non-NULL | non-NULL | non-NULL | NULL | Remove all rename column transformations with the specified <code>table_name</code> , <code>column_name</code> , and <code>step_number</code> for the specified rule. |
| non-NULL | non-NULL | non-NULL | non-NULL | Remove all rename column transformations with the specified <code>table_name</code> , <code>column_name</code> , and <code>step_number</code> for the specified rule. |

221.4.33 RENAME_SCHEMA Procedure

This procedure either adds or removes a declarative rule-based transformation which renames a schema in a row logical change record (LCR) that satisfies the specified rule.

For the transformation to be performed when the specified rule evaluates to `TRUE`, the rule must be in the positive rule set of an XStream client. XStream clients include capture processes, propagations, and apply processes.

Note:

Declarative transformations can transform row LCRs only. Therefore, a DML rule must be specified when you run this procedure. If a DDL rule is specified, then the procedure raises an error.

See Also:

Oracle Database XStream Guide for more information about declarative rule-based transformations

Syntax

```
DBMS_XSTREAM_ADM.RENAME_SCHEMA (
    rule_name          IN  VARCHAR2,
    from_schema_name  IN  VARCHAR2,
    to_schema_name    IN  VARCHAR2,
    step_number       IN  NUMBER    DEFAULT 0,
    operation          IN  VARCHAR2  DEFAULT 'ADD');
```

Parameters

Table 221-30 RENAME_SCHEMA Procedure Parameters

| Parameter | Description |
|------------------|---|
| rule_name | The name of the rule, specified as <code>[schema_name.]rule_name</code> . If <code>NULL</code> , then the procedure raises an error. For example, to specify a rule in the <code>hr</code> schema named <code>employees12</code> , enter <code>hr.employees12</code> . If the schema is not specified, then the current user is the default. |
| from_schema_name | The name of the schema to be renamed in each row LCR that satisfies the rule. |
| to_schema_name | The new name of the schema in each row LCR that satisfies the rule. |
| step_number | The order of execution of the transformation. See Also: <i>Oracle Database XStream Guide</i> for more information about transformation ordering |
| operation | Specify <code>'ADD'</code> to add the transformation to the rule. Specify <code>'REMOVE'</code> to remove the transformation from the rule. |

Usage Notes

When 'REMOVE' is specified for the `operation` parameter, all of the rename schema declarative rule-based transformations for the specified rule are removed that match the specified `from_schema_name`, `to_schema_name`, and `step_number` parameters. Nulls specified for these parameters act as wildcards. The following table lists the behavior of the `RENAME_SCHEMA` procedure when one or more of these parameters is `NULL`:

| <code>from_schema_name</code> | <code>to_schema_name</code> | <code>step_number</code> | Result |
|-------------------------------|-----------------------------|--------------------------|--|
| NULL | NULL | NULL | Remove all rename schema transformations for the specified rule. |
| NULL | NULL | non-NULL | Remove all rename schema transformations with the specified <code>step_number</code> for the specified rule. |
| NULL | non-NULL | non-NULL | Remove all rename schema transformations with the specified <code>to_schema_name</code> and <code>step_number</code> for the specified rule. |
| non-NULL | NULL | non-NULL | Remove all rename schema transformations with the specified <code>from_schema_name</code> and <code>step_number</code> for the specified rule. |
| NULL | non-NULL | NULL | Remove all rename schema transformations with the specified <code>to_schema_name</code> for the specified rule. |
| non-NULL | non-NULL | NULL | Remove all rename schema transformations with the specified <code>from_schema_name</code> and <code>to_schema_name</code> for the specified rule. |
| non-NULL | NULL | NULL | Remove all rename schema transformations with the specified <code>from_schema_name</code> for the specified rule. |
| non-NULL | non-NULL | non-NULL | Remove all rename schema transformations with the specified <code>from_schema_name</code> , <code>to_schema_name</code> , and <code>step_number</code> for the specified rule. |

221.4.34 RENAME_TABLE Procedure

This procedure either adds or removes a declarative rule-based transformation which renames a table in a row logical change record (row LCR) that satisfies the specified rule.

For the transformation to be performed when the specified rule evaluates to `TRUE`, the rule must be in the positive rule set of an XStream client. XStream clients include capture processes, propagations, and apply processes.

Note:

Declarative transformations can transform row LCRs only. Therefore, a DML rule must be specified when you run this procedure. If a DDL rule is specified, then the procedure raises an error.

See Also:

Oracle Database XStream Guide for more information about declarative rule-based transformations

Syntax

```
DBMS_XSTREAM_ADM.RENAME_TABLE(
  rule_name          IN VARCHAR2,
  from_table_name    IN VARCHAR2,
  to_table_name      IN VARCHAR2,
  step_number        IN NUMBER    DEFAULT 0,
  operation           IN VARCHAR2  DEFAULT 'ADD');
```

Parameters

Table 221-31 RENAME_TABLE Procedure Parameters

| Parameter | Description |
|------------------------------|---|
| <code>rule_name</code> | The name of the rule, specified as <code>[schema_name.]rule_name</code> . If <code>NULL</code> , then the procedure raises an error. For example, to specify a rule in the <code>hr</code> schema named <code>employees12</code> , enter <code>hr.employees12</code> . If the schema is not specified, then the current user is the default. |
| <code>from_table_name</code> | The name of the table to be renamed in each row LCR that satisfies the rule, specified as <code>[schema_name.]object_name</code> . For example, <code>hr.employees</code> . If the schema is not specified, then the current user is the default. |
| <code>to_table_name</code> | The new name of the table in each row LCR that satisfies the rule, specified as <code>[schema_name.]object_name</code> . For example, <code>humres.staff</code> . The transformation can rename the table only, the schema only, or the table and the schema. If the schema is not specified, then the current user is the default. |

Table 221-31 (Cont.) RENAME_TABLE Procedure Parameters

| Parameter | Description |
|-------------|---|
| step_number | The order of execution of the transformation. See Also: <i>Oracle Database XStream Guide</i> for more information about transformation ordering |
| operation | Specify 'ADD' to add the transformation to the rule. Specify 'REMOVE' to remove the transformation from the rule. |

Usage Notes

When 'REMOVE' is specified for the `operation` parameter, all of the rename table declarative rule-based transformations for the specified rule are removed that match the specified `from_table_name`, `to_table_name`, and `step_number` parameters. Nulls specified for these parameters act as wildcards. The following table lists the behavior of the `RENAME_TABLE` procedure when one or more of these parameters is `NULL`:

| from_table_name | to_table_name | step_number | Result |
|-----------------|---------------|-------------|--|
| NULL | NULL | NULL | Remove all rename table transformations for the specified rule. |
| NULL | NULL | non-NULL | Remove all rename table transformations with the specified <code>step_number</code> for the specified rule. |
| NULL | non-NULL | non-NULL | Remove all rename table transformations with the specified <code>to_table_name</code> and <code>step_number</code> for the specified rule. |
| non-NULL | NULL | non-NULL | Remove all rename table transformations with the specified <code>from_table_name</code> and <code>step_number</code> for the specified rule. |
| NULL | non-NULL | NULL | Remove all rename table transformations with the specified <code>to_table_name</code> for the specified rule. |
| non-NULL | non-NULL | NULL | Remove all rename table transformations with the specified <code>from_table_name</code> and <code>to_table_name</code> for the specified rule. |
| non-NULL | NULL | NULL | Remove all rename table transformations with the specified <code>from_table_name</code> for the specified rule. |

| from_table_name | to_table_name | step_number | Result |
|-----------------|---------------|-------------|--|
| non-NULL | non-NULL | non-NULL | Remove all rename table transformations with the specified from_table_name, to_table_name, and step_number for the specified rule. |

221.4.35 SET_MESSAGE_TRACKING Procedure

This procedure sets the tracking label for logical change records (LCRs) produced by the current session.

This procedure affects only the current session. Any LCRs produced by the current session are tracked, including captured LCRs and persistent LCRs.

Note:

The tracking label set by this procedure does not track non-LCR messages.

See Also:

KAWGET_MESSAGE_TRACKING

Syntax

```
DBMS_XSTREAM_ADM.SET_MESSAGE_TRACKING(
    tracking_label IN VARCHAR2 DEFAULT 'Streams_tracking',
    actions       IN NUMBER   DEFAULT DBMS_XSTREAM_ADM.ACTION_MEMORY);
```

Parameters

Table 221-32 SET_MESSAGE_TRACKING Procedure Parameters

| Parameter | Description |
|----------------|--|
| tracking_label | The label used to track the LCRs produced by the session. Set this parameter to NULL to stop message tracking in the current session. The size limit for a label is 4,000 bytes. |
| actions | When DBMS_XSTREAM_ADM.ACTION_MEMORY is specified, the LCRs are tracked in memory. Currently, DBMS_XSTREAM_ADM.ACTION_MEMORY is the only valid setting for this parameter. The value specified for this parameter is an enumerated constant. Enumerated constants must be prefixed with the package name. |

221.4.36 SET_PARAMETER Procedure

This procedure sets a parameter for an outbound server, an inbound server, or an outbound server's capture process.

Syntax

```
DBMS_XSTREAM_ADM.SET_PARAMETER (
    streams_name    IN  VARCHAR2,
    streams_type    IN  VARCHAR2,
    parameter       IN  VARCHAR2,
    value           IN  VARCHAR2  DEFAULT NULL,
    no_wait         IN  BOOLEAN   DEFAULT FALSE,
    source_database IN  VARCHAR2  DEFAULT NULL);
```

Parameters

Table 221-33 SET_PARAMETER Procedure Parameters

| Parameter | Description |
|--------------|--|
| streams_type | The type of XStream client: <ul style="list-style-type: none"> Specify <code>capture</code> for a capture process. Specify <code>apply</code> for an outbound server or inbound server. |
| streams_name | The name of the capture process, outbound server, or inbound server. Do not specify an owner. |
| parameter | The name of the parameter you are setting. See " Capture Process Parameters " for information about capture process parameters. See " Apply Component Parameters " for information about outbound server and inbound server parameters. |
| value | The value to which the parameter is set. If <code>NULL</code> , then the parameter is set to its default value. |
| no_wait | If <code>TRUE</code> , then the parameter is set immediately. If <code>FALSE</code> , then the parameter is set after synchronizing with the running capture process, inbound server, or outbound server. When you modify multiple parameters for the same process consecutively, setting this parameter to <code>TRUE</code> speeds up each call. However, if the process is currently running, you must set this parameter to <code>FALSE</code> in the last to the procedure to ensure that the process uses the modified parameter values. If the <code>no_wait</code> parameter is set to <code>TRUE</code> for the last call to the procedure, the running process might not detect the parameter changes. |

Table 221-33 (Cont.) SET_PARAMETER Procedure Parameters

| Parameter | Description |
|-----------------|--|
| source_database | <p>If CURRENT, then the parameter is set only in the container where the procedure is invoked. CURRENT can be specified while connected to the root or to a PDB.</p> <p>If ALL, then the parameter is set in all containers in the CDB and all PDBs created after the procedure is invoked. To specify ALL, the procedure must be invoked in the root.</p> <p>If a container name, then the parameter is set in the specified container. To specify root, use CDB\$ROOT while connected to the root. To specify a PDB, the procedure must be invoked in the root.</p> <p>Note: This parameter only applies to CDBs. Also, a non-null value can be specified only for the following parameters:</p> <ul style="list-style-type: none"> • include_objects capture parameter • excludetag capture or apply parameter • excludetrans capture or apply parameter • excludeuser capture or apply parameter • excludeuserid capture or apply parameter • getreplicates capture or apply parameter • getappls capture or apply parameter |

221.4.37 SET_TAG Procedure

This procedure sets the binary tag for all redo entries subsequently generated by the current session.

Each redo entry generated by DML or DDL statements in the current session will have this tag. This procedure affects only the current session.

Syntax

```
DBMS_XSTREAM_ADM.SET_TAG(
    tag IN RAW DEFAULT NULL);
```

Parameters

Table 221-34 SET_TAG Procedure Parameters

| Parameter | Description |
|-----------|---|
| tag | <p>The binary tag for all subsequent redo entries generated by the current session. A raw value is a sequence of bytes, and a byte is a sequence of bits.</p> <p>By default, the tag for a session is NULL.</p> <p>The size limit for a tag value is 2000 bytes.</p> |

Usage Notes

To set the tag to the hexadecimal value of '17' in the current session, run the following procedure:

```
EXEC DBMS_XSTREAM_ADM.SET_TAG(tag => HEXTORAW('17'));
```

The following are considerations for the `SET_TAG` procedure:

- This procedure is not transactional. That is, the effects of `SET_TAG` cannot be rolled back.
- If the `SET_TAG` procedure is run to set a non-NULL session tag before a data dictionary build has been performed on the database, then the redo entries for a transaction that started before the dictionary build might not include the specified tag value for the session. Therefore, perform a data dictionary build before using the `SET_TAG` procedure in a session. A data dictionary build happens when the `DBMS_CAPTURE_ADM.BUILD` procedure is run. The `BUILD` procedure can be run automatically when a capture process is created.

[BUILD Procedure](#)

221.4.38 SET_UP_QUEUE Procedure

This procedure creates a queue table and a ANYDATA queue.

Syntax

```
DBMS_XSTREAM_ADM.SET_UP_QUEUE (
  queue_table      IN  VARCHAR2  DEFAULT 'streams_queue_table',
  storage_clause  IN  VARCHAR2  DEFAULT NULL,
  queue_name       IN  VARCHAR2  DEFAULT 'streams_queue',
  queue_user       IN  VARCHAR2  DEFAULT NULL,
  comment         IN  VARCHAR2  DEFAULT NULL);
```

Parameters

Table 221-35 SET_UP_QUEUE Procedure Parameters

| Parameter | Description |
|--------------------------|---|
| <code>queue_table</code> | The name of the queue table specified as <code>[schema_name.]queue_table_name</code> . For example, <code>strmadmin.streams_queue_table</code> . If the schema is not specified, then the current user is the default. If the queue table owner is not specified, then the procedure specifies the user who runs this procedure automatically as the queue table owner. Queue table names can be a maximum of 24 bytes. |

Table 221-35 (Cont.) SET_UP_QUEUE Procedure Parameters

| Parameter | Description |
|----------------|---|
| storage_clause | <p>The storage clause for queue table</p> <p>The storage parameter is included in the <code>CREATE TABLE</code> statement when the queue table is created. You can specify any valid table storage clause.</p> <p>If a tablespace is not specified here, then the procedure creates the queue table and all its related objects in the default user tablespace of the user who runs this procedure. If a tablespace is specified here, then the procedure creates the queue table and all its related objects in the tablespace specified in the storage clause.</p> <p>If <code>NULL</code>, then the procedure uses the storage characteristics of the tablespace in which the queue table is created.</p> <p>See Also: <i>Oracle Database SQL Language Reference</i> for more information about storage clauses</p> |
| queue_name | <p>The name of the queue that will function as the <code>ANYDATA</code> queue, specified as <code>[schema_name.]queue_name</code>. For example, <code>strmadmin.streams_queue</code>.</p> <p>If the schema is not specified, then the procedure uses the queue table owner. The owner of the queue table must also be the owner of the queue. The queue owner automatically has privileges to perform all queue operations on the queue.</p> <p>If the schema is not specified for this parameter, and the queue table owner is not specified in <code>queue_table</code>, then the current user is the default.</p> <p>Queue names can be a maximum of 24 bytes.</p> |
| queue_user | <p>The name of the user who requires <code>ENQUEUE</code> and <code>DEQUEUE</code> privileges for the queue. This user also is configured as a secure queue user of the queue. The queue user cannot grant these privileges to other users because they are not granted with the <code>GRANT</code> option.</p> <p>If <code>NULL</code>, then the procedure does not grant any privileges. You can also grant queue privileges to the appropriate users using the <code>DBMS_AQADM</code> package.</p> |
| comment | The comment for the queue |

Usage Notes

Set up includes the following actions:

- If the specified queue table does not exist, then this procedure runs the `CREATE_QUEUE_TABLE` procedure in the `DBMS_AQADM` package to create the queue table with the specified storage clause. If this procedure creates the queue table, then it creates a multiple consumer `ANYDATA` queue that is both a secure queue and a transactional queue.

Also, if the database is Oracle Database 10g release 2 or later, the `sort_list` setting in `CREATE_QUEUE_TABLE` is set to `commit_time`. If the database is a release before Oracle Database 10g release 2, the `sort_list` setting in `CREATE_QUEUE_TABLE` is set to `enq_time`.

- If the specified queue table exists, then the queue uses the properties of the existing queue table.
- If the specified queue name does not exist, then this procedure runs the `CREATE_QUEUE` procedure in the `DBMS_AQADM` package to create the queue.
- This procedure starts the queue.
- If a queue user is specified, then this procedure configures this user as a secure queue user of the queue and grants `ENQUEUE` and `DEQUEUE` privileges on the queue to the specified queue user.

To configure the queue user as a secure queue user, this procedure creates an Advanced Queuing agent with the same name as the user name, if one does not exist. If an agent with this name exists and is associated with the queue user only, then it is used. `SET_UP_QUEUE` then runs the `ENABLE_DB_ACCESS` procedure in the `DBMS_AQADM` package, specifying the agent and the user.

Note:

If the agent that `SET_UP_QUEUE` tries to create exists and is associated with a user other than the user specified by `queue_user`, then the procedure raises an error. In this case, rename or remove the existing agent, and retry `SET_UP_QUEUE`.

221.4.39 SPLIT_STREAMS Procedure

This procedure splits one stream flowing from a capture process off from all of the other streams flowing from the capture process.

This procedure is intended for an Oracle Replication environment in which a capture process captures changes that are propagated to two or more destination databases. When one destination of a propagation stops accepting the captured changes, the changes remain in the capture process's queue. The queue can grow and begin to spill LCRs to the hard disk, degrading the performance of the Oracle Replication environment. A destination might stop accepting changes for several reasons. For example, the destination database might be down.

Specifically, this procedure performs the following actions:

1. Creates a new queue at the database running the capture process. The new queue is called the cloned queue because it is a clone of the queue used by the original stream. The new queue will be used by the new, cloned capture process, and it will be the source queue for the new, cloned propagation.
2. Creates a new propagation that propagates LCRs from the source queue created in Step 1 to the existing destination queue. The new propagation is called the cloned propagation because it is a clone of the propagation used by the original stream. The cloned propagation uses the same rule set as the original propagation.
3. Stops the capture process.
4. Queries the acknowledge SCN for the original propagation. The acknowledged SCN is the last SCN acknowledged by the apply process that applies the changes sent by the propagation.

5. Creates a new capture process. The new capture process is called the cloned capture process because it is a clone of the capture process used by the original stream. The procedure sets the start SCN for the cloned capture process to the value of the queried acknowledged SCN. The cloned capture process uses the same rule set as the original capture process.
6. Drops the original propagation.
7. Starts the original capture process with the start SCN set to the acknowledged SCN queried in Step 4.
8. If the `auto_merge_threshold` parameter is set to a positive number, then creates an Oracle Scheduler job to run the `MERGE_STREAMS_JOB` procedure at set intervals according to its schedule. When the two streams are within the specified merge threshold, the `MERGE_STREAMS_JOB` procedure runs the `MERGE_STREAMS` procedure to merge the streams automatically.

After the `SPLIT_STREAMS` procedure has finished running, the cloned capture process is disabled. When the problem at the destination database is solved, and the destination queue can accept changes, you should start the cloned capture process using the `START_CAPTURE` procedure in the `DBMS_CAPTURE_ADM` package.

Note:

If the original capture process is a downstream capture process, then you must configure the cloned capture process to read the redo log from the source database before you start the cloned capture process.

See Also:

- ["MERGE_STREAMS Procedure"](#)
- ["MERGE_STREAMS_JOB Procedure"](#)

Syntax

```
DBMS_XSTREAM_ADM.SPLIT_STREAMS (
  propagation_name          IN          VARCHAR2,
  cloned_propagation_name   IN          VARCHAR2 DEFAULT NULL,
  cloned_queue_name        IN          VARCHAR2 DEFAULT NULL,
  cloned_capture_name      IN          VARCHAR2 DEFAULT NULL,
  perform_actions          IN          BOOLEAN  DEFAULT TRUE,
  script_name              IN          VARCHAR2 DEFAULT NULL,
  script_directory_object  IN          VARCHAR2 DEFAULT NULL,
  auto_merge_threshold     IN          NUMBER  DEFAULT NULL,
  schedule_name            IN OUT     VARCHAR2,
  merge_job_name           IN OUT     VARCHAR2);
```

Parameters

Table 221-36 SPLIT_STREAMS Procedure Parameters

| Parameter | Description |
|--------------------------------------|---|
| <code>propagation_name</code> | The name of the propagation that cannot send LCRs to its destination queue. The specified propagation is the propagation for the stream that is being split off from the other streams. You must specify an existing propagation name. Do not specify an owner. |
| <code>cloned_propagation_name</code> | The name of the new propagation created by this procedure for the stream that is split off. If <code>NULL</code> , then the system generates a propagation name. |
| <code>cloned_queue_name</code> | The name of the new queue created by this procedure for the stream that is split off. If <code>NULL</code> , then the system generates a queue name. |
| <code>cloned_capture_name</code> | The name of the new capture process created by this procedure for the stream that is split off. If <code>NULL</code> , then the system generates a capture process name. |
| <code>perform_actions</code> | <p>If <code>TRUE</code>, then the procedure performs the necessary actions to split the stream directly.</p> <p>If <code>FALSE</code>, then the procedure does not perform the necessary actions to split the stream directly.</p> <p>Specify <code>FALSE</code> when this procedure is generating a script that you can edit and then run. The procedure raises an error if you specify <code>FALSE</code> and either of the following parameters is <code>NULL</code>:</p> <ul style="list-style-type: none"> <code>script_name</code> <code>script_directory_object</code> |
| <code>script_name</code> | <p>If non-<code>NULL</code> and the <code>perform_actions</code> parameter is <code>FALSE</code>, then specify the name of the script generated by this procedure. The script contains all of the statements used to split the stream. If a file with the specified script name exists in the specified directory for the <code>script_directory_object</code> parameter, then the procedure appends the statements to the existing file.</p> <p>If non-<code>NULL</code> and the <code>perform_actions</code> parameter is <code>TRUE</code>, then the procedure generates the specified script and performs the actions to split the stream directly.</p> <p>If <code>NULL</code> and the <code>perform_actions</code> parameter is <code>TRUE</code>, then the procedure performs the actions to split the stream directly and does not generate a script.</p> <p>If <code>NULL</code> and the <code>perform_actions</code> parameter is <code>FALSE</code>, then the procedure raises an error.</p> |

Table 221-36 (Cont.) SPLIT_STREAMS Procedure Parameters

| Parameter | Description |
|--------------------------------------|---|
| <code>script_directory_object</code> | <p>The directory object for the directory on the local computer system into which the generated script is placed.</p> <p>If the <code>script_name</code> parameter is <code>NULL</code>, then the procedure ignores this parameter and does not generate a script.</p> <p>If <code>NULL</code> and the <code>script_name</code> parameter is non-<code>NULL</code>, then the procedure raises an error.</p> <p>Note: The specified directory object cannot point to an Oracle Automatic Storage Management (ASM) disk group.</p> |
| <code>auto_merge_threshold</code> | <p>If a positive number is specified, then the stream that was split off is automatically merged back into all of the other streams flowing from the capture process by an Oracle Scheduler job. The job runs the <code>MERGE_STREAMS_JOB</code> procedure at set intervals according to its schedule. The value of the <code>CAPTURE_MESSAGE_CREATE_TIME</code> column for each capture process in the <code>GV\$XSTREAM_CAPTURE</code> dynamic performance view determines when the streams are merged. Specifically, if the difference, in seconds, between <code>CAPTURE_MESSAGE_CREATE_TIME</code> of the cloned capture process and the original capture process is less than or equal to the value specified for the <code>auto_merge_threshold</code> parameter, then the two streams are merged automatically. The cloned capture process must be started before the split stream can be merged back with the original stream.</p> <p>If <code>NULL</code> or 0 (zero) is specified, then the split stream is not merged back with the original stream automatically. To merge the split stream with the original stream, run the <code>MERGE_STREAM</code> procedure manually when the <code>CAPTURE_MESSAGE_CREATE_TIME</code> of the cloned capture process catches up to, or nearly catches up to, the <code>CAPTURE_MESSAGE_CREATE_TIME</code> of the original capture process.</p> <p>The <code>CAPTURE_MESSAGE_CREATE_TIME</code> records the time when a captured change was recorded in the redo log.</p> |
| <code>schedule_name</code> | <p>The Oracle Scheduler schedule name, specified as <code>[schema_name.]schedule_name</code>. For example, <code>strmadmin.merge_schedule</code>. If the schema is not specified, then the current user is the default.</p> <p>If <code>auto_merge_threshold</code> is a non-<code>NULL</code> positive number, then the schedule is used by the job that will automatically merge the streams at the appropriate time. You can specify a schedule name to adhere to naming conventions or to track the schedule more easily.</p> <p>If <code>NULL</code> and <code>auto_merge_threshold</code> is a non-<code>NULL</code> positive number, then the system generates a schedule name.</p> <p>If <code>auto_merge_threshold</code> is <code>NULL</code> or 0 (zero), then this parameter must be <code>NULL</code>.</p> <p>If this procedure creates a schedule, the schedule starts when the procedure completes. You can modify the schedule to control how often the merge job is run.</p> <p>If an existing schedule name is specified, an error is raised.</p> |

Table 221-36 (Cont.) SPLIT_STREAMS Procedure Parameters

| Parameter | Description |
|----------------|--|
| merge_job_name | <p>The Oracle Scheduler job name, specified as <code>[schema_name.]merge_job_name</code>. For example, <code>strmadmin.merge_job</code>. If the schema is not specified, then the current user is the default.</p> <p>If <code>auto_merge_threshold</code> is a non-NULL positive number, then the job will automatically merge the streams at the appropriate time. Specify a merge job name to adhere to naming conventions or to track the job more easily.</p> <p>If NULL and <code>auto_merge_threshold</code> is a non-NULL positive number, then the system generates a job name.</p> <p>If <code>auto_merge_threshold</code> is NULL or 0 (zero), then this parameter must be NULL.</p> <p>If an existing job name is specified, an error is raised.</p> |

Oracle Database Administrator's Guide for information about Oracle Scheduler

221.4.40 START_OUTBOUND Procedure

This procedure starts an XStream outbound server. The outbound server streams out the LCRs to an XStream client application.

Syntax

```
DBMS_XSTREAM_ADM.START_OUTBOUND(
    server_name      IN VARCHAR2);
```

Parameters

Table 221-37 START_OUTBOUND Procedure Parameters

| Parameter | Description |
|-------------|--|
| server_name | The name of the outbound server being started. A NULL specification is not allowed. Do not specify an owner. |

221.4.41 STOP_OUTBOUND Procedure

This procedure stops an XStream outbound server. The outbound server streams out the LCRs to an XStream client application.

Syntax

```
DBMS_XSTREAM_ADM.STOP_OUTBOUND(  
    server_name IN VARCHAR2,  
    force       IN BOOLEAN DEFAULT FALSE);
```

Parameters

Table 221-38 STOP_OUTBOUND Procedure Parameters

| Parameter | Description |
|-------------|--|
| server_name | The name of the outbound server being stopped. A NULL specification is not allowed. Do not specify an owner. |
| force | If TRUE, then the procedure stops the outbound server and its capture process as soon as possible. If FALSE, then the procedure stops the outbound server after ensuring that there are no gaps in the set of applied transactions. The behavior of the apply component depends on the setting specified for the force parameter and the setting specified for the commit_serialization apply component parameter. |

DBMS_XSTREAM_AUTH

The `DBMS_XSTREAM_AUTH` package provides subprograms for granting privileges to and revoking privileges from XStream administrators.

This chapter contains the following topic:

- [Overview](#)
- [Security Model](#)
- [Summary of DBMS_XSTREAM_AUTH Subprograms](#)

See Also:

[GRANT_ADMIN_PRIVILEGE Procedure](#)

222.1 DBMS_XSTREAM_AUTH Overview

This package provides subprograms for granting privileges to XStream administrators and revoking privileges from XStream administrators.

222.2 DBMS_XSTREAM_AUTH Security Model

Security on this package can be controlled by either granting `EXECUTE` on this package to selected users or roles, or by granting `EXECUTE_CATALOG_ROLE` to selected users or roles.

The user executing the subprograms in the `DBMS_XSTREAM_AUTH` package must have `SYSDBA` administrative privilege, and the user must exercise the privilege using `AS SYSDBA` at connect time.

If subprograms in the package are run from within a stored procedure, then the user who runs the subprograms must be granted `EXECUTE` privilege on the package directly. It cannot be granted through a role.

To ensure that the user who runs the subprograms in this package has the necessary privileges, connect as an administrative user who can create users, grant privileges, and create tablespaces when using this package.

222.3 Summary of DBMS_XSTREAM_AUTH Subprograms

This table lists the `DBMS_XSTREAM_AUTH` subprograms and briefly describes them.

Table 222-1 DBMS_XSTREAM_AUTH Package Subprograms

| Subprogram | Description |
|--|---|
| GRANT_ADMIN_PRIVILEGE Procedure | Either grants the privileges needed by a user to be an XStream administrator directly, or generates a script that grants these privileges |
| GRANT_REMOTE_ADMIN_ACCESS Procedure | Enables a remote XStream administrator to perform administrative actions at the local database by connecting to the grantee using a database link |
| REVOKE_ADMIN_PRIVILEGE Procedure | Either revokes XStream administrator privileges from a user directly, or generates a script that revokes these privileges |
| REVOKE_REMOTE_ADMIN_ACCESS Procedure | Disables a remote XStream administrator from performing administrative actions by connecting to the grantee using a database link |

 **Note:**

All subprograms commit unless specified otherwise.

222.3.1 GRANT_ADMIN_PRIVILEGE Procedure

This procedure either grants the privileges needed by a user to be an XStream administrator directly, or generates a script that grants these privileges.

 **See Also:**

["GRANT_ADMIN_PRIVILEGE Procedure"](#)

Syntax

```
DBMS_XSTREAM_AUTH.GRANT_ADMIN_PRIVILEGE (
  grantee           IN  VARCHAR2,
  privilege_type    IN  VARCHAR2  DEFAULT '*',
  grant_select_privileges IN  BOOLEAN  DEFAULT FALSE,
  do_grants         IN  BOOLEAN  DEFAULT TRUE,
  file_name         IN  VARCHAR2  DEFAULT NULL,
  directory_name    IN  VARCHAR2  DEFAULT NULL,
  grant_optional_privileges IN  VARCHAR2  DEFAULT NULL,
  container         IN  VARCHAR2  DEFAULT 'CURRENT');
```

Parameters

Table 222-2 GRANT_ADMIN_PRIVILEGE Procedure Parameters

| Parameter | Description |
|-------------------------|--|
| grantee | The user to whom privileges are granted |
| privilege_type | Specify one of the following values: <ul style="list-style-type: none"> • CAPTURE Specifying CAPTURE grants the minimum privileges required by the user to administer capture processes. • APPLY Specifying APPLY grants the minimum privileges required by the user to administer outbound servers, inbound servers, and apply processes. • * Specifying * grants the minimum privileges required by the user to administer capture processes, outbound servers, inbound servers, and apply processes. |
| grant_select_privileges | If TRUE, then the procedure grants a set of privileges, including SELECT_CATALOG_ROLE, to the user. If FALSE, then the procedure does not grant the set of privileges to the user. SELECT_CATALOG_ROLE enables the user to select from the data dictionary. Set this parameter to TRUE for the XStream trusted user model. Set this parameter to FALSE for the XStream untrusted user model. |
| do_grants | If TRUE, then the procedure grants the privileges to the specified grantee directly, and adds the grantee to the DBA_XSTREAM_ADMINISTRATOR data dictionary view with YES for both the LOCAL_PRIVILEGES column and the ACCESS_FROM_REMOTE column. If the user already has an entry in this data dictionary view, then the procedure does not make another entry, and no error is raised. If TRUE and any of the grant statements fails, then the procedure raises an error. If FALSE, then the procedure does not grant the privileges to the specified grantee directly, and does not add the grantee to the DBA_XSTREAM_ADMINISTRATOR data dictionary view. You specify FALSE when the procedure is generating a file that you will run later. If you specify FALSE and either the file_name or directory_name parameter is NULL, then the procedure raises an error. |
| file_name | The name of the file generated by the procedure. The file contains all of the statements that grant the privileges. If a file with the specified file name exists in the specified directory name, then the grant statements are appended to the existing file. If NULL, then the procedure does not generate a file. |

Table 222-2 (Cont.) GRANT_ADMIN_PRIVILEGE Procedure Parameters

| Parameter | Description |
|---------------------------|--|
| directory_name | <p>The directory into which the generated file is placed. The specified directory must be a directory object created using the SQL statement <code>CREATE DIRECTORY</code>. If you specify a directory, then the user who invokes the procedure must have the <code>WRITE</code> privilege on the directory object.</p> <p>If the <code>file_name</code> parameter is <code>NULL</code>, then this parameter is ignored, and the procedure does not generate a file.</p> <p>If <code>NULL</code> and the <code>file_name</code> parameter is non-<code>NULL</code>, then the procedure raises an error.</p> |
| grant_optional_privileges | <p>A comma-separated list of optional privileges to grant to the grantee, such as the <code>DV_XSTREAM_ADMIN</code> and <code>DV_GOLDENGATE_ADMIN</code> privileges</p> |
| container | <p>If <code>CURRENT</code>, then grants privileges to the grantee only in the container where the procedure is invoked. <code>CURRENT</code> can be specified while connected to the root or to a PDB.</p> <p>If <code>ALL</code>, then grants privileges to the grantee in all containers in the CDB and all PDBs created after the procedure is invoked. To specify <code>ALL</code>, the procedure must be invoked in the root.</p> <p>If a container name, then grants privileges to the grantee only in the specified container. To specify root, use <code>CDB\$ROOT</code> while connected to the root. To specify a PDB, the procedure must be invoked in the root.</p> <p>Note: This parameter only applies to CDBs.</p> |

Usage Notes

The user who runs the procedure must be an administrative user who can grant privileges to other users.

Specifically, the procedure grants the following privileges to the specified user:

- The `RESTRICTED SESSION` system privilege
- `EXECUTE` on the following packages:
 - `DBMS_APPLY_ADM`
 - `DBMS_AQ`
 - `DBMS_AQADM`
 - `DBMS_AQIN`
 - `DBMS_AQELM`
 - `DBMS_CAPTURE_ADM`
 - `DBMS_FLASHBACK`
 - `DBMS_LOCK`
 - `DBMS_PROPAGATION_ADM`
 - `DBMS_RULE_ADM`
 - `DBMS_TRANSFORM`
 - `DBMS_XSTREAM_ADM`

- Privileges to enqueue messages into and dequeue messages from any queue
- Privileges to manage any queue
- Privileges to create, alter, and execute any of the following types of objects in the user's own schema and in other schemas:
 - Evaluation contexts
 - Rule sets
 - Rules

In addition, the grantee can grant these privileges to other users.

- SELECT_CATALOG_ROLE
- SELECT or READ privilege on data dictionary views related to XStream and Oracle Replication
- The ability to allow a remote XStream administrator to perform administrative actions through a database link by connecting to the grantee

This ability is enabled by running the GRANT_REMOTE_ADMIN_ACCESS procedure in this package.

 **Note:**

- To view all of the statements run by the procedure in detail, you can use the procedure to generate a script and then view the script in a text editor.
- This procedure grants only the privileges necessary to configure and administer an XStream environment. You can grant additional privileges to the grantee if necessary.

 **See Also:**

- ["GRANT_REMOTE_ADMIN_ACCESS Procedure"](#)
- *Oracle Database SQL Language Reference* for information about the CREATE DIRECTORY SQL statement

222.3.2 GRANT_REMOTE_ADMIN_ACCESS Procedure

This procedure enables a remote XStream administrator to perform administrative actions at the local database by connecting to the grantee using a database link.

Syntax

```
DBMS_XSTREAM_AUTH.GRANT_REMOTE_ADMIN_ACCESS(  
    grantee IN VARCHAR2);
```

Parameters

Table 222-3 GRANT_REMOTE_ADMIN_ACCESS Procedure Parameter

| Parameter | Description |
|-----------|--|
| grantee | The user who allows remote access. The procedure adds the grantee to the DBA_XSTREAM_ADMINISTRATOR data dictionary view with YES for the ACCESS_FROM_REMOTE column. If the user already has an entry in this data dictionary view, then the procedure does not make another entry. Instead, it updates the ACCESS_FROM_REMOTE column to YES. |

Usage Notes

Typically, you run the procedure and specify a grantee at a local source database if a downstream capture process captures changes originating at the local source database. The XStream administrator at a downstream capture database administers the source database using this connection.

**Note:**

The GRANT_ADMIN_PRIVILEGE procedure in this package runs this procedure.

**See Also:**

"GRANT_ADMIN_PRIVILEGE Procedure"

222.3.3 REVOKE_ADMIN_PRIVILEGE Procedure

This procedure either revokes XStream administrator privileges from a user directly, or generates a script that revokes these privileges.

Syntax

```
DBMS_XSTREAM_AUTH.REVOKE_ADMIN_PRIVILEGE (
  grantee                IN  VARCHAR2,
  privilege_type         IN  VARCHAR2  DEFAULT '*',
  revoke_select_privileges IN  BOOLEAN  DEFAULT FALSE,
  do_revokes             IN  BOOLEAN  DEFAULT TRUE,
  file_name              IN  VARCHAR2  DEFAULT NULL,
  directory_name         IN  VARCHAR2  DEFAULT NULL,
  revoke_optional_privileges IN  VARCHAR2  DEFAULT NULL,
  container              IN  VARCHAR2  DEFAULT 'CURRENT');
```

Parameters

Table 222-4 *REVOKE_ADMIN_PRIVILEGE Procedure Parameters*

| Parameter | Description |
|--------------------------|---|
| grantee | The user from whom privileges are revoked |
| privilege_type | Specify one of the following values: <ul style="list-style-type: none"> CAPTURE Specifying CAPTURE revokes the minimum privileges required by the user to administer capture processes. APPLY Specifying APPLY revokes the minimum privileges required by the user to administer outbound servers, inbound servers, and apply processes. * Specifying * revokes the minimum privileges required by the user to administer capture processes, outbound servers, inbound servers, and apply processes. |
| revoke_select_privileges | If TRUE, then the procedure revokes a set of privileges, including SELECT_CATALOG_ROLE, to the user. If FALSE, then the procedure does not revoke the set of privileges to the user. SELECT_CATALOG_ROLE enables the user to select from the data dictionary. |
| do_revokes | If TRUE, then the procedure revokes the privileges from the specified user directly, and removes the user from the DBA_XSTREAM_ADMINISTRATOR data dictionary view. If the user does not have a record in this data dictionary view, then the procedure does not remove a record from the view, and no error is raised. If TRUE and any of the revoke statements fails, then the procedure raises an error. A revoke statement fails if the user is not granted the privilege that is being revoked. If FALSE, then the procedure does not revoke the privileges from the specified user directly, and does not remove the user from the DBA_XSTREAM_ADMINISTRATOR data dictionary view. You specify FALSE when the procedure is generating a file that you will run later. If you specify FALSE and either the file_name or directory_name parameter is NULL, then the procedure does not raise an error. |
| file_name | The name of the file generated by this procedure. The file contains all of the statements that revoke the privileges. If a file with the specified file name exists in the specified directory name, then the revoke statements are appended to the existing file. If NULL, then the procedure does not generate a file. |
| directory_name | The directory into which the generated file is placed. The specified directory must be a directory object created using the SQL statement CREATE DIRECTORY. If you specify a directory, then the user who invokes the procedure must have the WRITE privilege on the directory object. If the file_name parameter is NULL, then this parameter is ignored, and the procedure does not generate a file. If NULL and the file_name parameter is non-NULL, then the procedure raises an error. |

Table 222-4 (Cont.) REVOKE_ADMIN_PRIVILEGE Procedure Parameters

| Parameter | Description |
|----------------------------|--|
| revoke_optional_privileges | A comma-separated list of optional privileges to revoke from the grantee, such as the DV_XSTREAM_ADMIN and DV_GOLDENGATE_ADMIN privileges |
| container | <p>If CURRENT, then revokes privileges from the grantee only in the container where the procedure is invoked. CURRENT can be specified while connected to the root or to a PDB.</p> <p>If ALL, then revokes privileges from the grantee in all containers in the CDB. To specify ALL, the procedure must be invoked in the root.</p> <p>If a container name, then revokes privileges from the grantee only in the specified container. To specify root, use CDB\$ROOT while connected to the root. To specify a PDB, the procedure must be invoked in the root.</p> <p>Note: This parameter only applies to CDBs.</p> |

Usage Notes

The user who runs this procedure must be an administrative user who can revoke privileges from other users. Specifically, this procedure revokes the privileges granted by running the GRANT_ADMIN_PRIVILEGE procedure in this package.

Note:

To view all of the statements run by this procedure in detail, you can use the procedure to generate a script and then view the script in a text editor.

See Also:

- "[GRANT_ADMIN_PRIVILEGE Procedure](#)"
- *Oracle Database SQL Language Reference* for information about the CREATE DIRECTORY SQL statement

222.3.4 REVOKE_REMOTE_ADMIN_ACCESS Procedure

This procedure disables a remote XStream administrator from performing administrative actions by connecting to the grantee using a database link.

Note:

The REVOKE_ADMIN_PRIVILEGE procedure in this package runs this procedure.

**See Also:**

"REVOKE_ADMIN_PRIVILEGE Procedure"

Syntax

```
DBMS_XSTREAM_AUTH.REVOKE_REMOTE_ADMIN_ACCESS (  
    grantee IN VARCHAR2);
```

Parameters**Table 222-5 REVOKE_REMOTE_ADMIN_ACCESS Procedure Parameter**

| Parameter | Description |
|-----------|---|
| grantee | <p>The user for whom access from a remote XStream administrator is disabled.</p> <p>If a row for the grantee exists in the <code>DBA_XSTREAM_ADMINISTRATOR</code> data dictionary view, then the procedure updates the <code>ACCESS_FROM_REMOTE</code> column for the grantee to <code>NO</code>. If, after this update, both the <code>LOCAL_PRIVILEGES</code> column and the <code>ACCESS_FROM_REMOTE</code> column are <code>NO</code> for the grantee, then the procedure removes the grantee from the view.</p> <p>If no row for the grantee exists in the <code>DBA_XSTREAM_ADMINISTRATOR</code> data dictionary view, then the procedure does not update the view and does not raise an error.</p> |

DEBUG_EXTPROC

The `DEBUG_EXTPROC` package enables you to start up the extproc agent within a session. This utility package can help you debug external procedures.

This chapter contains the following topics:

- [Security Model](#)
- [Operational Notes](#)
- [Rules and Limits](#)
- [Summary of `DEBUG_EXTPROC` Subprograms](#)

223.1 `DEBUG_EXTPROC` Security Model

Your Oracle account must have `EXECUTE` privileges on the package and `CREATE LIBRARY` privileges.

223.2 `DEBUG_EXTPROC` Operational Notes

These operational notes apply to `DEBUG_EXTPROC`.

To install the package, run the script `DBGEXTP.SQL`.

- Install/load this package in the Oracle USER where you want to debug the 'extproc' process.
- Ensure that you have execute privileges on package `DEBUG_EXTPROC`

```
SELECT SUBSTR(OBJECT_NAME, 1, 20)
FROM USER_OBJECTS
WHERE OBJECT_NAME = 'DEBUG_EXTPROC';
```
- You can install this package as any other user, as long as you have `EXECUTE` privileges on the package.

 **Note:**

These notes assumes that you built your shared library with debug symbols to aid in the debugging process. Please check the C compiler manual pages for the appropriate C compiler switches to build the shared library with debug symbols.

Having installed the package, proceed accordingly:

- Start a new Oracle session through SQL*Plus or OCI program by connecting to `ORACLE`.

- Execute procedure `DEBUG_EXTPROC.STARTUP_EXTPROC_AGENT` to startup the extproc agent in this session; for example, execute `DEBUG_EXTPROC.STARTUP_EXTPROC_AGENT`; Do not exit this session, because that terminates the extproc agent.
- Determine the PID of the extproc agent that was started up for this session.
- Using a debugger (for example, gdb, dbx, or the native system debugger), load the extproc executable and attach to the running process.
- Set a breakpoint on function 'pextproc' and let the debugger continue with its execution.
- Now execute your external procedure in the same session where you first executed `DEBUG_EXTPROC.STARTUP_EXTPROC_AGENT`
- Your debugger should now break in function 'pextproc'. At this point in time, the shared library referenced by your PL/SQL external function would have been loaded and the function resolved. Now set a breakpoint in your C function and let the debugger continue its execution.

Because PL/SQL loads the shared library at runtime, the debugger you use may or may not automatically be able to track the new symbols from the shared library. You may have to issue some debugger command to load the symbols (for example, 'share' in gdb)

- The debugger should now break in your C function. Its assumed that you had built the shared library with debugging symbols.
- Now proceed with your debugging.

223.3 Rules and Limits

`DEBUG_EXTPROC` works only on platforms with debuggers that can attach to a running process.

223.4 Summary of `DEBUG_EXTPROC` Subprograms

The `STARTUP_EXTPROC_AGENT` procedure is the only `DEBUG_EXTPROC` subprogram.

Table 223-1 `DEBUG_EXTPROC` Package Subprograms

| Subprogram | Description |
|---|--|
| STARTUP_EXTPROC_AGENT Procedure | Starts up the extproc agent process in the session |

223.4.1 `STARTUP_EXTPROC_AGENT` Procedure

This procedure starts up the extproc agent process in the session. This enables you to get the PID of the executing process. This PID is needed to be able to attach to the running process using a debugger.

Syntax

```
DEBUG_EXTPROC.STARTUP_EXTPROC_AGENT;
```

224

HTF

The `HTF` (hypertext functions) and `HTP` (hypertext procedures) packages generate HTML tags. For example, the `HTF.ANCHOR` function generates the HTML anchor tag, `<A>`.

See Also:

For more information about implementation of this package:

- *Oracle Fusion Middleware Administrator's Guide for Oracle HTTP Server*
- *Oracle Fusion Middleware User's Guide for mod_plsql*

This chapter contains the following topics:

- [Deprecated Subprograms](#)
- [Operational Notes](#)
- [Rules and Limits](#)
- [Examples](#)
- [Summary of Tags](#)
- [Summary of HTF Subprograms](#)

224.1 HTF Deprecated Subprograms

The `ESCAPE_URL` function is deprecated with Oracle Database 10g.

Note:

Oracle recommends that you do not use deprecated procedures in new applications. Support for deprecated features is for backward compatibility only.

Related Topics

- [ESCAPE_URL Function](#)
This deprecated function replaces characters that have special meaning in HTML and HTTP with their escape sequences.

224.2 HTF Operational Notes

These operational notes apply to the HTF package.

For every HTF function that generates one or more HTML tags, there is a corresponding HTP procedure with identical parameters with the following exception:

- The [PRINTS Procedure](#) and the [PS Procedure](#) do not have HTF function equivalents. Use the [ESCAPE_SC Function](#) or the [ESCAPE_URL Function](#) if you need a string conversion function. Note that while there is a [ESCAPE_SC Procedure](#) that performs the same operation as the [PRINTS Procedure](#) and the [PS Procedure](#), there is no procedural equivalent for the [ESCAPE_URL Function](#).
- The [FORMAT_CELL Function](#) does not have an HTP equivalent. The function formats column values inside an HTML table using [TABLEDATA Function](#) which does have an HTP equivalent in the [TABLEDATA Procedure](#). The advantage of this using the [FORMAT_CELL Function](#) is that it allows for better control over the HTML tables.

The function versions do not directly generate output in your Web page. Instead, they pass their output as return values to the statements that invoked them. Use these functions when you need to nest calls. To print the output of HTF functions, call the functions from within the HTF.PRINT function. It then prints its parameters to the generated Web page.

224.3 Rules and Limits

If you use values of the LONG datatype in functions such as HTF.PRINT, HTF.PRN, HTF.PA or OWA_UTIL.CELLSPRINT, only the first 32 K of the LONG data is used. The LONG data is bound to a VARCHAR2 datatype in the function.

224.4 HTF Examples

The commands in this example generate a simple HTML document.

```
CREATE OR REPLACE PROCEDURE hello AS
BEGIN
  HTP.P (HTF.HTMLOPEN); -- generates <HTML>
  HTP.P (HTF.HEADOPEN); -- generates <HEAD>
  HTP.P (HTF.TITLE('Hello')); -- generates <TITLE>Hello</TITLE>
  HTP.P (HTF.HEADCLOSE); -- generates </HEAD>
  HTP.P (HTF.BODYOPEN); -- generates <BODY>
  HTP.P (HTF.HEADER(1, 'Hello')); -- generates <H1>Hello</H1>
  HTP.P (HTF.BODYCLOSE); -- generates </BODY>
  HTP.P (HTF.HTMLCLOSE); -- generates </HTML>
END;
```

224.5 Summary of Tags

This list summarizes the HTML tags generated by the HTF package.

HTML, HEAD, and BODY Tags

[HTMLOPEN Function](#), [HTMLCLOSE Function](#) - generate <HTML> and </HTML>

[HEADOPEN Function](#), [HEADCLOSE Function](#) - generate <HEAD> and </HEAD>

[BODYOPEN Function](#), [BODYCLOSE Function](#) - generate <BODY> and </BODY>

Comment Tag

[COMMENT Function](#) - generates <!-- and -->

[http://www.w3.org.BASE Function](#) - generates <BASE>

[LINKREL Function](#) - generates <LINK> with the REL attribute

[LINKREV Function](#) - generates <LINK> with the REV attribute

[TITLE Function](#) - generates <TITLE>

[META Function](#) - generates <META>

[SCRIPT Function](#) - generates <SCRIPT>

[STYLE Function](#) - generates <STYLE>

[ISINDEX Function](#) - generates <ISINDEX>

Applet Tags

[APPLETOPEN Function](#), [APPLETCLOSE Function](#) - generate <APPLET> and </APPLET>

[PARAM Function](#) - generates <PARAM>

List Tags

[OLISTOPEN Function](#), [OLISTCLOSE Function](#) - generate and

[ULISTOPEN Function](#), [ULISTCLOSE Function](#) - generate and

[DLISTOPEN Function](#), [DLISTCLOSE Function](#) - generate <DL> and </DL>

[DLISTTERM Function](#) - generates <DT>

[DLISTDEF Function](#) - generates <DD>

[DIRLISTOPEN Function](#), [DIRLISTCLOSE Function](#) - generate <DIR> and </DIR>

[LISTHEADER Function](#) - generates <LH>

[LISTINGOPEN Function](#), [LISTINGCLOSE Function](#) - generate <LISTING> and </LISTING>

[MENULISTOPEN Function](#) - generate <MENU> and </MENU>

[LISTITEM Function](#) - generates

Form Tags

[FORMOPEN Function](#), [FORMCLOSE Function](#) - generate <FORM> and </FORM>

[FORMCHECKBOX Function](#) - generates <INPUT TYPE="CHECKBOX">

[FORMHIDDEN Function](#) - generates <INPUT TYPE="HIDDEN">

[FORMIMAGE Function](#) - generates <INPUT TYPE="IMAGE">

FORMPASSWORD Function - generates `<INPUT TYPE="PASSWORD">`

FORMRADIO Function - generates `<INPUT TYPE="RADIO">`

FORMSELECTOPEN Function, FORMSELECTCLOSE Function - generate `<SELECT>`
and `</SELECT>`

FORMSELETOPTION Function - generates `<OPTION>`

FORMTEXT Function - generates `<INPUT TYPE="TEXT">`

FORMTEXTAREA Function - generate `<TEXTAREA>`

FORMTEXTAREAOPEN Function, FORMTEXTAREACLOSE Function - generate
`<TEXTAREA>` and `</TEXTAREA>`

FORMRESET Function - generates `<INPUT TYPE="RESET">`

FORMSUBMIT Function - generates `<INPUT TYPE="SUBMIT">`

Table Tags

TABLEOPEN Function, TABLECLOSE Function - generate `<TABLE>` and `</TABLE>`

TABLECAPTION Function - generates `<CAPTION>`

TABLEROWOPEN Function, TABLEROWCLOSE Function - generate `<TR>` and `</TR>`

TABLEHEADER Function - generates `<TH>`

TABLEDATA Function - generates `<TD>`

IMG, HR, and A Tags

HR Function, LINE Function - generate `<HR>`

IMG Function, IMG2 Function - generate ``

ANCHOR Function, ANCHOR2 Function - generate `<A>`

MAOPEN Function, MAPCLOSE Function - generate `<MAP>` and `</MAP>`

Paragraph Formatting Tags

HEADER Function - generates heading tags (`<H1>` to `<H6>`)

PARA Function, PARAGRAPH Function - generate `<P>`

PRN Functions, PRINT Functions - generate any text that is passed in

PRN Functions, S Function - generate any text that is passed in; special characters in
HTML are escaped

PREOPEN Function, PRECLOSE Function - generate `<PRE>` and `</PRE>`

BLOCKQUOTEOPEN Function, BLOCKQUOTECLOSE Function - generate
`<BLOCKQUOTE>` and `</BLOCKQUOTE>`

DIV Function - generates `<DIV>`

NL Function, BR Function - generate `
`

[NOBR Function](#) - generates <NOBR>

[WBR Function](#) - generates <WBR>

[PLAINTEXT Function](#) - generates <PLAINTEXT>

[ADDRESS Function](#) - generates <ADDRESS>

[MAILTO Function](#) - generates <A> with the MAILTO attribute

[AREA Function](#) - generates <AREA>

[BGSOUND Function](#) - generates <BGSOUND>

Character Formatting Tags

[BASEFONT Function](#) - generates <BASEFONT>

[BIG Function](#) - generates <BIG>

[BOLD Function](#) - generates

[CENTER Function](#) - generates <CENTER> and </CENTER>

[CENTEROPEN Function](#), [CENTERCLOSE Function](#) - generate <CENTER> and </CENTER>

[CITE Function](#) - generates <CITE>

[CODE Function](#) - generates <CODE>

[DFN Function](#) - generates <DFN>

[EM Function](#), [EMPHASIS Function](#) - generate

[FONTOPEN Function](#), [FONTCLOSE Function](#) - generate and

[ITALIC Function](#) - generates <I>

[KBD Function](#), [KEYBOARD Function](#) - generate <KBD> and </KBD>

[S Function](#) - generates <S>

[SAMPLE Function](#) - generates <SAMP>

[SMALL Function](#) - generates <SMALL>

[STRIKE Function](#) - generates <STRIKE>

[STRONG Function](#) - generates

[SUB Function](#) - generates <SUB>

[SUP Function](#) - generates <SUP>

[TELETYPE Function](#) - generates <TT>

[UNDERLINE Function](#) - generates <U>

[VARIABLE Function](#) - generates <VAR>

Frame Tags

[FRAME Function](#) - generates <FRAME>

[FRAMESETOPEN Function](#), [FRAMESETCLOSE Function](#) - generate `<FRAMESET>` and `</FRAMESET>`

[NOFRAMESOPEN Function](#), [NOFRAMESCLOSE Function](#) - generate `<NOFRAMES>` and `</NOFRAMES>`

224.6 Summary of HTF Subprograms

This table lists the HTF subprograms and briefly describes them.

Table 224-1 HTF Package Subprograms

| Subprogram | Description |
|--|---|
| ADDRESS Function | Generates the <code><ADDRESS></code> and <code></ADDRESS></code> tags which specify the address, author and signature of a document |
| ANCHOR Function | Generates the <code><A></code> and <code></code> tags which specify the source or destination of a hypertext link |
| ANCHOR2 Function | Generates the <code><A></code> and <code></code> tags which specify the source or destination of a hypertext link |
| APPLETCLOSE Function | Closes the applet invocation with the <code></APPLET></code> tag |
| APPLETOPEN Function | Generates the <code><APPLET></code> tag which begins the invocation of a Java applet |
| AREA Function | Generates the <code><AREA></code> tag, which defines a client-side image map |
| BASE Function | Generates the <code><BASE></code> tag which records the URL of the document |
| BASEFONT Function | Generates the <code><BASEFONT></code> tag which specifies the base font size for a Web page |
| BGSOUND Function | Generates the <code><BGSOUND></code> tag which includes audio for a Web page |
| BIG Function | Generates the <code><BIG></code> and <code></BIG></code> tags which direct the browser to render the text in a bigger font |
| BLOCKQUOTECLOSE Function | Generates the <code></BLOCKQUOTE></code> tag which mark the end of a section of quoted text |
| BLOCKQUOTEOPEN Function | Generates the <code><BLOCKQUOTE></code> tag, which marks the beginning of a section of quoted text |
| BODYCLOSE Function | Generates the <code></BODY></code> tag which marks the end of a body section of an HTML document |
| BODYOPEN Function | Generates the <code><BODY></code> tag which marks the beginning of the body section of an HTML document |
| BOLD Function | Generates the <code></code> and <code></code> tags which direct the browser to display the text in boldface |
| BR Function | Generates the <code> </code> tag which begins a new line of text |
| CENTER Function | Generates the <code><CENTER></code> and <code></CENTER></code> tags which center a section of text within a Web page |
| CENTERCLOSE Function | Generates the <code></CENTER></code> tag which marks the end of a section of text to center |

Table 224-1 (Cont.) HTF Package Subprograms

| Subprogram | Description |
|---------------------------------------|--|
| CENTEROPEN Function | Generates the <CENTER> tag which mark the beginning of a section of text to center |
| CITE Function | Generates the <CITE> and </CITE> tags which direct the browser to render the text as a citation |
| CODE Function | Generates the <CODE> and </CODE> tags which direct the browser to render the text in monospace font or however "code" is defined stylistically |
| COMMENT Function | Generates the comment tags <!-- ctext --> |
| DFN Function | Generates the <DFN> and </DFN> tags which direct the browser to mark the text as italics or however "definition" is defined stylistically |
| DIRLISTCLOSE Function | Generates the </DIR> tag which ends a directory list section |
| DIRLISTOPEN Function | Generates the <DIR> which starts a directory list section |
| DIV Function | Generates the <DIV> tag which creates document divisions |
| DLISTCLOSE Function | Generates the </DL> tag which ends a definition list |
| DLISTDEF Function | Generates the <DD> tag, which inserts definitions of terms |
| DLISTOPEN Function | Generates the <DL> tag which starts a definition list |
| DLISTTERM Function | Generates the <DT> tag which defines a term in a definition list <DL> |
| EM Function | Generates the and tags, which define text to be emphasized |
| EMPHASIS Function | Generates the and tags, which define text to be emphasized |
| ESCAPE_SC Function | Replaces characters that have special meaning in HTML with their escape sequences |
| ESCAPE_URL Function | Replaces characters that have special meaning in HTML and HTTP with their escape sequences |
| FONTCLOSE Function | Generates the tag which marks the end of a section of text with the specified font characteristics |
| FONTOPEN Function | Generates the which marks the beginning of section of text with the specified font characteristics |
| FORMAT_CELL Function | formats column values inside an HTML table using the TABLEDATA Function |
| FORMCHECKBOX Function | Generates the <INPUT> tag with TYPE="checkbox" which inserts a checkbox element in a form |
| FORMCLOSE Function | Generates the </FORM> tag which marks the end of a form section in an HTML document |
| FORMFILE Function | Generates the <INPUT> tag with TYPE="file" which inserts a file form element, and is used for file uploading for a given page |
| FORMHIDDEN Function | Generates the <INPUT> tag with TYPE="hidden" which inserts a hidden form element |

Table 224-1 (Cont.) HTF Package Subprograms

| Subprogram | Description |
|----------------------------|--|
| FORMIMAGE Function | Generates the <INPUT> tag with TYPE="image" which creates an image field that the user clicks to submit the form immediately |
| FORMOPEN Function | Generates the <FORM> tag which marks the beginning of a form section in an HTML document |
| FORMPASSWORD Function | Generates the <INPUT> tag with TYPE="password" which creates a single-line text entry field |
| FORMRADIO Function | Generates the <INPUT> tag with TYPE="radio", which creates a radio button on the HTML form |
| FORMRESET Function | Generates the <INPUT> tag with TYPE="reset" which creates a button that, when selected, resets the form fields to their initial values |
| FORMSELECTCLOSE Function | Generates the </SELECT> tag which marks the end of a Select form element |
| FORMSELECTOPEN Function | Generates the </SELECT> tag which marks the beginning of a Select form element |
| FORMSELECTOPTION Function | Generates the <OPTION> tag which represents one choice in a Select element |
| FORMSUBMIT Function | Generates the <INPUT> tag with TYPE="submit" which creates a button that, when clicked, submits the form |
| FORMTEXT Function | Generates the <INPUT> tag with TYPE="text", which creates a field for a single line of text |
| FORMTEXTAREA Function | Generates the <TEXTAREA> tag, which creates a text field that has no predefined text in the text area |
| FORMTEXTAREA2 Function | Generates the <TEXTAREA> tag, which creates a text field that has no predefined text in the text area with the ability to specify a wrap style |
| FORMTEXTAREACLOSE Function | Generates the </TEXTAREA> tag which ends a text area form element |
| FORMTEXTAREAOPEN Function | Generates the <TEXTAREA> which marks the beginning of a text area form element |
| FORMTEXTAREAOPEN2 Function | Generates the <TEXTAREA> which marks the beginning of a text area form element with the ability to specify a wrap style |
| FRAME Function | Generates the <FRAME> tag which defines the characteristics of a frame created by a <FRAMESET> tag |
| FRAMESETCLOSE Function | Generates the </FRAMESET> tag which ends a frameset section |
| FRAMESETOPEN Function | Generates the </FRAMESET> tag which begins a frameset section |
| HEADCLOSE Function | Generates the </HEAD> tag which marks the end of an HTML document head section |
| HEADER Function | Generates opening heading tags (<H1> to <H6>) and their corresponding closing tags (</H1> to </H6>) |

Table 224-1 (Cont.) HTF Package Subprograms

| Subprogram | Description |
|-----------------------|---|
| HEADOPEN Function | Generates the <HEAD> tag which marks the beginning of the HTML document head section |
| HR Function | Generates the <HR> tag, which generates a line in the HTML document |
| HTMLCLOSE Function | Generates the </HTML> tag which marks the end of an HTML document |
| HTMLOPEN Function | Generates the <HTML> tag which marks the beginning of an HTML document |
| IMG Function | Generates the tag which directs the browser to load an image onto the HTML page |
| IMG2 Function | Generates the tag which directs the browser to load an image onto the HTML page with the option of specifying values for the USEMAP attribute |
| ISINDEX Function | Creates a single entry field with a prompting text, such as "enter value," then sends that value to the URL of the page or program |
| ITALIC Function | Generates the <I> and </I> tags which direct the browser to render the text in italics |
| KBD Function | Generates the <KBD> and </KBD> tags which direct the browser to render the text in monospace font |
| KEYBOARD Function | Generates the <KBD> and </KBD> tags, which direct the browser to render the text in monospace font |
| LINE Function | Generates the <HR> tag, which generates a line in the HTML document |
| LINKREL Function | Generates the <LINK> tag with the REL attribute which delineates the relationship described by the hypertext link from the anchor to the target |
| LINKREV Function | Generates the <LINK> tag with the REV attribute which delineates the relationship described by the hypertext link from the target to the anchor |
| LISTHEADER Function | Generates the <LH> and </LH> tags which print an HTML tag at the beginning of the list |
| LISTINGCLOSE Function | Generates the </LISTING> tags which marks the end of a section of fixed-width text in the body of an HTML page |
| LISTINGOPEN Function | Generates the <LISTING> tag which marks the beginning of a section of fixed-width text in the body of an HTML page |
| LISTITEM Function | Generates the tag, which indicates a list item |
| MAILTO Function | Generates the <A> tag with the HREF set to 'mailto' prepended to the mail address argument |
| MAPCLOSE Function | Generates the </MAP> tag which marks the end of a set of regions in a client-side image map |
| MAPOPEN Function | Generates the <MAP> tag which mark the beginning of a set of regions in a client-side image map |

Table 224-1 (Cont.) HTF Package Subprograms

| Subprogram | Description |
|--|--|
| MENULISTCLOSE Function | Generates the <code></MENU></code> tag which ends a list that presents one line for each item |
| MENULISTOPEN Function | Generates the <code><MENU></code> tag which begins a list that presents one line for each item |
| META Function | Generates the <code><META></code> tag, which embeds meta-information about the document and also specifies values for HTTP headers |
| NL Function | Generates the <code> </code> tag which begins a new line of text |
| NOBR Function | Generates the <code><NOBR></code> and <code></NOBR></code> tags which turn off line-breaking in a section of text |
| NOFRAMESCLOSE Function | Generates the <code></NOFRAMES></code> tag which marks the end of a no-frames section |
| NOFRAMESOPEN Function | Generates the <code><NOFRAMES></code> tag which mark the beginning of a no-frames section |
| OLISTCLOSE Function | Generates the <code></code> tag which defines the end of an ordered list |
| OLISTOPEN Function | Generates the <code></code> tag which marks the beginning of an ordered list |
| PARA Function | Generates the <code><P></code> tag which indicates that the text that comes after the tag is to be formatted as a paragraph |
| PARAGRAPH Function | Adds attributes to the <code><P></code> tag |
| PARAM Function | Generates the <code><PARAM></code> tag which specifies parameter values for Java applets |
| PLAINTEXT Function | Generates the <code><PLAINTEXT></code> and <code></PLAINTEXT></code> tags which direct the browser to render the text they surround in fixed-width type |
| PRECLOSE Function | Generates the <code></PRE></code> tag which marks the end of a section of preformatted text in the body of the HTML page |
| PREOPEN Function | Generates the <code><PRE></code> tag which marks the beginning of a section of preformatted text in the body of the HTML page |
| PRINT Functions | Generates the specified parameter as a string terminated with the <code>\n</code> newline character |
| PRN Functions | Generates the specified parameter as a string |
| S Function | Generates the <code><S></code> and <code></S></code> tags which direct the browser to render the text they surround in strikethrough type |
| SAMPLE Function | Generates the <code><SAMP></code> and <code></SAMP></code> tags which direct the browser to render the text they surround in monospace font or however "sample" is defined stylistically |
| SCRIPT Function | Generates the <code><SCRIPT></code> and <code></SCRIPT></code> tags which contain a script written in languages such as JavaScript and VBscript |
| SMALL Function | Generates the <code><SMALL></code> and <code></SMALL></code> tags, which direct the browser to render the text they surround using a small font |

Table 224-1 (Cont.) HTF Package Subprograms

| Subprogram | Description |
|--|---|
| STRIKE Function | Generates the <STRIKE> and </STRIKE> tags which direct the browser to render the text they surround in strikethrough type |
| STRONG Function | Generates the and tags which direct the browser to render the text they surround in bold or however "strong" is defined stylistically |
| STYLE Function | Generates the <STYLE> and </STYLE> tags which include a style sheet in a Web page |
| SUB Function | Generates the _{and} tags which direct the browser to render the text they surround as subscript |
| SUP Function | Generates the ^{and} tags which direct the browser to render the text they surround as superscript |
| TABLECAPTION Function | Generates the <CAPTION> and </CAPTION> tags which place a caption in an HTML table |
| TABLECLOSE Function | Generates the </TABLE> tag which marks the end of an HTML table |
| TABLEDATA Function | Generates the <TD> and </TD> tags which insert data into a cell of an HTML table |
| TABLEHEADER Function | Generates the <TH> and </TH> tags which insert a header cell in an HTML table. |
| TABLEOPEN Function | Generates the <TABLE> tag which marks the beginning of an HTML table |
| TABLEROWCLOSE Function | Generates the </TR> tag which marks the end of a new row in an HTML table |
| TABLEROWOPEN Function | Generates the <TR> tag which marks the beginning of a new row in an HTML table |
| TELETYPE Function | Generates the <TT> and </TT> tags which direct the browser to render the text they surround in a fixed width typewriter font, for example, the courier font |
| TITLE Function | Generates the <TITLE> and </TITLE> tags which specify the text to display in the titlebar of the browser window |
| ULISTCLOSE Function | Generates the tag which marks the end of an unordered list |
| ULISTOPEN Function | Generates the tag which marks the beginning of an unordered list |
| UNDERLINE Function | Generates the <U> and </U> tags, which direct the browser to render the text they surround with an underline |
| VARIABLE Function | Generates the <VAR> and </VAR> tags which direct the browser to render the text they surround in italics or however "variable" is defined stylistically. |
| WBR Function | Generates the <WBR> tag, which inserts a soft line break within a section of NOBR text |

224.6.1 ADDRESS Function

This function generates the `<ADDRESS>` and `</ADDRESS>` tags which specify the address, author and signature of a document.

Syntax

```
HTF.ADDRESS (
  cvalue      IN      VARCHAR2
  cnowrap     IN      VARCHAR2  DEFAULT NULL
  cclear      IN      VARCHAR2  DEFAULT NULL
  cattributes IN      VARCHAR2  DEFAULT NULL)
RETURN VARCHAR2;
```

Parameters

Table 224-2 ADDRESS Function Parameters

| Parameter | Description |
|--------------------------|---|
| <code>cvalue</code> | The string that goes between the <code><ADDRESS></code> and <code></ADDRESS></code> tags. |
| <code>cnowrap</code> | If the value for this parameter is not NULL, the <code>NOWRAP</code> attribute is included in the tag |
| <code>cclear</code> | The value for the <code>CLEAR</code> attribute. |
| <code>cattributes</code> | The other attributes to be included as-is in the tag |

Examples

This function generates

```
<ADDRESS CLEAR="cclear" NOWRAP cattributes>cvalue</ADDRESS>
```

224.6.2 ANCHOR Function

Like the `ANCHOR2` function, this function generates the `<A>` and `` HTML tags which specify the source or destination of a hypertext link.

The difference between these subprograms is that the [ANCHOR2 Function](#) provides a target and therefore can be used for a frame.

Syntax

```
HTF.ANCHOR (
  curl        IN      VARCHAR2,
  ctext       IN      VARCHAR2,
  cname       IN      VARCHAR2  DEFAULT NULL,
  cattributes IN      VARCHAR2  DEFAULT NULL)
RETURN VARCHAR2;
```

Parameters

Table 224-3 ANCHOR Function Parameters

| Parameter | Description |
|-------------|---|
| curl | The value for the HREF attribute. |
| cctx | The string that goes between the <A> and tags. |
| cname | The value for the NAME attribute. |
| cattributes | The other attributes to be included as-is in the tag. |

Examples

This function generates

```
<A HREF="curl" NAME="cname" cattributes>cctx</A>
```

Usage Notes

This tag accepts several attributes, but either HREF or NAME is required. HREF specifies to where to link. NAME allows this tag to be a target of a hypertext link.

224.6.3 ANCHOR2 Function

Like the ANCHOR function, this function generates the <A> and HTML tags which specify the source or destination of a hypertext link.

The difference between this and the ANCHOR function is that this function provides a target and therefore can be used for a frame.

Syntax

```
HTF.ANCHOR2 (
  curl          IN          VARCHAR2,
  cctx          IN          VARCHAR2,
  cname         IN          VARCHAR2  DEFAULT NULL,
  ctarget       IN          varchar2  DEFAULT NULL,
  cattributes   IN          VARCHAR2  DEFAULT NULL)
RETURN VARCHAR2;
```

Parameters

Table 224-4 ANCHOR2 Function Parameters

| Parameter | Description |
|-------------|--|
| curl | The value for the HREF attribute. |
| cctx | The string that goes between the <A> and tags. |
| cname | The value for the NAME attribute |
| ctarget | The value for the TARGET attribute. |
| cattributes | The other attributes to be included as-is in the tag |

Examples

This function generates

```
<A HREF="curl" NAME="cname" TARGET = "ctarget" cattributes>ctext</A>
```

224.6.4 APPLETCLOSE Function

This function closes the applet invocation with the `</APPLET>` tag.

You must first invoke the a Java applet using [APPLETOPEN Function](#)

Syntax

```
HTF.APPLETCLOSE  
RETURN VARCHAR2;
```

224.6.5 APPLETOPEN Function

This function generates the `<APPLET>` tag which begins the invocation of a Java applet.

You close the applet invocation with [APPLETCLOSE Function](#) which generates the `</APPLET>` tag.

Syntax

```
HTF.APPLETOPEN (  
    ccode          IN          VARCHAR2,  
    cheight        IN          NUMBER,  
    cwidth         IN          NUMBER,  
    cattributes    IN          VARCHAR2  DEFAULT NULL)  
RETURN VARCHAR2;
```

Parameters

Table 224-5 APPLETOPEN Function Parameters

| Parameter | Description |
|-------------|---|
| ccode | The value for the <code>CODE</code> attribute which specifies the name of the applet class. |
| cheight | The value for the <code>HEIGHT</code> attribute. |
| cwidth | The value for the <code>WIDTH</code> attribute. |
| cattributes | The other attributes to be included as-is in the tag. |

Examples

This function generates

```
<APPLET CODE=ccode HEIGHT=cheight WIDTH=cwidth cattributes>
```

so that, for example,

```
HTF.appletopen('testclass.class', 100, 200, 'CODEBASE="/ows-applets"')
```

generates

```
<APPLET CODE="testclass.class" height=100 width=200 CODEBASE="/ows-applets">
```

Usage Notes

- Specify parameters to the Java applet using the [PARAM Function](#) function.
- Use the `cattributes` parameter to specify the `CODEBASE` attribute since the PL/SQL cartridge does not know where to find the class files. The `CODEBASE` attribute specifies the virtual path containing the class files.

224.6.6 AREA Function

This function generates the `<AREA>` tag, which defines a client-side image map. The `<AREA>` tag defines areas within the image and destinations for the areas.

Syntax

```
HTF.AREA (
  ccoords      IN      VARCHAR2
  cshape      IN      VARCHAR2  DEFAULT NULL,
  chref       IN      VARCHAR2  DEFAULT NULL,
  cnohref     IN      VARCHAR2  DEFAULT NULL,
  ctargt      IN      VARCHAR2  DEFAULT NULL,
  cattributes  IN      VARCHAR2  DEFAULT NULL)
RETURN VARCHAR2;
```

Parameters

Table 224-6 AREA Function Parameters

| Parameter | Description |
|--------------------------|---|
| <code>ccords</code> | The value for the <code>COORDS</code> attribute. |
| <code>cshape</code> | The value for the <code>SHAPE</code> attribute. |
| <code>chref</code> | The value for the <code>HREF</code> attribute. |
| <code>cnohref</code> | If the value for this parameter is not <code>NULL</code> , the <code>NOHREF</code> attribute is added to the tag. |
| <code>ctargt</code> | The value for the <code>TARGET</code> attribute. |
| <code>cattributes</code> | The other attributes to be included as-is in the tag. |

Examples

This function generates

```
<AREA COORDS="ccords" SHAPE="cshape" HREF="chref" NOHREF TARGET="ctargt" cattributes>
```

224.6.7 BASE Function

This function generates the `<BASE>` tag which records the URL of the document.

Syntax

```
HTF.BASE (
  ctargt      IN      VARCHAR2  DEFAULT NULL,
```

```

    cattributes    IN          VARCHAR2    DEFAULT NULL)
RETURN VARCHAR2;

```

Parameters

Table 224-7 BASE Function Parameters

| Parameter | Description |
|-------------|--|
| ctarget | The value for the TARGET attribute which establishes a window name to which all links in this document are targeted. |
| cattributes | The other attributes to be included as-is in the tag. |

Examples

This function generates

```
<BASE HREF="<current URL>" TARGET="ctarget" cattributes>
```

224.6.8 BASEFONT Function

This function generates the <BASEFONT> tag which specifies the base font size for a Web page.

Syntax

```

HTF.BASEFONT (
    nsize    IN    INTEGER)
RETURN VARCHAR2;

```

Parameters

Table 224-8 BASEFONT Function Parameters

| Parameter | Description |
|-----------|-----------------------------------|
| nsize | The value for the SIZE attribute. |

Examples

This function generates

```
<BASEFONT SIZE="nsize">
```

224.6.9 BGSOUND Function

This function generates the <BGSOUND> tag which includes audio for a Web page.

Syntax

```

HTF.BGSOUND (
    csrc      IN          VARCHAR2,
    cloop     IN          VARCHAR2    DEFAULT NULL,
    cattributes IN        VARCHAR2    DEFAULT NULL)
RETURN VARCHAR2;

```

Parameters

Table 224-9 BGSOUND Function Parameters

| Parameter | Description |
|-------------|---|
| csrc | The value for the SRC attribute. |
| cloop | The value for the LOOP attribute. |
| cattributes | The other attributes to be included as-is in the tag. |

Examples

This function generates

```
<BGSOUND SRC="csrc" LOOP="cloop" cattributes>
```

224.6.10 BIG Function

This function generates the <BIG> and </BIG> tags which direct the browser to render the text in a bigger font.

Syntax

```
HTF.BIG (
    ctext          IN          VARCHAR2,
    cattributes    IN          VARCHAR2  DEFAULT NULL)
RETURN VARCHAR2;
```

Parameters

Table 224-10 BIG Function Parameters

| Parameter | Description |
|-------------|---|
| ctext | The text that goes between the tags. |
| cattributes | The other attributes to be included as-is in the tag. |

Examples

This function generates

```
<BIG cattributes>ctext</BIG>
```

224.6.11 BLOCKQUOTECLOSE Function

This function generates the </BLOCKQUOTE> tag which mark the end of a section of quoted text.

You mark the beginning of a section of text by means of the [BLOCKQUOTEOPEN Function](#).

Syntax

```
HTF.BLOCKQUOTECLOSE
RETURN VARCHAR2;
```

Examples

This function generates

```
</BLOCKQUOTE>
```

224.6.12 BLOCKQUOTEOPEN Function

This function generates the `<BLOCKQUOTE>` tag, which marks the beginning of a section of quoted text.

You mark the end of a section of text by means of the [BLOCKQUOTECLOSE Function](#).

Syntax

```
HTF.BLOCKQUOTEOPEN (
  cnowrap      IN          VARCHAR2  DEFAULT NULL,
  cclear       IN          VARCHAR2  DEFAULT NULL,
  cattributes  IN          VARCHAR2  DEFAULT NULL)
RETURN VARCHAR2;
```

Parameters

Table 224-11 BLOCKQUOTEOPEN Function Parameters

| Parameter | Description |
|-------------|--|
| cnowrap | If the value for this parameter is not NULL, the NOWRAP attribute is added to the tag. |
| cclear | The value for the CLEAR attribute. |
| cattributes | The other attributes to be included as-is in the tag. |

Examples

This function generates

```
<BLOCKQUOTE CLEAR="cclear" NOWRAP cattributes>
```

224.6.13 BODYCLOSE Function

This function generates the `</BODY>` tag which marks the end of a body section of an HTML document.

You mark the beginning of a body section by means of the [BODYOPEN Function](#).

Syntax

```
HTF.BODYCLOSE
RETURN VARCHAR2;
```

Examples

This function generates

```
</BODY>
```

224.6.14 BODYOPEN Function

This function generates the <BODY> tag which marks the beginning of the body section of an HTML document.

You mark the end of a body section by means of the [BODYCLOSE Function](#).

Syntax

```
HTF.BODYOPEN (  
    cbackground IN VARCHAR2 DEFAULT NULL,  
    cattributes IN VARCHAR2 DEFAULT NULL)  
RETURN VARCHAR2;
```

Parameters

Table 224-12 BODYOPEN Function Parameters

| Parameter | Description |
|-------------|--|
| cbackground | The value for the BACKGROUND attribute which specifies a graphic file to use for the background of the document. |
| cattributes | The other attributes to be included as-is in the tag. |

Examples

This function generates

```
<BODY background="cbackground" cattributes>
```

so that

```
HTF.BODYOPEN('/img/background.gif')  
RETURN VARCHAR2;
```

generates:

```
<BODY background="/img/background.gif">
```

224.6.15 BOLD Function

This function generates the and tags which direct the browser to display the text in boldface.

Syntax

```
HTF.BOLD (  
    ctext IN VARCHAR2,  
    cattributes IN VARCHAR2 DEFAULT NULL)  
RETURN VARCHAR2;
```

Parameters

Table 224-13 BOLD Function Parameters

| Parameter | Description |
|---------------------------|---|
| c <code>text</code> | The text that goes between the tags. |
| c <code>attributes</code> | The other attributes to be included as-is in the tag. |

Examples

This function generates

```
<B cattributes>ctext</B>
```

224.6.16 BR Function

This function generates the `
` tag which begins a new line of text.

It performs the same operation as the [NL Function](#).

Syntax

```
HTF.BR(
  cclear          IN          VARCHAR2  DEFAULT NULL,
  cattributes     IN          VARCHAR2  DEFAULT NULL)
RETURN VARCHAR2;
```

Parameters

Table 224-14 BR Function Parameters

| Parameter | Description |
|---------------------------|---|
| c <code>clear</code> | The value for the <code>CLEAR</code> attribute. |
| c <code>attributes</code> | The other attributes to be included as-is in the tag. |

Examples

This function generates

```
<BR CLEAR="cclear" cattributes>
```

224.6.17 CENTER Function

This function generates the `<CENTER>` and `</CENTER>` tags which center a section of text within a Web page.

Syntax

```
HTF.CENTER (
  ctext          IN          VARCHAR2)
RETURN VARCHAR2;
```

Parameters

Table 224-15 CENTER Parameters

| Parameter | Description |
|---------------------|--------------------------------------|
| <code>c</code> text | The text that goes between the tags. |

Examples

This function generates

```
<CENTER>c
```

text</CENTER>

224.6.18 CENTERCLOSE Function

This function generates the </CENTER> tag which marks the end of a section of text to center.

You mark the beginning of a section of text to center with the [CENTEROPEN Function](#).

Syntax

```
HTF.CENTERCLOSE  
RETURN VARCHAR2;
```

Examples

This function generates

```
</CENTER>
```

224.6.19 CENTEROPEN Function

This function generates the <CENTER> tag which mark the beginning of a section of text to center.

You mark the beginning of a section of text to center with the [CENTERCLOSE Function](#).

Syntax

```
HTF.CENTEROPEN  
RETURN VARCHAR2;
```

Examples

This function generates

```
<CENTER>
```

224.6.20 CITE Function

This function generates the `<CITE>` and `</CITE>` tags which direct the browser to render the text as a citation.

Syntax

```
HTF.CITE (  
    ctext          IN          VARCHAR2,  
    cattributes    IN          VARCHAR2  DEFAULT NULL)  
RETURN VARCHAR2;
```

Parameters

Table 224-16 CITE Function Parameters

| Parameter | Description |
|--------------------------|---|
| <code>ctext</code> | The text to render as citation. |
| <code>cattributes</code> | The other attributes to be included as-is in the tag. |

Examples

This function generates

```
<CITE cattributes>ctext</CITE>
```

224.6.21 CODE Function

This function generates the `<CODE>` and `</CODE>` tags which direct the browser to render the text in monospace font or however "code" is defined stylistically.

Syntax

```
HTF.CODE (  
    ctext          IN          VARCHAR2,  
    cattributes    IN          VARCHAR2  DEFAULT NULL)  
RETURN VARCHAR2;
```

Parameters

Table 224-17 CODE Function Parameters

| Parameter | Description |
|--------------------------|--|
| <code>ctext</code> | The text to render as code. |
| <code>cattributes</code> | The other attributes to be included as-is in the tag |

Examples

This function generates

```
<CODE cattributes>ctext</CODE>
```

224.6.22 COMMENT Function

This function generates the comment tags.

Syntax

```
HTF.COMMENT (  
    ctext          IN          VARCHAR2)  
    RETURN VARCHAR2;
```

Parameters

Table 224-18 COMMENT Function Parameters

| Parameter | Description |
|-----------|--------------|
| ctext | The comment. |

Examples

This function generates

```
<!-- ctext -->
```

224.6.23 DFN Function

This function generates the `<DFN>` and `</DFN>` tags which direct the browser to mark the text in italics or however "definition" is described stylistically.

Syntax

```
HTF.DFN (  
    ctext          IN          VARCHAR2)  
    RETURN VARCHAR2;
```

Parameters

Table 224-19 DFN Function Parameters

| Parameter | Description |
|-----------|--------------------------------|
| ctext | The text to render in italics. |

Examples

This function generates

```
<DFN>ctext</DFN>
```

224.6.24 DIRLISTCLOSE Function

This function generates the `</DIR>` tag which ends a directory list section. You start a directory list section with the DIRLISTOPEN Function.

Syntax

```
HTF.DIRLISTCLOSE  
    RETURN VARCHAR2;
```

Usage Notes

A directory list presents a list of items that contains up to 20 characters. Items in this list are typically arranged in columns, 24 characters wide. Insert the `` tag directly or invoke the [LISTITEM Function](#) so that the `` tag appears directly after the `</DIR>` tag to define the items as a list.

Examples

This function generates

```
</DIR>
```

Related Topics

- [DIRLISTOPEN Function](#)
This function generates the `<DIR>` which starts a directory list section. You end a directory list section with the DIRLISTCLOSE Function.

224.6.25 DIRLISTOPEN Function

This function generates the `<DIR>` which starts a directory list section. You end a directory list section with the DIRLISTCLOSE Function.

Syntax

```
HTF.DIRLISTOPEN  
    RETURN VARCHAR2;
```

Usage Notes

A directory list presents a list of items that contains up to 20 characters. Items in this list are typically arranged in columns, 24 characters wide. Insert the `` tag directly or invoke the [LISTITEM Function](#) so that the `` tag appears directly after the `</DIR>` tag to define the items as a list.

Examples

This function generates

```
<DIR>
```

Related Topics

- [DIRLISTCLOSE Function](#)
This function generates the `</DIR>` tag which ends a directory list section. You start a directory list section with the DIRLISTOPEN Function.

224.6.26 DIV Function

This function generates the <DIV> tag which creates document divisions.

Syntax

```
HTF.DIV (  
    calign          IN          VARCHAR2  DEFAULT NULL,  
    cattributes    IN          VARCHAR2  DEFAULT NULL)  
RETURN VARCHAR2;
```

Parameters

Table 224-20 DIV Function Parameters

| Parameter | Description |
|-------------|---|
| calign | The value for the ALIGN attribute. |
| cattributes | The other attributes to be included as-is in the tag. |

Examples

This function generates

```
<DIV ALIGN="calign" cattributes>
```

224.6.27 DLISTCLOSE Function

This function generates the </DL> tag which ends a definition list. You start a definition list by means of the DLISTOPEN Function.

Syntax

```
HTF.DLISTCLOSE  
RETURN VARCHAR2;
```

Usage Notes

A definition list looks like a glossary: it contains terms and definitions. Terms are inserted using the [DLISTTERM Function](#) and definitions are inserted using the [DLISTDEF Function](#).

Examples

This function generates

```
</DL>
```

Related Topics

- [DLISTOPEN Function](#)
This function generates the <DL> tag which starts a definition list. You end a definition list by means of the DLISTCLOSE Function.

224.6.28 DLISTDEF Function

This function generates the <DD> tag, which inserts definitions of terms. Use this tag for a definition list <DL>. Terms are tagged <DT> and definitions are tagged <DD>.

Syntax

```
HTF.DLISTDEF (  
    ctext          IN          VARCHAR2  DEFAULT NULL,  
    cclear         IN          VARCHAR2  DEFAULT NULL,  
    cattributes    IN          VARCHAR2  DEFAULT NULL)  
RETURN VARCHAR2;
```

Parameters

Table 224-21 DLISTDEF Function Parameters

| Parameter | Description |
|-------------|---|
| ctext | The definition of the term. |
| cclear | The value for the CLEAR attribute. |
| cattributes | The other attributes to be included as-is in the tag. |

Examples

This function generates

```
<DD CLEAR="cclear" cattributes>ctext
```

224.6.29 DLISTOPEN Function

This function generates the <DL> tag which starts a definition list. You end a definition list by means of the DLISTCLOSE Function.

Syntax

```
HTF.DLISTOPEN (  
    cclear         IN          VARCHAR2  DEFAULT NULL,  
    cattributes    IN          VARCHAR2  DEFAULT NULL)  
RETURN VARCHAR2;
```

Parameters

Table 224-22 DLISTOPEN Function Parameters

| Parameter | Description |
|-------------|---|
| cclear | The value for the CLEAR attribute. |
| cattributes | The other attributes to be included as-is in the tag. |

Usage Notes

A definition list looks like a glossary: it contains terms and definitions. Terms are inserted using the [DLISTTERM Function](#) and definitions are inserted using the [DLISTDEF Function](#).

Examples

This function generates

```
<DL CLEAR="cclear" cattributes>
```

Related Topics

- [DLISTCLOSE Function](#)
This function generates the `</DL>` tag which ends a definition list. You start a definition list by means of the [DLISTOPEN Function](#).

224.6.30 DLISTTERM Function

This function generates the `<DT>` tag which defines a term in a definition list `<DL>`.

Syntax

```
HTF.DLISTTERM (
  ctext          IN          VARCHAR2  DEFAULT NULL,
  cclear         IN          VARCHAR2  DEFAULT NULL,
  cattributes    IN          VARCHAR2  DEFAULT NULL)
RETURN VARCHAR2;
```

Parameters

Table 224-23 DLISTTERM Function Parameters

| Parameter | Description |
|-------------|---|
| ctext | The term. |
| cclear | The value for the CLEAR attribute. |
| cattributes | The other attributes to be included as-is in the tag. |

Examples

This function generates

```
<DT CLEAR="cclear" cattributes>ctext
```

224.6.31 EM Function

This function generates the `` and `` tags, which define text to be emphasized.

It performs the same task as the [EMPHASIS Function](#).

Syntax

```
HTF.EM(
  ctext          IN          VARCHAR2,
```

```

    cattributes    IN          VARCHAR2    DEFAULT NULL)
RETURN VARCHAR2;

```

Parameters

Table 224-24 EM Function Parameters

| Parameter | Description |
|-------------|---|
| ctext | The text to emphasize. |
| cattributes | The other attributes to be included as-is in the tag. |

Examples

This function generates

```
<EM cattributes>ctext</EM>
```

224.6.32 EMPHASIS Function

This function generates the `` and `` tags, which define text to be emphasized.

It performs the same task as the [EM Function](#).

Syntax

```

HTF.EMPHASIS(
    ctext          IN          VARCHAR2,
    cattributes    IN          VARCHAR2    DEFAULT NULL)
RETURN VARCHAR2;

```

Parameters

Table 224-25 EMPHASIS Function Parameters

| Parameter | Description |
|-------------|---|
| ctext | The text to emphasize. |
| cattributes | The other attributes to be included as-is in the tag. |

Examples

This function generates

```
<EM cattributes>ctext</EM>
```

224.6.33 ESCAPE_SC Function

This function replaces characters that have special meaning in HTML with their escape sequences.

The following characters are converted:

- `&` to `&`
- `"` to `"`

- < to <
- > to >

This function performs the same operation as HTTP. [PRINTS Procedure](#) and HTTP. [PS Procedure](#).

Syntax

```
HTF.ESCAPE_SC(  
    ctext          IN          VARCHAR2);
```

Parameters

Table 224-26 ESCAPE_SC Function Parameters

| Parameter | Description |
|-----------|-----------------------------|
| ctext | The text string to convert. |

224.6.34 ESCAPE_URL Function

This deprecated function replaces characters that have special meaning in HTML and HTTP with their escape sequences.

Note:

This procedure, deprecated in Release 10g, and provided here only for reasons of backward compatibility, does not comply with the Internet Engineering Task Force (IETF) Request for Comments (RFC) standards of URL encoding. If you need to encode URLs, it is recommended you use the [ESCAPE Function](#) in the [UTL_URL](#) package.

The following characters are converted:

- & to &
- " to "
- < to <
- > to >
- % to &25

Syntax

```
HTF.ESCAPE_URL(  
    p_url          IN          VARCHAR2);
```

Parameters

Table 224-27 ESCAPE_URL Function Parameters

| Parameter | Description |
|-----------|------------------------|
| p_url | The string to convert. |

224.6.35 FONTCLOSE Function

This function generates the `` tag which marks the end of a section of text with the specified font characteristics.

You mark the beginning of the section text by means of the [FONTOPEN Function](#).

Syntax

```
HTF.FONTCLOSE
  RETURN VARCHAR2;
```

Examples

This function generates

```
</FONT>
```

224.6.36 FONTOPEN Function

This function generates the `` which marks the beginning of section of text with the specified font characteristics.

You mark the end of the section text by means of the [FONTCLOSE Function](#).

Syntax

```
HTF.FONTOPEN(
  ccolor      IN      VARCHAR2  DEFAULT NULL,
  cface       IN      VARCHAR2  DEFAULT NULL,
  csize       IN      VARCHAR2  DEFAULT NULL,
  cattributes IN      VARCHAR2  DEFAULT NULL)
  RETURN VARCHAR2;
```

Parameters

Table 224-28 FONTOPEN Function Parameters

| Parameter | Description |
|-------------|---|
| ccolor | The value for the <code>COLOR</code> attribute. |
| cface | The value for the <code>FACE</code> attribute |
| csize | The value for the <code>SIZE</code> attribute |
| cattributes | The other attributes to be included as-is in the tag. |

Examples

This function generates

```
<FONT COLOR="ccolor" FACE="cface" SIZE="csize" cattributes>
```

224.6.37 FORMAT_CELL Function

This function formats column values inside an HTML table using the TABLEDATA Function. It allows for better control over the HTML tables.

Syntax

```
HTF.FORMAT_CELL(  
    columnValue      IN      VARCHAR2  
    format_numbers   IN      VARCHAR2  DEFAULT NULL  
    RETURN VARCHAR2;
```

Parameters

Table 224-29 FORMAT_CELL Function Parameters

| Parameter | Description |
|----------------|--|
| columnValue | The value that needs to be formatted in an HTML table. |
| format_numbers | The format that numeric data is displayed in. If the value of this parameter is not NULL, the number fields are right-justified and rounded to two decimal places. |

Examples

This function generates

```
<TD >columnValue</TD>
```

Related Topics

- [TABLEDATA Function](#)
This function generates the <TD> and </TD> tags which insert data into a cell of an HTML table.

224.6.38 FORMCHECKBOX Function

This function generates the <INPUT> tag with TYPE="checkbox" which inserts a checkbox element in a form.

A checkbox element is a button that the user toggles on or off.

Syntax

```
HTF.FORMCHECKBOX(  
    cname           IN      VARCHAR2,  
    cvalue          IN      VARCHAR2  DEFAULT 'ON',  
    cchecked        IN      VARCHAR2  DEFAULT NULL,  
    cattributes     IN      VARCHAR2  DEFAULT NULL)  
    RETURN VARCHAR2;
```

Parameters

Table 224-30 FORMCHECKBOX Function Parameters

| Parameter | Description |
|-------------|---|
| cname | The value for the NAME attribute. |
| cvalue | The value for the VALUE attribute. |
| cchecked | If the value for this parameter is not NULL, the CHECKED attribute is added to the tag. |
| cattributes | The other attributes to be included as-is in the tag. |

Examples

This function generates

```
<INPUT TYPE="checkbox" NAME="cname" VALUE="cvalue" CHECKED cattributes>
```

224.6.39 FORMCLOSE Function

This function generates the `</FORM>` tag which marks the end of a form section in an HTML document.

You mark the beginning of the form section by means of the [FORMOPEN Function](#).

Syntax

```
HTF.FORMCLOSE
  RETURN VARCHAR2;
```

Examples

This function generates

```
</FORM>
```

224.6.40 FORMFILE Function

This function generates the `<INPUT>` tag with `TYPE="file"` which inserts a file form element. This is used for file uploading for a given page.

Syntax

```
HTF.FORMFILE(
  cname          IN          VARCHAR2,
  caccept        IN          VARCHAR2  DEFAULT NULL,
  cattributes    IN          VARCHAR2  DEFAULT NULL)
  RETURN VARCHAR2;
```

Parameters

Table 224-31 FORMFILE Function Parameters

| Parameter | Description |
|-------------|---|
| cname | The value for the <code>NAME</code> attribute. |
| caccept | A comma-delimited list of MIME types for upload. |
| cattributes | The other attributes to be included as-is in the tag. |

Examples

This function generates

```
<INPUT TYPE="file" NAME="cname" ACCEPT="caccept" cattributes>
```

224.6.41 FORMHIDDEN Function

This function generates the `<INPUT>` tag with `TYPE="hidden"`, which inserts a hidden form element.

This element is not seen by the user. It submits additional values to the script.

Syntax

```
HTF.FORMHIDDEN (
  cname          IN          VARCHAR2,
  cvalue         IN          VARCHAR2  DEFAULT NULL,
  cattributes    IN          VARCHAR2  DEFAULT NULL)
RETURN VARCHAR2;
```

Parameters

Table 224-32 FORMHIDDEN Function Parameters

| Parameter | Description |
|-------------|---|
| cname | The value for the <code>NAME</code> attribute. |
| cvalue | The value for the <code>VALUE</code> attribute. |
| cattributes | The other attributes to be included as-is in the tag. |

Examples

This function generates

```
<INPUT TYPE="hidden" NAME="cname" VALUE="cvalue" cattributes>
```

224.6.42 FORMIMAGE Function

This function generates the `<INPUT>` tag with `TYPE="image"` which creates an image field that the user clicks to submit the form immediately.

The coordinates of the selected point are measured in pixels, and returned (along with other contents of the form) in two name/value pairs. The x coordinate is submitted under the name

of the field with `.x` appended, and the `y` coordinate with `.y` appended. Any `VALUE` attribute is ignored.

Syntax

```
HTF.FORMIMAGE (
  cname          IN          VARCHAR2,
  csrc           IN          VARCHAR2,
  calign         IN          VARCHAR2  DEFAULT NULL,
  cattributes    IN          VARCHAR2  DEFAULT NULL)
RETURN VARCHAR2;
```

Parameters

Table 224-33 FORMIMAGE Function Parameters

| Parameter | Description |
|--------------------------|---|
| <code>cname</code> | The value for the <code>NAME</code> attribute. |
| <code>csrc</code> | The value for the <code>SRC</code> attribute that specifies the image file. |
| <code>calign</code> | The value for the <code>ALIGN</code> attribute. |
| <code>cattributes</code> | The other attributes to be included as-is in the tag. |

Examples

This function generates

```
<INPUT TYPE="image" NAME="cname" SRC="csrc" ALIGN="calign" cattributes>
```

224.6.43 FORMOPEN Function

This function generates the `<FORM>` tag which marks the beginning of a form section in an HTML document.

You mark the end of the form section by means of the [FORMCLOSE Function](#).

Syntax

```
HTF.FORMOPEN (
  curl           IN          VARCHAR2,
  cmethod        IN          VARCHAR2  DEFAULT 'POST',
  ctarger        IN          VARCHAR2  DEFAULT NULL,
  cenctype       IN          VARCHAR2  DEFAULT NULL,
  cattributes    IN          VARCHAR2  DEFAULT NULL)
RETURN VARCHAR2;
```

Parameters

Table 224-34 FORMOPEN Function Parameters

| Parameter | Description |
|----------------------|---|
| <code>curl</code> | The URL of the Web Request Broker or CGI script where the contents of the form is sent. This parameter is required. |
| <code>cmethod</code> | The value for the <code>METHOD</code> attribute. The value can be "GET" or "POST". |

Table 224-34 (Cont.) FORMOPEN Function Parameters

| Parameter | Description |
|-------------|---|
| ctarget | The value for the TARGET attribute. |
| cenctype | The value for the ENCTYPE attribute. |
| cattributes | The other attributes to be included as-is in the tag. |

Examples

This function generates

```
<FORM ACTION="curl" METHOD="cmethod" TARGET="ctarget" ENCTYPE="cenctype" cattributes>
```

224.6.44 FORMPASSWORD Function

This function generates the <INPUT> tag with TYPE="password" which creates a single-line text entry field.

When the user enters text in the field, each character is represented by one asterisk. This is used for entering passwords.

Syntax

```
HTF.FORMPASSWORD(
  cname          IN          VARCHAR2,
  csize          IN          VARCHAR2,
  cmaxlength    IN          VARCHAR2  DEFAULT NULL,
  cvalue        IN          VARCHAR2  DEFAULT NULL,
  cattributes    IN          VARCHAR2  DEFAULT NULL)
RETURN VARCHAR2;
```

Parameters**Table 224-35 FORMPASSWORD Function Parameters**

| Parameter | Description |
|-------------|---|
| cname | The value for the NAME attribute. |
| csize | The value for the SIZE attribute. |
| cmaxlength | The value for the MAXLENGTH attribute. |
| cvalue | The value for the VALUE attribute. |
| cattributes | The other attributes to be included as-is in the tag. |

Examples

This function generates

```
<INPUT TYPE="password" NAME="cname" SIZE="csize" MAXLENGTH="cmmaxlength" VALUE="cvalue"
cattributes>
```

224.6.45 FORMRADIO Function

This function generates the `<INPUT>` tag with `TYPE="radio"`, which creates a radio button on the HTML form. Within a set of radio buttons, the user selects only one. Each radio button in the same set has the same name, but different values. The selected radio button generates a name/value pair.

Syntax

```
HTF.FORMRADIO(  
  cname          IN          VARCHAR2,  
  cvalue         IN          VARCHAR2,  
  cchecked       IN          VARCHAR2  DEFAULT NULL,  
  cattributes    IN          VARCHAR2  DEFAULT NULL)  
RETURN VARCHAR2;
```

Parameters

Table 224-36 FORMRADIO Function Parameters

| Parameter | Description |
|--------------------------|--|
| <code>cname</code> | The value for the <code>NAME</code> attribute. |
| <code>cvalue</code> | The value for the <code>VALUE</code> attribute. |
| <code>cchecked</code> | If the value for this parameter is not <code>NULL</code> , the <code>CHECKED</code> attribute is added to the tag. |
| <code>cattributes</code> | The other attributes to be included as-is in the tag. |

Examples

This function generates

```
<INPUT TYPE="radio" NAME="cname" VALUE="cvalue" CHECKED cattributes>
```

224.6.46 FORMRESET Function

This function generates the `<INPUT>` tag with `TYPE="reset"` which creates a button that, when selected, resets the form fields to their initial values.

Syntax

```
HTF.FORMRESET(  
  cvalue         IN          VARCHAR2  DEFAULT 'Reset',  
  cattributes    IN          VARCHAR2  DEFAULT NULL)  
RETURN VARCHAR2;
```

Parameters

Table 224-37 FORMRESET Function Parameters

| Parameter | Description |
|---------------------|---|
| <code>cvalue</code> | The value for the <code>VALUE</code> attribute. |

Table 224-37 (Cont.) FORMRESET Function Parameters

| Parameter | Description |
|--------------------------|---|
| <code>cattributes</code> | The other attributes to be included as-is in the tag. |

Examples

This function generates

```
<INPUT TYPE="reset" VALUE="cvalue" cattributes>
```

224.6.47 FORMSELECTCLOSE Function

This function generates the `</SELECT>` tag which marks the end of a Select form element.

A Select form element is a listbox where the user selects one or more values. You mark the beginning of Select form element by means of the [FORMSELECTOPEN Function](#). The values are inserted using [FORMSELETOPTION Function](#).

Syntax

```
HTF.FORMSELECTCLOSE  
RETURN VARCHAR2;
```

Examples

This function generates

```
</SELECT>
```

as shown under [Examples](#) of the [FORMSELECTOPEN Function](#).

224.6.48 FORMSELECTOPEN Function

This function generates the `<SELECT>` tags which begins a Select form element.

A Select form element is a listbox where the user selects one or more values. You mark the end of Select form element by means of the [FORMSELECTCLOSE Function](#). The values are inserted using [FORMSELETOPTION Function](#).

Syntax

```
HTF.FORMSELECTOPEN(  
  cname          IN   VARCHAR2,  
  cprompt        IN   VARCHAR2  DEFAULT NULL,  
  nsize          IN   INTEGER    DEFAULT NULL,  
  cattributes    IN   VARCHAR2  DEFAULT NULL)  
RETURN VARCHAR2;
```

Parameters

Table 224-38 FORMSELECTOPEN Function Parameters

| Parameter | Description |
|-------------|---|
| cname | The value for the NAME attribute. |
| cprompt | The string preceding the list box. |
| nsize | The value for the SIZE attribute. |
| cattributes | The other attributes to be included as-is in the tag. |

Examples

This function generates

```
cprompt <SELECT NAME="cname" SIZE="nsize" cattributes>
</SELECT>
```

so that

```
HTF.FORMSELECTOPEN('greatest_player';
  'Pick the greatest player:');
HTF.FORMSELECTOPTION('Messier');
HTF.FORMSELECTOPTION('Howe');
HTF.FORMSELECTOPTION('Gretzky');.
HTF.FORMSELECTCLOSE;
```

generates

```
Pick the greatest player:
<SELECT NAME="greatest_player">
<OPTION>Messier
<OPTION>Howe
<OPTION>Gretzky
</SELECT>
```

224.6.49 FORMSELETOPTION Function

This function generates the <OPTION> tag which represents one choice in a Select element.

Syntax

```
HTF.FORMSELETOPTION(
  cvalue          IN          VARCHAR2,
  cselected       IN          VARCHAR2  DEFAULT NULL,
  cattributes     IN          VARCHAR2  DEFAULT NULL)
RETURN VARCHAR2;
```

Parameters

Table 224-39 FORMSELETOPTION Function Parameters

| Parameter | Description |
|-------------|---|
| cvalue | The text for the option |
| cvalue | If the value for this parameter is not NULL, the <code>SELECTED</code> attribute is added to the tag. |
| cattributes | The other attributes to be included as-is in the tag. |

Examples

This function generates `<OPTION SELECTED cattributes>cvalue` as shown under the Examples section of the [FORMSELECTOPEN Function](#).

224.6.50 FORMSUBMIT Function

This function generates the `<INPUT>` tag with `TYPE="submit"` which creates a button that, when clicked, submits the form. If the button has a `NAME` attribute, the button contributes a name/value pair to the submitted data.

Syntax

```
HTF.FORMSUBMIT (
    cname          IN          VARCHAR2   DEFAULT NULL,
    cvalue         IN          VARCHAR2   DEFAULT 'Submit',
    cattributes    IN          VARCHAR2   DEFAULT NULL)
RETURN VARCHAR2;
```

Parameters

Table 224-40 FORMSUBMIT Function Parameters

| Parameter | Description |
|-------------|---|
| cname | The value for the <code>NAME</code> attribute. |
| cvalue | The value for the <code>VALUE</code> attribute. |
| cattributes | The other attributes to be included as-is in the tag. |

Examples

This function generates

```
<INPUT TYPE="submit" NAME="cname" VALUE="cvalue" cattributes>
```

224.6.51 FORMTEXT Function

This function generates the `<INPUT>` tag with `TYPE="text"`, which creates a field for a single line of text.

Syntax

```
HTF.FORMTEXT (
  cname          IN          VARCHAR2,
  csize          IN          VARCHAR2  DEFAULT NULL,
  cmaxlength     IN          VARCHAR2  DEFAULT NULL,
  cvalue         IN          VARCHAR2  DEFAULT NULL,
  cattributes    IN          VARCHAR2  DEFAULT NULL)
RETURN VARCHAR2;
```

Parameters

Table 224-41 FORMTEXT Function Parameters

| Parameter | Description |
|--------------------------|---|
| <code>cname</code> | The value for the <code>NAME</code> attribute. |
| <code>csize</code> | The value for the <code>SIZE</code> attribute. |
| <code>cmaxlength</code> | The value for the <code>MAXLENGTH</code> attribute. |
| <code>cvalue</code> | The value for the <code>VALUE</code> attribute. |
| <code>cattributes</code> | The other attributes to be included as-is in the tag. |

Examples

This function generates

```
<INPUT TYPE="text" NAME="cname" SIZE="csize" MAXLENGTH="cmmaxlength"
VALUE="cvalue" cattributes>
```

224.6.52 FORMTEXTAREA Function

This function generates the `<TEXTAREA>` tag, which creates a text field that has no predefined text in the text area. This field enables entering several lines of text.

The same operation is performed by the [FORMTEXTAREA2 Function](#) which in addition has the `cwrap` parameter that lets you specify a wrap style.

Syntax

```
HTF.FORMTEXTAREA (
  cname          IN          VARCHAR2,
  nrows         IN          INTEGER,
  ncolumns      IN          INTEGER,
  calign        IN          VARCHAR2  DEFAULT NULL,
  cattributes    IN          VARCHAR2  DEFAULT NULL)
RETURN VARCHAR2;
```

Parameters

Table 224-42 FORMTEXTAREA Function Parameters

| Parameter | Description |
|-------------|--|
| cname | The value for the <code>NAME</code> attribute. |
| nrows | The value for the <code>ROWS</code> attribute. This is an integer. |
| ncolumns | The value for the <code>COLS</code> attribute. This is an integer. |
| calign | The value for the <code>ALIGN</code> attribute. |
| cattributes | The other attributes to be included as-is in the tag. |

Examples

This function generates

```
<TEXTAREA NAME="cname" ROWS="nrows" COLS="ncolumns" ALIGN="calign" cattributes></TEXTAREA>
```

224.6.53 FORMTEXTAREA2 Function

This function generates the `<TEXTAREA>` tag, which creates a text field that has no predefined text in the text area. This field enables entering several lines of text.

The same operation is performed by the [FORMTEXTAREA Function](#) except that in that case you cannot specify a wrap style.

Syntax

```
HTF.FORMTEXTAREA2 (
    cname          IN          VARCHAR2,
    nrows          IN          INTEGER,
    ncolumns       IN          INTEGER,
    calign         IN          VARCHAR2  DEFAULT NULL,
    cwrap         IN          VARCHAR2  DEFAULT NULL,
    cattributes    IN          VARCHAR2  DEFAULT NULL)
RETURN VARCHAR2;
```

Parameters

Table 224-43 FORMTEXTAREA2 Function Parameters

| Parameter | Description |
|-------------|--|
| cname | The value for the <code>NAME</code> attribute. |
| nrows | The value for the <code>ROWS</code> attribute. This is an integer. |
| ncolumns | The value for the <code>COLS</code> attribute. This is an integer. |
| calign | The value for the <code>ALIGN</code> attribute. |
| cwrap | The value for the <code>WRAP</code> attribute. |
| cattributes | The other attributes to be included as-is in the tag. |

Examples

This function generates

```
<TEXTAREA NAME="cname" ROWS="nrows" COLS="ncolumns" ALIGN="calign" WRAP="cwrap"
cattributes></TEXTAREA>
```

224.6.54 FORMTEXTAREACLOSE Function

This function generates the `</TEXTAREA>` tag which ends a text area form element.

You open a text area element by means of either [FORMTEXTAREAOPEN Function](#) or [FORMTEXTAREAOPEN2 Function](#).

Syntax

```
HTF.FORMTEXTAREACLOSE
RETURN VARCHAR2;
```

Examples

This function generates

```
</TEXTAREA>
```

224.6.55 FORMTEXTAREAOPEN Function

This function generates the `<TEXTAREA>` which marks the beginning of a text area form element.

The same operation is performed by the [FORMTEXTAREAOPEN2 Function](#) which in addition has the `cwrap` parameter that lets you specify a wrap style. You mark the end of a text area form element by means of the [FORMTEXTAREACLOSE Function](#).

Syntax

```
HTF.FORMTEXTAREAOPEN (
  cname          IN          VARCHAR2,
  nrows          IN          INTEGER,
  ncolumns       IN          INTEGER,
  calign         IN          VARCHAR2  DEFAULT NULL,
  cattributes    IN          VARCHAR2  DEFAULT NULL)
RETURN VARCHAR2;
```

Parameters

Table 224-44 FORMTEXTAREAOPEN Function Parameters

| Parameter | Description |
|--------------------------|--|
| <code>cname</code> | The value for the <code>NAME</code> attribute. |
| <code>nrows</code> | The value for the <code>ROWS</code> attribute. This is an integer. |
| <code>ncolumns</code> | The value for the <code>COLS</code> attribute. This is an integer. |
| <code>calign</code> | The value for the <code>ALIGN</code> attribute. |
| <code>cattributes</code> | The other attributes to be included as-is in the tag. |

Examples

This function generates

```
<TEXTAREA NAME="cname" ROWS="nrows" COLS="ncolumns" ALIGN="calign" cattributes>
```

224.6.56 FORMTEXTAREAOPEN2 Function

This function generates the `<TEXTAREA>` which marks the beginning of a text area form element.

The same operation is performed by the [FORMTEXTAREAOPEN Function](#) except that in that case you cannot specify a wrap style. You mark the end of a text area form element by means of the [FORMTEXTAREACLOSE Function](#).

Syntax

```
HTF.FORMTEXTAREAOPEN2 (
  cname          IN          VARCHAR2,
  nrows          IN          INTEGER,
  ncolumns       IN          INTEGER,
  calign         IN          VARCHAR2  DEFAULT NULL,
  cwrap         IN          VARCHAR2  DEFAULT NULL,
  cattributes    IN          VARCHAR2  DEFAULT NULL)
RETURN VARCHAR2;
```

Parameters

Table 224-45 FORMTEXTAREAOPEN2 Function Parameters

| Parameter | Description |
|-------------|---|
| cname | The value for the NAME attribute. |
| nrows | The value for the ROWS attribute. This is an integer. |
| ncolumns | The value for the COLS attribute. This is an integer. |
| calign | The value for the ALIGN attribute. |
| cwrap | The value for the WRAP attribute. |
| cattributes | The other attributes to be included as-is in the tag. |

Examples

This function generates

```
<TEXTAREA NAME="cname" ROWS="nrows" COLS="ncolumns" ALIGN="calign" WRAP = "cwrap"
cattributes>
```

224.6.57 FRAME Function

This function generates the <FRAME> tag which begins the characteristics of a frame created by a <FRAMESET> tag.

Syntax

```
HTF.FRAME (
  csrc          IN          VARCHAR2,
  cname        IN          VARCHAR2  DEFAULT NULL,
  cmarginwidth IN          VARCHAR2  DEFAULT NULL,
  cmarginheight IN        VARCHAR2  DEFAULT NULL,
  cscrolling   IN          VARCHAR2  DEFAULT NULL,
  cnoresize    IN          VARCHAR2  DEFAULT NULL,
  cattributes  IN          VARCHAR2  DEFAULT NULL)
RETURN VARCHAR2;
```

Parameters

Table 224-46 FRAME Function Parameters

| Parameter | Description |
|--------------|--|
| csrc | The URL to display in the frame. |
| cname | The value for the NAME attribute. |
| cmarginwidth | The value for the MARGINWIDTH attribute. |
| cscrolling | The value for the SCROLLING attribute. |
| cnoresize | If the value for this parameter is not NULL, the NORESIZE attribute is added to the tag. |
| cattributes | The other attributes to be included as-is in the tag. |

Examples

This function generates

```
<FRAME SRC="csrc" NAME="cname" MARGINWIDTH="cmarginwidth"
MARGINHEIGHT="cmarginheight" SCROLLING="cscrolling" NORESIZE cattributes>
```

224.6.58 FRAMESETCLOSE Function

This function generates the </FRAMESET> tag which ends a frameset section.

You mark the beginning of a frameset section by means of the [FRAMESETOPEN Function](#).

Syntax

```
HTF.FRAMESETCLOSE
RETURN VARCHAR2;
```

Examples

This function generates

```
</FRAMESET>
```

224.6.59 FRAMESETOPEN Function

This function generates the `<FRAMESET>` tag which define a frameset section.

You mark the end of a frameset section by means of the [FRAMESETCLOSE Function](#).

Syntax

```
HTF.FRAMESETOPEN (  
    crows          IN          VARCHAR2  DEFAULT NULL,  
    ccols          IN          VARCHAR2  DEFAULT NULL,  
    cattributes    IN          VARCHAR2  DEFAULT NULL)  
RETURN VARCHAR2;
```

Parameters

Table 224-47 FRAMESETOPEN Function Parameters

| Parameter | Description |
|--------------------------|---|
| <code>crows</code> | The value for the <code>ROWS</code> attribute. |
| <code>ccols</code> | The value for the <code>COLS</code> attribute. |
| <code>cattributes</code> | The other attributes to be included as-is in the tag. |

Examples

This function generates

```
<FRAMESET ROWS="crows" COLS="ccols" cattributes>
```

224.6.60 HEADCLOSE Function

This function generates the `</HEAD>` tag which marks the end of an HTML document head section.

You mark the beginning of an HTML document head section by means of the [HEADOPEN Function](#).

Syntax

```
HTF.HEADCLOSE  
RETURN VARCHAR2;
```

Examples

This function generates

```
</HEAD>
```

224.6.61 HEADER Function

This function generates opening heading tags (<H1> to <H6>) and their corresponding closing tags (</H1> to </H6>).

Syntax

```
HTF.HEADER(
  nsize      IN      INTEGER,
  cheader    IN      VARCHAR2,
  calign     IN      VARCHAR2  DEFAULT NULL,
  cnowrap    IN      VARCHAR2  DEFAULT NULL,
  cclear     IN      VARCHAR2  DEFAULT NULL,
  cattributes IN      VARCHAR2  DEFAULT NULL)
RETURN VARCHAR2;
```

Parameters

Table 224-48 HEADER Function Parameters

| Parameter | Description |
|-------------|--|
| nsize | The heading level. This is an integer between 1 and 6. |
| cheader | The text to display in the heading. |
| calign | The value for the ALIGN attribute. |
| cnowrap | The value for the NOWRAP attribute. |
| cclear | The value for the CLEAR attribute. |
| cattributes | The other attributes to be included as-is in the tag. |

Examples

```
HTF.header (1, 'Overview')
  RETURN VARCHAR2;
```

produces:

```
<H1>Overview</H1>
```

224.6.62 HEADOPEN Function

This function generates the <HEAD> tag which marks the beginning of the HTML document head section.

You mark the end of an HTML document head section by means of the [HEADCLOSE Function](#).

Syntax

```
HTF.HEADOPEN
  RETURN VARCHAR2;
```

Examples

This function generates

<HEAD>

224.6.63 HR Function

This function generates the <HR> tag, which generates a line in the HTML document.

This subprogram performs the same operation as the [LINE Function](#).

Syntax

```
HTF.HR (
  cclear      IN      VARCHAR2  DEFAULT NULL,
  csrc        IN      VARCHAR2  DEFAULT NULL,
  cattributes IN      VARCHAR2  DEFAULT NULL)
RETURN VARCHAR2;
```

Parameters

Table 224-49 HR Function Parameters

| Parameter | Description |
|-------------|---|
| cclear | The value for the CLEAR attribute. |
| csrc | The value for the SRC attribute which specifies a custom image as the source of the line. |
| cattributes | The other attributes to be included as-is in the tag. |

Examples

This function generates

```
<HR CLEAR="cclear" SRC="csrc" cattributes>
```

224.6.64 HTMLCLOSE Function

This function generates the </HTML> tag which marks the end of an HTML document.

You use the [HTMLOPEN Function](#) to mark the beginning of an HTML document.

Syntax

```
HTF.HTMLCLOSE
RETURN VARCHAR2;
```

Examples

This function generates

```
</HTML>
```

224.6.65 HTMLOPEN Function

This function generates the <HTML> tag which marks the beginning of an HTML document.

You use the [HTMLCLOSE Function](#) to mark the end of the an HTML document.

Syntax

```
HTF.HTMLOPEN
  RETURN VARCHAR2;
```

Examples

This function generates

```
<HTML>
```

224.6.66 IMG Function

This function generates the `` tag which directs the browser to load an image onto the HTML page.

The [IMG2 Function](#) performs the same operation but additionally uses the `cusemap` parameter.

Syntax

```
HTF.IMG (
  curl          IN          VARCHAR2  DEFAULT NULL,
  calign        IN          VARCHAR2  DEFAULT NULL,
  calt          IN          VARCHAR2  DEFAULT NULL,
  cismap        IN          VARCHAR2  DEFAULT NULL,
  cattributes   IN          VARCHAR2  DEFAULT NULL)
  RETURN VARCHAR2;
```

Parameters**Table 224-50 IMG Function Parameters**

| Parameter | Description |
|--------------------------|--|
| <code>curl</code> | The value for the SRC attribute. |
| <code>calign</code> | The value for the ALIGN attribute. |
| <code>calt</code> | The value for the ALT attribute which specifies alternative text to display if the browser does not support images. |
| <code>cismap</code> | If the value for this parameter is not NULL, the ISMAP attribute is added to the tag. The attribute indicates that the image is an imagemap. |
| <code>cattributes</code> | The other attributes to be included as-is in the tag. |

Examples

This function generates

```
<IMG SRC="curl" ALIGN="calign" ALT="calt" ISMAP cattributes>
```

224.6.67 IMG2 Function

This function generates the tag, which directs the browser to load an image onto the HTML page.

The [IMG Function](#) performs the same operation but does not use the `cusemap` parameter.

Syntax

```
HTF.IMG2(
  curl          IN          VARCHAR2  DEFAULT NULL,
  calign        IN          VARCHAR2  DEFAULT NULL,
  calt          IN          VARCHAR2  DEFAULT NULL,
  cismap        IN          VARCHAR2  DEFAULT NULL,
  cusemap       IN          VARCHAR2  DEFAULT NULL,
  cattributes   IN          VARCHAR2  DEFAULT NULL)
RETURN VARCHAR2;
```

Parameters

Table 224-51 IMG2 Function Parameters

| Parameter | Description |
|--------------------------|--|
| <code>curl</code> | The value for the SRC attribute. |
| <code>calign</code> | The value for the ALIGN attribute. |
| <code>calt</code> | The value for the ALT attribute which specifies alternative text to display if the browser does not support images. |
| <code>cismap</code> | If the value for this parameter is not NULL, the ISMAP attribute is added to the tag. The attribute indicates that the image is an imagemap. |
| <code>cusemap</code> | The value for the USEMAP attribute which specifies a client-side image map. |
| <code>cattributes</code> | The other attributes to be included as-is in the tag. |

Examples

This function generates

```
<IMG SRC="curl" ALIGN="calign" ALT="calt" ISMAP USEMAP="cusemap" cattributes>
```

224.6.68 ISINDEX Function

This function creates a single entry field with a prompting text, such as "*enter value*," then sends that value to the URL of the page or program.

Syntax

```
HTF.ISINDEX(
  cprompt       IN          VARCHAR2  DEFAULT NULL,
  curl          IN          VARCHAR2  DEFAULT NULL)
RETURN VARCHAR2;
```

Parameters

Table 224-52 ISINDEX Function Parameters

| Parameter | Description |
|-----------|-------------------------------------|
| cprompt | The value for the PROMPT attribute. |
| curl | The value for the HREF attribute. |

Examples

This function generates

```
<ISINDEX PROMPT="cprompt" HREF="curl">
```

224.6.69 ITALIC Function

This function generates the `<I>` and `</I>` tags which direct the browser to render the text in italics.

Syntax

```
HTF.ITALIC(
  ctext          IN          VARCHAR2,
  cattributes    IN          VARCHAR2  DEFAULT NULL)
RETURN VARCHAR2;
```

Parameters

Table 224-53 ITALIC Function Parameters

| Parameter | Description |
|-------------|---|
| ctext | The text to be rendered in italics. |
| cattributes | The other attributes to be included as-is in the tag. |

Examples

This function generates

```
<I cattributes>ctext</I>
```

224.6.70 KBD Function

This function generates the `<KBD>` and `</KBD>` tags which direct the browser to render the text in monospace font.

This subprogram performs the same operation as the [KEYBOARD Function](#).

Syntax

```
HTF.KBD(
  ctext          IN          VARCHAR2,
  cattributes    IN          VARCHAR2  DEFAULT NULL)
RETURN VARCHAR2;
```

Parameters

Table 224-54 KBD Function Parameters

| Parameter | Description |
|-------------------------------------|---|
| <code>c_{text}</code> | The text to be rendered in monospace. |
| <code>c_{attributes}</code> | The other attributes to be included as-is in the tag. |

Examples

This function generates

```
<KBD cattributes>ctext</KBD>
```

224.6.71 KEYBOARD Function

This function generates the `<KBD>` and `</KBD>` tags, which direct the browser to render the text in monospace font.

This subprogram performs the same operation as the [KBD Function](#).

Syntax

```
HTF.KEYBOARD (
  ctext          IN          VARCHAR2,
  cattributes    IN          VARCHAR2  DEFAULT NULL)
RETURN VARCHAR2;
```

Parameters

Table 224-55 KEYBOARD Function Parameters

| Parameter | Description |
|-------------------------------------|---|
| <code>c_{text}</code> | The text to be rendered in monospace. |
| <code>c_{attributes}</code> | The other attributes to be included as-is in the tag. |

Examples

This function generates

```
<KBD cattributes>ctext</KBD>
```

224.6.72 LINE Function

This function generates the `<HR>` tag, which generates a line in the HTML document.

This subprogram performs the same operation as the [HR Function](#).

Syntax

```
HTF.LINE (
  cclear        IN          VARCHAR2  DEFAULT NULL,
  csrc          IN          VARCHAR2  DEFAULT NULL,
```

```

    cattributes    IN          VARCHAR2    DEFAULT NULL)
RETURN VARCHAR2;

```

Parameters

Table 224-56 LINE Function Parameters

| Parameter | Description |
|-------------|---|
| cclear | The value for the CLEAR attribute. |
| csrc | The value for the SRC attribute which specifies a custom image as the source of the line. |
| cattributes | The other attributes to be included as-is in the tag. |

Examples

This function generates

```
<HR CLEAR="cclear" SRC="csrc" cattributes>
```

224.6.73 LINKREL Function

This function generates the <LINK> tag with the REL attribute which delineates the relationship described by the hypertext link from the anchor to the target. This is only used when the HREF attribute is present.

This is the opposite of [LINKREV Function](#). This tag indicates a relationship between documents but does not create a link. To create a link, use the [ANCHOR Function](#).

Syntax

```

HTF.LINKREL (
    crel          IN          VARCHAR2,
    curl          IN          VARCHAR2,
    cttitle      IN          VARCHAR2    DEFAULT NULL)
RETURN VARCHAR2;

```

Parameters

Table 224-57 LINKREL Function Parameters

| Parameter | Description |
|-----------|------------------------------------|
| crel | The value for the REL attribute. |
| curl | The value for the URL attribute. |
| cttitle | The value for the TITLE attribute. |

Examples

This function generates

```
<LINK REL="crel" HREF="curl" TITLE="cttitle">
```

224.6.74 LINKREV Function

This function generates the `<LINK>` tag with the `REV` attribute which delineates the relationship described by the hypertext link from the target to the anchor.

This is the opposite of the [LINKREL Function](#). This tag indicates a relationship between documents, but does not create a link. To create a link, use the [ANCHOR Function](#).

Syntax

```
HTF.LINKREV (
  crev          IN          VARCHAR2,
  curl          IN          VARCHAR2,
  ctitle       IN          VARCHAR2  DEFAULT NULL)
RETURN VARCHAR2;
```

Parameters

Table 224-58 LINKREV Function Parameters

| Parameter | Description |
|-----------|---|
| crev | The value for the <code>REV</code> attribute. |
| curl | The value for the <code>URL</code> attribute. |
| ctitle | The value for the <code>TITLE</code> attribute. |

Examples

This function generates

```
<LINK REV="crev" HREF="curl" TITLE="ctitle">
```

224.6.75 LISTHEADER Function

This function generates the `<LH>` and `</LH>` tags which print an HTML tag at the beginning of the list.

Syntax

```
HTF.LISTHEADER (
  ctext        IN          VARCHAR2,
  cattributes  IN          VARCHAR2  DEFAULT NULL)
RETURN VARCHAR2;
```

Parameters

Table 224-59 LISTHEADER Function Parameters

| Parameter | Description |
|-------------|--|
| ctext | The text to place between <code><LH></code> and <code></LH></code> . |
| cattributes | The other attributes to be included as-is in the tag. |

Examples

This function generates

```
<LH cattributes>ctext</LH>
```

224.6.76 LISTINGCLOSE Function

This function generates the `</LISTING>` tags which marks the end of a section of fixed-width text in the body of an HTML page.

To mark the beginning of a section of fixed-width text in the body of an HTML page, use the [LISTINGOPEN Function](#).

Syntax

```
HTF.LISTINGCLOSE  
RETURN VARCHAR2;
```

Examples

This function generates

```
</LISTING>
```

224.6.77 LISTINGOPEN Function

This function generates the `<LISTING>` tag which marks the beginning of a section of fixed-width text in the body of an HTML page.

To mark the end of a section of fixed-width text in the body of an HTML page, use the [LISTINGCLOSE Function](#).

Syntax

```
HTF.LISTINGOPEN  
RETURN VARCHAR2;
```

Examples

This function generates

```
<LISTING>
```

224.6.78 LISTITEM Function

This function generates the `` tag, which indicates a list item.

Syntax

```
HTF.LISTITEM(  
  ctext          IN          VARCHAR2  DEFAULT NULL,  
  cclear         IN          VARCHAR2  DEFAULT NULL,  
  cdingbat       IN          VARCHAR2  DEFAULT NULL,  
  csrc           IN          VARCHAR2  DEFAULT NULL,  
  cattributes    IN          VARCHAR2  DEFAULT NULL)  
RETURN VARCHAR2;
```

Parameters

Table 224-60 LISTITEM Function Parameters

| Parameter | Description |
|-------------|---|
| ctext | The text for the list item. |
| cclear | The value for the CLEAR attribute. |
| cdingbat | The value for the DINGBAT attribute. |
| csrc | The value for the SRC attribute. |
| cattributes | The other attributes to be included as-is in the tag. |

Examples

This function generates

```
<LI CLEAR="cclear" DINGBAT="cdingbat" SRC="csrc" cattributes>ctext
```

224.6.79 MAILTO Function

This function generates the <A> tag with the HREF set to 'mailto' prepended to the mail address argument.

Syntax

```
HTF.MAILTO(
  caddress      IN          VARCHAR2,
  ctext         IN          VARCHAR2,
  cname         IN          VARCHAR2,
  cattributes   IN          VARCHAR2  DEFAULT NULL)
RETURN VARCHAR2;
```

Parameters

Table 224-61 MAILTO Function Parameters

| Parameter | Description |
|-------------|---|
| caddress | The email address of the recipient. |
| ctext | The clickable portion of the link. |
| cname | The value for the NAME attribute. |
| cattributes | The other attributes to be included as-is in the tag. |

Examples

This function generates

```
<A HREF="mailto:caddress" NAME="cname" cattributes>ctext</A>
```

so that

```
HTF.mailto('pres@white_house.gov','Send Email to the President');
```

generates:

```
<A HREF="mailto:pres@white_house.gov">Send Email to the President</A>
```

224.6.80 MAPCLOSE Function

This function generates the `</MAP>` tag which marks the end of a set of regions in a client-side image map

. To mark the beginning of a set of regions in a client-side image map, use the [MAPOPEN Function](#).

Syntax

```
HTF.MAPCLOSE
  RETURN VARCHAR2;
```

Examples

This function generates

```
</MAP>
```

224.6.81 MAPOPEN Function

This function generates the `<MAP>` tag which mark the beginning of a set of regions in a client-side image map.

To mark the end of a set of regions in a client-side image map, use the [MAPCLOSE Function](#).

Syntax

```
HTF.MAPOPEN (
  cname          IN          VARCHAR2  DEFAULT NULL,
  cattributes    IN          VARCHAR2  DEFAULT NULL)
  RETURN VARCHAR2;
```

Parameters

Table 224-62 MAPOPEN Function Parameters

| Parameter | Description |
|-------------|---|
| cname | The value for the NAME attribute. |
| cattributes | The other attributes to be included as-is in the tag. |

Examples

This function generates

```
<MAP NAME="cname" cattributes>
```

224.6.82 MENULISTCLOSE Function

This function generates the `</MENU>` tag which ends a list that presents one line for each item.

To begin a list of this kind, use the [MENULISTOPEN Function](#). The items in the list appear more compact than an unordered list. The [LISTITEM Function](#) defines the list items in a menu list.

Syntax

```
HTF.MENULISTCLOSE  
    RETURN VARCHAR2;
```

Examples

This function generates

```
</MENU>
```

224.6.83 MENULISTOPEN Function

This function generates the `<MENU>` tag which begins a list that presents one line for each item.

To end a list of this kind, use the [MENULISTCLOSE Function](#). The items in the list appear more compact than an unordered list. The [LISTITEM Function](#) defines the list items in a menu list.

Syntax

```
HTF.MENULISTOPEN  
    RETURN VARCHAR2;
```

Examples

This function generates

```
<MENU>
```

224.6.84 META Function

This function generates the `<META>` tag, which embeds meta-information about the document and also specifies values for HTTP headers. For example, you can specify the expiration date, keywords, and author name.

Syntax

```
HTF.META(  
    chttp_equiv    IN    VARCHAR2,  
    cname          IN    VARCHAR2,  
    ccontent       IN    VARCHAR2)  
    RETURN VARCHAR2;
```

Parameters

Table 224-63 META Function Parameters

| Parameter | Description |
|-------------|---|
| chttp_equiv | The value for the <code>CHTTP_EQUIV</code> attribute. |
| cname | The value for the <code>NAME</code> attribute. |
| ccontent | The value for the <code>CONTENT</code> attribute. |

Examples

This function generates

```
<META HTTP-EQUIV="chttp_equiv" NAME ="cname" CONTENT="ccontent">
```

so that

```
HTF.meta ('Refresh', NULL, 120);
```

generates

```
<META HTTP-EQUIV="Refresh" CONTENT=120>
```

On some Web browsers, this causes the current URL to be reloaded automatically every 120 seconds.

224.6.85 NL Function

This function generates the `
` tag which begins a new line of text.

It performs the same operation as the [BR Function](#).

Syntax

```
HTF.NL(
  cclear          IN          VARCHAR2  DEFAULT NULL,
  cattributes     IN          VARCHAR2  DEFAULT NULL)
RETURN VARCHAR2;
```

Parameters

Table 224-64 NL Function Parameters

| Parameter | Description |
|-------------|---|
| cclear | The value for the <code>CLEAR</code> attribute. |
| cattributes | The other attributes to be included as-is in the tag. |

Examples

This function generates

```
<BR CLEAR="cclear" cattributes>
```

224.6.86 NOBR Function

This function generates the `<NOBR>` and `</NOBR>` tags which turn off line-breaking in a section of text.

Syntax

```
HTF.NOBR (  
  ctext          IN          VARCHAR2)  
  RETURN VARCHAR2;
```

Parameters

Table 224-65 NOBR Function Parameters

| Parameter | Description |
|--------------------|--|
| <code>ctext</code> | The text that is to be rendered on one line. |

Examples

This function generates

```
<NOBR>ctext</NOBR>
```

224.6.87 NOFRAMESCLOSE Function

This function generates the `</NOFRAMES>` tag which marks the end of a no-frames section.

To mark the beginning of a no-frames section, use the [FRAMESETOPEN Function](#). See also [FRAME Function](#), [FRAMESETOPEN Function](#) and [FRAMESETCLOSE Function](#).

Syntax

```
HTF.NOFRAMESCLOSE  
  RETURN VARCHAR2;
```

Examples

This function generates

```
</NOFRAMES>
```

224.6.88 NOFRAMESOPEN Function

This function generates the `<NOFRAMES>` tag which mark the beginning of a no-frames section.

To mark the end of a no-frames section, use the [FRAMESETCLOSE Function](#). See also [FRAME Function](#), [FRAMESETOPEN Function](#) and [FRAMESETCLOSE Function](#).

Syntax

```
HTF.NOFRAMESOPEN  
  RETURN VARCHAR2;
```

Examples

This function generates

```
<NOFRAMES>
```

224.6.89 OLISTCLOSE Function

This function generates the `` tag which defines the end of an ordered list. An ordered list presents a list of numbered items.

To mark the beginning of a list of this kind, use the [OLISTOPEN Function](#). Numbered items are added using [LISTITEM Function](#).

Syntax

```
HTF.OLISTCLOSE
  RETURN VARCHAR2;
```

Examples

This function generates

```
</OL>
```

224.6.90 OLISTOPEN Function

This function generates the `` tag which marks the beginning of an ordered list. An ordered list presents a list of numbered items.

To mark the end of a list of this kind, use the [OLISTCLOSE Function](#). Numbered items are added using [LISTITEM Function](#).

Syntax

```
HTF.OLISTOPEN (
  cclear          IN          VARCHAR2  DEFAULT NULL,
  cwrap           IN          VARCHAR2  DEFAULT NULL,
  cattributes     IN          VARCHAR2  DEFAULT NULL)
  RETURN VARCHAR2;
```

Parameters**Table 224-66** OLISTOPEN Function Parameters

| Parameter | Description |
|-------------|---|
| cclear | The value for the CLEAR attribute. |
| cwrap | The value for the WRAP attribute. |
| cattributes | The other attributes to be included as-is in the tag. |

Examples

This function generates

```
<OL CLEAR="cclear" WRAP="cwrap" cattributes>
```

224.6.91 PARA Function

This function generates the <P> tag which indicates that the text that comes after the tag is to be formatted as a paragraph.

You can add attributes to the tag by means of the [PARAGRAPH Function](#).

Syntax

```
HTF.PARA
  RETURN VARCHAR2;
```

Examples

This function generates

```
<P>
```

224.6.92 PARAGRAPH Function

You can use this function to add attributes to the <P> tag created by the PARA Function.

Syntax

```
HTF.PARAGRAPH(
  calign          IN          VARCHAR2  DEFAULT NULL,
  cnowrap         IN          VARCHAR2  DEFAULT NULL,
  cclear         IN          VARCHAR2  DEFAULT NULL,
  cattributes     IN          VARCHAR2  DEFAULT NULL)
  RETURN VARCHAR2;
```

Parameters

Table 224-67 PARAGRAPH Function Parameters

| Parameter | Description |
|-------------|--|
| calign | The value for the ALIGN attribute. |
| cnowrap | If the value for this parameter is not NULL, the NOWRAP attribute is added to the tag. |
| cclear | The value for the CLEAR attribute. |
| cattributes | The other attributes to be included as-is in the tag. |

Examples

This function generates

```
<P ALIGN="calign" NOWRAP CLEAR="cclear" cattributes>
```

Related Topics

- [PARA Function](#)
This function generates the <P> tag which indicates that the text that comes after the tag is to be formatted as a paragraph.

224.6.93 PARAM Function

This function generates the `<PARAM>` tag which specifies parameter values for Java applets.

The values can reference HTML variables. To invoke a Java applet from a Web page, use [APPLETOPEN Function](#) to begin the invocation. Use one [PARAM Function](#) for each desired name-value pair, and use [APPLETCLOSE Function](#) to end the applet invocation.

Syntax

```
HTF.PARAM(  
    cname          IN          VARCHAR2  
    cvalue         IN          VARCHAR2)  
RETURN VARCHAR2;
```

Parameters

Table 224-68 PARAM Function Parameters

| Parameter | Description |
|-----------|------------------------------------|
| cname | The value for the NAME attribute. |
| cvalue | The value for the VALUE attribute. |

Examples

This function generates

```
<PARAM NAME=cname VALUE="cvalue">
```

224.6.94 PLAINTEXT Function

This function generates the `<PLAINTEXT>` and `</PLAINTEXT>` tags which direct the browser to render the text they surround in fixed-width type.

Syntax

```
HTF.PLAINTEXT(  
    ctext          IN          VARCHAR2,  
    cattributes    IN          VARCHAR2 DEFAULT NULL)  
RETURN VARCHAR2;
```

Parameters

Table 224-69 PLAINTEXT Function Parameters

| Parameter | Description |
|-------------|---|
| ctext | The text to be rendered in fixed-width font. |
| cattributes | The other attributes to be included as-is in the tag. |

Examples

This function generates

```
<PLAINTEXT cattributes>ctext</PLAINTEXT>
```

224.6.95 PRECLOSE Function

This function generates the `</PRE>` tag which marks the end of a section of preformatted text in the body of the HTML page.

To mark the beginning of a section of preformatted text in the body of the HTML page, use the [PREOPEN Function](#).

Syntax

```
HTF.PRECLOSE  
    RETURN VARCHAR2;
```

Examples

This function generates

```
</PRE>
```

224.6.96 PREOPEN Function

This function generates the `<PRE>` tag which marks the beginning of a section of preformatted text in the body of the HTML page.

To mark the end of a section of preformatted text in the body of the HTML page, use the [PRECLOSE Function](#).

Syntax

```
HTF.PREOPEN (  
    cclear          IN          VARCHAR2  DEFAULT NULL,  
    cwidth          IN          VARCHAR2  DEFAULT NULL,  
    cattributes     IN          VARCHAR2  DEFAULT NULL)  
    RETURN VARCHAR2;
```

Parameters

Table 224-70 PREOPEN Function Parameters

| Parameter | Description |
|-------------|---|
| cclear | The value for the CLEAR attribute. |
| cwidth | The value for the WIDTH attribute. |
| cattributes | The other attributes to be included as-is in the tag. |

Examples

This function generates

```
<PRE CLEAR="cclear" WIDTH="cwidth" cattributes>
```

224.6.97 PRINT Functions

These functions generate the specified parameter as a string terminated with the `\n` newline character.

The [PRN Functions](#) performs the same operation but does not terminate with a newline character.

Syntax

```
HTF.PRINT (  
    cbuf      IN      VARCHAR2)  
    RETURN VARCHAR2;
```

```
HTF.PRINT (  
    dbuf      IN      DATE)  
    RETURN VARCHAR2;
```

```
HTF.PRINT (  
    nbuf      IN      NUMBER)  
    RETURN VARCHAR2;
```

Parameters

Table 224-71 PRINT Function Parameters

| Parameter | Description |
|-------------------|---|
| <code>cbuf</code> | The string to generate terminated by a newline. |
| <code>dbuf</code> | The string to generate terminated by a newline. |
| <code>nbuf</code> | The string to generate terminated by a newline. |

Usage Notes

- The `\n` character is not the same as `
`. The `\n` character formats the HTML source but it does not affect how the browser renders the HTML source. Use `
` to control how the browser renders the HTML source.
- These functions do not have function equivalents.

224.6.98 PRN Functions

These functions generate the specified parameter as a string.

Unlike the [PRINT Functions](#) the string is not terminated with the `\n` newline character.

Syntax

```
HTF.PRN (  
    cbuf      IN      VARCHAR2)  
    RETURN VARCHAR2;
```

```
HTF.PRN (  
    dbuf      IN      DATE)  
    RETURN VARCHAR2;
```

```
HTF.PRN (
  nbuf      IN      NUMBER)
RETURN VARCHAR2;
```

Parameters

Table 224-72 PRN Function Parameters

| Parameter | Description |
|-----------|---|
| cbuf | The string to generate (not terminated by a newline). |
| dbuf | The string to generate (not terminated by a newline). |
| nbuf | The string to generate (not terminated by a newline). |

Usage Notes

These functions do not have function equivalents.

224.6.99 S Function

This function generates the <S> and </S> tags which direct the browser to render the text they surround in strikethrough type.

This performs the same operation as [STRIKE Function](#).

Syntax

```
HTF.S (
  ctext      IN      VARCHAR2,
  cattributes IN      VARCHAR2  DEFAULT NULL)
RETURN VARCHAR2;
```

Parameters

Table 224-73 S Function Parameters

| Parameter | Description |
|-------------|---|
| ctext | The text to be rendered in strikethrough type. |
| cattributes | The other attributes to be included as-is in the tag. |

Examples

This function generates

```
<S cattributes>ctext</S>
```

224.6.100 SAMPLE Function

This function generates the `<SAMP>` and `</SAMP>` tags which direct the browser to render the text they surround in monospace font or however "sample" is defined stylistically.

Syntax

```
HTF.SAMPLE (  
    ctext          IN          VARCHAR2,  
    cattributes   IN          VARCHAR2  DEFAULT NULL)  
RETURN VARCHAR2;
```

Parameters

Table 224-74 SAMPLE Function Parameters

| Parameter | Description |
|-------------|---|
| ctext | The text to be rendered in monospace font. |
| cattributes | The other attributes to be included as-is in the tag. |

Examples

This function generates

```
<SAMP cattributes>ctext</SAMP>
```

224.6.101 SCRIPT Function

This function generates the `<SCRIPT>` and `</SCRIPT>` tags which contain a script written in languages such as JavaScript and VBscript.

Syntax

```
HTF.SCRIPT (  
    cscript       IN          VARCHAR2,  
    clanguage     IN          VARCHAR2  DEFAULT NULL)  
RETURN VARCHAR2;
```

Parameters

Table 224-75 SCRIPT Function Parameters

| Parameter | Description |
|-----------|--|
| cscript | The text of the script. This is the text that makes up the script itself, not the name of a file containing the script. |
| clanguage | The language in which the script is written. If this parameter is omitted, the user's browser determines the scripting language. |

Examples

This function generates

```
<SCRIPT LANGUAGE=clanguage>cscript</SCRIPT>
```

so that

```
HTF.script ('Erupting_Volcano', 'Javascript');
```

generates

```
<SCRIPT LANGUAGE=Javascript>"script text here"</SCRIPT>
```

This causes the browser to run the script enclosed in the tags.

224.6.102 SMALL Function

This function generates the `<SMALL>` and `</SMALL>` tags, which direct the browser to render the text they surround using a small font.

Syntax

```
HTF.SMALL (
  ctext          IN          VARCHAR2,
  cattributes   IN          VARCHAR2  DEFAULT NULL)
RETURN VARCHAR2;
```

Parameters

Table 224-76 SMALL Function Parameters

| Parameter | Description |
|-------------|---|
| ctext | The text to be rendered in small font. |
| cattributes | The other attributes to be included as-is in the tag. |

Examples

This function generates

```
<SMALL cattributes>ctext</SMALL>
```

224.6.103 STRIKE Function

This function generates the `<STRIKE>` and `</STRIKE>` tags which direct the browser to render the text they surround in strikethrough type.

This performs the same operation as [S Function](#).

Syntax

```
STRIKE (
  ctext          IN          VARCHAR2,
  cattributes   IN          VARCHAR2  DEFAULT NULL)
RETURN VARCHAR2;
```

Parameters

Table 224-77 STRIKE Function Parameters

| Parameter | Description |
|-------------------------------------|---|
| <code>c_{text}</code> | The text to be rendered in strikethrough type. |
| <code>c_{attributes}</code> | The other attributes to be included as-is in the tag. |

Examples

This function generates

```
<STRIKE cattributes>ctext</STRIKE>
```

224.6.104 STRONG Function

This function generates the `` and `` tags which direct the browser to render the text they surround in bold, or however "strong" is defined.

Syntax

```
HTF.STRONG (
  ctext          IN          VARCHAR2,
  cattributes    IN          VARCHAR2  DEFAULT NULL)
RETURN VARCHAR2;
```

Parameters

Table 224-78 STRONG Function Parameters

| Parameter | Description |
|-------------------------------------|---|
| <code>c_{text}</code> | The text to be emphasized. |
| <code>c_{attributes}</code> | The other attributes to be included as-is in the tag. |

Examples

This function generates

```
<STRONG cattributes>ctext</STRONG>
```

224.6.105 STYLE Function

This function generates the `<STYLE>` and `</STYLE>` tags which include a style sheet in a Web page.

You can get more information about style sheets at <http://www.w3.org>. This feature is not compatible with browsers that support only HTML versions 2.0 or earlier. Such browsers will ignore this tag.

Syntax

```
HTF.STYLE (
    cstyle          IN          VARCHAR2)
RETURN VARCHAR2;
```

Parameters**Table 224-79** STYLE Function Parameters

| Parameter | Description |
|-----------|-----------------------------------|
| cstyle | The style information to include. |

Examples

This function generates

```
<STYLE>cstyle</STYLE>
```

224.6.106 SUB Function

This function generates the `_{` and `}` tags which direct the browser to render the text they surround as subscript.

Syntax

```
HTF.SUB (
    ctext          IN          VARCHAR2,
    calign         in          VARCHAR2  DEFAULT NULL,
    cattributes    IN          VARCHAR2  DEFAULT NULL)
RETURN VARCHAR2;
```

Parameters**Table 224-80** SUB Function Parameters

| Parameter | Description |
|-------------|---|
| ctext | The text to render in subscript. |
| calign | The value for the <code>ALIGN</code> attribute. |
| cattributes | The other attributes to be included as-is in the tag. |

Examples

This function generates

```
<SUB ALIGN="calign" cattributes>ctext</SUB>
```

224.6.107 SUP Function

This function generates the `^{` and `}` tags which direct the browser to render the text they surround as superscript.

Syntax

```
HTF.SUP (
  ctext          IN          VARCHAR2,
  calign         in          VARCHAR2  DEFAULT NULL,
  cattributes    IN          VARCHAR2  DEFAULT NULL)
RETURN VARCHAR2;
```

Parameters

Table 224-81 SUP Function Parameters

| Parameter | Description |
|--------------------------|---|
| <code>ctext</code> | The text to render in superscript. |
| <code>calign</code> | The value for the <code>ALIGN</code> attribute. |
| <code>cattributes</code> | The other attributes to be included as-is in the tag. |

Examples

This function generates

```
<SUP ALIGN="calign" cattributes>ctext</SUP>
```

224.6.108 TABLECAPTION Function

This function generates the `<CAPTION>` and `</CAPTION>` tags which place a caption in an HTML table.

Syntax

```
HTF.TABLECAPTION (
  ccaption       IN          VARCHAR2,
  calign         in          VARCHAR2  DEFAULT NULL,
  cattributes    IN          VARCHAR2  DEFAULT NULL)
RETURN VARCHAR2;
```

Parameters

Table 224-82 TABLECAPTION Function Parameters

| Parameter | Description |
|--------------------------|---|
| <code>ctext</code> | The text for the caption. |
| <code>calign</code> | The value for the <code>ALIGN</code> attribute. |
| <code>cattributes</code> | The other attributes to be included as-is in the tag. |

Examples

This function generates

```
<CAPTION ALIGN="calign" cattributes>ccaption</CAPTION>
```

224.6.109 TABLECLOSE Function

This function generates the `</TABLE>` tag which marks the end of an HTML table.

To define the beginning of an HTML table, use the [TABLEOPEN Function](#).

Syntax

```
HTF.TABLECLOSE  
    RETURN VARCHAR2;
```

Examples

This function generates

```
</TABLE>
```

224.6.110 TABLEDATA Function

This function generates the `<TD>` and `</TD>` tags which insert data into a cell of an HTML table.

Syntax

```
HTF.TABLEDATA (  
    cvalue          IN          VARCHAR2  DEFAULT NULL,  
    calign          IN          VARCHAR2  DEFAULT NULL,  
    cdp             IN          VARCHAR2  DEFAULT NULL,  
    cnowrap         IN          VARCHAR2  DEFAULT NULL,  
    crowspan        IN          VARCHAR2  DEFAULT NULL,  
    ccolspan        IN          VARCHAR2  DEFAULT NULL,  
    cattributes     IN          VARCHAR2  DEFAULT NULL)  
    RETURN VARCHAR2;
```

Parameters

Table 224-83 TABLEDATA Function Parameters

| Parameter | Description |
|-------------|--|
| cvalue | The data for the cell in the table. |
| calign | The value for the <code>ALIGN</code> attribute. |
| cdp | The value for the <code>DP</code> attribute. |
| cnowrap | If the value of this parameter is not <code>NULL</code> , the <code>NOWRAP</code> attribute is added to the tag. |
| ccolspan | The value for the <code>COLSPAN</code> attribute. |
| cattributes | The other attributes to be included as-is in the tag. |

Examples

This function generates

```
<TD ALIGN="calign" DP="cdp" ROWSPAN="crowspan" COLSPAN="ccolspan" NOWRAP
cattributes>cvalue</TD>
```

224.6.111 TABLEHEADER Function

This function generates the <TH> and </TH> tags which insert a header cell in an HTML table.

The <TH> tag is similar to the <TD> tag except that the text in this case the rows are usually rendered in bold type.

Syntax

```
HTF.TABLEHEADER(
    cvalue      IN          VARCHAR2  DEFAULT NULL,
    calign      IN          VARCHAR2  DEFAULT NULL,
    cdp         IN          VARCHAR2  DEFAULT NULL,
    cnowrap     IN          VARCHAR2  DEFAULT NULL,
    crowspan    IN          VARCHAR2  DEFAULT NULL,
    ccolspan    IN          VARCHAR2  DEFAULT NULL,
    cattributes IN          VARCHAR2  DEFAULT NULL)
RETURN VARCHAR2;
```

Parameters

Table 224-84 TABLEHEADER Function Parameters

| Parameter | Description |
|-------------|---|
| cvalue | The data for the cell in the table. |
| calign | The value for the ALIGN attribute. |
| cdp | The value for the DP attribute. |
| cnowrap | If the value of this parameter is not NULL, the NOWRAP attribute is added to the tag. |
| crispen | The value for the ROWSPAN attribute. |
| ccolspan | The value for the COLSPAN attribute. |
| cattributes | The other attributes to be included as-is in the tag. |

Examples

This function generates

```
<TH ALIGN="calign" DP="cdp" ROWSPAN="crowspan" COLSPAN="ccolspan" NOWRAP
cattributes>cvalue</TH>
```

224.6.112 TABLEOPEN Function

This function generates the <TABLE> tag which marks the beginning of an HTML table.

To define the end of an HTML table, use the [TABLECLOSE Function](#).

Syntax

```
HTF.TABLEOPEN (
  cborder      IN      VARCHAR2  DEFAULT NULL
  calign       IN      VARCHAR2  DEFAULT NULL,
  cnowrap     IN      VARCHAR2  DEFAULT NULL,
  cclear       IN      VARCHAR2  DEFAULT NULL
  cattributes  IN      VARCHAR2  DEFAULT NULL)
RETURN VARCHAR2;
```

Parameters

Table 224-85 TABLEOPEN Function Parameters

| Parameter | Description |
|-------------|--|
| border | The value for the <code>BORDER</code> attribute. |
| calign | The value for the <code>ALIGN</code> attribute. |
| cnowrap | If the value of this parameter is not <code>NULL</code> , the <code>NOWRAP</code> attribute is added to the tag. |
| cclear | The value for the <code>CLEAR</code> attribute. |
| cattributes | The other attributes to be included as-is in the tag. |

Examples

This function generates

```
<TABLE "cborder" NOWRAP ALIGN="calign" CLEAR="cclear" cattributes>
```

224.6.113 TABLEROWCLOSE Function

This function generates the </TR> tag which marks the end of a new row in an HTML table.

To mark the beginning of a new row, use the [TABLEROWOPEN Function](#).

Syntax

```
HTF.TABLEROWCLOSE
RETURN VARCHAR2;
```

Examples

This function generates

```
</TABLE>
```

224.6.114 TABLEROWOPEN Function

This function generates the <TR> tag which marks the beginning of a new row in an HTML table.

To mark the end of a new row, use the [TABLEROWCLOSE Function](#).

Syntax

```
HTF.TABLEROWOPEN (
  calign          IN          VARCHAR2  DEFAULT NULL,
  cvalign         IN          VARCHAR2  DEFAULT NULL,
  cdp             IN          VARCHAR2  DEFAULT NULL,
  cnowrap         IN          VARCHAR2  DEFAULT NULL,
  cattributes     IN          VARCHAR2  DEFAULT NULL)
RETURN VARCHAR2;
```

Parameters

Table 224-86 TABLEROWOPEN Function Parameters

| Parameter | Description |
|-------------|---|
| calign | The value for the ALIGN attribute. |
| cvalign | The value for the VALIGN attribute. |
| cdp | The value for the DP attribute. |
| cnowrap | If the value of this parameter is not NULL, the NOWRAP attribute is added to the tag. |
| cattributes | The other attributes to be included as-is in the tag. |

Examples

This function generates

```
<<TR ALIGN="calign" VALIGN="cvalign" DP="cdp" NOWRAP cattributes>
```

224.6.115 TELETYPE Function

This function generates the <TT> and </TT> tags which direct the browser to render the text they surround in a fixed width typewriter font, for example, the courier font.

Syntax

```
HTF.TELETYPE (
  ctext          IN          VARCHAR2,
  cattributes     IN          VARCHAR2  DEFAULT NULL)
RETURN VARCHAR2;
```

Parameters

Table 224-87 TELETYPE Function Parameters

| Parameter | Description |
|---------------------------|---|
| c <code>text</code> | The text to render in a fixed width typewriter font. |
| c <code>attributes</code> | The other attributes to be included as-is in the tag. |

Examples

This function generates

```
<TT cattributes>ctext</TT>
```

224.6.116 TITLE Function

This function generates the `<TITLE>` and `</TITLE>` tags which specify the text to display in the titlebar of the browser window.

Syntax

```
HTF.TITLE(  
  ctitle          IN          VARCHAR2)  
  RETURN VARCHAR2;
```

Parameters

Table 224-88 TITLE Function Parameters

| Parameter | Description |
|----------------------|--|
| c <code>title</code> | The text to display in the titlebar of the browser window. |

Examples

This function generates

```
<TITLE>ctitle</TITLE>
```

224.6.117 ULISTCLOSE Function

This function generates the `` tag which marks the end of an unordered list. An unordered list presents items with bullets.

To mark the beginning of an unordered list, use the [ULISTOPEN Function](#). Add list items with [LISTITEM Function](#).

Syntax

```
HTF.ULISTCLOSE  
  RETURN VARCHAR2;
```

Examples

This function generates

```
</UL>
```

224.6.118 ULISTOPEN Function

This function generates the `` tag which marks the beginning of an unordered list. An unordered list presents items with bullets.

To mark the end of an unordered list, use the [ULISTCLOSE Function](#). Add list items with [LISTITEM Function](#).

Syntax

```
HTF.ULISTOPEN (
    cclear      IN      VARCHAR2  DEFAULT NULL,
    cwrap       IN      VARCHAR2  DEFAULT NULL,
    cdingbat    IN      VARCHAR2  DEFAULT NULL,
    csrc        IN      VARCHAR2  DEFAULT NULL,
    cattributes IN      VARCHAR2  DEFAULT NULL)
RETURN VARCHAR2;
```

Parameters**Table 224-89** ULISTOPEN Function Parameters

| Parameter | Description |
|-------------|---|
| cclear | The value for the CLEAR attribute. |
| cwrap | The value for the WRAP attribute. |
| cdingbat | The value for the DINGBAT attribute. |
| csrc | The value for the SRC attribute. |
| cattributes | The other attributes to be included as-is in the tag. |

Examples

This function generates

```
<UL CLEAR="cclear" WRAP="cwrap" DINGBAT="cdingbat" SRC="csrc" cattributes>
```

224.6.119 UNDERLINE Function

This function generates the `<U>` and `</U>` tags, which direct the browser to render the text they surround with an underline.

Syntax

```
HTF.UNDERLINE (
    ctext      IN      VARCHAR2,
    cattributes IN      VARCHAR2  DEFAULT NULL)
RETURN VARCHAR2;
```

Parameters

Table 224-90 UNDERLINE Function Parameters

| Parameter | Description |
|-------------|---|
| ctext | The text to render with an underline. |
| cattributes | The other attributes to be included as-is in the tag. |

Examples

This function generates

```
<U cattributes>ctext</U>
```

224.6.120 VARIABLE Function

This function generates the `<VAR>` and `</VAR>` tags which direct the browser to render the text they surround in italics or however "variable" is defined stylistically.

Syntax

```
HTF.VARIABLE (
  ctext          IN          VARCHAR2,
  cattributes    IN          VARCHAR2  DEFAULT NULL)
RETURN VARCHAR2;
```

Parameters

Table 224-91 VARIABLE Function Parameters

| Parameter | Description |
|-------------|---|
| ctext | The text to render in italics. |
| cattributes | The other attributes to be included as-is in the tag. |

Examples

This function generates

```
<VAR cattributes>ctext</VAR>
```

224.6.121 WBR Function

This function generates the `<WBR>` tag, which inserts a soft line break within a section of NOBR text.

Syntax

```
HTF.WBR
RETURN VARCHAR2;
```

Examples

This function generates

<WBR>

225

HTP

The `HTP` (hypertext procedures) and `HTF` (hypertext functions) packages generate HTML tags. For example, the `HTP.ANCHOR` procedure generates the HTML anchor tag, `<A>`.

This chapter contains the following topics:

- [Operational Notes](#)
- [Rules and Limits](#)
- [Examples](#)
- [Summary of Tags](#)
- [Summary of HTP Subprograms](#)

See Also:

For more information about implementation of this package:

- *Oracle Fusion Middleware Administrator's Guide for Oracle HTTP Server*
- *Oracle Fusion Middleware User's Guide for mod_plsql*

225.1 HTP Operational Notes

Certain operational notes apply to the `HTP` package.

For every HTP procedure that generates one or more HTML tags, there is a corresponding HTF function with identical parameters with the following exception:

- The [PRINTS Procedure](#) and the [PS Procedure](#) do not have HTF function equivalents. Use the [ESCAPE_SC Function](#) or the [ESCAPE_URL Function](#) if you need a string conversion function. Note that while there is a [ESCAPE_SC Procedure](#) that performs the same operation as the [PRINTS Procedure](#) and the [PS Procedure](#), there is no procedural equivalent for the [ESCAPE_URL Function](#).
- The [FORMAT_CELL Function](#) does not have an HTP equivalent. The function formats column values inside an HTML table using [TABLEDATA Function](#) which does have an HTP equivalent in the [TABLEDATA Procedure](#). The advantage of this using the [FORMAT_CELL Function](#) is that it allows for better control over the HTML tables.

The function versions do not directly generate output in your Web page. Instead, they pass their output as return values to the statements that invoked them. Use these functions when you need to nest calls. To print the output of HTF functions, call the functions from within the `HTP.PRINT` procedure. It then prints its parameters to the generated Web page.

225.2 HTP Rules and Limits

If you use values of the LONG datatype in procedures such as HTP.PRINT, HTP.PRN, HTP.PRINTS, HTP.PA or OWA_UTIL.CELLSPRINT, only the first 32 K of the LONG data is used. The LONG data is bound to a VARCHAR2 datatype in the procedure.

225.3 HTP Examples

These commands generate a simple HTML document.

```
CREATE OR REPLACE PROCEDURE hello AS
BEGIN
  HTP.HTMLOPEN;           -- generates <HTML>
  HTP.HEADOPEN;          -- generates <HEAD>
  HTP.TITLE('Hello');    -- generates <TITLE>Hello</TITLE>
  HTP.HEADCLOSE;        -- generates </HEAD>
  HTP.BODYOPEN;         -- generates <BODY>
  HTP.HEADER(1, 'Hello'); -- generates <H1>Hello</H1>
  HTP.BODYCLOSE;        -- generates </BODY>
  HTP.HTMLCLOSE;        -- generates </HTML>
END;
```

225.4 HTP Summary of Tags

HTP tags can be grouped by type, to make understanding them easier.

HTML, HEAD, and BODY Tags

[HTMLOPEN Procedure](#), [HTMLCLOSE Procedure](#) - generate <HTML> and </HTML>

[HEADOPEN Procedure](#), [HEADCLOSE Procedure](#) - generate <HEAD> and </HEAD>

[BODYOPEN Procedure](#), [BODYCLOSE Procedure](#) - generate <BODY> and </BODY>

Comment Tag

[COMMENT Procedure](#) - generates <!-- and -->

Tags in the <HEAD> Area

[BASE Procedure](#) - generates <BASE>

[LINKREL Procedure](#) - generates <LINK> with the REL attribute

[LINKREV Procedure](#) - generates <LINK> with the REV attribute

[TITLE Procedure](#) - generates <TITLE>

[META Procedure](#) - generates <META>

[SCRIPT Procedure](#) - generates <SCRIPT>

[STYLE Procedure](#) - generates <STYLE>

[ISINDEX Procedure](#) - generates <ISINDEX>

Applet Tags

[APPLETOPEN Procedure](#), [APPLETCLOSE Procedure](#) - generate `<APPLET>` and `</APPLET>`

[PARAM Procedure](#) - generates `<PARAM>`

List Tags

[OLISTOPEN Procedure](#), [OLISTCLOSE Procedure](#) - generate `` and ``

[ULISTOPEN Procedure](#), [ULISTCLOSE Procedure](#) - generate `` and ``

[DLISTOPEN Procedure](#), [DLISTCLOSE Procedure](#) - generate `<DL>` and `</DL>`

[DLISTTERM Procedure](#) - generates `<DT>`

[DLISTDEF Procedure](#) - generates `<DD>`

[DIRLISTOPEN Procedure](#), [DIRLISTCLOSE Procedure](#) - generate `<DIR>` and `</DIR>`

[LISTHEADER Procedure](#) - generates `<LH>`

[LISTINGOPEN Procedure](#), [LISTINGCLOSE Procedure](#) - generate `<LISTING>` and `</LISTING>`

[MENULISTOPEN Procedure](#) - generate `<MENU>` and `</MENU>`

[LISTITEM Procedure](#) - generates ``

Form Tags

[FORMOPEN Procedure](#), [FORMCLOSE Procedure](#) - generate `<FORM>` and `</FORM>`

[FORMCHECKBOX Procedure](#) - generates `<INPUT TYPE="CHECKBOX">`

[FORMHIDDEN Procedure](#) - generates `<INPUT TYPE="HIDDEN">`

[FORMIMAGE Procedure](#) - generates `<INPUT TYPE="IMAGE">`

[FORMPASSWORD Procedure](#) - generates `<INPUT TYPE="PASSWORD">`

[FORMRADIO Procedure](#) - generates `<INPUT TYPE="RADIO">`

[FORMSELECTOPEN Procedure](#), [FORMSELECTCLOSE Procedure](#) - generate `<SELECT>` and `</SELECT>`

[FORMSELETOPTION Procedure](#) - generates `<OPTION>`

[FORMTEXT Procedure](#) - generates `<INPUT TYPE="TEXT">`

[FORMTEXTAREA Procedure](#) - generate `<TEXTAREA>`

[FORMTEXTAREAOPEN Procedure](#), [FORMTEXTAREACLOSE Procedure](#) - generate `<TEXTAREA>` and `</TEXTAREA>`

[FORMRESET Procedure](#) - generates `<INPUT TYPE="RESET">`

[FORMSUBMIT Procedure](#) - generates `<INPUT TYPE="SUBMIT">`

Table Tags

[TABLEOPEN Procedure](#), [TABLECLOSE Procedure](#) - generate `<TABLE>` and `</TABLE>`

[TABLECAPTION Procedure](#) - generates `<CAPTION>`

[TABLEROWOPEN Procedure](#), [TABLEROWCLOSE Procedure](#) - generate `<TR>` and `</TR>`

[TABLEHEADER Procedure](#) - generates `<TH>`

[TABLEDATA Procedure](#) - generates `<TD>`

IMG, HR, and A Tags

[HR Procedure](#), [LINE Procedure](#) - generate `<HR>`

[IMG Procedure](#), [IMG2 Procedure](#) - generate ``

[ANCHOR Procedure](#), [ANCHOR2 Procedure](#) - generate `<A>`

[MAOPEN Procedure](#), [MAPCLOSE Procedure](#) - generate `<MAP>` and `</MAP>`

Paragraph Formatting Tags

[HEADER Procedure](#) - generates heading tags (`<H1>` to `<H6>`)

[PARA Procedure](#), [PARAGRAPH Procedure](#) - generate `<P>`

[PRN Procedures](#), [PRINT Procedures](#) - generate any text that is passed in

[PRINTS Procedure](#), [PS Procedure](#) - generate any text that is passed in; special characters in HTML are escaped

[PREOPEN Procedure](#), [PRECLOSE Procedure](#) - generate `<PRE>` and `</PRE>`

[BLOCKQUOTEOPEN Procedure](#), [BLOCKQUOTECLOSE Procedure](#) - generate `<BLOCKQUOTE>` and `</BLOCKQUOTE>`

[DIV Procedure](#) - generates `<DIV>`

[NL Procedure](#), [BR Procedure](#) - generate `
`

[NOBR Procedure](#) - generates `<NOBR>`

[WBR Procedure](#) - generates `<WBR>`

[PLAINTEXT Procedure](#) - generates `<PLAINTEXT>`

[ADDRESS Procedure](#) - generates `<ADDRESS>`

[MAILTO Procedure](#) - generates `<A>` with the `MAILTO` attribute

[AREA Procedure](#) - generates `<AREA>`

[BGSOUND Procedure](#) - generates `<BGSOUND>`

Character Formatting Tags

[BASEFONT Procedure](#) - generates `<BASEFONT>`

BIG Procedure - generates <BIG>

BOLD Procedure - generates

CENTER Procedure - generates <CENTER> and </CENTER>

CENTEROPEN Procedure, CENTERCLOSE Procedure - generate <CENTER> and </CENTER>

CITE Procedure - generates <CITE>

CODE Procedure - generates <CODE>

DFN Procedure - generates <DFN>

EM Procedure, EMPHASIS Procedure - generate

FONTOPEN Procedure, FONTCLOSE Procedure - generate and

ITALIC Procedure - generates <I>

KBD Procedure, KEYBOARD Procedure - generate <KBD> and </KBD>

S Procedure - generates <S>

SAMPLE Procedure - generates <SAMP>

SMALL Procedure - generates <SMALL>

STRIKE Procedure - generates <STRIKE>

STRONG Procedure - generates

SUB Procedure - generates <SUB>

SUP Procedure - generates <SUP>

TELETYPE Procedure - generates <TT>

UNDERLINE Procedure - generates <U>

VARIABLE Procedure - generates <VAR>

Frame Tags

FRAME Procedure - generates <FRAME>

FRAMESETOPEN Procedure, FRAMESETCLOSE Procedure - generate <FRAMESET> and </FRAMESET>

NOFRAMESOPEN Procedure, NOFRAMESCLOSE Procedure - generate <NOFRAMES> and </NOFRAMES>

225.5 Summary of HTP Subprograms

This table lists the HTP subprograms and briefly describes them.

Table 225-1 HTP Package Subprograms

| Subprogram | Description |
|---|--|
| ADDRESS Procedure | Generates the <ADDRESS> and </ADDRESS> tags which specify the address, author and signature of a document |
| ANCHOR Procedure | Generates the <A> and tags which specify the source or destination of a hypertext link |
| ANCHOR2 Procedure | Generates the <A> and tags which specify the source or destination of a hypertext link |
| APPLETCLOSE Procedure | Closes the applet invocation with the </APPLET> tag |
| APPLETOPEN Procedure | Generates the <APPLET> tag which begins the invocation of a Java applet |
| AREA Procedure | Generates the <AREA> tag, which defines a client-side image map |
| BASE Procedure | Generates the <BASE> tag which records the URL of the document |
| BASEFONT Procedure | Generates the <BASEFONT> tag which specifies the base font size for a Web page |
| BGSOUND Procedure | Generates the <BGSOUND> tag which includes audio for a Web page |
| BIG Procedure | Generates the <BIG> and </BIG> tags which direct the browser to render the text in a bigger font |
| BLOCKQUOTECLOSE Procedure | Generates the </BLOCKQUOTE> tag which mark the end of a section of quoted text |
| BLOCKQUOTEOPEN Procedure | Generates the <BLOCKQUOTE> tag, which marks the beginning of a section of quoted text |
| BODYCLOSE Procedure | Generates the </BODY> tag which marks the end of a body section of an HTML document |
| BODYOPEN Procedure | Generates the <BODY> tag which marks the beginning of the body section of an HTML document |
| BOLD Procedure | Generates the and tags which direct the browser to display the text in boldface |
| BR Procedure | Generates the tag which begins a new line of text |
| CENTER Procedure | Generates the <CENTER> and </CENTER> tags which center a section of text within a Web page |
| CENTERCLOSE Procedure | Generates the </CENTER> tag which marks the end of a section of text to center |
| CENTEROPEN Procedure | Generates the <CENTER> tag which mark the beginning of a section of text to center |
| CITE Procedure | Generates the <CITE> and </CITE> tags which direct the browser to render the text as a citation |
| CODE Procedure | Generates the <CODE> and </CODE> tags which direct the browser to render the text in monospace font or however "code" is defined stylistically |
| COMMENT Procedure | Generates procedure generates the comment tags <!-- ctext --> |

Table 225-1 (Cont.) HTP Package Subprograms

| Subprogram | Description |
|------------------------|---|
| DFN Procedure | Generates the <DFN> and </DFN> tags which direct the browser to mark the text as italics or however "definition" is defined stylistically |
| DIRLISTCLOSE Procedure | Generates the </DIR> tag which ends a directory list section |
| DIRLISTOPEN Procedure | Generates the <DIR> which starts a directory list section |
| DIV Procedure | Generates the <DIV> tag which creates document divisions |
| DLISTCLOSE Procedure | Generates the </DL> tag which ends a definition list |
| DLISTDEF Procedure | Generates the <DD> tag, which inserts definitions of terms |
| DLISTOPEN Procedure | Generates the <DL> tag which starts a definition list |
| DLISTTERM Procedure | Generates the <DT> tag which defines a term in a definition list <DL> |
| EM Procedure | Generates the and tags, which define text to be emphasized |
| EMPHASIS Procedure | Generates the and tags, which define text to be emphasized |
| ESCAPE_SC Procedure | Replaces characters that have special meaning in HTML with their escape sequences |
| FONTCLOSE Procedure | Generates the tag which marks the end of a section of text with the specified font characteristics |
| FONTOPEN Procedure | Generates the which marks the beginning of section of text with the specified font characteristics |
| FORMCHECKBOX Procedure | Generates the <INPUT> tag with TYPE="checkbox" which inserts a checkbox element in a form |
| FORMCLOSE Procedure | Generates the </FORM> tag which marks the end of a form section in an HTML document |
| FORMOPEN Procedure | Generates the <FORM> tag which marks the beginning of a form section in an HTML document |
| FORMFILE Procedure | Generates the <INPUT> tag with TYPE="file" which inserts a file form element, and is used for file uploading for a given page |
| FORMHIDDEN Procedure | Generates the <INPUT> tag with TYPE="hidden" which inserts a hidden form element |
| FORMIMAGE Procedure | Generates the <INPUT> tag with TYPE="image" which creates an image field that the user clicks to submit the form immediately |
| FORMPASSWORD Procedure | Generates the <INPUT> tag with TYPE="password" which creates a single-line text entry field |
| FORMRADIO Procedure | Generates the <INPUT> tag with TYPE="radio", which creates a radio button on the HTML form |
| FORMRESET Procedure | Generates the <INPUT> tag with TYPE="reset" which creates a button that, when selected, resets the form fields to their initial values |

Table 225-1 (Cont.) HTP Package Subprograms

| Subprogram | Description |
|---|---|
| FORMSELECTCLOSE Procedure | Generates the <code></SELECT></code> tag which marks the end of a Select form element |
| FORMSELECTOPEN Procedure | Generates the <code></SELECT></code> tag which marks the beginning of a Select form element |
| FORMSELECTOPTION Procedure | Generates the <code><OPTION></code> tag which represents one choice in a Select element |
| FORMSUBMIT Procedure | Generates the <code><INPUT></code> tag with <code>TYPE="submit"</code> which creates a button that, when clicked, submits the form |
| FORMTEXT Procedure | Generates the <code><INPUT></code> tag with <code>TYPE="text"</code> , which creates a field for a single line of text |
| FORMTEXTAREA Procedure | Generates the <code><TEXTAREA></code> tag, which creates a text field that has no predefined text in the text area |
| FORMTEXTAREA2 Procedure | Generates the <code><TEXTAREA></code> tag, which creates a text field that has no predefined text in the text area with the ability to specify a wrap style |
| FORMTEXTAREACLOSE Procedure | Generates the <code></TEXTAREA></code> tag which ends a text area form element |
| FORMTEXTAREAOPEN Procedure | Generates the <code><TEXTAREA></code> which marks the beginning of a text area form element |
| FORMTEXTAREAOPEN2 Procedure | Generates the <code><TEXTAREA></code> which marks the beginning of a text area form element with the ability to specify a wrap style |
| FRAME Procedure | Generates the <code><FRAME></code> tag which begins the characteristics of a frame created by a <code><FRAMESET></code> tag |
| FRAMESETCLOSE Procedure | Generates the <code></FRAMESET></code> tag which ends a frameset section |
| FRAMESETOPEN Procedure | Generates the <code></FRAMESET></code> tag which begins a frameset section |
| HEADCLOSE Procedure | Generates the <code></HEAD></code> tag which marks the end of an HTML document head section |
| HEADER Procedure | Generates opening heading tags (<code><H1></code> to <code><H6></code>) and their corresponding closing tags (<code></H1></code> to <code></H6></code>) |
| HEADOPEN Procedure | Generates the <code><HEAD></code> tag which marks the beginning of the HTML document head section |
| HR Procedure | Generates the <code><HR></code> tag, which generates a line in the HTML document |
| HTMLCLOSE Procedure | Generates the <code></HTML></code> tag which marks the end of an HTML document |
| HTMLOPEN Procedure | Generates the <code><HTML></code> tag which marks the beginning of an HTML document |
| IMG Procedure | Generates the <code></code> tag which directs the browser to load an image onto the HTML page |
| IMG2 Procedure | Generates the <code></code> tag which directs the browser to load an image onto the HTML page with the option of specifying values for the <code>USEMAP</code> attribute |

Table 225-1 (Cont.) HTP Package Subprograms

| Subprogram | Description |
|-------------------------|---|
| ISINDEX Procedure | Creates a single entry field with a prompting text, such as "enter value," then sends that value to the URL of the page or program |
| ITALIC Procedure | Generates the <I> and </I> tags which direct the browser to render the text in italics |
| KBD Procedure | Generates the <KBD> and </KBD> tags which direct the browser to render the text in monospace font |
| KEYBOARD Procedure | Generates the <KBD> and </KBD> tags, which direct the browser to render the text in monospace font |
| LINE Procedure | Generates the <HR> tag, which generates a line in the HTML document |
| LINKREL Procedure | Generates the <LINK> tag with the REL attribute which delineates the relationship described by the hypertext link from the anchor to the target |
| LINKREV Procedure | Generates the <LINK> tag with the REV attribute which delineates the relationship described by the hypertext link from the target to the anchor |
| LISTHEADER Procedure | Generates the <LH> and </LH> tags which print an HTML tag at the beginning of the list |
| LISTINGCLOSE Procedure | Generates the </LISTING> tags which marks the end of a section of fixed-width text in the body of an HTML page |
| LISTINGOPEN Procedure | Generates the <LISTING> tag which marks the beginning of a section of fixed-width text in the body of an HTML page |
| LISTITEM Procedure | Generates the tag, which indicates a list item |
| MAILTO Procedure | Generates the <A> tag with the HREF set to 'mailto' prepended to the mail address argument |
| MAPCLOSE Procedure | Generates the </MAP> tag which marks the end of a set of regions in a client-side image map |
| MAPOPEN Procedure | Generates the <MAP> tag which mark the beginning of a set of regions in a client-side image map |
| MENULISTCLOSE Procedure | Generates the </MENU> tag which ends a list that presents one line for each item |
| MENULISTOPEN Procedure | Generates the <MENU> tag which begins a list that presents one line for each item |
| META Procedure | Generates the <META> tag, which embeds meta-information about the document and also specifies values for HTTP headers |
| NL Procedure | Generates the tag which begins a new line of text |
| NOBR Procedure | Generates the <NOBR> and </NOBR> tags which turn off line-breaking in a section of text |
| NOFRAMESCLOSE Procedure | Generates the </NOFRAMES> tag which marks the end of a no-frames section |
| NOFRAMESOPEN Procedure | Generates the <NOFRAMES> tag which mark the beginning of a no-frames section |

Table 225-1 (Cont.) HTP Package Subprograms

| Subprogram | Description |
|--------------------------------------|--|
| OLISTCLOSE Procedure | Generates the <code></code> tag which defines the end of an ordered list |
| OLISTOPEN Procedure | Generates the <code></code> tag which marks the beginning of an ordered list |
| PARA Procedure | Generates the <code><P></code> tag which indicates that the text that comes after the tag is to be formatted as a paragraph |
| PARAGRAPH Procedure | Adds attributes to the <code><P></code> tag |
| PARAM Procedure | Generates the <code><PARAM></code> tag which specifies parameter values for Java applets |
| PLAINTEXT Procedure | Generates the <code><PLAINTEXT></code> and <code></PLAINTEXT></code> tags which direct the browser to render the text they surround in fixed-width type |
| PRECLOSE Procedure | Generates the <code></PRE></code> tag which marks the end of a section of preformatted text in the body of the HTML page |
| PREOPEN Procedure | Generates the <code><PRE></code> tag which marks the beginning of a section of preformatted text in the body of the HTML page |
| PRINT Procedures | Generates the specified parameter as a string terminated with the <code>\n</code> newline character |
| PRINTS Procedure | Generates a string and replaces the following characters with the corresponding escape sequence |
| PRN Procedures | Generates the specified parameter as a string |
| PS Procedure | Generates a string and replaces the following characters with the corresponding escape sequence. |
| S Procedure | Generates the <code><S></code> and <code></S></code> tags which direct the browser to render the text they surround in strikethrough type |
| SAMPLE Procedure | Generates the <code><SAMP></code> and <code></SAMP></code> tags which direct the browser to render the text they surround in monospace font or however "sample" is defined stylistically |
| SCRIPT Procedure | Generates the <code><SCRIPT></code> and <code></SCRIPT></code> tags which contain a script written in languages such as JavaScript and VBscript |
| SMALL Procedure | Generates the <code><SMALL></code> and <code></SMALL></code> tags, which direct the browser to render the text they surround using a small font |
| STRIKE Procedure | Generates the <code><STRIKE></code> and <code></STRIKE></code> tags which direct the browser to render the text they surround in strikethrough type |
| STRONG Procedure | Generates the <code></code> and <code></code> tags which direct the browser to render the text they surround in bold or however "strong" is defined stylistically |
| STYLE Procedure | Generates the <code><STYLE></code> and <code></STYLE></code> tags which include a style sheet in a Web page |
| SUB Procedure | Generates the <code><SUB></code> and <code></SUB></code> tags which direct the browser to render the text they surround as subscript |
| SUP Procedure | Generates the <code><SUP></code> and <code></SUP></code> tags which direct the browser to render the text they surround as superscript |

Table 225-1 (Cont.) HTP Package Subprograms

| Subprogram | Description |
|---|---|
| TABLECAPTION Procedure | Generates the <CAPTION> and </CAPTION> tags which place a caption in an HTML table |
| TABLECLOSE Procedure | Generates the </TABLE> tag which marks the end of an HTML table |
| TABLEDATA Procedure | Generates the <TD> and </TD> tags which insert data into a cell of an HTML table |
| TABLEHEADER Procedure | Generates the <TH> and </TH> tags which insert a header cell in an HTML table. |
| TABLEOPEN Procedure | Generates the <TABLE> tag which marks the beginning of an HTML table |
| TABLEROWCLOSE Procedure | Generates the </TR> tag which marks the end of a new row in an HTML table |
| TABLEROWOPEN Procedure | Generates the <TR> tag which marks the beginning of a new row in an HTML table |
| TELETYPE Procedure | Generates the <TT> and </TT> tags which direct the browser to render the text they surround in a fixed width typewriter font, for example, the courier font |
| TITLE Procedure | Generates the <TITLE> and </TITLE> tags which specify the text to display in the titlebar of the browser window |
| ULISTCLOSE Procedure | Generates the tag which marks the end of an unordered list |
| ULISTOPEN Procedure | Generates the tag which marks the beginning of an unordered list |
| UNDERLINE Procedure | Generates the <U> and </U> tags, which direct the browser to render the text they surround with an underline |
| VARIABLE Procedure | Generates the <VAR> and </VAR> tags which direct the browser to render the text they surround in italics or however "variable" is defined stylistically. |
| WBR Procedure | Generates the <WBR> tag, which inserts a soft line break within a section of NOBR text |

225.5.1 ADDRESS Procedure

This procedure generates the <ADDRESS> and </ADDRESS> tags which specify the address, author and signature of a document.

Syntax

```
HTP.ADDRESS (
    cvalue          IN          VARCHAR2
    cnowrap        IN          VARCHAR2  DEFAULT NULL
    cclear         IN          VARCHAR2  DEFAULT NULL
    cattributes    IN          VARCHAR2  DEFAULT NULL);
```

Parameters

Table 225-2 ADDRESS Procedure Parameters

| Parameter | Description |
|--------------------------|---|
| <code>cvalue</code> | The string that goes between the <code><ADDRESS></code> and <code></ADDRESS></code> tags. |
| <code>cnowrap</code> | If the value for this parameter is not NULL, the <code>NOWRAP</code> attribute is included in the tag |
| <code>cclear</code> | The value for the <code>CLEAR</code> attribute. |
| <code>cattributes</code> | The other attributes to be included as-is in the tag |

Examples

This procedure generates

```
<ADDRESS CLEAR="cclear" NOWRAP cattributes>cvalue</ADDRESS>
```

225.5.2 ANCHOR Procedure

Like the `ANCHOR2` procedure, this procedure generates the `<A>` and `` HTML tags which specify the source or destination of a hypertext link.

The difference between these subprograms is that the [ANCHOR2 Procedure](#) provides a target and therefore can be used for a frame.

Syntax

```
HTP.ANCHOR (
  curl          IN          VARCHAR2,
  ctext         IN          VARCHAR2,
  cname         IN          VARCHAR2  DEFAULT NULL,
  cattributes   IN          VARCHAR2  DEFAULT NULL);
```

Parameters

Table 225-3 ANCHOR Procedure Parameters

| Parameter | Description |
|--------------------------|---|
| <code>curl</code> | The value for the <code>HREF</code> attribute. |
| <code>ctext</code> | The string that goes between the <code><A></code> and <code></code> tags. |
| <code>cname</code> | The value for the <code>NAME</code> attribute. |
| <code>cattributes</code> | The other attributes to be included as-is in the tag. |

Examples

This procedure generates

```
<A HREF="curl" NAME="cname" cattributes>ctext</A>
```

Usage Notes

This tag accepts several attributes, but either `HREF` or `NAME` is required. `HREF` specifies to where to link. `NAME` allows this tag to be a target of a hypertext link.

225.5.3 ANCHOR2 Procedure

Like the `ANCHOR` procedure, this procedure generates the `<A>` and `` HTML tags which specify the source or destination of a hypertext link.

The difference between this procedure and the `ANCHOR` procedure is that this procedure provides a target and therefore can be used for a frame.

Syntax

```
HTP.ANCHOR2 (  
    curl           IN          VARCHAR2,  
    ctext          IN          VARCHAR2,  
    cname          IN          VARCHAR2  DEFAULT NULL,  
    ctarget        in          varchar2  DEFAULT NULL,  
    cattributes    IN          VARCHAR2  DEFAULT NULL);
```

Parameters

Table 225-4 ANCHOR2 Procedure Parameters

| Parameter | Description |
|--------------------------|---|
| <code>curl</code> | The value for the <code>HREF</code> attribute. |
| <code>ctext</code> | The string that goes between the <code><A></code> and <code></code> tags. |
| <code>cname</code> | The value for the <code>NAME</code> attribute |
| <code>ctarget</code> | The value for the <code>TARGET</code> attribute. |
| <code>cattributes</code> | The other attributes to be included as-is in the tag |

Examples

This procedure generates

```
<A HREF="curl" NAME="cname" TARGET = "ctarget" cattributes>ctext</A>
```

225.5.4 APPLETCLOSE Procedure

This procedure closes the applet invocation with the `</APPLET>` tag.

You must first invoke the a Java applet using [APPLETOPEN Procedure](#).

Syntax

```
HTP.APPLETCLOSE;
```

225.5.5 APPLETOPEN Procedure

This procedure generates the `<APPLET>` tag which begins the invocation of a Java applet.

You close the applet invocation with [APPLETCLOSE Procedure](#) which generates the `</APPLET>` tag.

Syntax

```
HTP.APPLETOPEN (  
    ccode          IN          VARCHAR2,  
    cheight       IN          NUMBER,  
    cwidth        IN          NUMBER,  
    cattributes   IN          VARCHAR2 DEFAULT NULL);
```

Parameters

Table 225-5 APPLETOPEN Procedure Parameters

| Parameter | Description |
|--------------------------|---|
| <code>ccode</code> | The the value for the <code>CODE</code> attribute which specifies the name of the applet class. |
| <code>cheight</code> | The value for the <code>HEIGHT</code> attribute. |
| <code>cwidth</code> | The value for the <code>WIDTH</code> attribute. |
| <code>cattributes</code> | The other attributes to be included as-is in the tag. |

Examples

This procedure generates

```
<APPLET CODE=ccode HEIGHT=cheight WIDTH=cwidth cattributes>
```

so that, for example,

```
HTP.appletopen('testclass.class', 100, 200, 'CODEBASE="/ows-applets"')
```

generates

```
<APPLET CODE="testclass.class" height=100 width=200 CODEBASE="/ows-applets">
```

Usage Notes

- Specify parameters to the Java applet using the [PARAM Procedure](#).
- Use the `cattributes` parameter to specify the `CODEBASE` attribute since the PL/SQL cartridge does not know where to find the class files. The `CODEBASE` attribute specifies the virtual path containing the class files.

225.5.6 AREA Procedure

This procedure generates the <AREA> tag, which defines a client-side image map. The <AREA> tag defines areas within the image and destinations for the areas.

Syntax

```
HTP.AREA (
  ccoords          IN          VARCHAR2
  cshape           IN          VARCHAR2  DEFAULT NULL,
  chref            IN          VARCHAR2  DEFAULT NULL,
  cnohref          IN          VARCHAR2  DEFAULT NULL,
  ctarger          IN          VARCHAR2  DEFAULT NULL,
  cattributes      IN          VARCHAR2  DEFAULT NULL);
```

Parameters

Table 225-6 AREA Procedure Parameters

| Parameter | Description |
|-------------|--|
| ccords | The the value for the COORDS attribute. |
| cshape | The value for the SHAPE attribute. |
| chref | The value for the HREF attribute. |
| cnohref | If the value for this parameter is not NULL, the NOHREF attribute is added to the tag. |
| ctarger | The value for the TARGET attribute. |
| cattributes | The other attributes to be included as-is in the tag. |

Examples

This procedure generates

```
<AREA COORDS="ccoords" SHAPE="cshape" HREF="chref" NOHREF TARGET="ctarger" cattributes>
```

225.5.7 BASE Procedure

This procedure generates the <BASE> tag which records the URL of the document.

Syntax

```
HTP.BASE (
  ctarger          IN          VARCHAR2  DEFAULT NULL,
  cattributes      IN          VARCHAR2  DEFAULT NULL);
```

Parameters

Table 225-7 BASE Procedure Parameters

| Parameter | Description |
|-----------|--|
| ctarger | The value for the TARGET attribute which establishes a window name to which all links in this document are targeted. |

Table 225-7 (Cont.) BASE Procedure Parameters

| Parameter | Description |
|--------------------------|---|
| <code>cattributes</code> | The other attributes to be included as-is in the tag. |

Examples

This procedure generates

```
<BASE HREF="<current URL>" TARGET="ctarget" cattributes>
```

225.5.8 BASEFONT Procedure

This procedure generates the `<BASEFONT>` tag which specifies the base font size for a Web page.

Syntax

```
HTP.BASEFONT (
    nsize    IN    INTEGER);
```

Parameters**Table 225-8 BASEFONT Procedure Parameters**

| Parameter | Description |
|--------------------|--|
| <code>nsize</code> | The value for the <code>SIZE</code> attribute. |

Examples

This procedure generates

```
<BASEFONT SIZE="nsize">
```

225.5.9 BGSOUND Procedure

This procedure generates the `<BGSOUND>` tag which includes audio for a Web page.

Syntax

```
HTP.BGSOUND (
    csrc          IN    VARCHAR2,
    cloop         IN    VARCHAR2  DEFAULT NULL,
    cattributes   IN    VARCHAR2  DEFAULT NULL);
```

Parameters**Table 225-9 BGSOUND Procedure Parameters**

| Parameter | Description |
|-------------------|---|
| <code>csrc</code> | The value for the <code>SRC</code> attribute. |

Table 225-9 (Cont.) BGSOUND Procedure Parameters

| Parameter | Description |
|--------------------------|---|
| <code>cloop</code> | The value for the <code>LOOP</code> attribute. |
| <code>cattributes</code> | The other attributes to be included as-is in the tag. |

Examples

This procedure generates

```
<BGSOUND SRC="csrc" LOOP="cloop" cattributes>
```

225.5.10 BIG Procedure

This procedure generates the `<BIG>` and `</BIG>` tags which direct the browser to render the text in a bigger font.

Syntax

```
HTP.BIG (
    ctext          IN          VARCHAR2,
    cattributes    IN          VARCHAR2  DEFAULT NULL);
```

Parameters**Table 225-10 BIG Procedure Parameters**

| Parameter | Description |
|--------------------------|---|
| <code>ctext</code> | The the text that goes between the tags. |
| <code>cattributes</code> | The other attributes to be included as-is in the tag. |

Examples

This procedure generates

```
<BIG cattributes>ctext</BIG>
```

225.5.11 BLOCKQUOTECLOSE Procedure

This procedure generates the `</BLOCKQUOTE>` tag which mark the end of a section of quoted text.

You mark the beginning of a section of text by means of the [BLOCKQUOTEOPEN Procedure](#).

Syntax

```
HTP.BLOCKQUOTECLOSE;
```

Examples

This procedure generates

</BLOCKQUOTE>

225.5.12 BLOCKQUOTEOPEN Procedure

This procedure generates the <BLOCKQUOTE> tag, which marks the beginning of a section of quoted text.

You mark the end of a section of text by means of the [BLOCKQUOTECLOSE Procedure](#).

Syntax

```
HTP.BLOCKQUOTEOPEN (
  cnowrap      IN      VARCHAR2  DEFAULT NULL,
  cclear       IN      VARCHAR2  DEFAULT NULL,
  cattributes  IN      VARCHAR2  DEFAULT NULL);
```

Parameters

Table 225-11 BLOCKQUOTEOPEN Procedure Parameters

| Parameter | Description |
|-------------|--|
| cnowrap | If the value for this parameter is not NULL, the NOWRAP attribute is added to the tag. |
| cclear | The value for the CLEAR attribute. |
| cattributes | The other attributes to be included as-is in the tag. |

Examples

This procedure generates

```
<BLOCKQUOTE CLEAR="cclear" NOWRAP cattributes>
```

225.5.13 BODYCLOSE Procedure

This procedure generates the </BODY> tag which marks the end of a body section of an HTML document.

You mark the beginning of a body section by means of the [BODYOPEN Procedure](#).

Syntax

```
HTP.BODYCLOSE;
```

Examples

This procedure generates

```
</BODY>
```

225.5.14 BODYOPEN Procedure

This procedure generates the `<BODY>` tag which marks the beginning of the body section of an HTML document.

You mark the end of a body section by means of the [BODYCLOSE Procedure](#).

Syntax

```
HTP.BODYOPEN (
    cbackground IN VARCHAR2 DEFAULT NULL,
    cattributes IN VARCHAR2 DEFAULT NULL);
```

Parameters

Table 225-12 BODYOPEN Procedure Parameters

| Parameter | Description |
|--------------------------|---|
| <code>cbackground</code> | The value for the <code>BACKGROUND</code> attribute which specifies a graphic file to use for the background of the document. |
| <code>cattributes</code> | The other attributes to be included as-is in the tag. |

Examples

This procedure generates

```
<BODY background="cbackground" cattributes>
```

so that

```
HTP.BODYOPEN('/img/background.gif');
```

generates:

```
<BODY background="/img/background.gif">
```

225.5.15 BOLD Procedure

This procedure generates the `` and `` tags which direct the browser to display the text in boldface.

Syntax

```
HTP.BOLD (
    ctext IN VARCHAR2,
    cattributes IN VARCHAR2 DEFAULT NULL);
```

Parameters

Table 225-13 BOLD Procedure Parameters

| Parameter | Description |
|--------------------|--------------------------------------|
| <code>ctext</code> | The text that goes between the tags. |

Table 225-13 (Cont.) BOLD Procedure Parameters

| Parameter | Description |
|--------------------------|---|
| <code>cattributes</code> | The other attributes to be included as-is in the tag. |

Examples

This procedure generates

```
<B cattributes>ctext</B>
```

225.5.16 BR Procedure

This procedure generates the `
` tag which begins a new line of text.

It performs the same operation as the [NL Procedure](#).

Syntax

```
HTP.BR (
  cclear          IN          VARCHAR2  DEFAULT NULL,
  cattributes     IN          VARCHAR2  DEFAULT NULL);
```

Parameters**Table 225-14 BR Procedure Parameters**

| Parameter | Description |
|--------------------------|---|
| <code>cclear</code> | The value for the <code>CLEAR</code> attribute. |
| <code>cattributes</code> | The other attributes to be included as-is in the tag. |

Examples

This procedure generates

```
<BR CLEAR="cclear" cattributes>
```

225.5.17 CENTER Procedure

This procedure generates the `<CENTER>` and `</CENTER>` tags which center a section of text within a Web page.

Syntax

```
HTP.CENTER (
  ctext          IN          VARCHAR2);
```

Parameters

Table 225-15 CENTER Parameters

| Parameter | Description |
|----------------------------------|--------------------------------------|
| <code>c</code> <code>text</code> | The text that goes between the tags. |

Examples

This procedure generates

```
<CENTER>c
```

`text`

```
</CENTER>
```

225.5.18 CENTERCLOSE Procedure

This procedure generates the `</CENTER>` tag which marks the end of a section of text to center.

You mark the beginning of a section of text to center with the [CENTEROPEN Procedure](#).

Syntax

```
HTP.CENTERCLOSE;
```

Examples

This procedure generates

```
</CENTER>
```

225.5.19 CENTEROPEN Procedure

This procedure generates the `<CENTER>` tag which mark the beginning of a section of text to center.

You mark the beginning of a of a section of text to center by means of the [CENTERCLOSE Procedure](#).

Syntax

```
HTP.CENTEROPEN;
```

Examples

This procedure generates

```
<CENTER>
```

225.5.20 CITE Procedure

This procedure generates the `<CITE>` and `</CITE>` tags which direct the browser to render the text as a citation.

Syntax

```
HTP.CITE (  
    ctext          IN          VARCHAR2,  
    cattributes    IN          VARCHAR2  DEFAULT NULL);
```

Parameters

Table 225-16 CITE Procedure Parameters

| Parameter | Description |
|--------------------------|---|
| <code>ctext</code> | The text to render as citation. |
| <code>cattributes</code> | The other attributes to be included as-is in the tag. |

Examples

This procedure generates

```
<CITE cattributes>ctext</CITE>
```

225.5.21 CODE Procedure

This procedure generates the `<CODE>` and `</CODE>` tags which direct the browser to render the text in monospace font or however "code" is defined stylistically.

Syntax

```
HTP.CODE (  
    ctext          IN          VARCHAR2,  
    cattributes    IN          VARCHAR2  DEFAULT NULL);
```

Parameters

Table 225-17 CODE Procedure Parameters

| Parameter | Description |
|--------------------------|--|
| <code>ctext</code> | The text to render as code. |
| <code>cattributes</code> | The other attributes to be included as-is in the tag |

Examples

This procedure generates

```
<CODE cattributes>ctext</CODE>
```

225.5.22 COMMENT Procedure

This procedure generates the comment tags.

Syntax

```
HTP.COMMENT (  
    ctext          IN          VARCHAR2);
```

Parameters

Table 225-18 COMMENT Procedure Parameters

| Parameter | Description |
|-----------|--------------|
| ctext | The comment. |

Examples

This procedure generates

```
<!-- ctext -->
```

225.5.23 DFN Procedure

This procedure generates the `<DFN>` and `</DFN>` tags which direct the browser to mark the text in italics or however "definition" is described stylistically.

Syntax

```
HTP.DFN (  
    ctext          IN          VARCHAR2);
```

Parameters

Table 225-19 DFN Procedure Parameters

| Parameter | Description |
|-----------|--------------------------------|
| ctext | The text to render in italics. |

Examples

This procedure generates

```
<DFN>ctext</DFN>
```

225.5.24 DIRLISTCLOSE Procedure

This procedure generates the `</DIR>` tag which ends a directory list section. You start a directory list section with the DIRLISTOPEN Procedure.

Syntax

```
HTP.DIRLISTCLOSE;
```

Usage Notes

A directory list presents a list of items that contains up to 20 characters. Items in this list are typically arranged in columns, 24 characters wide. Insert the tag directly or invoke the [LISTITEM Procedure](#) so that the tag appears directly after the </DIR> tag to define the items as a list.

Examples

This procedure generates

```
</DIR>
```

Related Topics

- [DIRLISTOPEN Procedure](#)
This procedure generates the <DIR> which starts a directory list section. You end a directory list section with the DIRLISTCLOSE Procedure.

225.5.25 DIRLISTOPEN Procedure

This procedure generates the <DIR> which starts a directory list section. You end a directory list section with the DIRLISTCLOSE Procedure.

Syntax

```
HTP.DIRLISTOPEN;
```

Usage Notes

A directory list presents a list of items that contains up to 20 characters. Items in this list are typically arranged in columns, 24 characters wide. Insert the tag directly or invoke the [LISTITEM Procedure](#) so that the tag appears directly after the </DIR> tag to define the items as a list.

Examples

This procedure generates

```
<DIR>
```

Related Topics

- [DIRLISTCLOSE Procedure](#)
This procedure generates the </DIR> tag which ends a directory list section. You start a directory list section with the DIRLISTOPEN Procedure.

225.5.26 DIV Procedure

This procedure generates the <DIV> tag which creates document divisions.

Syntax

```
HTP.DIV (  
    calign          IN          VARCHAR2    DEFAULT NULL,  
    cattributes    IN          VARCHAR2    DEFAULT NULL);
```

Parameters

Table 225-20 DIV Procedure Parameters

| Parameter | Description |
|--------------------------|---|
| <code>calign</code> | The value for the <code>ALIGN</code> attribute. |
| <code>cattributes</code> | The other attributes to be included as-is in the tag. |

Examples

This procedure generates

```
<DIV ALIGN="calign" cattributes>
```

225.5.27 DLISTCLOSE Procedure

This procedure generates the `</DL>` tag which ends a definition list. You start a definition list by means of the [DLISTOPEN Procedure](#).

Syntax

```
HTP.DLISTCLOSE;
```

Usage Notes

A definition list looks like a glossary: it contains terms and definitions. Terms are inserted using the [DLISTTERM Procedure](#) and definitions are inserted using the [DLISTDEF Procedure](#).

Examples

This procedure generates

```
</DL>
```

Related Topics

- [DLISTOPEN Procedure](#)
This procedure generates the `<DL>` tag which starts a definition list. You end a definition list by means of the [DLISTCLOSE Procedure](#).

225.5.28 DLISTDEF Procedure

This procedure generates the `<DD>` tag, which inserts definitions of terms. Use this tag for a definition list `<DL>`. Terms are tagged `<DT>` and definitions are tagged `<DD>`.

Syntax

```
HTP.DLISTDEF (
  ctext          IN          VARCHAR2  DEFAULT NULL,
  cclear        IN          VARCHAR2  DEFAULT NULL,
  cattributes    IN          VARCHAR2  DEFAULT NULL);
```

Parameters

Table 225-21 DLISTDEF Procedure Parameters

| Parameter | Description |
|--------------------------|---|
| <code>ctext</code> | The definition of the term. |
| <code>cclear</code> | The value for the <code>CLEAR</code> attribute. |
| <code>cattributes</code> | The other attributes to be included as-is in the tag. |

Examples

This procedure generates

```
<DD CLEAR="cclear" cattributes>ctext
```

225.5.29 DLISTOPEN Procedure

This procedure generates the `<DL>` tag which starts a definition list. You end a definition list by means of the `DLISTCLOSE` Procedure.

Syntax

```
HTP.DLISTOPEN (
  cclear      IN      VARCHAR2  DEFAULT NULL,
  cattributes IN      VARCHAR2  DEFAULT NULL);
```

Parameters

Table 225-22 DLISTOPEN Procedure Parameters

| Parameter | Description |
|--------------------------|---|
| <code>cclear</code> | The value for the <code>CLEAR</code> attribute. |
| <code>cattributes</code> | The other attributes to be included as-is in the tag. |

Usage Notes

A definition list looks like a glossary: it contains terms and definitions. Terms are inserted using the [DLISTTERM Procedure](#) and definitions are inserted using the [DLISTDEF Procedure](#).

Examples

This procedure generates

```
<DL CLEAR="cclear" cattributes>
```

Related Topics

- [DLISTCLOSE Procedure](#)
This procedure generates the `</DL>` tag which ends a definition list. You start a definition list by means of the `DLISTOPEN` Procedure.

225.5.30 DLISTTERM Procedure

This procedure generates the <DT> tag which defines a term in a definition list <DL>.

Syntax

```
HTP.DLISTTERM (
  ctext          IN          VARCHAR2  DEFAULT NULL,
  cclear         IN          VARCHAR2  DEFAULT NULL,
  cattributes    IN          VARCHAR2  DEFAULT NULL);
```

Parameters

Table 225-23 DLISTTERM Procedure Parameters

| Parameter | Description |
|-------------|---|
| ctext | The term. |
| cclear | The value for the CLEAR attribute. |
| cattributes | The other attributes to be included as-is in the tag. |

Examples

This procedure generates

```
<DT CLEAR="cclear" cattributes>ctext
```

225.5.31 EM Procedure

This procedure generates the and tags, which define text to be emphasized.

It performs the same task as the [EMPHASIS Procedure](#).

Syntax

```
HTP.EM(
  ctext          IN          VARCHAR2,
  cattributes    IN          VARCHAR2  DEFAULT NULL);
```

Parameters

Table 225-24 EM Procedure Parameters

| Parameter | Description |
|-------------|---|
| ctext | The text to emphasize. |
| cattributes | The other attributes to be included as-is in the tag. |

Examples

This procedure generates

```
<EM cattributes>ctext</EM>
```

225.5.32 EMPHASIS Procedure

This procedure generates the `` and `` tags, which define text to be emphasized.

It performs the same task as the [EM Procedure](#).

Syntax

```
HTP.EMPHASIS (  
    ctext          IN          VARCHAR2,  
    cattributes    IN          VARCHAR2  DEFAULT NULL);
```

Parameters

Table 225-25 EMPHASIS Procedure Parameters

| Parameter | Description |
|--------------------------|---|
| <code>ctext</code> | The text to emphasize. |
| <code>cattributes</code> | The other attributes to be included as-is in the tag. |

Examples

This procedure generates

```
<EM cattributes>ctext</EM>
```

225.5.33 ESCAPE_SC Procedure

This procedure replaces characters that have special meaning in HTML with their escape sequences.

The following characters are converted:

- `&` to `&`
- `"` to `"`
- `<` to `<`
- `>` to `>`

This procedure performs the same operation as [PRINTS Procedures](#) and [PS Procedure](#).

Syntax

```
HTP.ESCAPE_SC (  
    ctext          IN          VARCHAR2);
```

Parameters**Table 225-26 ESCAPE_SC Procedure Parameters**

| Parameter | Description |
|---------------------|-----------------------------|
| c <code>text</code> | The text string to convert. |

225.5.34 FONTCLOSE Procedure

This procedure generates the `` tag which marks the end of a section of text with the specified font characteristics.

You mark the beginning of the section text by means of the [FONTOPEN Procedure](#).

Syntax

```
HTP.FONTCLOSE;
```

Examples

This procedure generates

```
</FONT>
```

225.5.35 FONTOPEN Procedure

This procedure generates the `` which marks the beginning of section of text with the specified font characteristics.

You mark the end of the section text by means of the [FONTCLOSE Procedure](#).

Syntax

```
HTP.FONTOPEN(
  ccolor      IN      VARCHAR2  DEFAULT NULL,
  cface       IN      VARCHAR2  DEFAULT NULL,
  csize       IN      VARCHAR2  DEFAULT NULL,
  cattributes IN      VARCHAR2  DEFAULT NULL);
```

Parameters**Table 225-27 FONTOPEN Procedure Parameters**

| Parameter | Description |
|---------------------------|---|
| c <code>color</code> | The value for the <code>COLOR</code> attribute. |
| c <code>face</code> | The value for the <code>FACE</code> attribute |
| c <code>size</code> | The value for the <code>SIZE</code> attribute |
| c <code>attributes</code> | The other attributes to be included as-is in the tag. |

Examples

This procedure generates

```
<FONT COLOR="ccolor" FACE="cface" SIZE="csize" cattributes>
```

225.5.36 FORMCHECKBOX Procedure

This procedure generates the `<INPUT>` tag with `TYPE="checkbox"` which inserts a checkbox element in a form.

A checkbox element is a button that the user toggles on or off.

Syntax

```
HTP.FORMCHECKBOX (
  cname          IN          VARCHAR2,
  cvalue         IN          VARCHAR2  DEFAULT 'ON',
  cchecked       IN          VARCHAR2  DEFAULT NULL,
  cattributes    IN          VARCHAR2  DEFAULT NULL);
```

Parameters

Table 225-28 FORMCHECKBOX Procedure Parameters

| Parameter | Description |
|--------------------------|--|
| <code>cname</code> | The value for the <code>NAME</code> attribute. |
| <code>cvalue</code> | The value for the <code>VALUE</code> attribute. |
| <code>cchecked</code> | If the value for this parameter is not <code>NULL</code> , the <code>CHECKED</code> attribute is added to the tag. |
| <code>cattributes</code> | The other attributes to be included as-is in the tag. |

Examples

This procedure generates

```
<INPUT TYPE="checkbox" NAME="cname" VALUE="cvalue" CHECKED cattributes>
```

225.5.37 FORMCLOSE Procedure

This procedure generates the `</FORM>` tag which marks the end of a form section in an HTML document.

You mark the beginning of the form section by means of the [FORMOPEN Procedure](#).

Syntax

```
HTP.FORMCLOSE;
```

Examples

This procedure generates

```
</FORM>
```

225.5.38 FORMOPEN Procedure

This procedure generates the `<FORM>` tag which marks the beginning of a form section in an HTML document.

You mark the end of the form section by means of the [FORMCLOSE Procedure](#).

Syntax

```
HTP.FORMOPEN (
    curl           IN          VARCHAR2,
    cmethod       IN          VARCHAR2  DEFAULT 'POST',
    ctarget       IN          VARCHAR2  DEFAULT NULL,
    cenctype      IN          VARCHAR2  DEFAULT NULL,
    cattributes   IN          VARCHAR2  DEFAULT NULL);
```

Parameters

Table 225-29 FORMOPEN Procedure Parameters

| Parameter | Description |
|--------------------------|--|
| <code>curl</code> | The URL of the WRB or CGI script where the contents of the form is sent. This parameter is required. |
| <code>cmethod</code> | The value for the <code>METHOD</code> attribute. The value can be "GET" or "POST". |
| <code>ctarget</code> | The value for the <code>TARGET</code> attribute. |
| <code>cenctype</code> | The value for the <code>ENCTYPE</code> attribute. |
| <code>cattributes</code> | The other attributes to be included as-is in the tag. |

Examples

This procedure generates

```
<FORM ACTION="curl" METHOD="cmethod" TARGET="ctarget" ENCTYPE="cenctype" cattributes>
```

225.5.39 FORMFILE Procedure

This procedure generates the `<INPUT>` tag with `TYPE="file"` which inserts a file form element. This is used for file uploading for a given page.

Syntax

```
HTP.FORMFILE (
    cname         IN          VARCHAR2,
    caccept       IN          VARCHAR2  DEFAULT NULL,
    cattributes   IN          VARCHAR2  DEFAULT NULL);
```

Parameters

Table 225-30 FORMFILE Procedure Parameters

| Parameter | Description |
|--------------------|--|
| <code>cname</code> | The value for the <code>NAME</code> attribute. |

Table 225-30 (Cont.) FORMFILE Procedure Parameters

| Parameter | Description |
|--------------------------|---|
| <code>caccept</code> | A comma-delimited list of MIME types for upload. |
| <code>cattributes</code> | The other attributes to be included as-is in the tag. |

Examples

This procedure generates

```
<INPUT TYPE="file" NAME="cname" ACCEPT="caccept" cattributes>
```

225.5.40 FORMHIDDEN Procedure

This procedure generates the `<INPUT>` tag with `TYPE="hidden"`, which inserts a hidden form element.

This element is not seen by the user. It submits additional values to the script.

Syntax

```
HTP.FORMHIDDEN (
  cname      IN      VARCHAR2,
  cvalue     IN      VARCHAR2  DEFAULT NULL,
  cattributes IN      VARCHAR2  DEFAULT NULL);
```

Parameters**Table 225-31 FORMHIDDEN Procedure Parameters**

| Parameter | Description |
|--------------------------|---|
| <code>cname</code> | The value for the <code>NAME</code> attribute. |
| <code>cvalue</code> | The value for the <code>VALUE</code> attribute. |
| <code>cattributes</code> | The other attributes to be included as-is in the tag. |

Examples

This procedure generates

```
<INPUT TYPE="hidden" NAME="cname" VALUE="cvalue" cattributes>
```

225.5.41 FORMIMAGE Procedure

This procedure generates the `<INPUT>` tag with `TYPE="image"` which creates an image field that the user clicks to submit the form immediately.

The coordinates of the selected point are measured in pixels, and returned (along with other contents of the form) in two name/value pairs. The x coordinate is submitted under the name of the field with `.x` appended, and the y coordinate with `.y` appended. Any `VALUE` attribute is ignored.

Syntax

```
HTP.FORMIMAGE (
  cname      IN      VARCHAR2,
  csrc       IN      VARCHAR2,
  calign     IN      VARCHAR2  DEFAULT NULL,
  cattributes IN      VARCHAR2  DEFAULT NULL);
```

Parameters**Table 225-32 FORMIMAGE Procedure Parameters**

| Parameter | Description |
|-------------|--|
| cname | The value for the NAME attribute. |
| csrc | The value for the SRC attribute that specifies the image file. |
| calign | The value for the ALIGN attribute. |
| cattributes | The other attributes to be included as-is in the tag. |

Examples

This procedure generates

```
<INPUT TYPE="image" NAME="cname" SRC="csrc" ALIGN="calign" cattributes>
```

225.5.42 FORMPASSWORD Procedure

This procedure generates the <INPUT> tag with TYPE="password" which creates a single-line text entry field. When the user enters text in the field, each character is represented by one asterisk. This is used for entering passwords.

Syntax

```
HTP.FORMPASSWORD (
  cname      IN      VARCHAR2,
  csize      IN      VARCHAR2,
  cmaxlength IN      VARCHAR2  DEFAULT NULL,
  cvalue     IN      VARCHAR2  DEFAULT NULL,
  cattributes IN      VARCHAR2  DEFAULT NULL);
```

Parameters**Table 225-33 FORMPASSWORD Procedure Parameters**

| Parameter | Description |
|-------------|---|
| cname | The value for the NAME attribute. |
| csize | The value for the SIZE attribute. |
| cmmaxlength | The value for the MAXLENGTH attribute. |
| cvalue | The value for the VALUE attribute. |
| cattributes | The other attributes to be included as-is in the tag. |

Examples

This procedure generates

```
<INPUT TYPE="password" NAME="cname" SIZE="csize" MAXLENGTH="cmaxlength"  
VALUE="cvalue" cattributes>
```

225.5.43 FORMRADIO Procedure

This procedure generates the `<INPUT>` tag with `TYPE="radio"`, which creates a radio button on the HTML form. Within a set of radio buttons, the user selects only one. Each radio button in the same set has the same name, but different values. The selected radio button generates a name/value pair.

Syntax

```
HTP.FORMRADIO(  
  cname          IN          VARCHAR2,  
  cvalue         IN          VARCHAR2,  
  cchecked       IN          VARCHAR2  DEFAULT NULL,  
  cattributes    IN          VARCHAR2  DEFAULT NULL);
```

Parameters

Table 225-34 FORMRADIO Procedure Parameters

| Parameter | Description |
|--------------------------|--|
| <code>cname</code> | The value for the <code>NAME</code> attribute. |
| <code>cvalue</code> | The value for the <code>VALUE</code> attribute. |
| <code>cchecked</code> | If the value for this parameter is not <code>NULL</code> , the <code>CHECKED</code> attribute is added to the tag. |
| <code>cattributes</code> | The other attributes to be included as-is in the tag. |

Examples

This procedure generates

```
<INPUT TYPE="radio" NAME="cname" VALUE="cvalue" CHECKED cattributes>
```

225.5.44 FORMRESET Procedure

This procedure generates the `<INPUT>` tag with `TYPE="reset"` which creates a button that, when selected, resets the form fields to their initial values.

Syntax

```
HTP.FORMRESET(  
  cvalue         IN          VARCHAR2  DEFAULT 'Reset',  
  cattributes    IN          VARCHAR2  DEFAULT NULL);
```

Parameters

Table 225-35 FORMRESET Procedure Parameters

| Parameter | Description |
|--------------------------|---|
| <code>cvalue</code> | The value for the <code>VALUE</code> attribute. |
| <code>cattributes</code> | The other attributes to be included as-is in the tag. |

Examples

This procedure generates

```
<INPUT TYPE="reset" VALUE="cvalue" cattributes>
```

225.5.45 FORMSELECTCLOSE Procedure

This procedure generates the `</SELECT>` tag which marks the end of a Select form element.

A Select form element is a listbox where the user selects one or more values. You mark the beginning of Select form element by means of the [FORMSELECTOPEN Procedure](#). The values are inserted using [FORMSELETOPTION Procedure](#).

Syntax

```
HTP.FORMSELECTCLOSE;
```

Examples

This procedure generates

```
</SELECT>
```

as shown under Examples of the [FORMSELECTOPEN Procedure](#).

225.5.46 FORMSELECTOPEN Procedure

This procedure generates the `<SELECT>` tags which creates a Select form element.

A Select form element is a listbox where the user selects one or more values. You mark the end of Select form element by means of the [FORMSELECTCLOSE Procedure](#). The values are inserted using [FORMSELETOPTION Procedure](#).

Syntax

```
FORMSELECTOPEN (
  cname          IN          VARCHAR2,
  cprompt        IN          VARCHAR2  DEFAULT NULL,
  nsize          IN          INTEGER   DEFAULT NULL,
  cattributes    IN          VARCHAR2  DEFAULT NULL);
```

Parameters

Table 225-36 FORMSELECTOPEN Procedure Parameters

| Parameter | Description |
|--------------------------|---|
| <code>cname</code> | The value for the <code>NAME</code> attribute. |
| <code>cprompt</code> | The string preceding the list box. |
| <code>nsize</code> | The value for the <code>SIZE</code> attribute. |
| <code>cattributes</code> | The other attributes to be included as-is in the tag. |

Examples

This procedure generates

```
cprompt <SELECT NAME="cname" SIZE="nsize" cattributes>
</SELECT>
```

so that

```
HTP.FORMSELECTOPEN('greatest_player';
  'Pick the greatest player:');
HTP.FORMSELECTOPTION('Messier');
HTP.FORMSELECTOPTION('Howe');
HTP.FORMSELECTOPTION('Gretzky');.
HTP.FORMSELECTCLOSE;
```

generates

```
Pick the greatest player:
<SELECT NAME="greatest_player">
<OPTION>Messier
<OPTION>Howe
<OPTION>Gretzky
</SELECT>
```

225.5.47 FORMSELECTOPTION Procedure

This procedure generates the `<OPTION>` tag which represents one choice in a Select element.

Syntax

```
HTP.FORMSELECTOPTION (
  cvalue          IN          VARCHAR2,
  cselected       IN          VARCHAR2  DEFAULT NULL,
  cattributes     IN          VARCHAR2  DEFAULT NULL);
```

Parameters

Table 225-37 FORMSELECTOPTION Procedure Parameters

| Parameter | Description |
|---------------------|--------------------------|
| <code>cvalue</code> | The text for the option. |

Table 225-37 (Cont.) FORMSELETOPTION Procedure Parameters

| Parameter | Description |
|--------------------------|---|
| <code>cvalue</code> | If the value for this parameter is not NULL, the <code>SELECTED</code> attribute is added to the tag. |
| <code>cattributes</code> | The other attributes to be included as-is in the tag. |

Examples

This procedure generates

```
<OPTION SELECTED cattributes>cvalue
```

as shown under Examples of the [FORMSELETOPTION Procedure](#).

225.5.48 FORMSUBMIT Procedure

This procedure generates the `<INPUT>` tag with `TYPE="submit"` which creates a button that, when clicked, submits the form. If the button has a `NAME` attribute, the button contributes a name/value pair to the submitted data.

Syntax

```
HTP.FORMSUBMIT (
  cname          IN          VARCHAR2  DEFAULT NULL,
  cvalue         IN          VARCHAR2  DEFAULT 'Submit',
  cattributes    IN          VARCHAR2  DEFAULT NULL);
```

Parameters**Table 225-38 FORMSUBMIT Procedure Parameters**

| Parameter | Description |
|--------------------------|---|
| <code>cname</code> | The value for the <code>NAME</code> attribute. |
| <code>cvalue</code> | The value for the <code>VALUE</code> attribute. |
| <code>cattributes</code> | The other attributes to be included as-is in the tag. |

Examples

This procedure generates

```
<INPUT TYPE="submit" NAME="cname" VALUE="cvalue" cattributes>
```

225.5.49 FORMTEXT Procedure

This procedure generates the `<INPUT>` tag with `TYPE="text"`, which creates a field for a single line of text.

Syntax

```
HTP.FORMTEXT (
  cname          IN          VARCHAR2,
```

```

csize          IN          VARCHAR2  DEFAULT NULL,
cmaxlength     IN          VARCHAR2  DEFAULT NULL,
cvalue         IN          VARCHAR2  DEFAULT NULL,
cattributes    IN          VARCHAR2  DEFAULT NULL);

```

Parameters

Table 225-39 FORMTEXT Procedure Parameters

| Parameter | Description |
|-------------|---|
| cname | The value for the NAME attribute. |
| csize | The value for the SIZE attribute. |
| cmaxlength | The value for the MAXLENGTH attribute. |
| cvalue | The value for the VALUE attribute. |
| cattributes | The other attributes to be included as-is in the tag. |

Examples

This procedure generates

```

<INPUT TYPE="text" NAME="cname" SIZE="csize" MAXLENGTH="cmaxlength"
VALUE="cvalue" cattributes>

```

225.5.50 FORMTEXTAREA Procedure

This procedure generates the <TEXTAREA> tag, which creates a text field that has no predefined text in the text area. This field enables entering several lines of text.

The same operation is performed by the [FORMTEXTAREA2 Procedure](#) which in addition has the `cwrap` parameter that lets you specify a wrap style.

Syntax

```

HTP.FORMTEXTAREA (
  cname          IN          VARCHAR2,
  nrows          IN          INTEGER,
  ncolumns       IN          INTEGER,
  calign         , IN          VARCHAR2  DEFAULT NULL,
  cattributes    IN          VARCHAR2  DEFAULT NULL);

```

Parameters

Table 225-40 FORMTEXTAREA Procedure Parameters

| Parameter | Description |
|-------------|---|
| cname | The value for the NAME attribute. |
| nrows | The value for the ROWS attribute. This is an integer. |
| ncolumns | The value for the COLS attribute. This is an integer. |
| calign | The value for the ALIGN attribute. |
| cattributes | The other attributes to be included as-is in the tag. |

Examples

This procedure generates

```
<TEXTAREA NAME="cname" ROWS="nrows" COLS="ncolumns" ALIGN="calign" cattributes></TEXTAREA>
```

225.5.51 FORMTEXTAREA2 Procedure

This procedure generates the `<TEXTAREA>` tag, which creates a text field that has no predefined text in the text area. This field enables entering several lines of text.

The same operation is performed by the [FORMTEXTAREA Procedure](#) except that in that case you cannot specify a wrap style.

Syntax

```
HTP.FORMTEXTAREA2 (
    cname          IN          VARCHAR2,
    nrows          IN          INTEGER,
    ncolumns       IN          INTEGER,
    calign         IN          VARCHAR2  DEFAULT NULL,
    cwrap         IN          VARCHAR2  DEFAULT NULL,
    cattributes    IN          VARCHAR2  DEFAULT NULL);
```

Parameters

Table 225-41 FORMTEXTAREA2 Procedure Parameters

| Parameter | Description |
|--------------------------|--|
| <code>cname</code> | The value for the <code>NAME</code> attribute. |
| <code>nrows</code> | The value for the <code>ROWS</code> attribute. This is an integer. |
| <code>ncolumns</code> | The value for the <code>COLS</code> attribute. This is an integer. |
| <code>calign</code> | The value for the <code>ALIGN</code> attribute. |
| <code>cwrap</code> | The value for the <code>WRAP</code> attribute. |
| <code>cattributes</code> | The other attributes to be included as-is in the tag. |

Examples

This procedure generates

```
<TEXTAREA NAME="cname" ROWS="nrows" COLS="ncolumns" ALIGN="calign" WRAP="cwrap" cattributes></TEXTAREA>
```

225.5.52 FORMTEXTAREACLOSE Procedure

This procedure generates the `</TEXTAREA>` tag which ends a text area form element.

You open a text area element by means of either [FORMTEXTAREAOPEN Procedure](#) or [FORMTEXTAREAOPEN2 Procedure](#).

Syntax

```
HTP.FORMTEXTAREACLOSE;
```

Examples

This procedure generates

```
</TEXTAREA>
```

225.5.53 FORMTEXTAREAOPEN Procedure

This procedure generates the `<TEXTAREA>` which marks the beginning of a text area form element.

The same operation is performed by the [FORMTEXTAREAOPEN2 Procedure](#) which in addition has the `cwrap` parameter that lets you specify a wrap style. You mark the end of a text area form element by means of the [FORMTEXTAREACLOSE Procedure](#).

Syntax

```
HTP.FORMTEXTAREAOPEN (
  cname          IN          VARCHAR2,
  nrows          IN          INTEGER,
  ncolumns       IN          INTEGER,
  calign         IN          VARCHAR2  DEFAULT NULL,
  cattributes    IN          VARCHAR2  DEFAULT NULL);
```

Parameters

Table 225-42 FORMTEXTAREAOPEN Procedure Parameters

| Parameter | Description |
|--------------------------|--|
| <code>cname</code> | The value for the <code>NAME</code> attribute. |
| <code>nrows</code> | The value for the <code>ROWS</code> attribute. This is an integer. |
| <code>ncolumns</code> | The value for the <code>COLS</code> attribute. This is an integer. |
| <code>calign</code> | The value for the <code>ALIGN</code> attribute. |
| <code>cattributes</code> | The other attributes to be included as-is in the tag. |

Examples

This procedure generates

```
<TEXTAREA NAME="cname" ROWS="nrows" COLS="ncolumns" ALIGN="calign" cattributes>
```

225.5.54 FORMTEXTAREAOPEN2 Procedure

This procedure generates the `<TEXTAREA>` which marks the beginning of a text area form element.

The same operation is performed by the [FORMTEXTAREAOPEN Procedure](#) except that in that case you cannot specify a wrap style. You mark the end of a text area form element by means of the [FORMTEXTAREACLOSE Procedure](#).

Syntax

```
HTP.FORMTEXTAREAOPEN2 (
  cname          IN          VARCHAR2,
```

```

nrows          IN          INTEGER,
ncolumns       IN          INTEGER,
calign         IN          VARCHAR2  DEFAULT NULL,
cwrap         IN          VARCHAR2  DEFAULT NULL,
cattributes    IN          VARCHAR2  DEFAULT NULL);

```

Parameters

Table 225-43 FORMTEXTAREAOPEN2 Procedure Parameters

| Parameter | Description |
|-------------|---|
| cname | The value for the NAME attribute. |
| nrows | The value for the ROWS attribute. This is an integer. |
| ncolumns | The value for the COLS attribute. This is an integer. |
| calign | The value for the ALIGN attribute. |
| cwrap | The value for the WRAP attribute. |
| cattributes | The other attributes to be included as-is in the tag. |

Examples

This procedure generates

```

<TEXTAREA NAME="cname" ROWS="nrows" COLS="ncolumns" ALIGN="calign" WRAP = "cwrap"
cattributes>

```

225.5.55 FRAME Procedure

This procedure generates the <FRAME> tag which begins the characteristics of a frame created by a <FRAMESET> tag.

Syntax

```

HTP.FRAME (
  csrc          IN          VARCHAR2,
  cname         IN          VARCHAR2  DEFAULT NULL,
  cmarginwidth  IN          VARCHAR2  DEFAULT NULL,
  cmarginheight IN          VARCHAR2  DEFAULT NULL,
  cscrolling    IN          VARCHAR2  DEFAULT NULL,
  cnoresize     IN          VARCHAR2  DEFAULT NULL,
  cattributes   IN          VARCHAR2  DEFAULT NULL);

```

Parameters

Table 225-44 FRAME Procedure Parameters

| Parameter | Description |
|--------------|--|
| csrc | The URL to display in the frame. |
| cname | The value for the NAME attribute. |
| cmarginwidth | The value for the MARGINWIDTH attribute. |
| cscrolling | The value for the SCROLLING attribute. |

Table 225-44 (Cont.) FRAME Procedure Parameters

| Parameter | Description |
|--------------------------|--|
| <code>cnoresize</code> | If the value for this parameter is not NULL, the NORESIZE attribute is added to the tag. |
| <code>cattributes</code> | The other attributes to be included as-is in the tag. |

Examples

This procedure generates

```
<FRAME SRC="csrc" NAME="cname" MARGINWIDTH="cmarginwidth"
MARGINHEIGHT="cmarginheight" SCROLLING="cscrolling" NORESIZE cattributes>
```

225.5.56 FRAMESETCLOSE Procedure

This procedure generates the `</FRAMESET>` tag which ends a frameset section.

You mark the beginning of a frameset section by means of the [FRAMESETOPEN Procedure](#).

Syntax

```
HTP.FRAMESETCLOSE;
```

Examples

This procedure generates

```
</FRAMESET>
```

225.5.57 FRAMESETOPEN Procedure

This procedure generates the `<FRAMESET>` tag which define a frameset section.

You mark the end of a frameset section by means of the [FRAMESETCLOSE Procedure](#).

Syntax

```
HTP.FRAMESETOPEN (
    crows          IN          VARCHAR2   DEFAULT NULL,
    ccols          IN          VARCHAR2   DEFAULT NULL,
    cattributes    IN          VARCHAR2   DEFAULT NULL);
```

Parameters**Table 225-45 FRAMESETOPEN Procedure Parameters**

| Parameter | Description |
|--------------------------|---|
| <code>crows</code> | The value for the ROWS attribute. |
| <code>ccols</code> | The value for the COLS attribute. |
| <code>cattributes</code> | The other attributes to be included as-is in the tag. |

Examples

This procedure generates

```
<FRAMESET ROWS="rows" COLS="cols" cattributes>
```

225.5.58 HEADCLOSE Procedure

This procedure generates the `</HEAD>` tag which marks the end of an HTML document head section.

You mark the beginning of an HTML document head section by means of the [HEADOPEN Procedure](#).

Syntax

```
HTP.HEADCLOSE;
```

Examples

This procedure generates

```
</HEAD>
```

225.5.59 HEADER Procedure

This procedure generates opening heading tags (`<H1>` to `<H6>`) and their corresponding closing tags (`</H1>` to `</H6>`).

Syntax

```
HTP.HEADER(  
  nsize          IN          INTEGER,  
  cheader        IN          VARCHAR2,  
  calign         IN          VARCHAR2  DEFAULT NULL,  
  cnowrap        IN          VARCHAR2  DEFAULT NULL,  
  cclear         IN          VARCHAR2  DEFAULT NULL,  
  cattributes    IN          VARCHAR2  DEFAULT NULL);
```

Parameters

Table 225-46 HEADER Procedure Parameters

| Parameter | Description |
|--------------------------|--|
| <code>nsize</code> | The the heading level. This is an integer between 1 and 6. |
| <code>cheader</code> | The text to display in the heading. |
| <code>calign</code> | The value for the <code>ALIGN</code> attribute. |
| <code>cnowrap</code> | The value for the <code>NOWRAP</code> attribute. |
| <code>cclear</code> | The value for the <code>CLEAR</code> attribute. |
| <code>cattributes</code> | The other attributes to be included as-is in the tag. |

Examples

```
HTP.header (1, 'Overview');
```

produces:

```
<H1>Overview</H1>
```

225.5.60 HEADOPEN Procedure

This procedure generates the `<HEAD>` tag which marks the beginning of the HTML document head section.

You mark the end of an HTML document head section by means of the [HEADCLOSE Procedure](#).

Syntax

```
HTP.HEADOPEN;
```

Examples

This procedure generates

```
<HEAD>
```

225.5.61 HR Procedure

This procedure generates the `<HR>` tag, which generates a line in the HTML document.

This subprogram performs the same operation as the [LINE Procedure](#).

Syntax

```
HTP.HR (
  cclear      IN          VARCHAR2  DEFAULT NULL,
  csrc        IN          VARCHAR2  DEFAULT NULL,
  cattributes IN          VARCHAR2  DEFAULT NULL);
```

Parameters

Table 225-47 HR Procedure Parameters

| Parameter | Description |
|--------------------------|--|
| <code>cclear</code> | The value for the <code>CLEAR</code> attribute. |
| <code>csrc</code> | The value for the <code>SRC</code> attribute which specifies a custom image as the source of the line. |
| <code>cattributes</code> | The other attributes to be included as-is in the tag. |

Examples

This procedure generates

```
<HR CLEAR="cclear" SRC="csrc" cattributes>
```

225.5.62 HTMLCLOSE Procedure

This procedure generates the `</HTML>` tag which marks the end of an HTML document.

You use the [HTMLOPEN Procedure](#) to mark the beginning of an HTML document.

Syntax

```
HTP.HTMLCLOSE;
```

Examples

This procedure generates

```
</HTML>
```

225.5.63 HTMLOPEN Procedure

This procedure generates the `<HTML>` tag which marks the beginning of an HTML document.

You use the [HTMLCLOSE Procedure](#) to mark the end of the an HTML document.

Syntax

```
HTP.HTMLOPEN;
```

Examples

This procedure generates

```
<HTML>
```

225.5.64 IMG Procedure

This procedure generates the `` tag which directs the browser to load an image onto the HTML page.

The [IMG2 Procedure](#) performs the same operation but additionally uses the `cusemap` parameter.

Syntax

```
HTP.IMG(  
    curl           IN          VARCHAR2  DEFAULT NULL,  
    calign         IN          VARCHAR2  DEFAULT NULL,  
    calt          IN          VARCHAR2  DEFAULT NULL,  
    cismap        IN          VARCHAR2  DEFAULT NULL,  
    cattributes   IN          VARCHAR2  DEFAULT NULL);
```

Parameters

Table 225-48 IMG Procedure Parameters

| Parameter | Description |
|-------------------|----------------------------------|
| <code>curl</code> | The value for the SRC attribute. |

Table 225-48 (Cont.) IMG Procedure Parameters

| Parameter | Description |
|--------------------------|---|
| <code>calign</code> | The value for the <code>ALIGN</code> attribute. |
| <code>calt</code> | The value for the <code>ALT</code> attribute which specifies alternative text to display if the browser does not support images. |
| <code>cismap</code> | If the value for this parameter is not <code>NULL</code> , the <code>ISMAP</code> attribute is added to the tag. The attribute indicates that the image is an imagemap. |
| <code>cattributes</code> | The other attributes to be included as-is in the tag. |

Examples

This procedure generates

```
<IMG SRC="curl" ALIGN="calign" ALT="calt" ISMAP cattributes>
```

225.5.65 IMG2 Procedure

This procedure generates the `` tag, which directs the browser to load an image onto the HTML page.

The [IMG Procedure](#) performs the same operation but does not use the `cusemap` parameter.

Syntax

```
HTP.IMG2(
  curl          IN          VARCHAR2  DEFAULT NULL,
  calign        IN          VARCHAR2  DEFAULT NULL,
  calt          IN          VARCHAR2  DEFAULT NULL,
  cismap        IN          VARCHAR2  DEFAULT NULL,
  cusemap       IN          VARCHAR2  DEFAULT NULL,
  cattributes   IN          VARCHAR2  DEFAULT NULL);
```

Parameters**Table 225-49 IMG2 Procedure Parameters**

| Parameter | Description |
|--------------------------|---|
| <code>curl</code> | The value for the <code>SRC</code> attribute. |
| <code>calign</code> | The value for the <code>ALIGN</code> attribute. |
| <code>calt</code> | The value for the <code>ALT</code> attribute which specifies alternative text to display if the browser does not support images. |
| <code>cismap</code> | If the value for this parameter is not <code>NULL</code> , the <code>ISMAP</code> attribute is added to the tag. The attribute indicates that the image is an imagemap. |
| <code>cusemap</code> | The value for the <code>USEMAP</code> attribute which specifies a client-side image map. |
| <code>cattributes</code> | The other attributes to be included as-is in the tag. |

Examples

This procedure generates

```
<IMG SRC="curl" ALIGN="calign" ALT="calt" ISMAP USEMAP="cusemap" cattributes>
```

225.5.66 ISINDEX Procedure

This procedure creates a single entry field with a prompting text, such as "enter value," then sends that value to the URL of the page or program.

Syntax

```
HTP.ISINDEX(
  cprompt      IN      VARCHAR2      DEFAULT NULL,
  curl         IN      VARCHAR2      DEFAULT NULL);
```

Parameters

Table 225-50 ISINDEX Procedure Parameters

| Parameter | Description |
|-----------|-------------------------------------|
| cprompt | The value for the PROMPT attribute. |
| curl | The value for the HREF attribute. |

Examples

This procedure generates

```
<ISINDEX PROMPT="cprompt" HREF="curl">
```

225.5.67 ITALIC Procedure

This procedure generates the <I> and </I> tags which direct the browser to render the text in italics.

Syntax

```
HTP.ITALIC(
  ctext        IN      VARCHAR2,
  cattributes  IN      VARCHAR2      DEFAULT NULL);
```

Parameters

Table 225-51 ITALIC Procedure Parameters

| Parameter | Description |
|-------------|---|
| ctext | The text to be rendered in italics. |
| cattributes | The other attributes to be included as-is in the tag. |

Examples

This procedure generates

```
<I cattributes>ctext</I>
```

225.5.68 KBD Procedure

This procedure generates the `<KBD>` and `</KBD>` tags which direct the browser to render the text in monospace font.

This subprogram performs the same operation as the [KEYBOARD Procedure](#).

Syntax

```
HTP.KBD (  
    ctext          IN          VARCHAR2,  
    cattributes   IN          VARCHAR2  DEFAULT NULL);
```

Parameters

Table 225-52 KBD Procedure Parameters

| Parameter | Description |
|--------------------------|---|
| <code>ctext</code> | The text to be rendered in monospace. |
| <code>cattributes</code> | The other attributes to be included as-is in the tag. |

Examples

This procedure generates

```
<KBD cattributes>ctext</KBD>
```

225.5.69 KEYBOARD Procedure

This procedure generates the `<KBD>` and `</KBD>` tags, which direct the browser to render the text in monospace font.

This subprogram performs the same operation as the [KBD Procedure](#).

Syntax

```
HTP.KEYBOARD (  
    ctext          IN          VARCHAR2,  
    cattributes   IN          VARCHAR2  DEFAULT NULL);
```

Parameters

Table 225-53 KEYBOARD Procedure Parameters

| Parameter | Description |
|--------------------------|---|
| <code>ctext</code> | The text to be rendered in monospace. |
| <code>cattributes</code> | The other attributes to be included as-is in the tag. |

Examples

This procedure generates

```
<KBD cattributes>ctext</KBD>
```

225.5.70 LINE Procedure

This procedure generates the `<HR>` tag, which generates a line in the HTML document.

This subprogram performs the same operation as the [HR Procedure](#).

Syntax

```
HTP.LINE(  
    cclear      IN      VARCHAR2  DEFAULT NULL,  
    csrc        IN      VARCHAR2  DEFAULT NULL,  
    cattributes IN      VARCHAR2  DEFAULT NULL);
```

Parameters

Table 225-54 LINE Procedure Parameters

| Parameter | Description |
|--------------------------|--|
| <code>cclear</code> | The value for the <code>CLEAR</code> attribute. |
| <code>csrc</code> | The value for the <code>SRC</code> attribute which specifies a custom image as the source of the line. |
| <code>cattributes</code> | The other attributes to be included as-is in the tag. |

Examples

This procedure generates

```
<HR CLEAR="cclear" SRC="csrc" cattributes>
```

225.5.71 LINKREL Procedure

This procedure generates the `<LINK>` tag with the `REL` attribute which delineates the relationship described by the hypertext link from the anchor to the target. This is only used when the `HREF` attribute is present.

This is the opposite of [LINKREV Procedure](#). This tag indicates a relationship between documents but does not create a link. To create a link, use the [ANCHOR Procedure](#).

Syntax

```
HTP.LINKREL(  
    crel        IN      VARCHAR2,  
    curl        IN      VARCHAR2,  
    ctitle      IN      VARCHAR2  DEFAULT NULL);
```

Parameters

Table 225-55 LINKREL Procedure Parameters

| Parameter | Description |
|-------------------|---|
| <code>crel</code> | The value for the <code>REL</code> attribute. |
| <code>curl</code> | The value for the <code>URL</code> attribute. |

Table 225-55 (Cont.) LINKREL Procedure Parameters

| Parameter | Description |
|---------------------|---|
| <code>ctitle</code> | The value for the <code>TITLE</code> attribute. |

Examples

This procedure generates

```
<LINK REL="crel" HREF="curl" TITLE="ctitle">
```

225.5.72 LINKREV Procedure

This procedure generates the `<LINK>` tag with the `REV` attribute which delineates the relationship described by the hypertext link from the target to the anchor.

This is the opposite of the [LINKREL Procedure](#). This tag indicates a relationship between documents, but does not create a link. To create a link, use the [ANCHOR Procedure](#).

Syntax

```
HTP.LINKREV(
    crev          IN          VARCHAR2,
    curl          IN          VARCHAR2,
    ctitle       IN          VARCHAR2  DEFAULT NULL);
```

Parameters**Table 225-56 LINKREV Procedure Parameters**

| Parameter | Description |
|---------------------|---|
| <code>crel</code> | The value for the <code>REV</code> attribute. |
| <code>curl</code> | The value for the <code>URL</code> attribute. |
| <code>ctitle</code> | The value for the <code>TITLE</code> attribute. |

Examples

This procedure generates

```
<LINK REV="crev" HREF="curl" TITLE="ctitle">
```

225.5.73 LISTHEADER Procedure

This procedure generates the `<LH>` and `</LH>` tags which print an HTML tag at the beginning of the list.

Syntax

```
HTP.LISTHEADER(
    ctext        IN          VARCHAR2,
    cattributes  IN          VARCHAR2  DEFAULT NULL);
```

Parameters

Table 225-57 LISTHEADER Procedure Parameters

| Parameter | Description |
|-------------------------------------|--|
| <code>c_{text}</code> | The text to place between <code><LH></code> and <code></LH></code> . |
| <code>c_{attributes}</code> | The other attributes to be included as-is in the tag. |

Examples

This procedure generates

```
<LH cattributes>ctext</LH>
```

225.5.74 LISTINGCLOSE Procedure

This procedure generates the `</LISTING>` tags which marks the end of a section of fixed-width text in the body of an HTML page.

To mark the beginning of a section of fixed-width text in the body of an HTML page, use the [LISTINGOPEN Procedure](#).

Syntax

```
HTP.LISTINGCLOSE;
```

Examples

This procedure generates

```
</LISTING>
```

225.5.75 LISTINGOPEN Procedure

This procedure generates the `<LISTING>` tag which marks the beginning of a section of fixed-width text in the body of an HTML page.

To mark the end of a section of fixed-width text in the body of an HTML page, use the [LISTINGCLOSE Procedure](#).

Syntax

```
HTP.LISTINGOPEN;
```

Examples

This procedure generates

```
<LISTING>
```

225.5.76 LISTITEM Procedure

This procedure generates the tag, which indicates a list item.

Syntax

```
HTP.LISTITEM(
  ctext          IN          VARCHAR2  DEFAULT NULL,
  cclear         IN          VARCHAR2  DEFAULT NULL,
  cdingbat       IN          VARCHAR2  DEFAULT NULL,
  csrc           IN          VARCHAR2  DEFAULT NULL,
  cattributes    IN          VARCHAR2  DEFAULT NULL);
```

Parameters

Table 225-58 LISTITEM Procedure Parameters

| Parameter | Description |
|-------------|---|
| ctext | The text for the list item. |
| cclear | The value for the CLEAR attribute. |
| cdingbat | The value for the DINGBAT attribute. |
| csrc | The value for the SRC attribute. |
| cattributes | The other attributes to be included as-is in the tag. |

Examples

This procedure generates

```
<LI CLEAR="cclear" DINGBAT="cdingbat" SRC="csrc" cattributes>ctext
```

225.5.77 MAILTO Procedure

This procedure generates the <A> tag with the HREF set to 'mailto' prepended to the mail address argument.

Syntax

```
HTP.MAILTO(
  caddress       IN          VARCHAR2,
  ctext          IN          VARCHAR2,
  cname          IN          VARCHAR2,
  cattributes    IN          VARCHAR2  DEFAULT NULL);
```

Parameters

Table 225-59 MAILTO Procedure Parameters

| Parameter | Description |
|-----------|-------------------------------------|
| caddress | The email address of the recipient. |
| ctext | The clickable portion of the link. |
| cname | The value for the NAME attribute. |

Table 225-59 (Cont.) MAILTO Procedure Parameters

| Parameter | Description |
|--------------------------|---|
| <code>cattributes</code> | The other attributes to be included as-is in the tag. |

Examples

This procedure generates

```
<A HREF="mailto:caddress" NAME="cname" cattributes>ctext</A>
```

so that

```
HTP.mailto('pres@white_house.gov','Send Email to the President');
```

generates:

```
<A HREF="mailto:pres@white_house.gov">Send Email to the President</A>
```

225.5.78 MAPCLOSE Procedure

This procedure generates the `</MAP>` tag which marks the end of a set of regions in a client-side image map.

To mark the beginning of a set of regions in a client-side image map, use the [MAPOPEN Procedure](#).

Syntax

```
HTP.MAPCLOSE;
```

Examples

This procedure generates

```
</MAP>
```

225.5.79 MAPOPEN Procedure

This procedure generates the `<MAP>` tag which mark the beginning of a set of regions in a client-side image map.

To mark the end of a set of regions in a client-side image map, use the [MAPCLOSE Procedure](#).

Syntax

```
HTP.MAPOPEN (
  cname          IN          VARCHAR2  DEFAULT NULL,
  cattributes    IN          VARCHAR2  DEFAULT NULL);
```

Parameters

Table 225-60 MAPOPEN Procedure Parameters

| Parameter | Description |
|--------------------------|---|
| <code>cname</code> | The value for the <code>NAME</code> attribute. |
| <code>cattributes</code> | The other attributes to be included as-is in the tag. |

Examples

This procedure generates

```
<MAP NAME="cname" cattributes>
```

225.5.80 MENULISTCLOSE Procedure

This procedure generates the `</MENU>` tag which ends a list that presents one line for each item.

To begin a list of this kind, use the [MENULISTOPEN Procedure](#). The items in the list appear more compact than an unordered list. The [LISTITEM Procedure](#) defines the list items in a menu list.

Syntax

```
HTP.MENULISTCLOSE;
```

Examples

This procedure generates

```
</MENU>
```

225.5.81 MENULISTOPEN Procedure

This procedure generates the `<MENU>` tag which begins a list that presents one line for each item.

To end a list of this kind, use the [MENULISTCLOSE Procedure](#). The items in the list appear more compact than an unordered list. The [LISTITEM Procedure](#) defines the list items in a menu list.

Syntax

```
HTP.MENULISTOPEN;
```

Examples

This procedure generates

```
<MENU>
```

225.5.82 META Procedure

This procedure generates the `<META>` tag, which embeds meta-information about the document and also specifies values for HTTP headers. For example, you can specify the expiration date, keywords, and author name.

Syntax

```
HTP.META(
  chttp_equiv   IN      VARCHAR2,
  cname         IN      VARCHAR2,
  ccontent      IN      VARCHAR2);
```

Parameters

Table 225-61 META Procedure Parameters

| Parameter | Description |
|--------------------------|---|
| <code>chttp_equiv</code> | The value for the <code>CHTTP_EQUIV</code> attribute. |
| <code>cname</code> | The value for the <code>NAME</code> attribute. |
| <code>ccontent</code> | The value for the <code>CONTENT</code> attribute. |

Examples

This procedure generates

```
<META HTTP-EQUIV="chttp_equiv" NAME ="cname" CONTENT="ccontent">
```

so that

```
HTP.meta ('Refresh', NULL, 120);
```

generates

```
<META HTTP-EQUIV="Refresh" CONTENT=120>
```

On some Web browsers, this causes the current URL to be reloaded automatically every 120 seconds.

225.5.83 NL Procedure

This procedure generates the `
` tag which begins a new line of text.

It performs the same operation as the [BR Procedure](#).

Syntax

```
HTP.NL(
  cclear        IN      VARCHAR2  DEFAULT NULL,
  cattributes   IN      VARCHAR2  DEFAULT NULL);
```

Parameters

Table 225-62 NL Procedure Parameters

| Parameter | Description |
|--------------------------|---|
| <code>cclear</code> | The value for the <code>CLEAR</code> attribute. |
| <code>cattributes</code> | The other attributes to be included as-is in the tag. |

Examples

This procedure generates

```
<BR CLEAR="cclear" cattributes>
```

225.5.84 NOBR Procedure

This procedure generates the `<NOBR>` and `</NOBR>` tags which turn off line-breaking in a section of text.

Syntax

```
HTP.NOBR(  
  ctext          IN          VARCHAR2);
```

Parameters

Table 225-63 NOBR Procedure Parameters

| Parameter | Description |
|--------------------|--|
| <code>ctext</code> | The text that is to be rendered on one line. |

Examples

This procedure generates

```
<NOBR>ctext</NOBR>
```

225.5.85 NOFRAMESCLOSE Procedure

This procedure generates the `</NOFRAMES>` tag which marks the end of a no-frames section.

To mark the beginning of a no-frames section, use the [FRAMESETOPEN Procedure](#). See also [FRAME Procedure](#), [FRAMESETOPEN Procedure](#) and [FRAMESETCLOSE Procedure](#).

Syntax

```
HTP.NOFRAMESCLOSE;
```

Examples

This procedure generates

```
</NOFRAMES>
```

225.5.86 NOFRAMESOPEN Procedure

This procedure generates the `<NOFRAMES>` tag which mark the beginning of a no-frames section.

To mark the end of a no-frames section, use the [FRAMESETCLOSE Procedure](#). See also [FRAME Procedure](#), [FRAMESETOPEN Procedure](#) and [FRAMESETCLOSE Procedure](#).

Syntax

```
HTP.NOFRAMESOPEN;
```

Examples

This procedure generates

```
<NOFRAMES>
```

225.5.87 OLISTCLOSE Procedure

This procedure generates the `` tag which defines the end of an ordered list. An ordered list presents a list of numbered items.

To mark the beginning of a list of this kind, use the [OLISTOPEN Procedure](#). Numbered items are added using [LISTITEM Procedure](#).

Syntax

```
HTP.OLISTCLOSE;
```

Examples

This procedure generates

```
</OL>
```

225.5.88 OLISTOPEN Procedure

This procedure generates the `` tag which marks the beginning of an ordered list. An ordered list presents a list of numbered items.

To mark the end of a list of this kind, use the [OLISTCLOSE Procedure](#). Numbered items are added using [LISTITEM Procedure](#).

Syntax

```
HTP.OLISTOPEN(  
  cclear      IN      VARCHAR2  DEFAULT NULL,  
  cwrap       IN      VARCHAR2  DEFAULT NULL,  
  cattributes IN      VARCHAR2  DEFAULT NULL);
```

Parameters

Table 225-64 OLISTOPEN Procedure Parameters

| Parameter | Description |
|--------------------------|---|
| <code>cclear</code> | The value for the <code>CLEAR</code> attribute. |
| <code>cwrap</code> | The value for the <code>WRAP</code> attribute. |
| <code>cattributes</code> | The other attributes to be included as-is in the tag. |

Examples

This procedure generates

```
<OL CLEAR="cclear" WRAP="cwrap" cattributes>
```

225.5.89 PARA Procedure

This procedure generates the `<P>` tag which indicates that the text that comes after the tag is to be formatted as a paragraph.

You can add attributes to the tag by means of the [PARAGRAPH Procedure](#).

Syntax

```
HTP.PARA;
```

Examples

This procedure generates

```
<P>
```

225.5.90 PARAGRAPH Procedure

You can use this procedure to add attributes to the `<P>` tag created by the `PARA` Procedure.

Syntax

```
HTP.PARAGRAPH (
    calign          IN          VARCHAR2  DEFAULT NULL,
    cnowrap         IN          VARCHAR2  DEFAULT NULL,
    cclear          IN          VARCHAR2  DEFAULT NULL,
    cattributes     IN          VARCHAR2  DEFAULT NULL);
```

Parameters

Table 225-65 PARAGRAPH Procedure Parameters

| Parameter | Description |
|---------------------|---|
| <code>calign</code> | The value for the <code>ALIGN</code> attribute. |

Table 225-65 (Cont.) PARAGRAPH Procedure Parameters

| Parameter | Description |
|--------------------------|--|
| <code>cnowrap</code> | If the value for this parameter is not NULL, the NOWRAP attribute is added to the tag. |
| <code>cclear</code> | The value for the CLEAR attribute. |
| <code>cattributes</code> | The other attributes to be included as-is in the tag. |

Examples

This procedure generates

```
<P ALIGN="calign" NOWRAP CLEAR="cclear" cattributes>
```

Related Topics

- [PARA Procedure](#)
This procedure generates the <P> tag which indicates that the text that comes after the tag is to be formatted as a paragraph.

225.5.91 PARAM Procedure

This procedure generates the <PARAM> tag which specifies parameter values for Java applets.

The values can reference HTML variables. To invoke a Java applet from a Web page, use [APPLETOPEN Procedure](#) to begin the invocation. Use one [PARAM Procedure](#) for each desired name-value pair, and use [APPLETCLOSE Procedure](#) to end the applet invocation.

Syntax

```
HTP.PARAM(  
  cname          IN          VARCHAR2  
  cvalue         IN          VARCHAR2);
```

Parameters**Table 225-66 PARAM Procedure Parameters**

| Parameter | Description |
|---------------------|------------------------------------|
| <code>cname</code> | The value for the NAME attribute. |
| <code>cvalue</code> | The value for the VALUE attribute. |

Examples

This procedure generates

```
<PARAM NAME=cname VALUE="cvalue">
```

225.5.92 PLAINTEXT Procedure

This procedure generates the `<PLAINTEXT>` and `</PLAINTEXT>` tags which direct the browser to render the text they surround in fixed-width type.

Syntax

```
HTP.PLAINTEXT (  
    ctext          IN          VARCHAR2,  
    cattributes    IN          VARCHAR2  DEFAULT NULL);
```

Parameters

Table 225-67 PLAINTEXT Procedure Parameters

| Parameter | Description |
|--------------------------|---|
| <code>ctext</code> | The text to be rendered in fixed-width font. |
| <code>cattributes</code> | The other attributes to be included as-is in the tag. |

Examples

This procedure generates

```
<PLAINTEXT cattributes>ctext</PLAINTEXT>
```

225.5.93 PRECLOSE Procedure

This procedure generates the `</PRE>` tag which marks the end of a section of preformatted text in the body of the HTML page.

To mark the beginning of a section of preformatted text in the body of the HTML page, use the [PREOPEN Procedure](#).

Syntax

```
HTP.PRECLOSE;
```

Examples

This procedure generates

```
</PRE>
```

225.5.94 PREOPEN Procedure

This procedure generates the `<PRE>` tag which marks the beginning of a section of preformatted text in the body of the HTML page.

To mark the end of a section of preformatted text in the body of the HTML page, use the [PRECLOSE Procedure](#).

Syntax

```
HTP.PREOPEN (  
    cclear          IN          VARCHAR2  DEFAULT NULL,
```

```

cwidth      IN      VARCHAR2  DEFAULT NULL,
cattributes IN      VARCHAR2  DEFAULT NULL);

```

Parameters

Table 225-68 PREOPEN Procedure Parameters

| Parameter | Description |
|--------------------------|---|
| <code>cclear</code> | The value for the <code>CLEAR</code> attribute. |
| <code>cwidth</code> | The value for the <code>WIDTH</code> attribute. |
| <code>cattributes</code> | The other attributes to be included as-is in the tag. |

Examples

This procedure generates

```
<PRE CLEAR="cclear" WIDTH="cwidth" cattributes>
```

225.5.95 PRINT Procedures

These procedures generate the specified parameter as a string terminated with the `\n` newline character.

The [PRN Procedures](#) performs the same operation but does not terminate with a newline character.

Syntax

```
HTP.PRINT (
  cbuf      IN      VARCHAR2);
```

```
HTP.PRINT (
  dbuf      IN      DATE);
```

```
HTP.PRINT (
  nbuf      IN      NUMBER);
```

Parameters

Table 225-69 PRINT Procedure Parameters

| Parameter | Description |
|-------------------|---|
| <code>cbuf</code> | The string to generate terminated by a newline. |
| <code>dbuf</code> | The string to generate terminated by a newline. |
| <code>nbuf</code> | The string to generate terminated by a newline. |

Usage Notes

- The `\n` character is not the same as `
`. The `\n` character formats the HTML source but it does not affect how the browser renders the HTML source. Use `
` to control how the browser renders the HTML source.
- These procedures do not have function equivalents.

225.5.96 PRINTS Procedure

This procedure generates a string and replaces certain characters with a corresponding escape sequence.

The following characters are replaced with the corresponding escape sequence.

- < to <
- > to >
- " to "
- & to &

If not replaced, the special characters are interpreted as HTML control characters and produce garbled output. This procedure and the [PS Procedure](#) perform the same operation as the [PRN Procedures](#) but with character substitution.

Syntax

```
HTP.PRINTS (  
  ctext      IN      VARCHAR2);
```

Parameters

Table 225-70 PRINTS Procedure Parameters

| Parameter | Description |
|-----------|---|
| ctext | The string where to perform character substitution. |

Usage Notes

This procedure does not have an HTF function equivalent (see [Operational Notes](#) for the HTF implementation).

225.5.97 PRN Procedures

These procedures generate the specified parameter as a string.

Unlike the [PRINT Procedures](#) the string is not terminated with the \n newline character.

Syntax

```
HTP.PRN (  
  cbuf      IN      VARCHAR2);
```

```
HTP.PRN (  
  dbuf      IN      DATE);
```

```
HTP.PRN (  
  nbuf      IN      NUMBER);
```

Parameters

Table 225-71 PRN Procedure Parameters

| Parameter | Description |
|-----------|---|
| cbuf | The string to generate (not terminated by a newline). |
| dbuf | The string to generate (not terminated by a newline). |
| nbuf | The string to generate (not terminated by a newline). |

Usage Notes

These procedures do not have function equivalents.

225.5.98 PS Procedure

This procedure generates a string and replaces certain characters with the corresponding escape sequence.

This procedure replaces the following characters with the corresponding escape sequence.

- < to <
- > to >
- " to "
- & to &

If not replaced, the special characters are interpreted as HTML control characters and produce garbled output. This procedure and the [PRINTS Procedure](#) perform the same operation as the [PRN Procedures](#) but with character substitution.

Syntax

```
HTP.PS (  
    ctext      IN      VARCHAR2);
```

Parameters

Table 225-72 PS Procedure Parameters

| Parameter | Description |
|-----------|---|
| ctext | The string where to perform character substitution. |

Usage Notes

This procedure does not have an HTF function equivalent (see [Operational Notes](#) for the HTF implementation).

225.5.99 S Procedure

This procedure generates the `<S>` and `</S>` tags which direct the browser to render the text they surround in strikethrough type.

This performs the same operation as [STRIKE Procedure](#).

Syntax

```
HTP.S (  
    ctext          IN          VARCHAR2,  
    cattributes    IN          VARCHAR2  DEFAULT NULL);
```

Parameters

Table 225-73 S Procedure Parameters

| Parameter | Description |
|--------------------------|---|
| <code>ctext</code> | The text to be rendered in strikethrough type. |
| <code>cattributes</code> | The other attributes to be included as-is in the tag. |

Examples

This procedure generates

```
<S cattributes>ctext</S>
```

225.5.100 SAMPLE Procedure

This procedure generates the `<SAMP>` and `</SAMP>` tags which direct the browser to render the text they surround in monospace font or however "sample" is defined stylistically.

Syntax

```
HTP.SAMPLE (  
    ctext          IN          VARCHAR2,  
    cattributes    IN          VARCHAR2  DEFAULT NULL);
```

Parameters

Table 225-74 SAMPLE Procedure Parameters

| Parameter | Description |
|--------------------------|---|
| <code>ctext</code> | The text to be rendered in monospace font. |
| <code>cattributes</code> | The other attributes to be included as-is in the tag. |

Examples

This procedure generates

```
<SAMP cattributes>ctext</SAMP>
```

225.5.101 SCRIPT Procedure

This procedure generates the `<SCRIPT>` and `</SCRIPT>` tags which contain a script written in languages such as JavaScript and VBscript.

Syntax

```
HTP.SCRIPT (  
    cscript          IN          VARCHAR2,  
    clanguage        IN          VARCHAR2  DEFAULT NULL);
```

Parameters

Table 225-75 SCRIPT Procedure Parameters

| Parameter | Description |
|------------------------|--|
| <code>cscript</code> | The text of the script. This is the text that makes up the script itself, not the name of a file containing the script. |
| <code>clanguage</code> | The language in which the script is written. If this parameter is omitted, the user's browser determines the scripting language. |

Examples

This procedure generates

```
<SCRIPT LANGUAGE=clanguage>cscript</SCRIPT>
```

so that

```
HTP.script ('Erupting_Volcano', 'Javascript');
```

generates

```
<SCRIPT LANGUAGE=Javascript>"script text here"</SCRIPT>
```

This causes the browser to run the script enclosed in the tags.

225.5.102 SMALL Procedure

This procedure generates the `<SMALL>` and `</SMALL>` tags, which direct the browser to render the text they surround using a small font.

Syntax

```
HTP.SMALL (  
    ctext          IN          VARCHAR2,  
    cattributes    IN          VARCHAR2  DEFAULT NULL);
```

Parameters

Table 225-76 SMALL Procedure Parameters

| Parameter | Description |
|--------------------|--|
| <code>ctext</code> | The text to be rendered in small font. |

Table 225-76 (Cont.) SMALL Procedure Parameters

| Parameter | Description |
|--------------------------|---|
| <code>cattributes</code> | The other attributes to be included as-is in the tag. |

Examples

This procedure generates

```
<SMALL cattributes>ctext</SMALL>
```

225.5.103 STRIKE Procedure

This procedure generates the `<STRIKE>` and `</STRIKE>` tags which direct the browser to render the text they surround in strikethrough type.

This performs the same operation as [S Procedure](#).

Syntax

```
HTP.STRIKE (
    ctext          IN          VARCHAR2,
    cattributes    IN          VARCHAR2  DEFAULT NULL);
```

Parameters**Table 225-77 STRIKE Procedure Parameters**

| Parameter | Description |
|--------------------------|---|
| <code>ctext</code> | The text to be rendered in strikethrough type. |
| <code>cattributes</code> | The other attributes to be included as-is in the tag. |

Examples

This procedure generates

```
<STRIKE cattributes>ctext</STRIKE>
```

225.5.104 STRONG Procedure

This procedure generates the `` and `` tags which direct the browser to render the text they surround in bold, or however "strong" is defined.

Syntax

```
HTP.STRONG (
    ctext          IN          VARCHAR2,
    cattributes    IN          VARCHAR2  DEFAULT NULL);
```

Parameters

Table 225-78 STRONG Procedure Parameters

| Parameter | Description |
|-------------------------------------|---|
| <code>c_{text}</code> | The text to be emphasized. |
| <code>c_{attributes}</code> | The other attributes to be included as-is in the tag. |

Examples

This procedure generates

```
<STRONG cattributes>ctext</STRONG>
```

225.5.105 STYLE Procedure

This procedure generates the `<STYLE>` and `</STYLE>` tags which include a style sheet in a Web page.

You can get more information about style sheets at <http://www.w3.org>. This feature is not compatible with browsers that support only HTML versions 2.0 or earlier. Such browsers will ignore this tag.

Syntax

```
HTP.STYLE(  
    cstyle          IN          VARCHAR2);
```

Parameters

Table 225-79 STYLE Procedure Parameters

| Parameter | Description |
|--------------------------------|---------------------------------------|
| <code>c_{style}</code> | The the style information to include. |

Examples

This procedure generates

```
<STYLE>cstyle</STYLE>
```

225.5.106 SUB Procedure

This procedure generates the `_{` and `}` tags which direct the browser to render the text they surround as subscript.

Syntax

```
HTP.SUB(  
    ctext          IN          VARCHAR2,  
    calign        in          VARCHAR2  DEFAULT NULL,  
    cattributes   IN          VARCHAR2  DEFAULT NULL);
```

Parameters

Table 225-80 SUB Procedure Parameters

| Parameter | Description |
|--------------------------|---|
| <code>ctext</code> | The text to render in subscript. |
| <code>calign</code> | The value for the <code>ALIGN</code> attribute. |
| <code>cattributes</code> | The other attributes to be included as-is in the tag. |

Examples

This procedure generates

```
<SUB ALIGN="calign" cattributes>ctext</SUB>
```

225.5.107 SUP Procedure

This procedure generates the `^{` and `}` tags which direct the browser to render the text they surround as superscript.

Syntax

```
HTP.SUP (
    ctext          IN          VARCHAR2,
    calign         in          VARCHAR2  DEFAULT NULL,
    cattributes    IN          VARCHAR2  DEFAULT NULL);
```

Parameters

Table 225-81 SUP Procedure Parameters

| Parameter | Description |
|--------------------------|---|
| <code>ctext</code> | The text to render in superscript. |
| <code>calign</code> | The value for the <code>ALIGN</code> attribute. |
| <code>cattributes</code> | The other attributes to be included as-is in the tag. |

Examples

This procedure generates

```
<SUP ALIGN="calign" cattributes>ctext</SUP>
```

225.5.108 TABLECAPTION Procedure

This procedure generates the `<CAPTION>` and `</CAPTION>` tags which place a caption in an HTML table.

Syntax

```
HTP.TABLECAPTION (
    ccaption      IN          VARCHAR2,
```

```

calign      in      VARCHAR2  DEFAULT NULL,
cattributes IN      VARCHAR2  DEFAULT NULL);

```

Parameters

Table 225-82 TABLECAPTION Procedure Parameters

| Parameter | Description |
|-------------|---|
| ctext | The text for the caption. |
| calign | The value for the ALIGN attribute. |
| cattributes | The other attributes to be included as-is in the tag. |

Examples

This procedure generates

```
<CAPTION ALIGN="calign" cattributes>ccaption</CAPTION>
```

225.5.109 TABLECLOSE Procedure

This procedure generates the </TABLE> tag which marks the end of an HTML table.

To define the beginning of an HTML table, use the [TABLEOPEN Procedure](#).

Syntax

```
HTP.TABLECLOSE;
```

Examples

This procedure generates

```
</TABLE>
```

225.5.110 TABLEDATA Procedure

This procedure generates the <TD> and </TD> tags which insert data into a cell of an HTML table.

Syntax

```

HTP.TABLEDATA (
  cvalue      IN      VARCHAR2  DEFAULT NULL,
  calign      IN      VARCHAR2  DEFAULT NULL,
  cdp         IN      VARCHAR2  DEFAULT NULL,
  cnowrap     IN      VARCHAR2  DEFAULT NULL,
  crowspan    IN      VARCHAR2  DEFAULT NULL,
  ccolspan    IN      VARCHAR2  DEFAULT NULL,
  cattributes IN      VARCHAR2  DEFAULT NULL);

```

Parameters

Table 225-83 TABLEDATA Procedure Parameters

| Parameter | Description |
|--------------------------|--|
| <code>cvalue</code> | The data for the cell in the table. |
| <code>calign</code> | The value for the <code>ALIGN</code> attribute. |
| <code>cdp</code> | The value for the <code>DP</code> attribute. |
| <code>cnowrap</code> | If the value of this parameter is not <code>NULL</code> , the <code>NOWRAP</code> attribute is added to the tag. |
| <code>ccolspan</code> | The value for the <code>COLSPAN</code> attribute. |
| <code>cattributes</code> | The other attributes to be included as-is in the tag. |

Examples

This procedure generates

```
<TD ALIGN="calign" DP="cdp" ROWSPAN="crowspan" COLSPAN="ccolspan" NOWRAP
attributes>cvalue</TD>
```

225.5.111 TABLEHEADER Procedure

This procedure generates the `<TH>` and `</TH>` tags which insert a header cell in an HTML table.

The `<TH>` tag is similar to the `<TD>` tag except that the text in this case the rows are usually rendered in bold type.

Syntax

```
HTP.TABLEHEADER (
  cvalue      IN          VARCHAR2  DEFAULT NULL,
  calign      IN          VARCHAR2  DEFAULT NULL,
  cdp         IN          VARCHAR2  DEFAULT NULL,
  cnowrap     IN          VARCHAR2  DEFAULT NULL,
  crowspan    IN          VARCHAR2  DEFAULT NULL,
  ccolspan    IN          VARCHAR2  DEFAULT NULL,
  cattributes IN          VARCHAR2  DEFAULT NULL);
```

Parameters

Table 225-84 TABLEHEADER Procedure Parameters

| Parameter | Description |
|----------------------|--|
| <code>cvalue</code> | The data for the cell in the table. |
| <code>calign</code> | The value for the <code>ALIGN</code> attribute. |
| <code>cdp</code> | The value for the <code>DP</code> attribute. |
| <code>cnowrap</code> | If the value of this parameter is not <code>NULL</code> , the <code>NOWRAP</code> attribute is added to the tag. |
| <code>crispen</code> | The value for the <code>ROWSPAN</code> attribute. |

Table 225-84 (Cont.) TABLEHEADER Procedure Parameters

| Parameter | Description |
|---------------------------|---|
| <code>c colspan</code> | The value for the <code>COLSPAN</code> attribute. |
| <code>c attributes</code> | The other attributes to be included as-is in the tag. |

Examples

This procedure generates

```
<TH ALIGN="calign" DP="cdp" ROWSPAN="crowspan" COLSPAN="c colspan" NOWRAP
c attributes>cvalue</TH>
```

225.5.112 TABLEOPEN Procedure

This procedure generates the `<TABLE>` tag which marks the beginning of an HTML table.

To define the end of an HTML table, use the [TABLECLOSE Procedure](#).

Syntax

```
HTP.TABLEOPEN (
  cborder          IN          VARCHAR2          DEFAULT NULL
  calign           IN          VARCHAR2          DEFAULT NULL,
  cnowrap         IN          VARCHAR2          DEFAULT NULL,
  cclear          IN          VARCHAR2          DEFAULT NULL
  c attributes     IN          VARCHAR2          DEFAULT NULL);
```

Parameters**Table 225-85 TABLEOPEN Procedure Parameters**

| Parameter | Description |
|---------------------------|--|
| <code>border</code> | The value for the <code>BORDER</code> attribute. |
| <code>calign</code> | The value for the <code>ALIGN</code> attribute. |
| <code>c nowrap</code> | If the value of this parameter is not <code>NULL</code> , the <code>NOWRAP</code> attribute is added to the tag. |
| <code>cclear</code> | The value for the <code>CLEAR</code> attribute. |
| <code>c attributes</code> | The other attributes to be included as-is in the tag. |

Examples

This procedure generates

```
<TABLE "cborder" NOWRAP ALIGN="calign" CLEAR="cclear" c attributes>
```

225.5.113 TABLEROWCLOSE Procedure

This procedure generates the `</TR>` tag which marks the end of a new row in an HTML table.

To mark the beginning of a new row, use the [TABLEROWOPEN Procedure](#).

Syntax

```
HTP.TABLEROWCLOSE;
```

Examples

This procedure generates

```
</TABLE>
```

225.5.114 TABLEROWOPEN Procedure

This procedure generates the `<TR>` tag which marks the beginning of a new row in an HTML table.

To mark the end of a new row, use the [TABLEROWCLOSE Procedure](#).

Syntax

```
HTP.TABLEROWOPEN (
  calign          IN          VARCHAR2  DEFAULT NULL,
  cvalign         IN          VARCHAR2  DEFAULT NULL,
  cdp             IN          VARCHAR2  DEFAULT NULL,
  cnowrap         IN          VARCHAR2  DEFAULT NULL,
  cattributes     IN          VARCHAR2  DEFAULT NULL);
```

Parameters**Table 225-86 TABLEROWOPEN Procedure Parameters**

| Parameter | Description |
|--------------------------|--|
| <code>calign</code> | The value for the <code>ALIGN</code> attribute. |
| <code>cvalign</code> | The value for the <code>VALIGN</code> attribute. |
| <code>cdp</code> | The value for the <code>DP</code> attribute. |
| <code>cnowrap</code> | If the value of this parameter is not <code>NULL</code> , the <code>NOWRAP</code> attribute is added to the tag. |
| <code>cattributes</code> | The other attributes to be included as-is in the tag. |

Examples

This procedure generates

```
<<TR ALIGN="calign" VALIGN="cvalign" DP="cdp" NOWRAP cattributes>
```

225.5.115 TELETYPE Procedure

This procedure generates the `<TT>` and `</TT>` tags which direct the browser to render the text they surround in a fixed width typewriter font, for example, the courier font.

Syntax

```
HTP.TELETYPE (
  ctext          IN          VARCHAR2,
  cattributes     IN          VARCHAR2  DEFAULT NULL);
```

Parameters

Table 225-87 TELETYPE Procedure Parameters

| Parameter | Description |
|--------------------------|---|
| <code>ctext</code> | The text to render in a fixed width typewriter font. |
| <code>cattributes</code> | The other attributes to be included as-is in the tag. |

Examples

This procedure generates

```
<TT cattributes>ctext</TT>
```

225.5.116 TITLE Procedure

This procedure generates the `<TITLE>` and `</TITLE>` tags which specify the text to display in the titlebar of the browser window.

Syntax

```
HTP.TITLE(  
    ctitle          IN          VARCHAR2);
```

Parameters

Table 225-88 TITLE Procedure Parameters

| Parameter | Description |
|---------------------|--|
| <code>ctitle</code> | The text to display in the titlebar of the browser window. |

Examples

This procedure generates

```
<TITLE>ctitle</TITLE>
```

225.5.117 ULISTCLOSE Procedure

This procedure generates the `` tag which marks the end of an unordered list. An unordered list presents items with bullets.

To mark the beginning of an unordered list, use the [ULISTOPEN Procedure](#). Add list items with [LISTITEM Procedure](#).

Syntax

```
HTP.ULISTCLOSE;
```

Examples

This procedure generates

```
</TABLE>
```

225.5.118 ULISTOPEN Procedure

This procedure generates the tag which marks the beginning of an unordered list. An unordered list presents items with bullets.

To mark the end of an unordered list, use the [ULISTCLOSE Procedure](#). Add list items with [LISTITEM Procedure](#).

Syntax

```
HTP.ULISTOPEN (
  cclear      IN      VARCHAR2  DEFAULT NULL,
  cwrap       IN      VARCHAR2  DEFAULT NULL,
  cdingbat    IN      VARCHAR2  DEFAULT NULL,
  csrc        IN      VARCHAR2  DEFAULT NULL,
  cattributes IN      VARCHAR2  DEFAULT NULL);
```

Parameters

Table 225-89 ULISTOPEN Procedure Parameters

| Parameter | Description |
|-------------|---|
| cclear | The value for the CLEAR attribute. |
| cwrap | The value for the WRAP attribute. |
| cdingbat | The value for the DINGBAT attribute. |
| csrc | The value for the SRC attribute. |
| cattributes | The other attributes to be included as-is in the tag. |

Examples

This procedure generates

```
<UL CLEAR="cclear" WRAP="cwrap" DINGBAT="cdingbat" SRC="csrc" cattributes>
```

225.5.119 UNDERLINE Procedure

This procedure generates the <U> and </U> tags, which direct the browser to render the text they surround with an underline.

Syntax

```
HTP.UNDERLINE (
  ctext      IN      VARCHAR2,
  cattributes IN      VARCHAR2  DEFAULT NULL);
```

Parameters

Table 225-90 UNDERLINE Procedure Parameters

| Parameter | Description |
|-----------|---------------------------------------|
| ctext | The text to render with an underline. |

Table 225-90 (Cont.) UNDERLINE Procedure Parameters

| Parameter | Description |
|--------------------------|---|
| <code>cattributes</code> | The other attributes to be included as-is in the tag. |

Examples

This procedure generates

```
<U cattributes>ctext</U>
```

225.5.120 VARIABLE Procedure

This procedure generates the `<VAR>` and `</VAR>` tags which direct the browser to render the text they surround in italics or however "variable" is defined stylistically.

Syntax

```
HTP.VARIABLE (
    ctext          IN          VARCHAR2,
    cattributes    IN          VARCHAR2  DEFAULT NULL);
```

Parameters**Table 225-91 VARIABLE Procedure Parameters**

| Parameter | Description |
|--------------------------|---|
| <code>ctext</code> | The text to render in italics. |
| <code>cattributes</code> | The other attributes to be included as-is in the tag. |

Examples

This procedure generates

```
<VAR cattributes>ctext</VAR>
```

225.5.121 WBR Procedure

This procedure generates the `<WBR>` tag, which inserts a soft line break within a section of NOBR text.

Syntax

```
HTP.WBR;
```

Examples

This procedure generates

```
<WBR>
```

OWA_CACHE

The `OWA_CACHE` package provides an interface that enables the PL/SQL Gateway cache to improve the performance of PL/SQL Web applications.

See Also:

For more information about implementation of this package:

- [Oracle Fusion Middleware Administrator's Guide for Oracle HTTP Server](#)
- [Oracle Fusion Middleware User's Guide for mod_plsql](#)

The chapter contains the following topics:

- [Constants](#)
- [Summary of OWA_CACHE Subprograms](#)

226.1 OWA_CACHE Constants

`OWA_CACHE` defines several constants to use when specifying parameter values.

- `system_level` CONSTANT VARCHAR(6) := 'SYSTEM';
- `user_level` CONSTANT VARCHAR(4) := 'USER';

226.2 Summary of OWA_CACHE Subprograms

This table lists the `OWA_CACHE` subprograms and briefly describes them.

Table 226-1 OWA_CACHE Package Subprograms

| Subprogram | Description |
|---|--|
| DISABLE Procedure | Disables the cache for this particular request |
| GET_ETAG Function | Returns the tag associated with the cached content (used in the Validation technique model only) |
| GET_LEVEL Function | Returns the caching level (used in the Validation technique model only) |
| SET_CACHE Procedure | Sets up the cache headers for validation model cache type |
| SET_EXPIRES Procedure | Sets up the cache headers for expires model cache type |
| SET_NOT_MODIFIED Procedure | Sets up the headers for a not modified cache hit (used in the Validation technique model only) |
| SET_SURROGATE_CONTROL Procedure | Sets up the headers for a surrogate-control header for Web cache |

226.2.1 DISABLE Procedure

This procedure disables the cache for this particular request.

Syntax

```
OWA_CACHE.DISABLE;
```

226.2.2 GET_ETAG Function

This function returns the tag associated with the cached content. It is used in the Validation technique only.

Syntax

```
OWA_CACHE.GET_ETAG  
RETURN VARCHAR2;
```

Return Values

The tag for cache hit, otherwise NULL.

226.2.3 GET_LEVEL Function

This returns the caching level. It is used in the Validation technique model only.

Syntax

```
OWA_CACHE.GET_LEVEL  
RETURN VARCHAR2;
```

Return Values

The caching level string ('USER' or 'SYSTEM') for cache hit, otherwise NULL.

226.2.4 SET_CACHE Procedure

This procedure sets up the cache headers for validation model cache type.

Syntax

```
OWA_CACHE.SET_CACHE(  
  p_etag      IN      VARCHAR2,  
  p_level     IN      VARCHAR2);
```

Parameters

Table 226-2 *SET_CACHE Procedure Parameters*

| Parameter | Description |
|-----------|---|
| p_etag | The etag associated with this content |
| p_level | The caching level ('USER' or 'SYSTEM'). |

Exceptions

VALUE_ERROR is thrown if

- p_etag is greater than 55
- p_level is not 'USER' or 'SYSTEM'

226.2.5 SET_EXPIRES Procedure

This procedure sets up the cache headers for expires model cache type.

Syntax

```
OWA_CACHE.SET_EXPIRES(  
    p_expires    IN      NUMBER,  
    p_level      IN      VARCHAR2);
```

Parameters

Table 226-3 SET_EXPIRES Procedure Parameters

| Parameter | Description |
|-----------|--|
| p_expires | The number of minutes this content is valid. |
| p_level | The caching level ('USER' or 'SYSTEM'). |

Exceptions

VALUE_ERROR is thrown if

- p_expires is negative or zero
- p_level is not 'USER' or 'SYSTEM'
- p_expires is > 525600 (1 year)

226.2.6 SET_NOT_MODIFIED Procedure

This procedure sets up the headers for a not-modified cache hit. It is used in the Validation technique only.

Syntax

```
OWA_CACHE.SET_NOT_MODIFIED;
```

Exceptions

VALUE_ERROR is thrown if the etag was not passed in

226.2.7 SET_SURROGATE_CONTROL Procedure

This procedure sets the headers for a surrogate-control header for Web cache

Syntax

```
OWA_CACHE.SET_SURROGATE_CONTROL(  
    p_value      IN      VARCHAR2);
```

Parameters

Table 226-4 SET_SURROGATE_CONTROL Procedure Parameters

| Parameter | Description |
|-----------|---|
| p_value | The value to be passed as the Surrogate-Control header. |

Exceptions

VALUE_ERROR is thrown if p_value is greater than 55 in length.

OWA_COOKIE

The OWA_COOKIE package provides an interface for sending and retrieving HTTP cookies from the client's browser.

See Also:

For more information about implementation of this package:

- [Oracle Fusion Middleware Administrator's Guide for Oracle HTTP Server](#)
- [Oracle Fusion Middleware User's Guide for mod_plsql](#)

The chapter contains the following topics:

- [Overview](#)
- [Types](#)
- [Rules and Limits](#)
- [Summary of OWA_COOKIE Subprograms](#)

227.1 OWA_CUSTOM Overview

Cookies are opaque strings sent to the browser to maintain state between HTTP calls. State can be maintained throughout the client's sessions, or longer if an expiration date is included. The system date is calculated with reference to the information specified in the OWA_CUSTOM package.

227.2 OWA_COOKIE Types

This datatype contains cookie name-value pairs.

Since the HTTP standard allows cookie names to be overloaded (that is, multiple values can be associated with the same cookie name), there is a PL/SQL RECORD holding all values associated with a given cookie name.

```
TYPE vc_arr IS TABLE OF VARCHAR2(4000) INDEX BY BINARY_INTEGER.
```

```
TYPE COOKIE IS RECORD (
  name      VARCHAR2(4000),
  vals      vc_arr,
  num_vals  INTEGER);
```

227.3 OWA_COOKIE Rules and Limits

All HTTP headers must be in English and the ASCII character set. If the headers are generated from the database, verify they are created in the English language.

227.4 Summary of OWA_COOKIE Subprograms

This table lists the OWA_COOKIE subprograms and briefly describes them.

Table 227-1 OWA_COOKIE Package Subprograms

| Subprogram | Description |
|-----------------------------------|--|
| GET Function | Gets the value of the specified cookie |
| GET_ALL Procedure | Gets all cookie name-value pairs |
| REMOVE Procedure | Removes the specified cookie |
| SEND procedure | Generates a "Set-Cookie" line in the HTTP header |

227.4.1 GET Function

This function returns the values associated with the specified cookie. The values are returned in a OWA_COOKIE.COOKIE DATA TYPE .

Syntax

```
OWA_COOKIE.GET (
    name          IN          VARCHAR2)
RETURN COOKIE;
```

Parameters

Table 227-2 GET Function Parameters

| Parameter | Description |
|-----------|-------------------------|
| name | The name of the cookie. |

Return Values

OWA_COOKIE.COOKIE DATA TYPE.

227.4.2 GET_ALL Procedure

This procedure returns all cookie names and their values from the client's browser. The values appear in the order in which they were sent from the browser.

Syntax

```
OWA_COOKIE.GET_ALL (
    names      OUT          vc_arr,
    vals       OUT          vc_arr,
    num_vals   OUT          INTEGER);
```

Parameters

Table 227-3 GET_ALL Procedure Parameters

| Parameter | Description |
|-----------|-----------------------------------|
| names | The names of the cookies. |
| vals | The values of the cookies. |
| num_vals | The number of cookie-value pairs. |

227.4.3 REMOVE Procedure

This procedure forces a cookie to expire immediately by setting the "expires" field of a Set-Cookie line in the HTTP header to "01-Jan-1990".

This procedure must be called within the context of an HTTP header.

Syntax

```
OWA_COOKIE.REMOVE (
  name          IN          VARCHAR2,
  val           IN          VARCHAR2,
  path          IN          VARCHAR2  DEFAULT NULL);
```

Parameters

Table 227-4 REMOVE Procedure Parameters

| Parameter | Description |
|-----------|-----------------------------------|
| name | The name of the cookie to expire. |
| val | The value of the cookie. |
| path | [Currently unused] |

227.4.4 SEND procedure

This procedure generates a Set-Cookie line, which transmits a cookie to the client.

This procedure must occur in the context of an HTTP header.

Syntax

```
OWA_COOKIE.SEND (
  name          in          varchar2,
  value         in          varchar2,
  expires       in          date      DEFAULT NULL,
  path          in          varchar2  DEFAULT NULL,
  domain        in          varchar2  DEFAULT NULL,
  secure        in          varchar2  DEFAULT NULL);
```

Parameters

Table 227-5 SEND Procedure Parameters

| Parameter | Description |
|------------------|--|
| name | The name of the cookie. |
| value | The value of the cookie. |
| expires | The date at which the cookie will expire |
| path | The value for the path field. |
| domain | The value for the domain field. |
| secure | If the value of this parameter is not NULL, the "secure" field is added to the line. |

OWA_CUSTOM

The `OWA_CUSTOM` package provides a Global PLSQL Agent Authorization callback function.

It is used when PLSQL Agent's authorization scheme is set to `GLOBAL` or `CUSTOM` when there is no overriding `OWA_CUSTOM` package.

See Also:

For more information about implementation of this package:

- [Oracle Fusion Middleware Administrator's Guide for Oracle HTTP Server](#)
- [Oracle Fusion Middleware User's Guide for `mod_plsql`](#)

The chapter contains the following topics:

- [Constants](#)
- [Summary of `OWA_CUSTOM` Subprograms](#)

228.1 `OWA_CUSTOM` Constants

`OWA_CUSTOM` defines several constants to use when specifying parameter values.

- `dbms_server_timezone` CONSTANT VARCHAR2(3) := 'PST';
- `dbms_server_gmtdiff` CONSTANT NUMBER := NULL;

228.2 Summary of `OWA_CUSTOM` Subprograms

The `AUTHORIZE` function is the only subprogram in the `OWA_CUSTOM` package.

Table 228-1 *`OWA_CUSTOM` Package Subprograms*

| Subprogram | Description |
|------------------------------------|---|
| AUTHORIZE Function | Provides a Global PLSQL Agent Authorization callback function |

228.2.1 `AUTHORIZE` Function

This function is used when PLSQL Agent's authorization scheme is set to `GLOBAL` or `CUSTOM` when there is no overriding `OWA_CUSTOM` package.

Syntax

```
OWA_CUSTOM.AUTHORIZE
RETURN BOOLEAN;
```

OWA_IMAGE

The `OWA_IMAGE` package provides an interface to access the coordinates where a user clicked on an image.

The chapter contains the following topics:

- [Overview](#)
- [Types](#)
- [Variables](#)
- [Examples](#)
- [Summary of OWA_IMAGE Subprograms](#)

See Also:

For more information about implementation of this package:

- [Oracle Fusion Middleware Administrator's Guide for Oracle HTTP Server](#)
- [Oracle Fusion Middleware User's Guide for mod_plsql](#)

229.1 OWA_IMAGE Overview

Use this package when you have any image map whose destination links invoke the PL/SQL Gateway.

229.2 OWA_IMAGE Types

This datatype (`point`) contain the X and Y values of a coordinate, and so provides the coordinates of a user's click on an imagemap.

It is defined as:

```
TYPE POINT IS TABLE OF VARCHAR2(32767) INDEX BY BINARY_INTEGER
```

229.3 OWA_IMAGE Variables

This package variable (`null_point`) of `TYPE POINT` is used to default point parameters. Both the X and the Y fields of this variable are `NULL`.

229.4 OWA_IMAGE Examples

This example shows use of OWA_IMAGE.

```
CREATE OR REPLACE PROCEDURE process_image
  (my_img in OWA_IMAGE.POINT)
  AS
  x integer := OWA_IMAGE.GET_X(my_img);
  y integer := OWA_IMAGE.GET_Y(my_img);
BEGIN
  /* process the coordinate */
END
```

229.5 Summary of OWA_IMAGE Subprograms

This table lists the OWA_IMAGE subprograms and briefly describes them.

Table 229-1 OWA_IMAGE Package Subprograms

| Subprogram | Description |
|--------------------------------|----------------------------------|
| GET_X Function | Gets the X value of a point type |
| GET_Y Function | Gets the Y value of a point type |

229.5.1 GET_X Function

This function returns the x coordinate of the point where the user clicked on an image map.

Syntax

```
OWA_IMAGE.GET_X(
  p          IN          point)
RETURN INTEGER;

OWA_IMAGE.GET_X(
  p          IN          point)
RETURN INTEGER PARALLEL_ENABLE DETERMINISTIC;
```

Parameters

Table 229-2 GET_X Function Parameters

| Parameter | Description |
|-----------|-----------------------------------|
| p | The point where the user clicked. |

Return Values

The X coordinate as an integer.

229.5.2 GET_Y Function

This function returns the Y coordinate of the point where the user clicked on an image map.

Syntax

```
OWA_IMAGE.GET_Y(  
  p          IN          point)  
  RETURN INTEGER;  
  
OWA_IMAGE.GET_Y(  
  p          IN          point)  
  RETURN INTEGER PARALLEL_ENABLE DETERMINISTIC;
```

Parameters

Table 229-3 GET_Y Function Parameters

| Parameter | Description |
|-----------|-----------------------------------|
| p | The point where the user clicked. |

Return Values

The Y coordinate as an integer.

OWA_OPT_LOCK

The `OWA_OPT_LOCK` package contains subprograms that impose optimistic locking strategies so as to prevent lost updates.

This chapter contains the following topics:

- [Overview](#)
- [Types](#)
- [Summary of OWA_OPT_LOCK Subprograms](#)

See Also:

For more information about implementation of this package:

- [Oracle Fusion Middleware Administrator's Guide for Oracle HTTP Server](#)
- [Oracle Fusion Middleware User's Guide for mod_plsql](#)

230.1 OWA_OPT_LOCK Overview

The `OWA_OPT_LOCK` package contains subprograms that impose optimistic locking strategies, so as to prevent lost updates.

It checks if the row that the user is interested in updating has been changed by someone else in the meantime.

The PL/SQL Gateway cannot use conventional database locking schemes because HTTP is a stateless protocol. The `OWA_OPT_LOCK` package gives you two ways of dealing with the lost update problem:

- The hidden fields method stores the previous values in hidden fields in the HTML page. When the user requests an update, the PL/SQL Gateway checks these values against the current state of the database. The update operation is performed only if the values match. To use this method, call the `owa_opt_lock.store_values` procedure.
- The checksum method stores a checksum rather than the values themselves. To use this method, call the `owa_opt_lock.checksum` function.

These methods are optimistic. They do not prevent other users from performing updates, but they do reject the current update if an intervening update has occurred.

230.2 OWA_TEXT Types

This datatype is a PL/SQL table intended to hold ROWIDs.

```
TYPE VCARRAY IS TABLE OF VARCHAR2(2000) INDEX BY BINARY_INTEGER
```

Note that this is different from the `OWA_TEXT.VC_ARR` DATA TYPE.

230.3 Summary of OWA_OPT_LOCK Subprograms

This table lists the `OWA_OPT_LOCK` subprograms and briefly describes them.

Table 230-1 OWA_OPT_LOCK Package Subprograms

| Subprogram | Description |
|--|--|
| CHECKSUM Functions | Returns the checksum value |
| GET_ROWID Function | Returns the ROWID value |
| STORE_VALUES Procedure | Stores unmodified values in hidden fields for later verification |
| VERIFY_VALUES Function | Verifies the stored values against modified values |

230.3.1 CHECKSUM Functions

This function returns a `checksum` value for a specified string, or for a row in a table. For a row in a table, the function calculates the `checksum` value based on the values of the columns in the row. This function comes in two versions.

The first version returns a `checksum` based on the specified string. This is a "pure" 32-bit `checksum` executed by the database and based on the Internet 1 protocol.

The second version returns a `checksum` based on the values of a row in a table. This is a "impure" 32-bit `checksum` based on the Internet 1 protocol.

Syntax

```
OWA_OPT_LOCK.CHECKSUM(
  p_buff      IN      VARCHAR2)
RETURN NUMBER;
```

```
OWA_OPT_LOCK.CHECKSUM(
  p_buff      IN      VARCHAR2)
RETURN NUMBER PARALLEL_ENABLE DETERMINISTIC;
```

```
OWA_OPT_LOCK.CHECKSUM(
  p_owner     IN      VARCHAR2,
  p_tname     IN      VARCHAR2,
  p_rowid     IN      ROWID)
RETURN NUMBER;
```

Parameters

Table 230-2 CHECKSUM Function Parameters

| Parameter | Description |
|----------------------|---|
| <code>p_buff</code> | The nstring where you want to calculate the <code>checksum</code> . |
| <code>p_owner</code> | The owner of the table. |
| <code>p_tname</code> | The table name. |

Table 230-2 (Cont.) CHECKSUM Function Parameters

| Parameter | Description |
|-----------|---|
| p_rowid | The row in p_tname where you want to calculate the checksum value. Use the GET_ROWID Function to convert VCARRAY values to proper rowids. |

230.3.2 GET_ROWID Function

This function returns the ROWID datatype from the specified OWA_OPT_LOCK.VCARRAY DATA TYPE.

Syntax

```
OWA_OPT_LOCK.GET_ROWID(
  p_old_values      IN      vccarray)
RETURN ROWID;
```

```
OWA_OPT_LOCK.GET_ROWID(
  p_old_values      IN      vccarray)
RETURN ROWID PARALLEL_ENABLE DETERMINISTIC;
```

Parameters

Table 230-3 GET_ROWID Function Parameters

| Parameter | Description |
|--------------|--|
| p_old_values | This parameter is usually passed in from an HTML form. |

230.3.3 STORE_VALUES Procedure

This procedure stores the column values of the row that you want to update later. The values are stored in hidden HTML form elements.

Syntax

```
OWA_OPT_LOCK.STORE_VALUES (
  p_owner          IN      VARCHAR2,
  p_tname          IN      VARCHAR2,
  p_rowid          IN      ROWID);
```

Parameters

Table 230-4 STORE_VALUES Procedure Parameters

| Parameter | Description |
|-----------|---|
| p_owner | The owner of the table. |
| p_tname | The name of the table. |
| p_rowid | The row where you want to store values. |

Usage Notes

Before updating the row, compare these values with the current row values to ensure that the values in the row have not been changed. If the values have changed, you can warn the users and let them decide if the update should take place.

The procedure generates series of hidden form elements:

- One hidden form element is created for the table owner. The name of the element is "old_p_tname", where p_tname is the name of the table. The value of the element is the owner name.
- One hidden form element is created for the table name. The name of the element is "old_p_tname", where p_tname is the name of the table. The value of the element is the table name.
- One element is created for each column in the row. The name of the element is "old_p_tname", where p_tname is the name of the table. The value of the element is the column value.

See also the [VERIFY_VALUES Function](#).

230.3.4 VERIFY_VALUES Function

This function verifies whether values in the specified row have been updated since the last query.

Use this function with the [STORE_VALUES Procedure](#).

Syntax

```
OWA_OPT_LOCK.VERIFY_VALUES(
    p_old_values IN varray)
RETURN BOOLEAN;
```

Parameters

Table 230-5 VERIFY_VALUES Function Parameters

| Parameter | Description |
|--------------|---|
| p_old_values | <p>A PL/SQL table containing the following information:</p> <ul style="list-style-type: none"> • p_old_values(1) specifies the owner of the table. • p_old_values(2) specifies the table. • p_old_values(3) specifies the rowid of the row to verify. <p>The remaining indexes contain values for the columns in the table.</p> <p>Typically, this parameter is passed in from the HTML form, where you have previously called the STORE_VALUES Procedure to store the row values on hidden form elements.</p> |

Return Values

TRUE if no other update has been performed, otherwise FALSE.

OWA_PATTERN

The OWA_PATTERN package provides an interface to locate text patterns within strings and replace the matched string with another string.

See Also:

For more information about implementation of this package, see the following:

- [Oracle Fusion Middleware Administrator's Guide for Oracle HTTP Server](#)
- [Oracle Fusion Middleware User's Guide for mod_plsql](#)

The chapter contains the following topics:

- [Types](#)
- [Operational Notes](#)
- [Summary of OWA_PATTERN Subprograms](#)

231.1 OWA_PATTERN Types

You can use a pattern as both an input and output parameter. Because of this, you can pass the same regular expression to OWA_PATTERN function calls, and it only has to be parsed once.

- `OWA_PATTERN.PATTERN`

231.2 OWA_PATTERN Operational Notes

The OWA_PATTERN subprograms are overloaded. Specifically, there are six versions of `MATCH`, and four each of `AMATCH` and `CHANGE`.

The subprograms use the following parameters:

- `line` - This is the target to be examined for a match. It can be more than one line of text or a `owa_text.multi_line` datatype.
- `pat` - This is the pattern that the subprograms attempt to locate in line. The pattern can contain regular expressions. In the `owa_pattern.change` function and procedure, this parameter is called `from_str`.
- `flags` - This specifies whether the search is case-sensitive or if substitutions are done globally.

Use regular expressions with the subprograms in this package. You Specify a regular expression by creating the string you want to match interspersed with various wildcard tokens and quantifiers.

- [Wildcards](#)

- [Quantifiers](#)
- [Flags](#)

231.2.1 OWA_PATTERN Wildcards

Wildcard tokens match something other than themselves.

Table 231-1 *Wildcard tokens recognized by OWA_PATTERN package*

| Token | Description |
|---------|--|
| ^ | Matches newline or the beginning of the target |
| \$ | Matches newline or the end of the target |
| \n | Matches newline |
| . | Matches any character except newline |
| \t | Matches tab |
| \d | Matches digits [0-9] |
| \D | Matches non-digits [not 0-9] |
| \w | Matches word characters (0-9, a-z, A-Z, or _) |
| \W | Matches non-word characters (not 0-9, a-z, A-Z, or _) |
| \s | Matches whitespace characters (blank, tab, or newline). |
| \S | Matches non-whitespace characters (not blank, tab, or newline) |
| \b | Matches "word" boundaries (between \w and \W) |
| \x<HEX> | Matches the value in the current character set of the two hexadecimal digits |
| \<OCT> | Matches the value in the current character set of the two or three octal digits |
| \ | Followed by any character not covered by another case matches that character |
| & | Applies only to <code>CHANGE</code> . This causes the string that matched the regular expression to be included in the string that replaces it. This differs from the other tokens in that it specifies how a target is changed rather than how it is matched. This is explained further under CHANGE Functions and Procedures . |

231.2.2 OWA_PATTERN Quantifiers

Any tokens except `&` can have their meaning extended by any of the following quantifiers. You can also apply these quantifiers to literals.

Table 231-2 **Quantifiers**

| Quantifier | Description |
|------------|-------------------------------|
| ? | 0 or 1 occurrence(s) |
| * | 0 or more occurrences |
| + | 1 or more occurrence(s) |
| {n} | Exactly <i>n</i> occurrences |
| {n, } | At least <i>n</i> occurrences |

Table 231-2 (Cont.) Quantifiers

| Quantifier | Description |
|-------------------------|--|
| { <i>n</i> , <i>m</i> } | At least <i>n</i> , but not more than <i>m</i> , occurrences |

231.2.3 OWA_PATTERN Flags

In addition to targets and regular expressions, the OWA_PATTERN functions and procedures use flags to affect how they are interpreted.

Table 231-3 Flags

| Flag | Description |
|------|---|
| i | This indicates a case-insensitive search. |
| g | This applies only to CHANGE. It indicates a global replace. That is, all portions of the target that match the regular expression are replaced. |

231.3 Summary of OWA_PATTERN Subprograms

This table lists the OWA_PATTERN subprograms and briefly describes them.

Table 231-4 OWA_PATTERN Package Subprograms

| Subprogram | Description |
|---|---|
| AMATCH Function | Determines if a string contains the specified pattern. It lets you specify where in the string the match has to occur |
| CHANGE Functions and Procedures | Replaces a pattern within a string. If you call it as a function it returns the number of times the regular expression was found and replaced |
| GETPAT Procedure | Generates a pattern datatype from a VARCHAR2 type |
| MATCH Function | Determines if a string contains the specified pattern |

231.3.1 AMATCH Function

This function specifies if a pattern occurs in a particular location in a string.

There are four versions to this function:

- The first and second versions of the function do not save the matched tokens (these are saved in the `backrefs` parameters in the third and fourth versions). The difference between the first and second versions is the `pat` parameter, which can be a VARCHAR2 or a pattern datatype.
- The third and fourth versions of the function save the matched tokens in the `backrefs` parameter. The difference between the third and fourth versions is the `pat` parameter, which can be a VARCHAR2 or a pattern datatype.

 **Note:**

If multiple overlapping strings match the regular expression, this function takes the longest match.

Syntax

```
OWA_PATTERN.AMATCH (
    line           IN           VARCHAR2,
    from_loc       IN           INTEGER,
    pat            IN           VARCHAR2,
    flags          IN           VARCHAR2  DEFAULT NULL)
RETURN INTEGER;
```

```
OWA_PATTERN.AMATCH (
    line           IN           VARCHAR2,
    from_loc       IN           INTEGER,
    pat            IN OUT      PATTERN,
    flags          IN           VARCHAR2  DEFAULT NULL)
RETURN INTEGER;
```

```
OWA_PATTERN.AMATCH (
    line           IN           VARCHAR2
    from_loc       IN           INTEGER
    pat            IN           varchar2
    backrefs       OUT          owa_text.vc_arr
    flags          IN           VARCHAR2  DEFAULT NULL)
RETURN INTEGER;
```

```
OWA_PATTERN.AMATCH (
    line           IN           VARCHAR2
    from_loc       IN           INTEGER
    pat            IN OUT      PATTERN
    backrefs       OUT          owa_text.vc_arr
    flags          IN           VARCHAR2  DEFAULT NULL)
RETURN INTEGER;
```

Parameters

Table 231-5 AMATCH Function Parameters

| Parameter | Description |
|-----------|---|
| line | The text to search in. |
| from_loc | The location (in number of characters) in line where the search is to begin. |
| pat | The string to match. It can contain regular expressions. This can be either a VARCHAR2 or a pattern. If it is a pattern, the output value of this parameter is the pattern matched. |
| backrefs | The text that is matched. Each token that is matched is placed in a cell in the OWA_TEXT.VC_ARR DATA TYPE PL/SQL table. |
| flags | Whether or not the search is case-sensitive. If the value of this parameter is "i", the search is case-insensitive. Otherwise the search is case-sensitive. |

Return Values

The index of the character after the end of the match, counting from the beginning of `line`. If there was no match, the function returns 0.

231.3.2 CHANGE Functions and Procedures

This function or procedure searches and replaces a string or `multi_line` datatype. If multiple overlapping strings match the regular expression, this subprogram takes the longest match.

Syntax

```
OWA_PATTERN.CHANGE (
  line           IN OUT  VARCHAR2,
  from_str       IN      VARCHAR2,
  to_str         IN      VARCHAR2,
  flags          IN      VARCHAR2  DEFAULT NULL)
RETURN INTEGER;
```

```
OWA_PATTERN.CHANGE (
  line           IN OUT  VARCHAR2,
  from_str       IN      VARCHAR2,
  to_str         IN      VARCHAR2,
  flags          IN      VARCHAR2  DEFAULT NULL);
```

```
owa_pattern.change (
  mline          IN OUT  owa_text.multi_line,
  from_str       IN      VARCHAR2,
  to_str         IN      VARCHAR2,
  flags          IN      VARCHAR2  DEFAULT NULL)
RETURN INTEGER;
```

```
OWA_PATTERN.CHANGE (
  mline          IN OUT  owa_text.multi_line,
  from_str       IN      VARCHAR2,
  to_str         IN      VARCHAR2,
  flags          IN      VARCHAR2  DEFAULT NULL);
```

Parameters

Table 231-6 CHANGE Procedure Parameters

| Parameter | Description |
|-----------------------|---|
| <code>line</code> | The text to search in. The output value of this parameter is the altered string. |
| <code>mline</code> | The text to search in. This is a <code>owa_text.multi_line</code> datatype. The output value of this parameter is the altered string. |
| <code>from_str</code> | The regular expression to replace. |
| <code>to_str</code> | The substitution pattern. |
| <code>flags</code> | Whether or not the search is case-sensitive, and whether or not changes are to be made globally. If "i" is specified, the search is case-insensitive. If "g" is specified, changes are made to all matches. Otherwise, the function stops after the first substitution is made. |

Return Values

As a function, it returns the number of substitutions made. If the flag "g" is not used, this number can only be 0 or 1 and only the first match is replaced. The flag "g" specifies to replace all matches with the regular expression.

Examples

```
OWA_PATTERN.CHANGE('Cats in pajamas', 'C.+in', '& red ')
```

The regular expression matches the substring "Cats in". It then replaces this string with "& red". The ampersand character "&" indicates "Cats in" because that is what matched the regular expression. Thus, this procedure replaces the string "Cats in pajamas" with "Cats in red" If you call this as a function instead of a procedure, the value returned is 1, indicating that a single substitution has been made.

Example 2:

```
CREATE OR REPLACE PROCEDURE test_pattern as theline VARCHAR2(256);
num_found      INTEGER;
BEGIN
    theline := 'what is the goal?';
    num_found := OWA_PATTERN.CHANGE(theline, 'goal', 'idea', 'g');
    HTP.PRINT(num_found); -- num_found is 1
    HTP.PRINT(theline); -- theline is 'what is the idea?'
END;
/
SHOW ERRORS
```

231.3.3 GETPAT Procedure

This procedure converts a VARCHAR2 string into an OWA_PATTERN.PATTERN DATA TYPE.

Syntax

```
OWA_PATTERN.GETPAT(
    arg      IN      VARCHAR2,
    pat      IN OUT  pattern);
```

Parameters

Table 231-7 GETPAT Procedure Parameters

| Parameter | Description |
|-----------|---|
| arg | The string to convert. |
| pat | the OWA_PATTERN.PATTERN DATA TYPE initialized with arg. |

231.3.4 MATCH Function

This function determines if a string contains the specified pattern. The pattern can contain regular expressions. If multiple overlapping strings can match the regular expression, this function takes the longest match.

Syntax

```
owa_pattern.match(
  line      IN      VARCHAR2,
  pat       IN      VARCHAR2,
  flags     IN      VARCHAR2  DEFAULT NULL)
RETURN BOOLEAN;
```

```
owa_pattern.match(
  line      IN      VARCHAR2,
  pat       IN OUT  PATTERN,
  flags     IN      VARCHAR2  DEFAULT NULL)
RETURN BOOLEAN;
```

```
owa_pattern.match(
  line      IN      VARCHAR2,
  pat       IN      VARCHAR2,
  backrefs  OUT     owa_text.vc_arr,
  flags     IN      VARCHAR2  DEFAULT NULL)
RETURN BOOLEAN;
```

```
OWA_PATTERN.MATCH(
  line      IN      VARCHAR2,
  pat       IN OUT  PATTERN,
  backrefs  OUT     owa_text.vc_arr,
  flags     IN      VARCHAR2  DEFAULT NULL)
RETURN BOOLEAN;
```

```
owa_pattern.match(
  mline     IN      owa_text.multi_line,
  pat       IN      VARCHAR2,
  rlist     OUT     owa_text.row_list,
  flags     IN      VARCHAR2  DEFAULT NULL)
RETURN BOOLEAN;
```

```
OWA_PATTERN.MATCH(
  mline     IN      owa_text.multi_line,
  pat       IN OUT  pattern,
  rlist     OUT     owa_text.row_list,
  flags     IN      VARCHAR2  DEFAULT NULL)
RETURN BOOLEAN;
```

Parameters

Table 231-8 MATCH Function Parameters

| Parameter | Description |
|-----------|--|
| line | The line to search in. |
| mline | The text to search in. This is a <code>owa_text.multi_line</code> datatype.. |

Table 231-8 (Cont.) MATCH Function Parameters

| Parameter | Description |
|-----------|---|
| pat | The pattern to match. This is either a VARCHAR2 or a OWA_PATTERN.PATTERN DATA TYPE. It is a pattern, the output value of this parameter is the pattern matched. |
| backrefs | The text that is matched. Each token that is matched is placed in a cell in the OWA_TEXT.VC_ARR DATA TYPE PL/SQL table. This parameter is a row_list that holds each string in the target that was matched by a sequence of tokens in the regular expression. |
| rlist | An output parameter containing a list of matches. |
| flags | Whether or not the search is case-sensitive. If the value of this parameter is "i", the search is case-insensitive. Otherwise the search is case-sensitive. |

Return Values

TRUE if a match was found, FALSE otherwise.

Examples

KAZOO is the target where it is searching for the zoo.* regular expression. The period indicates any character other than newline, and the asterisk matches 0 or more of the preceding characters. In this case, it matches any character other than the newline.

Therefore, this regular expression specifies that a matching target consists of zoo, followed by any set of characters neither ending in nor including a newline (which does not match the period). The i flag indicates to ignore case in the search. In this case, the function returns TRUE, which indicates that a match had been found.

```
boolean foundMatch;
foundMatch := owa_pattern.match('KAZOO', 'zoo.*', 'i');
```

The following example searches for the string "goal" followed by any number of characters in sometext. If found,

```
sometext VARCHAR2(256);
pat      VARCHAR2(256);

sometext := 'what is the goal?'
pat      := 'goal.*';
IF OWA_PATTERN.MATCH(sometext, pat)
  THEN
    HTP.PRINT('Match found');
  ELSE
    HTP.PRINT('Match not found');
END IF;
```

Operational Notes

- The regular expression in this function can be either a VARCHAR2 or an OWA_PATTERN.PATTERN DATA TYPE. Create an OWA_PATTERN.PATTERN DATA TYPE from a string using the OWA_PATTERN.GETPAT procedure.

- Create a `MULTI_LINE` DATA TYPE from a long string using the `OWA_TEXT.STREAM2MULTI` procedure. If a `multi_line` is used, the `rlist` parameter specifies a list of chunks where matches were found.
- If the line is a string and not a `multi_line`, you can add an optional output parameter called `backrefs`. This parameter is a `row_list` that holds each string in the target that was matched by a sequence of tokens in the regular expression.

OWA_SEC

The `OWA_SEC` package provides an interface for custom authentication.

The chapter contains the following topics:

- [Operational Notes](#)
- [Summary of OWA_SEC Subprograms](#)

232.1 OWA_SEC Operational Notes

Parameters that have default values are optional.

232.2 Summary of OWA_SEC Subprograms

This table lists the `OWA_SEC` subprograms in alphabetical order and briefly describes them.

Table 232-1 OWA_SEC Package Subprograms

| Subprogram | Description |
|--|---|
| GET_CLIENT_HOSTNAME Function | Returns the client's hostname |
| GET_CLIENT_IP Function | Returns the client's IP address |
| GET_PASSWORD Function | Returns the password that the user entered |
| GET_USER_ID Function | Returns the username that the user entered |
| SET_AUTHORIZATION Procedure | Enables the PL/SQL application to use custom authentication |
| SET_PROTECTION_REALM Procedure | Defines the realm that the page is in |

232.2.1 GET_CLIENT_HOSTNAME Function

This function returns the hostname of the client.

Syntax

```
OWA_SEC.GET_CLIENT_HOSTNAME  
RETURN VARCHAR2;
```

Return Values

The hostname.

232.2.2 GET_CLIENT_IP Function

This function returns the IP address of the client.

Syntax

```
OWA_SEC.GET_CLIENT_IP  
RETURN OWA_UTIL.IP_ADDRESS;
```

Return Values

The IP address. The `owa_util.ip_address` datatype is a PL/SQL table where the first four elements contain the four numbers of the IP address. For example, if the IP address is 123.45.67.89 and the variable `ipaddr` is of the `owa_util.ip_address` datatype, the variable would contain the following values:

```
ipaddr(1) = 123  
ipaddr(2) = 45  
ipaddr(3) = 67  
ipaddr(4) = 89
```

232.2.3 GET_PASSWORD Function

This function returns the password that the user used to log in.

Syntax

```
OWA_SEC.GET_PASSWORD  
RETURN VARCHAR2;
```

Return Values

The password.

Usage Notes

For security reasons, this function returns a true value only when custom authentication is used. If you call this function when you are not using custom authentication, the function returns an undefined value. Thus, the database passwords are not exposed.

232.2.4 GET_USER_ID Function

This function returns the username that the user used to log in.

Syntax

```
OWA_SEC.GET_USER_ID  
RETURN VARCHAR2;
```

Return Values

The username.

232.2.5 SET_AUTHORIZATION Procedure

This procedure, called in the initialization portion of the OWA_CUSTOM package, sets the authorization scheme for the PL/SQL Gateway.

This implements your `authorize` function, which authorizes the user before his requested procedure is run. The placement of the `authorize` function depends on the scheme you select.

Syntax

```
OWA_SEC.SET_AUTHORIZATION(  
    scheme          IN      INTEGER);
```

Parameters

Table 232-2 SET_AUTHORIZATION Procedure Parameters

| Parameter | Description |
|-----------|--|
| scheme | <p>The authorization scheme. It is one of the following schemes for SET_AUTHORIZATION:</p> <ul style="list-style-type: none"> OWA_SEC.NO_CHECK - Specifies that the PL/SQL application is not to do any custom authentication. This is the default. OWA_SEC.GLOBAL - Defines an authorize function that is called for all users and all procedures. This is the OWA_CUSTOM.AUTHORIZE Function in the "sys" schema. OWA_SEC.PER_PACKAGE - Define an authorize function that is called when procedures in a package or anonymous procedures are called. If the procedures are in a package, the package.AUTHORIZE function in the user's schema is called to authorize the user. If the procedures are not in a package, then the anonymous authorize function in the user's schema is called. OWA_SEC.CUSTOM - Implements different authorize functions for each user. The function OWA_CUSTOM.AUTHORIZE Function in the user's schema is called to authorize the user. If the user's schema does not contain an OWA_CUSTOM.AUTHORIZE Function, the PL/SQL Gateway looks for it in the "sys" schema. <p>The custom authorize function has the following signature:</p> <pre>FUNCTION AUTHORIZE RETURN BOOLEAN;</pre> <p>If the function returns TRUE, authentication succeeded. If it returns FALSE, authentication failed. If the authorize function is not defined, the Gateway returns an error and fails.</p> |

Related Topics

- [OWA_CUSTOM](#)
The OWA_CUSTOM package provides a Global PLSQL Agent Authorization callback function.

232.2.6 SET_PROTECTION_REALM Procedure

This procedure sets the realm of the page that is returned to the user. The user enters a username and login that already exist in the realm.

Syntax

```
OWA_SEC.SET_PROTECTION_REALM(
    realm          IN          VARCHAR2);
```

Parameters

Table 232-3 SET_PROTECTION_REALM Procedure Parameters

| Parameter | Description |
|-----------|---|
| realm | The realm where the page belongs. This string is displayed to the user. |

OWA_TEXT

The `OWA_TEXT` package contains subprograms used by `OWA_PATTERN` for manipulating strings. They are externalized so you can use them directly.

See Also:

For more information about implementation of this package:

- [Oracle Fusion Middleware Administrator's Guide for Oracle HTTP Server](#)
- [Oracle Fusion Middleware User's Guide for `mod_plsql`](#)

The chapter contains the following topics:

- [Types](#)
- [Summary of `OWA_TEXT` Subprograms](#)

233.1 OWA_OPT_LOCK Types

There are three `OWA_OPT_LOCK` lock types.

- [MULTI_LINE DATA TYPE](#)
- [ROW_LIST DATA TYPE](#)
- [VC_ARR DATA TYPE](#)

233.1.1 MULTI_LINE DATA TYPE

This datatype is a PL/SQL record that holds large amounts of text. The `rows` field, of type `OWA_TEXT.VC_ARR DATA TYPE`, contains the text data in the record.

```
TYPE multi_line IS RECORD (
    rows          vc_arr,
    num_rows      INTEGER,
    partial_row   BOOLEAN);
```

233.1.2 ROW_LIST DATA TYPE

This is the datatype for holding data to be processed.

```
TYPE row_list IS RECORD (
    rows          int_arr,
    num_rows      INTEGER);
```

```
int_arr IS DEFINED AS:
```

```
TYPE int_arr IS TABLE OF INTEGER INDEX BY BINARY_INTEGER;
```

233.1.3 VC_ARR DATA TYPE

This is a component of the MULTI_LINE DATA TYPE and is used for holding large amounts of text.

```
TYPE vc_arr IS TABLE OF VARCHAR2(32767) INDEX BY BINARY_INTEGER;
```

Related Topics

- [MULTI_LINE DATA TYPE](#)

This datatype is a PL/SQL record that holds large amounts of text. The rows field, of type OWA_TEXT.VC_ARR DATA TYPE, contains the text data in the record.

233.2 Summary of OWA_TEXT Subprograms

This table lists the OWA_TEXT subprograms and briefly describes them.

Table 233-1 OWA_TEXT Package Subprograms

| Subprogram | Description |
|---|--|
| ADD2MULTI Procedure | Adds text to an existing multi_line type |
| NEW_ROW_LIST Function and Procedure | Creates a new row_list |
| PRINT_MULTI Procedure | Prints out the contents of a multi_list |
| PRINT_ROW_LIST Procedure | Prints out the contents of a row_list |
| STREAM2MULTI Procedure | Converts a varchar2 to a multi_line type |

233.2.1 ADD2MULTI Procedure

This procedure adds content to an existing Multi_Line Data Type

Syntax

```
OWA_TEXT.ADD2MULTI (
    stream          IN          VARCHAR2,
    mline          IN OUT    multi_line,

    continue      IN    BOOLEAN DEFAULT TRUE);
```

Parameters

Table 233-2 ADD2MULTI Procedure Parameters

| Parameter | Description |
|-----------|--|
| stream | The text to add. |
| mline | The OWA_TEXT.MULTI_LINE DATA TYPE. The output of this parameter contains <i>stream</i> . |

Table 233-2 (Cont.) ADD2MULTI Procedure Parameters

| Parameter | Description |
|-----------|---|
| continue | If TRUE, the procedure appends <i>stream</i> within the previous final row (assuming it is less than 32K). If FALSE, the procedure places <i>stream</i> in a new row. |

233.2.2 NEW_ROW_LIST Function and Procedure

This function or procedure creates a new `OWA_TEX.ROW_LIST DATA TYPE`.

The function version uses no parameters and returns a new empty `row_list`. The procedure version creates the `row_list` datatype as an output parameter.

Syntax

```
OWA_TEXT.NEW_ROW_LIST
  RETURN ROW_LIST;

OWA_TEXT.NEW_ROW_LIST(
  rlist   OUT   row_list);
```

Parameters

Table 233-3 NEW_ROW_LIST Procedure Parameters

| Parameter | Description |
|-----------|---|
| rlist | This is an output parameter containing the new <code>row_list</code> datatype |

Return Values

The function version returns the new `row_list` datatype.

233.2.3 PRINT_MULTI Procedure

This procedure uses the PRINT Procedures or the PRN Procedures to print the "rows" field of the `OWA_TEXT.MULTI_LINE DATA TYPE`.

Syntax

```
OWA_TEXT.PRINT_MULTI(
  mline   IN   multi_line);
```

Parameters

Table 233-4 PRINT_MULTI Procedure Parameters

| Parameter | Description |
|-----------|--|
| mline | The <code>multi_line</code> datatype to print. |

Return Values

The contents of the `multi_line`.

Related Topics

- [PRINT Procedures](#)
These procedures generate the specified parameter as a string terminated with the `\n` newline character.
- [PRN Procedures](#)
These procedures generate the specified parameter as a string.

233.2.4 PRINT_ROW_LIST Procedure

This procedure uses the PRINT Procedures or the PRN Procedures to print the "rows" field of the `OWA_TEXT.ROW_LIST` DATA TYPE.

Syntax

```
OWA_TEXT.PRINT_ROW_LIST(  
    rlist      IN      multi_line);
```

Parameters**Table 233-5 PRINT_ROW_LIST Procedure Parameters**

| Parameter | Description |
|--------------------|--|
| <code>rlist</code> | The <code>row_list</code> datatype to print. |

Return Values

The contents of the `row_list`.

Related Topics

- [PRINT Procedures](#)
These procedures generate the specified parameter as a string terminated with the `\n` newline character.
- [PRN Procedures](#)
These procedures generate the specified parameter as a string.

233.2.5 STREAM2MULTI Procedure

This procedure converts a string to a `multi_line` datatype.

Syntax

```
OWA_TEXT.STREAM2MULTI(  
    stream      IN      VARCHAR2  
    mline      OUT     multi_line);
```

Parameters

Table 233-6 STREAM2MULTI Procedure Parameters

| Parameter | Description |
|-----------|--|
| stream | The string to convert. |
| mline | The stream in OWA_TEXT.MULTI_LINE DATA TYPE format |

OWA_UTIL

The `OWA_UTIL` package contains utility subprograms for performing operations such as getting the value of CGI environment variables, printing the data that is returned to the client, and printing the results of a query in an HTML table.

See Also:

For more information about implementation of this package:

- [Oracle Fusion Middleware Administrator's Guide for Oracle HTTP Server](#)
- [Oracle Fusion Middleware User's Guide for `mod_plsql`](#)

This chapter contains the following topics:

- [Overview](#)
- [Types](#)
- [Summary of OWA_UTIL Subprograms](#)

234.1 OWA_UTIL Overview

The `OWA_UTIL` package contains three types of utility subprograms.

- Dynamic SQL Utilities enable you to produce pages with dynamically generated SQL code.
- HTML utilities enable you to retrieve the values of CGI environment variables and perform URL redirects.
- Date utilities enable correct date-handling. Date values are simple strings in HTML, but are treated as a datatype by the Oracle database.

234.2 OWA_UTIL Types

`OWA_UTIL` uses Types to specify creating information.

- [DATATYPE Datatype](#)
- [IDENT_ARR Datatype](#)
- [IP_ADDRESS Datatype](#)

234.2.1 DATETYPE Datatype

The TODATE Function converts an item of this type to the type `DATE`, which is understood and properly handled as data by the database. The procedure `CHOOSE_DATE` Procedure enables the user to select the desired date.

```
TYPE dateType IS TABLE OF VARCHAR2(10) INDEX BY BINARY_INTEGER;
```

Related Topics

- [TODATE Function](#)
This function converts the DATETYPE Datatype to the standard Oracle `DATE` type.
- [CHOOSE_DATE Procedure](#)
This procedure generates three HTML form elements that allow the user to select the day, the month, and the year.

234.2.2 IDENT_ARR Datatype

This datatype is used for an array.

```
TYPE ident_arr IS TABLE OF VARCHAR2(30) INDEX BY BINARY_INTEGER;
```

234.2.3 IP_ADDRESS Datatype

This datatype is used by the `GET_CLIENT_IP` Function in the `OWA_SEC` package.

```
TYPE ip_address IS TABLE OF INTEGER INDEX BY BINARY_INTEGER;
```

Related Topics

- [GET_CLIENT_IP Function](#)
This function returns the IP address of the client.
- [OWA_SEC](#)
The `OWA_SEC` package provides an interface for custom authentication.

234.3 Summary of OWA_UTIL Subprograms

This table lists the `OWA_UTIL` subprograms and briefly describes them.

Table 234-1 OWA_UTIL Package Subprograms

| Subprogram | Description |
|---|---|
| BIND_VARIABLES Function | Prepares a SQL query and binds variables to it |
| CALENDARPRINT Procedures | Prints a calendar |
| CELLSPRINT Procedures | Prints the contents of a query in an HTML table |
| CHOOSE_DATE Procedure | Generates HTML form elements that allow the user to select a date |
| GET_CGI_ENV Function | Returns the value of the specified CGI environment variable |
| GET_OWA_SERVICE_PATH Function | Returns the full virtual path for the PL/SQL Gateway |

Table 234-1 (Cont.) OWA_UTIL Package Subprograms

| Subprogram | Description |
|---|---|
| GET_PROCEDURE Function | Returns the name of the procedure that is invoked by the PL/SQL Gateway |
| HTTP_HEADER_CLOSE Procedure | Closes the HTTP header |
| LISTPRINT Procedure | Generates a HTML form element that contains data from a query |
| MIME_HEADER Procedure | Generates the Content-type line in the HTTP header |
| PRINT_CGI_ENV Procedure | Generates a list of all CGI environment variables and their values |
| REDIRECT_URL Procedure | Generates the Location line in the HTTP header |
| SHOWPAGE Procedure | Prints a page generated by the HTP and HTF packages in SQL*Plus |
| SHOWSOURCE Procedure | Prints the source for the specified subprogram |
| SIGNATURE procedure | Prints a line that says that the page is generated by the PL/SQL Agent |
| STATUS_LINE Procedure | Generates the Status line in the HTTP header |
| TABLEPRINT Function | Prints the data from a table in the database as an HTML table |
| TODATE Function | Converts dateType data to the standard PL/SQL date type |
| WHO_CALLED_ME Procedure | Returns information on the caller of the procedure. |

234.3.1 BIND_VARIABLES Function

This function prepares a SQL query by binding variables to it, and stores the output in an opened cursor. Use this function as a parameter to a procedure sending a dynamically generated query. Specify up to 25 bind variables.

Syntax

```
OWA_UTIL.BIND_VARIABLES (
  theQuery      IN      VARCHAR2  DEFAULT NULL,
  bv1Name       IN      VARCHAR2  DEFAULT NULL,
  bv1Value      IN      VARCHAR2  DEFAULT NULL,
  bv2Name       IN      VARCHAR2  DEFAULT NULL,
  bv2Value      IN      VARCHAR2  DEFAULT NULL,
  bv3Name       IN      VARCHAR2  DEFAULT NULL,
  bv3Value      IN      VARCHAR2  DEFAULT NULL,
  ...
  bv25Name      IN      VARCHAR2  DEFAULT NULL,
  bv25Value     IN      VARCHAR2  DEFAULT NULL)
RETURN INTEGER;
```

Parameters

Table 234-2 BIND_VARIABLES Function Parameters

| Parameter | Description |
|-----------|--|
| theQuery | The SQL query statement which must be a SELECT statement |
| bv1Name | The name of the variable |
| bv1Value | The value of the variable |

Return Values

An integer identifying the opened cursor.

234.3.2 CALENDARPRINT Procedures

These procedures creates a calendar in HTML with a visible border. Each date in the calendar can contain any number of hypertext links.

This procedure has 2 versions.

- Version 1 uses a hard-coded query stored in a varchar2 string.
- Version 2 uses a dynamic query prepared with the [BIND_VARIABLES Function](#).

Syntax

```
OWA_UTIL.CALENDARPRINT (
  p_query      IN      VARCHAR2,
  p_mf_only    IN      VARCHAR2  DEFAULT 'N');
```

```
OWA_UTIL.CALENDARPRINT (
  p_cursor     IN      INTEGER,
  p_mf_only    IN      VARCHAR2  DEFAULT 'N');
```

Parameters

Table 234-3 CALENDARPRINT Procedure Parameters

| Parameter | Description |
|-----------|---|
| p_query | A PL/SQL query. |
| p_cursor | A PL/SQL cursor containing the same format as p_query. |
| p_mf_only | If "N" (the default), the generated calendar includes Sunday through Saturday. Otherwise, it includes Monday through Friday only. |

Usage Notes

Design your query as follows:

- The first column is a DATE. This correlates the information produced by the query with the calendar output generated by the procedure.
- The query output must be sorted on this column using ORDER BY.

- The second column contains the text, if any, that you want printed for that date.
- The third column contains the destination for generated links. Each item in the second column becomes a hypertext link to the destination given in this column. If this column is omitted, the items in the second column are simple text, not links.

234.3.3 CELLSPRINT Procedures

This procedure generates an HTML table from the output of a SQL query. SQL atomic data items are mapped to HTML cells and SQL rows to HTML rows. You must write the code to begin and end the HTML table.

There are nine versions of this procedure:

- The first version passes the results of a query into an index table. Perform the query and CELLSPRINT does the formatting. To have more control in generating an HTML table from the output of an SQL query, use the [FORMAT_CELL Function](#) in the "HTF" package.
- The second and third versions display rows (up to the specified maximum) returned by the query or cursor.
- The fourth and fifth versions exclude a specified number of rows from the HTML table. Use the fourth and fifth versions to scroll through result sets by saving the last row seen in a hidden form element.
- The sixth through ninth versions are the same as the first four versions, except that they return a row count output parameter.

Syntax

```
OWA_UTIL.CELLSPRINT (
  p_colCnt      IN    INTEGER,
  p_resultTbl   IN    vc_arr,

  p_format_numbers IN  VARCHAR2  DEFAULT NULL);
```

```
OWA_UTIL.CELLSPRINT (
  p_theQuery    IN    VARCHAR2,
  p_max_rows    IN    NUMBER      DEFAULT 100,
  p_format_numbers IN  VARCHAR2  DEFAULT NULL);
```

```
OWA_UTIL.CELLSPRINT (
  p_theCursor   IN    INTEGER,
  p_max_rows    IN    NUMBER      DEFAULT 100,
  p_format_numbers IN  VARCHAR2  DEFAULT NULL);
```

```
OWA_UTIL.CELLSPRINT (
  p_theQuery    IN    VARCHAR2,
  p_max_rows    IN    NUMBER      DEFAULT 100,
  p_format_numbers IN  VARCHAR2  DEFAULT NULL,
  p_skip_rec    IN    NUMBER      DEFAULT 0,
  p_more_data   OUT   BOOLEAN);
```

```
OWA_UTIL.CELLSPRINT (
  p_theCursor   IN    INTEGER,
  p_max_rows    IN    NUMBER      DEFAULT 100,
  p_format_numbers IN  VARCHAR2  DEFAULT NULL,
  p_skip_rec    IN    NUMBER      DEFAULT 0,
  p_more_data   OUT   BOOLEAN);
```

```

OWA_UTIL.CELLSPRINT (
  p_theQuery      IN   VARCHAR2,
  p_max_rows      IN   NUMBER      DEFAULT 100,
  p_format_numbers IN   VARCHAR2   DEFAULT NULL,
  p_reccnt        OUT  NUMBER);

OWA_UTIL.CELLSPRINT (
  p_theCursor     IN   INTEGER,
  p_max_rows      IN   NUMBER      DEFAULT 100,
  p_format_numbers IN   VARCHAR2   DEFAULT NULL,
  p_reccnt        OUT  NUMBER);

OWA_UTIL.CELLSPRINT (
  p_theQuery      IN   VARCHAR2,
  p_max_rows      IN   NUMBER      DEFAULT 100,
  p_format_numbers IN   VARCHAR2   DEFAULT NULL,
  p_skip_rec      IN   NUMBER      DEFAULT 0,
  p_more_data     OUT  BOOLEAN,
  p_reccnt        OUT  NUMBER);

OWA_UTIL.CELLSPRINT (
  p_theCursor     IN   INTEGER,
  p_max_rows      IN   NUMBER      DEFAULT 100,
  p_format_numbers IN   VARCHAR2   DEFAULT NULL,
  p_skip_rec      IN   NUMBER      DEFAULT 0,
  p_more_data     OUT  BOOLEAN,
  p_reccnt        OUT  NUMBER);

```

Parameters

Table 234-4 CELLSPRINT Procedure Parameters

| Parameter | Description |
|------------------|--|
| p_query | A PL/SQL query. |
| p_colCnt | The number of columns in the table. |
| p_theQuery | A SQL SELECT statement. |
| p_theCursor | A cursor ID. This can be the return value from the BIND_VARIABLES Function . |
| p_max_rows | The maximum number of rows to print. |
| p_format_numbers | If the value of this parameter is not NULL, number fields are right justified and rounded to two decimal places. |
| p_skip_rec | The number of rows to exclude from the HTML table. |
| p_more_data | TRUE if there are more rows in the query or cursor, FALSE otherwise. |
| p_reccnt | The number of rows that have been returned by the query. This value does not include skipped rows (if any). |
| p_resultTbl | The index table which will contain the result of the query. Each entry in the query will correspond to one column value. |

Examples

This procedure generates

```
<tr><td>QueryResultItem</td><td>QueryResultItem</td></tr>...
```

234.3.4 CHOOSE_DATE Procedure

This procedure generates three HTML form elements that allow the user to select the day, the month, and the year.

Syntax

```
OWA_UTIL.CHOOSE_DATE (
    p_name      IN      VARCHAR2,
    p_date      IN      DATE          DEFAULT SYSDATE);
```

Parameters

Table 234-5 CHOOSE_DATE Procedure Parameters

| Parameter | Description |
|-----------|--|
| p_name | The name of the form elements. |
| p_date | The initial date that is selected when the HTML page is displayed. |

Usage Notes

- The parameter in the procedure that receives the data from these elements must be a [GET_CGI_ENV Function](#).
- Use the [TODATE Function](#) to convert the [GET_CGI_ENV Function](#) value to the standard Oracle DATE datatype.

Examples

```
<SELECT NAME="p_name" SIZE="1">
<OPTION value="01">1
...
<OPTION value="31">31
</SELECT>
-
<SELECT NAME="p_name" SIZE="1">
<OPTION value="01">JAN
...
<OPTION value="12">DEC
</SELECT>
-
<SELECT NAME="p_name" SIZE="1">
<OPTION value="1992">1992
...
<OPTION value="2002">2002
</SELECT>
```

234.3.5 GET_CGI_ENV Function

This function returns the value of the specified CGI environment variable.

Syntax

```
OWA_UTIL.GET_CGI_ENV(  
    param_name    IN    VARCHAR2)  
    RETURN VARCHAR2;
```

Parameters

Table 234-6 GET_CGI_ENV Function Parameters

| Parameter | Description |
|------------|---|
| param_name | The name of the CGI environment variable. It is case-insensitive. |

Return Values

The value of the specified CGI environment variable. If the variable is not defined, the function returns `NULL`.

234.3.6 GET_OWA_SERVICE_PATH Function

This function returns the full virtual path of the PL/SQL Gateway that is handling the request.

Syntax

```
OWA_UTIL.GET_OWA_SERVICE_PATH  
    RETURN VARCHAR2;
```

Return Values

A virtual path of the PL/SQL Gateway that is handling the request.

234.3.7 GET_PROCEDURE Function

This function returns the name of the procedure that is being invoked by the PL/SQL Gateway.

Syntax

```
OWA_UTIL.GET_PROCEDURE  
    RETURN VARCHAR2;
```

Return Values

The name of a procedure, including the package name if the procedure is defined in a package.

234.3.8 HTTP_HEADER_CLOSE Procedure

This procedure generates a newline character to close the HTTP header.

Syntax

```
OWA_UTIL.HTTP_HEADER_CLOSE;
```

Return Values

A newline character, which closes the HTTP header.

Usage Notes

- Use this procedure if you have not closed the header by using the `bclose_header` parameter in calls such as [MIME_HEADER Procedure](#), [REDIRECT_URL Procedure](#), or [STATUS_LINE Procedure](#)
- The HTTP header must be closed before any `HTP.PRINT` or `HTP.PRN` calls.

234.3.9 LISTPRINT Procedure

This procedure generates an HTML selection list form element from the output of a SQL query.

There are two versions of this procedure.

- The first version contains a hard-coded SQL query.
- The second version uses a dynamic query prepared with the [BIND_VARIABLES Function](#).

Syntax

```
OWA_UTIL.LISTPRINT(
  p_theQuery    IN    VARCHAR2,
  p_cname       IN    VARCHAR2,
  p_nsize       IN    NUMBER,
  p_multiple    IN    BOOLEAN  DEFAULT FALSE);
```

```
OWA_UTIL.LISTPRINT(
  p_theCursor   IN    INTEGER,
  p_cname       IN    VARCHAR2,
  p_nsize       IN    NUMBER,
  p_multiple    IN    BOOLEAN  DEFAULT FALSE);
```

Parameters

Table 234-7 LISTPRINT Procedure Parameters

| Parameter | Description |
|--------------------------|--|
| <code>p_theQuery</code> | The SQL query. |
| <code>p_theCursor</code> | The cursor ID. This can be the return value from the BIND_VARIABLES Function . |
| <code>p_cname</code> | The name of the HTML form element. |

Table 234-7 (Cont.) LISTPRINT Procedure Parameters

| Parameter | Description |
|------------|---|
| p_nsize | The size of the form element (this controls how many items the user can see without scrolling). |
| p_multiple | Whether multiple selection is permitted. |

Usage Notes

The columns in the output of the query are handled in the following manner:

- The first column specifies the values that are sent back. These values are for the VALUE attribute of the OPTION tag.
- The second column specifies the values that the user sees.
- The third column specifies whether or not the row is marked as SELECTED in the OPTION tag. If the value is not NULL, the row is selected.

Examples

```
<SELECT NAME="p_cname" SIZE="p_nsize">
<OPTION SELECTED value='value_from_the_first_column'>value_from_the_second_column
<OPTION SELECTED value='value_from_the_first_column'>value_from_the_second_column
...
</SELECT>
```

234.3.10 MIME_HEADER Procedure

This procedure changes the default MIME header that the script returns. This procedure must come before any HTP.PRINT or HTP.PRN calls to direct the script not to use the default MIME header.

Syntax

```
OWA_UTIL.MIME_HEADER(
  ccontent_type IN VARCHAR2 DEFAULT 'text/html',
  bclose_header IN BOOLEAN DEFAULT TRUE,
  ccharset IN VARCHAR2 DEFAULT NULL);
```

Parameters

Table 234-8 MIME_HEADER Procedure Parameters

| Parameter | Description |
|---------------|--|
| ccontent_type | The MIME type to generate |
| bclose_header | Whether or not to close the HTTP header. If TRUE, two newlines are sent, which closes the HTTP header. Otherwise, one newline is sent, and the HTTP header remains open. |
| ccharset | The character set to use. The character set only makes sense if the MIME type is of type 'text'. Therefore, the character set is only tagged on to the Content-Type header only if the MIME type passed in is of type 'text'. Any other MIME type, such as 'image', will not have any character set tagged on. |

Examples

```
Content-type: <ccontent_type>; charset=<ccharset>
```

so that

```
owa_util.mime_header('text/plain', false, 'ISO-8859-4')
```

generates

```
Content-type: text/plain; charset=ISO-8859-4\n
```

234.3.11 PRINT_CGI_ENV Procedure

This procedure generates all the CGI environment variables and their values made available by the PL/SQL Gateway to the stored procedure.

Syntax

```
OWA_UTIL.PRINT_CGI_ENV;
```

Examples

This procedure generates a list in the following format:

```
cgi_env_var_name = value\n
```

234.3.12 REDIRECT_URL Procedure

This procedure specifies that the application server is to visit the specified URL. The URL may specify either a Web page to return or a program to execute.

Syntax

```
OWA_UTIL.REDIRECT_URL(  
    curl          IN          VARCHAR2  
    bclose_header IN          BOOLEAN    DEFAULT TRUE);
```

Parameters**Table 234-9 REDIRECT_URL Procedure Parameters**

| Parameter | Description |
|---------------|--|
| curl | The URL to visit. |
| bclose_header | Whether or not to close the HTTP header. If <code>TRUE</code> , two newlines are sent, which closes the HTTP header. Otherwise, one newline is sent, and the HTTP header remains open. |

Usage Notes

This procedure must come before any HTP procedure or HTF function call.

Examples

This procedure generates

Location: <curl>\n\n

234.3.13 SHOWPAGE Procedure

This procedure prints out the HTML output of a procedure in SQL*Plus.

The procedure must use the HTP or HTF packages to generate the HTML page, and this procedure must be issued after the HTP or HTF page-generating subprogram has been called and before any other HTP or HTF subprograms are directly or indirectly called.

Syntax

```
OWA_UTIL.SHOWPAGE;
```

Usage Notes

- This method is useful for generating pages filled with static data.
- This procedure uses the [DBMS_OUTPUT](#) package and is limited to 32767 characters for each line and an overall buffer size of 1,000,000 bytes.

Examples

The output of htp procedure is displayed in SQL*Plus, SQL*DBA, or Oracle Server Manager. For example:

```
SQL> set serveroutput on
SQL> spool gretzky.html
SQL> execute hockey.pass("Gretzky")
SQL> execute owa_util.showpage
SQL> exit
```

This would generate an HTML page that could be accessed from Web browsers.

234.3.14 SHOWSOURCE Procedure

This procedure prints the source of the specified procedure, function, or package. If a procedure or function which belongs to a package is specified, then the entire package is displayed.

Syntax

```
OWA_UTIL.SHOWSOURCE (
    cname      IN      VARCHAR2);
```

Parameters

Table 234-10 SHOWSOURCE Procedure Parameters

| Parameter | Description |
|-----------|--|
| cname | The function or procedure whose source you want to show. |

234.3.15 SIGNATURE procedure

This procedure generates an HTML line followed by a signature line on the HTML document.

If a parameter is specified, the procedure also generates a hypertext link to view the PL/SQL source for that procedure. The link calls the [SHOWSOURCE Procedure](#).

Syntax

```
OWA_UTIL.SIGNATURE;

OWA_UTIL.SIGNATURE (
    cname          IN          VARCHAR2);
```

Parameters

Table 234-11 SIGNATURE Procedure Parameters

| Parameter | Description |
|-----------|--|
| cname | The function or procedure whose source you want to show. |

Examples

Without a parameter, the procedure generates a line that looks like the following:

```
This page was produced by the PL/SQL Agent on August 9, 2001 09:30.
```

With a parameter, the procedure generates a signature line in the HTML document that looks like the following:

```
This page was produced by the PL/SQL Agent on 8/09/01 09:30
View PL/SQL Source
```

234.3.16 STATUS_LINE Procedure

This procedure sends a standard HTTP status code to the client.

This procedure must come before any `http.print` or `http.prn` calls so that the status code is returned as part of the header, rather than as "content data".

Syntax

```
OWA_UTIL.STATUS_LINE (
    nstatus        IN          INTEGER,
    creason        IN          VARCHAR2  DEFAULT NULL,
    bclose_header  IN          BOOLEAN   DEFAULT TRUE);
```

Parameters

Table 234-12 STATUS_LINE Procedure Parameters

| Parameter | Description |
|-----------|---------------------------------|
| nstatus | The status code. |
| creason | The string for the status code. |

Table 234-12 (Cont.) STATUS_LINE Procedure Parameters

| Parameter | Description |
|---------------|--|
| bclose_header | Whether or not to close the HTTP header. If TRUE, two newlines are sent, which closes the HTTP header. Otherwise, one newline is sent, and the HTTP header remains open. |

Examples

This procedure generates

```
Status: <nstatus> <creason>\n\n
```

234.3.17 TABLEPRINT Function

This function generates either preformatted tables or HTML tables (depending on the capabilities of the user's browser) from database tables.

Syntax

```
OWA_UTIL.TABLEPRINT(
  ctable          IN          VARCHAR2,
  cattributes     IN          VARCHAR2  DEFAULT NULL,
  ntable_type     IN          INTEGER   DEFAULT HTML_TABLE,
  ccolumns        IN          VARCHAR2  DEFAULT '*',
  cclauses        IN          VARCHAR2  DEFAULT NULL,
  ccol_aliases    IN          VARCHAR2  DEFAULT NULL,
  nrow_min        IN          NUMBER    DEFAULT 0,
  nrow_max        IN          NUMBER    DEFAULT NULL)
RETURN BOOLEAN;
```

Parameters

Table 234-13 TABLEPRINT Function Parameters

| Parameter | Description |
|--------------|--|
| ctable | The database table. |
| cattributes | Other attributes to be included as-is in the tag. |
| ntable_type | How to generate the table. Specify HTML_TABLE to generate the table using <TABLE> tags or PRE_TABLE to generate the table using the <PRE> tags. These are constants: <ul style="list-style-type: none"> HTML_TABLE CONSTANT INTEGER := 1; PRE_TABLE CONSTANT INTEGER := 2; |
| ccolumns | A comma-delimited list of columns from ctable to include in the generated table. |
| cclauses | WHERE or ORDER BY clauses, which specify which rows to retrieve from the database table, and how to order them. |
| ccol_aliases | A comma-delimited list of headings for the generated table. |
| nrow_min | The first row, of those retrieved, to display. |
| nrow_max | The last row, of those retrieved, to display. |

Return Values

Returns `TRUE` if there are more rows beyond the `nrow_max` requested, `FALSE` otherwise.

Usage Notes

- RAW columns are supported, but LONG RAW columns are not. References to LONG RAW columns will print the result 'Not Printable'.
- Note that in this function, `cattributes` is the second rather than the last parameter.

Examples

For browsers that do not support HTML tables, create the following procedure:

```
CREATE OR REPLACE PROCEDURE showemps IS
    ignore_more BOOLEAN;
BEGIN
    ignore_more := OWA_UTIL.TABLEPRINT('emp', 'BORDER', OWA_UTIL.PRE_TABLE);
END;
```

Requesting a URL such as

`http://myhost:7777/pls/hr/showemps`

returns to the following to the client:

```
<PRE>
-----
| EMPNO |ENAME |JOB      |MGR  |HIREDATE  | SAL | COMM | DEPTNO |
-----|-----|-----|-----|-----|-----|-----|-----|
| 7369 | SMITH | CLERK   | 7902 | 17-DEC-80 | 800 |      | 20 |
| 7499 | ALLEN | SALESMAN| 7698 | 20-FEB-81 | 1600 | 300 | 30 |
| 7521 | WARD  | SALESMAN| 7698 | 22-FEB-81 | 1250 | 500 | 30 |
| 7566 | JONES | MANAGER | 7839 | 02-APR-81 | 2975 |      | 20 |
| 7654 | MARTIN | SALESMAN| 7698 | 28-SEP-81 | 1250 | 1400 | 30 |
| 7698 | BLAKE | MANAGER | 7839 | 01-MAY-81 | 2850 |      | 30 |
| 7782 | CLARK | MANAGER | 7839 | 09-JUN-81 | 2450 |      | 10 |
| 7788 | SCOTT | ANALYST | 7566 | 09-DEC-82 | 3000 |      | 20 |
| 7839 | KING  | PRESIDENT |      | 17-NOV-81 | 5000 |      | 10 |
| 7844 | TURNER | SALESMAN| 7698 | 08-SEP-81 | 1500 | 0 | 30 |
| 7876 | ADAMS | CLERK   | 7788 | 12-JAN-83 | 1100 |      | 20 |
| 7900 | JAMES | CLERK   | 7698 | 03-DEC-81 | 950 |      | 30 |
| 7902 | FORD  | ANALYST | 7566 | 03-DEC-81 | 3000 |      | 20 |
| 7934 | MILLER | CLERK   | 7782 | 23-JAN-82 | 1300 |      | 10 |
-----
</PRE>
```

To view the employees in department 10, and only their employee ids, names, and salaries, create the following procedure:

```
CREATE OR REPLACE PROCEDURE showemps_10 IS
    ignore_more BOOLEAN;
begin
    ignore_more := OWA_UTIL.TABLEPRINT
        ('EMP', 'BORDER', OWA_UTIL.PRE_TABLE,
         'empno, ename, sal', 'WHERE deptno=10 ORDER BY empno',
         'Employee Number, Name, Salary');
END;
```

A request for a URL like

`http://myhost:7777/pls/hr/showemps_10`

would return the following to the client:

```
<PRE>
-----
| Employee Number |Name      | Salary |
-----
| 7782             | CLARK    | 2450   |
| 7839             | KING     | 5000   |
| 7934             | MILLER   | 1300   |
-----
</PRE>
```

For browsers that support HTML tables, to view the department table in an HTML table, create the following procedure:

```
CREATE OR REPLACE PROCEDURE showdept IS
  ignore_more BOOLEAN;
BEGIN
  ignore_more := oWA_UTIL.TABLEPRINT('dept', 'BORDER');
END;
```

A request for a URL like

`http://myhost:7777/pls/hr/showdept`

would return the following to the client:

```
<TABLE BORDER>
<TR>
<TH>DEPTNO</TH>
<TH>DNAME</TH>
<TH>LOC</TH>
</TR>
<TR>
<TD ALIGN="LEFT">10</TD>
<TD ALIGN="LEFT">ACCOUNTING</TD>
<TD ALIGN="LEFT">NEW YORK</TD>
</TR>
<TR>
<TD ALIGN="LEFT">20</TD>
<TD ALIGN="LEFT">RESEARCH</TD>
<TD ALIGN="LEFT">DALLAS</TD>
</TR>
<TR>
<TD ALIGN="LEFT">30</TD>
<TD ALIGN="LEFT">SALES</TD>
<TD ALIGN="LEFT">CHICAGO</TD>
</TR>
<TR>
<TD ALIGN="LEFT">40</TD>
<TD ALIGN="LEFT">OPERATIONS</TD>
<TD ALIGN="LEFT">BOSTON</TD>
</TR>
</TABLE>
```

A Web browser would format this to look like the following table:

| DEPTNO | DNAME | LOC |
|--------|------------|----------|
| 10 | ACCOUNTING | NEW YORK |
| 20 | RESEARCH | DALLAS |
| 30 | SALES | CHICAGO |

234.3.18 TODATE Function

This function converts the DATETYPE Datatype to the standard Oracle DATE type.

Syntax

```
OWA_UTIL.TODATE(
    p_dateArray    IN    dateType)
RETURN DATE;
```

Parameters

Table 234-14 TODATE Function Parameters

| Parameter | Description |
|-------------|-----------------------|
| p_dateArray | The value to convert. |

Related Topics

- [DATETYPE Datatype](#)
The TODATE Function converts an item of this type to the type DATE, which is understood and properly handled as data by the database. The procedure CHOOSE_DATE Procedure enables the user to select the desired date.

234.3.19 WHO_CALLED_ME Procedure

This procedure returns information (in the form of output parameters) about the PL/SQL code unit that invoked it.

Syntax

```
OWA_UTIL.WHO_CALLED_ME (
    owner          OUT    VARCHAR2,
    name           OUT    VARCHAR2,
    lineno         OUT    NUMBER,
    caller_t       OUT    VARCHAR2);
```

Parameters

Table 234-15 WHO_CALLED_ME Procedure Parameters

| Parameter | Description |
|-----------|--------------------------------|
| owner | The owner of the program unit. |

Table 234-15 (Cont.) WHO_CALLED_ME Procedure Parameters

| Parameter | Description |
|-----------|--|
| name | The name of the program unit. This is the name of the package, if the calling program unit is wrapped in a package, or the name of the procedure or function if the calling program unit is a standalone procedure or function. If the calling program unit is part of an anonymous block, this is NULL. |
| lineno | The line number within the program unit where the call was made. |
| caller_t | The type of program unit that made the call. The possibilities are: package body, anonymous block, procedure, and function. Procedure and function are only for standalone procedures and functions. |

235

SDO_CS

The `SDO_CS` package contains functions and procedures for working with coordinate systems.

You can perform explicit coordinate transformations on a single geometry or an entire layer of geometries (that is, all geometries in a specified column in a table).

For a complete description of this package within the context of Oracle Spatial, see `SDO_CS` in the *Oracle Spatial and Graph Developer's Guide*.

SDO_CSW_PROCESS

The `SDO_CSW_PROCESS` package contains subprograms for various processing operations related to support for Catalog Services for the Web (CSW).

For a complete description of this package within the context of Oracle Spatial, see `SDO_CSW_PROCESS` in the *Oracle Spatial and Graph Developer's Guide*.

SDO_GCDR

The `SDO_GCDR` package contains the Oracle Spatial geocoding subprograms, which let you geocode unformatted postal addresses.

For a complete description of this package within the context of Oracle Spatial, see `SDO_GCDR` in the *Oracle Spatial and Graph Developer's Guide*.

SDO_GEOM

The `SDO_GEOM` package contains the geometry functions.

These can be grouped into the following categories (with examples of each):

- **Relationship (True/False) between two objects:** `RELATE`, `WITHIN_DISTANCE`
- **Validation:** `VALIDATE_GEOMETRY_WITH_CONTEXT`, `VALIDATE_LAYER_WITH_CONTEXT`
- **Single-object operations:** `SDO_ARC_DENSIFY`, `SDO_AREA`, `SDO_BUFFER`, `SDO_CENTROID`, `SDO_CONVEXHULL`, `SDO_LENGTH`, `SDO_MBR`, `SDO_POINTONSURFACE`
- **Two-object operations:** `SDO_DISTANCE`, `SDO_DIFFERENCE`, `SDO_INTERSECTION`, `SDO_UNION`, `SDO_XOR`

For a complete description of this package within the context of Oracle Spatial, see `SDO_GEOM` in the *Oracle Spatial and Graph Developer's Guide*.

SDO_GEOR

The `SDO_GEOR` package contains functions and procedures for the Oracle Spatial GeoRaster feature, which lets you store, index, query, analyze, and deliver raster image data and its associated spatial vector geometry data and metadata.

For complete description of this package within the context of Oracle Spatial, see `SDO_GEOR` in the *Oracle Spatial and Graph GeoRaster Developer's Guide*.

SDO_GEOR_ADMIN

The `SDO_GEOR_ADMIN` package contains subprograms for administrative operations related to GeoRaster.

For a complete description of this package within the context of Oracle Spatial, see `SDO_GEOR_ADMIN` in the *Oracle Spatial and Graph GeoRaster Developer's Guide*.

SDO_GEOR_AGGR

The `SDO_GEOR_AGGR` package provides an interface to the `SDO_GEOR_AGGR` package for performing aggregate operations on GeoRaster objects.

For a complete description of this package within the context of Oracle Spatial, see `SDO_GEOR_AGGR` in the *Oracle Spatial and Graph GeoRaster Developer's Guide*.

SDO_GEOR_RA

The `SDO_GEOR_RA` package provides an interface to the `SDO_GEOR_RA` package for performing raster algebra and analytic operations related to GeoRaster.

For a complete description of this package within the context of Oracle Spatial, see `SDO_GEOR_RA` in the *Oracle Spatial and Graph GeoRaster Developer's Guide*.

SDO_GEOR_UTL

The `SDO_GEOR_UTL` package contains utility functions and procedures for the Oracle Spatial GeoRaster feature, including those related to using triggers with GeoRaster data.

For complete description of this package within the context of Oracle Spatial, see `SDO_GEOR_UTL` in the *Oracle Spatial and Graph GeoRaster Developer's Guide*.

SDO_LRS

The `SDO_LRS` package contains functions that create, modify, query, and convert linear referencing elements.

For a complete description of this package within the context of Oracle Spatial, see `SDO_LRS` in the *Oracle Spatial and Graph Developer's Guide*.

245

SDO_MIGRATE

The `SDO_MIGRATE` package lets you upgrade geometry tables from previous releases of Oracle Spatial.

For a complete description of this package within the context of Oracle Spatial, see `SDO_MIGRATE` in the *Oracle Spatial and Graph Developer's Guide*.

SDO_NET

The `SDO_NET` package contains functions and procedures for working with data modeled as nodes and links in a network.

For a complete description of this package within the context of Oracle Spatial, see `SDO_NET` in the *Oracle Spatial and Graph Topology Data Model and Network Data Model Graph Developer's Guide*.

SDO_NFE

The `SDO_NFE` package contains functions and procedures for performing network feature editing.

For a complete description of this package within the context of Oracle Spatial and Graph, see [SDO_NFE](#) in the *Oracle Spatial and Graph Topology Data Model and Network Data Model Graph Developer's Guide*.

248

SDO_OLS

The `SDO_OLS` package contains subprograms for Spatial OpenLS support.

For a complete description of this package within the context of Oracle Spatial, see `SDO_OLS` in the *Oracle Spatial and Graph Developer's Guide*.

SDO_PC_PKG

The `SDO_PC_PKG` package contains subprograms to support the use of point clouds in Spatial.

For a complete description of this package within the context of Oracle Spatial, see `SDO_PC_PKG` in the *Oracle Spatial and Graph Developer's Guide*.

250

SDO_SAM

The `SDO_SAM` package contains functions and procedures for spatial analysis and data mining.

For a complete description of this package within the context of Oracle Spatial, see `SDO_SAM` in the *Oracle Spatial and Graph Developer's Guide*.

SDO_TIN_PKG

The `SDO_TIN_PKG` package contains subprograms to support the use of triangulated irregular networks (TINs) in Spatial.

For a complete description of this package within the context of Oracle Spatial, see `SDO_TIN_PKG` in the

SDO_TOPO

The `SDO_TOPO` package contains subprograms for creating and managing Oracle Spatial topologies.

For a complete description of this package within the context of Oracle Spatial, see `SDO_TOPO` in the *Oracle Spatial and Graph Topology Data Model and Network Data Model Graph Developer's Guide*.

SDO_TOPO_MAP

The `SDO_TOPO_MAP` package contains subprograms for editing Oracle Spatial topologies using a cache (TopoMap object).

For a complete description of this package within the context of Oracle Spatial, see `SDO_TOPO_MAP` in the *Oracle Spatial and Graph Topology Data Model and Network Data Model Graph Developer's Guide*.

SDO_TUNE

The `SDO_TUNE` package contains Spatial tuning functions and procedures.

For complete description of this package within the context of Oracle Spatial, see `SDO_TUNE` in the *Oracle Spatial and Graph Developer's Guide*.

255

SDO_UTIL

The `SDO_UTIL` package contains the utility functions and procedures for Oracle Spatial.

For complete description of this package within the context of Oracle Spatial, see `SDO_UTIL` in the *Oracle Spatial and Graph Developer's Guide*.

SDO_WFS_LOCK

The `SDO_WFS_LOCK` package contains subprograms for WFS support for registering and unregistering feature tables. Registering a feature table enables the table for WFS transaction locking; unregistering a feature table disables the table for WFS transaction locking.

For a complete description of this package within the context of Oracle Spatial, see `SDO_WFS_LOCK` in the *Oracle Spatial and Graph Developer's Guide*.

SDO_WFS_PROCESS

The `SDO_WFS_PROCESS` package contains subprograms for various processing operations related to support for Web Feature Services.

For a complete description of this package within the context of Oracle Spatial, see `SDO_WFS_PROCESS` in the *Oracle Spatial and Graph Developer's Guide*.

SEM_APIS

The `SEM_APIS` package contains subprograms for working with the Resource Description Framework (RDF) and Web Ontology Language (OWL) in an Oracle database.

For a complete description of this package within the context of Oracle Database semantic technology support, see `SEM_APIS` in the *Oracle Spatial and Graph RDF Semantic Graph Developer's Guide*.

SEM_OLS

The `SEM_OLS` package provides an interface to the `SEM_OLS` package for providing triple-level security to RDF data, using Oracle Label Security (OLS).

For a complete description of this package, see `SEM_OLS` in the *Oracle Spatial and Graph RDF Semantic Graph Developer's Guide*.

260

SEM_PERF

The `SEM_PERF` package contains subprograms for examining and enhancing the performance of the Resource Description Framework (RDF) and Web Ontology Language (OWL) support in an Oracle database.

For a complete description of this package within the context of Oracle Database semantic technology support, see `SEM_PERF` in the *Oracle Spatial and Graph RDF Semantic Graph Developer's Guide*.

SEM_RDFCTX

The `SEM_RDFCTX` package contains subprograms for managing extractor policies and semantic indexes created for documents.

For a complete description of this package within the context of Oracle Database semantic technology support, see `SEM_RDFCTX` in the *Oracle Spatial and Graph RDF Semantic Graph Developer's Guide*

SEM_RDFSA

The `SEM_RDFSA` package contains subprograms for providing fine-grained access control to RDF data, using either a virtual private database (VPD) or Oracle Label Security (OLS).

For a complete description of this package within the context of Oracle Database semantic technology support, see `SEM_RDFSA` in the *Oracle Spatial and Graph RDF Semantic Graph Developer's Guide*.

UTL_CALL_STACK

The `UTL_CALL_STACK` package provides an interface to provide information about currently executing subprograms.

Functions return subprogram names, unit names, owner names, edition names, and line numbers for given dynamic depths. Other functions return error stack information.

This chapter contains the following topics:

- [Overview](#)
- [Security Model](#)
- [UTL_CALL_STACK Operational Notes](#)
- [UTL_CALL_STACK Exceptions](#)
- [Data Structures](#)
- [Summary of UTL_CALL_STACK Subprograms](#)

See Also:

- *Oracle Database PL/SQL Language Reference* regarding Conditional Compilation
- *Oracle Database Development Guide* regarding Using PL/Scope and Using the PL/SQL Hierarchical Profiler

263.1 UTL_CALL_STACK Overview

The `UTL_CALL_STACK` package provides an interface for PL/SQL programmers to obtain information about currently executing programs including the subprogram name from dynamic and lexical stacks and the depths of those stacks.

Individual functions return subprogram names, unit names, owner names, edition names, and line numbers for given dynamic depths. More functions return error stack information. Such information can be used to create more revealing error logs and application execution traces.

Dynamic Depth

The dynamic depth of an executing instance of a PL/SQL subprogram is defined recursively.

- The dynamic depth of the currently executing subprogram instance is one.
- Otherwise, the dynamic depth of the subprogram instance is one more than the dynamic depth of the subprogram it invoked.
- If there is a SQL, Java, or other non-PL/SQL context that invoked or was invoked by an executing subprogram, it occupies a level on the call stack as if it were a subprogram.

In the case of a call stack in which A calls B, which calls C, which calls D, which calls E, which calls F, which calls E, this stack can be written as a line with the dynamic depths underneath:

```
A B C D E F E
7 6 5 4 3 2 1
```

Lexical Depth

The lexical depth of a PL/SQL subprogram is defined recursively.

- The lexical depth of a unit, an anonymous block, trigger, or ADT is one (1).
- The lexical depth of a subprogram defined within another object is one plus the lexical depth of that object.

Blocks do not affect lexical depth.

Error Depth

The error depth is the number of errors on the error stack.

For example, consider the following anonymous block.

```
BEGIN
  BEGIN
    ... (1)
    raise zero_divide;
  EXCEPTION
    when others then
      raise no_data_found;
  END;
EXCEPTION
  WHEN others THEN
    ... (2)
END;
```

The error depth at (1) is zero and at (2) is two.

Backtrace

The backtrace is a trace from where the exception was thrown to where the backtrace was examined.

Consider a call stack in which A calls B which calls C and C raises an exception. If the backtrace was examined in C, the backtrace would have one unit, C, and the backtrace depth would be one. If it was examined in A, it would have three units, A, B and C, and backtrace depth would be three.

The depth of a backtrace is zero in the absence of an exception.

263.2 UTL_CALL_STACK Security Model

EXECUTE on UTL_CALL_STACK is granted to PUBLIC.

The UTL_CALL_STACK package does not show wrapped program units. For example, consider a call stack in which program unit A calls B, which calls C, and in turn calls UTL_CALL_STACK to determine the subprogram list. If program unit B is wrapped, then the subprogram list only shows program unit C.

263.3 UTL_CALL_STACK Operational Notes

Certain operational notes apply to UTL_CALL_STACK.

- Compiler optimizations can change lexical, dynamic and backtrace depth.
- UTL_CALL_STACK is not supported past RPC boundaries. For example, if A calls remote procedure B, B will not be able to obtain information about A using UTL_CALL_STACK.
- Lexical unit information is available through the PL/SQL conditional compilation feature and is therefore not exposed through UTL_CALL_STACK.

263.4 UTL_CALL_STACK Exceptions

This table lists the exceptions raised by UTL_CALL_STACK.

Table 263-1 Exceptions Raised by UTL_CALL_STACK

| Exception | Error Code | Description |
|---------------------|------------|--|
| BAD_DEPTH_INDICATOR | 64610 | This exception is raised when a provided depth is out of bounds. Dynamic and lexical depth are positive integer values. Error and backtrace depths are non-negative integer values and are zero only in the absence of an exception. |

263.5 UTL_CALL_STACK Data Structures

The UTL_CALL_STACK package defines a VARRAY type, UNIT_QUALIFIED_NAME.

VARRAY Type

- [UNIT_QUALIFIED_NAME](#)

263.5.1 UNIT_QUALIFIED_NAME

This data structure is a varray whose individual elements are, in order, the unit name, any lexical parents of the subprogram, and the subprogram name.

```
TYPE UNIT_QUALIFIED_NAME IS VARRAY(256) OF VARCHAR2(32767);
```

Example

Consider the following contrived PL/SQL procedure:

```
PROCEDURE topLevel IS
  FUNCTION localFunction(...) RETURNS VARCHAR2 IS
    FUNCTION innerFunction(...) RETURNS VARCHAR2 IS
      BEGIN
        DECLARE
          localVar PLS_INTEGER;
        BEGIN
          ... (1)
        END;
      END;
    END;
```

```
BEGIN
  ...
END;
```

The unit qualified name at (1) would be

```
["topLevel", "localFunction", "innerFunction"]
```

If the unit were an anonymous block, the unit name would be "__anonymous_block"

263.6 Summary of UTL_CALL_STACK Subprograms

This table lists the subprograms in the UTL_CALL_STACK package.

Table 263-2 UTL_CALL_STACK Package Subprograms

| Subprogram | Description |
|---|---|
| BACKTRACE_DEPTH Function | Returns the number of backtrace items in the backtrace |
| BACKTRACE_LINE Function | Returns the line number of the unit at the specified backtrace depth |
| BACKTRACE_UNIT Function | Returns the name of the unit at the specified backtrace depth |
| CURRENT_EDITION Function | Returns the current edition name of the unit of the subprogram at the specified dynamic depth |
| CONCATENATE_SUBPROGRAM Function | Returns a concatenated form of a unit-qualified name |
| DYNAMIC_DEPTH Function | Returns the number of subprograms on the call stack |
| ERROR_DEPTH Function | Returns the number of errors on the error stack |
| ERROR_MSG Function | Returns the error message of the error at the specified error depth |
| ERROR_NUMBER Function | Returns the error number of the error at the specified error depth |
| LEXICAL_DEPTH Function | Returns the lexical nesting level of the subprogram at the specified dynamic depth |
| OWNER Function | Returns the owner name of the unit of the subprogram at the specified dynamic depth |
| UNIT_LINE Function | Returns the line number of the unit of the subprogram at the specified dynamic depth |
| SUBPROGRAM Function | Returns the unit-qualified name of the subprogram at the specified dynamic depth |

263.6.1 BACKTRACE_DEPTH Function

This function returns the number of backtrace items in the backtrace.

Syntax

```
UTL_CALL_STACK.BACKTRACE_DEPTH
RETURN PLS_INTEGER;
```

Return Values

The number of backtrace items in the backtrace, zero in the absence of an exception.

263.6.2 BACKTRACE_LINE Function

This function returns the line number of the unit at the specified backtrace depth.

Syntax

```
UTL_CALL_STACK.BACKTRACE_LINE (  
    backtrace_depth IN PLS_INTEGER)  
RETURN PLS_INTEGER;
```

Parameters

Table 263-3 *BACKTRACE_LINE Function Parameters*

| Parameter | Description |
|-----------------|--------------------|
| backtrace_depth | Depth in backtrace |

Return Values

The line number of the unit at the specified backtrace depth

263.6.3 BACKTRACE_UNIT Function

This function returns the name of the unit at the specified backtrace depth.

Syntax

```
UTL_CALL_STACK.BACKTRACE_UNIT (  
    backtrace_depth IN PLS_INTEGER)  
RETURN VARCHAR2;
```

Parameters

Table 263-4 *BACKTRACE_UNIT Function Parameters*

| Parameter | Description |
|-----------------|--------------------|
| backtrace_depth | Depth in backtrace |

Return Values

The name of the unit at the specified backtrace depth

263.6.4 CURRENT_EDITION Function

This function returns the current edition name of the unit of the subprogram at the specified dynamic depth.

Syntax

```
UTL_CALL_STACK.CURRENT_EDITION (  
    dynamic_depth    IN    PLS_INTEGER)  
    RETURN VARCHAR2;
```

Parameters

Table 263-5 *CURRENT_EDITION Function Parameters*

| Parameter | Description |
|---------------|--------------------------|
| dynamic_depth | Depth in the error stack |

Return Values

The current edition name of the unit of the subprogram at the specified dynamic depth

263.6.5 CONCATENATE_SUBPROGRAM Function

This function returns a concatenated form of a unit-qualified name.

Syntax

```
UTL_CALL_STACK.CONCATENATE_SUBPROGRAM (  
    qualified_name    IN    UNIT_QUALIFIED_NAME)  
    RETURN VARCHAR2;
```

Parameters

Table 263-6 *CONCATENATE_SUBPROGRAM Function Parameters*

| Parameter | Description |
|----------------|-----------------------|
| qualified_name | A unit-qualified name |

Return Values

A string of the form `UNIT.SUBPROGRAM.LOCAL_SUBPROGRAM`

263.6.6 DYNAMIC_DEPTH Function

This function returns the number of subprograms on the call stack.

Syntax

```
UTL_CALL_STACK.DYNAMIC_DEPTH  
    RETURN PLS_INTEGER;
```

Return Values

The number of subprograms on the call stack

263.6.7 ERROR_DEPTH Function

This function returns the number of errors on the error stack.

Syntax

```
UTL_CALL_STACK.ERROR_DEPTH  
RETURN PLS_INTEGER;
```

Return Values

The number of errors on the error stack

263.6.8 ERROR_MSG Function

This function returns the error message of the error at the specified error depth.

Syntax

```
UTL_CALL_STACK.ERROR_MSG (  
    error_depth IN PLS_INTEGER)  
RETURN VARCHAR2;
```

Parameters

Table 263-7 *ERROR_MSG Function Parameters*

| Parameter | Description |
|-------------|--------------------------|
| error_depth | Depth in the error stack |

Return Values

The error message of the error at the specified error depth.

263.6.9 ERROR_NUMBER Function

This function returns the error number of the error at the specified error depth.

Syntax

```
UTL_CALL_STACK.ERROR_NUMBER (  
    error_depth IN PLS_INTEGER)  
RETURN PLS_INTEGER;
```

Parameters

Table 263-8 *ERROR_NUMBER Function Parameters*

| Parameter | Description |
|-------------|-------------------------|
| error_depth | Depth in the call stack |

Return Values

The error number of the error at the specified error depth

263.6.10 LEXICAL_DEPTH Function

This function returns the lexical nesting level of the subprogram at the specified dynamic depth.

Syntax

```
UTL_CALL_STACK.LEXICAL_DEPTH (
    dynamic_depth IN PLS_INTEGER)
RETURN PLS_INTEGER;
```

Parameters

Table 263-9 *LEXICAL_DEPTH Function Parameters*

| Parameter | Description |
|---------------|-------------------------|
| dynamic_depth | Depth in the call stack |

Return Values

The lexical nesting level of the subprogram at the specified dynamic depth

263.6.11 OWNER Function

This function returns the owner name of the unit of the subprogram at the specified dynamic depth.

Syntax

```
UTL_CALL_STACK.OWNER (
    dynamic_depth IN PLS_INTEGER)
RETURN VARCHAR2;
```

Parameters

Table 263-10 *OWNER Function Parameters*

| Parameter | Description |
|---------------|-------------------------|
| dynamic_depth | Depth in the call stack |

Return Values

The owner name of the unit of the subprogram at the specified dynamic depth

263.6.12 UNIT_LINE Function

This function returns the line number of the unit of the subprogram at the specified dynamic depth.

Syntax

```
UTL_CALL_STACK.UNIT_LINE (  
    dynamic_depth IN PLS_INTEGER)  
RETURN PLS_INTEGER;
```

Parameters

Table 263-11 *UNIT_LINE Function Parameters*

| Parameter | Description |
|---------------|-------------------------|
| dynamic_depth | Depth in the call stack |

Return Values

The line number of the unit of the subprogram at the specified dynamic depth

263.6.13 SUBPROGRAM Function

This function returns the unit-qualified name of the subprogram at the specified dynamic depth.

Syntax

```
UTL_CALL_STACK.SUBPROGRAM (  
    dynamic_depth IN PLS_INTEGER)  
RETURN UNIT_QUALIFIED_NAME;
```

Parameters

Table 263-12 *SUBPROGRAM Function Parameters*

| Parameter | Description |
|---------------|-------------------------|
| dynamic_depth | Depth in the call stack |

Return Values

Returns the unit-qualified name of the subprogram at the specified dynamic depth

264

UTL_COLL

The UTL_COLL package lets PL/SQL programs use collection locators to query and update.

This chapter contains the following topics:

- [Summary of UTL_COLL Subprograms](#)

264.1 Summary of UTL_COLL Subprograms

The UTL_COLL package has one subprogram, the IS_LOCATOR function.

Table 264-1 UTL_COLL Package Subprograms

| Subprogram | Description |
|-------------------------------------|---|
| IS_LOCATOR Function | Determines whether a collection item is actually a locator or not |

264.1.1 IS_LOCATOR Function

This function determines whether a collection item is actually a locator or not.

Syntax

```
UTL_COLL.IS_LOCATOR (  
    coln IN STANDARD)  
    RETURNS BOOLEAN;
```

Pragmas

Asserts WNDS, WNPS and RNPS pragmas

Parameters

Table 264-2 IS_LOCATOR Function Parameters

| Parameter | Description |
|-----------|------------------------------|
| coln | Nested table or varray item. |

Return Values

Table 264-3 IS_LOCATOR Function Return Values

| Return Value | Description |
|--------------|--------------------------------------|
| 1 | Collection item is indeed a locator. |
| 0 | Collection item is not a locator. |

Examples

```
CREATE OR REPLACE TYPE list_t AS TABLE OF VARCHAR2(20);
/

CREATE OR REPLACE TYPE phone_book_t AS OBJECT (
    pno number,
    ph list_t );
/

CREATE TABLE phone_book OF phone_book_t
    NESTED TABLE ph STORE AS nt_ph;
CREATE TABLE phone_book1 OF phone_book_t
    NESTED TABLE ph STORE AS nt_ph_1 RETURN LOCATOR;

INSERT INTO phone_book VALUES(1, list_t('650-633-5707','650-323-0953'));
INSERT INTO phone_book1 VALUES(1, list_t('415-555-1212'));

CREATE OR REPLACE PROCEDURE chk_coll IS
    plist list_t;
    plist1 list_t;
BEGIN
    SELECT ph INTO plist FROM phone_book WHERE pno=1;

    SELECT ph INTO plist1 FROM phone_book1 WHERE pno=1;

    IF (UTL_COLL.IS_LOCATOR(plist)) THEN
        DBMS_OUTPUT.PUT_LINE('plist is a locator');
    ELSE
        DBMS_OUTPUT.PUT_LINE('plist is not a locator');
    END IF;

    IF (UTL_COLL.IS_LOCATOR(plist1)) THEN
        DBMS_OUTPUT.PUT_LINE('plist1 is a locator');
    ELSE
        DBMS_OUTPUT.PUT_LINE('plist1 is not a locator');
    END IF;

END chk_coll;

SET SERVEROUTPUT ON
EXECUTE chk_coll;
```

265

UTL_COMPRESS

The `UTL_COMPRESS` package provides a set of data compression utilities.

This chapter contains the following topics:

- [Constants](#)
- [Exceptions](#)
- [Operational Notes](#)
- [Summary of UTL_COMPRESS Subprograms](#)

265.1 UTL_COMPRESS Constants

The maximum number of handles for piecewise operations can be defined by a constant.

```
UTLCOMP_MAX_HANDLE  CONSTANT  PLS_INTEGER := 5;
```

265.2 UTL_COMPRESS Exceptions

This table describes exceptions raised by `UTL_COMPRESS` subprograms.

Table 265-1 UTL_COMPRESS Exceptions

| Exception | Description |
|-------------------------------|--|
| <code>BUFFER_TOO_SMALL</code> | The compressed representation is too big. |
| <code>DATA_ERROR</code> | The input or output data stream was found to be an invalid format. |
| <code>INVALID_ARGUMENT</code> | One of the arguments was an invalid type or value. |
| <code>INVALID_HANDLE</code> | Invalid handle for piecewise compress or uncompress. |
| <code>STREAM_ERROR</code> | An error occurred during compression or uncompression of the data stream |

265.3 UTL_COMPRESS Operational Notes

Certain operational notes apply to `UTL_COMPRESS`.

- It is the caller's responsibility to free the temporary `LOB` returned by the `LZ*` functions with `DBMS_LOB.FREETEMPORARY` call.
- A `BFILE` passed into `LZ_COMPRESS*` or `LZ_UNCOMPRESS*` has to be opened by `DBMS_LOB.FILEOPEN`.
- Under special circumstances (especially if the input has already been compressed) the output produced by one of the `UTL_COMPRESS` subprograms may be the same size, or even slightly larger than, the input.

- The output of the UTL_COMPRESS compressed data is compatible with gzip(with -n option)/gunzip on a single file.

265.4 Summary of UTL_COMPRESS Subprograms

This table lists the UTL_COMPRESS subprograms and briefly describes them.

Table 265-2 UTL_COMPRESS Package Subprograms

| Subprogram | Description |
|--|---|
| ISOPEN Function | Checks to see if the handle to a piecewise (un)compress context is open or closed |
| LZ_COMPRESS Functions and Procedures | Compresses data using Lempel-Ziv compression algorithm |
| LZ_COMPRESS_ADD Procedure | Adds a piece of compressed data |
| LZ_COMPRESS_CLOSE | Closes and finishes piecewise compress operation |
| LZ_COMPRESS_OPEN | Initializes a piecewise context that maintains the compress state and data |
| LZ_UNCOMPRESS Functions and Procedures | Accepts compressed input, verifies it to be a valid and uncompresses it |
| LZ_UNCOMPRESS_EXTRACT Procedure | Extracts a piece of uncompressed data |
| LZ_UNCOMPRESS_OPEN Function | Initializes a piecewise context that maintains the uncompress state and data |
| LZ_UNCOMPRESS_CLOSE Procedure | Closes and finishes the piecewise uncompress |

265.4.1 ISOPEN Function

This function checks to see if the handle to a piecewise (un)compress context is open or closed.

Syntax

```
UTL_COMPRESS.ISOPEN(  
    handle in binary_integer)  
RETURN BOOLEAN;
```

Parameters

Table 265-3 ISOPEN Function Parameters

| Parameter | Description |
|-----------|---|
| handle | The handle to a piecewise uncompress context. |

Return Values

TRUE if the given piecewise handle is opened, otherwise FALSE.

Examples

```
IF (UTL_COMPRESS.ISOPEN(myhandle) = TRUE) then
    UTL_COMPRESS.LZ_COMPRESS_CLOSE(myhandle, lob_1);
END IF;
```

Alternatively:

```
IF (UTL_COMPRESS.ISOPEN(myhandle) = TRUE) THEN
    UTL_COMPRESS.LZ_UNCOMPRESS_CLOSE(myhandle);
END IF;
```

265.4.2 LZ_COMPRESS Functions and Procedures

These functions and procedures compress data using Lempel-Ziv compression algorithm.

Syntax

This function accept a RAW as input, compress it and return the compressed RAW result and metadata:

```
UTL_COMPRESS.LZ_COMPRESS (
    src      IN      RAW,
    quality  IN      BINARY_INTEGER DEFAULT 6)
RETURN RAW;
```

This function accept a BLOB as input, compress it and returns a temporary BLOB for the compressed data:

```
UTL_COMPRESS.LZ_COMPRESS (
    src      IN      BLOB,
    quality  IN      BINARY_INTEGER DEFAULT 6)
RETURN BLOB;
```

This procedure returns the compressed data into the existing BLOB(dst) which is trimmed to the compressed data size:

```
UTL_COMPRESS.LZ_COMPRESS (
    src      IN      BLOB,
    dst      IN OUT NOCOPY BLOB,
    quality  IN      BINARY_INTEGER DEFAULT 6);
```

This function returns a temporary BLOB for the compressed data:

```
UTL_COMPRESS.LZ_COMPRESS (
    src      IN      BFILE,
    quality  IN      BINARY_INTEGER DEFAULT 6)
RETURN BLOB;
```

This procedure will return the compressed data into the existing BLOB(dst) which is trimmed to the compressed data size:

```
UTL_COMPRESS.LZ_COMPRESS (
    src      IN      BFILE,
    dst      IN OUT NOCOPY BLOB,
    quality  IN      BINARY_INTEGER DEFAULT 6);
```

Parameters

Table 265-4 LZ_COMPRESS Function and Procedures Parameters

| Parameter | Description |
|-----------|---|
| src | Data (RAW, BLOB or BFILE) to be compressed. |
| dst | Destination for compressed data |
| quality | An integer in the range 1 to 9, 1=fast compression, 9=best compression, default=6 |

Usage Notes

- `quality` is an optional compression tuning value. It allows the `UTL_COMPRESS` user to choose between speed and compression quality, meaning the percentage of reduction in size. A faster compression speed will result in less compression of the data. A slower compression speed will result in more compression of the data. Valid values are [1..9], with 1=fastest and 9=slowest. The default 'quality' value is 6.

265.4.3 LZ_COMPRESS_ADD Procedure

This procedure adds a piece of compressed data.

Syntax

```
UTL_COMPRESS.LZ_COMPRESS_ADD (
    handle IN          BINARY_INTEGER,
    dst    IN OUT NOCOPY BLOB,
    src    IN          RAW);
```

Parameters

Table 265-5 LZ_COMPRESS_ADD Procedure Parameters

| Parameter | Description |
|-----------|---|
| handle | The handle to a piecewise compress context. |
| dst | The opened LOB from <code>LZ_COMPRESS_OPEN</code> to store compressed data. |
| src | The input data to be compressed. |

Exceptions

- `invalid_handle` - out of range invalid or unopened handle.
- `invalid_argument` - NULL handle, src, dst, or invalid dst.

265.4.4 LZ_COMPRESS_CLOSE

This procedure closes and finishes piecewise compress operation.

Syntax

```
UTL_COMPRESS.LZ_COMPRESS_CLOSE (
    handle IN          BINARY_INTEGER,
    dst    IN OUT NOCOPY BLOB);
```

Parameters

Table 265-6 LZ_COMPRESS_CLOSE Procedure Parameters

| Parameter | Description |
|-----------|--|
| handle | The handle to a piecewise compress context. |
| dst | The opened LOB from LZ_COMPRESS_OPEN to store compressed data. |

Exceptions

- `invalid_handle` - out of range invalid or uninitialized handle.
- `invalid_argument` - NULL handle, dst, or invalid dst.

265.4.5 LZ_COMPRESS_OPEN

This function initializes a piecewise context that maintains the compress state and data.

Syntax

```
UTL_COMPRESS.LZ_COMPRESS_OPEN (
    dst    IN OUT NOCOPY BLOB,
    quality IN          BINARY_INTEGER DEFAULT 6)
RETURN BINARY_INTEGER;
```

Parameters

Table 265-7 LZ_COMPRESS_OPEN Function Parameters

| Parameter | Description |
|-----------|--|
| dst | User supplied LOB to store compressed data. |
| quality | Speed versus efficiency of resulting compressed output. <ul style="list-style-type: none"> • Valid values are the range 1..9, with a default value of 6. • 1=fastest compression, 9=slowest compression and best compressed file size. |

Return Values

A handle to an initialized piecewise compress context.

Exceptions

- `invalid_handle` - invalid handle, too many open handles.

- `invalid_argument` - NULL `dst` or invalid quality specified.

Usage Notes

Close the opened handle with `LZ_COMPRESS_CLOSE`

- once the piecewise compress is completed
 - in the event of an exception in the middle of process
- because lack of doing so will cause these handles to leak.

265.4.6 LZ_UNCOMPRESS Functions and Procedures

This procedure accepts as input a `RAW`, `BLOB` or `BFILE` compressed string, verifies it to be a valid compressed value, uncompresses it using Lempel-Ziv compression algorithm, and returns the uncompressed `RAW` or `BLOB` result.

Syntax

This function returns uncompressed data as `RAW`:

```
UTL_COMPRESS.LZ_UNCOMPRESS (
    src IN RAW)
RETURN RAW;
```

This function returns uncompressed data as a temporary `BLOB`:

```
UTL_COMPRESS.LZ_UNCOMPRESS (
    src IN BLOB)
RETURN BLOB;
```

This procedure returns the uncompressed data into the existing `BLOB(dst)`, which will be trimmed to the uncompressed data size:

```
UTL_COMPRESS.LZ_UNCOMPRESS (
    src IN BLOB,
    dst IN OUT NOCOPY BLOB);
```

This function returns a temporary `BLOB` for the uncompressed data:

```
UTL_COMPRESS.LZ_UNCOMPRESS (
    src IN BFILE)
RETURN BLOB;
```

This procedure returns the uncompressed data into the existing `BLOB(dst)`. The original `dst` data will be overwritten.

```
UTL_COMPRESS.LZ_UNCOMPRESS (
    src IN BFILE,
    dst IN OUT NOCOPY BLOB);
```

Parameters

Table 265-8 LZ_UNCOMPRESS Function and Procedures Parameters

| Parameter | Description |
|------------------|------------------|
| <code>src</code> | Compressed data. |

Table 265-8 (Cont.) LZ_UNCOMPRESS Function and Procedures Parameters

| Parameter | Description |
|-----------|------------------------------------|
| dst | Destination for uncompressed data. |

265.4.7 LZ_UNCOMPRESS_EXTRACT Procedure

This procedure extracts a piece of uncompressed data.

Syntax

```
UTL_COMPRESS.LZ_UNCOMPRESS_EXTRACT (
  handle IN          BINARY_INTEGER,
  dst     OUT NOCOPY RAW);
```

Parameters

Table 265-9 LZ_UNCOMPRESS_EXTRACT Function Parameters

| Parameter | Description |
|-----------|---|
| handle | The handle to a piecewise uncompress context. |
| dst | The uncompressed data. |

Exceptions

- `no_data_found` - finished uncompress.
- `invalid_handle` - out of range invalid or uninitialized handle.
- `invalid_argument` - NULL handle.

265.4.8 LZ_UNCOMPRESS_OPEN Function

This function initializes a piecewise context that maintains the uncompress state and data.

Syntax

```
UTL_COMPRESS.LZ_UNCOMPRESS_OPEN (
  src IN BLOB)
RETURN BINARY_INTEGER;
```

Parameters

Table 265-10 LZ_UNCOMPRESS_OPEN Function Parameters

| Parameter | Description |
|-----------|------------------------------------|
| src | The input data to be uncompressed. |

Return Values

A handle to an initialized piecewise compress context.

Exceptions

- `invalid_handle` - invalid handle, too many open handles.
- `invalid_argument` - NULL src.

Usage Notes

Close the opened handle with `LZ_UNCOMPRESS_CLOSE`

- once the piecewise uncompress is completed
 - in the event of an exception in the middle of process
- because lack of doing so will cause these handles to leak.

265.4.9 LZ_UNCOMPRESS_CLOSE Procedure

This procedure closes and finishes the piecewise uncompress.

Syntax

```
UTL_COMPRESS.LZ_UNCOMPRESS_CLOSE (
    handle IN BINARY_INTEGER);
```

Parameters

Table 265-11 LZ_UNCOMPRESS_CLOSE Procedure Parameters

| Parameter | Description |
|-----------|---|
| handle | The handle to a piecewise uncompress context. |

Exceptions

- `invalid_handle` - out of range invalid or uninitialized handle.
- `invalid_argument` - NULL handle.

UTL_ENCODE

The `UTL_ENCODE` package provides functions that encode `RAW` data into a standard encoded format so that the data can be transported between hosts.

You can use `UTL_ENCODE` functions to encode the body of email text. The package also contains the decode counterpart functions of the encode functions. The functions follow published standards for encoding to accommodate non-Oracle utilities on the sending or receiving ends.

This chapter contains the following topic:

- [Summary of UTL_ENCODE Subprograms](#)

266.1 Summary of UTL_ENCODE Subprograms

This table lists the `UTL_ENCODE` subprograms and briefly describes them.

Table 266-1 UTL_ENCODE Package Subprograms

| Subprogram | Description |
|--|---|
| BASE64_DECODE Function | Reads the base 64-encoded <code>RAW</code> input string and decodes it to its original <code>RAW</code> value |
| BASE64_ENCODE Function | Encodes the binary representation of the <code>RAW</code> value into base 64 elements and returns it in the form of a <code>RAW</code> string |
| MIMEHEADER_DECODE Function | Decodes a string from mime header format |
| MIMEHEADER_ENCODE Function | Encodes a string into mime header format |
| QUOTED_PRINTABLE_DECODE Function | Reads the <code>varchar2</code> quoted printable format input string and decodes it to the corresponding <code>RAW</code> string |
| QUOTED_PRINTABLE_ENCODE Function | Reads the <code>RAW</code> input string and encodes it to the corresponding quoted printable format string |
| TEXT_DECODE Function | Decodes a character set sensitive text string |
| TEXT_ENCODE Function | Encodes a character set sensitive text string |
| UUDECODE Function | Reads the <code>RAW</code> uuencode format input string and decodes it to the corresponding <code>RAW</code> string |
| UUENCODE Function | Reads the <code>RAW</code> input string and encodes it to the corresponding uuencode format string |

266.1.1 BASE64_DECODE Function

This function reads the base 64-encoded `RAW` input string and decodes it to its original `RAW` value.

Syntax

```
UTL_ENCODE.BASE64_DECODE (  
    r IN RAW)  
RETURN RAW;
```

Pragmas

```
pragma RESTRICT_REFERENCES(base64_decode, WNDS, RNDS, WNPS, RNPS);
```

Parameters

Table 266-2 BASE64_DECODE Function Parameters

| Parameter | Description |
|-----------|---|
| r | The RAW string containing base 64-encoded data. There are no defaults or optional parameters. |

Return Values

Table 266-3 BASE64_DECODE Function Return Values

| Return | Description |
|--------|-----------------------------|
| RAW | Contains the decoded string |

266.1.2 BASE64_ENCODE Function

This function encodes the binary representation of the `RAW` value into base 64 elements and returns it in the form of a `RAW` string.

Syntax

```
UTL_ENCODE.BASE64_ENCODE (  
    r IN RAW)  
RETURN RAW;
```

Pragmas

```
pragma RESTRICT_REFERENCES(base64_encode, WNDS, RNDS, WNPS, RNPS);
```

Parameters

Table 266-4 BASE64_ENCODE Function Parameters

| Parameter | Description |
|-----------|--|
| r | The RAW value to be encoded. There are no defaults or optional parameters. |

Return Values

Table 266-5 BASE64_ENCODE Function Return Values

| Return | Description |
|--------|---------------------------------------|
| RAW | Contains the encoded base 64 elements |

266.1.3 MIMEHEADER_DECODE Function

This function accepts as input an "encoded word."

It uses the form:

```
=?<charset>?<encoding>?<encoded text>?=
=?ISO-8859-1?Q?Here is some encoded text?=
```

The <encoded text> is encapsulated in mime header tags which give the `MIMEHEADER_DECODE` function information about how to decode the string. The mime header metadata tags are stripped from the input string and the <encoded text> is converted to the base database character set as follows:

- If this is a UTF16 platform, convert the encoded text from UTF16 to ASCII
- If this is an EBCDIC platform, convert the encoded text from EBCDIC to ASCII
- If this is an ASCII or UTF8 platform, no conversion needed

The string is decoded using either quoted-printable or base64 decoding, as specified by the <encoding> metadata tag in the encoded word. The resulting converted and decoded text is returned to the caller as a `VARCHAR2` string.

Syntax

```
UTL_ENCODE.MIMEHEADER_DECODE (
    buf    IN  VARCHAR2 CHARACTER SET ANY_CS)
RETURN data VARCHAR2 CHARACTER SET buf%CHARSET;
```

Parameters

Table 266-6 MIMEHEADER_DECODE Function Parameters

| Parameter | Description |
|-----------|---|
| buf | The encoded text data with mime header format tags. |

Return Values

Table 266-7 MIMEHEADER_DECODE Function Return Values

| Return | Description |
|--------|--|
| data | The encoded text data with mime header format tags |

Examples

```
v2:=utl_encode.mimeheader_decode('=?ISO-8859-1?Q?Here is some encoded text?');
```

266.1.4 MIMEHEADER_ENCODE Function

This function returns as an output an "encoded word".

The output is in the following form:

```
=?<charset>?<encoding>?<encoded text>?=
=?ISO-8859-1?Q?Here is some text?=
```

The `buf` input parameter is the text to be encoded and becomes the `<encoded text>`.

The `<encoding>` value is either "Q" or "B" for quoted-printable encode or base64 encoding respectively. The `ENCODING` input parameter accepts as valid values `UTL_ENCODE.QUOTED_PRINTABLE` or `UTL_ENCODE.BASE64` or `NULL`. If `NULL`, quoted-printable encoding is selected as a default value.

The `<charset>` value is specified as the input parameter `encode_charset`. If `NULL`, the database character set is selected as a default value.

The mimeheader encoding process includes conversion of the `buf` input string to the character set specified by the `encode_charset` parameter. The converted string is encoded to either quoted-printable or base64 encoded format. The mime header tags are appended and prepended.

Finally, the string is converted to the base character set of the database:

- If this is a UTF16 platform, convert the encoded text to UTF16
- If this is an EBCDIC platform, convert the encoded text to EBCDIC
- If this is an ASCII or UTF8 platform, no conversion needed.

Syntax

```
UTL_ENCODE.MIMEHEADER_ENCODE (
    buf          IN  VARCHAR2 CHARACTER SET ANY_CS,
    encode_charset IN VARCHAR2 DEFAULT NULL,
    encoding     IN  PLS_INTEGER DEFAULT NULL)
RETURN string VARCHAR2 CHARACTER SET buf%CHARSET;
```

Parameters

Table 266-8 MIMEHEADER_ENCODE Function Parameters

| Parameter | Description |
|----------------|---|
| buf | The text data. |
| encode_charset | The target character set. |
| encoding | The encoding format. Valid values are UTL_ENCODE.BASE64, UTL_ENCODE.QUOTED_PRINTABLE and NULL |

Return Values

Table 266-9 MIMEHEADER_ENCODE Function Return Values

| Return | Description |
|--------|---|
| string | A VARCHAR2 encoded string with mime header format tags. |

266.1.5 QUOTED_PRINTABLE_DECODE Function

This function reads the `varchar2` quoted printable format input string and decodes it to the corresponding `RAW` string.

Syntax

```
UTL_ENCODE.QUOTED_PRINTABLE_DECODE (
    r IN RAW)
RETURN RAW;
```

Pragmas

```
pragma RESTRICT_REFERENCES(quoted_printable_decode, WNDS, RNDS, WNPS, RNPS);
```

Parameters

Table 266-10 QUOTED_PRINTABLE_DECODE Function Parameters

| Parameters | Description |
|------------|---|
| r | The RAW string containing a quoted printable data string. There are no defaults or optional parameters. |

Return Values

Table 266-11 QUOTED_PRINTABLE_DECODE Function Return Values

| Return | Description |
|--------|--------------------|
| RAW | The decoded string |

266.1.6 QUOTED_PRINTABLE_ENCODE Function

This function reads the RAW input string and encodes it to the corresponding quoted printable format string.

Syntax

```
UTL_ENCODE.QUOTED_PRINTABLE_ENCODE (
    r IN RAW)
RETURN RAW;
```

Pragmas

```
pragma RESTRICT_REFERENCES(quoted_printable_encode, WNDS, RNDS, WNPS, RNPS);
```

Parameters

Table 266-12 QUOTED_PRINTABLE_ENCODE Function Parameters

| Parameter | Description |
|-----------|---|
| r | The RAW string. There are no defaults or optional parameters. |

Return Values

Table 266-13 QUOTED_PRINTABLE_ENCODE Function Return Values

| Return | Description |
|--------|--------------------------------------|
| RAW | Contains the quoted printable string |

266.1.7 TEXT_DECODE Function

This function converts the input text to the target character set as specified by the `encode_charset` parameter, if not NULL.

The encoded text is converted to the base character set of database, as follows:

- If this is a UTF16 platform, convert the encoded text from UTF16 to ASCII
- If this is an EBCDIC platform, convert the encoded text from EBCDIC to ASCII
- If this is an ASCII or UTF8 platform, no conversion needed

You can decode from either quoted-printable or base64 format, with regard to each encoding parameter. If NULL, quoted-printable is selected as a default decoding format. If `encode_charset` is not NULL, you convert the string from the specified character set to the database character set. The resulting decoded and converted text string is returned to the caller.

Syntax

```
UTL_ENCODE.TEXT_DECODE (
    buf          IN  VARCHAR2 CHARACTER SET ANY_CS,
    encode_charset IN VARCHAR2 DEFAULT NULL,
```

```

encoding      IN PLS_INTEGER DEFAULT NULL)
RETURN string VARCHAR2 CHARACTER SET buf%CHARSET;

```

Parameters

Table 266-14 TEXT_DECODE Function Parameters

| Parameter | Description |
|----------------|--|
| buf | The encoded text data. |
| encode_charset | The source character set. |
| encoding | The encoding format. Valid values are UTL_ENCODE.BASE64, UTL_ENCODE.QUOTED_PRINTABLE and NULL. |

Return Values

Table 266-15 TEXT_DECODE Function Return Values

| Return | Description |
|--------|---------------------------------|
| string | A VARCHAR2 decoded text string. |

Examples

```

v2:=UTL_ENCODE.TEXT_DECODE(
    'Here is some text',
    WE8ISO8859P1,
    UTL_ENCODE.BASE64);

```

266.1.8 TEXT_ENCODE Function

This function converts the input text to the target character set as specified by the `encode_charset` parameter, if not NULL.

The text is encoded to either base64 or quoted-printable format, as specified by the `encoding` parameter. Quoted-printable is selected as a default if ENCODING is NULL.

The encoded text is converted to the base character set of the database:

- If this is a UTF16 platform, convert the encoded text to UTF16
- If this is an EBCDIC platform, convert the encoded text to EBCDIC
- If this is an ASCII or UTF8 platform, no conversion needed

The resulting encoded and converted text string is returned to the caller.

Syntax

```

UTL_ENCODE.TEXT_ENCODE (
    buf          IN VARCHAR2 CHARACTER SET ANY_CS,
    encode_charset IN VARCHAR2 DEFAULT NULL,
    encoding     IN PLS_INTEGER DEFAULT NULL)
RETURN string VARCHAR2 CHARACTER SET buf%CHARSET;

```

Parameters

Table 266-16 TEXT_ENCODE Function Parameters

| Parameter | Description |
|----------------|---|
| buf | The text data. |
| encode_charset | The target character set. |
| encoding | The encoding format. Valid values are UTL_ENCODE.BASE64, UTL_ENCODE.QUOTED_PRINTABLE and NULL |

Return Values

Table 266-17 TEXT_ENCODE Function Return Values

| Return | Description |
|--------|---|
| string | A VARCHAR2 encoded string with mime header format tags. |

Examples

```
v2:=utl_encode.text_encode(
    'Here is some text',
    'WE8ISO8859P1',
    UTL_ENCODE.BASE64);
```

266.1.9 UUDECODE Function

This function reads the RAW uuencode format input string and decodes it to the corresponding RAW string.

See "[UUENCODE Function](#)" for discussion of the cumulative nature of UUENCODE and UUDECODE for data streams.

Syntax

```
UTL_ENCODE.UUDECODE (
    r IN RAW)
RETURN RAW;
```

Pragmas

```
pragma RESTRICT_REFERENCES(uudecode, WNDS, RNDS, WNPS, RNPS);
```

Parameters

Table 266-18 UUDECODE Function Parameters

| Parameter | Description |
|-----------|--|
| r | The RAW string containing the uuencoded data string. There are no defaults or optional parameters. |

Return Values

Table 266-19 UUECODE Function Return Values

| Return | Description |
|--------|------------------------|
| RAW | The decoded RAW string |

266.1.10 UUECODE Function

This function reads the RAW input string and encodes it to the corresponding uuencode format string.

The output of this function is cumulative, in that it can be used to encode large data streams, by splitting the data stream into acceptably sized RAW values, encoded, and concatenated into a single encoded string.

Syntax

```
UTL_ENCODE.UUECODE (
  r          IN RAW,
  type       IN PLS_INTEGER DEFAULT 1,
  filename   IN VARCHAR2 DEFAULT NULL,
  permission IN VARCHAR2 DEFAULT NULL) RETURN RAW;
```

Pragmas

```
pragma RESTRICT_REFERENCES(uuencode, WNDS, RNDS, WNPS, RNPS);
```

Parameters

Table 266-20 UUECODE Function Parameters

| Parameter | Description |
|------------|--|
| r | RAW string |
| type | Optional number parameter containing the type of uuencoded output. Options: complete—a defined PL/SQL constant with a value of 1. (default) header_piece ...middle_piece ...end_piece |
| filename | Optional varchar2 parameter containing the uuencode filename; the default is uuencode.txt |
| permission | Optional varchar2 parameter containing the permission mode; the default is 0 (a text string zero). |

Return Values

Table 266-21 UUECODE Function Return Values

| Return | Description |
|--------|-------------------------------------|
| RAW | Contains the uuencode format string |

UTL_FILE

With the `UTL_FILE` package, PL/SQL programs can read and write operating system text files. `UTL_FILE` provides a restricted version of operating system stream file I/O.

This chapter contains the following topics:

- [Security Model](#)
- [Operational Notes](#)
- [Rules and Limits](#)
- [Exceptions](#)
- [Examples](#)
- [Data Structures](#)
- [Summary of UTL_FILE Subprograms](#)

267.1 UTL_FILE Security Model

The set of files and directories that are accessible to the user through `UTL_FILE` is controlled by a number of factors and database parameters. Foremost of these is the set of directory objects that have been granted to the user.

The nature of directory objects is discussed in the *Oracle Database SQL Language Reference*.

Assuming the user has both `READ` and `WRITE` access to the directory object `USER_DIR`, the user can open a file located in the operating system directory described by `USER_DIR`, but not in subdirectories or parent directories of this directory.

Lastly, the client (text I/O) and server implementations are subject to operating system file permission checking.

`UTL_FILE` provides file access both on the client side and on the server side. When run on the server, `UTL_FILE` provides access to all operating system files that are accessible from the server. On the client side, as in the case for Forms applications, `UTL_FILE` provides access to operating system files that are accessible from the client.

Directory objects offer more flexibility and granular control to the `UTL_FILE` application administrator, can be maintained dynamically (that is, without shutting down the database), and are consistent with other Oracle tools. `CREATE ANY DIRECTORY` privilege is granted only to `SYS` and `SYSTEM` by default.

Note:

Use the `CREATE DIRECTORY` feature for directory access verification.

Note that neither hard nor symbolic links are supported.

On UNIX systems, the owner of a file created by the `FOPEN` function is the owner of the shadow process running the instance. Normally, this owner is `ORACLE`. Files created using `FOPEN` are always writable and readable using the `UTL_FILE` subprograms. However, non-privileged operating system users who need to read these files outside of PL/SQL may need access from a system administrator.

 **WARNING:**

The privileges needed to access files in a directory object are operating system specific. `UTL_FILE` directory object privileges give you read and write access to all files within the specified directory.

267.2 UTL_FILE Operational Notes

Keep these notes in mind when using `UTL_FILE`.

The file location and file name parameters are supplied to the `FOPEN` function as separate strings, so that the file location can be checked against the list of accessible directories as specified by the `ALL_DIRECTORIES` view of accessible directory objects. Together, the file location and name must represent a legal filename on the system, and the directory must be accessible. A subdirectory of an accessible directory is not necessarily also accessible; it too must be specified using a complete path name matching an `ALL_DIRECTORIES` object.

`UTL_FILE` implicitly interprets line terminators on read requests, thereby affecting the number of bytes returned on a `GET_LINE` call. For example, the `len` parameter of `UTL_FILE.GET_LINE` specifies the requested number of bytes of character data. The number of bytes actually returned to the user will be the lesser of:

- The `GET_LINE len` parameter, or
- The number of bytes until the next line terminator character, or
- The `max_linesize` parameter specified by `UTL_FILE.FOPEN`

The `FOPEN max_linesize` parameter must be a number in the range 1 and 32767. If unspecified, Oracle supplies a default value of 1024. The `GET_LINE len` parameter must be a number in the range 1 and 32767. If unspecified, Oracle supplies the default value of `max_linesize`. If `max_linesize` and `len` are defined to be different values, then the lesser value takes precedence.

`UTL_FILE.GET_RAW` ignores line terminators.

`UTL_FILE` expects that files opened by `UTL_FILE.FOPEN` in text mode are encoded in the database character set. It expects that files opened by `UTL_FILE.FOPEN_NCHAR` in text mode are encoded in the UTF8 character set. If an opened file is not encoded in the expected character set, the result of an attempt to read the file is indeterminate. When data encoded in one character set is read and Globalization Support is told (such as by means of `NLS_LANG`) that it is encoded in another character set, the result is indeterminate. If `NLS_LANG` is set, it should therefore be the same as the database character set.

267.3 UTL_FILE Rules and Limits

Operating system-specific parameters, such as C-shell environment variables under UNIX, cannot be used in the file location or file name parameters.

UTL_FILE I/O capabilities are similar to standard operating system stream file I/O (OPEN, GET, PUT, CLOSE) capabilities, but with some limitations. For example, you call the FOPEN function to return a file handle, which you use in subsequent calls to GET_LINE or PUT to perform stream I/O to a file. When file I/O is done, you call FCLOSE to complete any output and free resources associated with the file.

Note:

The UTL_FILE package is similar to the client-side TEXT_IO package currently provided by Oracle Procedure Builder. Restrictions for a server implementation require some API differences between UTL_FILE and TEXT_IO. In PL/SQL file I/O, errors are returned using PL/SQL exceptions.

267.4 UTL_FILE Exceptions

This table describes exceptions raised by UTL_FILE subprograms.

Table 267-1 UTL_FILE Package Exceptions

| Exception Name | Description |
|---------------------|---|
| INVALID_PATH | File location is invalid. |
| INVALID_MODE | The open_mode parameter in FOPEN is invalid. |
| INVALID_FILEHANDLE | File handle is invalid. |
| INVALID_OPERATION | File could not be opened or operated on as requested. |
| READ_ERROR | Destination buffer too small, or operating system error occurred during the read operation |
| WRITE_ERROR | Operating system error occurred during the write operation. |
| INTERNAL_ERROR | Unspecified PL/SQL error |
| CHARSETMISMATCH | A file is opened using FOPEN_NCHAR, but later I/O operations use nonchar functions such as PUTF or GET_LINE. |
| FILE_OPEN | The requested operation failed because the file is open. |
| INVALID_MAXLINESIZE | The MAX_LINESIZE value for FOPEN () is invalid; it should be within the range 1 to 32767. |
| INVALID_FILENAME | The filename parameter is invalid. |
| ACCESS_DENIED | Permission to access to the file location is denied. |
| INVALID_OFFSET | Causes of the INVALID_OFFSET exception: <ul style="list-style-type: none"> • ABSOLUTE_OFFSET = NULL and RELATIVE_OFFSET = NULL, or • ABSOLUTE_OFFSET < 0, or • Either offset caused a seek past the end of the file |

Table 267-1 (Cont.) UTL_FILE Package Exceptions

| Exception Name | Description |
|----------------|---|
| DELETE_FAILED | The requested file delete operation failed. |
| RENAME_FAILED | The requested file rename operation failed. |

Procedures in UTL_FILE can also raise predefined PL/SQL exceptions such as NO_DATA_FOUND or VALUE_ERROR.

267.5 UTL_FILE Examples

These two examples show use of the procedure.

Example 1

Note:

The examples are UNIX-specific.

Given the following:

```
SQL> CREATE DIRECTORY log_dir AS '/appl/gl/log';
SQL> GRANT READ ON DIRECTORY log_dir TO DBA;
SQL> GRANT WRITE ON DIRECTORY log_dir TO DBA;

SQL> CREATE DIRECTORY USER_DIR AS '/appl/gl/user';
SQL> GRANT READ ON DIRECTORY USER_DIR TO PUBLIC;
SQL> GRANT WRITE ON DIRECTORY USER_DIR TO PUBLIC;
```

The following file locations and filenames are valid and accessible as follows:

| File Location | Filename | READ and WRITE |
|---------------|------------|--------------------------|
| /appl/gl/log | L12345.log | Users with DBA privilege |
| /appl/gl/user | u12345.tmp | All users |

The following file locations and filenames are invalid:

| File Location | Filename | Invalid Because |
|---------------------|------------------|---|
| /appl/gl/log/backup | L12345.log | # subdirectories are not accessible |
| /APPL/gl/log | L12345.log | # directory strings must follow case sensitivity rules as required by the O/S |
| /appl/gl/log | backup/L1234.log | # filenames may not include portions of directory paths |

| File Location | Filename | Invalid Because |
|---------------|------------|---|
| /user/tmp | L12345.log | # no corresponding CREATE DIRECTORY command has been issued |

Example 2

```

DECLARE
  V1 VARCHAR2(32767);
  F1 UTL_FILE.FILE_TYPE;
BEGIN
  -- In this example MAX_LINESIZE is less than GET_LINE's length request
  -- so the number of bytes returned will be 256 or less if a line terminator is seen.
  F1 := UTL_FILE.FOPEN('USER_DIR', 'u12345.tmp', 'R', 256);
  UTL_FILE.GET_LINE(F1, V1, 32767);
  UTL_FILE.FCLOSE(F1);

  -- In this example, FOPEN's MAX_LINESIZE is NULL and defaults to 1024,
  -- so the number of bytes returned will be 1024 or less if a line terminator is
  -- seen.
  F1 := UTL_FILE.FOPEN('USER_DIR', 'u12345.tmp', 'R');
  UTL_FILE.GET_LINE(F1, V1, 32767);
  UTL_FILE.FCLOSE(F1);

  -- In this example, GET_LINE doesn't specify a number of bytes, so it defaults to
  -- the same value as FOPEN's MAX_LINESIZE which is NULL in this case and defaults to
  -- 1024.
  -- So the number of bytes returned will be 1024 or less if a line terminator is
  -- seen.
  F1 := UTL_FILE.FOPEN('USER_DIR', 'u12345.tmp', 'R');
  UTL_FILE.GET_LINE(F1, V1);
  UTL_FILE.FCLOSE(F1);
END;

```

267.6 UTL_FILE Data Structures

The UTL_FILE package defines a RECORD type.

Record Types

- [FILETYPE Record Type](#)

267.6.1 FILETYPE Record Type

The contents of FILE_TYPE are private to the UTL_FILE package. You should not reference or change components of this record.

```

TYPE file_type IS RECORD (
  id          BINARY_INTEGER,
  datatype    BINARY_INTEGER,
  byte_mode   BOOLEAN);

```

Fields

Table 267-2 FILE_TYPE Fields

| Field | Description |
|-----------|---|
| id | A numeric value indicating the internal file handle number |
| datatype | Indicates whether the file is a CHAR file, Nchar file or other (binary) |
| byte_mode | Indicates whether the file was open as a binary file, or as a text file |

▲ Caution:

Oracle does not guarantee the persistence of `FILE_TYPE` values between database sessions or within a single session. Attempts to clone file handles or use dummy file handles may have indeterminate outcomes.

267.7 Summary of UTL_FILE Subprograms

This table lists the `UTL_FILE` subprograms and briefly describes them.

Table 267-3 UTL_FILE Subprograms

| Subprogram | Description |
|--|--|
| FCLOSE Procedure | Closes a file |
| FCLOSE_ALL Procedure | Closes all open file handles |
| FCOPY Procedure | Copies a contiguous portion of a file to a newly created file |
| FFLUSH Procedure | Physically writes all pending output to a file |
| FGETATTR Procedure | Reads and returns the attributes of a disk file |
| FGETPOS Function | Returns the current relative offset position within a file, in bytes |
| FOPEN Function | Opens a file for input or output |
| FOPEN_NCHAR Function | Opens a file in Unicode for input or output |
| FREMOVE Procedure | Deletes a disk file, assuming that you have sufficient privileges |
| FRENAME Procedure | Renames an existing file to a new name, similar to the UNIX <code>mv</code> function |
| FSEEK Procedure | Adjusts the file pointer forward or backward within the file by the number of bytes specified |
| GET_LINE Procedure | Reads text from an open file |
| GET_LINE_NCHAR Procedure | Reads text in Unicode from an open file |
| GET_RAW Procedure | Reads a <code>RAW</code> string value from a file and adjusts the file pointer ahead by the number of bytes read |
| IS_OPEN Function | Determines if a file handle refers to an open file |

Table 267-3 (Cont.) UTL_FILE Subprograms

| Subprogram | Description |
|--|--|
| NEW_LINE Procedure | Writes one or more operating system-specific line terminators to a file |
| PUT Procedure | Writes a string to a file |
| PUT_LINE Procedure | Writes a line to a file, and so appends an operating system-specific line terminator |
| PUT_LINE_NCHAR Procedure | Writes a Unicode line to a file |
| PUT_NCHAR Procedure | Writes a Unicode string to a file |
| PUTF Procedure | A <code>PUT</code> procedure with formatting |
| PUTF_NCHAR Procedure | A <code>PUT_NCHAR</code> procedure with formatting, and writes a Unicode string to a file, with formatting |
| PUT_RAW Procedure | Accepts as input a <code>RAW</code> data value and writes the value to the output buffer |

267.7.1 FCLOSE Procedure

This procedure closes an open file identified by a file handle.

Syntax

```
UTL_FILE.FCLOSE (
    file IN OUT FILE_TYPE);
```

Parameters

Table 267-4 FCLOSE Procedure Parameters

| Parameter | Description |
|-------------------|---|
| <code>file</code> | Active file handle returned by an <code>FOPEN</code> or <code>FOPEN_NCHAR</code> call |

Usage Notes

If there is buffered data yet to be written when `FCLOSE` runs, then you may receive a `WRITE_ERROR` exception when closing a file.

Exceptions

```
WRITE_ERROR
INVALID_FILEHANDLE
```

267.7.2 FCLOSE_ALL Procedure

This procedure closes all open file handles for the session. This should be used as an emergency cleanup procedure, for example, when a PL/SQL program exits on an exception.

Syntax

```
UTL_FILE.FCLOSE_ALL;
```

Usage Notes

Note:

`FCLOSE_ALL` does not alter the state of the open file handles held by the user. This means that an `IS_OPEN` test on a file handle after an `FCLOSE_ALL` call still returns `TRUE`, even though the file has been closed. No further read or write operations can be performed on a file that was open before an `FCLOSE_ALL`.

Exceptions

```
WRITE_ERROR
```

267.7.3 FCOPY Procedure

This procedure copies a contiguous portion of a file to a newly created file.

By default, the whole file is copied if the `start_line` and `end_line` parameters are omitted. The source file is opened in read mode. The destination file is opened in write mode. A starting and ending line number can optionally be specified to select a portion from the center of the source file for copying.

Syntax

```
UTL_FILE.FCOPY (
    src_location    IN VARCHAR2,
    src_filename   IN VARCHAR2,
    dest_location   IN VARCHAR2,
    dest_filename   IN VARCHAR2,
    start_line      IN BINARY_INTEGER DEFAULT 1,
    end_line        IN BINARY_INTEGER DEFAULT NULL);
```

Parameters

Table 267-5 FCOPY Procedure Parameters

| Parameters | Description |
|---------------------------|--|
| <code>src_location</code> | Directory location of the source file, a <code>DIRECTORY_NAME</code> from the <code>ALL_DIRECTORIES</code> view (case sensitive) |
| <code>src_filename</code> | Source file to be copied |

Table 267-5 (Cont.) FCOPY Procedure Parameters

| Parameters | Description |
|----------------------------|---|
| <code>dest_location</code> | Destination directory where the destination file is created |
| <code>dest_filename</code> | Destination file created from the source file |
| <code>start_line</code> | Line number at which to begin copying. The default is 1 for the first line |
| <code>end_line</code> | Line number at which to stop copying. The default is NULL, signifying end of file |

Exceptions

`INVALID_FILENAME`
`INVALID_PATH`
`INVALID_OPERATION`
`INVALID_OFFSET`
`READ_ERROR`
`WRITE_ERROR`

267.7.4 FFLUSH Procedure

`FFLUSH` physically writes pending data to the file identified by the file handle. Normally, data being written to a file is buffered. The `FFLUSH` procedure forces the buffered data to be written to the file. The data must be terminated with a newline character.

Flushing is useful when the file must be read while still open. For example, debugging messages can be flushed to the file so that they can be read immediately.

Syntax

```
UTL_FILE.FFLUSH (
    file IN FILE_TYPE);
```

Parameters**Table 267-6 FFLUSH Procedure Parameters**

| Parameters | Description |
|-------------------|---|
| <code>file</code> | Active file handle returned by an <code>FOPEN</code> or <code>FOPEN_NCHAR</code> call |

Exceptions

`INVALID_FILENAME`
`INVALID_MAXLINESIZE`
`INVALID_OPERATION`
`WRITE_ERROR`

267.7.5 FGETATTR Procedure

This procedure reads and returns the attributes of a disk file.

Syntax

```
UTL_FILE.FGETATTR(  
    location    IN VARCHAR2,  
    filename    IN VARCHAR2,  
    fexists     OUT BOOLEAN,  
    file_length OUT NUMBER,  
    block_size  OUT BINARY_INTEGER);
```

Parameters

Table 267-7 FGETATTR Procedure Parameters

| Parameters | Description |
|-------------|--|
| location | Directory location of the source file, a DIRECTORY_NAME from the ALL_DIRECTORIES view (case sensitive) |
| filename | Name of the file to be examined |
| fexists | A BOOLEAN for whether or not the file exists |
| file_length | Length of the file in bytes. NULL if file does not exist. |
| block_size | File system block size in bytes. NULL if the file does not exist. |

Exceptions

```
INVALID_PATH  
INVALID_FILENAME  
INVALID_OPERATION  
READ_ERROR  
ACCESS_DENIED
```

267.7.6 FGETPOS Function

This function returns the current relative offset position within a file, in bytes.

Syntax

```
UTL_FILE.FGETPOS (  
    file IN FILE_TYPE)  
RETURN PLS_INTEGER;
```

Parameters

Table 267-8 FGETPOS Parameters

| Parameters | Description |
|------------|---------------------------------------|
| file | Directory location of the source file |

Return Values

FGETPOS returns the relative offset position for an open file, in bytes. It raises an exception if the file is not open. It returns 0 for the beginning of the file.

Exceptions

INVALID_FILEHANDLE

INVALID_OPERATION

READ_ERROR

Usage Notes

If file is opened for byte mode operations, then the INVALID_OPERATION exception is raised.

267.7.7 FOPEN Function

This function opens a file. You can specify the maximum line size and have a maximum of 50 files open simultaneously.

See also [FOPEN_NCHAR Function](#).

Syntax

```
UTL_FILE.FOPEN (
  location      IN VARCHAR2,
  filename      IN VARCHAR2,
  open_mode     IN VARCHAR2,
  max_linesize  IN BINARY_INTEGER DEFAULT 1024)
RETURN FILE_TYPE;
```

Parameters

Table 267-9 FOPEN Function Parameters

| Parameter | Description |
|-----------|--|
| location | Directory location of file. This string is a directory object name and must be specified in upper case. Read privileges must be granted on this directory object for the UTL_FILE user to run FOPEN. |
| filename | File name, including extension (file type), without directory path. If a directory path is given as a part of the filename, it is ignored by FOPEN. On Unix, the filename cannot end with /. |

Table 267-9 (Cont.) FOPEN Function Parameters

| Parameter | Description |
|---------------------------|--|
| <code>open_mode</code> | <p>Specifies how the file is opened. Modes include:</p> <ul style="list-style-type: none"> • <code>r</code> -- read text • <code>w</code> -- write text • <code>a</code> -- append text • <code>rb</code> -- read byte mode • <code>wb</code> -- write byte mode • <code>ab</code> -- append byte mode <p>If you try to open a file specifying 'a' or 'ab' for <code>open_mode</code> but the file does not exist, the file is created in <code>write</code> mode.</p> |
| <code>max_linesize</code> | <p>Maximum number of bytes for each line, including the newline character, for this file (minimum value 1, maximum value 32767). If unspecified, Oracle supplies a default value of 1024.</p> |

Return Values

FOPEN returns a file handle, which must be passed to all subsequent procedures that operate on that file. The specific contents of the file handle are private to the UTL_FILE package, and individual components should not be referenced or changed by the UTL_FILE user.

Table 267-10 FOPEN Function Return Values

| Return | Description |
|------------------------|---------------------|
| <code>FILE_TYPE</code> | Handle to open file |

Exceptions

- INVALID_MAXILINESIZE
- INVALID_MODE
- INVALID_OPERATION
- INVALID_PATH
- INVALID_FILENAME

Usage Notes

The file location and file name parameters must be supplied to the FOPEN function as quoted strings so that the file location can be checked against the list of accessible directories as specified by the ALL_DIRECTORIES view of accessible directory objects.

267.7.8 FOPEN_NCHAR Function

This function opens a file in national character set mode for input or output, with the maximum line size specified. With this function, you can read or write a text file in Unicode instead of in the database character set.

You can have a maximum of 50 files open simultaneously.

Even though the contents of an `NVARCHAR2` buffer may be AL16UTF16 or UTF8 (depending on the national character set of the database), the contents of the file are always read and written in UTF8. `UTL_FILE` converts between UTF8 and AL16UTF16 as necessary.

See also [FOPEN Function](#).

Syntax

```
UTL_FILE.FOPEN_NCHAR (
    location      IN VARCHAR2,
    filename      IN VARCHAR2,
    open_mode     IN VARCHAR2,
    max_linesize  IN BINARY_INTEGER DEFAULT 1024)
RETURN FILE_TYPE;
```

Parameters

Table 267-11 FOPEN_NCHAR Function Parameters

| Parameter | Description |
|--------------|---|
| location | Directory location of file |
| filename | File name (including extension) |
| open_mode | Open mode (r,w,a,rb,wb,ab) |
| max_linesize | Maximum number of characters for each line, including the newline character, for this file (minimum value 1, maximum value 32767) |

Return Values

`FOPEN_NCHAR` returns a file handle, which must be passed to all subsequent procedures that operate on that file. The specific contents of the file handle are private to the `UTL_FILE` package, and individual components should not be referenced or changed by the `UTL_FILE` user.

Table 267-12 FOPEN_NCHAR Function Return Values

| Return | Description |
|-----------|---------------------|
| FILE_TYPE | Handle to open file |

Exceptions

```
INVALID_MAXILINESIZE
INVALID_MODE
INVALID_OPERATION
```

INVALID_PATH

267.7.9 FREMOVE Procedure

This procedure deletes a disk file, assuming that you have sufficient privileges.

Syntax

```
UTL_FILE.FREMOVE (  
    location IN VARCHAR2,  
    filename IN VARCHAR2);
```

Parameters

Table 267-13 FREMOVE Procedure Parameters

| Parameters | Description |
|------------|--|
| location | Directory location of the file, a DIRECTORY_NAME from ALL_DIRECTORIES (case sensitive) |
| filename | Name of the file to be deleted |

Exceptions

ACCESS_DENIED

DELETE_FAILED

INVALID_FILENAME

INVALID_OPERATION

INVALID_PATH

Usage Notes

The FREMOVE procedure does not verify privileges before deleting a file. The O/S verifies file and directory permissions. An exception is returned on failure.

267.7.10 FRENAME Procedure

This procedure renames an existing file to a new name, similar to the UNIX mv function.

Syntax

```
UTL_FILE.FRENAME (  
    src_location    IN  VARCHAR2,  
    src_filename    IN  VARCHAR2,  
    dest_location   IN  VARCHAR2,  
    dest_filename   IN  VARCHAR2,  
    overwrite       IN  BOOLEAN DEFAULT FALSE);
```

Parameters

Table 267-14 FRENAME Procedure Parameters

| Parameters | Description |
|---------------|---|
| src_location | Directory location of the source file, a DIRECTORY_NAME from the ALL_DIRECTORIES view (case sensitive) |
| src_filename | Source file to be renamed |
| dest_location | Destination directory of the destination file, a DIRECTORY_NAME from the ALL_DIRECTORIES view (case sensitive) |
| dest_filename | New name of the file |
| overwrite | Default is FALSE. Permission on both the source and destination directories must be granted. You can use the overwrite parameter to specify whether or not to overwrite a file if one exists in the destination directory. The default is FALSE for no overwrite. |

Exceptions

ACCESS_DENIED
INVALID_FILENAME
INVALID_PATH
RENAME_FAILED

267.7.11 FSEEK Procedure

This procedure adjusts the file pointer forward or backward within the file by the number of bytes specified.

Syntax

```
UTL_FILE.FSEEK (
    file           IN OUT  UTL_FILE.FILE_TYPE,
    absolute_offset IN      PL_INTEGER DEFAULT NULL,
    relative_offset IN      PLS_INTEGER DEFAULT NULL);
```

Parameters

Table 267-15 FSEEK Procedure Parameters

| Parameters | Description |
|-----------------|---|
| file | File handle |
| absolute_offset | Absolute location to which to seek; default = NULL |
| relative_offset | Number of bytes to seek forward or backward; positive = forward, negative integer = backward, zero = current position, default = NULL |

Exceptions

INVALID_FILEHANDLE

```
INVALID_OFFSET
INVALID_OPERATION
READ_ERROR
```

Usage Notes

- Using `FSEEK`, you can read previous lines in the file without first closing and reopening the file. You must know the number of bytes by which you want to navigate.
- If `relative_offset`, the procedure seeks forward. If `relative_offset > 0`, or backward, if `relative_offset < 0`, the procedure seeks through the file by the number of `relative_offset` bytes specified.
- If the beginning of the file is reached before the number of bytes specified, then the file pointer is placed at the beginning of the file. If the end of the file is reached before the number of bytes specified, then an `INVALID_OFFSET` error is raised.
- If `absolute_offset`, the procedure seeks to an absolute location specified in bytes.
- If file is opened for byte mode operations, then the `INVALID OPERATION` exception is raised.

267.7.12 GET_LINE Procedure

This procedure reads text from the open file identified by the file handle and places the text in the output buffer parameter. Text is read up to, but not including, the line terminator, or up to the end of the file, or up to the end of the `len` parameter. It cannot exceed the `max_linesize` specified in `FOPEN`.

Syntax

```
UTL_FILE.GET_LINE (
    file          IN FILE_TYPE,
    buffer        OUT VARCHAR2,
    len           IN PLS_INTEGER DEFAULT NULL);
```

Parameters

Table 267-16 GET_LINE Procedure Parameters

| Parameters | Description |
|---------------------|--|
| <code>file</code> | Active file handle returned by an <code>FOPEN</code> call. The file must be open for reading (mode <code>r</code>); otherwise an <code>INVALID_OPERATION</code> exception is raised. |
| <code>buffer</code> | Data buffer to receive the line read from the file |
| <code>len</code> | The number of bytes read from the file. Default is <code>NULL</code> . If <code>NULL</code> , Oracle supplies the value of <code>max_linesize</code> . |

Exceptions

```
INVALID_FILEHANDLE
```

```
INVALID_OPERATION
NO_DATA_FOUND
READ_ERROR
```

Usage Notes

If the line does not fit in the buffer, a `READ_ERROR` exception is raised. If no text was read due to end of file, the `NO_DATA_FOUND` exception is raised. If the file is opened for byte mode operations, the `INVALID_OPERATION` exception is raised.

Because the line terminator character is not read into the buffer, reading blank lines returns empty strings.

The maximum size of the `buffer` parameter is 32767 bytes unless you specify a smaller size in `FOPEN`. If unspecified, Oracle supplies a default value of 1024. See also "[GET_LINE_NCHAR Procedure](#)".

267.7.13 GET_LINE_NCHAR Procedure

This procedure reads text from the open file identified by the file handle and places the text in the output buffer parameter. With this function, you can read a text file in Unicode instead of in the database character set.

The file must be opened in national character set mode, and must be encoded in the UTF8 character set. The expected buffer datatype is `NVARCHAR2`. If a variable of another datatype, such as `NCHAR`, `NCLOB`, or `VARCHAR2` is specified, PL/SQL will perform standard implicit conversion from `NVARCHAR2` after the text is read.

See also [GET_LINE Procedure](#)

Syntax

```
UTL_FILE.GET_LINE_NCHAR (
    file          IN FILE_TYPE,
    buffer        OUT NVARCHAR2,
    len           IN PLS_INTEGER DEFAULT NULL);
```

Parameters

Table 267-17 GET_LINE_NCHAR Procedure Parameters

| Parameters | Description |
|---------------------|--|
| <code>file</code> | Active file handle returned by an <code>FOPEN_NCHAR</code> call. The file must be open for reading (mode <code>r</code>). If the file is opened by <code>FOPEN</code> instead of <code>FOPEN_NCHAR</code> , a <code>CHARSETMISMATCH</code> exception is raised. |
| <code>buffer</code> | Data buffer to receive the line read from the file |
| <code>len</code> | The number of bytes read from the file. Default is <code>NULL</code> . If <code>NULL</code> , Oracle supplies the value of <code>max_linesize</code> . |

Exceptions

```
INVALID_FILEHANDLE
INVALID_OPERATION
```

NO_DATA_FOUND

READ_ERROR

267.7.14 GET_RAW Procedure

This procedure reads a RAW string value from a file and adjusts the file pointer ahead by the number of bytes read. UTL_FILE.GET_RAW ignores line terminators.

Syntax

```

UTL_FILE.GET_RAW (
    file      IN          UTL_FILE.FILE_TYPE,
    buffer    OUT NOCOPY RAW,
    len       IN          PLS_INTEGER DEFAULT NULL);

```

Parameters

Table 267-18 GET_RAW Procedure Parameters

| Parameters | Description |
|------------|---|
| file | File handle |
| buffer | RAW data |
| len | The number of bytes read from the file. Default is NULL. If NULL, len is assumed to be the maximum length of RAW. |

Exceptions

INVALID_FILEHANDLE

INVALID_OPERATION

LENGTH_MISMATCH

NO_DATA_FOUND

READ_ERROR

Usage Notes

The subprogram will raise `No_Data_Found` when it attempts to read past the end of the file. Your application should allow for this by catching the exception in its processing loop.

```

PROCEDURE Sys.p (n IN VARCHAR2) IS
    h      UTL_FILE.FILE_TYPE := UTL_FILE.FOPEN('D', n, 'r', 32767);
    Buf    RAW(32767);
    Amnt   CONSTANT PLS_INTEGER := 32767;
BEGIN
    LOOP
        BEGIN
            Utl_File.Get_Raw(h, Buf, Amnt);
            -- Do something with this chunk
        EXCEPTION WHEN No_Data_Found THEN EXIT; END;
    END LOOP;
    UTL_FILE.FCLOSE (h);
END;

```

267.7.15 IS_OPEN Function

This function tests a file handle to see if it identifies an open file.

IS_OPEN reports only whether a file handle represents a file that has been opened, but not yet closed. It does not guarantee that there will be no operating system errors when you attempt to use the file handle.

Syntax

```
UTL_FILE.IS_OPEN (  
    file IN FILE_TYPE)  
    RETURN BOOLEAN;
```

Parameters

Table 267-19 IS_OPEN Function Parameters

| Parameter | Description |
|-----------|---|
| file | Active file handle returned by an FOPEN or FOPEN_NCHAR call |

Return Values

TRUE or FALSE

Exceptions

INVALID_FILEHANDLE

267.7.16 NEW_LINE Procedure

This procedure writes one or more line terminators to the file identified by the input file handle.

This procedure is separate from PUT because the line terminator is a platform-specific character or sequence of characters.

Syntax

```
UTL_FILE.NEW_LINE (  
    file IN FILE_TYPE,  
    lines IN BINARY_INTEGER := 1);
```

Parameters

Table 267-20 NEW_LINE Procedure Parameters

| Parameters | Description |
|------------|---|
| file | Active file handle returned by an FOPEN or FOPEN_NCHAR call |
| lines | Number of line terminators to be written to the file |

Exceptions

INVALID_FILEHANDLE
 INVALID_OPERATION
 WRITE_ERROR

267.7.17 PUT Procedure

PUT writes the text string stored in the buffer parameter to the open file identified by the file handle.

The file must be open for write operations. No line terminator is appended by PUT; use NEW_LINE to terminate the line or use PUT_LINE to write a complete line with a line terminator. See also "[PUT_NCHAR Procedure](#)".

Syntax

```
UTL_FILE.PUT (
    file      IN FILE_TYPE,
    buffer    IN VARCHAR2);
```

Parameters**Table 267-21 PUT Procedure Parameters**

| Parameters | Description |
|------------|---|
| file | Active file handle returned by an FOPEN_NCHAR call. The file must be open for writing. |
| buffer | Buffer that contains the text to be written to the file. User must have opened the file using mode w or mode a; otherwise, an INVALID_OPERATION exception is raised. |

Usage Notes

The maximum size of the buffer parameter is 32767 bytes unless you specify a smaller size in FOPEN. If unspecified, Oracle supplies a default value of 1024. The sum of all sequential PUT calls cannot exceed 32767 without intermediate buffer flushes.

Exceptions

INVALID_FILEHANDLE
 INVALID_OPERATION
 WRITE_ERROR

267.7.18 PUT_LINE Procedure

This procedure writes the text string stored in the buffer parameter to the open file identified by the file handle.

The file must be open for write operations. PUT_LINE terminates the line with the platform-specific line terminator character or characters.

See also "[PUT_LINE_NCHAR Procedure](#)".

Syntax

```
UTL_FILE.PUT_LINE (  
    file      IN FILE_TYPE,  
    buffer    IN VARCHAR2,  
    autoflush IN BOOLEAN DEFAULT FALSE);
```

Parameters

Table 267-22 PUT_LINE Procedure Parameters

| Parameters | Description |
|------------|---|
| file | Active file handle returned by an FOPEN call |
| buffer | Text buffer that contains the lines to be written to the file |
| autoflush | Flushes the buffer to disk after the WRITE |

Exceptions

INVALID_FILEHANDLE

INVALID_OPERATION

WRITE_ERROR

Usage Notes

- The maximum size of the `buffer` parameter is 32767 bytes unless you specify a smaller size in `FOPEN`. If unspecified, Oracle supplies a default value of 1024. The sum of all sequential `PUT` calls cannot exceed 32767 without intermediate buffer flushes.
- If file is opened for byte mode operations, then the `INVALID_OPERATION` exception is raised.

267.7.19 PUT_LINE_NCHAR Procedure

This procedure writes the text string stored in the `buffer` parameter to the open file identified by the file handle. With this function, you can write a text file in Unicode instead of in the database character set.

This procedure is equivalent to the [PUT_NCHAR Procedure](#), except that the line separator is appended to the written text. See also [PUT_LINE Procedure](#).

Syntax

```
UTL_FILE.PUT_LINE_NCHAR (  
    file      IN FILE_TYPE,  
    buffer    IN NVARCHAR2);
```

Parameters

Table 267-23 PUT_LINE_NCHAR Procedure Parameters

| Parameters | Description |
|------------|--|
| file | Active file handle returned by an FOPEN_NCHAR call. The file must be open for writing. |
| buffer | Text buffer that contains the lines to be written to the file |

Exceptions

INVALID_FILEHANDLE

INVALID_OPERATION

WRITE_ERROR

Usage Notes

- The maximum size of the `buffer` parameter is 32767 bytes unless you specify a smaller size in `FOPEN`. If unspecified, Oracle supplies a default value of 1024. The sum of all sequential `PUT` calls cannot exceed 32767 without intermediate buffer flushes.
- If file is opened for byte mode operations, then the `INVALID_OPERATION` exception is raised.

267.7.20 PUT_NCHAR Procedure

This procedure writes the text string stored in the `buffer` parameter to the open file identified by the file handle.

With this function, you can write a text file in Unicode instead of in the database character set. The file must be opened in the national character set mode. The text string will be written in the UTF8 character set. The expected buffer datatype is `NVARCHAR2`. If a variable of another datatype is specified, PL/SQL will perform implicit conversion to `NVARCHAR2` before writing the text.

Syntax

```
UTL_FILE.PUT_NCHAR (
    file      IN FILE_TYPE,
    buffer    IN NVARCHAR2);
```

Parameters

Table 267-24 PUT_NCHAR Procedure Parameters

| Parameters | Description |
|------------|---|
| file | Active file handle returned by an FOPEN_NCHAR call. If the file is opened by <code>FOPEN</code> instead of <code>FOPEN_NCHAR</code> , a <code>CHARSETMISMATCH</code> exception is raised. |

Table 267-24 (Cont.) PUT_NCHAR Procedure Parameters

| Parameters | Description |
|---------------------|---|
| <code>buffer</code> | Buffer that contains the text to be written to the file. User must have opened the file using mode <code>w</code> or mode <code>a</code> ; otherwise, an <code>INVALID_OPERATION</code> exception is raised. |

Exceptions`INVALID_FILEHANDLE``INVALID_OPERATION``WRITE_ERROR`**Usage Notes**

The maximum size of the `buffer` parameter is 32767 bytes unless you specify a smaller size in `FOPEN`. If unspecified, Oracle supplies a default value of 1024. The sum of all sequential `PUT` calls cannot exceed 32767 without intermediate buffer flushes.

Related Topics

- [PUT Procedure](#)
`PUT` writes the text string stored in the `buffer` parameter to the open file identified by the file handle.

267.7.21 PUTF Procedure

This procedure is a formatted `PUT` procedure.

It works like a limited `printf()`.

Syntax

```
UTL_FILE.PUTF (
    file      IN FILE_TYPE,
    format    IN VARCHAR2,
    [arg1     IN VARCHAR2 DEFAULT NULL,
     . . .
    arg5      IN VARCHAR2 DEFAULT NULL]);
```

Parameters**Table 267-25 PUTF Procedure Parameters**

| Parameters | Description |
|---------------------|--|
| <code>file</code> | Active file handle returned by an <code>FOPEN</code> call |
| <code>format</code> | Format string that can contain text as well as the formatting characters <code>\n</code> and <code>%s</code> |

Table 267-25 (Cont.) PUTF Procedure Parameters

| Parameters | Description |
|------------|---|
| arg1..arg5 | <p>From one to five operational argument strings.</p> <p>Argument strings are substituted, in order, for the %s formatters in the format string.</p> <p>If there are more formatters in the format parameter string than there are arguments, then an empty string is substituted for each %s for which there is no argument.</p> |

Usage Notes

- If file is opened for byte mode operations, then the INVALID_OPERATION exception is raised.
- The format string can contain any text, but the character sequences %s and \n have special meaning.

| Character Sequence | Meaning |
|--------------------|---|
| %s | Substitute this sequence with the string value of the next argument in the argument list. |
| \n | Substitute with the appropriate platform-specific line terminator. |

Exceptions

INVALID_FILEHANDLE
INVALID_OPERATION
WRITE_ERROR

Examples

The following example writes the lines:

```

Hello, world!
I come from Zork with greetings for all earthlings.

my_world varchar2(4) := 'Zork';
...
PUTF(my_handle, 'Hello, world!\nI come from %s with %s.\n',
      my_world,
      'greetings for all earthlings');
```

If there are more %s formatters in the format parameter than there are arguments, then an empty string is substituted for each %s for which there is no matching argument.

- [PUTF_NCHAR Procedure](#)
This procedure is a formatted version of a PUT_NCHAR Procedure.

267.7.22 PUTF_NCHAR Procedure

This procedure is a formatted version of a PUT_NCHAR Procedure.

Using `PUTF_NCHAR`, you can write a text file in Unicode instead of in the database character set. It accepts a format string with formatting elements `\n` and `%s`, and up to five arguments to be substituted for consecutive instances of `%s` in the format string. The expected datatype of the format string and the arguments is `NVARCHAR2`.

If variables of another datatype are specified, PL/SQL will perform implicit conversion to `NVARCHAR2` before formatting the text. Formatted text is written in the UTF8 character set to the file identified by the file handle. The file must be opened in the national character set mode.

Syntax

```
UTL_FILE.PUTF_NCHAR (
    file      IN FILE_TYPE,
    format    IN NVARCHAR2,
    [arg1     IN NVARCHAR2  DEFAULT NULL,
    . . .
    arg5      IN NVARCHAR2  DEFAULT NULL]);
```

Parameters

Table 267-26 PUTF_NCHAR Procedure Parameters

| Parameters | Description |
|-------------------------|--|
| <code>file</code> | Active file handle returned by an <code>FOPEN_NCHAR</code> call. The file must be open for reading (mode <code>r</code>). If the file is opened by <code>FOPEN</code> instead of <code>FOPEN_NCHAR</code> , a <code>CHARSETMISMATCH</code> exception is raised. |
| <code>format</code> | Format string that can contain text as well as the formatting characters <code>\n</code> and <code>%s</code> |
| <code>arg1..arg5</code> | From one to five operational argument strings. Argument strings are substituted, in order, for the <code>%s</code> formatters in the format string. If there are more formatters in the format parameter string than there are arguments, then an empty string is substituted for each <code>%s</code> for which there is no argument. |

Exceptions

`INVALID_FILEHANDLE`

`INVALID_OPERATION`

`WRITE_ERROR`

Usage Notes

- The maximum size of the `buffer` parameter is 32767 bytes unless you specify a smaller size in `FOPEN`. If unspecified, Oracle supplies a default value of 1024. The sum of all sequential `PUT` calls cannot exceed 32767 without intermediate buffer flushes.

- If file is opened for byte mode operations, then the `INVALID_OPERATION` exception is raised.

Related Topics

- [PUT_NCHAR Procedure](#)
This procedure writes the text string stored in the `buffer` parameter to the open file identified by the file handle.

267.7.23 PUT_RAW Procedure

This procedure accepts as input a `RAW` data value and writes the value to the output buffer.

Syntax

```
UTL_FILE.PUT_RAW (
    file           IN    UTL_FILE.FILE_TYPE,
    buffer         IN    RAW,
    autoflush      IN    BOOLEAN DEFAULT FALSE);
```

Parameters

Table 267-27 PUT_RAW Procedure Parameters

| Parameters | Description |
|------------------------|--|
| <code>file</code> | File handle |
| <code>buffer</code> | The <code>RAW</code> data written to the buffer |
| <code>autoflush</code> | If <code>TRUE</code> , then performs a flush after writing the value to the output buffer; default is <code>FALSE</code> . |

Exceptions

`INVALID_FILEHANDLE`

`INVALID_OPERATION`

`WRITE_ERROR`

Usage Notes

You can request an automatic flush of the buffer by setting the third argument to `TRUE`.

The maximum size of the `buffer` parameter is 32767 bytes unless you specify a smaller size in `FOPEN`. If unspecified, Oracle supplies a default value of 1024. The sum of all sequential `PUT` calls cannot exceed 32767 without intermediate buffer flushes.

UTL_HTTP

The `UTL_HTTP` package makes Hypertext Transfer Protocol (HTTP) callouts from SQL and PL/SQL. You can use it to access data on the Internet over HTTP.

When the package fetches data from a Web site using HTTPS, it requires Oracle Wallet Manager which can be created by either Oracle Wallet Manager or the `orapki` utility. Non-HTTPS fetches do not require an Oracle wallet.

Note:

Oracle Wallet Manager (OWM) is deprecated with Oracle Database 21c. Please ensure your wallets are using the strongest protections available.

Instead of using Oracle Wallet Manager, Oracle recommends that you use the command line tools `orapki` and `mkstore`.

Oracle recommends that you do not use deprecated values in new applications. Support for deprecated features is for backward compatibility only.

268.1 UTL_HTTP Overview

With the `UTL_HTTP` package, you can write PL/SQL programs that communicate with Web (HTTP) servers. `UTL_HTTP` also contains a function that can be used in SQL queries.

The package supports HTTP over the Secured Socket Layer protocol (SSL), also known as HTTPS. It also supports SSL client authentication by sending the client-certificate in a wallet to authenticate with the remote Web server.

Other Internet-related data-access protocols (such as the File Transfer Protocol (FTP) or the Gopher protocol) are also supported using an HTTP proxy server that supports those protocols.

268.2 UTL_HTTP Security Model

This package is an invoker's rights package. The invoking user will need the `connect` privilege granted in the access control list assigned to the remote network host to which he wants to connect, as well as the `use-client-certificates` or the `use-passwords` privilege to authenticate himself with the remote Web server using the credentials stored in an Oracle wallet.

Note:

For more information about managing fine-grained access, see *Oracle Database Security Guide*

268.3 UTL_HTTP Constants

The `UTL_HTTP` package defines several constants to use when specifying parameter values.

These are shown in following tables.

- [Table 268-1](#)
- [Table 268-2](#)
- [Table 268-3](#)

Table 268-1 UTL_HTTP Constants - HTTP Versions

| Name | Type | Value | Description |
|-------------------------------|---------------------------|-------------------------|--|
| <code>HTTP_VERSION_1_0</code> | <code>VARCHAR2(10)</code> | <code>'HTTP/1.0'</code> | Denotes HTTP version 1.0 that can be used in the function <code>BEGIN_REQUEST</code> . |
| <code>HTTP_VERSION_1_1</code> | <code>VARCHAR2(10)</code> | <code>'HTTP/1.1'</code> | Denotes HTTP version 1.1 that can be used in the function <code>BEGIN_REQUEST</code> . |

Table 268-2 UTL_HTTP Constants - Default Ports

| Name | Type | Value | Description |
|--------------------|-------------|-------|--|
| DEFAULT_HTTP_PORT | PLS_INTEGER | 80 | The default TCP/IP port (80) at which a Web server or proxy server listens |
| DEFAULT_HTTPS_PORT | PLS_INTEGER | 443 | The default TCP/IP port (443) at which an HTTPS Web server listens |

Table 268-3 UTL_HTTP Constants - HTTP 1.1 Status Codes

| Name | Type | Value | Description |
|------------------------------------|-------------|-------|---|
| HTTP_CONTINUE | PLS_INTEGER | 100 | The client should continue with its request. This interim response is used to inform the client that the initial part of the request has been received and has not yet been rejected by the server. |
| HTTP_SWITCHING_PROTOCOLS | PLS_INTEGER | 101 | The server understands and is willing to comply with the client's request, through the Upgrade message header field, for a change in the application protocol being used on this connection. The server will switch protocols to those defined by the response's Upgrade header field immediately after the empty line which terminates the 101 response. |
| HTTP_OK | PLS_INTEGER | 200 | The request has succeeded. The information returned with the response is dependent on the method used in the request |
| HTTP_CREATED | PLS_INTEGER | 201 | The request has been fulfilled and resulted in a new resource being created. |
| HTTP_ACCEPTED | PLS_INTEGER | 202 | The request has been accepted for processing, but the processing has not been completed. The request might or might not eventually be acted upon, as it might be disallowed when processing actually takes place. |
| HTTP_NON_AUTHORITATIVE_INFORMATION | PLS_INTEGER | 203 | The returned metainformation in the entity-header is not the definitive set as available from the origin server, but is gathered from a local or a third-party copy. |
| HTTP_NO_CONTENT | PLS_INTEGER | 204 | The server has fulfilled the request but does not need to return an entity-body, and might want to return updated metainformation. |
| HTTP_RESET_CONTENT | PLS_INTEGER | 205 | The server has fulfilled the request and the user agent should reset the document view which caused the request to be sent. The response must not include an entity. |
| HTTP_PARTIAL_CONTENT | PLS_INTEGER | 206 | The server has fulfilled the partial GET request for the resource. |

Table 268-3 (Cont.) UTL_HTTP Constants - HTTP 1.1 Status Codes

| Name | Type | Value | Description |
|--------------------------|-------------|-------|--|
| HTTP_MULTIPLE_CHOICES | PLS_INTEGER | 300 | The requested resource corresponds to any one of a set of representations, each with its own specific location, and agent-driven negotiation information is being provided so that the user (or user agent) can select a preferred representation and redirect its request to that location. |
| HTTP_MOVED_PERMANENTLY | PLS_INTEGER | 301 | The requested resource has been assigned a new permanent URI and any future references to this resource should use one of the returned URIs. |
| HTTP_FOUND_CONSTANT | PLS_INTEGER | 302 | The requested resource resides temporarily under a different URI. |
| HTTP_SEE_OTHER | PLS_INTEGER | 303 | The response to the request can be found under a different URI and should be retrieved using a GET method on that resource. |
| HTTP_NOT_MODIFIED | PLS_INTEGER | 304 | If the client has performed a conditional GET request and access is allowed, but the document has not been modified, the server responds with this status code. |
| HTTP_USE_PROXY | PLS_INTEGER | 305 | The requested resource must be accessed through the proxy given by the Location field. The Location field gives the URI of the proxy. |
| HTTP_TEMPORARY_REDIRECT | PLS_INTEGER | 307 | The requested resource resides temporarily under a different URI. |
| HTTP_BAD_REQUEST | PLS_INTEGER | 400 | The request could not be understood by the server due to malformed syntax. |
| HTTP_UNAUTHORIZED | PLS_INTEGER | 401 | The request requires user authentication. The client may repeat the request with a suitable Authorization header field. If the request already included Authorization credentials, then the 401 response indicates that authorization has been refused for those credentials. |
| HTTP_PAYMENT_REQUIRED | PLS_INTEGER | 402 | This code is reserved for future use. |
| HTTP_FORBIDDEN | PLS_INTEGER | 403 | The server understood the request, but is refusing to fulfill it. |
| HTTP_NOT_FOUND | PLS_INTEGER | 404 | The server has not found anything matching the Request-URI. |
| HTTP_NOT_ACCEPTABLE | PLS_INTEGER | 406 | The resource identified by the request is only capable of generating response entities which have content characteristics not acceptable according to the accept headers sent in the request. |
| HTTP_PROXY_AUTH_REQUIRED | PLS_INTEGER | 407 | This code is similar to 401 (Unauthorized), but indicates that the client must first authenticate itself with the proxy. |

Table 268-3 (Cont.) UTL_HTTP Constants - HTTP 1.1 Status Codes

| Name | Type | Value | Description |
|--|-------------|-------|---|
| HTTP_REQUEST_TIMEOUT_OUT | PLS_INTEGER | 408 | The client did not produce a request within the time that the server was prepared to wait. |
| HTTP_CONFLICT | PLS_INTEGER | 409 | The request could not be completed due to a conflict with the current state of the resource. |
| HTTP_GONE | PLS_INTEGER | 410 | The requested resource is no longer available at the server and no forwarding address is known. |
| HTTP_LENGTH_REQUIRED | PLS_INTEGER | 411 | The server refuses to accept the request without a defined Content-Length. |
| HTTP_PRECONDITION_FAILED | PLS_INTEGER | 412 | The precondition given in one or more of the request-header fields evaluated to false when it was tested on the server. |
| HTTP_REQUEST_ENTITY_TOO_LARGE_CONSTANT | PLS_INTEGER | 413 | The server is refusing to process a request because the request entity is larger than the server is willing or able to process. |
| HTTP_REQUEST_URI_TOO_LARGE | PLS_INTEGER | 414 | The server is refusing to service the request because the Request-URI is longer than the server is willing to interpret. |
| HTTP_UNSUPPORTED_MEDIA_TYPE | PLS_INTEGER | 415 | The server is refusing to service the request because the entity of the request is in a format not supported by the requested resource for the requested method. |
| HTTP_REQ_RANGE_NOT_SATISFIABLE | PLS_INTEGER | 416 | A server returns a response with this status code if a request included a Range request-header field, and none of the range-specifier values in this field overlap the current extent of the selected resource, and the request did not include an If-Range request-header field. |
| HTTP_EXPECTATION_FAILED | PLS_INTEGER | 417 | The expectation given in an Expect request-header field could not be met by this server, or, if the server is a proxy, the server has unambiguous evidence that the request could not be met by the next-hop server. |
| HTTP_NOT_IMPLEMENTED | PLS_INTEGER | 501 | The server does not support the functionality required to fulfill the request. |
| HTTP_BAD_GATEWAY | PLS_INTEGER | 502 | The server, while acting as a gateway or proxy, received an invalid response from the upstream server it accessed in attempting to fulfill the request |
| HTTP_SERVICE_UNAVAILABLE | PLS_INTEGER | 503 | The server is currently unable to handle the request due to a temporary overloading or maintenance of the server. |

Table 268-3 (Cont.) UTL_HTTP Constants - HTTP 1.1 Status Codes

| Name | Type | Value | Description |
|----------------------------|-------------|-------|---|
| HTTP_GATEWAY_TIMEOUT_OUT | PLS_INTEGER | 504 | The server, while acting as a gateway or proxy, did not receive a timely response from the upstream server specified by the URI (for example, HTTP, FTP, LDAP) or some other auxiliary server (for example, DNS) it needed to access in attempting to complete the request. |
| HTTP_VERSION_NOT_SUPPORTED | PLS_INTEGER | 505 | The server does not support, or refuses to support, the HTTP protocol version that was used in the request message. |

268.4 UTL_HTTP Exceptions

Exceptions indicate that the UTL_HTTP package encountered issues.

The following table lists these exceptions. By default, UTL_HTTP raises the exception `request_failed` when a request fails to execute. If the package is set to raise a detailed exception by `set_detailed_excp_support`, the rest of the exceptions will be raised directly (except for the exception `end_of_body`, which will be raised by `READ_TEXT`, `READ_LINE`, and `READ_RAW` regardless of the setting).

Table 268-4 UTL_HTTP Exceptions

| Exception | Error Code | Reason | Where Raised |
|-------------------|------------|---|---|
| BAD_ARGUMENT | 29261 | The argument passed to the interface is bad | Any HTTP request or response interface when <code>detailed_exception</code> is enabled |
| BAD_URL | 29262 | The requested URL is badly formed | <code>BEGIN_REQUEST</code> , when <code>detailed_exception</code> is enabled |
| END_OF_BODY | 29266 | The end of HTTP response body is reached | <code>READ_RAW</code> , <code>READ_TEXT</code> , and <code>READ_LINE</code> , when <code>detailed_exception</code> is enabled |
| HEADER_NOT_FOUND | 29265 | The header is not found | <code>GET_HEADER</code> , <code>GET_HEADER_BY_NAME</code> , when <code>detailed_exception</code> is enabled |
| HTTP_CLIENT_ERROR | 29268 | From <code>GET_RESPONSE</code> , the response status code indicates that a client error has occurred (status code in 4xx range). Or from <code>begin_request</code> , the HTTP proxy returns a status code in the 4xx range when making an HTTPS request through the proxy. | <code>GET_RESPONSE</code> , <code>BEGIN_REQUEST</code> when <code>detailed_exception</code> is enabled |

Table 268-4 (Cont.) UTL_HTTP Exceptions

| Exception | Error Code | Reason | Where Raised |
|-----------------------------|------------|---|---|
| HTTP_SERVER_ERROR | 29269 | From GET_RESPONSE, the response status code indicates that a client error has occurred (status code in 5xx range). Or from begin_request, the HTTP proxy returns a status code in the 5xx range when making an HTTPS request through the proxy. | GET_RESPONSE, BEGIN_REQUEST when detailed_exception is enabled |
| NETWORK_ACCESS_DENIED | 24247 | Access to the remote network host or credentials in an Oracle wallet is denied | BEGIN_REQUEST and SET_AUTHENTICATION_FROM_WALLET when detailed_exception is enabled |
| ILLEGAL_CALL | 29267 | The call to UTL_HTTP is illegal at the current state of the HTTP request | SET_HEADER, SET_AUTHENTICATION, and SET_PERSISTENT_CONN_SUPPORT, when detailed_exception is enabled |
| PARTIAL_MULTIBYTE_EXCEPTION | 29275 | No complete character is read and a partial multibyte character is found at the end of the response body | READ_TEXT and READ_LINE, when detailed_exception is enabled |
| PROTOCOL_ERROR | 29263 | An HTTP protocol error occurs when communicating with the Web server | SET_HEADER, GET_RESPONSE, READ_RAW, READ_TEXT, and READ_LINE, when detailed_exception is enabled |
| REQUEST_FAILED | 29273 | The request fails to executes | Any HTTP request or response interface when detailed_exception is disabled |
| TOO_MANY_REQUESTS | 29270 | Too many requests or responses are open | BEGIN_REQUEST, when detailed_exception is enabled |
| TRANSFER_TIMEOUT | 29276 | No data is read and a read timeout occurred | READ_TEXT and READ_LINE, when detailed_exception is enabled |
| UNKNOWN_SCHEME | 29264 | The scheme of the requested URL is unknown | BEGIN_REQUEST and GET_RESPONSE, when detailed_exception is enabled |

 **Note:**

The `partial_multibyte_char` and `transfer_timeout` exceptions are duplicates of the same exceptions defined in `UTL_TCP`. They are defined in this package so that the use of this package does not require the knowledge of the `UTL_TCP`. As those exceptions are duplicates, an exception handle that catches the `partial_multibyte_char` and `transfer_timeout` exceptions in this package also catch the exceptions in the `UTL_TCP`.

For `REQUEST` and `REQUEST_PIECES`, the `request_failed` exception is raised when any exception occurs and `detailed_exception` is disabled.

268.5 UTL_HTTP Examples

These five examples demonstrate how to use `UTL_HTTP`.

- [General Usage](#)
- [Retrieving HTTP Response Headers](#)
- [Handling HTTP Authentication](#)
- [Retrieving and Restoring Cookies](#)
- [Making HTTP Request with Private Wallet and Cookie Table](#)

268.5.1 UTL_HTTP General Usage

This is an general example of `UTL_HTTP` usage.

```
SET SERVEROUTPUT ON SIZE 40000

DECLARE
    req    UTL_HTTP.REQ;
    resp   UTL_HTTP.RESP;
    value  VARCHAR2(1024);
BEGIN
    UTL_HTTP.SET_PROXY('proxy.my-company.com', 'corp.my-company.com');
    req := UTL_HTTP.BEGIN_REQUEST('http://www-hr.corp.my-company.com');
    UTL_HTTP.SET_HEADER(req, 'User-Agent', 'Mozilla/4.0');
    resp := UTL_HTTP.GET_RESPONSE(req);
    LOOP
        UTL_HTTP.READ_LINE(resp, value, TRUE);
        DBMS_OUTPUT.PUT_LINE(value);
    END LOOP;
    UTL_HTTP.END_RESPONSE(resp);
EXCEPTION
    WHEN UTL_HTTP.END_OF_BODY THEN
        UTL_HTTP.END_RESPONSE(resp);
END;
```

268.5.2 UTL_HTTP Retrieving HTTP Response Headers

This example shows how `UTL_HTTP` retrieves HTTP response headers.

```
SET SERVEROUTPUT ON SIZE 40000

DECLARE
    req    UTL_HTTP.REQ;
    resp   UTL_HTTP.RESP;
    name   VARCHAR2(256);
    value  VARCHAR2(1024);
BEGIN
    UTL_HTTP.SET_PROXY('proxy.my-company.com', 'corp.my-company.com');
    req := UTL_HTTP.BEGIN_REQUEST('http://www-hr.corp.my-company.com');
    UTL_HTTP.SET_HEADER(req, 'User-Agent', 'Mozilla/4.0');
    resp := UTL_HTTP.GET_RESPONSE(req);
    DBMS_OUTPUT.PUT_LINE('HTTP response status code: ' || resp.status_code);
```

```

DBMS_OUTPUT.PUT_LINE('HTTP response reason phrase: ' || resp.reason_phrase);
FOR i IN 1..UTL_HTTP.GET_HEADER_COUNT(resp) LOOP
    UTL_HTTP.GET_HEADER(resp, i, name, value);
    DBMS_OUTPUT.PUT_LINE(name || ': ' || value);
END LOOP;
UTL_HTTP.END_RESPONSE(resp);
END;
```

268.5.3 UTL_HTTP Handling HTTP Authentication

This code sample indicates how UTL_HTTP handles HTTP authentication.

```

SET serveroutput ON SIZE 40000

CREATE OR REPLACE PROCEDURE get_page (url      IN VARCHAR2,
                                     username IN VARCHAR2 DEFAULT NULL,
                                     password IN VARCHAR2 DEFAULT NULL,
                                     realm    IN VARCHAR2 DEFAULT NULL) AS

    req      UTL_HTTP.REQ;
    resp     UTL_HTTP.RESP;
    my_scheme VARCHAR2(256);
    my_realm VARCHAR2(256);
    name     VARCHAR2(256);
    value    VARCHAR2(256);
BEGIN
    -- Turn off checking of status code. We will check it by ourselves.
    UTL_HTTP.SET_RESPONSE_ERROR_CHECK(FALSE);
    req := UTL_HTTP.BEGIN_REQUEST(url);
    IF (username IS NOT NULL) THEN
        UTL_HTTP.SET_AUTHENTICATION(req, username, password); -- Use HTTP Basic Authen.
        Scheme
    END IF;
    resp := UTL_HTTP.GET_RESPONSE(req);
    IF (resp.status_code = UTL_HTTP.HTTP_UNAUTHORIZED) THEN
        UTL_HTTP.GET_AUTHENTICATION(resp, my_scheme, my_realm, FALSE);
        DBMS_OUTPUT.PUT_LINE('Web proxy server is protected. ');
        DBMS_OUTPUT.PUT('Please provide the required ' || my_scheme || ' authentication
username/password for realm ' || my_realm || '
for the proxy server. ');
        UTL_HTTP.END_RESPONSE(resp);
        RETURN;
    ELSIF (resp.status_code = UTL_HTTP.HTTP_PROXY_AUTH_REQUIRED) THEN
        UTL_HTTP.GET_AUTHENTICATION(resp, my_scheme, my_realm, TRUE);
        DBMS_OUTPUT.PUT_LINE('Web page ' || url || ' is protected. ');
        DBMS_OUTPUT.PUT('Please provide the required ' || my_scheme || ' authentication
username/password for realm ' || my_realm || '
for the Web page. ');
        UTL_HTTP.END_RESPONSE(resp);
        RETURN;
    END IF;
    FOR i IN 1..UTL_HTTP.GET_HEADER_COUNT(resp) LOOP
        UTL_HTTP.GET_HEADER(resp, i, name, value);
        DBMS_OUTPUT.PUT_LINE(name || ': ' || value);
    END LOOP;
    UTL_HTTP.END_RESPONSE(resp);
END;
```

268.5.4 UTL_HTTP Retrieving and Restoring Cookies

This example show how UTL_HTTP can be used to retrieve and restore cookies.

```
CREATE TABLE my_cookies (
  session_id INTEGER,
  name       VARCHAR2(256),
  value      VARCHAR2(1024),
  domain     VARCHAR2(256),
  expire     DATE,
  path       VARCHAR2(1024),
  secure     VARCHAR2(1),
  version    INTEGER);

CREATE SEQUENCE session_id;
SET SERVEROUTPUT ON SIZE 40000

REM Retrieve cookies from UTL_HTTP
CREATE OR REPLACE FUNCTION save_cookies RETURN PLS_INTEGER AS
  cookies          UTL_HTTP.COOKIE_TABLE;
  my_session_id   PLS_INTEGER;
  secure          VARCHAR2(1);
BEGIN
  /* assume that some cookies have been set in previous HTTP requests. */
  UTL_HTTP.GET_COOKIES(cookies);
  SELECT session_id.nextval INTO my_session_id FROM DUAL;
  FOR i in 1..cookies.count LOOP
    IF (cookies(i).secure) THEN
      secure := 'Y';
    ELSE
      secure := 'N';
    END IF;
    INSERT INTO my_cookies
    VALUES (my_session_id, cookies(i).name, cookies(i).value,
            cookies(i).domain,
            cookies(i).expire, cookies(i).path, secure, cookies(i).version);
  END LOOP;
  RETURN my_session_id;
END;
/

REM Retrieve cookies from UTL_HTTP
CREATE OR REPLACE PROCEDURE restore_cookies (this_session_id IN PLS_INTEGER)
AS
  cookies          UTL_HTTP.COOKIE_TABLE;
  cookie           UTL_HTTP.COOKIE;
  i                PLS_INTEGER := 0;
  CURSOR c (c_session_id PLS_INTEGER) IS
    SELECT * FROM my_cookies WHERE session_id = c_session_id;
BEGIN
  FOR r IN c(this_session_id) LOOP
    i := i + 1;
    cookie.name      := r.name;
    cookie.value     := r.value;
    cookie.domain    := r.domain;
    cookie.expire    := r.expire;
    cookie.path      := r.path;
    IF (r.secure = 'Y') THEN
      cookie.secure := TRUE;
    END IF;
  END LOOP;
END;
```

```

ELSE
    cookie.secure := FALSE;
END IF;
cookie.version := r.version;
cookies(i) := cookie;
END LOOP;
UTL_HTTP.CLEAR_COOKIES;
UTL_HTTP.ADD_COOKIES(cookies);
END;
/

```

268.5.5 UTL_HTTP Making HTTP Request with Private Wallet and Cookie Table

This example shows how UTL_HTTP creates a request context with a wallet and cookie table, then makes an HTTP Request using that wallet and cookie table.

```

SET SERVEROUTPUT ON SIZE 40000

CREATE OR REPLACE PROCEDURE DISPLAY_PAGE(url IN VARCHAR2) AS
    request_context UTL_HTTP.REQUEST_CONTEXT_KEY;
    req             UTL_HTTP.REQ;
    resp           UTL_HTTP.RESP;
    data           VARCHAR2(1024);

BEGIN

    -- Create a request context with its wallet and cookie table
    request_context := UTL_HTTP.CREATE_REQUEST_CONTEXT(
        wallet_path      => 'file:/oracle/wallets/test/wallet',
        wallet_password  => '*****',
        enable_cookies   => TRUE,
        max_cookies      => 300,
        max_cookies_per_site => 20);

    -- Make a HTTP request using the private wallet and cookie
    -- table in the request context
    req := UTL_HTTP.BEGIN_REQUEST(
        url              => url,
        request_context => request_context);
    resp := UTL_HTTP.GET_RESPONSE(req);

    BEGIN
        LOOP
            UTL_HTTP.READ_TEXT(resp, data);
            DBMS_OUTPUT.PUT(data);
        END LOOP;
    EXCEPTION
        WHEN UTL_HTTP.END_OF_BODY THEN
            UTL_HTTP.END_RESPONSE(resp);
    END;

    -- Destroy the request context
    UTL_HTTP.DESTROY_REQUEST_CONTEXT(request_context);

END;

BEGIN
    DISPLAY_PAGE('https://www.example.com/');

```

```
END;
/
```

268.5.6 UTL_HTTP Using a Proxy Server

This example shows using a proxy server for an Oracle Database connection.

The `UTL_HTTP.REQUEST` procedure uses the proxy server host name and the port number to access the HTTPS URL from within the Oracle Database.

```
SELECT UTL_HTTP.REQUEST('<URL>',
'<proxy_hostname>:<proxy_port_number>', '<wallet_directory>',
'<wallet_password>') FROM DUAL;
```

Note:

By default, the `UTL_HTTP.REQUEST` procedure enables you to omit or set the "proxy" argument as `NULL`.

268.6 UTL_HTTP Data Structures

Data structures are used to represent requests, responses, cookies, connections, and request context.

- [REQ Type](#)
- [RESP Type](#)
- [COOKIE and COOKIE_TABLE Types](#)
- [CONNECTION Type](#)
- [REQUEST_CONTEXT_KEY Type](#)

268.6.1 REQ Type

Use this PL/SQL record type to represent an HTTP request.

Syntax

```
TYPE req IS RECORD (
    url          VARCHAR2(32767),
    method      VARCHAR2(64),
    http_version VARCHAR2(64));
```

Parameters

Table 268-5 REQ Type Parameters

| Parameter | Description |
|------------------|---|
| <code>url</code> | The URL of the HTTP request. It is set after the request is created by <code>BEGIN_REQUEST</code> . |

Table 268-5 (Cont.) REQ Type Parameters

| Parameter | Description |
|---------------------------|--|
| <code>method</code> | The method to be performed on the resource identified by the URL. It is set after the request is created by <code>BEGIN_REQUEST</code> . |
| <code>http_version</code> | The HTTP protocol version used to send the request. It is set after the request is created by <code>BEGIN_REQUEST</code> . |

Usage Notes

The information returned in `REQ` from the interface `begin_request` is for read-only. Changing the field values in the record has no effect on the request.

There are other fields in `REQ` record type whose names begin with the prefix `private_`. The fields are private and are intended for use by implementation of the `UTL_HTTP` package. You should not modify the fields.

268.6.2 REQUEST_CONTEXT_KEY Type

This type is used to represent the key to a request context.

A request context is a context that holds a private wallet and cookie table to make a HTTP request. This private wallet and cookie table, unlike the session-wide ones maintained in the package, will not be shared with other HTTP requests within the database session.

Syntax

```
SUBTYPE request_context_key IS PLS_INTEGER;
```

Usage Notes

To provide enhanced security, `UTL_HTTP` allows PL/SQL programs to create request contexts. A request context is a private context that holds a wallet and a cookie table that will not be shared with other programs in the same database session when making HTTP requests and receiving HTTP responses. PL/SQL programs should use request contexts when they need to use wallets or cookies that contain sensitive information such as authentication credentials.

268.6.3 RESP Type

This PL/SQL record type is used to represent an HTTP response.

Syntax

```
TYPE resp IS RECORD (  
    status_code    PLS_INTEGER,  
    reason_phrase  VARCHAR2(256),  
    http_version   VARCHAR2(64));
```

Parameters

Table 268-6 RESP Type Parameters

| Parameter | Description |
|---------------|--|
| status_code | The status code returned by the Web server. It is a 3-digit integer that indicates the results of the HTTP request as handled by the Web server. It is set after the response is processed by GET_RESPONSE. |
| reason_phrase | The short textual message returned by the Web server that describe the status code. It gives a brief description of the results of the HTTP request as handled by the Web server. It is set after the response is processed by GET_RESPONSE. |
| http_version | The HTTP protocol version used in the HTTP response. It is set after the response is processed by GET_RESPONSE. |

Usage Notes

The information returned in `RESP` from the interface `GET_RESPONSE` is read-only. There are other fields in the `RESP` record type whose names begin with the prefix `private_`. The fields are private and are intended for use by implementation of the `UTL_HTTP` package. You should not modify the fields.

268.6.4 COOKIE and COOKIE_TABLE Types

The `COOKIE` type is the PL/SQL record type that represents an HTTP cookie. The `COOKIE_TABLE` type is a PL/SQL index-by-table type that represents a collection of HTTP cookies.

Syntax

```
TYPE cookie IS RECORD (
    name  VARCHAR2(256),
    value VARCHAR2(1024),
    domain VARCHAR2(256),
    expire TIMESTAMP WITH TIME ZONE,
    path  VARCHAR2(1024),
    secure BOOLEAN,
    version PLS_INTEGER,
    comment VARCHAR2(1024));

TYPE cookie_table IS TABLE OF cookie INDEX BY binary_integer;
```

Fields of COOKIE Record Type

[Table 268-7](#) shows the fields for the `COOKIE` and `COOKIE_TABLE` record types.

Table 268-7 Fields of COOKIE and COOKIE_TABLE Type

| Field | Description |
|-------|-----------------------------|
| name | The name of the HTTP cookie |
| value | The value of the cookie |

Table 268-7 (Cont.) Fields of COOKIE and COOKIE_TABLE Type

| Field | Description |
|---------|---|
| domain | The domain for which the cookie is valid |
| expire | The time by which the cookie will expire |
| path | The subset of URLs to which the cookie applies |
| secure | Should the cookie be returned to the Web server using secured means only. |
| version | The version of the HTTP cookie specification the cookie conforms. This field is <code>NULL</code> for Netscape cookies. |
| comment | The comment that describes the intended use of the cookie. This field is <code>NULL</code> for Netscape cookies. |

Usage Notes

PL/SQL programs do not usually examine or change the cookie information stored in the `UTL_HTTP` package. The cookies are maintained by the package transparently. They are maintained inside the `UTL_HTTP` package, and they last for the duration of the database session only. PL/SQL applications that require cookies to be maintained beyond the lifetime of a database session can read the cookies using `GET_COOKIES`, store them persistently in a database table, and re-store the cookies back in the package using `ADD_COOKIES` in the next database session. All the fields in the `cookie` record, except for the `comment` field, must be stored. Do not alter the cookie information, which can result in an application error in the Web server or compromise the security of the PL/SQL and the Web server applications. See "[Retrieving and Restoring Cookies](#)".

268.6.5 CONNECTION Type

Use the PL/SQL record type to represent the remote hosts and TCP/IP ports of a network connection that is kept persistent after an HTTP request is completed, according to the HTTP 1.1 protocol specification. The persistent network connection may be reused by a subsequent HTTP request to the same host and port. The subsequent HTTP request may be completed faster because the network connection latency is avoided. `connection_table` is a PL/SQL table of `connection`.

For a direct HTTP persistent connection to a Web server, the `host` and `port` fields contain the host name and TCP/IP port number of the Web server. The `proxy_host` and `proxy_port` fields are not set. For an HTTP persistent connection that was previously used to connect to a Web server using a proxy, the `proxy_host` and `proxy_port` fields contain the host name and TCP/IP port number of the proxy server. The `host` and `port` fields are not set, which indicates that the persistent connection, while connected to a proxy server, is not bound to any particular target Web server. An HTTP persistent connection to a proxy server can be used to access any target Web server that is using a proxy.

The `SSL` field indicates if Secured Socket Layer (SSL) is being used in an HTTP persistent connection. An HTTPS request is an HTTP request made over SSL. For an HTTPS (SSL) persistent connection connected using a proxy, the `host` and `port` fields contain the host name and TCP/IP port number of the target HTTPS Web server and the fields will always be set. An HTTPS persistent connection to an HTTPS Web server using a proxy server can only be reused to make another request to the same target Web server.

Syntax

```
TYPE connection IS RECORD (  
    host VARCHAR2(256),  
    port PLS_INTEGER,  
    proxy_host VARCHAR2(256),  
    proxy_port PLS_INTEGER,  
    ssl BOOLEAN);
```

```
TYPE connection_table IS TABLE OF connection INDEX BY BINARY_INTEGER;
```

268.7 UTL_HTTP Operations

These topics provide information about how UTL_HTTP makes HTTP requests from SQL and PL/SQL.

- [Operational Flow](#)
- [Simple HTTP Fetches](#)
- [HTTP Requests](#)
- [HTTP Responses](#)
- [HTTP Persistent Connections](#)
- [Error Conditions](#)
- [Session Settings](#)
- [Request Context](#)
- [External Password Store](#)

268.7.1 UTL_HTTP Operational Flow

The UTL_HTTP package provides access to the HTTP protocol.

The interfaces must be called in the order shown in the following illustration, or an exception will be raised.

Figure 268-1 Flow of the Core UTL_HTTP Package

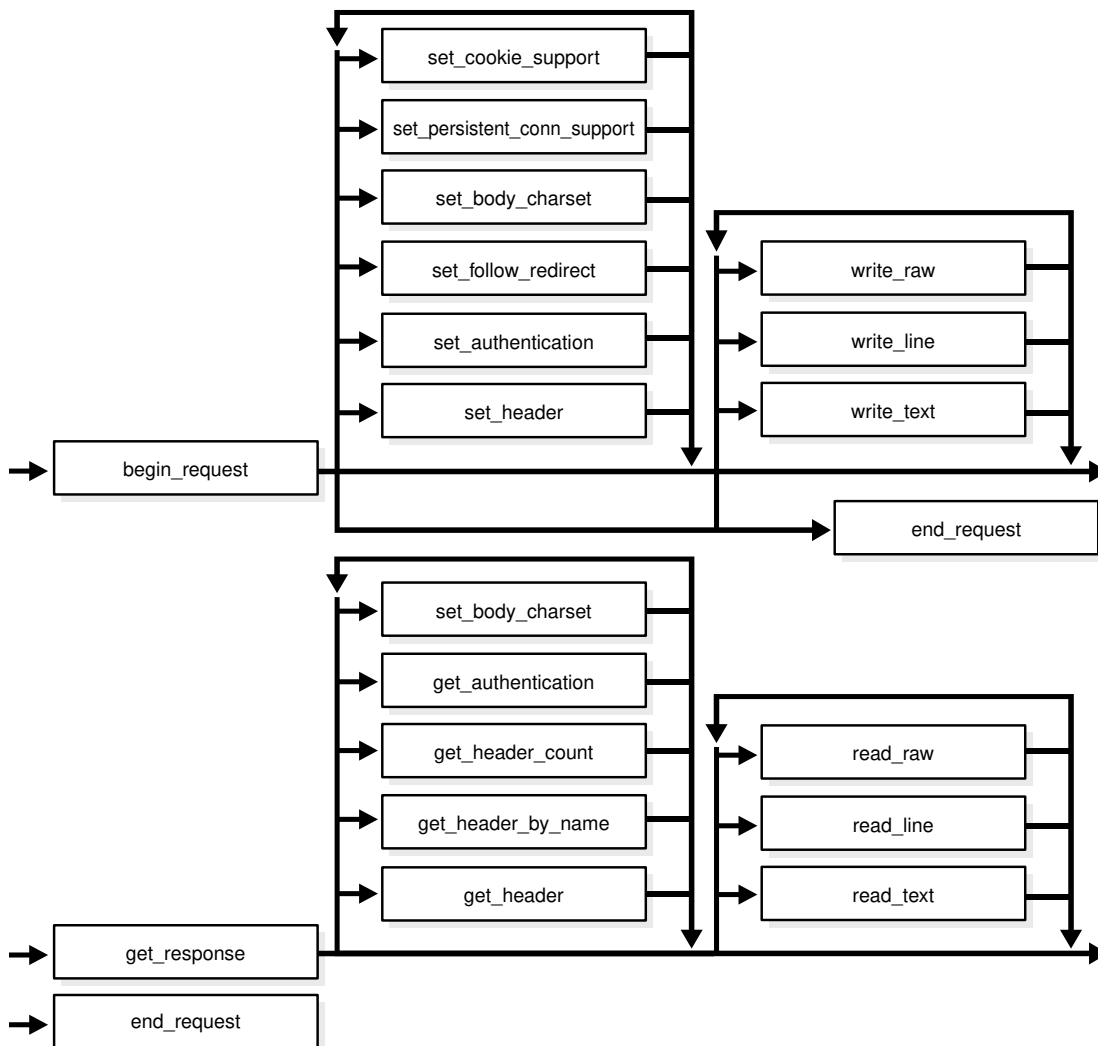

illustration: arpls006
release: 9
caption: The flow of the core UTL_HTTP Package API
date: 9/5/01
platform: pc

The following can be called at any time:

- **Non-protocol interfaces that manipulate cookies**
 - GET_COOKIE_COUNT
 - GET_COOKIES
 - ADD_COOKIES
 - CLEAR_COOKIES
- **Persistent connections**
 - GET_PERSISTENT_CONN_COUNT
 - GET_PERSISTENT_CONNS
 - CLOSE_PERSISTENT_CONN
 - CLOSE_PERSISTENT_CONNS
- **Interfaces that manipulate attributes and configurations of the UTL_HTTP package in the current session**
 - SET_PROXY
 - GET_PROXY
 - SET_COOKIE_SUPPORT
 - GET_COOKIE_SUPPORT
 - SET_FOLLOW_REDIRECT
 - GET_FOLLOW_REDIRECT
 - SET_BODY_CHARSET
 - GET_BODY_CHARSET
 - SET_PERSISTENT_CONN_SUPPORT
 - GET_PERSISTENT_CONN_SUPPORT
 - SET_DETAILED_EXCP_SUPPORT
 - GET_DETAILED_EXCP_SUPPORT
 - SET_WALLET
 - SET_TRANSFER_TIMEOUT
 - GET_TRANSFER_TIMEOUT
- **Interfaces that retrieve the last detailed exception code and message UTL_HTTP package in the current session**
 - GET_DETAILED_SQLCODE
 - GET_DETAILED_SQLERRM

 **Note:**

Some of the request and response interfaces bear the same name as the interface that manipulates the attributes and configurations of the package in the current session. They are overloaded versions of the interface that manipulate a request or a response.

268.7.2 UTL_HTTP Simple HTTP Fetches

`REQUEST` and `REQUEST_PIECES` take a string uniform resource locator (URL), contact that site, and return the data (typically HTML) obtained from that site.

You should not expect `REQUEST` or `REQUEST_PIECES` to succeed in contacting a URL unless you can contact that URL by using a browser on the same machine (and with the same privileges, environment variables, and so on.)

If `REQUEST` or `REQUEST_PIECES` fails (for example, if it raises an exception, or if it returns an HTML-formatted error message, but you believe that the URL argument is correct), then try contacting that same URL with a browser to verify network availability from your machine. You may have a proxy server set in your browser that needs to be set with each `REQUEST` or `REQUEST_PIECES` call using the optional `proxy` parameter.

 **Note:**

UTL_HTTP can also use environment variables to specify its proxy behavior. For example, on UNIX, setting the environment variable `http_proxy` to a URL uses that service as the proxy server for HTTP requests. Setting the environment variable `no_proxy` to a domain name does not use the HTTP proxy server for URLs in that domain. When the UTL_HTTP package is executed in the Oracle database server, the environment variables are the ones that are set when the database instance is started.

 **See Also:**

[Simple HTTP Fetches in a Single Call Subprograms](#)

268.7.3 UTL_HTTP HTTP Requests

The HTTP Requests group of subprograms begin an HTTP request, manipulate attributes, and send the request information to the Web server. When a request is created, it inherits the default settings of the HTTP cookie support, follow-redirect, body character set, persistent-

connection support, and transfer timeout of the current session. The settings can be changed by calling the request interface.

**See Also:**

[HTTP Requests Subprograms](#)

268.7.4 UTL_HTTP HTTP Responses

The HTTP Responses group of subprograms manipulate an HTTP response obtained from `GET_RESPONSE` and receive response information from the Web server.

When a response is created for a request, it inherits settings of the HTTP cookie support, follow-redirect, body character set, persistent-connection support, and transfer timeout from the request. Only the body character set can be changed by calling the response interface.

**See Also:**

[HTTP Responses Subprograms](#)

268.7.5 UTL_HTTP HTTP Cookies

The `UTL_HTTP` package provides subprograms to manipulate HTTP cookies.

**See Also:**

[HTTP Cookies Subprograms](#)

268.7.6 UTL_HTTP HTTP Persistent Connections

The `UTL_HTTP` package provides subprograms to manipulate persistent connections.

**See Also:**

[HTTP Persistent Connections Subprograms](#)

268.7.7 UTL_HTTP Error Conditions

The `UTL_HTTP` package provides subprograms to retrieve error information.

See Also:

[Error Conditions Subprograms](#)

268.7.8 UTL_HTTP Session Settings

Session settings manipulate the configuration and default behavior of `UTL_HTTP` when HTTP requests are executed within a database user session.

When a request is created, it inherits the default settings of the HTTP cookie support, follow-redirect, body character set, persistent-connection support, and transfer timeout of the current session. Those settings can be changed later by calling the request interface. When a response is created for a request, it inherits those settings from the request. Only the body character set can be changed later by calling the response interface.

See Also:

[Session Settings Subprograms](#)

268.7.9 UTL_HTTP Request Context

The `UTL_HTTP` package maintains a common wallet and cookie table within the database session that all HTTP requests and responses share. This makes it easy for users to share the wallet or to maintain application state in the cookies within the session. However, if an application stores private information in the wallet or in the cookies that it does not want to share with other applications in the same database session, it may define a request context to hold its own wallet and cookie table and use this request context to make HTTP requests.

See Also:

[HTTP Requests Subprograms](#)

268.7.10 UTL_HTTP External Password Store

The `UTL_HTTP` package allows HTTP password credentials to be stored in an Oracle wallet's external password store. The external password store provides an easy but secure storage

for passwords and frees the application developers from the need to maintain their own storage.

[SET_AUTHENTICATION_FROM_WALLET Procedure](#)

268.8 UTL_HTTP Subprogram Groups

This section describes the `UTL_HTTP` subprograms. They are grouped by function.

- [Simple HTTP Fetches in a Single Call Subprograms](#)
- [Session Settings Subprograms](#)
- [HTTP Requests Subprograms](#)
- [HTTP Request Contexts Subprograms](#)
- [HTTP Responses Subprograms](#)
- [HTTP Cookies Subprograms](#)
- [HTTP Persistent Connections Subprograms](#)
- [Error Conditions Subprograms](#)

268.8.1 UTL_HTTP Simple HTTP Fetches in a Single Call Subprograms

`REQUEST` and `REQUEST_PIECES` take a string uniform resource locator (URL), contact that site, and return the data (typically HTML) obtained from that site.

Table 268-8 UTL_HTTP Subprograms—Simple HTTP Fetches in a Single Call

| Subprogram | Description |
|---|---|
| REQUEST Function | Returns up to the first 2000 bytes of the data retrieved from the given URL. This function can be used directly in SQL queries. |
| REQUEST_PIECES Function | Returns a PL/SQL table of 2000-byte pieces of the data retrieved from the given URL. |

268.8.2 UTL_HTTP Session Settings Subprograms

This table lists and briefly describes the `UTL_HTTP` Session Settings Subprograms.

Table 268-9 UTL_HTTP Subprograms—Session Settings

| Subprogram | Description |
|--|---|
| GET_BODY_CHARSET Procedure | Retrieves the default character set of the body of all future HTTP requests |
| GET_COOKIE_SUPPORT Procedure | Retrieves the current cookie support settings |

Table 268-9 (Cont.) UTL_HTTP Subprograms—Session Settings

| Subprogram | Description |
|---|--|
| GET_DETAILED_EXCP_SUPPORT Procedure | Checks if the UTL_HTTP package will raise a detailed exception or not |
| GET_FOLLOW_REDIRECT Procedure | Retrieves the follow-redirect setting in the current session |
| GET_PERSISTENT_CONN_SUPPORT Procedure | Checks if the persistent connection support is enabled and gets the maximum number of persistent connections in the current session |
| GET_PROXY Procedure | Retrieves the current proxy settings |
| GET_RESPONSE_ERROR_CHECK Procedure | Checks if the response error check is set or not |
| GET_TRANSFER_TIMEOUT Procedure | Retrieves the current network transfer timeout value |
| SET_TRANSFER_TIMEOUT Procedure | Sets the default character set of the body of all future HTTP requests when the media type is <code>text</code> and the character set is not specified in the <code>Content-Type</code> header |
| SET_COOKIE_SUPPORT Procedures | Sets whether or not future HTTP requests will support HTTP cookies; sets the maximum number of cookies maintained in the current database user session |
| SET_DETAILED_EXCP_SUPPORT Procedure | Sets the UTL_HTTP package to raise a detailed exception |
| SET_FOLLOW_REDIRECT Procedures | Sets the maximum number of times UTL_HTTP follows the HTTP redirect instruction in the HTTP responses to future requests in the <code>GET_RESPONSE</code> function |
| SET_PERSISTENT_CONN_SUPPORT Procedure | Sets whether or not future HTTP requests will support the HTTP 1.1 persistent connection; sets the maximum number of persistent connections maintained in the current database user session |
| SET_PROXY Procedure | Sets the proxy to be used for requests of HTTP or other protocols |
| SET_RESPONSE_ERROR_CHECK Procedure | Sets whether or not <code>GET_RESPONSE</code> raises an exception when the Web server returns a status code that indicates an error—a status code in the 4xx or 5xx ranges |
| SET_TRANSFER_TIMEOUT Procedure | Sets the timeout value for UTL_HTTP to read the HTTP response from the Web server or proxy server |
| SET_WALLET Procedure | Sets the Oracle Wallet used for all HTTP requests over Secured Socket Layer (SSL), that is, HTTPS |

268.8.3 UTL_HTTP HTTP Requests Subprograms

This table lists and briefly describes the UTL_HTTP HTTP Requests.

Table 268-10 UTL_HTTP Subprograms—HTTP Requests

| Subprogram | Description |
|--|--|
| BEGIN_REQUEST Function | Begins a new HTTP request. UTL_HTTP establishes the network connection to the target Web server or the proxy server and sends the HTTP request line. |
| SET_HEADER Procedure | Sets an HTTP request header. The request header is sent to the Web server as soon as it is set. |

Table 268-10 (Cont.) UTL_HTTP Subprograms—HTTP Requests

| Subprogram | Description |
|--|---|
| SET_AUTHENTICATION Procedure | Sets HTTP authentication information in the HTTP request header. The Web server needs this information to authorize the request. |
| SET_AUTHENTICATION_FROM_WALLET Procedure | Sets the HTTP authentication information in the HTTP request header needed for the request to be authorized by the Web server using the username and password credential stored in the Oracle wallet. |
| SET_BODY_CHARSET Procedures | Sets the character set of the request body when the media type is text but the character set is not specified in the Content-Type header |
| SET_COOKIE_SUPPORT Procedures | Enables or disables support for the HTTP cookies in the request |
| SET_FOLLOW_REDIRECT Procedures | Sets the maximum number of times UTL_HTTP follows the HTTP redirect instruction in the HTTP response to this request in the GET_RESPONSE Function |
| SET_PERSISTENT_CONN_SUPPORT Procedure | Enables or disables support for the HTTP 1.1 persistent-connection in the request |
| SET_PROXY Procedure | Writes a text line in the HTTP request body and ends the line with new-line characters (CRLF as defined in UTL_TCP) |
| WRITE_RAW Procedure | Writes some binary data in the HTTP request body |
| WRITE_TEXT Procedure | Writes some text data in the HTTP request body |

268.8.4 UTL_HTTP HTTP Request Contexts Subprograms

UTL_HTTP HTTP Request Contexts subprograms create or destroy a request context.

The following table lists and briefly describes the UTL_HTTP HTTP Request Contexts.

Table 268-11 UTL_HTTP Subprograms—HTTP Request Contexts

| Subprogram | Description |
|---|---|
| CREATE_REQUEST_CONTEXT Function | Creates a request context in UTL_HTTP for a wallet and a cookie table |
| DESTROY_REQUEST_CONTEXT Procedure | Destroys a request context in UTL_HTTP |

268.8.5 UTL_HTTP HTTP Responses Subprograms

This table lists and briefly describes the HTTP Responses Subprograms of UTL_HTTP.

Table 268-12 UTL_HTTP Subprograms—HTTP Responses

| Subprogram | Description |
|--|--|
| END_RESPONSE Procedure | Ends the HTTP response. It completes the HTTP request and response. |
| GET_AUTHENTICATION Procedure | Retrieves the HTTP authentication information needed for the request to be accepted by the Web server as indicated in the HTTP response header |

Table 268-12 (Cont.) UTL_HTTP Subprograms—HTTP Responses

| Subprogram | Description |
|--|--|
| GET_HEADER Procedure | Returns the n th HTTP response header name and value returned in the response |
| GET_HEADER_BY_NAME Procedure | Returns the HTTP response header value returned in the response given the name of the header |
| GET_HEADER_COUNT Function | Returns the number of HTTP response headers returned in the response |
| GET_RESPONSE Function | Reads the HTTP response. When the function returns, the status line and the HTTP response headers have been read and processed. |
| READ_LINE Procedure | Reads the HTTP response body in text form until the end of line is reached and returns the output in the caller-supplied buffer |
| READ_RAW Procedure | Reads the HTTP response body in binary form and returns the output in the caller-supplied buffer |
| READ_TEXT Procedure | Reads the HTTP response body in text form and returns the output in the caller-supplied buffer |
| SET_BODY_CHARSET Procedures | Sets the character set of the response body when the media type is "text" but the character set is not specified in the <code>Content-Type</code> header |

268.8.6 UTL_HTTP HTTP Cookies Subprograms

The HTTP cookies subprograms manages cookies in the `UTL_HTTP` package.

The following table lists and briefly describes the HTTP cookies subprograms of `UTL_HTTP`.

Table 268-13 UTL_HTTP Subprograms—HTTP Cookies

| Subprogram | Description |
|---|---|
| ADD_COOKIES Procedure | Add the cookies either to a request context or to the <code>UTL_HTTP</code> package's session state |
| CLEAR_COOKIES Procedure | Clears all the cookies maintained either in a request context or in the <code>UTL_HTTP</code> package's session state |
| GET_COOKIE_COUNT Function | Returns the number of cookies maintained either in a request context or in the <code>UTL_HTTP</code> package's session states |
| GET_COOKIES Function | Returns all the cookies maintained either in a request context or in the <code>UTL_HTTP</code> package's session state. |

268.8.7 UTL_HTTP HTTP Persistent Connections Subprograms

This table lists and briefly describes the `UTL_HTTP` HTTP Persistent Connections subprograms.

Table 268-14 UTL_HTTP Subprograms—HTTP Persistent Connections

| Subprogram | Description |
|--|--|
| CLOSE_PERSISTENT_CONN Procedure | Closes an HTTP persistent connection maintained by the UTL_HTTP package in the current database session |
| CLOSE_PERSISTENT_CONNS Procedure | Closes a group of HTTP persistent connections maintained by the UTL_HTTP package in the current database session |
| GET_PERSISTENT_CONN_COUNT Function | Returns the number of network connections currently kept persistent by the UTL_HTTP package to the Web servers |
| GET_PERSISTENT_CONNS Procedure | Returns all the network connections currently kept persistent by the UTL_HTTP package to the Web servers |

268.8.8 UTL_HTTP Error Conditions Subprograms

This table lists and briefly describes error conditions subprograms of UTL_HTTP .

Table 268-15 UTL_HTTP Subprograms—Error Conditions

| Subprogram | Description |
|---|---|
| GET_DETAILED_SQLCODE Function | Retrieves the detailed SQLCODE of the last exception raised |
| GET_DETAILED_SQLERRM Function | Retrieves the detailed SQLERRM of the last exception raised |

268.9 Summary of UTL_HTTP Subprograms

This table lists the UTL_HTTP subprograms and briefly describes them.

Table 268-16 UTL_HTTP Package Subprograms

| Subprogram | Description | Group |
|---|---|---|
| ADD_COOKIES Procedure | Add the cookies either to a request context or to the UTL_HTTP package's session state | HTTP Cookies Subprograms |
| BEGIN_REQUEST Function | Begins a new HTTP request. UTL_HTTP establishes the network connection to the target Web server or the proxy server and sends the HTTP request line | HTTP Requests Subprograms |
| CLEAR_COOKIES Procedure | Clears all the cookies maintained either in a request context or in the UTL_HTTP package's session state | HTTP Cookies Subprograms |
| CLOSE_PERSISTENT_CONN Procedure | Closes an HTTP persistent connection maintained by the UTL_HTTP package in the current database session | HTTP Persistent Connections Subprograms |

Table 268-16 (Cont.) UTL_HTTP Package Subprograms

| Subprogram | Description | Group |
|--|--|---|
| CLOSE_PERSISTENT_CONNECTIONS Procedure | Closes a group of HTTP persistent connections maintained by the UTL_HTTP package in the current database session | HTTP Persistent Connections Subprograms |
| CREATE_REQUEST_CONTEXT Function | Creates a request context in UTL_HTTP for a wallet and a cookie table | HTTP Requests Subprograms |
| DESTROY_REQUEST_CONTEXT Procedure | Destroys a request context in UTL_HTTP for a wallet and a cookie table | HTTP Requests Subprograms |
| END_REQUEST Procedure | Ends the HTTP request | HTTP Requests Subprograms |
| END_RESPONSE Procedure | Ends the HTTP response. It completes the HTTP request and response | HTTP Responses Subprograms |
| GET_AUTHENTICATION Procedure | Retrieves the HTTP authentication information needed for the request to be accepted by the Web server as indicated in the HTTP response header | HTTP Responses Subprograms |
| GET_BODY_CHARSET Procedure | Retrieves the default character set of the body of all future HTTP requests | Session Settings Subprograms |
| GET_COOKIE_COUNT Function | Returns the number of cookies currently maintained by the UTL_HTTP package set by all Web servers | HTTP Cookies Subprograms |
| GET_COOKIE_SUPPORT Procedure | Retrieves the current cookie support settings | Session Settings Subprograms |
| GET_COOKIES Function | Returns all the cookies currently maintained by the UTL_HTTP package set by all Web servers | HTTP Cookies Subprograms |
| GET_DETAILED_EXCP_SUPPORT Procedure | Checks if the UTL_HTTP package will raise a detailed exception or not | Session Settings Subprograms |
| GET_DETAILED_SQLCODE Function | Retrieves the detailed SQLCODE of the last exception raised | Error Conditions Subprograms |
| GET_DETAILED_SQLERRM Function | Retrieves the detailed SQLERRM of the last exception raised | Error Conditions Subprograms |
| GET_FOLLOW_REDIRECT Procedure | Retrieves the follow-redirect setting in the current session | Session Settings Subprograms |
| GET_HEADER Procedure | Returns the n th HTTP response header name and value returned in the response | HTTP Responses Subprograms |

Table 268-16 (Cont.) UTL_HTTP Package Subprograms

| Subprogram | Description | Group |
|---|---|---|
| GET_HEADER_BY_NAME Procedure | Returns the HTTP response header value returned in the response given the name of the header | HTTP Responses Subprograms |
| GET_HEADER_COUNT Function | Returns the number of HTTP response headers returned in the response | HTTP Responses and HTTP Responses Subprograms |
| GET_PERSISTENT_CONNECTION_COUNT Function | Returns the number of network connections currently kept persistent by the UTL_HTTP package to the Web servers | HTTP Persistent Connections Subprograms |
| GET_HEADER_COUNT Function | Sees whether or not future HTTP requests will support the HTTP 1.1 persistent connection; sets the maximum number of persistent connections maintained in the current database user session | Session Settings Subprograms |
| GET_PERSISTENT_CONNECTION_SUPPORT Procedure | Checks if the persistent connection support is enabled and gets the maximum number of persistent connections in the current session (see Session Settings Subprograms) | HTTP Persistent Connections Subprograms |
| GET_PERSISTENT_CONNS Procedure | Returns all the network connections currently kept persistent by the UTL_HTTP package to the Web servers | HTTP Persistent Connections Subprograms |
| GET_PROXY Procedure | Retrieves the current proxy settings | Session Settings Subprograms |
| GET_RESPONSE Function | Reads the HTTP response. When the function returns, the status line and the HTTP response headers have been read and processed | HTTP Responses Subprograms |
| GET_RESPONSE_ERROR_CHECK Procedure | Checks if the response error check is set or no | Session Settings Subprograms |
| GET_TRANSFER_TIMEOUT Procedure | Retrieves the current network transfer timeout value | Session Settings Subprograms |
| READ_LINE Procedure | Reads the HTTP response body in text form until the end of line is reached and returns the output in the caller-supplied buffer | HTTP Responses Subprograms |
| READ_RAW Procedure | Reads the HTTP response body in binary form and returns the output in the caller-supplied buffer | HTTP Responses Subprograms |

Table 268-16 (Cont.) UTL_HTTP Package Subprograms

| Subprogram | Description | Group |
|--|---|---|
| READ_TEXT Procedure | Reads the HTTP response body in text form and returns the output in the caller-supplied buffer | HTTP Responses Subprograms |
| REQUEST Function | Returns up to the first 2000 bytes of the data retrieved from the given URL. This function can be used directly in SQL queries. | Simple HTTP Fetches in a Single Call Subprograms |
| REQUEST_PIECES Function | Returns a PL/SQL table of 2000-byte pieces of the data retrieved from the given URL | Simple HTTP Fetches in a Single Call Subprograms |
| SET_AUTHENTICATION Procedure | Sets HTTP authentication information in the HTTP request header. The Web server needs this information to authorize the request. | HTTP Requests Subprograms |
| SET_AUTHENTICATION_FROM_WALLET Procedure | Sets the HTTP authentication information in the HTTP request header needed for the request to be authorized by the Web server using the username and password credential stored in the Oracle wallet. | HTTP Requests Subprograms |
| SET_BODY_CHARSET Procedures | Sets the default character set of the body of all future HTTP requests when the media type is <code>text</code> and the character set is not specified in the <code>Content-Type</code> header | Session Settings Subprograms |
| SET_BODY_CHARSET Procedures | Sets the character set of the request body when the media type is <code>text</code> but the character set is not specified in the <code>Content-Type</code> header | HTTP Requests Subprograms |
| SET_BODY_CHARSET Procedures | Sets the character set of the response body when the media type is "text" but the character set is not specified in the <code>Content-Type</code> header | HTTP Responses Subprograms and Session Settings Subprograms |
| SET_COOKIE_SUPPORT Procedures | Enables or disables support for the HTTP cookies in the request | HTTP Requests Subprograms |
| SET_DETAILED_EXCEPT_SUPPORT Procedure | Sets whether or not future HTTP requests will support HTTP cookies; sets the maximum number of cookies maintained in the current database user session | Session Settings Subprograms |
| SET_DETAILED_EXCEPT_SUPPORT Procedure | Sets the UTL_HTTP package to raise a detailed exception | Session Settings Subprograms |

Table 268-16 (Cont.) UTL_HTTP Package Subprograms

| Subprogram | Description | Group |
|---|---|---|
| SET_FOLLOW_REDIRECT Procedures | Sets the maximum number of times UTL_HTTP follows the HTTP redirect instruction in the HTTP response to this request in the GET_RESPONSE function | HTTP Requests Subprograms |
| SET_HEADER Procedure | Sets the maximum number of times UTL_HTTP follows the HTTP redirect instruction in the HTTP responses to future requests in the GET_RESPONSE function | Session Settings Subprograms |
| SET_HEADER Procedure | Sets an HTTP request header. The request header is sent to the Web server as soon as it is set. | HTTP Requests Subprograms |
| SET_PERSISTENT_CONN_SUPPORT Procedure | Enables or disables support for the HTTP 1.1 persistent-connection in the request | HTTP Requests Subprograms |
| SET_PROXY Procedure | Sets the proxy to be used for requests of HTTP or other protocols | Session Settings and Session Settings Subprograms |
| SET_RESPONSE_ERROR_CHECK Procedure | Sets whether or not GET_RESPONSE raises an exception when the Web server returns a status code that indicates an error—a status code in the 4xx or 5xx ranges | Session Settings Subprograms |
| SET_TRANSFER_TIMEOUT Procedure | Sets the timeout value for UTL_HTTP to read the HTTP response from the Web server or proxy server | Session Settings and Session Settings Subprograms |
| SET_WALLET Procedure | Sets the Oracle Wallet used for all HTTP requests over Secured Socket Layer (SSL), that is, HTTPS | Session Settings Subprograms |
| WRITE_LINE Procedure | Writes a text line in the HTTP request body and ends the line with new-line characters (CRLF) as defined in UTL_TCP | HTTP Requests Subprograms |
| WRITE_RAW Procedure | Writes some binary data in the HTTP request body | HTTP Requests Subprograms |
| WRITE_TEXT Procedure | Writes some text data in the HTTP request body | HTTP Requests Subprograms |

268.9.1 ADD_COOKIES Procedure

This procedure adds the cookies either to a request context or to the `UTL_HTTP` package's session state.

See Also:

[HTTP Cookies](#) and [HTTP Cookies Subprograms](#)

Syntax

```
UTL_HTTP.ADD_COOKIES (  
    cookies          IN  cookie_table,  
    request_context  IN  request_context_key DEFAULT NULL);
```

Parameters

Table 268-17 ADD_COOKIES Procedure Parameters

| Parameter | Description |
|------------------------------|--|
| <code>cookies</code> | The cookies to be added |
| <code>request_context</code> | Request context to add the cookies. If <code>NULL</code> , the cookies will be added to the <code>UTL_HTTP</code> package's session state instead. |

Usage Notes

The cookies that the package currently maintains are not cleared before new cookies are added.

268.9.2 BEGIN_REQUEST Function

This function begins a new HTTP request. `UTL_HTTP` establishes the network connection to the target Web server or the proxy server and sends the HTTP request line. The PL/SQL program continues the request by calling some other interface to complete the request.

The URL may contain the username and password needed to authenticate the request to the server. The format is:

```
scheme://[user[:password]@]host[:port]/[...]
```

See Also:

[HTTP Requests](#) and [HTTP Requests Subprograms](#)

Syntax

```
UTL_HTTP.BEGIN_REQUEST (  
    url              IN  VARCHAR2,
```

```

method          IN  VARCHAR2 DEFAULT 'GET',
http_version    IN  VARCHAR2 DEFAULT NULL,
request_context IN  request_context_key DEFAULT NULL,
https_host      IN  VARCHAR2 DEFAULT NULL)
RETURN req;

```

Parameters

Table 268-18 BEGIN_REQUEST Function Parameters

| Parameter | Description |
|-----------------|--|
| url | The URL of the HTTP request |
| method | The method performed on the resource identified by the URL |
| http_version | The HTTP protocol version that sends the request. The format of the protocol version is HTTP/major-version.minor-version, where major-version and minor-version are positive numbers. If this parameter is set to NULL, UTL_HTTP uses the latest HTTP protocol version that it supports to send the request. The latest version that the package supports is 1.1 and it can be upgraded to a later version. The default is NULL. |
| request_context | Request context that holds the private wallet and the cookie table to use in this HTTP request. If this parameter is NULL, the wallet and cookie table shared in the current database session will be used instead. |
| https_host | A string representing the host name. If the string does not begin with a wildcard, the string will be used as the host name for server name indication (SNI). If the string begins with a wildcard, the string will be used to match against the common name (CN) of the remote server's certificate for an HTTPS request. If NULL, the host name in the given URL will be used for SNI. |

Usage Notes

- The URL passed as an argument to this function is not examined for illegal characters, such as spaces, according to URL specification RFC 2396. You should escape those characters with the `UTL_URL` package to return illegal and reserved characters. URLs should consist of US-ASCII characters only. See [UTL_URL](#) for a list of legal characters in URLs. Note that URLs should consist of US-ASCII characters only. The use of non-US-ASCII characters in a URL is generally unsafe.
- `BEGIN_REQUEST` can send a URL whose length is up to 32767 bytes. However, different Web servers impose different limits on the length of the URL they can accept. This limit is often about 4000 bytes. If this limit is exceeded, the outcome will depend on the Web server. For example, a Web server might simply drop the HTTP connection without returning a response of any kind. If this happens, a subsequent invocation of the [GET_RESPONSE Function](#) will raise the `PROTOCOL_ERROR` exception.

A URL will be long when its `QUERY_STRING` (that is, the information that follows the question mark (?)) is long. In general, it is better to send this parameterization in the body of the request using the `POST` method.

```

req := UTL_HTTP.BEGIN_REQUEST (url=>the_url, method=>'POST');
UTL_HTTP.SET_HEADER (r      => req,
                    name   => 'Content-Type',
                    value  => 'application/x-www-form-urlencoded');
UTL_HTTP.SET_HEADER (r      => req,
                    name   => 'Content-Length',
                    value  => '<length of data posted in bytes>');
UTL_HTTP.WRITE_TEXT (r      => req,
                    data   => 'p1 = value1&p2=value2...');
resp := UTL_HTTP.GET_RESPONSE
      (r      => req);
...

```

The programmer must determine whether a particular Web server may, or may not, accept data provided in this way.

- An Oracle wallet must be set before accessing Web servers over HTTPS. See the [SET_WALLET Procedure](#) procedure on how to set up an Oracle wallet. To use SSL client authentication, the client certificate should be stored in the wallet and the caller must have the `use-client-certificates` privilege on the wallet. See "Managing Fine-grained Access to External Network Services" in the *Oracle Database Security Guide* to grant the privilege.
- To connect to the remote Web server directly, or indirectly through a HTTP proxy, the `UTL_HTTP` must have the `connect` ACL privilege to the remote Web server host or the proxy host respectively.

268.9.3 CLEAR_COOKIES Procedure

This procedure clears all the cookies maintained either in a request context or in the `UTL_HTTP` package's session state.

See Also:

[HTTP Cookies](#) and [HTTP Cookies Subprograms](#)

Syntax

```

UTL_HTTP.CLEAR_COOKIES (
    request_context IN request_context_key DEFAULT NULL);

```

Parameters

Table 268-19 CLEAR_COOKIES Procedure Parameters

| Parameter | Description |
|------------------------------|---|
| <code>request_context</code> | Request context to clear the cookies. If <code>NULL</code> , the cookies maintained in the <code>UTL_HTTP</code> package's session state will be cleared instead. |

268.9.4 CLOSE_PERSISTENT_CONN Procedure

This procedure closes an HTTP persistent connection maintained by the `UTL_HTTP` package in the current database session.

See Also:

[HTTP Persistent Connections](#) and [HTTP Persistent Connections Subprograms](#)

Syntax

```
UTL_HTTP.CLOSE_PERSISTENT_CONN (
    conn IN connection);
```

Parameters

Table 268-20 CLOSE_PERSISTENT_CONN Procedure Parameters

| Parameter | Description |
|-------------------|---|
| <code>conn</code> | The HTTP persistent connection to close |

268.9.5 CLOSE_PERSISTENT_CONNS Procedure

This procedure closes a group of HTTP persistent connections maintained by the `UTL_HTTP` package in the current database session. This procedure uses a pattern-match approach to decide which persistent connections to close.

To close a group of HTTP persistent connection that share a common property (for example, all connections to a particular host, or all SSL connections), set the particular parameters and leave the rest of the parameters `NULL`. If a particular parameter is set to `NULL` when this procedure is called, that parameter will not be used to decide which connections to close.

For example, the following call to the procedure closes all persistent connections to `foobar`:

```
UTL_HTTP.CLOSE_PERSISTENT_CONNS(host => 'foobar');
```

And the following call to the procedure closes all persistent connections through the `foobar` at TCP/IP port 80:

```
UTL_HTTP.CLOSE_PERSISTENT_CONNS(proxy_host => 'foobar',
                                proxy_port => 80);
```

And the following call to the procedure closes all persistent connections:

```
UTL_HTTP.CLOSE_PERSISTENT_CONNS;
```

**See Also:**[HTTP Persistent Connections](#) and [HTTP Persistent Connections Subprograms](#)**Syntax**

```

UTL_HTTP.CLOSE_PERSISTENT_CONNS (
  host          IN VARCHAR2 DEFAULT NULL,
  port          IN PLS_INTEGER DEFAULT NULL,
  proxy_host    IN VARCHAR2 DEFAULT NULL,
  proxy_port    IN PLS_INTEGER DEFAULT NULL,
  ssl          IN BOOLEAN DEFAULT NULL);

```

Parameters**Table 268-21 CLOSE_PERSISTENT_CONNS Procedure Parameters**

| Parameter | Description |
|------------|---|
| host | The host for which persistent connections are to be closed |
| port | The port number for which persistent connections are to be closed |
| proxy_host | The proxy host for which persistent connections are to be closed |
| proxy_port | The proxy port for which persistent connections are to be closed |
| ssl | Close persistent SSL connection |

Usage Notes

Connections to the same Web server at different TCP/IP ports are counted individually. The host names of the Web servers are identified as specified in the URL of the original HTTP requests. Therefore, fully qualified host names with domain names will be counted differently from the host names without domain names.

Note that the use of a NULL value in a parameter when this procedure is called means that the caller does not care about its value when the package decides which persistent connection to close. If you want a NULL value in a parameter to match only a NULL value of the parameter of a persistent connection (which is when you want to close a specific persistent connection), you should use the `CLOSE_PERSISTENT_CONN` procedure that closes a specific persistent connection.

268.9.6 CREATE_REQUEST_CONTEXT Function

This function creates a request context. A request context is a context that holds a wallet and a cookie for private use in making a HTTP request. This allows the HTTP request to use a wallet and a cookie table that will not be shared with other applications making HTTP requests in the same database session.

**See Also:**[Request Context](#) and [HTTP Request Contexts Subprograms](#)

Syntax

```

UTL_HTTP.CREATE_REQUEST_CONTEXT (
  wallet_path          IN VARCHAR2 DEFAULT NULL,
  wallet_password     IN VARCHAR2 DEFAULT NULL,
  enable_cookies      IN BOOLEAN  DEFAULT TRUE,
  max_cookies         IN PLS_INTEGER DEFAULT 300,
  max_cookies_per_site IN PLS_INTEGER DEFAULT 20)
RETURN request_context_key;

```

Parameters

Table 268-22 CREATE_REQUEST_CONTEXT Function Parameters

| Parameter | Description |
|----------------------|---|
| wallet_path | Directory path that contains the Oracle wallet. The format is <i>file:directory-path</i> |
| wallet_password | The password needed to open the wallet. If the wallet is auto-login enabled, the password may be omitted and should be set to NULL. See the <i>Oracle Database Enterprise User Security Administrator's Guide</i> for detailed information about wallets. |
| enable_cookies | Sets whether HTTP requests using this request context should support HTTP cookies or not: TRUE to enable the support, FALSE to disable it. |
| max_cookies | Sets the maximum total number of cookies that will be maintained in this request context |
| max_cookies_per_site | Sets the maximum number of cookies per each Web site that will be maintained in this request context |

Return Values

The request context created.

Examples

```

DECLARE
  request_context UTL_HTTP.REQUEST_CONTEXT_KEY;
  req            utl_http.req;
BEGIN
  request_context := UTL_HTTP.CREATE_REQUEST_CONTEXT(
    wallet_path          => 'file:/oracle/wallets/test_wallets',
    wallet_password     => NULL,
    enable_cookies      => TRUE,
    max_cookies         => 300,
    max_cookies_per_site => 20);
  req := UTL_HTTP.BEGIN_REQUEST(
    url                 => 'http://www.example.com/',
    request_context     => request_context);
END;

```

268.9.7 DESTROY_REQUEST_CONTEXT Procedure

This procedure destroys a request context in `UTL_HTTP`. A request context cannot be destroyed when it is in use by a HTTP request or response.

See Also:

[Request Context](#) and [HTTP Request Contexts Subprograms](#)

Syntax

```
UTL_HTTP.DESTROY_REQUEST_CONTEXT (  
    request_context    request_context_key);
```

Parameters

Table 268-23 DESTROY_REQUEST_CONTEXT Procedure Parameters

| Parameter | Description |
|------------------------------|----------------------------|
| <code>request_context</code> | Request context to destroy |

Examples

```
DECLARE  
    request_context    UTL_HTTP.REQUEST_CONTEXT_KEY;  
BEGIN  
    request_context := UTL_HTTP.CREATE_REQUEST_CONTEXT(...);  
    ...  
    UTL_HTTP.DESTROY_REQUEST_CONTEXT(request_context);  
END;
```

268.9.8 END_REQUEST Procedure

This procedure ends the HTTP request. To terminate the HTTP request without completing the request and waiting for the response, the program can call this procedure. Otherwise, the program should go through the normal sequence of beginning a request, getting the response, and closing the response. The network connection will always be closed and will not be reused.

See Also:

[HTTP Requests](#) and [HTTP Requests Subprograms](#)

Syntax

```
UTL_HTTP.END_REQUEST (  
    r IN OUT NOCOPY req);
```

Parameters

Table 268-24 END_REQUEST Procedure Parameters

| Parameter | Description |
|-----------|------------------|
| r | The HTTP request |

268.9.9 END_RESPONSE Procedure

This procedure ends the HTTP response. It completes the HTTP request and response. Unless HTTP 1.1 persistent connection is used in this request, the network connection is also closed.

**See Also:**

[HTTP Responses](#) and [HTTP Responses Subprograms](#)

Syntax

```
UTL_HTTP.END_RESPONSE (  
    r IN OUT NOCOPY resp);
```

Parameters

Table 268-25 END_RESPONSE Procedure Parameters

| Parameter | Description |
|-----------|-------------------|
| r | The HTTP response |

268.9.10 GET_AUTHENTICATION Procedure

This procedure retrieves the HTTP authentication information needed for the request to be accepted by the Web server as indicated in the HTTP response header.

**See Also:**

[HTTP Responses](#) and [HTTP Responses Subprograms](#)

Syntax

```
UTL_HTTP.GET_AUTHENTICATION(  
    r          IN OUT NOCOPY resp,  
    scheme     OUT VARCHAR2,  
    realm      OUT VARCHAR2,  
    for_proxy  IN BOOLEAN DEFAULT FALSE);
```

Parameters

Table 268-26 GET_AUTHENTICATION Procedure Parameters

| Parameter | Description |
|------------------------|---|
| <code>r</code> | The HTTP response |
| <code>scheme</code> | The scheme for the required HTTP authentication |
| <code>realm</code> | The realm for the required HTTP authentication |
| <code>for_proxy</code> | Returns the HTTP authentication information required for the access to the HTTP proxy server instead of the Web server? Default is <code>FALSE</code> |

Usage Notes

When a Web client is unaware that a document is protected, at least two HTTP requests are required for the document to be retrieved. In the first HTTP request, the Web client makes the request without supplying required authentication information; so the request is denied. The Web client can determine the authentication information required for the request to be authorized by calling `GET_AUTHENTICATION`. The Web client makes the second request and supplies the required authentication information with `SET_AUTHORIZATION`. If the authentication information can be verified by the Web server, the request will succeed and the requested document is returned. Before making the request, if the Web client knows that authentication information is required, it can supply the required authentication information in the first request, thus saving an extra request.

268.9.11 GET_BODY_CHARSET Procedure

This procedure retrieves the default character set of the body of all future HTTP requests.

See Also:

[Session Settings](#) and [Session Settings Subprograms](#)

Syntax

```
UTL_HTTP.GET_BODY_CHARSET (
    charset OUT NOCOPY VARCHAR2);
```

Parameters

Table 268-27 GET_BODY_CHARSET Procedure Parameters

| Parameter | Description |
|----------------------|---|
| <code>charset</code> | The default character set of the body of all future HTTP requests |

268.9.12 GET_COOKIE_COUNT Function

This function returns the number of cookies maintained either in a request context or in the UTL_HTTP package's session state.

See Also:

[HTTP Cookies](#) and [HTTP Cookies Subprograms](#)

Syntax

```
UTL_HTTP.GET_COOKIE_COUNT (  
    request_context IN request_context_key DEFAULT NULL)  
    RETURN PLS_INTEGER;
```

Parameters

Table 268-28 GET_COOKIE_COUNT Function Parameters

| Parameter | Description |
|-----------------|--|
| request_context | Request context to return the cookie count for. If NULL, the cookie count maintained in the UTL_HTTP package's session state will be returned instead. |

268.9.13 GET_COOKIE_SUPPORT Procedure

This procedure retrieves the current cookie support settings.

See Also:

[Session Settings](#) and [Session Settings Subprograms](#)

Syntax

```
UTL_HTTP.GET_COOKIE_SUPPORT (  
    enable          OUT BOOLEAN,  
    max_cookies    OUT PLS_INTEGER,  
    max_cookies_per_site OUT PLS_INTEGER);
```

Parameters

Table 268-29 GET_COOKIE_SUPPORT Procedure Parameters

| Parameter | Description |
|-----------|--|
| enable | Indicates whether future HTTP requests should support HTTP cookies (TRUE) or not (FALSE) |

Table 268-29 (Cont.) GET_COOKIE_SUPPORT Procedure Parameters

| Parameter | Description |
|----------------------|---|
| max_cookies | Indicates the maximum total number of cookies maintained in the current session |
| max_cookies_per_site | Indicates the maximum number of cookies maintained in the current session for each Web site |

268.9.14 GET_COOKIES Function

This function returns all the cookies maintained either in a request context or in the UTL_HTTP package's session state.

See Also:

[HTTP Cookies](#) and [HTTP Cookies Subprograms](#)

Syntax

```
UTL_HTTP.GET_COOKIES (
    cookies          IN OUT NOCOPY cookie_table,
    request_context  IN          request_context_key DEFAULT NULL);
```

Parameters

Table 268-30 GET_COOKIES Function Parameters

| Parameter | Description |
|-----------------|--|
| cookies | The cookies returned |
| request_context | Request context to return the cookies for. If NULL, the cookies maintained in the UTL_HTTP package's session state will be returned instead. |

268.9.15 GET_DETAILED_EXCP_SUPPORT Procedure

This procedure checks if the UTL_HTTP package will raise a detailed exception or not.

See Also:

[Session Settings](#) and [Session Settings Subprograms](#)

Syntax

```
UTL_HTTP.GET_DETAILED_EXCP_SUPPORT (
    enable  OUT BOOLEAN);
```

Parameters

Table 268-31 GET_DETAILED_EXCP_SUPPORT Procedure Parameters

| Parameter | Description |
|-----------|---|
| enable | TRUE if UTL_HTTP raises a detailed exception; otherwise FALSE |

268.9.16 GET_DETAILED_SQLCODE Function

This function retrieves the detailed `SQLCODE` of the last exception raised.

See Also:

[Error Conditions](#) and [Error Conditions Subprograms](#)

Syntax

```
UTL_HTTP.GET_DETAILED_SQLCODE  
RETURN PLS_INTEGER;
```

268.9.17 GET_DETAILED_SQLERRM Function

This function retrieves the detailed `SQLERRM` of the last exception raised.

See Also:

[Error Conditions](#) and [Error Conditions Subprograms](#)

Syntax

```
UTL_HTTP.GET_DETAILED_SQLERRM  
RETURN VARCHAR2;
```

268.9.18 GET_FOLLOW_REDIRECT Procedure

This procedure retrieves the follow-redirect setting in the current session

See Also:

[Session Settings](#) and [Session Settings Subprograms](#)

Syntax

```
UTL_HTTP.GET_FOLLOW_REDIRECT (  
    max_redirects OUT PLS_INTEGER);
```

Parameters

Table 268-32 GET_FOLLOW_REDIRECT Procedure Parameters

| Parameter | Description |
|---------------|---|
| max_redirects | The maximum number of redirections for all future HTTP requests |

268.9.19 GET_HEADER Procedure

This procedure returns the n^{th} HTTP response header name and value returned in the response.

**See Also:**

[HTTP Responses](#) and [HTTP Responses Subprograms](#)

Syntax

```
UTL_HTTP.GET_HEADER (
    r      IN OUT NOCOPY resp,
    n      IN PLS_INTEGER,
    name   OUT NOCOPY VARCHAR2,
    value  OUT NOCOPY VARCHAR2);
```

Parameters

Table 268-33 GET_HEADER Procedure Parameters

| Parameter | Description |
|-----------|---------------------------------------|
| r | The HTTP response |
| n | The n^{th} header to return |
| name | The name of the HTTP response header |
| value | The value of the HTTP response header |

Usage Notes

If the response body returned by the remote Web server is encoded in chunked transfer encoding format, the trailer headers that are returned at the end of the response body will be added to the response, and the response header count will be updated. You can retrieve the additional headers after the end of the response body is reached and before you end the response.

268.9.20 GET_HEADER_BY_NAME Procedure

This procedure returns the HTTP response header value returned in the response given the name of the header.

See Also:

[HTTP Responses](#) and [HTTP Responses Subprograms](#)

Syntax

```
UTL_HTTP.GET_HEADER_BY_NAME(  
  r      IN OUT NOCOPY resp,  
  name   IN VARCHAR2,  
  value  OUT NOCOPY VARCHAR2,  
  n      IN PLS_INTEGER DEFAULT 1);
```

Parameters

Table 268-34 GET_HEADER_BY_NAME Procedure Parameters

| Parameter | Description |
|-----------|--|
| r | The HTTP response |
| name | The name of the HTTP response header for which the value is to return |
| value | The value of the HTTP response header |
| n | The n^{th} occurrence of an HTTP response header by the specified name to return. The default is 1. |

Usage Notes

If the response body returned by the remote Web server is encoded in chunked transfer encoding format, the trailer headers that are returned at the end of the response body will be added to the response, and the response header count will be updated. You can retrieve the additional headers after the end of the response body is reached and before you end the response.

268.9.21 GET_HEADER_COUNT Function

This function returns the number of HTTP response headers returned in the response.

See Also:

[HTTP Responses](#) and [HTTP Responses Subprograms](#)

Syntax

```
UTL_HTTP.GET_HEADER_COUNT (  
    r IN OUT NOCOPY resp)  
RETURN PLS_INTEGER;
```

Parameters

Table 268-35 GET_HEADER_COUNT Function Parameters

| Parameter | Description |
|-----------|-------------------|
| r | The HTTP response |

Usage Notes

If the response body returned by the remote Web server is encoded in chunked transfer encoding format, the trailer headers that are returned at the end of the response body will be added to the response, and the response header count will be updated. You can retrieve the additional headers after the end of the response body is reached and before you end the response.

268.9.22 GET_PERSISTENT_CONN_COUNT Function

This function returns the number of network connections currently kept persistent by the UTL_HTTP package to the Web servers.

See Also:

[HTTP Persistent Connections](#) and [HTTP Persistent Connections Subprograms](#)

Syntax

```
UTL_HTTP.GET_PERSISTENT_CONN_COUNT  
RETURN PLS_INTEGER;
```

Usage Notes

Connections to the same Web server at different TCP/IP ports are counted individually. The host names of the Web servers are identified as specified in the URL of the original HTTP requests. Therefore, fully qualified host names with domain names will be counted differently from the host names without domain names.

268.9.23 GET_PERSISTENT_CONN_SUPPORT Procedure

This procedure checks if the persistent connection support is enabled, and gets the maximum number of persistent connections in the current session.

See Also:

[Session Settings](#) and [Session Settings Subprograms](#)

Syntax

```
UTL_HTTP.GET_PERSISTENT_CONN_SUPPORT (  
    enable      OUT BOOLEAN,  
    max_conns  OUT PLS_INTEGER);
```

Parameters

Table 268-36 GET_PERSISTENT_CONN_SUPPORT Procedure Parameters

| Parameter | Description |
|-----------|--|
| enable | TRUE if persistent connection support is enabled; otherwise FALSE |
| max_conns | the maximum number of persistent connections maintained in the current session |

268.9.24 GET_PERSISTENT_CONNS Procedure

This procedure returns all the network connections currently kept persistent by the UTL_HTTP package to the Web servers.

See Also:

[HTTP Persistent Connections](#) and [HTTP Persistent Connections Subprograms](#)

Syntax

```
UTL_HTTP.get_persistent_conns (  
    connections IN OUT NOCOPY connection_table);
```

Parameters

Table 268-37 GET_PERSISTENT_CONNS Procedure Parameters

| Parameter | Description |
|-------------|---|
| connections | The network connections kept persistent |

Usage Notes

Connections to the same Web server at different TCP/IP ports are counted individually. The host names of the Web servers are identified as specified in the URL of the original HTTP requests. Therefore, fully qualified host names with domain names will be counted differently from the host names without domain names.

268.9.25 GET_PROXY Procedure

This procedure retrieves the current proxy settings.

See Also:

[Session Settings](#) and [Session Settings Subprograms](#)

Syntax

```
UTL_HTTP.GET_PROXY (
    proxy          OUT NOCOPY VARCHAR2,
    no_proxy_domains OUT NOCOPY VARCHAR2);
```

Parameters

Table 268-38 GET_PROXY Procedure Parameters

| Parameter | Description |
|------------------|---|
| proxy | The proxy (host and an optional port number) currently used by the UTL_HTTP package |
| no_proxy_domains | The list of hosts and domains for which no proxy is used for all requests |

268.9.26 GET_RESPONSE Function

This function reads the HTTP response.

When the function returns, the status line and the HTTP response headers have been read and processed. The status code, reason phrase, and the HTTP protocol version are stored in the response record. This function completes the HTTP headers section.

See Also:

[HTTP Responses](#) and [HTTP Responses Subprograms](#)

Syntax

```
UTL_HTTP.GET_RESPONSE (
    r          IN OUT NOCOPY req,
```

```
    return_info_response    IN BOOLEAN DEFAULT FALSE)
RETURN resp;
```

Parameters

Table 268-39 GET_RESPONSE Function Parameters

| Parameter | Description |
|----------------------|--|
| r | The HTTP response |
| return_info_response | Return 100 informational response or not. <ul style="list-style-type: none"> TRUE means <code>get_response</code> should return 100 informational response when it is received from the HTTP server. The request will not be ended if a 100 response is returned. FALSE means the API should ignore any 100 informational response received from the HTTP server and should return the following non-100 response instead. The default is FALSE. |

Exceptions

- When detailed-exception is disabled:
 - ORA-29273 REQUEST_FAILED - the request fails to execute. Use the [GET_DETAILED_EXCP_SUPPORT Procedure](#) and the [GET_DETAILED_SQLERRM Function](#) to get the detailed error message.
- When detailed-exception is enabled:
 - ORA-29261 BAD_ARGUMENT - some arguments passed are not valid
- When response error check is enabled:
 - ORA-29268 HTTP_CLIENT_ERROR - the response code is in 400 range
 - ORA-29269 HTTP_SERVER_ERROR - the response code is in 500 range

Usage Notes

- The request will be ended when this functions returns regardless of whether an exception is raised or not. There is no need to invoke the [END_REQUEST Procedure](#).
- If URL redirection occurs, the URL and method fields in the `req` record will be updated to the last redirected URL and the method used to access the URL.

Examples

In certain situations (initiated by the HTTP client or not), the HTTP server may return a 1xx informational response. The user who does not expect such a response may indicate to `GET_RESPONSE` to ignore the response and proceed to receive the regular response. In the case when the user expects such a response, the user can indicate to `GET_RESPONSE` to return the response.

For example, when a user is issuing a HTTP POST request with a large request body, the user may want to check with the HTTP server to ensure that the server will accept the request before sending the data. To do so, the user will send the additional `EXPECT: 100-CONTINUE` request header, and check for 100 CONTINUE response from

the server before proceeding to send the request body. Then, the user will get the regular HTTP response.

The following code example illustrates this:

```

DECLARE
  data  VARCHAR2(1024) := '...';
  req   utl_http.req;
  resp  utl_http.resp;
BEGIN

  req := utl_http.begin_request('http://www.acme.com/receiver', 'POST');
  utl_http.set_header(req, 'Content-Length', length(data));
  -- Ask HTTP server to return "100 Continue" response
  utl_http.set_header(req, 'Expect', '100-continue');
  resp := utl_http.get_response(req, TRUE);

  -- Check for and dispose "100 Continue" response
  IF (resp.status_code <> 100) THEN
    utl_http.end_response(resp);
    raise_application_error(20000, 'Request rejected');
  END IF;
  utl_http.end_response(resp);

  -- Now, send the request body
  utl_http.write_text(req, data);

  -- Get the regular response
  resp := utl_http.get_response(req);
  utl_http.read_text(resp, data);

  utl_http.end_response(resp);

END;
```

268.9.27 GET_RESPONSE_ERROR_CHECK Procedure

This procedure checks if the response error check is set or not.

See Also:

[Session Settings](#) and [Session Settings Subprograms](#)

Syntax

```

UTL_HTTP.GET_RESPONSE_ERROR_CHECK (
  enable OUT BOOLEAN);
```

Parameters

Table 268-40 GET_RESPONSE_ERROR_CHECK Procedure Parameters

| Parameter | Description |
|-----------|--|
| enable | TRUE if the response error check is set; otherwise FALSE |

268.9.28 GET_TRANSFER_TIMEOUT Procedure

This procedure retrieves the default timeout value for all future HTTP requests.

See Also:

[Session Settings](#) and [Session Settings Subprograms](#)

Syntax

```
UTL_HTTP.GET_TRANSFER_TIMEOUT (  
    timeout OUT PLS_INTEGER);
```

Parameters

Table 268-41 GET_TRANSFER_TIMEOUT Procedure Parameters

| Parameter | Description |
|-----------|---|
| timeout | The network transfer timeout value in seconds |

268.9.29 READ_LINE Procedure

This procedure reads the HTTP response body in text form until the end of line is reached and returns the output in the caller-supplied buffer.

The end of line is as defined in the function `read_line` of `UTL_TCP`. The `end_of_body` exception will be raised if the end of the HTTP response body is reached. Text data is automatically converted from the response body character set to the database character set.

See Also:

[HTTP Responses](#) and [HTTP Responses Subprograms](#)

Syntax

```
UTL_HTTP.READ_LINE (  
    r          IN OUT NOCOPY resp,  
    data      OUT NOCOPY VARCHAR2 CHARACTER SET ANY_CS,  
    remove_crlf IN BOOLEAN DEFAULT FALSE);
```

Parameters

Table 268-42 READ_LINE Procedure Parameters

| Parameter | Description |
|-----------|-------------------|
| r | The HTTP response |

Table 268-42 (Cont.) READ_LINE Procedure Parameters

| Parameter | Description |
|--------------------------|--|
| <code>data</code> | The HTTP response body in text form |
| <code>remove_crlf</code> | Removes the newline characters if set to <code>TRUE</code> |

Usage Notes

The `UTL_HTTP` package supports HTTP 1.1 chunked transfer-encoding. When the response body is returned in chunked transfer-encoding format as indicated in the response header, the package automatically decodes the chunks and returns the response body in de-chunked format.

If transfer timeout is set in the request of this response, `read_line` waits for each data packet to be ready to read until timeout occurs. If it occurs, this procedure stops reading and returns all the data read successfully. If no data is read successfully, the `transfer_timeout` exception is raised. The exception can be handled and the read operation can be retried later.

If a partial multibyte character is found at the end of the response body, `read_line` stops reading and returns all the complete multibyte characters read successfully. If no complete character is read successfully, the `partial_multibyte_char` exception is raised. The exception can be handled and the bytes of that partial multibyte character can be read as binary by the `read_raw` procedure. If a partial multibyte character is seen in the middle of the response body because the remaining bytes of the character have not arrived and read timeout occurs, the `transfer_timeout` exception is raised instead. The exception can be handled and the read operation can be retried later.

When the `Content-Type` response header specifies the character set of the response body and the character set is unknown or unsupported by Oracle, the "ORA-01482: unsupported character set" exception is raised if you try to read the response body as text. You can either read the response body as binary using the `READ_RAW` procedure, or set the character set of the response body explicitly using the `SET_BODY_CHARSET` procedure and read the response body as text again.

268.9.30 READ_RAW Procedure

This procedure reads the HTTP response body in binary form and returns the output in the caller-supplied buffer.

The `end_of_body` exception is raised if the end of the HTTP response body is reached.

**See Also:**

[HTTP Responses](#) and [HTTP Responses Subprograms](#)

Syntax

```
UTL_HTTP.READ_RAW(
  r          IN OUT NOCOPY resp,
```

```
data OUT NOCOPY RAW,
len IN PLS_INTEGER DEFAULT NULL);
```

Parameters

Table 268-43 READ_RAW Procedure Parameters

| Parameter | Description |
|-----------|--|
| r | The HTTP response |
| data | The HTTP response body in binary form |
| len | The number of bytes of data to read. If len is NULL, this procedure will read as much input as possible to fill the buffer allocated in data. The actual amount of data returned may be less than that specified if not much data is available before the end of the HTTP response body is reached or the transfer_timeout amount of time has elapsed. The default is NULL |

Usage Notes

The `UTL_HTTP` package supports HTTP 1.1 chunked transfer-encoding. When the response body is returned in chunked transfer-encoding format as indicated in the response header, the package automatically decodes the chunks and returns the response body in de-chunked format.

If transfer timeout is set in the request of this response, `read_raw` waits for each data packet to be ready to read until timeout occurs. If it occurs, `read_raw` stops reading and returns all the data read successfully. If no data is read successfully, the `transfer_timeout` exception is raised. The exception can be handled and the read operation can be retried later.

268.9.31 READ_TEXT Procedure

This procedure reads the HTTP response body in text form and returns the output in the caller-supplied buffer.

The `end_of_body` exception is raised if the end of the HTTP response body is reached. Text data is automatically converted from the response body character set to the database character set.

See Also:

[HTTP Responses](#) and [HTTP Responses Subprograms](#)

Syntax

```
UTL_HTTP.READ_TEXT(
r IN OUT NOCOPY resp,
data OUT NOCOPY VARCHAR2 CHARACTER SET ANY_CS,
len IN PLS_INTEGER DEFAULT NULL);
```

Parameters

Table 268-44 READ_TEXT Procedure Parameters

| Parameter | Description |
|-------------------|--|
| <code>r</code> | The HTTP response |
| <code>data</code> | The HTTP response body in text form |
| <code>len</code> | The maximum number of characters of data to read. If <code>len</code> is NULL, this procedure will read as much input as possible to fill the buffer allocated in <code>data</code> . The actual amount of data returned may be less than that specified if little data is available before the end of the HTTP response body is reached or the <code>transfer_timeout</code> amount of time has elapsed. The default is NULL. |

Usage Notes

The `UTL_HTTP` package supports HTTP 1.1 chunked transfer-encoding. When the response body is returned in chunked transfer-encoding format as indicated in the response header, the package automatically decodes the chunks and returns the response body in de-chunked format.

If transfer timeout is set in the request of this response, `read_text` waits for each data packet to be ready to read until timeout occurs. If it occurs, this procedure stops reading and returns all the data read successfully. If no data is read successfully, the `transfer_timeout` exception is raised. The exception can be handled and the read operation can be retried later.

If a partial multibyte character is found at the end of the response body, `read_text` stops reading and returns all the complete multibyte characters read successfully. If no complete character is read successfully, the `partial_multibyte_char` exception is raised. The exception can be handled and the bytes of that partial multibyte character can be read as binary by the `read_raw` procedure. If a partial multibyte character is seen in the middle of the response body because the remaining bytes of the character have not arrived and read timeout occurs, the `transfer_timeout` exception is raised instead. The exception can be handled and the read operation can be retried later.

When the `Content-Type` response header specifies the character set of the response body and the character set is unknown or unsupported by Oracle, the "ORA-01482: unsupported character set" exception is raised if you try to read the response body as text. You can either read the response body as binary using the `READ_RAW` procedure, or set the character set of the response body explicitly using the `SET_BODY_CHARSET` procedure and read the response body as text again.

268.9.32 REQUEST Function

This function returns up to the first 2000 bytes of data retrieved from the given URL.

This function can be used directly in SQL queries. The URL may contain the username and password needed to authenticate the request to the server. The format is

```
scheme://[user[:password]@]host[:port]/[...]
```

You can define a username/password for the proxy to be specified in the proxy string. The format is

```
[http://][user[:password]@]host[:port][/]
```

See Also:

[Simple HTTP Fetches](#) and [Simple HTTP Fetches in a Single Call Subprograms](#)

Syntax

```
UTL_HTTP.REQUEST (
    url          IN VARCHAR2,
    proxy        IN VARCHAR2 DEFAULT NULL,
    wallet_path  IN VARCHAR2 DEFAULT NULL,
    wallet_password IN VARCHAR2 DEFAULT NULL,
    https_host   IN VARCHAR2 DEFAULT NULL)
RETURN VARCHAR2;
```

Pragmas

```
pragma restrict_references (request, wnds, rnds, wnps, rnps);
```

Parameters

Table 268-45 REQUEST Function Parameters

| Parameter | Description |
|-----------------|--|
| url | Uniform resource locator |
| proxy | (Optional) Specifies a proxy server to use when making the HTTP request. See <code>SET_PROXY</code> for the full format of the proxy setting. |
| wallet_path | (Optional) Specifies a client-side wallet. The client-side wallet contains the list of trusted certificate authorities required for HTTPS request. The format of <code>wallet_path</code> on a PC is, for example, <code>file:c:\WINNT\Profiles\username\WALLETS</code> , and in Unix is, for example, <code>file:/home/username/wallets</code> When the <code>UTL_HTTP</code> package is executed in the Oracle database server, the wallet is accessed from the database server. Therefore, the wallet path must be accessible from the database server. See <code>SET_WALLET</code> for a description on how to set up an Oracle wallet. Non-HTTPS requests do not require an Oracle wallet. |
| wallet_password | (Optional) Specifies the password required to open the wallet |
| https_host | A string representing the host name. If the string does not begin with a wildcard, the string will be used as the host name for server name indication (SNI). If the string begins with a wildcard, the string will be used to match against the common name (CN) of the remote server's certificate for an HTTPS request. If NULL, the host name in the given URL will be used for SNI. |

Return Values

The return type is a string of length 2000 or less, which contains up to the first 2000 bytes of the HTML result returned from the HTTP request to the argument URL.

Exceptions

```
INIT_FAILED  
REQUEST_FAILED
```

Usage Notes

The URL passed as an argument to this function is not examined for illegal characters, for example, spaces, according to URL specification RFC 2396. The caller should escape those characters with the UTL_URL package. See the comments of the package for the list of legal characters in URLs. Note that URLs should consist of US-ASCII characters only. The use of non-US-ASCII characters in a URL is generally unsafe.

Please see the documentation of the function `SET_WALLET` on the use of an Oracle wallet, which is required for accessing HTTPS Web servers.

Unless response error check is turned on, this function does not raise an exception when a 4xx or 5xx response is received from the Web server. Instead, it returns the formatted error message from the Web server:

```
<HTML>  
<HEAD>  
<TITLE>Error Message</TITLE>  
</HEAD>  
<BODY>  
<H1>Fatal Error 500</H1>  
Can't Access Document: http://home.nothing.comm.  
<P>  
<B>Reason:</B> Can't locate remote host: home.nothing.comm.  
<P>  
<P><HR>  
<ADDRESS><A HREF="http://www.w3.org">  
CERN-HTTPD3.0A</A></ADDRESS>  
</BODY>  
</HTML>
```

Examples

```
SQL> SELECT UTL_HTTP.REQUEST('http://www.my-company.com/') FROM DUAL;  
UTL_HTTP.REQUEST('HTTP://WWW.MY-COMPANY.COM/')  
<html>  
<head><title>My Company Home Page</title>  
<!--changed Jan. 16, 19  
1 row selected.
```

If you are behind a firewall, include the `proxy` parameter. For example, from within the Oracle firewall, where there might be a proxy server named `www-proxy.my-company.com`:

```
SQLPLUS> SELECT  
UTL_HTTP.REQUEST('http://www.my-company.com', 'www-proxy.us.my-company.com') FROM DUAL;
```

268.9.33 REQUEST_PIECES Function

This function returns a PL/SQL table of 2000-byte pieces of the data retrieved from the given URL.

You can define a username/password for the proxy to be specified in the proxy string. The format is

```
[http://][user[:password]@]host[:port][/]
```

See Also:

[Simple HTTP Fetches](#) and [Simple HTTP Fetches in a Single Call Subprograms](#)

Syntax

```
TYPE html_pieces IS TABLE OF VARCHAR2(2000) INDEX BY BINARY_INTEGER;

UTL_HTTP.REQUEST_PIECES (
    url           IN VARCHAR2,
    max_pieces    IN NATURAL DEFAULT 32767,
    proxy         IN VARCHAR2 DEFAULT NULL,
    wallet_path   IN VARCHAR2 DEFAULT NULL,
    wallet_password IN VARCHAR2 DEFAULT NULL,
    https_host    IN VARCHAR2 DEFAULT NULL)
RETURN html_pieces;
```

Pragmas

```
PRAGMA RESTRICT_REFERENCES (request_pieces, WNDS, RNDS, WNPS, RNPS);
```

Parameters

Table 268-46 REQUEST_PIECES Function Parameters

| Parameter | Description |
|------------|---|
| url | Uniform resource locator |
| max_pieces | (Optional) The maximum number of pieces (each 2000 characters in length, except for the last, which may be shorter), that REQUEST_PIECES should return. If provided, then that argument should be a positive integer. |
| proxy | (Optional) Specifies a proxy server to use when making the HTTP request. See SET_PROXY for the full format of the proxy setting. |

Table 268-46 (Cont.) REQUEST_PIECES Function Parameters

| Parameter | Description |
|-----------------|--|
| wallet_path | (Optional) Specifies a client-side wallet. The client-side wallet contains the list of trusted certificate authorities required for HTTPS request. The format of wallet_path on a PC is, for example, file:c:\WINNT\Profiles\username\WALLETS, and in Unix is, for example, file:/home/username/wallets. When the UTL_HTTP package is executed in the Oracle database server, the wallet is accessed from the database server. Therefore, the wallet path must be accessible from the database server. See SET_WALLET for the description on how to set up an Oracle wallet. Non-HTTPS requests do not require an Oracle wallet. |
| wallet_password | (Optional) Specifies the password required to open the wallet |
| https_host | A string representing the host name. If the string does not begin with a wildcard, the string will be used as the host name for server name indication (SNI). If the string begins with a wildcard, the string will be used to match against the common name (CN) of the remote server's certificate for an HTTPS request. If NULL, the host name in the given URL will be used for SNI. |

Return Values

REQUEST_PIECES returns a PL/SQL table of type UTL_HTTP.HTML_PIECES. Each element of that PL/SQL table is a string of maximum length 2000. The elements of the PL/SQL table returned by REQUEST_PIECES are successive pieces of the data obtained from the HTTP request to that URL.

Exceptions

INIT_FAILED
REQUEST_FAILED

Usage Notes

The URL passed as an argument to this function will not be examined for illegal characters, for example, spaces, according to URL specification RFC 2396. The caller should escape those characters with the UTL_URL package. See the comments of the package for the list of legal characters in URLs. Note that URLs should consist of US-ASCII characters only. The use of non-US-ASCII characters in a URL is generally unsafe.

Each entry of the PL/SQL table (the "pieces") returned by this function may not be filled to their fullest capacity. The function may start filling the data in the next piece before the previous "piece" is totally full.

Please see the documentation of the function SET_WALLET on the use of an Oracle wallet, which is required for accessing HTTPS Web servers.

Unless response error check is turned on, this function does not raise an exception when a 4xx or 5xx response is received from the Web server. Instead, it returns the formatted error message from the Web server:

```

<HTML>
<HEAD>
<TITLE>Error Message</TITLE>
</HEAD>
<BODY>
<H1>Fatal Error 500</H1>
Can't Access Document:  http://home.nothing.comm.
<P>
<B>Reason:</B> Can't locate remote host:  home.nothing.comm.
<P>
<P><HR>
<ADDRESS><A HREF="http://www.w3.org">
CERN-HTTPD3.0A</A></ADDRESS>
</BODY>
</HTML>

```

Examples

```

SET SERVEROUTPUT ON

DECLARE
    x    UTL_HTTP.HTML_PIECES;
    len  PLS_INTEGER;
BEGIN
    x := UTL_HTTP.REQUEST_PIECES('http://www.oracle.com/', 100);
    DBMS_OUTPUT.PUT_LINE(x.count || ' pieces were retrieved. ');
    DBMS_OUTPUT.PUT_LINE('with total length ');
    IF x.count < 1 THEN
        DBMS_OUTPUT.PUT_LINE('0 ');
    ELSE
        len := 0;
        FOR i in 1..x.count LOOP
            len := len + length(x(i));
        END LOOP;
        DBMS_OUTPUT.PUT_LINE(len);
    END IF;
END;
/
-- Output
Statement processed.
4 pieces were retrieved.
with total length
7687

```

268.9.34 SET_AUTHENTICATION Procedure

This procedure sets HTTP authentication information in the HTTP request header. The Web server needs this information to authorize the request.

See Also:

[HTTP Requests](#) and [HTTP Requests Subprograms](#)

Syntax

```

UTL_HTTP.SET_AUTHENTICATION(
    r          IN OUT NOCOPY req,

```

```

username IN VARCHAR2,
password IN VARCHAR2,
scheme   IN VARCHAR2 DEFAULT 'Basic',
for_proxy IN BOOLEAN  DEFAULT FALSE);

```

Parameters

Table 268-47 SET_AUTHENTICATION Procedure Parameters

| Parameter | Description |
|-----------|---|
| r | HTTP request |
| username | Username for the HTTP authentication |
| password | Password for the HTTP authentication |
| scheme | HTTP authentication scheme. Either <code>Basic</code> for the HTTP basic or <code>AWS</code> for Amazon S3 authentication scheme. Default is <code>basic</code> . |
| for_proxy | Identifies if the HTTP authentication information is for access to the HTTP proxy server instead of the Web server. Default is <code>FALSE</code> . |

Usage Notes

The supported authentication schemes are HTTP basic and Amazon S3 authentication.

268.9.35 SET_AUTHENTICATION_FROM_WALLET Procedure

This procedure sets the HTTP authentication information in the HTTP request header needed for the request to be authorized by the Web server using the username and password credential stored in the Oracle wallet.

See Also:

[External Password Store](#) on [Oracle Database](#), and [HTTP Requests Subprograms](#)

Syntax

```

UTL_HTTP.SET_AUTHENTICATION_FROM_WALLET(
  r          IN OUT NOCOPY req,
  alias     IN VARCHAR2,
  scheme    IN VARCHAR2 DEFAULT 'Basic',
  for_proxy IN BOOLEAN  DEFAULT FALSE);

```

Parameters

Table 268-48 SET_AUTHENTICATION_FROM_WALLET Procedure Parameters

| Parameter | Description |
|-----------|---|
| r | The HTTP request |
| alias | Alias to identify and retrieve the username and password credential stored in the Oracle wallet |

Table 268-48 (Cont.) SET_AUTHENTICATION_FROM_WALLET Procedure Parameters

| Parameter | Description |
|-----------|---|
| scheme | HTTP authentication scheme. Either <code>Basic</code> for the HTTP basic or <code>AWS</code> for Amazon S3 authentication scheme. Default is <code>basic</code> . |
| for_proxy | Identifies if the HTTP authentication information is for access to the HTTP proxy server instead of the Web server. Default is <code>FALSE</code> . |

Usage Notes

- To use the password credentials in a wallet, the `UTL_HTTP` user must have the `use-passwords` privilege on the wallet.
- The supported authentication schemes are HTTP basic and Amazon S3 authentication schemes.

Examples

Creating a wallet and entering username and password in the wallet

```
> mkstore -wrl /oracle/wallets/test_wallet -create
Enter password: *****
Enter password again: *****
> mkstore -wrl /oracle/wallets/test_wallet -createCredential hr-access jsmith
Your secret/Password is missing in the command line
Enter your secret/Password: ****
Re-enter your secret/Password: ****
Enter wallet password: *****
```

Granting the use-passwords privilege on the wallet to a user by the database administrator

```
BEGIN
  DBMS_NETWORK_ACL_ADMIN.CREATE_ACL(
    acl          => 'wallet-acl.xml',
    description => 'Wallet ACL',
    principal   => 'SCOTT',
    is_grant    => TRUE,
    privilege   => 'use-passwords');
  DBMS_NETWORK_ACL_ADMIN.ASSIGN_WALLET_acl(
    acl          => 'wallet-acl.xml',
    wallet_path  => 'file: /oracle/wallets/test_wallet');
END;
```

Using username and password from the wallet

```
DECLARE
  req UTL_HTTP.req;
BEGIN
  UTL_HTTP.SET_WALLET(path => 'file:/oracle/wallets/test_wallet');
  req := UTL_HTTP.BEGIN_REQUEST(...);
  UTL_HTTP.SET_AUTHENTICATION_FROM_WALLET(req, 'hr-access');
  ...
END;
```

268.9.36 SET_BODY_CHARSET Procedures

This procedure is overloaded. The description of different functionality is located alongside the syntax declarations.

See Also:

- [HTTP Responses](#) and [HTTP Responses Subprograms](#)
- [Session Settings](#) and [Session Settings Subprograms](#)

Syntax

Sets the default character set of the body of all future HTTP requests when the media type is `text` and the character set is not specified in the `Content-Type` header. Following the HTTP protocol standard specification, if the media type of a request or a response is `text`, but the character set information is missing in the `Content-Type` header, the character set of the request or response body should default to `ISO-8859-1`. A response created for a request inherits the default body character set of the request instead of the body character set of the current session. The default body character set is `ISO-8859-1` in a database user session. The default body character set setting affects only future requests and has no effect on existing requests. After a request is created, the body character set can be changed by using the other `SET_BODY_CHARSET` procedure that operates on a request:

```
UTL_HTTP.SET_BODY_CHARSET (  
    charset IN VARCHAR2 DEFAULT NULL);
```

Sets the character set of the request body when the media type is `text` but the character set is not specified in the `Content-Type` header. According to the HTTP protocol standard specification, if the media type of a request or a response is "text" but the character set information is missing in the `Content-Type` header, the character set of the request or response body should default to "ISO-8859-1". Use this procedure to change the default body character set a request inherits from the session default setting:

```
UTL_HTTP.SET_BODY_CHARSET (  
    r          IN OUT NOCOPY req,  
    charset IN VARCHAR2 DEFAULT NULL);
```

Sets the character set of the response body when the media type is "text" but the character set is not specified in the `Content-Type` header. For each the HTTP protocol standard specification, if the media type of a request or a response is "text" but the character set information is missing in the `Content-Type` header, the character set of the request or response body should default to "ISO-8859-1". Use this procedure to change the default body character set a response inherits from the request:

```
UTL_HTTP.SET_BODY_CHARSET (  
    r          IN OUT NOCOPY resp,  
    charset IN VARCHAR2 DEFAULT NULL);
```

Parameters

Table 268-49 SET_BODY_CHARSET Procedure Parameters

| Parameter | Description |
|-----------|---|
| r | The HTTP response. |
| charset | The default character set of the response body. The character set can be in Oracle or Internet Assigned Numbers Authority (IANA) naming convention. If <code>charset</code> is <code>NULL</code> , the database character set is assumed. |

268.9.37 SET_COOKIE_SUPPORT Procedures

This overloaded procedure handles cookie support. The description of different functionality is located alongside the syntax declarations.

See Also:

- [HTTP Requests](#) and [HTTP Requests Subprograms](#)
- [Session Settings](#) and [Session Settings Subprograms](#)

Syntax

Enables or disables support for the HTTP cookies in the request. Use this procedure to change the cookie support setting a request inherits from the session default setting:

```
UTL_HTTP.SET_COOKIE_SUPPORT (
    r          IN OUT NOCOPY REQ,
    enable     IN BOOLEAN DEFAULT TRUE);
```

Sets whether or not future HTTP requests will support HTTP cookies, and the maximum number of cookies maintained in the current database user session:

```
UTL_HTTP.SET_COOKIE_SUPPORT (
    enable     IN BOOLEAN,
    max_cookies IN PLS_INTEGER DEFAULT 300,
    max_cookies_per_site IN PLS_INTEGER DEFAULT 20);
```

Parameters

Table 268-50 SET_COOKIE_SUPPORT Procedure Parameters

| Parameter | Description |
|-------------|---|
| r | The HTTP request |
| enable | Set <code>enable</code> to <code>TRUE</code> to enable HTTP cookie support; <code>FALSE</code> to disable |
| max_cookies | Sets the maximum total number of cookies maintained in the current session |

Table 268-50 (Cont.) SET_COOKIE_SUPPORT Procedure Parameters

| Parameter | Description |
|----------------------|--|
| max_cookies_per_site | Sets the maximum number of cookies maintained in the current session for each Web site |

Usage Notes

If cookie support is enabled for an HTTP request, all cookies saved in the current session and applicable to the request are returned to the Web server in the request in accordance with HTTP cookie specification standards. Cookies set in the response to the request are saved in the current session for return to the Web server in the subsequent requests if cookie support is enabled for those requests. If the cookie support is disabled for an HTTP request, no cookies are returned to the Web server in the request and the cookies set in the response to the request are not saved in the current session, although the `Set-Cookie` HTTP headers can still be retrieved from the response.

Cookie support is enabled by default for all HTTP requests in a database user session. The default setting of the cookie support (enabled versus disabled) affects only the future requests and has no effect on the existing ones. After your request is created, the cookie support setting may be changed by using the other `SET_COOKIE_SUPPORT` procedure that operates on a request.

The default maximum number of cookies saved in the current session is 20 for each site and 300 total.

If you lower the maximum total number of cookies or the maximum number of cookies for each Web site, the oldest cookies will be purged first to reduce the number of cookies to the lowered maximum. HTTP cookies saved in the current session last for the duration of the database session only; there is no persistent storage for the cookies. Cookies saved in the current session are not cleared if you disable cookie support.

See "[Examples](#)" for how to use `GET_COOKIES` and `ADD_COOKIES` to retrieve, save, and restore cookies.

268.9.38 SET_DETAILED_EXCP_SUPPORT Procedure

This procedure sets the `UTL_HTTP` package to raise a detailed exception.

By default, `UTL_HTTP` raises the `request_failed` exception when an HTTP request fails. Use `GET_DETAILED_SQLCODE` and `GET_DETAILED_SQLEERM` for more detailed information about the error.

**See Also:**

[Session Settings](#) and [Session Settings Subprograms](#)

Syntax

```
UTL_HTTP.SET_DETAILED_EXCP_SUPPORT (
    enable IN BOOLEAN DEFAULT FALSE);
```

Parameters

Table 268-51 SET_DETAILED_EXCP_SUPPORT Procedure Parameters

| Parameter | Description |
|-----------|--|
| enable | Asks UTL_HTTP to raise a detailed exception directly if set to TRUE; otherwise FALSE |

268.9.39 SET_FOLLOW_REDIRECT Procedures

This procedure sets the maximum number of times UTL_HTTP follows the HTTP redirect instruction in the HTTP response to this request, or future requests, in the GET_RESPONSE function.

See Also:

- [HTTP Requests](#) and [HTTP Requests Subprograms](#)
- [Session Settings](#) and [Session Settings Subprograms](#)

Syntax

Use this procedure to set the maximum number of redirections:

```
UTL_HTTP.SET_FOLLOW_REDIRECT (
    max_redirects IN PLS_INTEGER DEFAULT 3);
```

Use this procedure to change the maximum number of redirections a request inherits from the session default setting:

```
UTL_HTTP.SET_FOLLOW_REDIRECT(
    r              IN OUT NOCOPY req,
    max_redirects IN PLS_INTEGER DEFAULT 3);
```

Parameters

Table 268-52 SET_FOLLOW_REDIRECT Procedure Parameters

| Parameter | Description |
|---------------|--|
| r | The HTTP request |
| max_redirects | The maximum number of redirects. Set to zero to disable redirects. |

Usage Notes

If max_redirects is set to a positive number, the [GET_RESPONSE Function](#) will automatically follow the redirected URL for the HTTP response status code 301, 302, and 307 for the HTTP HEAD and GET methods, and 303 for all HTTP methods, and retry the HTTP request (the request method will be changed to HTTP GET for the status code 303) at the new location. It follows the redirection until the final, non-

redirect location is reached, or an error occurs, or the maximum number of redirections has been reached (to prevent an infinite loop). The URL and method fields in the `REQ` record will be updated to the last redirected URL and the method used to access the URL. Set the maximum number of redirects to zero to disable automatic redirection.

While it is set not to follow redirect automatically in the current session, it is possible to specify individual HTTP requests to follow redirect instructions the function `FOLLOW_REDIRECT` and vice versa.

The default maximum number of redirections in a database user session is 3. The default value affects only future requests and has no effect on existing requests.

The `SET_FOLLOW_REDIRECT` procedure must be called before `GET_RESPONSE` for any redirection to take effect.

268.9.40 SET_HEADER Procedure

This procedure sets an HTTP request header. The request header is sent to the Web server as soon as it is set.

See Also:

[HTTP Requests](#) and [HTTP Requests Subprograms](#)

Syntax

```
UTL_HTTP.SET_HEADER (
    r          IN OUT NOCOPY req,
    name      IN VARCHAR2,
    value     IN VARCHAR2);
```

Parameters

Table 268-53 SET_HEADER Procedure Parameters

| Parameter | Description |
|--------------------|--------------------------------------|
| <code>r</code> | The HTTP request |
| <code>name</code> | The name of the HTTP request header |
| <code>value</code> | The value of the HTTP request header |

Usage Notes

Multiple HTTP headers with the same name are allowed in the HTTP protocol standard. Therefore, setting a header does not replace a prior header with the same name.

If the request is made using HTTP 1.1, `UTL_HTTP` sets the Host header automatically for you.

When you set the `Content-Type` header with this procedure, `UTL_HTTP` looks for the character set information in the header value. If the character set information is present, it is set as the character set of the request body. It can be overridden later by using the `SET_BODY_CHARSET` procedure.

When you set the Transfer-Encoding header with the value `chunked`, `UTL_HTTP` automatically encodes the request body written by the `WRITE_TEXT`, `WRITE_LINE` and `WRITE_RAW` procedures. Note that some HTTP-1.1-based Web servers or CGI programs do not support or accept the request body encoding in the HTTP 1.1 chunked transfer-encoding format.

268.9.41 SET_PERSISTENT_CONN_SUPPORT Procedure

This overloaded procedure provides persistent connection support. Descriptions of the different functionality are given in the syntax declarations.

See Also:

[HTTP Requests](#) and [HTTP Requests Subprograms](#)

Syntax

Sets whether future HTTP requests should support the HTTP 1.1 persistent connection or not, and the maximum numbers of persistent connections to be maintained in the current database user session.

```
UTL_HTTP.SET_PERSISTENT_CONN_SUPPORT(
    enable      IN BOOLEAN DEFAULT FALSE,
    max_conns   IN PLS_INTEGER DEFAULT 0);
```

Enables or disables support for the HTTP 1.1 persistent-connection in the request.

```
UTL_HTTP.SET_PERSISTENT_CONN_SUPPORT(
    r           IN OUT NOCOPY req,
    enable      IN BOOLEAN DEFAULT FALSE);
```

Parameters

Table 268-54 SET_PERSISTENT_CONN_SUPPORT Procedure Parameters

| Parameter | Description |
|----------------------------|--|
| <code>enable</code> | TRUE to keep the network connection persistent. FALSE otherwise. |
| <code>maximum_conns</code> | Maximum number of connections |
| <code>r</code> | The HTTP request |

Usage Notes

If the persistent-connection support is enabled for an HTTP request, the package will keep the network connections to a Web server or the proxy server open in the package after the request is completed properly for a subsequent request to the same server to reuse for each HTTP 1.1 protocol specification. With the persistent connection support, subsequent HTTP requests may be completed faster because the network connection latency is avoided. If the persistent-connection support is disabled for a request, the package will always send the HTTP header "Connection: close" automatically in the HTTP request and close the network connection when the request is completed. This setting has no effect on HTTP requests that follows HTTP 1.0

protocol, for which the network connections will always be closed after the requests are completed.

When a request is being made, the package attempts to reuse an existing persistent connection to the target Web server (or proxy server) if one is available. If none is available, a new network connection will be initiated. The persistent-connection support setting for a request affects only whether the network connection should be closed after a request completes.

Use this procedure to change the persistent-connection support setting a request inherits from the session default setting.

Users should note that while the use of persistent connections in UTL_HTTP may reduce the time it takes to fetch multiple Web pages from the same server, it consumes precious system resources (network connections) in the database server. Also, excessive use of persistent connections may reduce the scalability of the database server when too many network connections are kept open in the database server. Network connections should be kept open only if they will be used immediately by subsequent requests and should be closed immediately when they are no longer needed. Set the default persistent connection support as disabled in the session, and enable persistent connection in individual HTTP requests as shown in "Examples".

The default value of the maximum number of persistent connections in a database session is zero. To truly enable persistent connections, you must also set the maximum number of persistent connections to a positive value or no connections will be kept persistent.

Note that if you want to use persistent connections, you must call the overload that takes the `maximum_conns` parameter prior to calling the [BEGIN_REQUEST Function](#), otherwise persistent connections will not be enabled for the current request even if the other form of `SET_PERSISTENT_CONN_SUPPORT` is called.

Examples

Using `SET_PERSISTENT_CONN_SUPPORT` in http requests at the session level, showing the active persistent connection after each request

```
DECLARE
  pieces utl_http.html_pieces;
  conns  utl_http.connection_table;
BEGIN

  -- Turns on persistent connection support for the request_pieces call.
  utl_http.set_persistent_conn_support(true, 1);

  FOR i IN 1..10 LOOP

    pieces := utl_http.request_pieces('http://www.example.com/');

    -- Shows the active persistent connection
    utl_http.get_persistent_conns(conns);
    FOR j IN 1..conns.count LOOP
      dbms_output.put_line('Persistent connection '||j||': '||conns(j).host||': '||
conns(j).port);
    END LOOP;

  END LOOP;

  -- Turns off persistent connection support. Set active max persistent connection to
  0 to close all active connections.
```

```

    utl_http.set_persistent_conn_support(false, 0);

END;
/

```

Using SET_PERSISTENT_CONN_SUPPORT in HTTP requests showing how to use persistent connection individually in each request to fetch multiple URLs at the same host

```

DECLARE
-- Table to store the URLs
TYPE vc2_table IS TABLE OF VARCHAR2(256) INDEX BY BINARY_INTEGER;
paths VC2_TABLE;

PROCEDURE fetch_pages(paths IN vc2_table) AS
    req UTL_HTTP.REQ;
    resp UTL_HTTP.RESP;
    data VARCHAR2(1024);

BEGIN

    -- Set the proxy server
    UTL_HTTP.SET_PROXY('www-proxy.example.com:80', '');

    FOR i IN 1..paths.count LOOP

        req := UTL_HTTP.BEGIN_REQUEST(paths(i));

        -- Use persistent connections except for the last request
        IF (i < paths.count) THEN
            -- Use a persistent connection for the current request
            UTL_HTTP.SET_PERSISTENT_CONN_SUPPORT(req, TRUE);
        END IF;

        resp := UTL_HTTP.GET_RESPONSE(req);

        -- Display the results of the response
        DBMS_OUTPUT.PUT_LINE('-');
        DBMS_OUTPUT.PUT_LINE('URL: ' || paths(i));
        DBMS_OUTPUT.PUT_LINE('HTTP Response Status Code: ' || resp.status_code);
        DBMS_OUTPUT.PUT_LINE('HTTP Response Reason Phrase: ' || resp.reason_phrase);
        DBMS_OUTPUT.PUT_LINE('HTTP Response Version: ' || resp.http_version);

        BEGIN
            LOOP
                UTL_HTTP.READ_TEXT(resp, data);
                -- do something with the data
            END LOOP;
        EXCEPTION
            WHEN UTL_HTTP.END_OF_BODY THEN
                NULL;
        END;
        UTL_HTTP.END_RESPONSE(resp);
    END LOOP;
END;

BEGIN
-- Set a maximum of 1 persistent connection, but start with persistent
connections
-- off
    UTL_HTTP.SET_PERSISTENT_CONN_SUPPORT(FALSE, 1);

```

```

-- Create a list of URLs
paths(1) := 'http://www.example.com/technetwork/index.html';
paths(2) := 'http://www.example.com/us/products/index.html';

fetch_pages(paths);
END;
/

```

268.9.42 SET_PROXY Procedure

This procedure sets the proxy to be used for requests of the HTTP or other protocols, excluding those for hosts that belong to the domain specified in `no_proxy_domains`.

`no_proxy_domains` is a comma-, semi-colon-, or space-separated list of domains or hosts for which HTTP requests should be sent directly to the destination HTTP server instead of going through a proxy server.

See Also:

[Session Settings](#) and [Session Settings Subprograms](#)

Syntax

```

UTL_HTTP.SET_PROXY (
    proxy          IN VARCHAR2,
    no_proxy_domains IN VARCHAR2);

```

Parameters

Table 268-55 SET_PROXY Procedure Parameters

| Parameter | Description |
|-------------------------------|--|
| <code>proxy</code> | The proxy (host and an optional port number) to be used by the UTL_HTTP package |
| <code>no_proxy_domains</code> | The list of hosts and domains for which no proxy should be used for all requests |

Usage Notes

The proxy may include an optional TCP/IP port number at which the proxy server listens. The syntax is `[http://]host[:port][/]`, for example, `www-proxy.my-company.com:80`. If the port is not specified for the proxy, port 80 is assumed.

Optionally, a port number can be specified for each domain or host. If the port number is specified, the no-proxy restriction is only applied to the request at the port of the particular domain or host, for example, `corp.my-company.com`, `eng.my-company.com:80`. When `no_proxy_domains` is `NULL` and the proxy is set, all requests go through the proxy. When the proxy is not set, UTL_HTTP sends requests to the target Web servers directly.

You can define a username/password for the proxy to be specified in the proxy string. The format is

```
[http://][user[:password]@]host[:port][/]
```

If proxy settings are set when the database server instance is started, the proxy settings in the environment variables `http_proxy` and `no_proxy` are assumed. Proxy settings set by this procedure override the initial settings.

268.9.43 SET_RESPONSE_ERROR_CHECK Procedure

This procedure sets whether or not `GET_RESPONSE` raises an exception when the Web server returns a status code that indicates an error—a status code in the 4xx or 5xx ranges.

For example, when the requested URL is not found in the destination Web server, a 404 (document not found) response status code is returned.

See Also:

[Session Settings](#) and [Session Settings Subprograms](#)

Syntax

```
UTL_HTTP.SET_RESPONSE_ERROR_CHECK (
    enable IN BOOLEAN DEFAULT FALSE);
```

Parameters

Table 268-56 SET_RESPONSE_ERROR_CHECK Procedure Parameters

| Parameter | Description |
|---------------------|--|
| <code>enable</code> | TRUE to check for response errors; otherwise FALSE |

Usage Notes

If the status code indicates an error—a 4xx or 5xx code—and this procedure is enabled, `GET_RESPONSE` will raise the `HTTP_CLIENT_ERROR` or `HTTP_SERVER_ERROR` exception. If `SET_RESPONSE_ERROR_CHECK` is set to `FALSE`, `GET_RESPONSE` will not raise an exception when the status code indicates an error.

Response error check is turned off by default.

The `GET_RESPONSE` function can raise other exceptions when `SET_RESPONSE_ERROR_CHECK` is set to `FALSE`.

268.9.44 SET_TRANSFER_TIMEOUT Procedure

This procedure sets the default time out value for all future HTTP requests that the `UTL_HTTP` package should attempt while reading the HTTP response from the Web server or proxy server.

This time out value may be used to avoid the PL/SQL programs from being blocked by busy Web servers or heavy network traffic while retrieving Web pages from the Web servers.

**See Also:**

[Session Settings](#) and [Session Settings Subprograms](#)

Syntax

```
UTL_HTTP.SET_TRANSFER_TIMEOUT (  
    timeout IN PLS_INTEGER DEFAULT 60);
```

Parameters**Table 268-57 SET_TRANSFER_TIMEOUT Procedure Parameters**

| Parameter | Description |
|-----------|--|
| timeout | The network transfer timeout value in seconds. |

Usage Notes

The default value of the time out is 60 seconds.

268.9.45 SET_WALLET Procedure

This procedure sets the Oracle wallet used for all HTTP requests over Secured Socket Layer (SSL), namely HTTPS.

When the `UTL_HTTP` package communicates with an HTTP server over SSL, the HTTP server presents its digital certificate, which is signed by a certificate authority, to the `UTL_HTTP` package for identification purpose. The Oracle wallet contains the list of certificate authorities that are trusted by the user of the `UTL_HTTP` package. An Oracle wallet is required to make an HTTPS request.

**See Also:**

- [Session Settings](#) and [Session Settings Subprograms](#)
- *Oracle Database Security Guide* managing fine-grained access

Syntax

```
UTL_HTTP.SET_WALLET (  
    path      IN VARCHAR2,  
    password  IN VARCHAR2 DEFAULT NULL);
```

Parameters

Table 268-58 SET_WALLET Procedure Parameters

| Parameter | Description |
|-----------|--|
| path | The directory path that contains the Oracle wallet. The format is <code>file:directory-path</code> . The format of <code>wallet_path</code> on a PC is, for example, <code>file:c:\WINNT\Profiles\username\WALLETS</code> , and in Unix is, for example, <code>file:/home/username/wallets</code> . When the UTL_HTTP package is executed in the Oracle database server, the wallet is accessed from the database server. Therefore, the wallet path must be accessible from the database server. |
| password | The password needed to open the wallet. If the wallet is auto-login enabled, the password may be omitted and should be set to <code>NULL</code> . See <i>Oracle Database Advanced Security Guide</i> for information about using Oracle Wallet Manager and the <code>ORAPKI</code> utility to create an auto-login wallet. |

Usage Notes

To set up an Oracle wallet, use the Oracle Wallet Manager to create a wallet. In order for the HTTPS request to succeed, the certificate authority that signs the certificate of the remote HTTPS Web server must be a trust point set in the wallet.

When a wallet is created, it is populated with a set of well-known certificate authorities as trust points. If the certificate authority that signs the certificate of the remote HTTPS Web server is not among the trust points, or the certificate authority has new root certificates, you should obtain the root certificate of that certificate authority and install it as a trust point in the wallet using Oracle Wallet Manager

See Also:

Oracle Database Advanced Security Guide for more information on Wallet Manager

268.9.46 WRITE_LINE Procedure

This procedure writes a text line in the HTTP request body and ends the line with new-line characters (CRLF as defined in `UTL_TCP`).

As soon as some data is sent as the HTTP request body, the HTTP request headers section is completed. Text data is automatically converted from the database character set to the request body character set.

See Also:

[HTTP Requests](#) and [HTTP Requests Subprograms](#)

Syntax

```
UTL_HTTP.WRITE_LINE(  
    r      IN OUT NOCOPY req,  
    data  IN VARCHAR2 CHARACTER SET ANY_CS);
```

Parameters

Table 268-59 WRITE_LINE Procedure Parameters

| Parameter | Description |
|-----------|--|
| r | The HTTP request |
| data | The text line to send in the HTTP request body |

Usage Notes

An HTTP client must always let the remote Web server know the length of the request body it is sending. If the amount of data is known beforehand, you can set the `Content-Length` header in the request, where the length of the content is measured in bytes instead of characters. If the length of the request body is not known beforehand, you can send the request body using the HTTP 1.1 chunked transfer-encoding format. The request body is sent in chunks, where the length of each chunk is sent before the chunk is sent. The `UTL_HTTP` package performs chunked transfer-encoding on the request body transparently when the `Transfer-Encoding: chunked` header is set. Note that some HTTP-1.1-based Web servers or CGI programs do not support or accept the request body encoding in the HTTP 1.1 chunked transfer-encoding format. See the `SET_HEADER` procedure for details.

If you send the `Content-Length` header, you should note that the length specified in the header should be the byte-length of the textual request body after it is converted from the database character set to the request body character set. When either one of the two character sets is a multibyte character set, the precise byte-length of the request body in the request body character set cannot be known beforehand. In this case, you can perform the character set conversion explicitly, determine the byte-length of the results, send the `Content-Length` header, and the results using the `WRITE_RAW` procedure to avoid the automatic character set conversion. Or, if the remote Web server or CGI programs allow, you can send the request body using the HTTP 1.1 chunked transfer-encoding format, where `UTL_HTTP` handles the length of the chunks transparently.

268.9.47 WRITE_RAW Procedure

This procedure writes some binary data in the HTTP request body. As soon as some data is sent as the HTTP request body, the HTTP request headers section is completed.

See Also:

[HTTP Requests](#) and [HTTP Requests Subprograms](#)

Syntax

```
UTL_HTTP.WRITE_RAW(  
  r      IN OUT NOCOPY REQ,  
  data  IN          RAW);
```

Parameters

Table 268-60 WRITE_RAW Procedure Parameters

| Parameter | Description |
|-----------|--|
| r | The HTTP request |
| data | The binary data to send in the HTTP request body |

Usage Notes

An HTTP client must always let the remote Web server know the length of the request body it is sending. If the amount of data is known beforehand, you can set the `Content-Length` header in the request, where the length of the content is measured in bytes instead of characters. If the length of the request body is not known beforehand, you can send the request body using the HTTP 1.1 chunked transfer-encoding format. The request body is sent in chunks, where the length of each chunk is sent before the chunk is sent. `UTL_HTTP` performs chunked transfer-encoding on the request body transparently when the `Transfer-Encoding:chunked` header is set. Note that some HTTP-1.1-based Web servers or CGI programs do not support or accept the request body encoding in the HTTP 1.1 chunked transfer-encoding format. See the `SET_HEADER` procedure for details.

268.9.48 WRITE_TEXT Procedure

This procedure writes some text data in the HTTP request body.

As soon as some data is sent as the HTTP request body, the HTTP request headers section is completed. Text data is automatically converted from the database character set to the request body character set.

See Also:

[HTTP Requests](#) and [HTTP Requests Subprograms](#)

Syntax

```
UTL_HTTP.WRITE_TEXT(  
  r      IN OUT NOCOPY REQ,  
  data  IN          VARCHAR2 CHARACTER SET ANY_CS);
```

Parameters

Table 268-61 WRITE_TEXT Procedure Parameters

| Parameter | Description |
|-----------|--|
| r | The HTTP request |
| data | The text data to send in the HTTP request body |

Usage Notes

An HTTP client must always let the remote Web server know the length of the request body it is sending. If the amount of data is known beforehand, you can set the `Content-Length` header in the request, where the length of the content is measured in bytes instead of characters. If the length of the request body is not known beforehand, you can send the request body using the HTTP 1.1 chunked transfer-encoding format. The request body is sent in chunks, where the length of each chunk is sent before the chunk is sent. `UTL_HTTP` performs chunked transfer-encoding on the request body transparently when the `Transfer-Encoding: chunked` header is set. Note that some HTTP-1.1-based Web servers or CGI programs do not support or accept the request body encoding in the HTTP 1.1 chunked transfer-encoding format. See the `SET_HEADER` procedure for details.

If you send the `Content-Length` header, you should note that the length specified in the header should be the byte-length of the textual request body after it is converted from the database character set to the request body character set. When either one of the two character sets is a multibyte character set, the precise byte-length of the request body in the request body character set cannot be known beforehand. In this case, you can perform the character set conversion explicitly, determine the byte-length of the results, send the `Content-Length` header, and the results using the `WRITE_RAW` procedure to avoid the automatic character set conversion. Or, if the remote Web server or CGI programs allow, you can send the request body using the HTTP 1.1 chunked transfer-encoding format, where `UTL_HTTP` handles the length of the chunks transparently.

UTL_I18N

UTL_I18N is a set of services that provides additional globalization functionality for applications written in PL/SQL.

See Also:

Oracle Database Globalization Support Guide

The chapter contains the following topics:

- [Overview](#)
- [Security Model](#)
- [Constants](#)
- [Summary of UTL_I18N Subprograms](#)

269.1 UTL_I18N Overview

UTL_I18N services provide additional globalization functionality for applications written in PL/SQL.

The UTL_I18N PL/SQL package consists of the following categories of services:

- String conversion functions for various datatypes.
- Functions that convert a text string to character references and vice versa.
- Functions that map between Oracle, Java, and ISO languages and territories.
- Functions that map between Oracle, Internet Assigned Numbers Authority (IANA), and e-mail safe character sets.
- A function that returns the Oracle character set name from an Oracle language name.
- A function that returns the maximum number of bytes for a character of an Oracle character set.
- A function that performs script transliteration.
- Functions that return the ISO currency code, local time zones, and local languages supported for a given territory.
- Functions that return the most appropriate linguistic sort, a listing of all the applicable linguistic sorts, and the local territories supported for a given language.
- Functions that map between the Oracle full and short language names.
- A function that returns the language translation of a given language and territory name.
- A function that returns a listing of the most commonly used time zones.

269.2 UTL_I18N Security Model

The functions of the `UTL_I18N` package neither read database contents nor modify them. The functions operate on their arguments only and/or they retrieve static internationalization information from NLS Data files. The execution privilege for the package is granted to `PUBLIC` by default

269.3 UTL_I18N Constants

`UTL_I18N` defines constants to use when specifying parameter values.

These constants are shown in the following table.

Table 269-1 UTL_I18N Constants

| Constant | Type | Value | Description |
|------------------------------------|---------------------------|-------------------------|--|
| <code>GENERIC_CONTEXT</code> | <code>PLS_INTEGER</code> | 0 | Returns the default character set for general cases. |
| <code>MAIL_GENERIC</code> | <code>PLS_INTEGER</code> | 0 | Map from an Oracle character set name to an email safe character set name on a non-Windows platform. |
| <code>ORACLE_TO_IANA</code> | <code>PLS_INTEGER</code> | 0 | Map from an Oracle character set name to an IANA character set name. |
| <code>SHIFT_IN</code> | <code>PLS_INTEGER</code> | 0 | Used with <code>shift_status</code> . Must be set the first time it is called in piecewise conversion. |
| <code>IANA_TO_ORACLE</code> | <code>PLS_INTEGER</code> | 1 | Map from an IANA character set name to an Oracle character set name. |
| <code>MAIL_CONTEXT</code> | <code>PLS_INTEGER</code> | 1 | The mapping is between an Oracle character set name and an email safe character set name. |
| <code>MAIL_WINDOWS</code> | <code>PLS_INTEGER</code> | 1 | Map from an Oracle character set name to an email safe character set name on a Windows platform. |
| <code>SHIFT_OUT</code> | <code>PLS_INTEGER</code> | 1 | |
| <code>FWKATAKANA_HIRAGANA</code> | <code>VARCHAR2(30)</code> | 'fwkatakana_hiragana' | Converts only fullwidth Katakana characters to fullwidth Hiragana characters. |
| <code>FWKATAKANA_HWKATAKANA</code> | <code>VARCHAR2(30)</code> | 'fwkatakana_hwkatakana' | Converts only fullwidth Katakana characters to halfwidth Katakana characters. |
| <code>HIRAGANA_FWKATAKANA</code> | <code>VARCHAR2(30)</code> | 'hiragana_fwkatana' | Converts only fullwidth Hiragana characters to fullwidth Katakana characters. |
| <code>HIRAGANA_HWKATAKANA</code> | <code>VARCHAR2(30)</code> | 'hiragana_hwkatana' | Converts only fullwidth Hiragana characters to halfwidth Katakana characters. |

Table 269-1 (Cont.) UTL_I18N Constants

| Constant | Type | Value | Description |
|---------------------------|--------------|-----------------------------|---|
| HWKATAKANA_FWKA TAKANA | VARCHAR2(30) | 'hwkatakana_fw katakana' | Converts only halfwidth Katakana characters to fullwidth Katakana characters. |
| HWKATAKANA_HIRA GANA | VARCHAR2(30) | 'hwkatakana_hi ragana' | Converts only halfwidth Katakana characters to fullwidth Hiragana characters. |
| KANA_FWKATAKANA | VARCHAR2(30) | 'kana_fwkataka na' | Converts any type of Kana character to a fullwidth Katakana character. |
| KANA_HIRAGANA | VARCHAR2(30) | 'kana_hiragana ' | Converts any type of Kana character to a fullwidth Hiragana character. |
| KANA_HWKATAKANA | VARCHAR2(30) | 'kana_hwkataka na' | Converts any type of Kana character to a halfwidth Katakana character. |

269.4 Summary of UTL_I18N Subprograms

This table lists the UTL_I18N subprograms and briefly describes them.

Table 269-2 UTL_I18N Package Subprograms

| Procedure | Description |
|--|--|
| ESCAPE_REFERENCE Function | Converts a given text string to its character reference counterparts, for characters that fall outside the document character set. |
| GET_COMMON_TIME_ZONES Function | Returns the list of common time zone IDs that are independent of the locales. |
| GET_DEFAULT_CHARSET Function | Returns the default Oracle character set name or the default e-mail safe character set name from an Oracle language name. |
| GET_DEFAULT_ISO_CURRENCY Function | Returns the default ISO 4217 currency code for the specified territory. |
| GET_DEFAULT_LINGUISTIC_SORT Function | Returns the default linguistic sort name for the specified language. |
| GET_LOCAL_LANGUAGES Function | Returns the local language names for the specified territory. |
| GET_LOCAL_LINGUISTIC_SORTS Function | Returns the local linguistic sort names for the specified language. |
| GET_LOCAL_TERRITORIES Function | Returns the local territory names for the specified language. |
| GET_LOCAL_TIME_ZONES Function | Returns the local time zone IDs for the specified territory. |
| GET_MAX_CHARACTER_SIZE Function | Returns the maximum character size of a given character set. |
| GET_TRANSLATION Function | Returns the translation of the language and territory name in the specified translation language. |

Table 269-2 (Cont.) UTL_I18N Package Subprograms

| Procedure | Description |
|--|---|
| MAP_CHARSET Function | <ul style="list-style-type: none"> Maps an Oracle character set name to an IANA character set name. Maps an IANA character set name to an Oracle character set name. Maps an Oracle character set name to an e-mail safe character set name. |
| MAP_FROM_SHORT_LANGUAGE Function | Maps an Oracle short language name to an Oracle language name. |
| MAP_LANGUAGE_FROM_ISO Function | Returns an Oracle language name from an ISO locale name. |
| MAP_LOCALE_TO_ISO Function | Returns an ISO locale name from the Oracle language and territory name. |
| MAP_TERRITORY_FROM_ISO Function | Returns an Oracle territory name from an ISO locale name. |
| MAP_TO_SHORT_LANGUAGE Function | Maps an Oracle language name to an Oracle short language name. |
| RAW_TO_CHAR Functions | Converts RAW data that is not encoded in the database character set into a VARCHAR2 string |
| RAW_TO_NCHAR Functions | Converts RAW data that is not encoded in the national character set into an NVARCHAR2 string |
| STRING_TO_RAW Function | Converts a VARCHAR2 or NVARCHAR2 string to another character set. The result is returned as a RAW datatype. |
| TRANSLITERATE Function | Transliterates between Japanese hiragana and katakana. |
| UNESCAPE_REFERENCE Function | Converts an input string that contains character references to a text string. |
| VALIDATE_CHARACTER_ENCODING Function | Validates the character encoding of VARCHAR2, NVARCHAR2, CLOB, and NCLOB data. |

269.4.1 ESCAPE_REFERENCE Function

This function converts a text string to its character reference counterparts for characters that fall outside the character set used by the current document.

Character references are mainly used in HTML and XML documents to represent characters independently of the encoding of the document. Character references may appear in two forms, numeric character references and character entity references. Numeric character references specify the Unicode code point value of a character, while character entity references use symbolic names to refer to the same character. For example, `å` is the numeric character reference for the small letter "a" with a ring above, whereas `å` is the character entity reference for the same character. Character entity references are also used to escape special characters, as an example, `<` represents the < (less than) sign. This is to avoid possible confusion with the beginning of a tag in Markup languages.

Syntax

```
UTL_I18N.ESCAPE_REFERENCE (
    str          IN VARCHAR2 CHARACTER SET ANY_CS,
```

```

    page_cs_name    IN VARCHAR2 DEFAULT NULL)
RETURN VARCHAR2 CHARACTER SET str%CHARSET;
```

Parameters

Table 269-3 ESCAPE_REFERENCE Function Parameters

| Parameter | Description |
|--------------|--|
| str | Specifies the input string |
| page_cs_name | Specifies the character set of the document. If page_cs_name is NULL, then the database character set is used for CHAR data and the national character set is used for NCHAR data. |

Usage Notes

If the user specifies an invalid character set or a NULL string, then the function returns a NULL string.

Examples

```
UTL_I18N.ESCAPE_REFERENCE('hello < '||chr(229),'us7ascii')
```

This returns 'hello < å'.

269.4.2 GET_COMMON_TIME_ZONES Function

This function returns a listing of the most coemmonly used time zones. This list contains a subset of the time zones that are supported in the database.

Syntax

```
UTL_I18N.GET_COMMON_TIME_ZONES
RETURN STRING_ARRAY;
```

Examples

Returns the list of the most commonly used time zones.

```

DECLARE
    retval UTL_I18N.STRING_ARRAY;
BEGIN
    retval := UTL_I18N.GET_COMMON_TIME_ZONES;
END;
/
```

269.4.3 GET_DEFAULT_CHARSET Function

This function returns the default Oracle character set name or the default e-mail safe character set name from an Oracle language name.

See Also:

"[MAP_CHARSET Function](#)" for an explanation of an e-mail safe character set

Syntax

```

UTL_I18N.GET_DEFAULT_CHARSET(
    language IN VARCHAR2,
    context IN PLS_INTEGER DEFAULT GENERIC_CONTEXT,
    iswindows IN BOOLEAN DEFAULT FALSE)
RETURN VARCHAR2;

```

Parameters

Table 269-4 GET_DEFAULT_CHARSET Function Parameters

| Parameter | Description |
|-----------|---|
| language | Specifies a valid Oracle language |
| context | GENERIC_CONTEXT MAIL_CONTEXT GENERIC_CONTEXT: Returns the default character set for general cases MAIL_CONTEXT: Returns the default e-mail safe character set name |
| iswindows | If context is set as MAIL_CONTEXT, then iswindows should be set to TRUE if the platform is Windows and FALSE if the platform is not Windows. The default is FALSE. iswindows has no effect if context is set as GENERIC_CONTEXT. |

Usage Notes

If the user specifies an invalid language name or an invalid flag, then the function returns a NULL string.

Examples

GENERIC_CONTEXT, iswindows=FALSE

```
UTL_I18N.GET_DEFAULT_CHARSET('French', UTL_I18N.GENERIC_CONTEXT, FALSE)
```

This returns 'WE8ISO8859P1'.

MAIL_CONTEXT, iswindows=TRUE

```
UTL_I18N.GET_DEFAULT_CHARSET('French', UTL_I18N.MAIL_CONTEXT, TRUE)
```

This returns 'WE8MSWIN1252'.

MAIL_CONTEXT, iswindows=FALSE

```
UTL_I18N.GET_DEFAULT_CHARSET('French', UTL_I18N.MAIL_CONTEXT, FALSE)
```

This returns 'WE8ISO8859P1'.

269.4.4 GET_DEFAULT_ISO_CURRENCY Function

This function returns the default ISO 4217 currency code for the specified territory.

Syntax

```
UTL_I18N.GET_DEFAULT_ISO_CURRENCY (  
    territory IN VARCHAR2 CHARACTER SET ANY_CS)  
RETURN VARCHAR2;
```

Parameters

Table 269-5 GET_DEFAULT_ISO_CURRENCY Function Parameters

| Parameter | Description |
|-----------|---|
| territory | Specifies a valid Oracle territory. It is case-insensitive. |

Usage Notes

If the user specifies an invalid territory name, then the function returns a NULL string.

Examples

Displays the default ISO currency code for China.

```
DECLARE  
    retval VARCHAR2(50);  
BEGIN  
    retval := UTL_I18N.GET_DEFAULT_ISO_CURRENCY('CHINA');  
    DBMS_OUTPUT.PUT_LINE(retval);  
END;  
/
```

269.4.5 GET_DEFAULT_LINGUISTIC_SORT Function

This function returns the most commonly used Oracle linguistic sort for the specified language.

Syntax

```
UTL_I18N.GET_DEFAULT_LINGUISTIC_SORT (  
    language IN VARCHAR2 CHARACTER SET ANY_CS)  
RETURN VARCHAR2;
```

Parameters

Table 269-6 GET_DEFAULT_LINGUISTIC_SORT Function Parameters

| Parameter | Description |
|-----------|--|
| language | Specifies a valid Oracle language. It is case-insensitive. |

Usage Notes

If the user specifies an invalid language name, then the function returns a NULL string.

Examples

Displays the name of the most appropriate linguistic sort name for the language used in the current SQL session.

```

DECLARE
    retval VARCHAR2(50);
BEGIN
    SELECT value INTO retval FROM nls_database_parameters
    WHERE parameter = 'NLS_LANGUAGE';
    retval := UTL_I18N.GET_DEFAULT_LINGUISTIC_SORT(retval);
    DBMS_OUTPUT.PUT_LINE(retval);
END;
/

```

269.4.6 GET_LOCAL_LANGUAGES Function

This function returns the local language names for the specified territory.

Syntax

```

UTL_I18N.GET_LOCAL_LANGUAGES (
    territory    IN VARCHAR2 CHARACTER SET ANY_CS)
RETURN STRING_ARRAY;

```

Parameters

Table 269-7 GET_LOCAL_LANGUAGES Function Parameters

| Parameter | Description |
|-----------|---|
| territory | Specifies a valid Oracle territory. It is case-insensitive. |

Usage Notes

If the user specifies an invalid territory name, then the function returns a NULL string.

Examples

Returns the list of local languages used in Belgium.

```

DECLARE
    retval UTL_I18N.STRING_ARRAY;
    cnt    INTEGER;
BEGIN
    retval := UTL_I18N.GET_LOCAL_LANGUAGES('BELGIUM');
    DBMS_OUTPUT.PUT('Count = ');
    DBMS_OUTPUT.PUT_LINE(retval.LAST);
    cnt := retval.FIRST;
    WHILE cnt IS NOT NULL LOOP
        DBMS_OUTPUT.PUT_LINE(retval(cnt));
        cnt := retval.NEXT(cnt);
    END LOOP;
END;
/
...
Count = 2

```

DUTCH
FRENCH

269.4.7 GET_LOCAL_LINGUISTIC_SORTS Function

This function returns a list of the Oracle linguistic sort names that are appropriate for the specified language. A `BINARY` sort is included for all languages.

Syntax

```
UTL_I18N.GET_LOCAL_LINGUISTIC_SORTS (
    language IN VARCHAR2 CHARACTER SET ANY_CS)
RETURN STRING_ARRAY;
```

Parameters

Table 269-8 GET_LOCAL_LINGUISTIC_SORTS Function Parameters

| Parameter | Description |
|-----------|--|
| language | Specifies a valid Oracle language. It is case-insensitive. |

Usage Notes

If the user specifies an invalid language name, then the function returns a `NULL` string.

Examples

Displays the local linguistic sort names for `JAPANESE`.

```
DECLARE
    retval UTL_I18N.STRING_ARRAY;
    cnt INTEGER;
BEGIN
    retval := UTL_I18N.GET_LOCAL_LINGUISTIC_SORTS('Japanese');
    DBMS_OUTPUT.PUT('Count = ');
    DBMS_OUTPUT.PUT_LINE(retval.COUNT);
    cnt := retval.FIRST;
    WHILE cnt IS NOT NULL LOOP
        DBMS_OUTPUT.PUT_LINE(retval(cnt));
        cnt := retval.NEXT(cnt);
    END LOOP;
END;
/

...
Count = 2
JAPANESE_M
BINARY
```

269.4.8 GET_LOCAL_TERRITORIES Function

This function returns the local territory names for the specified language.

Syntax

```
UTL_I18N.GET_LOCAL_TERRITORIES (
    language IN VARCHAR2 CHARACTER SET ANY_CS)
RETURN STRING_ARRAY;
```

Parameters

Table 269-9 GET_LOCAL_TERRITORIES Function Parameters

| Parameter | Description |
|-----------|--|
| language | Specifies a valid Oracle language. It is case-insensitive. |

Usage Notes

If the user specifies an invalid language name, then the function returns a NULL string.

Examples

Returns the list of Oracle territories that use German as one of their local languages.

```
DECLARE
    retval UTL_I18N.STRING_ARRAY;
    cnt    INTEGER;
BEGIN
    retval := UTL_I18N.GET_LOCAL_TERRITORIES('GERMAN');
    DBMS_OUTPUT.PUT('Count = ');
    DBMS_OUTPUT.PUT_LINE(retval.LAST);
    cnt := retval.FIRST;
    WHILE cnt IS NOT NULL LOOP
        DBMS_OUTPUT.PUT_LINE(retval(cnt));
        cnt := retval.NEXT(cnt);
    END LOOP;
END;
/
...
Count = 4
GERMANY
AUSTRIA
LUXEMBOURG
SWITZERLAND
```

269.4.9 GET_LOCAL_TIME_ZONES Function

This function returns the local time zone IDs for the specified territory.

Syntax

```
UTL_I18N.GET_LOCAL_TIME_ZONES (
    territory IN VARCHAR2 CHARACTER SET ANY_CS DEFAULT NULL)
RETURN STRING_ARRAY;
```

Parameters

Table 269-10 GET_LOCAL_TIME_ZONES Function Parameters

| Parameter | Description |
|-----------|---|
| territory | Specifies a valid Oracle territory. It is case-insensitive. |

Usage Notes

If the user specifies an invalid territory name, then the function returns a `NULL` string.

Examples

Creates a function that returns the list of time zones locally used in the territory `AZERBAIJAN` followed by the general common time zones. This is useful for when the user's territory is known and the application still allows the user to choose other time zones as a user's preference.

```
CREATE OR REPLACE FUNCTION get_time_zones
(territory IN VARCHAR2 CHARACTER SET ANY_CS)
RETURN utl_i18n.string_array
IS
    retval    utl_i18n.string_array;
    retval2   utl_i18n.string_array;
    stpos     INTEGER;
BEGIN
    retval := utl_i18n.get_local_time_zones(
        territory);
    retval2 := utl_i18n.get_common_time_zones;
    stpos := retval.LAST + 1;
    retval(stpos) := '-----'; -- a separator
    FOR i IN retval2.FIRST..retval2.LAST LOOP
        stpos := stpos + 1;
        retval(stpos) := retval2(i);
    END LOOP;
    RETURN retval;
END;
```

Returns the list of local time zones for `AZERBAIJAN` followed by the common time zones with a separator string of five dashes (-----).

```
DECLARE
    retval UTL_I18N.STRING_ARRAY;
    cnt INTEGER;
BEGIN
    DBMS_OUTPUT.ENABLE(100000);
    retval UTL_I18N.GET_TIME_ZONES('AZERBAIJAN');
    cnt := retval.FIRST;
    WHILE cnt IS NOT NULL LOOP
        DBMS_OUTPUT.PUT_LINE(retval(cnt));
        cnt := retval.NEXT(cnt);
    END LOOP;
END;
```

```
Asia/Baku
-----
```

```
Pacific/Pago_Pago
Pacific/Honolulu
America/Anchorage
America/Vancouver
America/Los_Angeles
America/Tijuana
America/Edmonton
America/Denver
America/Phoenix
America/Mazatlan
America/Winnipeg
America/Regina
America/Chicago
America/Mexico_City
America/Guatemala
America/El_Salvador
America/Managua
America/Costa_Rica
America/Montreal
...
```

269.4.10 GET_MAX_CHARACTER_SIZE Function

This function returns the maximum character size of a given character set.

Syntax

```
UTL_I18N.GET_MAX_CHARACTER_SIZE(
    charset_name          IN VARCHAR2 CHARACTER SET ANY_CS)
RETURN PLS_INTEGER;
```

Parameters

Table 269-11 GET_MAX_CHARACTER_SIZE Function Parameters

| Parameter | Description |
|--------------|---|
| charset_name | Specifies a valid character set name. It is case-insensitive. |

Usage Notes

For shift-sensitive character sets, the returned maximum character size will include the possible extra shift characters.

Examples

```
UTL_I18N.GET_MAX_CHARACTER_SIZE('AL32UTF8');
```

This returns 4.

269.4.11 GET_TRANSLATION Function

This function returns the translation of the language and territory name in the specified translation language.

Syntax

```
UTL_I18N.GET_TRANSLATION (
    parameter          IN VARCHAR2 CHARACTER SET ANY_CS,
    trans_language     IN VARCHAR2 'AMERICAN',
    flag               IN PLS_INTEGER DEFAULT LANGUAGE_TRANS)
RETURN VARCHAR2 CHARACTER SET parameter%CHARSET;
```

Parameters

Table 269-12 GET_TRANSLATION Function Parameters

| Parameter | Description |
|----------------|--|
| parameter | Specifies a valid language name, territory name, or a combined string in the form of <i>language_territory</i> . It is case-insensitive. |
| trans_language | Specifies a translation language name. For example, ITALIAN is for the Italian language. The default is AMERICAN, which indicates American English. |
| flag | Specifies the translation type: <ul style="list-style-type: none"> LANGUAGE_TRANS: The function returns the language translation. TERRITORY_TRANS: The function returns the territory translation. LANGUAGE_TERRITORY_TRANS: The function returns the language and territory translation. The default translation type is LANGUAGE_TRANS. |

Usage Notes

If VARCHAR2 is used as a parameter type, the returned translation text can be corrupted due to the conversion to the database character set. Using NVARCHAR2 as the parameter type will preserve the translation text because Unicode can encode all translated languages.

If the specified translation language is not available or an invalid name is provided, the default "American English" translations are returned. For example, Oracle does not provide GUJARATI translations, so the returned translation would be in American English.

Examples

The following returns the names of all the Oracle-supported languages in Italian.

```
DECLARE
    CURSOR c1 IS
        SELECT value FROM V$NLS_VALID_VALUES
        WHERE parameter = 'LANGUAGE'
        ORDER BY value;
    retval NVARCHAR2(100);
BEGIN
    FOR item IN c1 LOOP
        retval := UTL_I18N.GET_TRANSLATION (TO_NCHAR(item.value), 'italian');
    END LOOP;
END;
```

269.4.12 MAP_CHARSET Function

This function maps a character set to another character set.

It maps the following:

- An Oracle character set name to an IANA character set name.
- An IANA character set name to an Oracle character set name.
- An Oracle character set to an e-mail safe character set name.

Syntax

```
UTL_I18N.MAP_CHARSET (
    charset    IN VARCHAR2,
    context    IN PLS_INTEGER DEFAULT GENERIC_CONTEXT,
    flag       IN PLS_INTEGER DEFAULT ORACLE_TO_IANA)
RETURN VARCHAR2;
```

Parameters

Table 269-13 MAP_CHARSET Function Parameters

| Parameter | Description |
|-----------|--|
| charset | Specifies the character set name to be mapped. The mapping is case-insensitive. |
| context | GENERIC_CONTEXT MAIL_CONTEXT GENERIC_CONTEXT: The mapping is between an Oracle character set name and an IANA character set name. This is the default value. MAIL_CONTEXT: The mapping is between an Oracle character set name and an email safe character set name. |
| flag | <ul style="list-style-type: none"> • ORACLE_TO_IANA IANA_TO_ORACLE if GENERIC_CONTEXT is set ORACLE_TO_IANA: Map from an Oracle character set name to an IANA character set name. This is the default. IANA_TO_ORACLE: Map from an IANA character set name to an Oracle character set name. • MAIL_GENERIC MAIL_WINDOWS if MAIL_CONTEXT is set MAIL_GENERIC: Map from an Oracle character set name to an email safe character set name on a non-Windows platform. MAIL_WINDOWS: Map from an Oracle character set name to an email safe character set name on a Windows platform. |

Usage Notes

An e-mail safe character set is an Oracle character set that is commonly used by applications when they submit e-mail messages. The character set is usually used to convert contents in the database character set to e-mail safe contents. To specify the character set name in the mail header, you should use the corresponding IANA character set name obtained by calling the MAP_CHARSET function with the ORACLE_TO_IANA option, providing the e-mail safe character set name as input.

For example, no e-mail client recognizes message contents in the WE8DEC character set, whose corresponding IANA name is DEC-MCS. If WE8DEC is passed to the

`MAP_CHARSET` function with the `MAIL_CONTEXT` option, then the function returns `WE8ISO8859P1`. Its corresponding IANA name, `ISO-8859-1`, is recognized by most e-mail clients.

The steps in this example are as follows:

1. Call the `MAP_CHARSET` function with the `MAIL_CONTEXT | MAIL_GENERIC` option with the database character set name, `WE8DEC`. The result is `WE8ISO8859P1`.
2. Convert the contents stored in the database to `WE8ISO8859P1`.
3. Call the `MAP_CHARSET` function with the `ORACLE_TO_IANA | GENERIC_CONTEXT` option with the e-mail safe character set, `WE8ISO8859P1`. The result is `ISO-8859-1`.
4. Specify `ISO-8859-1` in the mail header when the e-mail message is submitted.

The function returns a character set name if a match is found. If no match is found or if the flag is invalid, then it returns `NULL`.

 **Note:**

Many Oracle character sets can map to one e-mail safe character set. There is no function that maps an e-mail safe character set to an Oracle character set name.

Examples

Generic Context

```
UTL_I18N.MAP_CHARSET('iso-8859-1',UTL_I18N.GENERIC_CONTEXT,UTL_I18N.IANA_TO_ORACLE)
```

This returns 'WE8ISO8859P1'.

Context

```
UTL_I18N.MAP_CHARSET('WE8DEC', utl_i18n.mail_context, utl_i18n.mail_generic)
```

This returns 'WE8ISO8859P1'.

 **See Also:**

Oracle Database Globalization Support Guide for a list of valid Oracle character sets

269.4.13 MAP_FROM_SHORT_LANGUAGE Function

This function maps an Oracle short language name to an Oracle language name.

Syntax

```
UTL_I18N.MAP_FROM_SHORT_LANGUAGE (  
    language          IN VARCHAR2 CHARACTER SET ANY_CS)  
RETURN VARCHAR2;
```

Parameters

Table 269-14 MAP_FROM_SHORT_LANGUAGE Function Parameters

| Parameter | Description |
|-----------|--|
| language | Specifies a valid short language name. It is case-insensitive. |

Usage Notes

If the user specifies an invalid language name, then the function returns a `NULL` string.

Examples

Returns the default linguistic sort name for the customer with the ID of 9000. Note that the table `customers` is from the `oe` user in the Common Schema. Because the customer's language preference is stored using a short language name, you need to convert to a full language name by calling the `GET_DEFAULT_LINGUISTIC_SORT` procedure.

```

DECLARE
    short_n VARCHAR2(10);
    ling_n VARCHAR2(50);
BEGIN
    SELECT nls_language INTO short
    FROM customers WHERE customer_id = 9000;
    ling_n := UTL_I18N.GET_DEFAULT_LINGUISTIC_SORT (
    UTL_I18N.MAP_FROM_SHORT_LANGUAGE(short_n));
    DBMS_OUTPUT.PUT_LINE(ling_n);
END;
/

```

269.4.14 MAP_LANGUAGE_FROM_ISO Function

This function returns an Oracle language name from an ISO locale name.

Syntax

```

UTL_I18N.MAP_LANGUAGE_FROM_ISO(
    isocale IN VARCHAR2)
RETURN VARCHAR2;

```

Parameters

Table 269-15 MAP_LANGUAGE_FROM_ISO Function Parameters

| Parameter | Description |
|-----------|--|
| isocale | Specifies the ISO locale. The mapping is case-insensitive. |

Usage Notes

If the user specifies an invalid locale string, then the function returns a `NULL` string.

If the user specifies a locale string that includes only the language (for example, `en_` instead of `en_US`), then the function returns the default language name for the specified language (for example, `American`).

Examples

```
UTL_I18N.MAP_LANGUAGE_FROM_ISO('en_US')
```

This returns 'American'.

See Also:

Oracle Database Globalization Support Guide for a list of valid Oracle languages

269.4.15 MAP_LOCALE_TO_ISO Function

This function returns an ISO locale name from an Oracle language name and an Oracle territory name.

A valid string must include at least one of the following: a valid Oracle language name or a valid Oracle territory name.

Syntax

```
UTL_I18N.MAP_LOCALE_TO_ISO (
    ora_language  IN VARCHAR2,
    ora_territory IN VARCHAR2)
RETURN VARCHAR2;
```

Parameters

Table 269-16 MAP_LOCALE_TO_ISO Function Parameters

| Parameter | Description |
|----------------------------|---|
| <code>ora_language</code> | Specifies an Oracle language name. It is case-insensitive. |
| <code>ora_territory</code> | Specifies an Oracle territory name. It is case-insensitive. |

Usage Notes

If the user specifies an invalid string, then the function returns a `NULL` string.

Examples

```
UTL_I18N.MAP_LOCALE_TO_ISO('American','America')
```

This returns 'en_US'.

 **See Also:**

Oracle Database Globalization Support Guide for a list of valid Oracle languages and territories

269.4.16 MAP_TERRITORY_FROM_ISO Function

This function returns an Oracle territory name from an ISO locale.

Syntax

```
UTL_I18N.MAP_TERRITORY_FROM_ISO (  
    isolocale IN VARCHAR2)  
RETURN VARCHAR2;
```

Parameters

Table 269-17 MAP_TERRITORY_FROM_ISO Function Parameters

| Parameter | Description |
|-----------|--|
| isolocale | Specifies the ISO locale. The mapping is case-insensitive. |

Usage Notes

If the user specifies an invalid locale string, then the function returns a `NULL` string.

If the user specifies a locale string that includes only the territory (for example, `_fr` instead of `fr_fr`), then the function returns the default territory name for the specified territory (for example, `France`).

Examples

```
UTL_I18N.MAP_TERRITORY_FROM_ISO('en_US')
```

This returns 'America'.

 **See Also:**

Oracle Database Globalization Support Guide for a list of valid Oracle territories

269.4.17 MAP_TO_SHORT_LANGUAGE Function

This function maps an Oracle language name to an Oracle short language name.

Syntax

```
UTL_I18N.MAP_TO_SHORT_LANGUAGE (  
    language IN VARCHAR2 CHARACTER SET ANY_CS)  
RETURN VARCHAR2;
```

Parameters

Table 269-18 MAP_TO_SHORT_LANGUAGE Function Parameters

| Parameter | Description |
|-----------|---|
| language | Specifies a valid full language name. It is case-insensitive. |

Usage Notes

If the user specifies an invalid language name, then the function returns a NULL string.

Examples

Returns the short language name for the language.

```
DECLARE retval VARCHAR2(100);BEGIN retval :=
UTL_I18N.MAP_TO_SHORT_LANGUAGE('american'); DBMS_OUTPUT.PUT_LINE(retval);END;/US
```

269.4.18 RAW_TO_CHAR Functions

This function converts RAW data from a valid Oracle character set to a VARCHAR2 string in the database character set.

The function is overloaded. The different forms of functionality are described along with the syntax declarations.

Syntax

Buffer Conversion:

```
UTL_I18N.RAW_TO_CHAR(
    data          IN RAW,
    src_charset   IN VARCHAR2 DEFAULT NULL)
RETURN VARCHAR2;
```

Piecewise conversion converts raw data into character data piece by piece:

```
UTL_I18N.RAW_TO_CHAR (
    data          IN RAW,
    src_charset   IN VARCHAR2 DEFAULT NULL,
    scanned_length OUT PLS_INTEGER,
    shift_status  IN OUT PLS_INTEGER)
RETURN VARCHAR2;
```

Parameters

Table 269-19 RAW_TO_CHAR Function Parameters

| Parameter | Description |
|----------------|--|
| data | Specifies the RAW data to be converted to a VARCHAR2 string |
| src_charset | Specifies the character set that the RAW data was derived from. If src_charset is NULL, then the database character set is used. |
| scanned_length | Specifies the number of bytes of source data scanned |

Table 269-19 (Cont.) RAW_TO_CHAR Function Parameters

| Parameter | Description |
|---------------------------|--|
| <code>shift_status</code> | <p>Specifies the shift status at the end of the scan. The user must set it to <code>SHIFT_IN</code> the first time it is called in piecewise conversion.</p> <p>Note: ISO 2022 character sets use escape sequences instead of shift characters to indicate the encoding method. <code>shift_status</code> cannot hold the encoding method information that is provided by the escape sequences for the next function call. As a result, this function cannot be used to reconstruct ISO 2022 character from raw data in a piecewise way unless each unit of input can be guaranteed to be a closed string. A closed string begins and ends in a 7-bit escape state.</p> |

Usage Notes

If the user specifies an invalid character set, `NULL` data, or data whose length is 0, then the function returns a `NULL` string.

Examples

Buffer Conversion

```
UTL_I18N.RAW_TO_CHAR(hextoraw('616263646566C2AA'), 'utf8')
```

This returns the following string in the database character set:

```
'abcde' || chr(170)
```

Piecewise Conversion

```
UTL_I18N.RAW_TO_CHAR(hextoraw('616263646566C2AA'),'utf8',shf,slen)
```

This expression returns the following string in the database character set:

```
'abcde' || chr(170)
```

It also sets `shf` to `SHIFT_IN` and `slen` to 8.

The following example converts data from the Internet piece by piece to the database character set.

```
rvalue RAW(1050);
nvalue VARCHAR2(1024);
conversion_state PLS_INTEGER = 0;
converted_len PLS_INTEGER;
rtemp RAW(10) = '';
conn utl_tcp.connection;
tlen PLS_INTEGER;

...
conn := utl_tcp.open_connection ( remote_host => 'localhost',
                                remote_port => 2000);

LOOP
    tlen := utl_tcp.read_raw(conn, rvalue, 1024);
    rvalue := utl_raw.concat(rtemp, rvalue);
    nvalue := utl_i18n.raw_to_char(rvalue, 'JA16SJIS', converted_len,
conversion_stat);
    if (converted_len < utl_raw.length(rvalue) )
```

```

    then
        rtemp := utl_raw.substr(rvalue, converted_len+1);
    else
        rtemp := '';
    end if;
    /* do anything you want with nvalue */
    /* e.g htp.prn(nvalue); */
END LOOP;
utl_tcp.close_connection(conn);
EXCEPTION
    WHEN utl_tcp.end_of_input THEN
        utl_tcp.close_connection(conn);
END;
```

269.4.19 RAW_TO_NCHAR Functions

This function converts **RAW** data from a valid Oracle character set to an **NVARCHAR2** string in the national character set.

The function is overloaded. The different forms of functionality are described along with the syntax declarations.

Syntax

Buffer Conversion:

```

UTL_I18N.RAW_TO_NCHAR (
    data          IN RAW,
    src_charset   IN VARCHAR2 DEFAULT NULL)
RETURN NVARCHAR2;
```

Piecewise conversion converts raw data into character data piece by piece:

```

UTL_I18N.RAW_TO_NCHAR (
    data          IN RAW,
    src_charset   IN VARCHAR2 DEFAULT NULL,
    scanned_length OUT PLS_INTEGER,
    shift_status  IN OUT PLS_INTEGER)
RETURN NVARCHAR2;
```

Parameters

Table 269-20 RAW_TO_NCHAR Function Parameters

| Parameter | Description |
|----------------|--|
| data | Specifies the RAW data to be converted to an NVARCHAR2 string |
| src_charset | Specifies the character set that the RAW data was derived from. If src_charset is NULL, then the database character set is used. |
| scanned_length | Specifies the number of bytes of source data scanned |

Table 269-20 (Cont.) RAW_TO_NCHAR Function Parameters

| Parameter | Description |
|---------------------------|--|
| <code>shift_status</code> | <p>Specifies the shift status at the end of the scan. The user must set it to <code>SHIFT_IN</code> the first time it is called in piecewise conversion.</p> <p>Note: ISO 2022 character sets use escape sequences instead of shift characters to indicate the encoding method. <code>shift_status</code> cannot hold the encoding method information that is provided by the escape sequences for the next function call. As a result, this function cannot be used to reconstruct ISO 2022 character from raw data in a piecewise way unless each unit of input can be guaranteed to be a closed string. A closed string begins and ends in a 7-bit escape state.</p> |

Usage Notes

If the user specifies an invalid character set, `NULL` data, or data whose length is 0, then the function returns a `NULL` string.

Examples

Buffer Conversion

```
UTL_I18N.RAW_TO_NCHAR(hextoraw('6162636465666C2AA'),'utf8')
```

This returns the following string in the national character set:

```
'abcde' || chr(170)
```

Piecewise Conversion

```
UTL_I18N.RAW_TO_NCHAR(hextoraw('6162636465666C2AA'),'utf8', shf, slen)
```

This expression returns the following string in the national character set:

```
'abcde' || chr(170)
```

It also sets `shf` to `SHIFT_IN` and `slen` to 8.

The following example converts data from the Internet piece by piece to the national character set.

```
rvalue RAW(1050);
nvalue NVARCHAR2(1024);
conversion_state PLS_INTEGER = 0;
converted_len PLS_INTEGER;
rtemp RAW(10) = '';
conn utl_tcp.connection;
tlen PLS_INTEGER;

...
conn := utl_tcp.open_connection ( remote_host => 'localhost',
                                remote_port => 2000);

LOOP
    tlen := utl_tcp.read_raw(conn, rvalue, 1024);
    rvalue := utl_raw.concat(rtemp, rvalue);
    nvalue := utl_i18n.raw_to_nchar(rvalue, 'JA16SJIS', converted_len,
conversion_stat);
    if (converted_len < utl_raw.length(rvalue) )
```

```

then
    rtemp := utl_raw.substr(rvalue, converted_len+1);
else
    rtemp := '';
end if;
/* do anything you want with nvalue */
/* e.g htp.prn(nvalue); */
END LOOP;
utl_tcp.close_connection(conn);
EXCEPTION
WHEN utl_tcp.end_of_input THEN
    utl_tcp.close_connection(conn);
END;

```

269.4.20 STRING_TO_RAW Function

This function converts a `VARCHAR2` or `NVARCHAR2` string to another valid Oracle character set and returns the result as `RAW` data.

Syntax

```

UTL_I18N.STRING_TO_RAW(
    data          IN VARCHAR2 CHARACTER SET ANY_CS,
    dst_charset   IN VARCHAR2 DEFAULT NULL)
RETURN RAW;

```

Parameters

Table 269-21 STRING_TO_RAW Function Parameters

| Parameter | Description |
|--------------------------|--|
| <code>data</code> | Specifies the <code>VARCHAR2</code> or <code>NVARCHAR2</code> string to convert. |
| <code>dst_charset</code> | Specifies the destination character set. If <code>dst_charset</code> is <code>NULL</code> , then the database character set is used for <code>CHAR</code> data and the national character set is used for <code>NCHAR</code> data. |

Usage Notes

If the user specifies an invalid character set, a `NULL` string, or a string whose length is 0, then the function returns a `NULL` string.

Examples

```

DECLARE
    r raw(50);
    s varchar2(20);
BEGIN
    s:='abcdef'||chr(170);
    r:=utl_i18n.string_to_raw(s,'utf8');
    dbms_output.put_line(rawtohex(r));
end;
/

```

This returns a hex value of '6162636465666C2AA'.

269.4.21 TRANSLITERATE Function

This function performs script transliteration. In this release, the `TRANSLITERATE` function only supports Japanese Kana conversion.

Syntax

```
UTL_I18N.TRANSLITERATE (
  data IN VARCHAR2 CHARACTER SET ANY_CS,
  name IN VARCHAR2)
RETURN VARCHAR2 CHARACTER SET data%CHARSET;
```

Parameters

Table 269-22 TRANSLITERATE Function Parameters

| Parameter | Description |
|-------------------|---|
| <code>data</code> | Specifies the data to be converted. Either <code>CHAR</code> or <code>NCHAR</code> datatype can be specified. |
| <code>name</code> | Specifies the transliteration name string. For a list of valid names, see Table 269-23 . |

Constants

These options specify Japanese Kana conversions.

Table 269-23 TRANSLITERATE Function Constants

| Constant Name | Value | Description |
|------------------------------------|--------------------------------------|---|
| <code>KANA_FWKATAKANA</code> | <code>'kana_fwkatkana'</code> | Converts any type of Kana character to a fullwidth Katakana character. |
| <code>KANA_HWKATAKANA</code> | <code>'kana_hwkatakana'</code> | Converts any type of Kana character to a halfwidth Katakana character. |
| <code>KANA_HIRAGANA</code> | <code>'kana_hiragana'</code> | Converts any type of Kana character to a fullwidth Hiragana character. |
| <code>FWKATAKANA_HWKATAKANA</code> | <code>'fwkatakana_hwkatakana'</code> | Converts only fullwidth Katakana characters to halfwidth Katakana characters. |
| <code>FWKATAKANA_HIRAGANA</code> | <code>'fwkatakana_hiragana'</code> | Converts only fullwidth Katakana characters to fullwidth Hiragana characters. |
| <code>HWKATAKANA_FWKATAKANA</code> | <code>'hwkatakana_fwkatakana'</code> | Converts only halfwidth Katakana characters to fullwidth Katakana characters. |
| <code>HWKATAKANA_HIRAGANA</code> | <code>'hwkatakana_hiragana'</code> | Converts only halfwidth Katakana characters to fullwidth Hiragana characters. |
| <code>HIRAGANA_FWKATAKANA</code> | <code>'hiragana_fwkatkana'</code> | Converts only fullwidth Hiragana characters to fullwidth Katakana characters. |
| <code>HIRAGANA_HWKATAKANA</code> | <code>'hiragana_hwkatakana'</code> | Converts only fullwidth Hiragana characters to halfwidth Katakana characters. |

Usage Notes

The function returns the converted string.

Examples

Given a table `japanese_emp`, containing an `NVARCHAR2` column `ename`, the following statement can be used to normalize all the kana names in `ename` to hiragana:

```
UPDATE japanese_emp
   SET ename = UTL_I18N.TRANSLITERATE (ename, 'kana_hiragana');
```

The following figure shows how this output might look.

Figure 269-1 Loading Locale-Specific Data to the Database

たなか
たなか
タナカ

↓

たなか
たなか
たなか

The following statement normalizes one kana name to hiragana:

```
DECLARE
  Name  japanese_emp.ename%TYPE;
  Eno   CONSTANT NUMBER(4) := 1;
BEGIN
  SELECT ename INTO name FROM japanese_emp WHERE enumber = eno;
  name := UTL_I18N.TRANSLITERATE(name, UTL_I18N.KANA_HIRAGANA);
  UPDATE japanese_emp SET ename = name WHERE enumber = eno;
EXCEPTION
  WHEN UTL_I18N.UNSUPPORTED_TRANSLITERATION THEN
    DBMS_OUTPUT.PUT_LINE('transliteration not supported');
END;
/
```

269.4.22 UNESCAPE_REFERENCE Function

This function returns a string from an input string that contains character references. It decodes each character reference to the corresponding character value.

See Also:

["ESCAPE_REFERENCE Function"](#) for more information about escape sequences

Syntax

```

UTL_I18N.UNESCAPE_REFERENCE (
    str IN VARCHAR2 CHARACTER SET ANY_CS)
RETURN VARCHAR2 CHARACTER SET str%CHARSET;

```

Parameters**Table 269-24 UNESCAPE_REFERENCE Function Parameters**

| Parameter | Description |
|-----------|----------------------------|
| str | Specifies the input string |

Usage Notes

If the user specifies a `NULL` string or a string whose length is 0, then the function returns a `NULL` string. If the function fails, then it returns the original string.

Examples

```
UTL_I18N.UNESCAPE_REFERENCE('hello &lt; &#xe5;')
```

This returns 'hello <' || chr(229).

269.4.23 VALIDATE_CHARACTER_ENCODING Functions

This function validates the character encoding of `VARCHAR2`, `NVARCHAR2`, `CLOB`, and `NCLOB` data. The validation is based on the database character set for `VARCHAR2` and `CLOB` data and national character set for `NVARCHAR2` and `NCLOB` data.

For Unicode character sets, such as `AL32UTF8`, `AL16UTF16`, `AL16UTF16LE`, `UTF8`, and `UTFE`, any byte sequences mapped to the following Unicode code points are considered invalid:

- Unpaired surrogate code point
- Non-character code point

In addition, any irregular or illegal UTF-8 byte sequence is considered invalid for `AL32UTF8` and `UTF8` character sets.

The `VALIDATE_CHARACTER_ENCODING` function is overloaded. One function is for validating `VARCHAR2` and `NVARCHAR2` data, while the other function is for validating `CLOB` and `NCLOB` data.

- **Validating VARCHAR2 and NVARCHAR2 data**

A `VARCHAR2` or `NVARCHAR2` byte or its byte sequence is considered invalid for a character set, if it does not map to any of the characters defined in the character set.

- **Validating CLOB and NCLOB data**

A LOB character is considered invalid for a character set if a byte (in case of a single-byte database character set) or a byte pair (in case of UTF-16 encoding used with a multibyte database character set) corresponding to the encoding of

the LOB character does not map to any of the characters defined in the character set.

Syntax

This function validates VARCHAR2 and NVARCHAR2 data:

```
UTL_I18N.VALIDATE_CHARACTER_ENCODING (
    data IN VARCHAR2 CHARACTER SET ANY_CS)
RETURN PLS_INTEGER;
```

This function validates CLOB and NCLOB data:

```
UTL_I18N.VALIDATE_CHARACTER_ENCODING (
    lob_loc IN CLOB CHARACTER SET ANY_CS)
RETURN PLS_INTEGER;
```

Parameters

Table 269-25 VALIDATE_CHARACTER_ENCODING Function Parameters

| Parameter | Description |
|-----------|---|
| data | VARCHAR2 or NVARCHAR2 data to validate. |
| lob_loc | CLOB or NCLOB data to validate. |

Usage Notes

This function returns the offset of the first invalid byte for the VARCHAR2 or NVARCHAR2 data. It returns the offset of the first invalid character for the CLOB or NCLOB data. It returns 0, if all the bytes in the character data are valid. It returns NULL, if the value of the parameter data or lob_loc is NULL.

Examples

This example validates the character encoding of NVARCHAR2 and CLOB data where the database character set is AL32UTF8 while the national character set is AL16UTF16.

```
CREATE TABLE temp(col1 NVARCHAR2(20), col2 CLOB);
INSERT INTO temp VALUES(UNISTR('foo\D800bar'), UNISTR('foo\D800bar'));
COMMIT;
SELECT UTL_I18N.VALIDATE_CHARACTER_ENCODING(col1) invalid_offset_column1,
       UTL_I18N.VALIDATE_CHARACTER_ENCODING(col2) invalid_offset_column2
FROM temp;
```

The query returns:

```
INVALID_OFFSET_COLUMN1 INVALID_OFFSET_COLUMN2
-----
                          7                      4
```

Here, the surrogate code point U+D800 is invalid. The number 7 is returned as INVALID_OFFSET_COLUMN1, because for col1, 'foo' is encoded in 6 bytes in NVARCHAR2 and the invalid code point U+D800 starts at offset 7. The number 4 is returned as INVALID_OFFSET_COLUMN2, because for col2, 'foo' is encoded in 3 UTF-16 code points in CLOB and the invalid code point U+D800 starts at offset 4.

270

UTL_IDENT

The `UTL_IDENT` package specifies which Database or client PL/SQL is running.

This chapter contains the following topics:

- [Overview](#)
- [Security Model](#)
- [Constants](#)

270.1 UTL_IDENT Overview

The `UTL_IDENT` package is intended for use for conditional compilation of PL/SQL packages that are supported by Oracle, TimesTen Database, and clients such as Oracle Forms.

270.2 UTL_IDENT Security Model

The `UTL_IDENT` package runs as the package owner `SYS`. The public synonym `UTL_IDENT`, and `EXECUTE` permission on this package is granted to `PUBLIC`.

270.3 UTL_IDENT Constants

The `UTL_IDENT` package defines several constants to use when specifying parameter values.

These constants are shown in the following table.

Table 270-1 UTL_IDENT Constants

| Constant | Type | Value | Description |
|-------------------------------|---------|------------|------------------------------------|
| <code>IS_ORACLE_SERVER</code> | BOOLEAN | TRUE/FALSE | Stipulates if Oracle Server or not |
| <code>IS_ORACLE_CLIENT</code> | BOOLEAN | TRUE/FALSE | Stipulates if Oracle Client or not |
| <code>IS_TIMESTEN</code> | BOOLEAN | TRUE/FALSE | Stipulates if TimesTen or not |
| <code>IS_ORACLE_FORMS</code> | BOOLEAN | TRUE/FALSE | Stipulates if Oracle Forms or not |

271

UTL_INADDR

The `UTL_INADDR` package provides a PL/SQL procedures to support internet addressing. It provides an API to retrieve host names and IP addresses of local and remote hosts.

This chapter contains the following topics:

- [Security Model](#)
- [Exceptions](#)
- [Examples](#)
- [Summary of UTL_INADDR Subprograms](#)

271.1 UTL_INADDR Security Model

This package is an invoker's rights package, which means that the invoking user must be granted the `connect` privilege in the access control list assigned to the remote network host to which he or she wishes to connect.

Note:

For more information about managing fine-grained access, see *Oracle Database Security Guide*.

271.2 UTL_INADDR Exceptions

This table describes exceptions raised by `UTL_INADDR` subprograms.

Table 271-1 *Exception - Internet Address Package*

| Number | Exception | Description |
|-----------|-----------------------|------------------------------|
| ORA-24247 | NETWORK_ACCESS_DENIED | Access to network is denied. |
| ORA-29257 | UNKNOWN_HOST | The host is unknown. |

271.3 UTL_INADDR Examples

This `UTL_INADDR` example retrieves the local host name and IP address.

```
SET serveroutput on
BEGIN
  DBMS_OUTPUT.PUT_LINE(UTL_INADDR.GET_HOST_NAME); -- get local host name
  DBMS_OUTPUT.PUT_LINE(UTL_INADDR.GET_HOST_ADDRESS); -- get local IP addr
END;
/
```

271.4 Summary of UTL_INADDR Subprograms

This table lists the UTL_INADDR subprograms and briefly describes them.

Table 271-2 UTL_INADDR Package Subprograms

| Subprogram | Description |
|---|---|
| GET_HOST_ADDRESS Function | Retrieves the IP address of the local or remote host given its name |
| GET_HOST_NAME Function | Retrieves the name of the local or remote host given its IP address |

271.4.1 GET_HOST_ADDRESS Function

This function retrieves the IP address of the specified host.

Syntax

```
UTL_INADDR.GET_HOST_ADDRESS (  
    host IN VARCHAR2 DEFAULT NULL)  
RETURN host_address VARCHAR2;
```

Parameters

Table 271-3 GET_HOST_ADDRESS Function Parameters

| Parameter | Description |
|-----------|--|
| host | The name of the host to retrieve the IP address. |

Return Values

Table 271-4 GET_HOST_ADDRESS Function Return Values

| Parameter | Description |
|--------------|--|
| host_address | The IP address of the specified host, or that of the local host if host is NULL. |

Exceptions

UNKNOWN_HOST: The specified IP address is unknown

Usage Notes

The permission to obtain the host name or IP address of the current host is controlled by the `resolve` privilege on `LOCALHOST`.

271.4.2 GET_HOST_NAME Function

This function retrieves the name of the local or remote host given its IP address.

Syntax

```
UTL_INADDR.GET_HOST_NAME (  
    ip IN VARCHAR2 DEFAULT NULL)  
RETURN host_name VARCHAR2;
```

Parameters

Table 271-5 GET_HOST_NAME Function Parameters

| Parameter | Description |
|-----------|--|
| ip | The IP address of the host used to determine its host name. If ip is not NULL, the official name of the host with its domain name is returned. If this is NULL, the name of the local host is returned and the name does not contain the domain to which the local host belongs. |

Return Values

Table 271-6 GET_HOST_NAME Function Return Values

| Parameter | Description |
|-----------|---|
| host_name | The name of the local or remote host of the specified IP address. |

Exceptions

UNKNOWN_HOST: The specified IP address is unknown

Usage Notes

The permission to obtain the host name or IP address of the current host is controlled by the `resolve` privilege granted through `DBMS_NETWORK_ACL_ADMIN` on `LOCALHOST`.

UTL_LMS

UTL_LMS retrieves and formats error messages in different languages.

This chapter contains the following topics:

- [Security Model](#)
- [Summary of UTL_LMS Subprograms](#)

See Also:

Oracle Database Globalization Support Guide

272.1 UTL_LMS Security Model

This package must be created as the user SYS.

272.2 Summary of UTL_LMS Subprograms

This table lists the UTL_LMS subprograms and briefly describes them.

Table 272-1 UTL_LMS Package Subprograms

| Function | Description |
|---|--|
| FORMAT_MESSAGE Function | Formats a retrieved error message |
| GET_MESSAGE Function | Retrieves an error message based on error number, product, facility, language, and message specified |

272.2.1 FORMAT_MESSAGE Function

This function formats a message retrieved by the GET_MESSAGE function and returns the formatted message. If the function fails, then it returns a NULL result.

The following table shows special characters that can be used in the format string.

| Special Character | Description |
|-------------------|--------------------------------------|
| '%s' | Substitute the next string argument |
| '%d' | Substitute the next integer argument |
| '%%' | Represents the special character % |

Syntax

```

UTL_LMS.FORMAT_MESSAGE (
    format IN VARCHAR2 CHARACTER SET ANY_CS,
    args   IN VARCHAR2 CHARACTER SET ANY_CS DEFAULT NULL)
RETURN VARCHAR2 CHARACTER SET format%CHARSET;

```

Parameters

Table 272-2 FORMAT_MESSAGE Procedure Parameters

| Parameter | Description |
|-----------|---------------------------------|
| format | Specifies the string to format |
| args | Specifies the list of arguments |

Examples

```

DECLARE
    s varchar2(200);
    i pls_integer;
BEGIN
    i:= utl_lms.get_message(26052, 'rdbms', 'ora', 'french', s);
    dbms_output.put_line('before format, message is: '||s);
    dbms_output.put_line('formatted message is: '||utl_lms.format_message(s, 9,
'my_column_name');
END;
/

```

The following is an unformatted message:

```
Type %d non pris en charge pour l'expression SQL sur la colonne %s.
```

The following is the formatted message:

```
Type 9 non pris en charge pour l'expression SQL sur la colonne my_column_name.
```

272.2.2 GET_MESSAGE Function

This function retrieves an Oracle error message. The user can define user-specific error messages with the `lmsgen` utility.

It returns 0 when it is successful. It returns -1 when it fails.

 **See Also:**

Oracle Database Globalization Support Guide for more information about the `lmsgen` utility

Syntax

```

UTL_LMS.GET_MESSAGE (
    errnum   IN PLS_INTEGER,
    product  IN VARCHAR2,

```

```
facility IN VARCHAR2,  
language IN VARCHAR2,  
message OUT NOCOPY VARCHAR2 CHARACTER SET ANY_CS)  
RETURN PLS_INTEGER;
```

Parameters

Table 272-3 GET_MESSAGE Function Parameters

| Parameter | Description |
|-----------|---|
| errnum | Specifies the error number. Example: '972' (for ORA-00972) |
| product | Specifies the product to which the error message applies Example: 'rdbms' |
| facility | Specifies the error message prefix Example: 'ora' |
| language | Specifies the language of the message. The parameter is case-insensitive. The default is NULL, which causes GET_MESSAGE to use the value of the NLS_LANGUAGE session parameter. |
| message | Specifies the output buffer for the retrieved message |

Usage Notes

If the `language` parameter is set to `NULL`, then the value of the `NLS_LANGUAGE` session parameter is used as the default.

Examples

```
DECLARE  
  s varchar2(200);  
  i pls_integer;  
BEGIN  
  i:=utl_lms.get_message(601, 'rdbms', 'oci', 'french', s);  
  dbms_output.put_line('OCI--00601 is: '||s);  
END  
/
```

The following output results:

```
OCI--00601 is: Echec du processus de nettoyage.
```

UTL_MAIL

The `UTL_MAIL` package is a utility for managing email which includes commonly used email features, such as attachments, CC, and BCC.

This chapter contains the following topics:

- [Security Model](#)
- [Operational Notes](#)
- [Rules and Limits](#)
- [Summary of UTL_MAIL Subprograms](#)

273.1 UTL_MAIL Security Model

`UTL_MAIL` is not installed by default because of the `SMTP_OUT_SERVER` configuration requirement and the security exposure this involves. In installing `UTL_MAIL`, you should take steps to prevent the port defined by `SMTP_OUT_SERVER` being swamped by data transmissions.

This package is now an invoker's rights package and the invoking user will need the connect privilege granted in the access control list assigned to the remote network host to which he wants to connect.

**Note:**

For more information about managing fine-grained access, see *Oracle Database Security Guide*.

273.2 UTL_MAIL Operational Notes

You must both install `UTL_MAIL` and define the `SMTP_OUT_SERVER`.

- To install `UTL_MAIL`:

```
sqlplus sys/<pwd>  
SQL> @$ORACLE_HOME/rdbms/admin/utlmail.sql  
SQL> @$ORACLE_HOME/rdbms/admin/prvtmail.plb
```

- You define the `SMTP_OUT_SERVER` parameter in the `init.ora` `rdbms` initialization file. However, if `SMTP_OUT_SERVER` is not defined, this invokes a default of `DB_DOMAIN` which is guaranteed to be defined to perform appropriately.

273.3 UTL_MAIL Rules and Limits

Use UTL_MAIL only within the context of the ASCII (American Standard Code for Information Interchange) and EBCDIC (Extended Binary-Coded Decimal Interchange Code) codes.

273.4 Summary of UTL_MAIL Subprograms

This table lists the UTL_MAIL subprograms and briefly describes them.

Table 273-1 UTL_MAIL Package Subprograms

| Subprogram | Description |
|--|---|
| SEND Procedure | Packages an email message into the appropriate format, locates SMTP information, and delivers the message to the SMTP server for forwarding to the recipients |
| SEND_ATTACH_RAW Procedure | Represents the SEND Procedure overloaded for RAW attachments |
| SEND_ATTACH_VARCHAR2 Procedure | Represents the SEND Procedure overloaded for VARCHAR2 attachments |

273.4.1 SEND Procedure

This procedure packages an email message into the appropriate format, locates SMTP information, and delivers the message to the SMTP server for forwarding to the recipients.

It hides the SMTP API and exposes a one-line email facility for ease of use.

Syntax

```
UTL_MAIL.SEND (
  sender      IN   VARCHAR2 CHARACTER SET ANY_CS,
  recipients  IN   VARCHAR2 CHARACTER SET ANY_CS,
  cc          IN   VARCHAR2 CHARACTER SET ANY_CS DEFAULT NULL,
  bcc         IN   VARCHAR2 CHARACTER SET ANY_CS DEFAULT NULL,
  subject     IN   VARCHAR2 CHARACTER SET ANY_CS DEFAULT NULL,
  message     IN   VARCHAR2 CHARACTER SET ANY_CS,
  mime_type   IN   VARCHAR2 DEFAULT 'text/plain; charset=us-ascii',
  priority    IN   PLS_INTEGER DEFAULT 3,
  replyto     IN   VARCHAR2 CHARACTER SET ANY_CS DEFAULT NULL);
```

Parameters

Table 273-2 SEND Procedure Parameters

| Parameter | Description |
|------------|--|
| sender | Email address of the sender |
| recipients | Email addresses of the recipient(s), separated by commas |

Table 273-2 (Cont.) SEND Procedure Parameters

| Parameter | Description |
|-----------|---|
| cc | Email addresses of the CC recipient(s), separated by commas, default is NULL |
| bcc | Email addresses of the BCC recipient(s), separated by commas, default is NULL |
| subject | String to be included as email subject string, default is NULL |
| message | Text message body |
| mime_type | Mime type of the message, default is 'text/plain; charset=us-ascii' |
| priority | Message priority, which maps to the X-priority field. 1 is the highest priority and 5 the lowest. The default is 3. |
| replyto | Defines to whom the reply email is to be sent |

273.4.2 SEND_ATTACH_RAW Procedure

This procedure is the `SEND` Procedure overloaded for `RAW` attachments.

Syntax

```

UTL_MAIL.SEND_ATTACH_RAW (
  sender          IN  VARCHAR2 CHARACTER SET ANY_CS,
  recipients      IN  VARCHAR2 CHARACTER SET ANY_CS,
  cc              IN  VARCHAR2 CHARACTER SET ANY_CS DEFAULT NULL,
  bcc             IN  VARCHAR2 CHARACTER SET ANY_CS DEFAULT NULL,
  subject         IN  VARCHAR2 CHARACTER SET ANY_CS DEFAULT NULL,
  message         IN  VARCHAR2 CHARACTER SET ANY_CS DEFAULT NULL,
  mime_type       IN  VARCHAR2 DEFAULT CHARACTER SET ANY_CS
                  DEFAULT 'text/plain; charset=us-ascii',
  priority        IN  PLS_INTEGER DEFAULT 3,
  attachment      IN  RAW,
  att_inline      IN  BOOLEAN DEFAULT TRUE,
  att_mime_type   IN  VARCHAR2 CHARACTER SET ANY_CS
                  DEFAULT 'text/plain; charset=us-ascii',
  att_filename    IN  VARCHAR2 CHARACTER SET ANY_CS DEFAULT NULL,
  replyto         IN  VARCHAR2 CHARACTER SET ANY_CS DEFAULT NULL);

```

Parameters

Table 273-3 SEND_ATTACH_RAW Procedure Parameters

| Parameter | Description |
|------------|---|
| sender | Email address of the sender |
| recipients | Email addresses of the recipient(s), separated by commas |
| cc | Email addresses of the CC recipient(s), separated by commas, default is NULL |
| bcc | Email addresses of the BCC recipient(s), separated by commas, default is NULL |
| subject | String to be included as email subject string, default is NULL |

Table 273-3 (Cont.) SEND_ATTACH_RAW Procedure Parameters

| Parameter | Description |
|---------------|---|
| message | Text message body |
| mime_type | Mime type of the message, default is 'text/plain; charset=us-ascii' |
| priority | Message priority, which maps to the X-priority field. 1 is the highest priority and 5 the lowest. The default is 3. |
| attachment | RAW attachment |
| att_inline | Specifies whether the attachment is viewable inline with the message body, default is TRUE |
| att_mime_type | Mime type of the attachment, default is 'application/octet' |
| att_filename | String specifying a filename containing the attachment, default is NULL |
| replyto | Defines to whom the reply email is to be sent |

273.4.3 SEND_ATTACH_VARCHAR2 Procedure

This procedure is the SEND Procedure overloaded for VARCHAR2 attachments.

Syntax

```
UTL_MAIL.SEND_ATTACH_VARCHAR2 (
  sender          IN  VARCHAR2 CHARACTER SET ANY_CS,
  recipients      IN  VARCHAR2 CHARACTER SET ANY_CS,
  cc              IN  VARCHAR2 CHARACTER SET ANY_CS DEFAULT NULL,
  bcc             IN  VARCHAR2 CHARACTER SET ANY_CS DEFAULT NULL,
  subject         IN  VARCHAR2 CHARACTER SET ANY_CS DEFAULT NULL,
  message         IN  VARCHAR2 CHARACTER SET ANY_CS DEFAULT NULL,
  mime_type       IN  VARCHAR2 CHARACTER SET ANY_CS
                    DEFAULT 'text/plain; charset=us-
ascii',
  priority        IN  PLS_INTEGER DEFAULT 3,
  attachment      IN  VARCHAR2 CHARACTER SET ANY_CS, ,
  att_inline      IN  BOOLEAN DEFAULT TRUE,
  att_mime_type   IN  VARCHAR2 CHARACTER SET ANY_CS
                    DEFAULT 'text/plain; charset=us-ascii',
  att_filename    IN  VARCHAR2 CHARACTER SET ANY_CS DEFAULT NULL,
  replyto         IN  VARCHAR2 CHARACTER SET ANY_CS DEFAULT NULL);
```

Parameters

Table 273-4 SEND_ATTACH_VARCHAR2 Procedure Parameters

| Parameter | Description |
|------------|---|
| sender | Email address of the sender |
| recipients | Email addresses of the recipient(s), separated by commas |
| cc | Email addresses of the CC recipient(s), separated by commas, default is NULL |
| bcc | Email addresses of the BCC recipient(s), separated by commas, default is NULL |

Table 273-4 (Cont.) SEND_ATTACH_VARCHAR2 Procedure Parameters

| Parameter | Description |
|------------------|---|
| subject | String to be included as email subject string, default is NULL |
| message | Text message body |
| mime_type | Mime type of the message, default is 'text/plain; charset=us-ascii' |
| priority | Message priority, which maps to the X-priority field. 1 is the highest priority and 5 the lowest. The default is 3. |
| attachment | Text attachment |
| att_inline | Specifies whether the attachment is inline, default TRUE |
| att_mime_type | Mime type of the attachment, default is 'text/plain; charset=us-ascii' |
| att_filename | String specifying a filename containing the attachment, default is NULL |
| replyto | Defines to whom the reply email is to be sent |

UTL_MATCH

The `UTL_MATCH` package facilitates matching two records. This is typically used to match names, such as two First Names or two Last Names.

This chapter contains the following topics:

- [Overview](#)
- [Security Model](#)
- [Summary of UTL_MATCH Subprograms](#)

274.1 UTL_MATCH Overview

`UTL_MATCH` can use either the Edit Distance algorithm or Jaro-Winkler algorithm when determining matches.

Edit Distance, also known as Levenshtein Distance (named after the Russian scientist Vladimir Levenshtein, who devised the algorithm in 1965), is a measure of similarity between two strings, `s1` and `s2`. The distance is the number of insertions, deletions or substitutions required to transform `s1` to `s2`.

The Edit Distance between strings `shackleford` and `shackelford` = 2.

The "Jaro-Winkler algorithm" is another way of calculating Edit distance between two strings. This method, developed at the U.S. Census, is a String Comparator measure that gives values of partial agreement between two strings. The string comparator accounts for length of strings and partially accounts for typical human errors made in alphanumeric strings.

The following table shows similarity values returned by Jaro-Winkler and Edit Distance

Table 274-1 Comparison between normalized values returned by Jaro-Winkler and Edit Distance algorithms

| String 1 | String 2 | Jaro Winkler | Edit Distance |
|------------|-----------|--------------|---------------|
| Dunningham | Cunnigham | 89 | 80 |
| Abroms | Abrams | 92 | 83 |
| Lampley | Campley | 90 | 86 |
| Marhta | Martha | 96 | 67 |
| Jonathon | Jonathan | 95 | 88 |
| Jeraldine | Geraldine | 92 | 89 |

274.2 UTL_MATCH Security Model

The `UTL_MATCH` package runs with definer's rights. `UTL_MATCH` must be created under `SYS`. Operations provided by this package are performed with `SYS` privileges.

274.3 Summary of UTL_MATCH Subprograms

This table lists the UTL_MATCH subprograms and briefly describes them.

Table 274-2 UTL_MATCH Package Subprograms

| Subprogram | Description |
|---|---|
| EDIT_DISTANCE Function | Calculates the number of changes required to transform string-1 into string-2 |
| EDIT_DISTANCE_SIMILARITY Function | Calculates the number of changes required to transform string-1 into string-2, returning a value between 0 (no match) and 100 (perfect match) |
| JARO_WINKLER Function | Calculates the measure of agreement between string-1 and string-2 |
| JARO_WINKLER_SIMILARITY Function | Calculates the measure of agreement between string-1 and string-2, returning a value between 0 (no match) and 100 (perfect match) |

274.3.1 EDIT_DISTANCE Function

This function calculates the number of insertions, deletions or substitutions required to transform string-1 into string-2.

Syntax

```
UTL_MATCH.EDIT_DISTANCE (
  s1 IN VARCHAR2,
  s2 IN VARCHAR2)
RETURN PLS_INTEGER;
```

Parameters

Table 274-3 EDIT_DISTANCE Function Parameters

| Parameter | Description |
|-----------|---|
| s1 | The string to be transformed |
| s2 | The string into which s1 is to be transformed |

Examples

```
SELECT UTL_MATCH.EDIT_DISTANCE('shackleford', 'shackelford') FROM DUAL;
-----
returns 2
```

274.3.2 EDIT_DISTANCE_SIMILARITY Function

This function calculates the number of insertions, deletions or substations required to transform string-1 into string-2, and returns the Normalized value of the Edit Distance between two strings.

The value is typically between 0 (no match) and 100 (perfect match).

Syntax

```

UTL_MATCH.EDIT_DISTANCE_SIMILARITY (
    s1 IN VARCHAR2,
    s2 IN VARCHAR2)
RETURN PLS_INTEGER;

```

Parameters**Table 274-4 EDIT_DISTANCE_SIMILARITY Function Parameters**

| Parameter | Description |
|-----------|---|
| s1 | The string to be transformed |
| s2 | The string into which s1 is to be transformed |

Examples

```

SELECT UTL_MATCH.EDIT_DISTANCE_SIMILARITY('shackleford', 'shackelford') FROM DUAL;
-----
returns 82

```

274.3.3 JARO_WINKLER Function

This function calculates the measure of agreement between two strings.

Syntax

```

UTL_MATCH.JARO_WINKLER (
    s1 IN VARCHAR2,
    s2 IN VARCHAR2)
RETURN BINARY_DOUBLE;

```

Parameters**Table 274-5 JARO_WINKLER Function Parameters**

| Parameter | Description |
|-----------|-------------|
| s1 | Input |
| s2 | input |

Examples

```

SELECT UTL_MATCH.JARO_WINKLER('shackleford', 'shackelford') FROM DUAL;
-----
returns 9.818E-001

```

274.3.4 JARO_WINKLER_SIMILARITY Function

This function calculates the measure of agreement between two strings, and returns a score between 0 (no match) and 100 (perfect match).

Syntax

```
UTL_MATCH.JARO_WINKLER_SIMILARITY (  
    s1 IN VARCHAR2,  
    s2 IN VARCHAR2)  
RETURN PLS_INTEGER;
```

Parameters

Table 274-6 JARO_WINKLER_SIMILARITY Function Parameters

| Parameter | Description |
|-----------|-------------|
| s1 | Input |
| s2 | input |

Examples

```
SELECT UTL_MATCH.JARO_WINKLER_SIMILARITY('shackleford', 'shackelford') FROM DUAL;  
-----  
returns 98
```

The `UTL_NLA` package exposes a subset of the BLAS and LAPACK (Version 3.0) operations on vectors and matrices represented as `VARRAYS`.

This chapter contains the following topics:

- [Overview](#)
- [Rules and Limits](#)
- [Security Model](#)
- [Subprogram Groups](#)
 - [BLAS Level 1 \(Vector-Vector Operations\) Subprograms](#)
 - [BLAS Level 2 \(Matrix-Vector Operations\) Subprograms](#)
 - [BLAS Level 3 \(Matrix-Matrix Operations\) Subprograms](#)
 - [LAPACK Driver Routines \(Linear Equations\) Subprograms](#)
 - [LAPACK Driver Routines \(LLS and Eigenvalue Problems\) Subprograms](#)
- [Summary of UTL_NLA Subprograms](#)

275.1 UTL_NLA Overview

The `UTL_NLA` package exposes a subset of the BLAS (Basic Linear Algebra Subprograms) and LAPACK (Linear Algebra PACKage) (Version 3.0) operations on vectors and matrices represented as `VARRAYS`.

Standards

For more information on the BLAS and LAPACK standards see

<http://www.netlib.org/blas/>

<http://www.netlib.org/lapack/>

Required Expertise

Users of this package are expected to have a sound grasp of linear algebra in general and of the BLAS and LAPACK libraries in particular.

Implementation

The mapping between BLAS and LAPACK procedures and their corresponding PL/SQL calls is one-to-one.

- All BLAS functions have the `BLAS_` prefix (for example, the [BLAS_ASUM Functions](#)). The subroutines and functions in BLAS are mapped to PL/SQL procedures and functions, respectively.

- All LAPACK functions have the `LAPACK_` prefix (for example, the [LAPACK_GBSV Procedures](#)). The subroutines in LAPACK are mapped to PL/SQL procedures. Procedures that perform the same operation but differ only on the datatype of the arguments have the same overloaded names.

The mapping between BLAS and LAPACK procedure parameters and those of their corresponding PL/SQL subprograms is almost one-to-one.

- Also in the PL/SQL interface for LAPACK, all `/work/` arguments have been removed. The `UTL_NLA` package manages the allocation and de-allocation of all work areas required by the libraries.
- A new optional parameter, `pack`, has been added to the end of each LAPACK procedure that specifies if the matrix has been linearized in the row-major or column-major (default) format.

275.2 UTL_NLA Rules and Limits

Vectors and matrices are stored in `VARRAYS` with a maximum size of one million entries. Given this restriction, `UTL_NLA` vectors can be up to one million entries but matrices need to be of size $R \times C \leq 1,000,000$.

275.3 UTL_NLA Security Model

The `UTL_NLA` package is owned by user `SYS` and is installed as part of database installation. Execution privilege on the package is granted to public. The routines in the package are run with invokers' rights (run with the privileges of the current user).

275.4 Subprogram Groups

The `UTL_NLA` package contains subprogram groups for BLAS and LAPACK operations.

- [BLAS Level 1 \(Vector-Vector Operations\) Subprograms](#)
- [BLAS Level 2 \(Matrix-Vector Operations\) Subprograms](#)
- [BLAS Level 3 \(Matrix-Matrix Operations\) Subprograms](#)
- [LAPACK Driver Routines \(Linear Equations\) Subprograms](#)
- [LAPACK Driver Routines \(LLS and Eigenvalue Problems\) Subprograms](#)

275.4.1 UTL_NLA BLAS Level 1 (Vector-Vector Operations) Subprograms

This table lists and briefly describes the `UTL_NLA` BLAS Level 1 Vector-Vector Operations subprograms.

Table 275-1 BLAS Level 1 (Vector-Vector Operations) Subprograms

| Subprogram | Description |
|-------------------------------------|--|
| BLAS_ASUM Functions | Computes the sum of the absolute values of the vector components |

Table 275-1 (Cont.) BLAS Level 1 (Vector-Vector Operations) Subprograms

| Subprogram | Description |
|--------------------------------------|---|
| BLAS_AXPY Procedures | Copies $\alpha X + Y$ into vector Y |
| BLAS_COPY Procedures | Copies the contents of vector X to vector Y |
| BLAS_DOT Functions | Returns the dot (scalar) product of two vectors X and Y |
| BLAS_IAMAX Functions | Computes the index of the first element of a vector that has the largest absolute value |
| BLAS_NRM2 Functions | Computes the vector 2-norm (Euclidean norm) |
| BLAS_ROT Procedures | Returns the plane rotation of points |
| BLAS_ROTG Procedures | Returns the Givens rotation of points |
| BLAS_SCAL Procedures | Scales a vector by a constant |
| BLAS_SWAP Procedures | Swaps the contents of two vectors each of size n |

275.4.2 UTL_NLA BLAS Level 2 (Matrix-Vector Operations) Subprograms

This table lists and briefly describes the UTL_NLA BLAS Level 2 Matrix-Vector Operations subprograms.

Table 275-2 BLAS Level 2 (Matrix-Vector Operations) Subprograms

| Subprogram | Description |
|--------------------------------------|---|
| BLAS_GBMV Procedures | Performs the matrix-vector operation $y := \alpha A x + \beta y$ or $y := \alpha A' x + \beta y$ where α and β are scalars, x and y are vectors and A is an m by n band matrix, with k_l sub-diagonals and k_u super-diagonals |
| BLAS_GEMV Procedures | Performs the matrix-vector operations $y := \alpha A x + \beta y$ or $y := \alpha A' x + \beta y$ where α and β are scalars, x and y are vectors and A is an m by n matrix |
| BLAS_GER Procedures | Performs a rank 1 operation $A := \alpha x x' + A$ where α is a scalar, x is an m element vector, y is an n element vector and A is an m by n matrix |
| BLAS_SBMV Procedures | Performs a matrix-vector operation $y := \alpha A x + \beta y$ where α and β are scalars, x and y are n element vectors and A is an n by n symmetric band matrix, with k super-diagonals |
| BLAS_SPMV Procedures | Performs a matrix-vector operation $y := \alpha A x + \beta y$ where α and β are scalars, x and y are n element vectors and A is an n by n symmetric matrix, supplied in packed form |
| BLAS_SPR Procedures | Performs a symmetric rank 1 operation $A := \alpha x x' + A$ where α is a real scalar, x is an n element vector, and A is an n by n symmetric matrix, supplied in packed form |
| BLAS_SPR2 Procedures | Performs a symmetric rank 2 operation $A := \alpha x x' + \alpha y y' + A$ where α is a scalar, x and y are n element vectors, and A is an n by n symmetric matrix, supplied in packed form |

Table 275-2 (Cont.) BLAS Level 2 (Matrix-Vector Operations) Subprograms

| Subprogram | Description |
|--------------------------------------|--|
| BLAS_SBMV Procedures | Performs a matrix-vector operation $y := \alpha A^*x + \beta y$ where α and β are scalars, x and y are n element vectors and A is an n by n symmetric band matrix, with k super-diagonals |
| BLAS_SYMV Procedures | Performs a matrix-vector operation $y := \alpha A^*x + \beta y$ where α and β are scalars, x and y are n element vectors and A is an n by n symmetric matrix |
| BLAS_SYR Procedures | Performs a symmetric rank 1 operation $A := \alpha x x^* + A$ where α is a real scalar, x is an n element vector, and A is an n by n symmetric matrix |
| BLAS_SYR2 Procedures | Performs a symmetric rank 2 operation $A := \alpha x x^* + \alpha y y^* + A$ where α is a scalar, x and y are n element vectors, and A is an n by n symmetric matrix |
| BLAS_TBMV Procedures | Performs a matrix-vector operation $x := A^*x$ or $A^*x = b$ where x is an n element vector and A is an n by n unit, or non-unit, upper or lower triangular band matrix, with $(k + 1)$ diagonals |
| BLAS_TBSV Procedures | Solves one of the systems of equation $A^*x = b$ or $A^*x = b$ where b and x are n element vectors and A is an n by n unit, or non-unit, upper or lower triangular band matrix, with $(k + 1)$ diagonals |
| BLAS_TPMV Procedures | Performs a matrix-vector operation $x := A^*x$ or $x := A^*x$ where x is an n element vector and A is an n by n unit, or non-unit, upper or lower triangular matrix, supplied in packed form |
| BLAS_TPSV Procedures | Solves one of the systems of equation $A^*x = b$ or $A^*x = b$ where b and x are n element vectors and A is an n by n unit, or non-unit, upper or lower triangular matrix, supplied in packed form |
| BLAS_TRMV Procedures | Performs a matrix-vector operation $x := A^*x$ or $x := A^*x$ where x is an n element vector and A is an n by n unit, or non-unit, upper or lower triangular matrix |
| BLAS_TRSV Procedures | Solves one of the systems of equation $A^*x = b$ or $A^*x = b$ where b and x are n element vectors and A is an n by n unit, or non-unit, upper or lower triangular matrix |

275.4.3 UTL_NLA BLAS Level 3 (Matrix-Matrix Operations) Subprograms

This table lists and briefly describes the UTL_NLA BLAS Level 3 Matrix-Matrix Operations subprograms.

Table 275-3 BLAS Level 3 (Matrix-Matrix Operations) Subprograms

| Subprogram | Description |
|---------------------------------------|---|
| BLAS_GEMM Procedures | Performs one of the matrix-vector operations $C := \alpha * \text{op}(A) * \text{op}(B) + \beta * C$ where $\text{op}(X)$ is one of $\text{op}(X) = X$ or $\text{op}(X) = X'$ where α and β are scalars, and A , B and C are matrices, with $\text{op}(A)$ an m by k matrix, $\text{op}(B)$ a k by n matrix and C an m by n matrix |
| BLAS_SYMM Procedures | Performs one of the matrix-vector operations $C := \alpha * A * B + \beta * C$ or $C := \alpha * B * A + \beta * C$ where α and β are scalars, A is a symmetric matrix, and B and C are m by n matrices |
| BLAS_SYR2K Procedures | Performs one of the symmetric rank2 k operations $C := \alpha * A * B' + \alpha * B * A' + \beta * C$ or $C := \alpha * A' * B + \alpha * B' * A + \beta * C$ where α and β are scalars, C is an n by n symmetric matrix and A and B are n by k matrices in the first case and k by n matrices in the second case |
| BLAS_SYRK Procedures | Performs one of the symmetric rank k operations $C := \alpha * A * A' + \beta * C$ or $C := \alpha * A' * A + \beta * C$ where α and β are scalars, C is an n by n symmetric matrix and A is an n by k matrix in the first case and a k by n matrix in the second case |
| BLAS_TRMM Procedures | Performs one of the matrix-vector operations $B := \alpha * \text{op}(A) * B$ or $B := \alpha * B * \text{op}(A)$ where α is a scalar, B is an m by n matrix, A is a unit, or non-unit, upper or lower triangular matrix and $\text{op}(A)$ is one of two alternatives |
| BLAS_TRSM Procedures | Performs one of the matrix-vector operations $\text{op}(A) * X = \alpha * B$ or $X * \text{op}(A) = \alpha * B$ where α is a scalar, X and B are m by n matrices, A is a unit, or non-unit, upper or lower triangular matrix, $\text{op}(A)$ is one of two alternatives. The matrix X is overwritten on B |

275.4.4 UTL_NLA LAPACK Driver Routines (Linear Equations) Subprograms

This table lists and briefly describes the LAPACK Driver Routines (Linear Equations) subprograms.

Table 275-4 LAPACK Driver Routines (Linear Equations) Subprograms

| Subprogram | Description |
|--|---|
| LAPACK_GBSV Procedures | This procedure computes the solution to a real system of linear equations $a * x = b$ where a is an n by n matrix and x and b are n by $nrhs$ matrices. The LU decomposition with partial pivoting and row interchanges is used to factor A . |
| LAPACK_GESV Procedures | This procedure computes the solution to a real system of linear equations $a * x = b$ where a is an n by n matrix and x and b are n by $nrhs$ matrices. The LU decomposition with partial pivoting and row interchanges is used to factor A . |

Table 275-4 (Cont.) LAPACK Driver Routines (Linear Equations) Subprograms

| Subprogram | Description |
|--|--|
| LAPACK_GTSV Procedures | This procedure solves the equation $a * x = b$ where a is an n by n tridiagonal matrix, by Gaussian elimination with partial pivoting. |
| LAPACK_PBSV Procedures | This procedure computes the solution to a real system of linear equations $a * x = b$ where a is an n by n symmetric positive definite band matrix and x and b are n by $nrhs$ matrices. The Cholesky decomposition is used to factor A . |
| LAPACK_POSV Procedures | This procedure computes the solution to a real system of linear equations $a * x = b$ where a is an n by n symmetric positive definite matrix and x and b are n by $nrhs$ matrices. The Cholesky decomposition is used to factor A . |
| LAPACK_PPSV Procedures | This procedure computes the solution to a real system of linear equations $a * x = b$ where a is an n by n symmetric positive definite matrix stored in packed format and x and b are n by $nrhs$ matrices. The Cholesky decomposition is used to factor A . |
| LAPACK_PTSV Procedures | This procedure computes the solution to a real system of linear equations $a * x = b$ where a is an n by n symmetric positive definite tridiagonal matrix, and x and b are n by $nrhs$ matrices. |
| LAPACK_SPSV Procedures | This procedure computes the solution to a real system of linear equations $a * x = b$ where a is an n by n symmetric matrix stored in packed format, and x and b are n by $nrhs$ matrices. The diagonal pivoting method is used to factor A . |
| LAPACK_SYSV Procedures | This procedure computes the solution to a real system of linear equations $a * x = b$ where a is an n by n symmetric matrix, and x and b are n by $nrhs$ matrices. The diagonal pivoting method is used to factor A . |

275.4.5 UTL_NLA LAPACK Driver Routines (LLS and Eigenvalue Problems) Subprograms

This table lists and briefly describes the LAPACK Driver Routines (LLS and Eigenvalue) subprograms.

Table 275-5 LAPACK Driver Routines (LLS and Eigenvalue Problems)

| Subprogram | Description |
|--|---|
| LAPACK_GEES Procedures | Computes for an n by n real nonsymmetric matrix A , the eigenvalues, the real Schur form T , and, optionally, the matrix of Schur vectors Z . This gives the Schur factorization $A = Z * T * (Z ** T)$. |
| LAPACK_GEEV Procedures | Computes for an n by n real nonsymmetric matrix A , the eigenvalues and, optionally, the left and/or right eigenvectors. |
| LAPACK_GELS Procedures | Solves overdetermined or underdetermined real linear systems involving an m by n matrix A , or its transpose, using a QR or LQ factorization of A . It is assumed that A has full rank. |

Table 275-5 (Cont.) LAPACK Driver Routines (LLS and Eigenvalue Problems)

| Subprogram | Description |
|---|--|
| LAPACK_GESDD Procedures | Computes the singular value decomposition (SVD) of a real m by n matrix A , optionally computing the left and right singular vectors. If singular vectors are desired, it uses a divide-and-conquer algorithm that makes mild assumptions about floating point arithmetic. |
| LAPACK_GESVD Procedures | Computes the singular value decomposition (SVD) of a real m by n matrix A , optionally computing the left and/or right singular vectors. The SVD is written $A = U * SIGMA * transpose(V)$. |
| LAPACK_SBEV Procedures | Computes all the eigenvalues and, optionally, eigenvectors of a real symmetric band matrix A |
| LAPACK_SBEVD Procedures | Computes all the eigenvalues and, optionally, eigenvectors of a real symmetric matrix A . If eigenvectors are desired, it uses a divide and conquer algorithm that makes mild assumptions about floating point arithmetic. |
| LAPACK_SPEV Procedures | Computes all the eigenvalues and, optionally, eigenvectors of a real symmetric matrix A in packed storage |
| LAPACK_SPEVD Procedures | Computes all the eigenvalues and, optionally, eigenvectors of a real symmetric matrix A in packed storage. If eigenvectors are desired, it uses a divide and conquer algorithm that makes mild assumptions about floating point arithmetic. |
| LAPACK_STEV Procedures | Computes all eigenvalues and, optionally, eigenvectors of a real symmetric tridiagonal matrix A |
| LAPACK_STEVD Procedures | Computes all eigenvalues and, optionally, eigenvectors of a real symmetric tridiagonal matrix A . If eigenvectors are desired, it uses a divide and conquer algorithm that makes mild assumptions about floating point arithmetic. |
| LAPACK_SYEV Procedures | Computes all eigenvalues and, optionally, eigenvectors of a real symmetric matrix A |
| LAPACK_SYEVD Procedures | Computes all the eigenvalues and, optionally, eigenvectors of a real symmetric matrix A . If eigenvectors are desired, it uses a divide and conquer algorithm that makes mild assumptions about floating point arithmetic. |

275.5 Summary of UTL_NLA Subprograms

This table lists the UTL_NLA subprograms and briefly describes them.

Table 275-6 UTL_NLA Package Subprograms

| Subprogram | Description | Group |
|--------------------------------------|--|---|
| BLAS_ASUM Functions | Computes the sum of the absolute values of the vector components | BLAS Level 1 (Vector-Vector Operations) Subprograms |
| BLAS_AXPY Procedures | Copies $\alpha * X + Y$ into vector Y | BLAS Level 1 (Vector-Vector Operations) Subprograms |
| BLAS_COPY Procedures | Copies the contents of vector X to vector Y | BLAS Level 1 (Vector-Vector Operations) Subprograms |

Table 275-6 (Cont.) UTL_NLA Package Subprograms

| Subprogram | Description | Group |
|--------------------------------------|---|---|
| BLAS_DOT Functions | Returns the dot (scalar) product of two vectors X and Y | BLAS Level 1 (Vector-Vector Operations) Subprograms |
| BLAS_GBMV Procedures | Performs the matrix-vector operation $y := \alpha * A * x + \beta * y$ or $y := \alpha * A' * x + \beta * y$ where alpha and beta are scalars, x and y are vectors and A is an m by n band matrix, with kl sub-diagonals and ku super-diagonals | BLAS Level 2 (Matrix-Vector Operations) Subprograms |
| BLAS_GEMM Procedures | Performs one of the matrix-vector operations where alpha and beta are scalars, and A, B and C are matrices, with op(A) an m by k matrix, op(B) a k by n matrix and C an m by n matrix | BLAS Level 3 (Matrix-Matrix Operations) Subprograms |
| BLAS_GEMV Procedures | Performs the matrix-vector operations $y := \alpha * A * x + \beta * y$ or $y := \alpha * A' * x + \beta * y$ where alpha and beta are scalars, x and y are vectors and A is an m by n matrix | BLAS Level 2 (Matrix-Vector Operations) Subprograms |
| BLAS_GER Procedures | Performs a rank 1 operation $A := \alpha * x * y' + A$ where alpha is a scalar, x is an m element vector, y is an n element vector and A is an m by n matrix | BLAS Level 2 (Matrix-Vector Operations) Subprograms |
| BLAS_IAMAX Functions | Computes the index of the first element of a vector that has the largest absolute value | BLAS Level 1 (Vector-Vector Operations) Subprograms |
| BLAS_NRM2 Functions | Computes the vector 2-norm (Euclidean norm) | BLAS Level 1 (Vector-Vector Operations) Subprograms |
| BLAS_ROT Procedures | Returns the plane rotation of points | BLAS Level 1 (Vector-Vector Operations) Subprograms |
| BLAS_ROTG Procedures | Returns the Givens rotation of points | BLAS Level 1 (Vector-Vector Operations) Subprograms |
| BLAS_SBMV Procedures | Performs a matrix-vector operation $y := \alpha * A * x + \beta * y$ where alpha and beta are scalars, x and y are n element vectors and A is an n by n symmetric band matrix, with k super-diagonals | BLAS Level 2 (Matrix-Vector Operations) Subprograms |
| BLAS_SCAL Procedures | Scales a vector by a constant | BLAS Level 1 (Vector-Vector Operations) Subprograms |

Table 275-6 (Cont.) UTL_NLA Package Subprograms

| Subprogram | Description | Group |
|---------------------------------------|---|---|
| BLAS_SPMV Procedures | Performs a matrix-vector operation $y := \alpha A x + \beta y$ where α and β are scalars, x and y are n element vectors and A is an n by n symmetric matrix, supplied in packed form | BLAS Level 2 (Matrix-Vector Operations) Subprograms |
| BLAS_SPR Procedures | Performs a symmetric rank 1 operation $A := \alpha x x' + A$ where α is a real scalar, x is an n element vector, and A is an n by n symmetric matrix, supplied in packed form | BLAS Level 2 (Matrix-Vector Operations) Subprograms |
| BLAS_SPR2 Procedures | Performs a symmetric rank 2 operation where α is a scalar, x and y are n element vectors, and A is an n by n symmetric matrix, supplied in packed form | BLAS Level 2 (Matrix-Vector Operations) Subprograms |
| BLAS_SWAP Procedures | Swaps the contents of two vectors each of size n | BLAS Level 1 (Vector-Vector Operations) Subprograms |
| BLAS_SYMM Procedures | Performs one of the matrix-vector operations where α and β are scalars, A is a symmetric matrix, and B and C are m by n matrices | BLAS Level 3 (Matrix-Matrix Operations) Subprograms |
| BLAS_SYMV Procedures | Performs a matrix-vector operation where α and β are scalars, x and y are n element vectors and A is an n by n symmetric matrix | BLAS Level 2 (Matrix-Vector Operations) Subprograms |
| BLAS_SYR Procedures | Performs a symmetric rank 1 operation where α is a real scalar, x is an n element vector, and A is an n by n symmetric matrix | BLAS Level 2 (Matrix-Vector Operations) Subprograms |
| BLAS_SYR2 Procedures | Performs a symmetric rank 2 operation where α is a scalar, x and y are n element vectors, and A is an n by n symmetric matrix | BLAS Level 2 (Matrix-Vector Operations) Subprograms |
| BLAS_SYR2K Procedures | Performs one of the symmetric rank2 k operations where α and β are scalars, C is an n by n symmetric matrix and A and B are n by k matrices in the first case and k by n matrices in the second case | BLAS Level 3 (Matrix-Matrix Operations) Subprograms |

Table 275-6 (Cont.) UTL_NLA Package Subprograms

| Subprogram | Description | Group |
|--------------------------------------|--|---|
| BLAS_SYRK Procedures | Performs one of the symmetric rank k operations where α and β are scalars, C is an n by n symmetric matrix and A is an n by k matrix in the first case and a k by n matrix in the second case | BLAS Level 3 (Matrix-Matrix Operations) Subprograms |
| BLAS_TBMV Procedures | Performs a matrix-vector operation where x is an n element vector and A is an n by n unit, or non-unit, upper or lower triangular band matrix, with $(k + 1)$ diagonals | BLAS Level 2 (Matrix-Vector Operations) Subprograms |
| BLAS_TBSV Procedures | Solves one of the systems of equation where b and x are n element vectors and A is an n by n unit, or non-unit, upper or lower triangular band matrix, with $(k + 1)$ diagonals | BLAS Level 2 (Matrix-Vector Operations) Subprograms |
| BLAS_TPMV Procedures | Performs a matrix-vector operation where x is an n element vector and A is an n by n unit, or non-unit, upper or lower triangular matrix, supplied in packed form | BLAS Level 2 (Matrix-Vector Operations) Subprograms |
| BLAS_TPSV Procedures | Solves one of the systems of equation where b and x are n element vectors and A is an n by n unit, or non-unit, upper or lower triangular matrix, supplied in packed form | BLAS Level 2 (Matrix-Vector Operations) Subprograms |
| BLAS_TRMM Procedures | Performs one of the matrix-vector operations where α is a scalar, B is an m by n matrix, A is a unit, or non-unit, upper or lower triangular matrix and $\text{op}(A)$ is one of two alternatives | BLAS Level 2 (Matrix-Vector Operations) Subprograms |
| BLAS_TRMV Procedures | Performs a matrix-vector operation where x is an n element vector and A is an n by n unit, or non-unit, upper or lower triangular matrix | BLAS Level 2 (Matrix-Vector Operations) Subprograms |
| BLAS_TRSM Procedures | Performs one of the matrix-vector operations $\text{op}(A) * X = \alpha * B$ or $X * \text{op}(A) = \alpha * B$ where α is a scalar, X and B are m by n matrices, A is a unit, or non-unit, upper or lower triangular matrix, $\text{op}(A)$ is one of two alternatives. The matrix X is overwritten on B | BLAS Level 3 (Matrix-Matrix Operations) Subprograms |

Table 275-6 (Cont.) UTL_NLA Package Subprograms

| Subprogram | Description | Group |
|---|--|--|
| BLAS_TRSV Procedures | Solves one of the systems of equation where b and x are n element vectors and A is an n by n unit, or non-unit, upper or lower triangular matrix | BLAS Level 2 (Matrix-Vector Operations) Subprograms |
| LAPACK_GBSV Procedures | This procedure computes the solution to a real system of linear equations $a * x = b$ where a is an n by n matrix and x and b are n by $nrhs$ matrices. The LU decomposition with partial pivoting and row interchanges is used to factor A . | LAPACK Driver Routines (Linear Equations) Subprograms |
| LAPACK_GEES Procedures | Computes for an n by n real nonsymmetric matrix A , the eigenvalues, the real Schur form T , and, optionally, the matrix of Schur vectors Z . This gives the Schur factorization $A = Z * T * (Z ** T)$. | LAPACK Driver Routines (LLS and Eigenvalue Problems) Subprograms |
| LAPACK_GEEV Procedures | Computes for an n by n real nonsymmetric matrix A , the eigenvalues and, optionally, the left and/or right eigenvectors. | LAPACK Driver Routines (LLS and Eigenvalue Problems) Subprograms |
| LAPACK_GELS Procedures | Solves overdetermined or underdetermined real linear systems involving an m by n matrix A , or its transpose, using a QR or LQ factorization of A . It is assumed that A has full rank. | LAPACK Driver Routines (LLS and Eigenvalue Problems) Subprograms |
| LAPACK_GESDD Procedures | Computes the singular value decomposition (SVD) of a real m by n matrix A , optionally computing the left and right singular vectors. If singular vectors are desired, it uses a divide-and-conquer algorithm that makes mild assumptions about floating point arithmetic. | LAPACK Driver Routines (LLS and Eigenvalue Problems) Subprograms |
| LAPACK_GESV Procedures | This procedure computes the solution to a real system of linear equations $a * x = b$ where a is an n by n matrix and x and b are n by $nrhs$ matrices. The LU decomposition with partial pivoting and row interchanges is used to factor A . | LAPACK Driver Routines (Linear Equations) Subprograms |

Table 275-6 (Cont.) UTL_NLA Package Subprograms

| Subprogram | Description | Group |
|-------------------------|--|--|
| LAPACK_GESVD Procedures | Computes the singular value decomposition (SVD) of a real m by n matrix A , optionally computing the left and/or right singular vectors. The SVD is written $A = U * SIGMA * \text{transpose}(V)$. | LAPACK Driver Routines (LLS and Eigenvalue Problems) Subprograms |
| LAPACK_GTSV Procedures | This procedure solves the equation $a * x = b$ where a is an n by n tridiagonal matrix, by Gaussian elimination with partial pivoting. | LAPACK Driver Routines (Linear Equations) Subprograms |
| LAPACK_PBSV Procedures | This procedure computes the solution to a real system of linear equations $a * x = b$ where a is an n by n symmetric positive definite band matrix and x and b are n by $nrhs$ matrices. The Cholesky decomposition is used to factor A . | LAPACK Driver Routines (Linear Equations) Subprograms |
| LAPACK_POSV Procedures | This procedure computes the solution to a real system of linear equations $a * x = b$ where a is an n by n symmetric positive definite matrix and x and b are n by $nrhs$ matrices. The Cholesky decomposition is used to factor A . | LAPACK Driver Routines (Linear Equations) Subprograms |
| LAPACK_PPSV Procedures | This procedure computes the solution to a real system of linear equations $a * x = b$ where a is an n by n symmetric positive definite matrix stored in packed format and x and b are n by $nrhs$ matrices. The Cholesky decomposition is used to factor A . | LAPACK Driver Routines (Linear Equations) Subprograms |
| LAPACK_PTSV Procedures | This procedure computes the solution to a real system of linear equations $a * x = b$ where a is an n by n symmetric positive definite tridiagonal matrix, and x and b are n by $nrhs$ matrices. | LAPACK Driver Routines (Linear Equations) Subprograms |
| LAPACK_SBEV Procedures | Computes all the eigenvalues and, optionally, eigenvectors of a real symmetric band matrix A . | LAPACK Driver Routines (LLS and Eigenvalue Problems) Subprograms |
| LAPACK_SBEVD Procedures | Computes all the eigenvalues and, optionally, eigenvectors of a real symmetric matrix A . If eigenvectors are desired, it uses a divide and conquer algorithm that makes mild assumptions about floating point arithmetic. | LAPACK Driver Routines (LLS and Eigenvalue Problems) Subprograms |

Table 275-6 (Cont.) UTL_NLA Package Subprograms

| Subprogram | Description | Group |
|---|---|--|
| LAPACK_SPEV Procedures | Computes all the eigenvalues and, optionally, eigenvectors of a real symmetric matrix A in packed storage | LAPACK Driver Routines (LLS and Eigenvalue Problems) Subprograms |
| LAPACK_SPEVD Procedures | Computes all the eigenvalues and, optionally, eigenvectors of a real symmetric matrix A in packed storage. If eigenvectors are desired, it uses a divide and conquer algorithm that makes mild assumptions about floating point arithmetic. | LAPACK Driver Routines (LLS and Eigenvalue Problems) Subprograms |
| LAPACK_SPSV Procedures | This procedure computes the solution to a real system of linear equations $a * x = b$ where a is an n by n symmetric matrix stored in packed format, and x and b are n by $nrhs$ matrices. The diagonal pivoting method is used to factor A . | LAPACK Driver Routines (Linear Equations) Subprograms |
| LAPACK_STEV Procedures | Computes all eigenvalues and, optionally, eigenvectors of a real symmetric tridiagonal matrix A | LAPACK Driver Routines (LLS and Eigenvalue Problems) Subprograms |
| LAPACK_STEVD Procedures | Computes all eigenvalues and, optionally, eigenvectors of a real symmetric tridiagonal matrix A . If eigenvectors are desired, it uses a divide and conquer algorithm that makes mild assumptions about floating point arithmetic. | LAPACK Driver Routines (LLS and Eigenvalue Problems) Subprograms |
| LAPACK_SYEVD Procedures | Computes all the eigenvalues and, optionally, eigenvectors of a real symmetric matrix A . If eigenvectors are desired, it uses a divide and conquer algorithm that makes mild assumptions about floating point arithmetic. | LAPACK Driver Routines (LLS and Eigenvalue Problems) Subprograms |
| LAPACK_SYSV Procedures | This procedure computes the solution to a real system of linear equations $a * x = b$ where a is an n by n symmetric matrix, and x and b are n by $nrhs$ matrices. The diagonal pivoting method is used to factor A . | LAPACK Driver Routines (Linear Equations) Subprograms |

275.5.1 BLAS_ASUM Functions

This procedure computes the sum of the absolute values of the vector components.

See Also:

[BLAS Level 1 \(Vector-Vector Operations\) Subprograms](#) for other subprograms in this group

Syntax

```

UTL_NLA.BLAS_ASUM (
    n      IN      POSITIVEN,
    x      IN      UTL_NLA_ARRAY_DBL,
    incx   IN      POSITIVEN)
RETURN BINARY_DOUBLE;

  y      IN OUT  UTL_NLA_ARRAY_FLT,
  incy   IN      POSITIVEN);

```

Parameters**Table 275-8 BLAS_AXPY Procedure Parameters**

| Parameter | Description |
|-----------|---|
| n | Specifies the number of elements of the vectors x and y. n must be at least zero. |
| alpha | Specifies the scalar alpha. |
| x | UTL_NLA_ARRAY_FLT/DBL of dimension at least (1 + (n - 1) * abs(incx)) |
| incx | Specifies the increment for the elements of x. incx must not be zero. |
| y | UTL_NLA_ARRAY_FLT/DBL of DIMENSION at least (1 + (n - 1) * abs(incy)) |
| incy | Specifies the increment for the elements of y. incy must not be zero. |

275.5.3 BLAS_COPY Procedures

This procedure copies the contents of vector X to vector Y.

**See Also:**

[BLAS Level 1 \(Vector-Vector Operations\) Subprograms](#) for other subprograms in this group

Syntax

```

UTL_NLA.BLAS_COPY (
  n      IN      POSITIVEN,
  x      IN      UTL_NLA_ARRAY_DBL,
  incx   IN      POSITIVEN,

  incx   IN      POSITIVEN,
  y      IN OUT UTL_NLA_ARRAY_FLT,
  incy   IN      POSITIVEN);

```

Parameters

Table 275-9 BLAS_COPY Procedure Parameters

| Parameter | Description |
|-----------|---|
| n | Specifies the number of elements of the vectors x and y. n must be at least zero. |
| x | UTL_NLA_ARRAY_FLT/DBL of dimension at least (1 + (n - 1) * abs(incx)) |
| incx | Specifies the increment for the elements of x. incx must not be zero. |
| y | UTL_NLA_ARRAY_FLT/DBL of dimension at least (1 + (n - 1) * abs(incy)) |
| incy | Specifies the increment for the elements of y. incy must not be zero. |

275.5.4 BLAS_DOT Functions

This function returns the dot (scalar) product of two vectors x and y.

See Also:

[BLAS Level 1 \(Vector-Vector Operations\) Subprograms](#) for other subprograms in this group

Syntax

```

UTL_NLA.BLAS_DOT (
  n      IN      POSITIVEN,
  x      IN      UTL_NLA_ARRAY_DBL,

incy   IN      POSITIVEN,
pack   IN      flag DEFAULT 'C');

```

Parameters

Table 275-11 BLAS_GBMV Procedure Parameters

| Parameter | Description |
|-----------|--|
| trans | <p>Specifies the operation to be performed:</p> <ul style="list-style-type: none"> trans = 'N' or 'n': $y := \alpha * A * x + \beta * y$ trans = 'T' or 't': $y := \alpha * A^T * x + \beta * y$ trans = 'C' or 'c': $y := \alpha * A^H * x + \beta * y$ |
| m | Specifies the number of rows of the matrix A. m must be at least zero. |
| n | Specifies the number of columns of the matrix A. n must be at least zero. |
| kl | Specifies the number of sub-diagonals of the matrix A. kl must satisfy $0 \leq kl$. |
| ku | Specifies the number of super-diagonals of the matrix A. ku must satisfy $0 \leq ku$. |
| alpha | SCALAR_FLOAT/DOUBLE. Specifies the scalar alpha. |
| a | <p>UTL_NLA_ARRAY_FLT/DBL of DIMENSION (lda, n).</p> <p>Before entry, the leading (kl + ku + 1) by n part of the array A must contain the matrix of coefficients, supplied column by column, with the leading diagonal of the matrix in row (ku+1) of the array, the first super-diagonal starting at position 2 in row ku, the first sub-diagonal starting at position 1 in row (ku+2), and so on.</p> <p>Elements in the array A that do not correspond to elements in the band matrix (such as the top left ku by ku triangle) are not referenced.</p> |
| lda | Specifies the first dimension of a as declared in the calling (sub) program. lda must be at least (kl+ku+1). |
| x | <p>UTL_NLA_ARRAY_FLT/DBL of dimension at least</p> $(1 + (n - 1) * \text{abs}(incx))$ <p>when trans = 'N' or 'n' and at least</p> $(1 + (m - 1) * \text{abs}(incx))$ <p>otherwise. Before entry, the incremented array X must contain the vector x.</p> |

Table 275-11 (Cont.) BLAS_GBMV Procedure Parameters

| Parameter | Description |
|-----------|---|
| incx | Specifies the increment for the elements of x . Must not be zero. |
| beta | SCALAR_FLOAT/DOUBLE. Specifies the scalar beta. When beta is supplied as zero then y need not be set on input. |
| y | UTL_NLA_ARRAY_FLT/DBL of dimension at least $(1 + (m - 1) * \text{abs}(\text{incy}))$ when trans = 'N' or 'n' and at least $(1 + (n - 1) * \text{abs}(\text{incy}))$ otherwise. Before entry with beta nonzero, the incremented array Y must contain the vector y . On exit, Y is overwritten by the updated vector y . |
| incy | Specifies the increment for the elements of y . Must not be zero. |
| pack | (Optional) Flags the packing of the matrices: <ul style="list-style-type: none"> 'C': column-major (default) 'R': row-major |

275.5.6 BLAS_GEMM Procedures

This procedure performs one of the matrix-matrix operations.

$$C := \text{alpha} * \text{op}(A) * \text{op}(B) + \text{beta} * C$$

where $\text{op}(X)$ is one of

$$\text{op}(X) = X$$

or

$$\text{op}(X) = X'$$

where alpha and beta are scalars, and A, B and C are matrices, with $\text{op}(A)$ an m by k matrix, $\text{op}(B)$ a k by n matrix and C an m by n matrix.

Parameters

Table 275-12 BLAS_GEMM Procedure Parameters

| Parameter | Description |
|-----------|---|
| transa | Specifies the form of $op(A)$ to be used in the matrix multiplication as follows: <ul style="list-style-type: none"> transa = 'N' or 'n': $op(A) = A$ transa = 'T' or 't': $op(A) = A'$ transa = 'C' or 'c': $op(A) = A^{-1}$ |
| transb | Specifies the form of $op(B)$ to be used in the matrix multiplication as follows: <ul style="list-style-type: none"> transb = 'N' or 'n': $op(B) = B$ transb = 'T' or 't': $op(B) = B'$ transb = 'C' or 'c': $op(B) = B^{-1}$ |
| m | Specifies the number of rows of the matrix $op(A)$ and of the matrix C. m must be at least zero. |
| n | Specifies the number of columns of the matrix $op(B)$ and of the matrix C. n must be at least zero. |
| k | Specifies the rows of the matrix $op(A)$ and the number of columns of the matrix $op(B)$. k must be at least zero. |
| alpha | SCALAR_FLOAT/DOUBLE. Specifies the scalar alpha. |
| a | UTL_NLA_ARRAY_FLT/DBL of DIMENSION (lda, ka) where ka is k when transa = 'N' or 'n', and is m otherwise. Before entry with transa = 'N' or 'n', the leading m by k part of the array A must contain the matrix A, otherwise the leading k by m part of the array A must contain the matrix A. |

Table 275-12 (Cont.) BLAS_GEMM Procedure Parameters

| Parameter | Description |
|-----------|---|
| lda | Specifies the first dimension of <i>a</i> as declared in the calling (sub) program. When <i>transa</i> = 'N' or 'n', <i>lda</i> must be at least $\max(1, k)$. |
| b | UTL_NLA_ARRAY_FLT/DBL of DIMENSION (<i>lda</i> , <i>kb</i>) where <i>kb</i> is <i>n</i> when <i>transb</i> = 'N' or 'n', and is <i>k</i> otherwise. Before entry with <i>transb</i> = 'N' or 'n', the leading <i>k</i> by <i>n</i> part of the array <i>b</i> must contain the matrix <i>B</i> , otherwise the leading <i>n</i> by <i>k</i> part of the array <i>b</i> must contain the matrix <i>B</i> . |
| ldb | Specifies the first dimension of <i>b</i> as declared in the calling (sub) program. When <i>transb</i> = 'N' or 'n', <i>ldb</i> must be at least $\max(1, n)$. |
| beta | SCALAR_FLOAT/DOUBLE. Specifies the scalar <i>beta</i> . When <i>beta</i> is supplied as zero then <i>c</i> need not be set on input. |
| c | UTL_NLA_ARRAY_FLT/DBL of DIMENSION (<i>ldc</i> , <i>n</i>). Before entry, the leading <i>m</i> by <i>n</i> part of the array <i>C</i> must contain the matrix <i>C</i> , except when <i>beta</i> is zero, in which case <i>C</i> need not be set on entry. On exit, the array <i>C</i> is overwritten by the <i>m</i> by <i>n</i> matrix $(\alpha * \text{op}(A) * \text{op}(B) + \beta * C)$. |
| ldc | Specifies the first dimension of <i>C</i> as declared in the calling (sub) program. <i>ldc</i> must be at least $\max(1, m)$. |
| pack | (Optional) Flags the packing of the matrices: <ul style="list-style-type: none"> 'C': column-major (default) 'R': row-major |

275.5.7 BLAS_GEMV Procedures

This procedure performs one of the matrix-vector operations: $y := \alpha * A * x + \beta * y$ or $y := \alpha * A' * x + \beta * y$ where α and β are scalars, x and y are vectors and A is an m by n matrix.

Parameters

Table 275-13 BLAS_GEMV Procedure Parameters

| Parameter | Description |
|-----------|---|
| trans | Specifies the operation to be performed: <ul style="list-style-type: none"> trans = 'N' or 'n', $y := \alpha * A * x + \beta * y$ trans = 'T' or 't', $y := \alpha * A^T * x + \beta * y$ trans = 'C' or 'c', $y := \alpha * A^H * x + \beta * y$ |
| m | Specifies the number of rows of the matrix A. m must be at least zero. |
| n | Specifies the number of columns of the matrix A. n must be at least zero. |
| alpha | SCALAR_FLOAT/DOUBLE. Specifies the scalar alpha. |
| a | UTL_NLA_ARRAY_FLT/DBL of DIMENSION (lda, n). Before entry, the leading m by n part of the array a must contain the matrix of coefficients. |
| lda | Specifies the first dimension of a as declared in the calling (sub) program. lda must be at least $\max(1, m)$. |
| x | UTL_NLA_ARRAY_FLT/DBL of dimension at least $(1 + (n - 1) * \text{abs}(\text{incx}))$ when trans = 'N' or 'n' and at least $(1 + (m - 1) * \text{abs}(\text{incx}))$ otherwise. Before entry, the incremented array X must contain the vector x. |
| incx | Specifies the increment for the elements of x. Must not be zero. |
| beta | SCALAR_FLOAT/DOUBLE. Specifies the scalar beta. When beta is supplied as zero then y need not be set on input. |

Table 275-13 (Cont.) BLAS_GEMV Procedure Parameters

| Parameter | Description |
|-----------|---|
| y | UTL_NLA_ARRAY_FLT/DBL of dimension at least $(1 + (m - 1) * \text{abs}(\text{incy}))$ when trans = 'N' or 'n' and at least $(1 + (n - 1) * \text{abs}(\text{incy}))$ otherwise. Before entry with beta nonzero, the incremented array Y must contain the vector y. On exit, Y is overwritten by the updated vector y. |
| incy | Specifies the increment for the elements of y. Must not be zero. |
| pack | (Optional) Flags the packing of the matrices: <ul style="list-style-type: none"> 'C': column-major (default) 'R': row-major |

275.5.8 BLAS_GER Procedures

This procedure performs the rank 1 operation: $A := \alpha * x * y' + A$ where alpha is a scalar, x is an m element vector, y is an n element vector and A is an m by n matrix.

| Parameter | Description |
|-----------|---|
| uplo | Specifies whether the upper or lower triangular part of the band matrix A is being supplied: <ul style="list-style-type: none"> uplo = 'U' or 'u'. The upper triangular part of A is supplied. uplo = 'L' or 'l'. The lower triangular part of A is supplied. |
| n | Specifies the order of the matrix A . n must be at least zero. |

Table 275-23 (Cont.) BLAS_SBMV Procedure Parameters

| Parameter | Description |
|-----------|---|
| k | Specifies the number of super-diagonals of the matrix A. k must satisfy $0 \leq k$. |
| alpha | SCALAR_FLOAT/DOUBLE. Specifies the scalar alpha. |
| a | <p>UTL_NLA_ARRAY_FLT/DBL of DIMENSION (lda,n).</p> <p>Before entry with uplo = 'U' or 'u', the leading (k+1) by n part of the array A must contain the upper triangular band part of the symmetric matrix, supplied column by column, with the leading diagonal of the matrix in row (k+1) of the array, the first super-diagonal starting at position 2 in row k, and so on. The top left k by k triangle of the array A is not referenced.</p> <p>Before entry with uplo = 'L' or 'l', the leading (k+1) by n part of the array A must contain the lower triangular band part of the symmetric matrix, supplied column by column, with the leading diagonal of the matrix in row 1 of the array, the first sub-diagonal starting at position 1 in row 2, and so on. The bottom right k by k triangle of the array A is not referenced.</p> <p>Unchanged on exit</p> |
| lda | Specifies the first dimension of a as declared in the calling (sub) program. lda must be at least (k + 1). |
| x | <p>UTL_NLA_ARRAY_FLT/DBL of dimension at least $(1 + (n-1) * \text{abs}(\text{incx}))$</p> <p>Before entry, the incremented array X must contain the n element vector x.</p> |
| incx | Specifies the increment for the elements of x. Must not be zero. |
| beta | SCALAR_FLOAT/DOUBLE. Specifies the scalar beta. |
| y | <p>UTL_NLA_ARRAY_FLT/DBL of dimension at least $(1 + (n-1) * \text{abs}(\text{incy}))$</p> <p>Before entry, the incremented array Y must contain the n element vector y. On exit, Y is overwritten by the updated vector y.</p> |
| incy | Specifies the increment for the elements of y. Must not be zero. |
| pack | <p>(Optional) Flags the packing of the matrices:</p> <ul style="list-style-type: none"> 'C': column-major (default) 'R': row-major |

275.5.18 BLAS_SWAP Procedures

This procedure swaps the contents of two vectors each of size n.

Syntax

```

UTL_NLA.BLAS_SWAP (
    n      IN      POSITIVEN,
    x      IN OUT  UTL_NLA_ARRAY_DBL,
    incx   IN      POSITIVEN,

```

```

y      IN OUT UTL_NLA_ARRAY_DBL,
incy   IN      POSITIVEN);

UTL_NLA.BLAS_SWAP (
  n      IN      POSITIVEN,
  x      IN OUT UTL_NLA_ARRAY_FLT,
  incx   IN      POSITIVEN,
  y      IN OUT UTL_NLA_ARRAY_FLT,
  incy   IN      POSITIVEN);

```

Parameters

Table 275-24 BLAS_SWAP Procedure Parameters

| Parameter | Description |
|-----------|---|
| n | Specifies the number of elements of the vectors x and y. n must be at least zero. |
| x | UTL_NLA_ARRAY_FLT/DBL of dimension at least (1+(n-1)*abs(incx)) |
| incx | Specifies the increment for the elements of x. incx must not be zero. |
| y | UTL_NLA_ARRAY_FLT/DBL of DIMENSION at least (1+(n-1)*abs(incy)) |
| incy | Specifies the increment for the elements of y. incy must not be zero. |

275.5.19 BLAS_SYMM Procedures

This procedure performs one of the matrix-matrix operations $C := \alpha * A * B + \beta * C$ or $C := \alpha * B * A + \beta * C$, where alpha and beta are scalars, A is a symmetric matrix, and B and C are m by n matrices.

Parameters

Table 275-30 BLAS_SYRK Procedure Parameters

| Parameter | Description |
|-----------|--|
| uplo | Specifies whether the upper or lower triangular part of the array C is to be referenced: <ul style="list-style-type: none"> uplo = 'U' or 'u' : Only the upper triangular part of C is to be referenced. uplo = 'L' or 'l' : Only the lower triangular part of C is to be referenced. |
| trans | Specifies the operations to be performed: <ul style="list-style-type: none"> trans = 'N' or 'n' : $C := \alpha * A * A' + \beta * C$ trans = 'T' or 't' : $C := \alpha * A' * A + \beta * C$ trans = 'C' or 'c' : $C := \alpha * A * A + \beta * C$ |
| n | Specifies the order of matrix C. n must be at least zero. |
| k | On entry with trans = 'N' or 'n', k specifies the number of columns of the matrix A. On entry with trans = 'T' or 't' or trans = 'C' or 'c', k specifies the number of rows of the matrix A. k must be at least zero. |
| alpha | SCALAR_FLOAT/DOUBLE. Specifies the scalar alpha. |
| a | UTL_NLA_ARRAY_FLT/DBL of DIMENSION (lda, ka) where ka is k when trans = 'N' or 'n', and is n otherwise. Before entry with trans = 'N' or 'n', the leading n by k part of the array A must contain the matrix A, otherwise the leading k by n part of the array A must contain the matrix A. |
| lda | Specifies the first dimension of a as declared in the calling (sub) program. When trans = 'N' or 'n', lda must be at least $\max(1, n)$, otherwise lda must be at least $\max(1, k)$. |
| beta | SCALAR_FLOAT/DOUBLE. Specifies the scalar beta. |
| c | UTL_NLA_ARRAY_FLT/DBL of DIMENSION (ldc, n). Before entry with uplo = 'U' or 'u', the leading n by n upper triangular part of the array C must contain the upper triangular part of the symmetric matrix and the strictly lower triangular part of C is not referenced. On exit, the upper triangular part of the array C is overwritten by the upper triangular part of the updated matrix. Before entry with uplo = 'L' or 'l', the leading n by n lower triangular part of the array C must contain the lower triangular part of the symmetric matrix and the strictly upper triangular part of C is not referenced. On exit, the lower triangular part of the array C is overwritten by the lower triangular part of the updated matrix. |
| ldc | Specifies the first dimension of C as declared in the calling (sub) program. ldc must be at least $\max(1, n)$. |
| pack | (Optional) Flags the packing of the matrices: <ul style="list-style-type: none"> 'C': column-major (default) 'R': row-major |

275.5.25 BLAS_TBMV Procedures

This procedure performs the matrix-vector operations $x := A*x$ or $x := A'*x$, where x is an n element vector and A is an n by n unit, or non-unit, upper or lower triangular band matrix, with $(k+1)$ diagonals.

Usage Notes

No test for singularity or near-singularity is included in this routine. Such tests must be performed before calling this routine.

275.5.29 BLAS_TRMM Procedures

This procedure performs a matrix-matrix operation.

It performs one of the following matrix-matrix operations:

```
B := alpha*op( A )*B
```

or

```
B := alpha*B*op( A )
```

where `alpha` is a scalar, `B` is an `m` by `n` matrix, `A` is a unit, or non-unit, upper or lower triangular matrix and `op(A)` is one of

```
op( A ) = A
```

or

```
op( A ) = A'
```

| n | Specifies the order of the matrix A. n must be at least zero. |
| a | UTL_NLA_ARRAY_FLT/DBL of DIMENSION (lda, n). Before entry with uplo = 'U' or 'u', the leading n by n upper triangular part of the array A must contain the upper triangular matrix and the strictly lower triangular part of A is not referenced. Before entry with uplo = 'L' or 'l', the leading n by n lower triangular part of the array A must contain the lower triangular matrix and the strictly upper triangular part of A is not referenced. Note that when diag = 'U' or 'u', the diagonal elements of A are not referenced either, but are assumed to be unity |
| lda | Specifies the first dimension of a as declared in the calling (sub) program. lda must be at least $\max(1, n)$. |
| x | UTL_NLA_ARRAY_FLT/DBL of dimension at least $(1+(n-1)*as(incx))$. Before entry, the incremented array X must contain the n element vector x. |
| incx | Specifies the increment for the elements of x. Must not be zero. |
| pack | (Optional) Flags the packing of the matrices: <ul style="list-style-type: none"> 'C': column-major (default) 'R': row-major |

275.5.31 BLAS_TRSM Procedures

This procedure performs a matrix-matrix operation.

It performs one of the matrix-matrix operations:

$$\text{op}(A) * X = \alpha * B$$

or

$$X * \text{op}(A) = \alpha * B$$

where alpha is a scalar, X and B are m by n matrices, A is a unit, or non-unit, upper or lower triangular matrix and op(A) is one of

$$\text{op}(A) = A$$

or

$$\text{op}(A) = A^T$$

The matrix X is overwritten on B.

Parameters

Table 275-37 BLAS_TRSM Procedure Parameters

| Parameter | Description |
|-----------|--|
| side | Specifies whether the symmetric matrix A appears on the left or right in the operation: <ul style="list-style-type: none"> side = 'L' or 'l': $op(A) * X = alpha * B$ side = 'R' or 'r': $X * op(A) = alpha * B$ |
| uplo | Specifies whether the upper or lower triangular part of the array A is to be referenced: <ul style="list-style-type: none"> uplo = 'U' or 'u': A is an upper triangular matrix. uplo = 'L' or 'l': A is a lower triangular matrix. |

Table 275-37 (Cont.) BLAS_TRSM Procedure Parameters

| Parameter | Description |
|-----------|--|
| transa | Specifies the form of $op(A)$ to be used in the matrix multiplication as follows: <ul style="list-style-type: none"> transa = 'N' or 'n': $op(A) = A$ transa = 'T' or 't': $op(A) = A'$ transa = 'C' or 'c': $op(A) = A^{-1}$ |
| diag | Specifies whether or not A is unit triangular: <ul style="list-style-type: none"> diag = 'U' or 'u'. A is assumed to be unit triangular. diag = 'N' or 'n'. A is not assumed to be unit triangular. |
| m | Specifies the number of rows of the B. m must be at least zero. |
| n | Specifies the number of columns of B. n must be at least zero. |
| alpha | SCALAR_FLOAT/DOUBLE. Specifies the scalar alpha. When alpha is zero then A is not referenced and B need not be set before entry. |
| a | UTL_NLA_ARRAY_FLT/DBL of DIMENSION (lda, k) where k is m when side = 'L' or 'l', and is n when side = 'R' or 'r'. Before entry with uplo = 'U' or 'u', the leading k by k upper triangular part of the array A must contain the upper triangular matrix, and the strictly lower triangular part of A is not referenced. Before entry with uplo = 'L' or 'l', the leading k by k lower triangular part of the array A must contain the lower triangular matrix and the strictly upper triangular part of A is not referenced. Note that when diag = 'U' or 'u', the diagonal elements of A are not referenced either, but are assumed to be unity. |
| lda | Specifies the first dimension of a as declared in the calling (sub) program. When side = 'L' or 'l', lda must be at least $\max(1, m)$, otherwise lda must be at least $\max(1, n)$. |
| b | UTL_NLA_ARRAY_FLT/DBL of DIMENSION (ldb, n). Before entry, the leading m by n part of the array B must contain the matrix B, and on exit is overwritten by the solution matrix X. |
| ldb | Specifies the first dimension of b as declared in the calling (sub) program. ldb must be at least $\max(1, m)$. |
| pack | (Optional) Flags the packing of the matrices: <ul style="list-style-type: none"> 'C': column-major (default) 'R': row-major |

275.5.32 BLAS_TRSV Procedures

This procedure solves one of the systems of equations $A*x = b$ or $A'*x = b$, where b and x are n element vectors and A is an n by n unit, or non-unit, upper or lower triangular matrix.

Usage Notes

No test for singularity or near-singularity is included in this routine. Such tests must be performed before calling this routine.

275.5.33 LAPACK_GBSV Procedures

This procedure computes the solution to a real system of linear equations $a * x = b$, where `a` is a band matrix of order `n` with `kl` sub diagonals and `ku` superdiagonals, and `x` and `b` are `n` by `nrhs` matrices.

The LU decomposition with partial pivoting and row interchanges is used to factor `A` as

$$a = L * U$$

where `L` is a product of permutation and unit lower triangular matrices with `kl` sub diagonals, and `U` is upper triangular with `kl+ku` superdiagonals. The factored form of `a` is then used to solve the system of equations

$$a * x = b$$

| ldb | The leading dimension of the array b. ldb >= max(1, n) |
| info | <ul style="list-style-type: none"> = 0 : successful exit < 0 : if info = -i, the i-th argument had an illegal value > 0 : if info = i, U(i,i) is exactly zero. The factorization has been completed, but the factor U is exactly singular, and the solution has not been computed |
| pack | (Optional) Flags the packing of the matrices: <ul style="list-style-type: none"> 'C': column-major (default) 'R': row-major |

275.5.34 LAPACK_GEES Procedures

This procedure computes for an n by n real nonsymmetric matrix A, the eigenvalues, the real Schur form T, and, optionally, the matrix of Schur vectors Z.

This gives the Schur factorization $A = Z^*T^*(Z^{**T})$.

A matrix is in real Schur form if it is upper quasi-triangular with 1 by 1 and 2 by 2 blocks. 2 by 2 blocks will be standardized in the form

$$\begin{bmatrix} a & b \\ c & a \end{bmatrix}$$

where $b^*c < 0$. The eigenvalues of such a block are $a \pm \sqrt{bc}$.

275.5.35 LAPACK_GELS Procedures

This procedure solves overdetermined or underdetermined real linear systems involving an m by n matrix A , or its transpose, using a QR or LQ factorization of A . It is assumed that A has full rank.

The following options are provided:

- If TRANS = 'N' and $m \geq n$: find the least squares solution of an overdetermined system, that is, solve the least squares problem

$$\text{minimize } || B - A * X ||$$
- If TRANS = 'N' and $m < n$: find the minimum norm solution of an underdetermined system $A * X = B$.
- If TRANS = 'T' and $m \geq n$: find the minimum norm solution of an undetermined system $A^{**T} * X = B$.
- If TRANS = 'T' and $m < n$: find the least squares solution of an overdetermined system, that is, solve the least squares problem $\text{minimize } || B - A^{**T} * X ||$.

275.5.36 LAPACK_GESDD Procedures

This procedure computes the singular value decomposition (SVD) of a real m by n matrix A , optionally computing the left and right singular vectors. If singular vectors are desired, it uses a divide-and-conquer algorithm that makes mild assumptions about floating point arithmetic.

The SVD is written

$$A = U * SIGMA * \text{transpose}(V)$$

where $SIGMA$ is an m by n matrix which is zero except for its $\min(m, n)$ diagonal elements, U is an m by m orthogonal matrix, and V is an n by n orthogonal matrix. The diagonal elements of $SIGMA$ are the singular values of A , they are real and non-negative, and are returned in descending order. The first $\min(m, n)$ columns of U and V are the left and right singular vectors of A .

Note that the routine returns V^{*T} , not V .

275.5.37 LAPACK_GESV Procedure

This procedure computes the solution to a real system of linear equations $a * x = b$, where a is an n by n matrix and x and b are n by $nrhs$ matrices.

The LU decomposition with partial pivoting and row interchanges is used to factor A as

$$a = P * L * U$$

where P is a permutation matrix, L is unit lower triangular, and U is upper triangular. The factored form of a is then used to solve the system of equations

$$a * x = b$$

275.5.38 LAPACK_GESVD Procedures

This procedure computes the singular value decomposition (SVD) of a real m by n matrix A, optionally computing the left and/or right singular vectors.

The SVD is written

$$A = U * SIGMA * \text{transpose}(V)$$

where SIGMA is an m by n matrix which is zero except for its $\min(m, n)$ diagonal elements, U is an m by m orthogonal matrix, and V is an n by n orthogonal matrix. The diagonal elements of SIGMA are the singular values of A , they are real and non-negative, and are returned in descending order. The first $\min(m, n)$ columns of U and V are the left and right singular vectors of A .

Note that the routine returns V^{*T} , not V .

275.5.39 LAPACK_GEEV Procedures

This procedure computes for an n by n real nonsymmetric matrix A , the eigenvalues and, optionally, the left and/or right eigenvectors.

- The right eigenvector $v(j)$ of A satisfies $A * v(j) = \text{lambda}(j) * v(j)$ where $\text{lambda}(j)$ is its eigenvalue.
- The left eigenvector $u(j)$ of A satisfies $u(j)**H * A = \text{lambda}(j) * u(j)**H$ where $u(j)**H$ denotes the conjugate transpose of $u(j)$.

The computed eigenvectors are normalized to have Euclidean norm equal to 1 and largest component real.

275.5.43 LAPACK_PPSV Procedures

This procedure computes the solution to a real system of linear equations $a * x = b$ where a is an n by n symmetric positive definite matrix stored in packed format and x and b are n by nrhs matrices.

The Cholesky decomposition is used to factor A as

$$A = U^{*T}U \text{ if UPLO} = 'U'$$

or

$$A = L * L^{*T} \text{ if UPLO} = 'L'$$

where **U** is an upper triangular matrix and **L** is a lower triangular matrix. The factored form of A is then used to solve the system of equations $A * X = B$.

275.5.44 LAPACK_PTSV Procedures

This procedure computes the solution to a real system of linear equations $a * x = b$, where a is an n by n symmetric positive definite tridiagonal matrix, and x and b are n by nrhs matrices.

a is factored as $A = L * D * L^{**T}$, and the factored form of a is then used to solve the system of equations.

275.5.49 LAPACK_SPSV Procedures

This procedure computes the solution to a real system of linear equations $a * x = b$, where *a* is an *n* by *n* symmetric matrix stored in packed format, and *x* and *b* are *n* by *nrhs* matrices.

The diagonal pivoting method is used to factor *A* as

$$A = U * D * U^{**T}, \text{ if } UPLO = 'U'$$

or

$$A = L * D * L^{**T}, \text{ if } UPLO = 'L'$$

where U (or L) is a product of permutation and unit upper (lower) triangular matrices, and D is symmetric and block diagonal with 1 by 1 and 2 by 2 diagonal blocks. The factored form of A is then used to solve the system of equations $A * X = B$.

275.5.54 LAPACK_SYSV Procedures

This procedure computes the solution to a real system of linear equations $A * X = B$, where A is an n by n symmetric matrix, and X and B are n by $nrhs$ matrices.

The diagonal pivoting method is used to factor A as

$$A = U * D * U^{**T}, \text{ if UPLO} = 'U'$$

or

$$A = L * D * L^{**T}, \text{ if UPLO} = 'L'$$

where U (or L) is a product of permutation and unit upper (lower) triangular matrices, and D is symmetric and block diagonal with 1 by 1 and 2 by 2 diagonal blocks. The factored form of A is then used to solve the system of equations $A * X = B$.

UTL_RAW

The `UTL_RAW` package provides SQL functions for manipulating `RAW` datatypes.

This chapter contains the following topics:

- [Overview](#)
- [Operational Notes](#)
- [Summary of UTL_RAW Subprograms](#)

276.1 UTL_RAW Overview

This package is necessary because normal SQL functions do not operate on `RAW`s, and PL/SQL does not allow overloading between a `RAW` and a `CHAR` datatype. `UTL_RAW` also includes subprograms that convert various COBOL number formats to, and from, `RAW`s.

`UTL_RAW` is not specific to the database environment, and it may actually be used in other environments. For this reason, the prefix `UTL` has been given to the package, instead of `DBMS`.

276.2 UTL_RAW Operational Notes

`UTL_RAW` allows a `RAW` "record" to be composed of many elements. By using the `RAW` datatype, character set conversion will not be performed, keeping the `RAW` in its original format when being transferred through remote procedure calls.

With the `RAW` functions, you can manipulate binary data that was previously limited to the `hexoraw` and `rawtohex` functions.

Note:

Notes on datatypes:

- The `PLS_INTEGER` and `BINARY_INTEGER` datatypes are identical. This document uses `BINARY_INTEGER` to indicate datatypes in reference information (such as for table types, record types, subprogram parameters, or subprogram return values), but may use either in discussion and examples.
- The `INTEGER` and `NUMBER(38)` datatypes are also identical. This document uses `INTEGER` throughout.

276.3 Summary of UTL_RAW Subprograms

This table lists the `UTL_RAW` subprograms and briefly describes them.

Table 276-1 UTL_RAW Package Subprograms

| Subprogram | Description |
|---|---|
| BIT_AND Function | Performs bitwise logical "and" of the values in RAW r1 with RAW r2 and returns the "anded" result RAW |
| BIT_COMPLEMENT Function | Performs bitwise logical "complement" of the values in RAW r and returns the "complement'ed" result RAW |
| BIT_OR Function | Performs bitwise logical "or" of the values in RAW r1 with RAW r2 and returns the "or'd" result RAW |
| BIT_XOR Function | Performs bitwise logical "exclusive or" of the values in RAW r1 with RAW r2 and returns the "xor'd" result RAW |
| CAST_FROM_BINARY_DOUBLE Function | Returns the RAW binary representation of a BINARY_DOUBLE value |
| CAST_FROM_BINARY_FLOAT Function | Returns the RAW binary representation of a BINARY_FLOAT value |
| CAST_FROM_BINARY_INTEGER Function | Returns the RAW binary representation of a BINARY_INTEGER value |
| CAST_FROM_NUMBER Function | Returns the RAW binary representation of a NUMBER value |
| CAST_TO_BINARY_DOUBLE Function | Casts the RAW binary representation of a BINARY_DOUBLE into a BINARY_DOUBLE |
| CAST_TO_BINARY_FLOAT Function | Casts the RAW binary representation of a BINARY_FLOAT into a BINARY_FLOAT |
| CAST_TO_BINARY_INTEGER Function | Casts the RAW binary representation of a BINARY_INTEGER into a BINARY_INTEGER |
| CAST_TO_NUMBER Function | Casts the RAW binary representation of a NUMBER into a NUMBER |
| CAST_TO_NVARCHAR2 Function | Converts a RAW value into a VARCHAR2 value |
| CAST_TO_RAW Function | Converts a VARCHAR2 value into a RAW value |
| CAST_TO_VARCHAR2 Function | Converts a RAW value into a VARCHAR2 value |
| COMPARE Function | Compares RAW r1 against RAW r2 |
| CONCAT Function | Concatenates up to 12 RAWs into a single RAW |
| CONVERT Function | Converts RAW r from character set from_charset to character set to_charset and returns the resulting RAW |
| COPIES Function | Returns n copies of r concatenated together |
| LENGTH Function | Returns the length in bytes of a RAW r |
| OVERLAY Function | Overlays the specified portion of target RAW with overlay RAW, starting from byte position pos of target and proceeding for len bytes |
| REVERSE Function | Reverses a byte sequence in RAW r from end to end |
| SUBSTR Function | Returns len bytes, starting at pos from RAW r |
| TRANSLATE Function | Translates the bytes in the input RAW r according to the bytes in the translation RAWs from_set and to_set |

Table 276-1 (Cont.) UTL_RAW Package Subprograms

| Subprogram | Description |
|--|---|
| TRANSLITERATE Function | Converts the bytes in the input RAW <i>r</i> according to the bytes in the transliteration RAWs <i>from_set</i> and <i>to_set</i> |
| XRANGE Function | Returns a RAW containing all valid 1-byte encodings in succession, beginning with the value <i>start_byte</i> and ending with the value <i>end_byte</i> |

276.3.1 BIT_AND Function

This function performs bitwise logical "and" of the values in RAW *r1* with RAW *r2* and returns the "anded" result RAW.

Syntax

```
UTL_RAW.BIT_AND (
    r1 IN RAW,
    r2 IN RAW)
RETURN RAW;
```

Pragmas

```
pragma restrict_references(bit_and, WNDS, RNDS, WNPS, RNPS);
```

Parameters

Table 276-2 BIT_AND Function Parameters

| Parameter | Description |
|-----------|-----------------------------|
| <i>r1</i> | RAW to "and" with <i>r2</i> |
| <i>r2</i> | RAW to "and" with <i>r1</i> |

Return Values

Table 276-3 BIT_AND Function Return Values

| Return | Description |
|--------|--|
| RAW | Containing the "and" of <i>r1</i> and <i>r2</i> |
| NULL | Either <i>r1</i> or <i>r2</i> input parameter was NULL |

Usage Notes

If *r1* and *r2* differ in length, the and operation is terminated after the last byte of the shorter of the two RAWs, and the unprocessed portion of the longer RAW is appended to the partial result. The result length equals the longer of the two input RAWs.

276.3.2 BIT_COMPLEMENT Function

This function performs bitwise logical "complement" of the values in RAW *r* and returns the complemented result RAW. The result length equals the input RAW *r* length.

Syntax

```
UTL_RAW.BIT_COMPLEMENT (  
    r IN RAW)  
    RETURN RAW;
```

Pragmas

```
pragma restrict_references(bit_complement, WNDS, RNDS, WNPS, RNPS);
```

Parameters

Table 276-4 BIT_COMPLEMENT Function Parameters

| Parameter | Description |
|-----------|---------------------------------------|
| <i>r</i> | RAW to perform "complement" operation |

Return Values

Table 276-5 BIT_COMPLEMENT Function Return Values

| Return | Description |
|--------|--------------------------------------|
| RAW | The "complement" of <i>r1</i> |
| NULL | If <i>r</i> input parameter was NULL |

276.3.3 BIT_OR Function

This function performs bitwise logical "or" of the values in RAW *r1* with RAW *r2* and returns the or'd result RAW.

Syntax

```
UTL_RAW.BIT_OR (  
    r1 IN RAW,  
    r2 IN RAW)  
    RETURN RAW;
```

Pragmas

```
pragma restrict_references(bit_or, WNDS, RNDS, WNPS, RNPS);
```

Parameters

Table 276-6 BIT_OR Function Parameters

| Parameters | Description |
|------------|---------------------|
| r1 | RAW to "or" with r2 |
| r2 | RAW to "or" with r1 |

Return Values

Table 276-7 BIT_OR Function Return Values

| Return | Description |
|--------|--|
| RAW | Containing the "or" of r1 and r2 |
| NULL | Either r1 or r2 input parameter was NULL |

Usage Notes

If r1 and r2 differ in length, then the "or" operation is terminated after the last byte of the shorter of the two RAWs, and the unprocessed portion of the longer RAW is appended to the partial result. The result length equals the longer of the two input RAWs.

276.3.4 BIT_XOR Function

This function performs bitwise logical "exclusive or" of the values in RAW r1 with RAW r2 and returns the xor'd result RAW.

Syntax

```
UTL_RAW.BIT_XOR (
    r1 IN RAW,
    r2 IN RAW)
RETURN RAW;
```

Pragmas

```
pragma restrict_references (bit_xor, WNDS, RNDS, WNPS, RNPS);
```

Parameters

Table 276-8 BIT_XOR Function Parameters

| Parameter | Description |
|-----------|----------------------|
| r1 | RAW to "xor" with r2 |
| r2 | RAW to "xor" with r1 |

Return Values

Table 276-9 BIT_XOR Function Return Values

| Return | Description |
|--------|---|
| RAW | Containing the "xor" of r1 and r2 |
| NULL | If either r1 or r2 input parameter was NULL |

Usage Notes

If r1 and r2 differ in length, then the "xor" operation is terminated after the last byte of the shorter of the two RAWs, and the unprocessed portion of the longer RAW is appended to the partial result. The result length equals the longer of the two input RAWs.

276.3.5 CAST_FROM_BINARY_DOUBLE Function

This function returns the RAW binary representation of a BINARY_DOUBLE value.

Syntax

```
UTL_RAW.CAST_FROM_BINARY_DOUBLE (
    n          IN BINARY_DOUBLE,
    endianness IN PLS_INTEGER DEFAULT 1)
RETURN RAW;
```

Pragmas

```
pragma restrict_references(cast_from_binary_double, WNDS, RNDS, WNPS, RNPS);
```

Parameters

Table 276-10 CAST_FROM_BINARY_DOUBLE Function Parameters

| Parameter | Description |
|------------|--|
| n | BINARY_DOUBLE value |
| endianness | A BINARY_INTEGER value indicating the endianness. The function recognizes the defined constants big_endian (1), little_endian (2), and machine_endian (3). The default is big_endian. A setting of machine_endian has the same effect as big_endian on a big endian machine, or the same effect as little_endian on a little endian machine. |

Return Values

The binary representation of the BINARY_DOUBLE value, or NULL if the input is NULL.

Usage Notes

- An 8-byte binary_double value maps to the IEEE 754 double-precision format as follows:

```
byte 0: bit 63 ~ bit 56
byte 1: bit 55 ~ bit 48
```

```
byte 2: bit 47 ~ bit 40
byte 3: bit 39 ~ bit 32
byte 4: bit 31 ~ bit 24
byte 5: bit 23 ~ bit 16
byte 6: bit 15 ~ bit 8
byte 7: bit 7 ~ bit 0
```

- The parameter `endianess` describes how the bytes of `BINARY_DOUBLE` are mapped to the bytes of `RAW`. In the following matrix, `rb0 ~ rb7` refer to the bytes in `raw` and `db0 ~ db7` refer to the bytes in `BINARY_DOUBLE`.

| endianess | rb0 | rb1 | rb2 | rb3 | rb4 | rb5 | rb6 | rb7 |
|----------------------------|-----|-----|-----|-----|-----|-----|-----|-----|
| <code>big_endian</code> | db0 | db1 | db2 | db3 | db4 | db5 | db6 | db7 |
| <code>little_endian</code> | db7 | db6 | db5 | db4 | db3 | db2 | db1 | db0 |

- In case of machine-endian, the 8 bytes of the `BINARY_DOUBLE` argument are copied straight across into the `RAW` return value. The effect is the same if the user has passed `big_endian` on a big-endian machine, or `little_endian` on a little-endian machine.

276.3.6 CAST_FROM_BINARY_FLOAT Function

This function returns the `RAW` binary representation of a `BINARY_FLOAT` value.

Syntax

```
UTL_RAW.CAST_FROM_BINARY_FLOAT(
    n          IN BINARY_FLOAT,
    endianess  IN PLS_INTEGER DEFAULT 1)
RETURN RAW;
```

Pragmas

```
pragma restrict_references(cast_from_binary_float, WNDS, RNDS, WNPS, RNPS);
```

Parameters

Table 276-11 CAST_FROM_BINARY_FLOAT Function Parameters

| Parameter | Description |
|------------------------|--|
| <code>n</code> | <code>BINARY_FLOAT</code> value |
| <code>endianess</code> | A <code>BINARY_INTEGER</code> value indicating the endianess. The function recognizes the defined constants <code>big_endian</code> (1), <code>little_endian</code> (2), and <code>machine_endian</code> (3). The default is <code>big_endian</code> . A setting of <code>machine_endian</code> has the same effect as <code>big_endian</code> on a big endian machine, or the same effect as <code>little_endian</code> on a little endian machine. |

Return Values

The binary representation (`RAW`) of the `BINARY_FLOAT` value, or `NULL` if the input is `NULL`.

Usage Notes

- A 4-byte `binary_float` value maps to the IEEE 754 single-precision format as follows:

```
byte 0: bit 31 ~ bit 24
byte 1: bit 23 ~ bit 16
byte 2: bit 15 ~ bit 8
byte 3: bit 7 ~ bit 0
```

- The parameter `endianess` describes how the bytes of `BINARY_FLOAT` are mapped to the bytes of `RAW`. In the following matrix, `rb0 ~ rb3` refer to the bytes in `RAW` and `fb0 ~ fb3` refer to the bytes in `BINARY_FLOAT`.

| Endianess | rb0 | rb1 | rb2 | rb3 |
|----------------------------|-----|-----|-----|-----|
| <code>big_endian</code> | fb0 | fb1 | fb2 | fb3 |
| <code>little_endian</code> | fb3 | fb2 | fb1 | fb0 |

- In case of machine-endian, the 4 bytes of the `BINARY_FLOAT` argument are copied straight across into the `RAW` return value. The effect is the same if the user has passed `big_endian` on a big-endian machine, or `little_endian` on a little-endian machine.

276.3.7 CAST_FROM_BINARY_INTEGER Function

This function returns the `RAW` binary representation of a `BINARY_INTEGER` value.

Syntax

```
UTL_RAW.CAST_FROM_BINARY_INTEGER (
    n          IN BINARY_INTEGER
    endianess  IN PLS_INTEGER DEFAULT BIG_ENDIAN)
RETURN RAW;
```

Pragmas

```
pragma restrict_references(cast_from_binary_integer, WNDS, RNDS, WNPS, RNPS);
```

Parameters

Table 276-12 CAST_FROM_BINARY_INTEGER Function Parameters

| Parameter | Description |
|------------------------|--|
| <code>n</code> | <code>BINARY_INTEGER</code> value. |
| <code>endianess</code> | A <code>BINARY_INTEGER</code> value indicating the endianess. The function recognizes the defined constants <code>big_endian</code> (1), <code>little_endian</code> (2), and <code>machine_endian</code> (3). The default is <code>big_endian</code> . A setting of <code>machine_endian</code> has the same effect as <code>big_endian</code> on a big endian machine, or the same effect as <code>little_endian</code> on a little endian machine. |

Return Values

The binary representation of the `BINARY_INTEGER` value.

276.3.8 CAST_FROM_NUMBER Function

This function returns the RAW binary representation of a NUMBER value.

Syntax

```
UTL_RAW.CAST_FROM_NUMBER (
    n IN NUMBER)
RETURN RAW;
```

Pragmas

```
pragma restrict_references(cast_from_number, WNDS, RNDS, WNPS, RNPS);
```

Parameters

Table 276-13 CAST_FROM_NUMBER Function Parameters

| Parameter | Description |
|-----------|--------------|
| n | NUMBER value |

Return Values

The binary representation of the NUMBER value.

276.3.9 CAST_TO_BINARY_DOUBLE Function

This function casts the RAW binary representation of a BINARY_DOUBLE into a BINARY_DOUBLE.

Syntax

```
UTL_RAW.CAST_TO_BINARY_DOUBLE (
    r          IN RAW
    endianness IN PLS_INTEGER DEFAULT 1)
RETURN BINARY_DOUBLE;
```

Pragmas

```
pragma restrict_references(cast_to_binary_double, WNDS, RNDS, WNPS, RNPS);
```

Parameters

Table 276-14 CAST_TO_BINARY_DOUBLE Function Parameters

| Parameter | Description |
|------------|---|
| r | Binary representation of a BINARY_DOUBLE |
| endianness | A PLS_INTEGER representing big-endian or little-endian architecture. The default is big-endian. |

Return Values

The BINARY_DOUBLE value.

Usage Notes

- If the `RAW` argument is more than 8 bytes, only the first 8 bytes are used and the rest of the bytes are ignored. If the result is `-0`, `+0` is returned. If the result is `NaN`, the value `BINARY_DOUBLE_NAN` is returned.
- If the `RAW` argument is less than 8 bytes, a `VALUE_ERROR` exception is raised.
- An 8-byte `binary_double` value maps to the IEEE 754 double-precision format as follows:

```
byte 0: bit 63 ~ bit 56
byte 1: bit 55 ~ bit 48
byte 2: bit 47 ~ bit 40
byte 3: bit 39 ~ bit 32
byte 4: bit 31 ~ bit 24
byte 5: bit 23 ~ bit 16
byte 6: bit 15 ~ bit 8
byte 7: bit 7 ~ bit 0
```
- The parameter `endianess` describes how the bytes of `BINARY_DOUBLE` are mapped to the bytes of `RAW`. In the following matrix, `rb0 ~ rb7` refer to the bytes in `raw` and `db0 ~ db7` refer to the bytes in `BINARY_DOUBLE`.

| Architecture | rb0 | rb1 | rb2 | rb3 | rb4 | rb5 | rb6 | rb7 |
|----------------------------|-----|-----|-----|-----|-----|-----|-----|-----|
| <code>big_endian</code> | db0 | db1 | db2 | db3 | db4 | db5 | db6 | db7 |
| <code>little_endian</code> | db7 | db6 | db5 | db4 | db3 | db2 | db1 | db0 |

- In case of machine-endian, the 8 bytes of the `RAW` argument are copied straight across into the `BINARY_DOUBLE` return value. The effect is the same if the user has passed `big_endian` on a big-endian machine, or `little_endian` on a little-endian machine.

276.3.10 CAST_TO_BINARY_FLOAT Function

This function casts the `RAW` binary representation of a `BINARY_FLOAT` into a `BINARY_FLOAT`.

Syntax

```
UTL_RAW.CAST_TO_BINARY_FLOAT (
    r          IN RAW
    endianess  IN PLS_INTEGER DEFAULT 1)
RETURN BINARY_FLOAT;
```

Pragmas

```
pragma restrict_references(cast_to_binary_float, WNDS, RNDS, WNPS, RNPS);
```

Parameters

Table 276-15 CAST_TO_BINARY_FLOAT Function Parameters

| Parameter | Description |
|----------------|--|
| <code>r</code> | Binary representation of a <code>BINARY_FLOAT</code> |

Table 276-15 (Cont.) CAST_TO_BINARY_FLOAT Function Parameters

| Parameter | Description |
|-----------|---|
| endianess | A PLS_INTEGER representing big-endian or little-endian architecture. The default is big-endian. |

Return Values

The BINARY_FLOAT value.

Usage Notes

- If the RAW argument is more than 4 bytes, only the first 4 bytes are used and the rest of the bytes are ignored. If the result is -0, +0 is returned. If the result is NaN, the value BINARY_FLOAT_NAN is returned.
- If the RAW argument is less than 4 bytes, a VALUE_ERROR exception is raised.
- A 4-byte binary_float value maps to the IEEE 754 single-precision format as follows:
 - byte 0: bit 31 ~ bit 24
 - byte 1: bit 23 ~ bit 16
 - byte 2: bit 15 ~ bit 8
 - byte 3: bit 7 ~ bit 0
- The parameter endianess describes how the bytes of BINARY_FLOAT are mapped to the bytes of RAW. In the following matrix, rb0 ~ rb3 refer to the bytes in RAW and fb0 ~ fb3 refer to the bytes in BINARY_FLOAT.

| Endianness | rb0 | rb1 | rb2 | rb3 |
|---------------|-----|-----|-----|-----|
| big_endian | fb0 | fb1 | fb2 | fb3 |
| little_endian | fb3 | fb2 | fb1 | fb0 |

- In case of machine-endian, the 4 bytes of the RAW argument are copied straight across into the BINARY_FLOAT return value. The effect is the same if the user has passed big_endian on a big-endian machine, or little_endian on a little-endian machine.

276.3.11 CAST_TO_BINARY_INTEGER Function

This function casts the RAW binary representation of a BINARY_INTEGER into a BINARY_INTEGER.

Syntax

```
UTL_RAW.CAST_TO_BINARY_INTEGER (
  r          IN RAW
  endianess  IN PLS_INTEGER DEFAULT BIG_ENDIAN)
RETURN BINARY_INTEGER;
```

Pragmas

```
pragma restrict_references(cast_to_binary_integer, WNDS, RNDS, WNPS, RNPS);
```

Parameters

Table 276-16 CAST_TO_BINARY_INTEGER Function Parameters

| Parameter | Description |
|------------------------|--|
| <code>r</code> | Binary representation of a <code>BINARY_INTEGER</code> |
| <code>endianess</code> | A <code>PLS_INTEGER</code> representing big-endian or little-endian architecture. The default is big-endian. |

Return Values

The `BINARY_INTEGER` value

276.3.12 CAST_TO_NUMBER Function

This function casts the `RAW` binary representation of a `NUMBER` into a `NUMBER`.

Syntax

```
UTL_RAW.CAST_TO_NUMBER (
    r IN RAW)
RETURN NUMBER;
```

Pragmas

```
pragma restrict_references(cast_to_number, WNDS, RNDS, WNPS, RNPS);
```

Parameters

Table 276-17 CAST_TO_NUMBER function Parameters

| Parameter | Description |
|----------------|--|
| <code>r</code> | Binary representation of a <code>NUMBER</code> |

Return Values

The `NUMBER` value.

276.3.13 CAST_TO_NVARCHAR2 Function

This function converts a `RAW` value represented using some number of data bytes into an `NVARCHAR2` value with that number of data bytes.

Note:

When casting to a `NVARCHAR2`, the current Globalization Support character set is used for the characters within that `NVARCHAR2` value.

Syntax

```
UTL_RAW.CAST_TO_NVARCHAR2 (
    r IN RAW)
RETURN NVARCHAR2;
```

Pragmas

```
pragma restrict_references(cast_to_NVARCHAR2, WNDS, RNDS, WNPS, RNPS);
```

Parameters**Table 276-18 CAST_TO_NVARCHAR2 Function Parameters**

| Parameter | Description |
|-----------|--|
| r | RAW (without leading length field) to be changed to a NVARCHAR2) |

Return Values**Table 276-19 CAST_TO_NVARCHAR2 Function Return Values**

| Return | Description |
|-----------|--|
| NVARCHAR2 | Containing having the same data as the input RAW |
| NULL | If r input parameter was NULL |

276.3.14 CAST_TO_RAW Function

This function converts a VARCHAR2 value represented using some number of data bytes into a RAW value with that number of data bytes. The data itself is not modified in any way, but its datatype is recast to a RAW datatype.

Syntax

```
UTL_RAW.CAST_TO_RAW (
    c IN VARCHAR2)
RETURN RAW;
```

Pragmas

```
pragma restrict_references(cast_to_raw, WNDS, RNDS, WNPS, RNPS);
```

Parameters**Table 276-20 CAST_TO_RAW Function Parameters**

| Parameter | Description |
|-----------|---------------------------------|
| c | VARCHAR2 to be changed to a RAW |

Return Values

Table 276-21 CAST_TO_RAW Function Return Values

| Return | Description |
|--------|---|
| RAW | Containing the same data as the input VARCHAR2 and equal byte length as the input VARCHAR2 and without a leading length field |
| NULL | If c input parameter was NULL |

276.3.15 CAST_TO_VARCHAR2 Function

This function converts a RAW value represented using some number of data bytes into a VARCHAR2 value with that number of data bytes.

Note:

When casting to a VARCHAR2, the current Globalization Support character set is used for the characters within that VARCHAR2.

Syntax

```
UTL_RAW.CAST_TO_VARCHAR2 (
    r IN RAW)
RETURN VARCHAR2;
```

Pragmas

```
pragma restrict_references(cast_to_VARCHAR2, WNDS, RNDS, WNPS, RNPS);
```

Parameters

Table 276-22 CAST_TO_VARCHAR2 Function Parameters

| Parameter | Description |
|-----------|--|
| r | RAW (without leading length field) to be changed to a VARCHAR2 |

Return Values

Table 276-23 CAST_TO_VARCHAR2 Function Return Values

| Return | Description |
|----------|--|
| VARCHAR2 | Containing having the same data as the input RAW |
| NULL | If r input parameter was NULL |

276.3.16 COMPARE Function

This function compares two RAW values. If they differ in length, then the shorter is extended on the right according to the optional pad parameter.

Syntax

```
UTL_RAW.COMPARE (
  r1 IN RAW,
  r2 IN RAW,
  pad IN RAW DEFAULT NULL)
RETURN NUMBER;
```

Pragmas

```
pragma restrict_references(compare, WNDS, RNDS, WNPS, RNPS);
```

Parameters

Table 276-24 COMPARE Function Parameters

| Parameter | Description |
|-----------|--|
| r1 | 1st RAW to be compared, may be NULL or 0 length |
| r2 | 2nd RAW to be compared, may be NULL or 0 length |
| pad | This is an optional parameter. Byte to extend whichever of r1 or r2 is shorter. The default: x'00' |

Return Values

Table 276-25 COMPARE Function Return Values

| Return | Description |
|--------|--|
| NUMBER | Equals 0 if RAW byte strings are both NULL or identical; or, Equals position (numbered from 1) of the first mismatched byte |

276.3.17 CONCAT Function

This function concatenates up to 12 RAWs into a single RAW. If the concatenated size exceeds 32K, then an error is returned

Syntax

```
UTL_RAW.CONCAT (
  r1 IN RAW DEFAULT NULL,
  r2 IN RAW DEFAULT NULL,
  r3 IN RAW DEFAULT NULL,
  r4 IN RAW DEFAULT NULL,
  r5 IN RAW DEFAULT NULL,
  r6 IN RAW DEFAULT NULL,
  r7 IN RAW DEFAULT NULL,
  r8 IN RAW DEFAULT NULL,
  r9 IN RAW DEFAULT NULL,
```

```
r10 IN RAW DEFAULT NULL,
r11 IN RAW DEFAULT NULL,
r12 IN RAW DEFAULT NULL)
RETURN RAW;
```

Pragmas

```
pragma restrict_references(concat, WNDS, RNDS, WNPS, RNPS);
```

Parameters

r1....r12 are the RAW items to concatenate.

Return Values

Table 276-26 CONCAT Function Return Values

| Return | Description |
|--------|-----------------------------------|
| RAW | Containing the items concatenated |

Exceptions

There is an error if the sum of the lengths of the inputs exceeds the maximum allowable length for a RAW, which is 32767 bytes.

276.3.18 CONVERT Function

This function converts RAW *r* from character set *from_charset* to character set *to_charset* and returns the resulting RAW.

Both *from_charset* and *to_charset* must be supported character sets defined to the Oracle server.

Syntax

```
UTL_RAW.CONVERT (
  r          IN RAW,
  to_charset IN VARCHAR2,
  from_charset IN VARCHAR2)
RETURN RAW;
```

Pragmas

```
pragma restrict_references(convert, WNDS, RNDS, WNPS, RNPS);
```

Parameters

Table 276-27 CONVERT Function Parameters

| Parameter | Description |
|---------------------|--|
| <i>r</i> | RAW byte-string to be converted |
| <i>to_charset</i> | Name of the character set to which <i>r</i> is converted |
| <i>from_charset</i> | Name of the character set in which <i>r</i> is supplied |

Return Values

Table 276-28 CONVERT Function Return Values

| Return | Description |
|--------|---|
| RAW | Byte string <i>r</i> converted according to the specified character sets. |

Exceptions

Table 276-29 CONVERT Function Exceptions

| Error | Description |
|-----------|---|
| ORA-06502 | PL/SQL: numeric or value error |
| ORA-12703 | This character set conversion is not supported |
| ORA-12705 | Cannot access NLS data files or invalid environment specified |

Usage Notes

- The NLS_LANG parameter form *language_territory.character set* is also accepted for *to_charset* and *from_charset*. However, this form is deprecated and should be avoided. Note that *language* and *territory* are ignored by this subprogram.
- The converted value is silently truncated if it exceeds the maximum length of a RAW value, which is 32767 bytes. Do not convert values longer than $\text{floor}(32767/4) = 8191$ bytes if you want to avoid this truncation for all possible combinations of *to_charset* and *from_charset*. You can use the maximum character width of the target character set *to_charset*, if known, to expand the limit to a less pessimistic value. For example, if the target character set is ZHS16GBK, the maximum safe source string length is $\text{floor}(32767/2) = 16383$ bytes. For single-byte target character sets, no truncation is ever necessary.

276.3.19 COPIES Function

This function returns *n* copies of *r* concatenated together.

Syntax

```
UTL_RAW.COPIES (
  r IN RAW,
  n IN NUMBER)
RETURN RAW;
```

Pragmas

```
pragma restrict_references(copies, WNDS, RNDS, WNPS, RNPS);
```

Parameters

Table 276-30 COPIES Function Parameters

| Parameters | Description |
|------------|--|
| r | RAW to be copied |
| n | Number of times to copy the RAW (must be positive) |

Return Values

This returns the RAW copied n times.

Exceptions

Table 276-31 COPIES Function Exceptions

| Error | Description |
|-------------|--|
| VALUE_ERROR | Either: - r is missing, NULL or 0 length - n < 1 - Length of result exceeds maximum length of a RAW |

276.3.20 LENGTH Function

This function returns the length in bytes of a RAW r.

Syntax

```
UTL_RAW.LENGTH (
    r IN RAW)
RETURN NUMBER;
```

Pragmas

```
pragma restrict_references(length, WNDS, RNDS, WNPS, RNPS);
```

Parameters

Table 276-32 LENGTH Function Parameters

| Parameter | Description |
|-----------|--------------------------------|
| r | RAW byte stream to be measured |

Return Values

Table 276-33 LENGTH Function Return Values

| Return | Description |
|--------|---------------------------|
| NUMBER | Current length of the RAW |

276.3.21 OVERLAY Function

This function overlays the specified portion of `target RAW` with `overlay_str RAW`, starting from byte position `pos` of `target` and proceeding for `len` bytes.

Syntax

```
UTL_RAW.OVERLAY (
  overlay_str IN RAW,
  target      IN RAW,
  pos         IN BINARY_INTEGER DEFAULT 1,
  len         IN BINARY_INTEGER DEFAULT NULL,
  pad         IN RAW             DEFAULT NULL)
RETURN RAW;
```

Pragmas

```
pragma restrict_references(overlay, WNDS, RNDS, WNPS, RNPS);
```

Parameters

Table 276-34 OVERLAY Function Parameters

| Parameters | Description |
|--------------------------|--|
| <code>overlay_str</code> | Byte-string used to overlay target |
| <code>target</code> | Byte-string which is to be overlaid |
| <code>pos</code> | Position in target (numbered from 1) to start overlay |
| <code>len</code> | The number of target bytes to overlay |
| <code>pad</code> | Pad byte used when <code>overlay len</code> exceeds <code>overlay_str length</code> or <code>pos</code> exceeds <code>target length</code> |

Defaults and Optional Parameters

Table 276-35 OVERLAY Function Optional Parameters

| Optional Parameter | Description |
|--------------------|---|
| <code>pos</code> | 1 |
| <code>len</code> | To the length of <code>overlay_str</code> |
| <code>pad</code> | <code>x'00'</code> |

Return Values

Table 276-36 OVERLAY Function Return Values

| Return | Description |
|------------------|--|
| <code>RAW</code> | The target <code>byte_string</code> overlaid as specified. |

Usage Notes

If `overlay_str` has less than `len` bytes, then it is extended to `len` bytes using the `pad` byte. If `overlay_str` exceeds `len` bytes, then the extra bytes in `overlay_str` are ignored. If `len` bytes beginning at position `pos` of `target` exceeds the length of `target`, then `target` is extended to contain the entire length of `overlay_str`.

If `len` is specified, it must be greater than or equal to 0. If `pos` is specified, it must be greater than or equal to 1. If `pos` exceeds the length of `target`, then `target` is padded with `pad` bytes to position `pos`, and `target` is further extended with `overlay_str` bytes.

Exceptions

Table 276-37 OVERLAY Function Exceptions

| Error | Description |
|-------------|--|
| VALUE_ERROR | Either: <ul style="list-style-type: none"> - <code>Overlay_str</code> is NULL or has 0 length - <code>Target</code> is missing or undefined - Length of <code>target</code> exceeds maximum length of a RAW - <code>len</code> < 0 - <code>pos</code> < 1 |

276.3.22 REVERSE Function

This function reverses a byte sequence in RAW `r` from end to end.

For example, `x'0102F3'` would be reversed to `x'F30201'`, and `'xyz'` would be reversed to `'zyx'`. The result length is the same as the input RAW length.

Syntax

```
UTL_RAW.REVERSE (
    r IN RAW)
RETURN RAW;
```

Pragmas

```
pragma restrict_references(reverse, WNDS, RNDS, WNPS, RNPS);
```

Parameters

Table 276-38 REVERSE Function Parameters

| Parameter | Description |
|----------------|----------------|
| <code>r</code> | RAW to reverse |

Return Values

Table 276-39 REVERSE Function Return Values

| Return | Description |
|--------|--------------------------------------|
| RAW | Containing the "reverse" of <i>r</i> |

Exceptions

Table 276-40 REVERSE Function Exceptions

| Error | Description |
|-------------|----------------------------------|
| VALUE_ERROR | <i>R</i> is NULL or has 0 length |

276.3.23 SUBSTR Function

This function returns *len* bytes, starting at *pos* from RAW *r*.

Syntax

```
UTL_RAW.SUBSTR (
  r      IN RAW,
  pos   IN BINARY_INTEGER,
  len   IN BINARY_INTEGER DEFAULT NULL)
RETURN RAW;
```

Pragmas

```
pragma restrict_references(substr, WNDS, RNDS, WNPS, RNPS);
```

Parameters

Table 276-41 SUBSTR Function Parameters

| Parameter | Description |
|------------|---|
| <i>r</i> | RAW byte-string from which a portion is extracted |
| <i>pos</i> | Byte position in <i>r</i> at which to begin extraction |
| <i>len</i> | Number of bytes from <i>pos</i> to extract from <i>r</i> (optional) |

Defaults and Optional Parameters

Table 276-42 SUBSTR Function Optional Parameter

| Optional Parameter | Description |
|--------------------|--|
| <i>len</i> | Position <i>pos</i> through to the end of <i>r</i> |

Return Values

Table 276-43 SUBSTR Function Return Values

| Return | Description |
|---------------------|---|
| portion of <i>r</i> | Beginning at <i>pos</i> for <i>len</i> bytes long |
| NULL | <i>r</i> input parameter was NULL |

Usage Notes

- If *pos* is positive, then `SUBSTR` counts from the beginning of *r* to find the first byte. If *pos* is negative, then `SUBSTR` counts backward from the end of the *r*. The value *pos* cannot be 0.
- If *len* is omitted, then `SUBSTR` returns all bytes to the end of *r*. The value *len* cannot be less than 1.

Exceptions

Table 276-44 SUBSTR Function Exceptions

| Error | Description |
|-------------|--|
| VALUE_ERROR | VALUE_ERROR is returned if: <ul style="list-style-type: none"> • <i>pos</i> = 0 or > length of <i>r</i> • <i>len</i> < 1 or > length of <i>r</i> - (<i>pos</i>-1) |

276.3.24 TRANSLATE Function

This function translates the bytes in the input RAW *r* according to the bytes in the translation RAWs *from_set* and *to_set*.

If a byte in *r* has a matching byte in *from_set*, then it is replaced by the byte in the corresponding position in *to_set*, or deleted.

Bytes in *r*, but undefined in *from_set*, are copied to the result. Only the first (leftmost) occurrence of a byte in *from_set* is used. Subsequent duplicates are not scanned and are ignored.

Syntax

```
UTL_RAW.TRANSLATE (
  r          IN RAW,
  from_set  IN RAW,
  to_set    IN RAW)
RETURN RAW;
```

Note:

Be aware that *to_set* and *from_set* are reversed in the calling sequence compared to `TRANSLITERATE`.

Pragmas

```
pragma restrict_references(translate, WNDS, RNDS, WNPS, RNPS);
```

Parameters

Table 276-45 TRANSLATE Function Parameters

| Parameter | Description |
|-----------------------|--|
| <code>r</code> | RAW source byte-string to be translated |
| <code>from_set</code> | RAW byte-codes to be translated, if present in <code>r</code> |
| <code>to_set</code> | RAW byte-codes to which corresponding <code>from_str</code> bytes are translated |

Return Values

Table 276-46 TRANSLATE Function Return Values

| Return | Description |
|--------|------------------------|
| RAW | Translated byte-string |

Usage Notes

- If `to_set` is shorter than `from_set`, the extra `from_set` bytes have no corresponding translation bytes. Bytes from the input RAW that match any such `from_set` bytes are not translated or included in the result. They are effectively translated to NULL.
- If `to_set` is longer than `from_set`, the extra `to_set` bytes are ignored.
- If a byte value is repeated in `from_set`, the repeated occurrence is ignored.

Note:

Differences from the [TRANSLITERATE Function](#):

- The `from_set` parameter comes before the `to_set` parameter in the calling sequence.
- Bytes from `r` that appear in `from_set` but have no corresponding values in `to_set` are not translated or included in the result.
- The resulting RAW value may be shorter than the input RAW value.

Note that `TRANSLATE` and `TRANSLITERATE` only differ in functionality when `to_set` has fewer bytes than `from_set`.

Exceptions

Table 276-47 TRANSLATE Function Exceptions

| Error | Description |
|-------------|--|
| VALUE_ERROR | Either: <ul style="list-style-type: none"> - r is NULL or has 0 length - from_set is NULL or has 0 length - to_set is NULL or has 0 length |

276.3.25 TRANSLITERATE Function

This function converts the bytes in the input RAW *r* according to the bytes in the transliteration RAWs *from_set* and *to_set*.

Successive bytes in *r* are looked up in the *from_set*, and, if not found, copied unaltered to the result RAW. If found, then they are replaced in the result RAW by either corresponding bytes in the *to_set*, or the *pad* byte when no correspondence exists.

Bytes in *r*, but undefined in *from_set*, are copied to the result. Only the first (leftmost) occurrence of a byte in *from_set* is used. Subsequent duplicates are not scanned and are ignored. The result RAW is always the same length as *r*.

Syntax

```
UTL_RAW.TRANSLITERATE (
    r          IN RAW,
    to_set     IN RAW DEFAULT NULL,
    from_set   IN RAW DEFAULT NULL,
    pad       IN RAW DEFAULT NULL)
RETURN RAW;
```

Note:

Be aware that *to_set* and *from_set* are reversed in the calling sequence compared to TRANSLATE.

Pragmas

```
pragma restrict_references(transliterate, WNDS, RNDS, WNPS, RNPS);
```

Parameters

Table 276-48 TRANSLITERATE Function Parameters

| Parameter | Description |
|---------------|--|
| <i>r</i> | RAW input byte-string to be converted |
| <i>to_set</i> | RAW byte-codes to which corresponding <i>from_set</i> bytes are converted (any length) |

Table 276-48 (Cont.) TRANSLITERATE Function Parameters

| Parameter | Description |
|-----------------------|--|
| <code>from_set</code> | RAW byte-codes to be converted, if presenting <code>r</code> (any length) |
| <code>pad</code> | 1 byte used when <code>to_set</code> is shorter than the <code>from_set</code> |

Defaults and Optional Parameters**Table 276-49 TRANSLITERATE Function Optional Parameters**

| Optional Parameter | Description |
|-----------------------|---|
| <code>to_set</code> | To the NULL string and effectively extended with <code>pad</code> to the length of <code>from_set</code> as necessary |
| <code>from_set</code> | x'00' through x'fff' |
| <code>pad</code> | x'00' |

Return Values**Table 276-50 TRANSLITERATE Function Return Values**

| Return | Description |
|--------|------------------------|
| RAW | Converted byte-string. |

Usage Notes

- If `to_set` is shorter than `from_set`, the extra `from_set` bytes have no corresponding conversion bytes. Bytes from the input RAW that match any such `from_set` bytes are converted in the result to the `pad` byte instead.
- If `to_set` is longer than `from_set`, the extra `to_set` bytes are ignored.
- If a byte value is repeated in `from_set`, the repeated occurrence is ignored.

 **Note:**

Differences from the [TRANSLATE Function](#):

- The `to_set` parameter comes before the `from_set` parameter in the calling sequence.
- Bytes from `r` that appear in `from_set` but have no corresponding values in `to_set` are replaced by `pad` in the result.
- The resulting RAW value always has the same length as the input RAW value.

Note that `TRANSLATE` and `TRANSLITERATE` only differ in functionality when `to_set` has fewer bytes than `from_set`.

Exceptions

Table 276-51 TRANSLITERATE Function Exceptions

| Error | Description |
|-------------|---------------------------|
| VALUE_ERROR | R is NULL or has 0 length |

276.3.26 XRANGE Function

This function returns a RAW value containing the succession of one-byte encodings beginning and ending with the specified byte-codes. The specified byte-codes must be single-byte RAW values. If the `start_byte` value is greater than the `end_byte` value, then the succession of resulting bytes begins with `start_byte`, wraps through `x'FF'` back to `x'00'`, then ends at `end_byte`.

Syntax

```
UTL_RAW.XRANGE (
    start_byte IN RAW DEFAULT NULL,
    end_byte   IN RAW DEFAULT NULL)
RETURN RAW;
```

Pragmas

```
pragma restrict_references(xrange, WNDS, RNDS, WNPS, RNPS);
```

Parameters

Table 276-52 XRANGE Function Parameters

| Parameters | Description |
|-------------------------|--|
| <code>start_byte</code> | Beginning byte-code value of resulting sequence. The default is <code>x'00'</code> . |
| <code>end_byte</code> | Ending byte-code value of resulting sequence. The default is <code>x'FF'</code> . |

Return Values

Table 276-53 XRANGE Function Return Values

| Return | Description |
|--------|---|
| RAW | Containing succession of 1-byte hexadecimal encodings |

UTL_RECOMP

The UTL_RECOMP package recompiles invalid PL/SQL modules, invalid views, Java classes, indextypes and operators in a database, either sequentially or in parallel.

This chapter contains the following topics:

- [Overview](#)
- [Operational Notes](#)
- [Examples](#)
- [Summary of UTL_RECOMP Subprograms](#)

277.1 UTL_RECOMP Overview

This script is particularly useful after a major-version upgrade that typically invalidates all PL/SQL and Java objects. Although invalid objects are recompiled automatically on use, it is useful to run this script prior to operation because this will either eliminate or minimize subsequent latencies due to on-demand automatic recompilation at runtime.

Parallel recompilation can exploit multiple CPUs to reduce the time taken to recompile invalid objects. The degree of parallelism is specified by the first argument to [RECOMP_PARALLEL Procedure](#).

In general, a parallelism setting of one thread for each available CPU provides a good initial setting. However, please note that the process of recompiling an invalid object writes a significant amount of data to system tables and is fairly I/O intensive. A slow disk system may be a significant bottleneck and limit speedups available from a higher degree of parallelism.

277.2 UTL_RECOMP Operational Notes

UTL_RECOMP has several operational notes.

- This package uses the job queue for parallel recompilation.
- This package must be run using `SQL*PLUS`.
- You must be connected `AS SYSDBA` to run this script.
- This package expects the following packages to have been created with `VALID` status:
 - `STANDARD` (`standard.sql`)
 - `DBMS_STANDARD` (`dbmsstdx.sql`)
 - `DBMS_JOB` (`dbmsjob.sql`)
 - `DBMS_RANDOM` (`dbmsrand.sql`)
- There should be no other DDL on the database while running entries in this package. Not following this recommendation may lead to deadlocks.

277.3 UTL_RECOMP Examples

These examples show various ways that UTL_RECOMP can recompile objects.

- Recompile all objects sequentially:

```
EXECUTE UTL_RECOMP.RECOMP_SERIAL();
```

- Recompile objects in schema SCOTT sequentially:

```
EXECUTE UTL_RECOMP.RECOMP_SERIAL('SCOTT');
```

- Recompile all objects using 4 parallel threads:

```
EXECUTE UTL_RECOMP.RECOMP_PARALLEL(4);
```

- Recompile objects in schema JOE using the number of threads specified in the parameter JOB_QUEUE_PROCESSES:

```
EXECUTE UTL_RECOMP.RECOMP_PARALLEL(NULL, 'JOE');
```

277.4 Summary of UTL_RECOMP Subprograms

This table lists the UTL_RECOMP subprograms and briefly describes them.

Table 277-1 UTL_RECOMP Package Subprograms

| Subprogram | Description |
|---|---|
| RECOMP_PARALLEL Procedure | Recompiles invalid objects in a given schema, or all invalid objects in the database, in parallel |
| RECOMP_SERIAL Procedure | Recompiles invalid objects in a given schema or all invalid objects in the database |

277.4.1 RECOMP_PARALLEL Procedure

This procedure uses the information exposed in the DBA_Dependencies view to recompile invalid objects in the database, or in a given schema, in parallel.

Syntax

```
UTL_RECOMP.RECOMP_PARALLEL(
  threads IN PLS_INTEGER DEFAULT NULL,
  schema IN VARCHAR2 DEFAULT NULL,
  flags IN PLS_INTEGER DEFAULT 0);
```

Parameters

Table 277-2 RECOMP_PARALLEL Procedure Parameters

| Parameter | Description |
|-----------|--|
| threads | The number of recompile threads to run in parallel. If NULL, use the value of 'job_queue_processes'. |

Table 277-2 (Cont.) RECOMP_PARALLEL Procedure Parameters

| Parameter | Description |
|-----------|--|
| schema | The schema in which to recompile invalid objects. If NULL, all invalid objects in the database are recompiled. |
| flags | Flag values are intended for internal testing and diagnosability only. |

Usage Notes

The UTL_RECOMP_COMPILED table is updated with objects that RECOMP_PARALLEL has attempted to compile, or that it has compiled so far. If you monitor the progress of the recompilation, then the number of objects should increase with time. These tables are used internally by RECOMP_PARALLEL to prevent an object from being compiled more than once.

Table 277-3 Tables Generated by UTL_RECOMP.RECOMP_PARALLEL

| Table | Purpose |
|----------------------|--|
| UTL_RECOMP_ERRORS | A table of objects that are sorted into groups, based on dependencies. It is used internally by RECOMP_PARALLEL to guide parallel recompilation. |
| UTL_RECOMP_COMPILED | A table of objects that RECOMP_PARALLEL has attempted to compile. It is used internally by recomp_parallel to prevent an object from being compiled more than once. |
| UTL_RECOMP_COMP_IDX1 | An index created on UTL_RECOMP_COMPILED, which uses object number as the primary key. |
| UTL_RECOMP_SKIP_LIST | A table of objects that RECOMP_PARALLEL will not attempt to compile. Typical usage is for RECOMP_PARALLEL to call UTL_RECOMP.POPULATE_UTL_RECOMP_SKIP_LIST before the update starts so that this table is filled with previously identified invalid objects. Afterward, when RECOMP_PARALLEL is run after upgrade, it will not attempt to compile those previously identified invalid objects. |

Table 277-4 Views Generated by UTL_RECOMP.RECOMP_PARALLEL

| View | Purpose |
|-----------------------------|---|
| UTL_RECOMP_ALL_OBJECTS | A view that includes all objects that can be compiled. |
| UTL_RECOMP_INVALID_ALL | A view that selects invalid objects from UTL_RECOMP_ALL_OBJECTS that have not been compiled and are not on the skip list. |
| UTL_RECOMP_INVALID_SEQ | A view that selects objects from UTL_RECOMP_INVALID_ALL that must be compiled sequentially. |
| UTL_RECOMP_INVALID_PARALLEL | A view that selects objects from UTL_RECOMP_INVALID_ALL that can be compiled in parallel. |
| UTL_RECOMP_INVALID_JAVA_SYN | A view that selects from UTL_RECOMP_ALL_OBJECTS objects that are invalid JAVA synonyms. |

Table 277-4 (Cont.) Views Generated by UTL_RECOMP.RECOMP_PARALLEL

| View | Purpose |
|------------------------|---|
| UTL_RECOMP_CIRCULAR_MV | A view that selects from UTL_RECOMP_ALL_OBJECTS materialized view objects that have a circular dependency chain. |
| UTL_RECOMP_INVALID_MV | A view that selects from UTL_RECOMP_ALL_OBJECTS materialized view objects that are invalid but don't have a circular dependency chain. |
| UTL_RECOMP_ALL_STUBS | A view that includes all stub objects that have not been compiled, and are not on the skip list. When this view is used in RECOMP_PARALLEL, it is restricted to show only stubs in the current edition. |

277.4.2 RECOMP_SERIAL Procedure

This procedure recompiles invalid objects in a given schema or all invalid objects in the database.

Syntax

```
UTL_RECOMP.RECOMP_SERIAL(
    schema IN VARCHAR2 DEFAULT NULL,
    flags  IN PLS_INTEGER DEFAULT 0);
```

Parameters

Table 277-5 RECOMP_SERIAL Procedure Parameters

| Parameter | Description |
|-----------|--|
| schema | The schema in which to recompile invalid objects. If NULL, all invalid objects in the database are recompiled. |
| flags | Flag values are intended for internal testing and diagnosability only. |

UTL_REF

The `UTL_REF` package provides PL/SQL procedures to support reference-based operations. Unlike `SQL`, `UTL_REF` procedures enable you to write generic type methods without knowing the object table name.

This chapter contains the following topics:

- [Overview](#)
- [Security Model](#)
- [Types](#)
- [Exceptions](#)
- [Summary of UTL_REF Subprograms](#)

278.1 UTL_REF Overview

`UTL_REF` procedures enable you to write generic type methods without knowing the object table name.

Oracle supports user-defined composite type or object type. Any instance of an object type is called an object. An object type can be used as the type of a column or as the type of a table.

In an object table, each row of the table stores an object. You can uniquely identify an object in an object table with an object identifier.

A reference is a persistent pointer to an object, and each reference can contain an object identifier. The reference can be an attribute of an object type, or it can be stored in a column of a table. Given a reference, an object can be retrieved.

278.2 UTL_REF Security Model

The procedural option is needed to use this package. This package must be created under `SYS` (`CONNECT /AS SYSDBA`). Operations provided by this package are performed under the current calling user, not under the package owner `SYS`.

You can use the `UTL_REF` package from stored PL/SQL procedures/packages on the server, as well as from client/side PL/SQL code.

When invoked from PL/SQL procedures/packages on the server, `UTL_REF` verifies that the invoker has the appropriate privileges to access the object pointed to by the `REF`.

 **Note:**

This is in contrast to PL/SQL packages/procedures on the server which operate with definer's privileges, where the package owner must have the appropriate privileges to perform the desired operations.

Thus, if `UTL_REF` is defined under user `SYS`, and user `A` invokes `UTL_REF.SELECT` to select an object from a reference, then user `A` (the invoker) requires the privileges to check.

When invoked from client-side PL/SQL code, `UTL_REF` operates with the privileges of the client session under which the PL/SQL execution is being done.

278.3 UTL_REF Types

An object type is a composite datatype defined by the user or supplied as a library type.

You can create the object type `employee_type` using the following syntax:

```
CREATE TYPE employee_type AS OBJECT (  
    name    VARCHAR2(20),  
    id      NUMBER,  
  
    member function GET_ID  
        (name VARCHAR2)  
        RETURN MEMBER);
```

The object type `employee_type` is a user-defined type that contains two attributes, `name` and `id`, and a member function, `GET_ID()`.

You can create an object table using the following SQL syntax:

```
CREATE TABLE employee_table OF employee_type;
```

278.4 UTL_REF Exceptions

Exceptions can be returned during execution of `UTL_REF` functions for various reasons.

For example, the following scenarios would result in exceptions:

- The object selected does not exist. This could be because either:
 1. The object has been deleted, or the given reference is dangling (invalid).
 2. The object table was dropped or does not exist.
- The object cannot be modified or locked in a serializable transaction. The object was modified by another transaction after the serializable transaction started.
- You do not have the privilege to select or modify the object. The caller of the `UTL_REF` subprogram must have the proper privilege on the object that is being selected or modified.

Table 278-1 UTL_REF Exceptions

| Exceptions | Description |
|----------------|--|
| errnum == 942 | Insufficient privileges. |
| errnum == 1031 | Insufficient privileges. |
| errnum == 8177 | Unable to serialize, if in a serializable transaction. |
| errnum == 60 | Deadlock detected. |
| errnum == 1403 | No data found (if the REF is NULL, and so on.). |

The UTL_REF package does not define any named exceptions. You may define exception handling blocks to catch specific exceptions and to handle them appropriately.

278.5 Summary of UTL_REF Subprograms

This table lists the UTL_REF subprograms and briefly describes them.

Table 278-2 UTL_REF Package Subprograms

| Subprogram | Description |
|---|-------------------------------------|
| DELETE_OBJECT Procedure | Deletes an object given a reference |
| LOCK_OBJECT Procedure | Locks an object given a reference |
| SELECT_OBJECT Procedure | Selects an object given a reference |
| UPDATE_OBJECT Procedure | Updates an object given a reference |

278.5.1 DELETE_OBJECT Procedure

This procedure deletes an object given a reference.

The semantic of this subprogram is similar to the following SQL statement:

```
DELETE FROM object_table
WHERE REF(t) = reference;
```

Unlike the preceding SQL statement, this subprogram does not require you to specify the object table name where the object resides.

Syntax

```
UTL_REF.DELETE_OBJECT (
    reference IN REF "<typename>");
```

Parameters

Table 278-3 DELETE_OBJECT Procedure Parameters

| Parameter | Description |
|-----------|------------------------------------|
| reference | Reference of the object to delete. |

Exceptions

May be raised.

Examples

The following example illustrates usage of the `UTL_REF` package to implement this scenario: if an employee of a company changes their address, their manager should be notified.

... declarations of `Address_t` and others...

```
CREATE OR REPLACE TYPE Person_t (
    name    VARCHAR2(64),
    gender  CHAR(1),
    address Address_t,
    MEMBER PROCEDURE setAddress(addr IN Address_t)
);

CREATE OR REPLACE TYPE BODY Person_t (
    MEMBER PROCEDURE setAddress(addr IN Address_t) IS
    BEGIN
        address := addr;
    END;
);

CREATE OR REPLACE TYPE Employee_t (
```

Under `Person_t`: Simulate implementation of inheritance using a `REF` to `Person_t` and delegation of `setAddress` to it.

```
    thePerson REF Person_t,
    empno     NUMBER(5),
    deptREF   Department_t,
    mgrREF    Employee_t,
    reminders StringArray_t,
    MEMBER PROCEDURE setAddress(addr IN Address_t),
    MEMBER procedure addReminder(reminder VARCHAR2);
);

CREATE TYPE BODY Employee_t (
    MEMBER PROCEDURE setAddress(addr IN Address_t) IS
        myMgr Employee_t;
        meAsPerson Person_t;
    BEGIN
```

Update the address by delegating the responsibility to `thePerson`. Lock the `Person` object from the reference, and also select it:

```
UTL_REF.LOCK_OBJECT(thePerson, meAsPerson);
meAsPerson.setAddress(addr);
```

Delegate to `thePerson`:

```
UTL_REF.UPDATE_OBJECT(thePerson, meAsPerson);
if mgr is NOT NULL THEN
```

Give the manager a reminder:

```

        UTL_REF.LOCK_OBJECT(mgr);
        UTL_REF.SELECT_OBJECT(mgr, myMgr);
        myMgr.addReminder
        ('Update address in the employee directory for' ||
         thePerson.name || ', new address: ' || addr.asString);
        UTL_REF.UPDATE_OBJECT(mgr, myMgr);
    END IF;
EXCEPTION
    WHEN OTHERS THEN
        errnum := SQLCODE;
        errmsg := SUBSTR(SQLERRM, 1, 200);

```

278.5.2 LOCK_OBJECT Procedure

This procedure locks an object given a reference. In addition, this procedure lets the program select the locked object.

The semantic of this subprogram is similar to the following SQL statement:

```

SELECT VALUE(t)
  INTO object
  FROM object_table t
 WHERE REF(t) = reference
 FOR UPDATE;

```

Unlike the preceding SQL statement, this subprogram does not require you to specify the object table name where the object resides. It is not necessary to lock an object before updating/deleting it.

Syntax

```

UTL_REF.LOCK_OBJECT (
    reference IN REF "<typename>");

UTL_REF.LOCK_OBJECT (
    reference IN REF "<typename>",
    object    IN OUT "<typename>");

```

Parameters

Table 278-4 LOCK_OBJECT Procedure Parameters

| Parameter | Description |
|-----------|--|
| reference | Reference of the object to lock. |
| object | The PL/SQL variable that stores the locked object. This variable should be of the same object type as the locked object. |

Exceptions

May be raised.

278.5.3 SELECT_OBJECT Procedure

This procedure selects an object given its reference. The selected object is retrieved from the database and its value is put into the PL/SQL variable 'object'.

The semantic of this subprogram is similar to the following SQL statement:

```
SELECT VALUE(t)
INTO object
FROM object_table t
WHERE REF(t) = reference;
```

Unlike the preceding SQL statement, this subprogram does not require you to specify the object table name where the object resides.

Syntax

```
UTL_REF.SELECT_OBJECT (
    reference IN REF "<typename>",
    object    IN OUT "<typename>");
```

Parameters

Table 278-5 SELECT_OBJECT Procedure Parameters

| Parameter | Description |
|-----------|--|
| reference | Reference to the object to select or retrieve. |
| object | The PL/SQL variable that stores the selected object; this variable should be of the same object type as the referenced object. |

Exceptions

May be raised.

278.5.4 UPDATE_OBJECT Procedure

This procedure updates an object given a reference. The referenced object is updated with the value contained in the PL/SQL variable 'object'.

The semantic of this subprogram is similar to the following SQL statement:

```
UPDATE object_table t
SET VALUE(t) = object
WHERE REF(t) = reference;
```

Unlike the preceding SQL statement, this subprogram does not require you to specify the object table name where the object resides.

Syntax

```
UTL_REF.UPDATE_OBJECT (
    reference IN REF "<typename>",
    object    IN    "<typename>");
```

Parameters

Table 278-6 UPDATE_OBJECT Procedure Parameters

| Parameter | Description |
|-----------|---|
| reference | Reference of the object to update. |
| object | The PL/SQL variable that contains the new value of the object. This variable should be of the same object type as the object to update. |

Exceptions

May be raised.

UTL_RPADV

The `UTL_RPADV` package provides subprograms to collect and analyze statistics for the Oracle Replication components in a distributed database environment. This package uses the Oracle Replication Performance Advisor to gather statistics.

This chapter contains the following topic:

- [UTL_RPADV Overview](#)
- [DBMS_COMPARISON Security Model](#)
- [UTL_RPADV Operational Notes](#)
- [Summary of UTL_RPADV Subprograms](#)

279.1 UTL_RPADV Overview

This package enables you to collect and analyze statistics about the performance of Oracle Replication components. You can either collect statistics on demand or you can create a monitoring job that continually monitors Oracle Replication performance.

When this package is used on an Oracle Database 11g Release 2 (11.2) database, it can monitor Oracle Database 10g Release 2 (10.2) and later databases. It cannot monitor databases before release 10.2.

279.2 DBMS_COMPARISON Security Model

Security on this package can be controlled by either granting `EXECUTE` on this package to selected users or roles, or by granting `EXECUTE_CATALOG_ROLE` to selected users or roles.

If subprograms in the package are run from within a stored procedure, then the user who runs the subprograms must be granted `EXECUTE` privilege on the package directly. It cannot be granted through a role.

To ensure that the user who runs the subprograms in this package has the necessary privileges, configure an Oracle Replication administrator and connect as the Oracle Replication administrator when using this package.

279.3 UTL_RPADV Operational Notes

To use this package, you must connect to an Oracle database as an Oracle Replication administrator and run the `utlrpadv.sql` script in the `rdbms/admin` directory in `ORACLE_HOME`.

The `utlrpadv.sql` script creates the following tables:

- [STREAMS\\$_PA_COMPONENT Table](#)
- [STREAMS\\$_PA_COMPONENT_LINK Table](#)
- [STREAMS\\$_PA_COMPONENT_PROP Table](#)

- STREAMS\$_PA_COMPONENT_STAT Table
- STREAMS\$_PA_CONTROL Table
- STREAMS\$_PA_DATABASE Table
- STREAMS\$_PA_DATABASE_PROP Table
- STREAMS\$_PA_MONITORING Table
- STREAMS\$_PA_PATH_BOTTLENECK Table
- STREAMS\$_PA_PATH_STAT Table
- STREAMS\$_PA_SHOW_COMP_STAT Table
- STREAMS\$_PA_SHOW_PATH_STAT Table

The Oracle Replication Performance Advisor populates these tables when it is run.

STREAMS\$_PA_COMPONENT Table

The STREAMS\$_PA_COMPONENT table displays information about the Oracle Replication components at each database.

Table 279-1 STREAMS\$_PA_COMPONENT Table

| Column | Datatype | NULL | Description |
|------------------------|----------------|----------|---|
| COMPONENT_ID | NUMBER | NOT NULL | Identification number assigned to the component by the Oracle Replication Performance Advisor |
| COMPONENT_NAME | VARCHAR2 (194) | | Name of the component |
| COMPONENT_DB | VARCHAR2 (128) | | Name of the database that contains the component |
| COMPONENT_TYPE | VARCHAR2 (20) | | Type of the component The following types are possible: <ul style="list-style-type: none"> • CAPTURE for a capture process • PROPAGATION SENDER for a propagation sender • PROPAGATION RECEIVER for a propagation receiver • APPLY for an apply process • QUEUE for a queue |
| COMPONENT_CHANGED_TIME | DATE | | Time when the component was last changed |

STREAMS\$_PA_COMPONENT_LINK Table

The STREAMS\$_PA_COMPONENT_LINK table displays information about how information flows between Oracle Replication components.

Table 279-2 STREAMS\$_PA_COMPONENT_LINK Table

| Column | Datatype | NULL | Description |
|--------------------------|-----------------|----------|--|
| PATH_ID | NUMBER | NOT NULL | Identification number assigned to the path by the Oracle Replication Performance Advisor |
| PATH_KEY | VARCHAR2 (4000) | | Unique key assigned to the path by the Oracle Replication Performance Advisor |
| SOURCE_COMPONENT_ID | NUMBER | NOT NULL | Source component ID for the path The path starts with this component. |
| DESTINATION_COMPONENT_ID | NUMBER | NOT NULL | Destination component ID for the path The path ends with this component. |
| POSITION | NUMBER | | Position of the component in the path |

STREAMS\$_PA_COMPONENT_PROP Table

The `STREAMS$_PA_COMPONENT_PROP` table displays information about capture processes and apply processes necessary for analysis by the Replication Performance Advisor.

Table 279-3 STREAMS\$_PA_COMPONENT_PROP Table

| Column | Datatype | NULL | Description |
|--------------|----------|----------|---|
| COMPONENT_ID | NUMBER | NOT NULL | Identification number assigned to the component by the Oracle Replication Performance Advisor |

Table 279-3 (Cont.) STREAMS\$_PA_COMPONENT_PROP Table

| Column | Datatype | NULL | Description |
|------------|---------------|------|---|
| PROP_NAME | VARCHAR2 (30) | | Property name For a capture process, the component properties include the following: <ul style="list-style-type: none"> • SOURCE_DATABASE - The source database for the changes captured by the capture process • PARALLELISM - The setting for the parallelism capture process parameter • OPTIMIZATION_MODE - Indicates whether the capture process uses combined capture and apply (greater than zero) or does not use combined capture and apply (0) For an apply process, the component properties include the following: <ul style="list-style-type: none"> • SOURCE_DATABASE - The source database for the messages applied by the apply process • PARALLELISM - The setting for the parallelism apply process parameter • APPLY_CAPTURED - Indicates whether the apply process applies captured messages (YES) persistent messages (NO) • MESSAGE_DELIVERY_MODE - Either buffered or persistent |
| PROP_VALUE | VARCHAR2 (30) | | Property value |

STREAMS\$_PA_COMPONENT_STAT Table

The STREAMS\$_PA_COMPONENT_STAT table displays performance statistics and session statistics about each Oracle Replication component.

Table 279-4 STREAMS\$_PA_COMPONENT_STAT Table

| Column | Datatype | NULL | Description |
|----------------|----------|------|---|
| ADVISOR_RUN_ID | NUMBER | | Identification number of the Oracle Replication Performance Advisor run |

Table 279-4 (Cont.) STREAMS\$_PA_COMPONENT_STAT Table

| Column | Datatype | NULL | Description |
|------------------------|---------------|------|--|
| ADVISOR_RUN_TIME | DATE | | Time when the Oracle Replication Performance Advisor was run for the advisor run ID |
| COMPONENT_ID | NUMBER | | Identification number assigned to the component by the Oracle Replication Performance Advisor |
| STATISTIC_TIME | DATE | | Time when the statistic was recorded |
| STATISTIC_NAME | VARCHAR2 (64) | | Name of the statistic |
| STATISTIC_VALUE | NUMBER | | Value recorded for the statistic |
| STATISTIC_UNIT | VARCHAR2 (64) | | Unit of measurement for the statistic |
| SUB_COMPONENT_TYP E | VARCHAR2 (64) | | Type of the subcomponent Only capture processes and apply processes have subcomponents. The following capture process subcomponent types are possible: <ul style="list-style-type: none"> • LOGMINER READER for a builder server of a capture process • LOGMINER PREPARER for a preparer server of a capture process • LOGMINER BUILDER for a reader server of a capture process • CAPTURE SESSION for a capture process session The following apply process subcomponent types are possible: <ul style="list-style-type: none"> • PROPAGATION SENDER+RECEIVER for sending LCRs from a capture process directly to an apply process in a combined capture and apply configuration in which both the capture process and apply process run on a single database • APPLY READER for a reader server of an apply process • APPLY COORDINATOR for a coordinator process of an apply process • APPLY SERVER for a reader server of an apply process |
| SESSION_ID | NUMBER | | Identification number of the session for the component. Query the V\$SESSION view for information about the session. |

Table 279-4 (Cont.) STREAMS\$_PA_COMPONENT_STAT Table

| Column | Datatype | NULL | Description |
|-----------------|----------|------|--|
| SESSION_SERIAL# | NUMBER | | Session serial number of the session for the component. Query the V\$SESSION view for information about the session. |

STREAMS\$_PA_CONTROL Table

The STREAMS\$_PA_CONTROL table displays the parameters set for the COLLECT_STATS procedure in this package. The parameters control the monitoring behavior.

Table 279-5 STREAMS\$_PA_CONTROL Table

| Column | Datatype | NULL | Description |
|------------------|-----------------|------|---|
| ADVISOR_RUN_ID | NUMBER | | Identification number of the Oracle Replication Performance Advisor run |
| ADVISOR_RUN_TIME | DATE | | Time when the Oracle Replication Performance Advisor was last run |
| PARAM_NAME | VARCHAR2 (30) | | The name of the parameter |
| PARAM_VALUE | VARCHAR2 (4000) | | The value set for the parameter |
| PARAM_UNIT | VARCHAR2 (30) | | The unit of the parameter |

STREAMS\$_PA_DATABASE Table

The STREAMS\$_PA_DATABASE table displays information about each database that contains Oracle Replication components.

Table 279-6 STREAMS\$_PA_DATABASE Table

| Column | Datatype | NULL | Description |
|---------------|-----------------|----------|--|
| GLOBAL_NAME | VARCHAR2 (128) | NOT NULL | Global name of the database analyzed by the Oracle Replication Performance Advisor |
| LAST_QUERIED | DATE | | The time when the Performance Advisor successfully collected information from a database in its last run |
| ERROR_NUMBER | NUMBER | | The error number of the error encountered when the database was last queried |
| ERROR_MESSAGE | VARCHAR2 (4000) | | The error message of the error encountered when the database was last queried |

STREAMS\$_PA_DATABASE_PROP Table

The STREAMS\$_PA_DATABASE_PROP table displays Oracle Replication database property information necessary for analysis by the Replication Performance Advisor.

Table 279-7 STREAMS\$_PA_DATABASE_PROP Table

| Column | Datatype | NULL | Description |
|-------------|----------------|----------|--|
| GLOBAL_NAME | VARCHAR2 (128) | NOT NULL | Global name of the database analyzed by the Oracle Replication Performance Advisor |
| PROP_NAME | VARCHAR2 (30) | | Property name The database properties include the following: <ul style="list-style-type: none"> • VERSION • COMPATIBILITY • MANAGEMENT_PACK_ACCESS • DB_UNIQUE_NAME |
| PROP_VALUE | VARCHAR2 (30) | | Property value |

STREAMS\$_PA_MONITORING Table

The `STREAMS$_PA_MONITORING` table displays information about each monitoring job running in a database.

Table 279-8 STREAMS\$_PA_MONITORING Table

| Column | Datatype | NULL | Description |
|------------------|---------------|----------|---|
| JOB_NAME | VARCHAR2 (30) | NOT NULL | Name of the monitoring job |
| CLIENT_NAME | VARCHAR2 (30) | | Name of the client that submitted the job See Also: " Full Monitoring Job Names " |
| QUERY_USER_NAME | VARCHAR2 (30) | | User granted privileges to view the monitoring results |
| SHOW_STATS_TABLE | VARCHAR2 (30) | | Name of the table used by the <code>SHOW_STATS</code> procedure to display statistics |
| STARTED_TIME | TIMESTAMP | | Time the monitoring job started |
| STOPPED_TIME | TIMESTAMP | | Time the monitoring job last stopped |
| ALTERED_TIME | TIMESTAMP | | Time the monitoring job was last altered |
| STATE | VARCHAR2 (30) | | State of the monitoring job, either <code>ENABLED</code> or <code>STOPPED</code> |

STREAMS\$_PA_PATH_BOTTLENECK Table

The `STREAMS$_PA_PATH_BOTTLENECK` table displays information about Oracle Replication components that might be slowing down the flow of messages.

Table 279-9 STREAMS\$_PA_PATH_BOTTLENECK Table

| Column | Datatype | NULL | Description |
|------------------|----------|------|---|
| ADVISOR_RUN_ID | NUMBER | | Identification number of the Oracle Replication Performance Advisor run |
| ADVISOR_RUN_TIME | DATE | | Time when the Oracle Replication Performance Advisor was last run |

Table 279-9 (Cont.) STREAMS\$_PA_PATH_BOTTLENECK Table

| Column | Datatype | NULL | Description |
|-----------------------|-----------------|------|--|
| ADVISOR_RUN_REASON | VARCHAR2 (4000) | | Reason for the bottleneck |
| PATH_ID | NUMBER | | Identification number assigned to the path by the Oracle Replication Performance Advisor |
| PATH_KEY | VARCHAR2 (4000) | | Unique key assigned to the path by the Oracle Replication Performance Advisor |
| COMPONENT_ID | NUMBER | | Identification number assigned to the component by the Oracle Replication Performance Advisor |
| TOP_SESSION_ID | NUMBER | | Session ID of the top component. Query the V\$SESSION view for information about the session. |
| TOP_SESSION_SERIAL# | NUMBER | | Session serial number of the top component. Query the V\$SESSION view for information about the session. |
| ACTION_NAME | VARCHAR2 (32) | | Action name for the top session |
| BOTTLENECK_IDENTIFIED | VARCHAR2 (30) | | Whether a bottleneck was identified |

STREAMS\$_PA_PATH_STAT Table

The STREAMS\$_PA_PATH_STAT table displays performance statistics about each stream path.

Table 279-10 STREAMS\$_PA_PATH_STAT Table

| Column | Datatype | NULL | Description |
|------------------|-----------------|------|--|
| ADVISOR_RUN_ID | NUMBER | | Identification number of the Oracle Replication Performance Advisor run |
| ADVISOR_RUN_TIME | DATE | | Time when the Oracle Replication Performance Advisor was run for the advisor run ID |
| PATH_ID | NUMBER | | Identification number assigned to the path by the Oracle Replication Performance Advisor |
| PATH_KEY | VARCHAR2 (4000) | | Unique key assigned to the path by the Oracle Replication Performance Advisor |
| STATISTIC_TIME | DATE | | Time when the statistic was recorded |
| STATISTIC_NAME | VARCHAR2 (64) | | Name of the statistic |
| STATISTIC_VALUE | NUMBER | | Value recorded for the statistic |
| STATISTIC_UNIT | VARCHAR2 (64) | | Unit of measurement for the statistic |

STREAMS\$_PA_SHOW_COMP_STAT Table

The `STREAMS$_PA_SHOW_COMP_STAT` table displays statistics for Oracle Replication components.

Table 279-11 STREAMS\$_PA_SHOW_COMP_STAT Table

| Column | Datatype | NULL | Description |
|------------------|----------------|------|---|
| ADVISOR_RUN_ID | NUMBER | | Identification number of the Oracle Replication Performance Advisor run |
| ADVISOR_RUN_TIME | DATE | | Time when the Oracle Replication Performance Advisor was last run |
| PATH_ID | NUMBER | | Identification number assigned to the path by the Oracle Replication Performance Advisor |
| POSITION | NUMBER | | Position of the component in the path |
| COMPONENT_ID | NUMBER | | Identification number assigned to the component by the Oracle Replication Performance Advisor |
| COMPONENT_NAME | VARCHAR2 (194) | | Name of the component |
| COMPONENT_TYPE | VARCHAR2 (30) | | Type of the component The following types are possible: <ul style="list-style-type: none">• CAPTURE for a capture process• PROPAGATION SENDER for a propagation sender• PROPAGATION RECEIVER for a propagation receiver• APPLY for an apply process• QUEUE for a queue |

Table 279-11 (Cont.) STREAMS\$_PA_SHOW_COMP_STAT Table

| Column | Datatype | NULL | Description |
|------------------------|----------------|------|--|
| SUB_COMPONENT_TY PE | VARCHAR2 (30) | | Type of the subcomponent Only capture processes and apply processes have subcomponents. The following capture process subcomponent types are possible: <ul style="list-style-type: none"> LOGMINER READER for a builder server of a capture process LOGMINER PREPARER for a preparer server of a capture process LOGMINER BUILDER for a reader server of a capture process CAPTURE SESSION for a capture process session The following apply process subcomponent types are possible: <ul style="list-style-type: none"> PROPAGATION SENDER+RECEIVER for sending LCRs from a capture process directly to an apply process in a combined capture and apply configuration in which both the capture process and apply process run on a single database APPLY READER for a reader server of an apply process APPLY COORDINATOR for a coordinator process of an apply process APPLY SERVER for a reader server of an apply process |
| SESSION_ID | NUMBER | | Identification number of the session for the component. Query the V\$SESSION view for information about the session. |
| SESSION_SERIAL# | NUMBER | | Session serial number of the session for the component. Query the V\$SESSION view for information about the session. |
| STATISTIC_ALIAS | VARCHAR2 (30) | | Name of the statistic |
| STATISTIC_NAME | VARCHAR2 (128) | | Name of the statistic |
| STATISTIC_VALUE | NUMBER | | Value recorded for the statistic |
| STATISTIC_UNIT | VARCHAR2 (128) | | Unit of measurement for the statistic |

STREAMS\$_PA_SHOW_PATH_STAT Table

The STREAMS\$_PA_SHOW_PATH_STAT table displays statistics for the stream paths in an Oracle Replication configuration. A monitoring job uses this table as the default table for the statistics collected for stream paths.

Table 279-12 STREAMS\$_PA_SHOW_PATH_STAT Table

| Column | Datatype | NULL | Description |
|--------------------|-----------------|------|--|
| PATH_ID | NUMBER | | Identification number assigned to the path by the Oracle Replication Performance Advisor |
| ADVISOR_RUN_ID | NUMBER | | Identification number of the Oracle Replication Performance Advisor run |
| ADVISOR_RUN_TIME | DATE | | Time when the Oracle Replication Performance Advisor was last run |
| SETTING | VARCHAR2 (2000) | | Setting for the Oracle Replication Performance Advisor Run |
| STATISTICS | VARCHAR2 (4000) | | Component-level statistics |
| SESSION_STATISTICS | VARCHAR2 (4000) | | Session-level statistics |
| OPTIMIZATION | NUMBER | | Whether the path uses the combined capture and apply optimization 0 (zero) means that the path does not use the combined capture and apply optimization. 1 means that the path uses the combined capture and apply optimization. |

279.4 Summary of UTL_RPADV Subprograms

This table lists the UTL_RPADV subprograms and briefly describes them.

Table 279-13 UTL_RPADV Package Subprograms

| Subprogram | Description |
|--|---|
| ALTER_MONITORING Procedure | Alters the monitoring job submitted by the current user. |
| COLLECT_STATS Procedure | Uses the Oracle Replication Performance Advisor to gather statistics about the Oracle Replication components and subcomponents in a distributed database environment. |
| IS_MONITORING Function | Checks whether a monitoring job is currently running. |
| SHOW_STATS Procedure | Generates output that includes the statistics gathered by the COLLECT_STATS procedure. |
| SHOW_STATS_HTML Procedure | Generates HTML output that includes the statistics gathered by the COLLECT_STATS procedure. |
| START_MONITORING Procedure | Starts a monitoring job. |
| STOP_MONITORING Procedure | Stops a monitoring job. |

279.4.1 ALTER_MONITORING Procedure

This procedure alters the monitoring job submitted by the current user.

Syntax

```
UTL_RPADV.ALTER_MONITORING(
    interval                IN NUMBER  DEFAULT NULL,
    top_event_threshold     IN NUMBER  DEFAULT NULL,
    bottleneck_idle_threshold IN NUMBER  DEFAULT NULL,
    bottleneck_flowctrl_threshold IN NUMBER  DEFAULT NULL,
    retention_time          IN NUMBER  DEFAULT NULL);
```

Parameters

Table 279-14 ALTER_MONITORING Procedure Parameters

| Parameter | Description |
|-------------------------------|--|
| interval | The amount of time, in seconds, between each Performance Advisor run. The maximum is 3600 seconds. If NULL, then the current value is not changed. |
| top_event_threshold | A percentage that determines whether a top wait event statistic is collected. The percentage for a wait event must be greater than the value specified in this parameter for the procedure to collect the wait event statistic. For example, if 15 is specified, then only wait events with a value larger than 15% are collected. If NULL, then the current value is not changed. |
| bottleneck_idle_threshold | A percentage that determines whether an Oracle Replication component session is eligible for bottleneck analysis based on its IDLE percentage. The IDLE percentage must be less than or equal to the value specified in this parameter for the Oracle Replication component session to be eligible for bottleneck analysis. For example, if 50 is specified, then only components that are idle 50% of the time or less are eligible for bottleneck analysis. If NULL, then the current value is not changed. |
| bottleneck_flowctrl_threshold | A percentage that determines whether an Oracle Replication component session is eligible for bottleneck analysis based on its FLOW CONTROL percentage. The FLOW CONTROL percentage must be less than or equal to the value specified in this parameter for the Oracle Replication component session to be eligible for bottleneck analysis. For example, if 50 is specified, then only components that are paused for flow control 50% of the time or less are eligible for bottleneck analysis. If NULL, then the current value is not changed. |

Table 279-14 (Cont.) ALTER_MONITORING Procedure Parameters

| Parameter | Description |
|-----------------------------|--|
| <code>retention_time</code> | The number of hours to retain monitoring results. If NULL, then the current value is not changed. |

Exceptions**Table 279-15 ALTER_MONITORING Procedure Exceptions**

| Exception | Description |
|-----------|--------------------------------|
| ORA-20113 | no active monitoring job found |

279.4.2 COLLECT_STATS Procedure

This procedure uses the Oracle Replication Performance Advisor to gather statistics about the Oracle Replication components and subcomponents in a distributed database environment.

**Note:**

This procedure commits.

Syntax

```
UTL_RPADV.COLLECT_STATS (
    interval                IN NUMBER    DEFAULT 60,
    num_runs                IN NUMBER    DEFAULT 10,
    comp_stat_table        IN VARCHAR2   DEFAULT 'STREAMS$_ADVISOR_COMP_STAT',
    path_stat_table        IN VARCHAR2   DEFAULT 'STREAMS$_ADVISOR_PATH_STAT',
    top_event_threshold    IN NUMBER    DEFAULT 15,
    bottleneck_idle_threshold IN NUMBER  DEFAULT 50,
    bottleneck_flowctrl_threshold IN NUMBER DEFAULT 50);
```

Parameters**Table 279-16 COLLECT_STATS Procedure Parameters**

| Parameter | Description |
|-----------------------|--|
| <code>interval</code> | The amount of time, in seconds, between each Performance Advisor run. The maximum is 3600 seconds. |
| <code>num_runs</code> | The number of times that the Oracle Replication Performance Advisor is run by the procedure. |

Table 279-16 (Cont.) COLLECT_STATS Procedure Parameters

| Parameter | Description |
|-------------------------------|--|
| comp_stat_table | <p>The name of the table that stores the statistics collected for Oracle Replication components and subcomponents. Specify the table name as <i>[schema_name.]object_name</i>. If the schema is not specified, then the current user is the default.</p> <p>The procedure creates the specified table if it does not exist.</p> <p>Oracle recommends that you use the default table <code>STREAMS\$_ADVISOR_COMP_STAT</code>.</p> <p>See "Usage Notes" for more information about this parameter.</p> |
| path_stat_table | <p>The name of the table that stores the statistics collected for stream paths. Specify the table name as <i>[schema_name.]object_name</i>. If the schema is not specified, then the current user is the default.</p> <p>The procedure creates the specified table if it does not exist.</p> <p>Oracle recommends that you use the default table <code>STREAMS\$_ADVISOR_PATH_STAT</code>.</p> <p>See "Usage Notes" for more information about this parameter.</p> |
| top_event_threshold | <p>A percentage that determines whether a top wait event statistic is collected.</p> <p>The percentage for a wait event must be greater than the value specified in this parameter for the procedure to collect the wait event statistic. For example, if 15 is specified, then only wait events with a value larger than 15% are collected.</p> |
| bottleneck_idle_threshold | <p>A percentage that determines whether an Oracle Replication component session is eligible for bottleneck analysis based on its <code>IDLE</code> percentage.</p> <p>The <code>IDLE</code> percentage must be less than or equal to the value specified in this parameter for the Oracle Replication component session to be eligible for bottleneck analysis. For example, if 50 is specified, then only components that are idle 50% of the time or less are eligible for bottleneck analysis.</p> |
| bottleneck_flowctrl_threshold | <p>A percentage that determines whether an Oracle Replication component session is eligible for bottleneck analysis based on its <code>FLOW CONTROL</code> percentage.</p> <p>The <code>FLOW CONTROL</code> percentage must be less than or equal to the value specified in this parameter for the Oracle Replication component session to be eligible for bottleneck analysis. For example, if 50 is specified, then only components that are paused for flow control 50% of the time or less are eligible for bottleneck analysis.</p> |

Usage Notes

The table specified in the `path_stat_table` parameter stores stream path statistics. This table also concatenates the component and subcomponent statistics stored in the table specified in the `comp_stat_table` parameter. The `SHOW_STATS` procedure in this package shows only the statistics stored in the table specified in the `path_stat_table` parameter.

279.4.3 IS_MONITORING Function

This function checks whether a monitoring job is currently running. This function either returns `TRUE` if a monitoring job is currently running or `FALSE` if a monitoring job is not currently running.

A monitoring job is submitted using the `START_MONITORING` procedure.

See Also:

["START_MONITORING Procedure"](#)

Syntax

```
UTL_RPADV.IS_MONITORING(  
    job_name      IN VARCHAR2  DEFAULT 'STREAMS$_MONITORING_JOB',  
    client_name   IN VARCHAR2  DEFAULT NULL)  
RETURN BOOLEAN;
```

Parameters

Table 279-17 IS_MONITORING Function Parameters

| Parameter | Description |
|--------------------------|--|
| <code>job_name</code> | The name of the job for which to check. |
| <code>client_name</code> | The name of the client that submitted the job. |

279.4.4 SHOW_STATS Procedure

This procedure generates output that includes the statistics gathered by the `COLLECT_STATS` and `START_MONITORING` procedures.

The output is formatted so that it can be imported into a spreadsheet for analysis.

Note:

This procedure does not commit.

 See Also:

- "COLLECT_STATS Procedure"
- "START_MONITORING Procedure"

Syntax

```
UTL_RPADV.SHOW_STATS(
  path_stat_table IN VARCHAR2 DEFAULT 'STREAMS$_ADVISOR_PATH_STAT',
  path_id         IN NUMBER   DEFAULT NULL,
  bgn_run_id     IN NUMBER   DEFAULT -1,
  end_run_id     IN NUMBER   DEFAULT -10,
  show_path_id   IN BOOLEAN  DEFAULT TRUE,
  show_run_id    IN BOOLEAN  DEFAULT TRUE,
  show_run_time  IN BOOLEAN  DEFAULT TRUE,
  show_optimization IN BOOLEAN DEFAULT TRUE,
  show_setting   IN BOOLEAN  DEFAULT FALSE,
  show_stat      IN BOOLEAN  DEFAULT TRUE,
  show_sess     IN BOOLEAN  DEFAULT FALSE,
  show_legend    IN BOOLEAN  DEFAULT TRUE);
```

Parameters

Table 279-18 *SHOW_STATS Procedure Parameters*

| Parameter | Description |
|-----------------|--|
| path_stat_table | <p>The name of the table that contains the stream path statistics. Specify the table name as <i>[schema_name.]object_name</i>. If the schema is not specified, then the current user is the default.</p> <p>When you gather statistics using the COLLECT_STATS procedure, this table is specified in the path_stat_table parameter in the COLLECT_STATS procedure. The default table is STREAMS\$_ADVISOR_PATH_STAT.</p> <p>When you gather statistics using the START_MONITORING procedure, you can determine the name for this table by querying the SHOW_STATS_TABLE column in the STREAMS\$_PA_MONITORING view. The default table for a monitoring job is STREAMS\$_PA_SHOW_PATH_STAT.</p> |
| path_id | <p>A stream path ID.</p> <p>If non-NULL, then the procedure shows output for the specified stream path only.</p> <p>If NULL, then the procedure shows output for all active stream paths.</p> |
| bgn_run_id | <p>The first Oracle Replication Performance Advisor run ID to show in the range of runs.</p> <p>See "Usage Notes" for more information about this parameter.</p> |
| end_run_id | <p>The last Oracle Replication Performance Advisor run ID to show in the range of runs.</p> <p>See "Usage Notes" for more information about this parameter.</p> |

Table 279-18 (Cont.) SHOW_STATS Procedure Parameters

| Parameter | Description |
|-------------------|---|
| show_path_id | If TRUE, then the path ID for each stream path is included in the output. If FALSE, then the path ID for each stream path is not included in the output. |
| show_run_id | If TRUE, then the Oracle Replication Performance Advisor run ID is included in the output. If FALSE, then the Oracle Replication Performance Advisor run ID is not included in the output. |
| show_run_time | If TRUE, then the Oracle Replication Performance Advisor run time is included in the output. If FALSE, then the Oracle Replication Performance Advisor run time is not included in the output. |
| show_optimization | If TRUE, then path output includes information pertaining to the combined capture and apply optimization. If FALSE, then path output does not include information pertaining to the combined capture and apply optimization. |
| show_setting | If TRUE, then the settings for the threshold parameters are included in the output. The threshold parameters are the top_event_threshold, bottleneck_idle_threshold, and bottleneck_flowctrl_threshold parameters in the COLLECT_STATS procedure. If FALSE, then the settings for the threshold parameters are not included in the output. |
| show_stat | If TRUE, then the component-level and subcomponent-level statistics are included in the output. These components include capture processes, queues, propagation senders, propagation receivers, and apply processes. The subcomponents are the subcomponents for capture processes and apply processes. If FALSE, then the component-level and subcomponent-level statistics are not included in the output. |
| show_sess | If TRUE, then the session-level statistics are included in the output. Session-level statistics include IDLE, FLOW CONTROL, and EVENT statistics. If FALSE, then the session-level statistics are not included in the output. |
| show_legend | If TRUE, then the legend is included in the output. The legend describes the abbreviations used in the output. If FALSE, then the legend is not included in the output. |

Usage Notes

Use the `bgn_run_id` and `end_run_id` together to specify the range of Oracle Replication Performance Advisor runs to display. Positive numbers show statistics from an earlier run forward. Negative numbers show statistics from a later run backward.

For example, if `bgn_run_id` is set to 1 and `end_run_id` is set to 10, then the procedure shows statistics for the first ten Oracle Replication Performance Advisor runs.

However, if `bgn_run_id` is set to `-1` and `end_run_id` is set to `-10`, then the procedure shows statistics for the last ten Oracle Replication Performance Advisor runs.

279.4.5 SHOW_STATS_HTML Procedure

This procedure generates HTML output that includes the statistics gathered by the `COLLECT_STATS` and `START_MONITORING` procedures.

Note:

This procedure does not commit.

See Also:

- ["COLLECT_STATS Procedure"](#)
- ["START_MONITORING Procedure"](#)

Syntax

```
UTL_RPADV.SHOW_STATS_HTML (
  directory          IN VARCHAR2,
  reportname        IN VARCHAR2  DEFAULT 'RPADVREPORT.HTML',
  comp_stat_table   IN VARCHAR2  DEFAULT 'STREAMS$_ADVISOR_COMP_STAT',
  path_id           IN NUMBER     DEFAULT NULL,
  bgn_run_id        IN NUMBER     DEFAULT -1,
  end_run_id        IN NUMBER     DEFAULT -10,
  detailed          IN BOOLEAN    DEFAULT TRUE);
```

Parameters

Table 279-19 SHOW_STATS_HTML Procedure Parameters

| Parameter | Description |
|-------------------------|---|
| <code>directory</code> | The directory object for the directory on the local computer system into which the generated HTML report is placed The specified directory object must be created using the SQL statement <code>CREATE DIRECTORY</code> , and the user who invokes the procedure must have <code>READ</code> and <code>WRITE</code> privilege on each one. |
| <code>reportname</code> | The name of the HTML report |

Table 279-19 (Cont.) SHOW_STATS_HTML Procedure Parameters

| Parameter | Description |
|-----------------|--|
| comp_stat_table | <p>The name of the table that stores the statistics collected for Oracle Replication components and subcomponents. Specify the table name as <i>[schema_name.]object_name</i>. If the schema is not specified, then the current user is the default.</p> <p>When you gather statistics using the <code>COLLECT_STATS</code> procedure, this table is specified in the <code>comp_stat_table</code> parameter in the <code>COLLECT_STATS</code> procedure. The default table is <code>STREAMS\$_ADVISOR_COMP_STAT</code>.</p> <p>When you gather statistics using the <code>START_MONITORING</code> procedure, you can determine the name for this table by querying the <code>SHOW_STATS_TABLE</code> column in the <code>STREAMS\$_PA_MONITORING</code> view. The default table for a monitoring job is <code>STREAMS\$_PA_SHOW_PATH_STAT</code>.</p> <p>Oracle recommends that you start a monitoring job with the <code>START_MONITORING</code> procedure in this package and use the appropriate the <code>STREAMS\$_PA_SHOW_PATH_STAT</code> table.</p> |
| path_id | <p>A stream path ID.</p> <p>If non-NULL, then the procedure shows output for the specified stream path only.</p> <p>If NULL, then the procedure shows output for all active stream paths.</p> |
| bgn_run_id | <p>The first Oracle Replication Performance Advisor run ID to show in the range of runs.</p> <p>See "Usage Notes" for more information about this parameter.</p> |
| end_run_id | <p>The last Oracle Replication Performance Advisor run ID to show in the range of runs.</p> <p>See "Usage Notes" for more information about this parameter.</p> |
| detailed | <p>If TRUE, then the procedure generates component-level statistics.</p> <p>If FALSE, then the procedure does not generate component-level statistics.</p> |

Usage Notes

Use the `bgn_run_id` and `end_run_id` together to specify the range of Oracle Replication Performance Advisor runs to display. Positive numbers show statistics from an earlier run forward. Negative numbers show statistics from a later run backward.

For example, if `bgn_run_id` is set to 1 and `end_run_id` is set to 10, then the procedure shows statistics for the first ten Oracle Replication Performance Advisor runs.

However, if `bgn_run_id` is set to -1 and `end_run_id` is set to -10, then the procedure shows statistics for the last ten Oracle Replication Performance Advisor runs.

279.4.6 START_MONITORING Procedure

This procedure starts a monitoring job.

This procedure runs the `COLLECT_STATS` procedure to gather statistics about the Oracle Replication components and subcomponents in a distributed database environment.

 **Note:**

This procedure commits.

 **See Also:**

- ["COLLECT_STATS Procedure"](#)

Syntax

```

UTL_RPADV.START_MONITORING(
    job_name           IN VARCHAR2  DEFAULT 'STREAMS$_MONITORING_JOB',
    client_name        IN VARCHAR2  DEFAULT NULL,
    query_user_name    IN VARCHAR2  DEFAULT NULL,
    interval           IN NUMBER     DEFAULT 60,
    top_event_threshold IN NUMBER     DEFAULT 15,
    bottleneck_idle_threshold IN NUMBER DEFAULT 50,
    bottleneck_flowctrl_threshold IN NUMBER DEFAULT 50,
    retention_time     IN NUMBER     DEFAULT 24);

```

Parameters**Table 279-20 START_MONITORING Procedure Parameters**

| Parameter | Description |
|---------------------|---|
| job_name | The name of the monitoring job to create. |
| client_name | The name of the client. |
| query_user_name | The user who will query the result tables. This procedure grants privileges to the specified user to enable the user to query the result tables. |
| interval | The amount of time, in seconds, between each Performance Advisor run. The maximum is 3600 seconds. The specified interval is used for the interval parameter in the COLLECT_STATS procedure. |
| top_event_threshold | A percentage that determines whether a top wait event statistic is collected. The percentage for a wait event must be greater than the value specified in this parameter for the procedure to collect the wait event statistic. For example, if 15 is specified, then only wait events with a value larger than 15% are collected. |

Table 279-20 (Cont.) START_MONITORING Procedure Parameters

| Parameter | Description |
|-------------------------------|---|
| bottleneck_idle_threshold | A percentage that determines whether an Oracle Replication component session is eligible for bottleneck analysis based on its IDLE percentage. The IDLE percentage must be less than or equal to the value specified in this parameter for the Oracle Replication component session to be eligible for bottleneck analysis. For example, if 50 is specified, then only components that are idle 50% of the time or less are eligible for bottleneck analysis. |
| bottleneck_flowctrl_threshold | A percentage that determines whether an Oracle Replication component session is eligible for bottleneck analysis based on its FLOW CONTROL percentage. The FLOW CONTROL percentage must be less than or equal to the value specified in this parameter for the Oracle Replication component session to be eligible for bottleneck analysis. For example, if 50 is specified, then only components that are paused for flow control 50% of the time or less are eligible for bottleneck analysis. |
| retention_time | The number of hours to retain monitoring results. |

Exceptions

Table 279-21 START_MONITORING Procedure Exceptions

| Exception | Description |
|-----------|--|
| ORA-20111 | cannot start monitoring due to active EM monitoring job Stop the Oracle Enterprise Manager (EM) monitoring job, and run the START_MONITORING procedure again. |
| ORA-20112 | cannot start monitoring due to active Replication monitoring job Stop the Replication monitoring job, and run the START_MONITORING procedure again. |

Usage Notes

The following are usage notes for the START_MONITORING procedure:

- [Requirements for the User Running the Procedure](#)
- [Full Monitoring Job Names](#)
- [Restrictions on Monitoring Jobs](#)

Requirements for the User Running the Procedure

The user who runs the START_MONITORING procedure must meet the following requirements:

- The user must have access to a database link to each database that contains Oracle Replication components.

- The user must have been granted privileges using the `DBMS_XSTREAM_AUTH.GRANT_ADMIN_PRIVILEGE` procedure, and each database link must connect to a user at the remote database that has been granted privileges using the `DBMS_XSTREAM_AUTH.GRANT_ADMIN_PRIVILEGE` procedure.

Full Monitoring Job Names

When you submit a monitoring job, the client name and job name are concatenated to form the full monitoring job name. You specify the client name using the `client_name` parameter and the job name using the `job_name` parameter when you run the `START_MONITORING` procedure. The client name for a monitoring job submitted by Oracle Enterprise Manager is always `EM`.

The following table show examples of full monitoring job names:

| Setting for <code>client_name</code> Parameter | Setting for <code>job_name</code> parameter | Full Monitoring Job Name |
|--|---|---|
| <code>NULL</code> | <code>STREAMS\$_MONITORING_JOB</code> | <code>STREAMS\$_MONITORING_JOB</code> |
| <code>EM</code> | <code>STREAMS\$_MONITORING_JOB</code> | <code>EMSTREAMS\$_MONITORING_JOB</code> |
| <code>strm</code> | <code>STREAMS\$_MONITORING_JOB</code> | <code>strmSTREAMS\$_MONITORING_JOB</code> |
| <code>strm</code> | <code>mjob1</code> | <code>strmmjob1</code> |

Restrictions on Monitoring Jobs

The following restrictions apply to monitoring jobs:

- The limit for the length of the full monitoring job name is 30 bytes.
- Two monitoring jobs cannot have the same full monitoring job name, even if the monitoring jobs were submitted by different schemas. The name check is not case-sensitive. For example, `strmSTREAMS$_MONITORING_JOB` and `STRMSTREAMS$_MONITORING_JOB` are considered to be the same name.
- Oracle Enterprise Manager can have at most one monitoring job for each database.
- Each schema can have at most one monitoring job.

279.4.7 STOP_MONITORING Procedure

This procedure stops a monitoring job that was submitted by the current user.

Syntax

```
UTL_RPADV.STOP_MONITORING(
    purge IN BOOLEAN DEFAULT FALSE);
```

Parameters

Table 279-22 STOP_MONITORING Procedure Parameters

| Parameter | Description |
|-----------|--|
| purge | If <code>TRUE</code> , then the procedure purges information about the monitoring job from the result tables. If <code>FALSE</code> , then the procedure retains information about the monitoring job in the result tables. |

UTL_SMTP

The `UTL_SMTP` package is designed for sending electronic mails (e-mails) over Simple Mail Transfer Protocol (SMTP) as specified by RFC821.

This chapter contains the following topics:

- [Overview](#)
- [Security Model](#)
- [Constants](#)
- [Types](#)
- [Reply Codes](#)
- [UTL_SMTP Operational Notes](#)
- [Exceptions](#)
- [Rules and Limits](#)
- [Examples](#)
- [Summary of UTL_SMTP Subprograms](#)

See Also:

Oracle Database Development Guide

280.1 UTL_SMTP Overview

The `UTL_SMTP` protocol consists of a set of commands for an e-mail client to dispatch e-mails to an SMTP server. The `UTL_SMTP` package provides interfaces to the SMTP commands.

For many of the commands, the package provides both a procedural and a functional interface. The functional form returns the reply from the server for processing by the client. The procedural form checks the reply and raises an exception if the reply indicates a transient (400-range reply code) or permanent error (500-range reply code). Otherwise, it discards the reply.

Note that the original SMTP protocol communicates using 7-bit ASCII. Using `UTL_SMTP`, all text data (in other words, those in `VARCHAR2`) is converted to US7ASCII before it is sent to the server. Some implementations of SMTP servers that support SMTP extension 8BITMIME [RFC1652] support full 8-bit communication between client and server. The body of the DATA command can be transferred in full 8 bits, but the rest of the SMTP command and response must be in 7 bits. When the target SMTP server supports 8BITMIME extension, users of multibyte databases may convert their non-US7ASCII, multibyte `VARCHAR2` data to RAW and use the `WRITE_RAW_DATA` subprogram to send multibyte data using 8-bit MIME encoding.

UTL_SMTP provides for SMTP communication as specified in RFC821, but does not provide an API to format the content of the message according to RFC 822 (for example, setting the subject of an electronic mail). You must format the message appropriately. In addition, UTL_SMTP does not have the functionality to implement an SMTP server for an e-mail clients to send e-mails using SMTP.

280.2 UTL_SMTP Security Model

This package is an invoker's rights package. The invoking user must have the `connect` privilege granted in the access control list assigned to the remote network host to which the user must connect.

Note:

For more information on managing fine-grained access, see *Oracle Database Security Guide*

280.3 UTL_SMTP Constants

UTL_SMTP defines several constants to use when specifying parameter values.

These are shown in the following table.

Table 280-1 UTL_SMTP Constants

| Name | Type | Value | Description |
|--------------------------------|----------------|---------------------------|--|
| ALL_SCHEMES | VARCHAR2 (256) | 'CRAM-MD5 PLAIN LOGIN' | List of all authentication schemes UTL_SMTP supports, in order of their relative security strength. The subset of the schemes in ALL_SCHEMES (namely, PLAIN and LOGIN) in which cleartext passwords are sent over SMTP must be used only in SMTP connections that are secured by Secure Socket Layer / Transport Layer Security (SSL/TLS). |
| NON_CLEARTEXT_PASSWORD_SCHEMES | VARCHAR2 (256) | 'CRAM-MD5' | List of authentication schemes that UTL_SMTP supports and in which no cleartext passwords are sent over SMTP. They can be used in SMTP connections that are not secured by SSL/TLS. Note that these schemes may still be weak when used in an insecure SMTP connection. |

280.4 UTL_SMTP Types

UTL_SMTP uses a CONNECTION record type and REPLY_REPLIES record types.

CONNECTION Record Type

This is a PL/SQL record type used to represent an SMTP connection.

Syntax

```
TYPE connection IS RECORD (  
    host          VARCHAR2(255),  
    port          PLS_INTEGER,  
    tx_timeout    PLS_INTEGER,  
    private_tcp_con utl_tcp.connection,  
    private_state PLS_INTEGER);
```

Fields

Table 280-2 CONNECTION Record Type Fields

| Field | Description |
|-----------------|---|
| host | Name of the remote host when connection is established. NULL when no connection is established. |
| port | Port number of the remote SMTP server connected. NULL when no connection is established. |
| tx_timeout | Time in seconds that the UTL_SMTP package waits before timing out in a read or write operation in this connection. In read operations, this package times out if no data is available for reading immediately. In write operations, this package times out if the output buffer is full and no data is to be sent into the network without being blocked. 0 indicates not to wait at all. NULL indicates to wait forever. |
| private_tcp_con | Private, for implementation use only. You should not modify this field. |
| private_state | Private, for implementation use only. You should not modify this field. |

Usage Notes

The read-only fields in a connection record are used to return information about the SMTP connection after the connection is successfully made with the [OPEN_CONNECTION Functions](#). Changing the values of these fields has no effect on the connection. The fields `private_tcp_con` and `private_state` for implementation use only. You should not modify these fields.

REPLY_REPLIES Record Types

These are PL/SQL record types used to represent an SMTP reply line. Each SMTP reply line consists of a reply code followed by a text message. While a single reply line is expected for most SMTP commands, some SMTP commands expect multiple reply lines. For those situations, a PL/SQL table of reply records is used to represent multiple reply lines.

Syntax

```
TYPE reply IS RECORD (
  code    PLS_INTEGER,
  text    VARCHAR2(508));
```

```
TYPE replies IS TABLE OF reply INDEX BY BINARY_INTEGER;
```

Fields**Table 280-3 REPLY, REPLIES Record Type Fields**

| Field | Description |
|-------|---------------------------|
| code | 3-digit reply code |
| text | Text message of the reply |

280.5 UTL_SMTP Reply Codes

SMTP servers send reply codes that indicate message or server status.

The following is a list of the SMTP reply codes.

Table 280-4 SMTP Reply Codes

| Reply Code | Meaning |
|------------|---|
| 211 | System status, or system help reply |
| 214 | Help message [Information on how to use the receiver or the meaning of a particular non-standard command; this reply is useful only to the human user] |
| 220 | <domain> Service ready |
| 221 | <domain> Service closing transmission channel |
| 250 | Requested mail action okay, completed |
| 251 | User not local; forwards to <forward-path> |
| 252 | OK, pending messages for node <node> started. Cannot VRFY user (for example, info is not local), but takes message for this user and attempts delivery. |
| 253 | OK, <messages> pending messages for node <node> started |
| 354 | Start mail input; end with <CRLF.CRLF> |
| 355 | Octet-offset is the transaction offset |
| 421 | <domain> Service not available, closing transmission channel (This can be a reply to any command if the service knows it must shut down.) |
| 450 | Requested mail action not taken: mailbox unavailable [for example, mailbox busy] |
| 451 | Requested action terminated: local error in processing |
| 452 | Requested action not taken: insufficient system storage |
| 453 | You have no mail. |

Table 280-4 (Cont.) SMTP Reply Codes

| Reply Code | Meaning |
|------------|--|
| 454 | TLS not available due to temporary reason. Encryption required for requested authentication mechanism. |
| 458 | Unable to queue messages for node <node> |
| 459 | Node <node> not allowed: reason |
| 500 | Syntax error, command unrecognized (This may include errors such as command line too long.) |
| 501 | Syntax error in parameters or arguments |
| 502 | Command not implemented |
| 503 | Bad sequence of commands |
| 504 | Command parameter not implemented |
| 521 | <Machine> does not accept mail. |
| 530 | Must issue a STARTTLS command first. Encryption required for requested authentication mechanism. |
| 534 | Authentication mechanism is too weak. |
| 538 | Encryption required for requested authentication mechanism. |
| 550 | Requested action not taken: mailbox unavailable [for, mailbox not found, no access] |
| 551 | User not local; please try <forward-path> |
| 552 | Requested mail action terminated: exceeded storage allocation |
| 553 | Requested action not taken: mailbox name not allowed [for example, mailbox syntax incorrect] |
| 554 | Transaction failed |

280.6 UTL_SMTP Operational Notes

An SMTP connection is initiated by a call to `OPEN_CONNECTION` Functions which returns a SMTP connection.

After a connection is established, the following calls are required to send a mail:

[HELO Function and Procedure](#) - identify the domain of the sender

[MAIL Function and Procedure](#)- start a mail, specify the sender

[RCPT Function](#) - specify the recipient

[OPEN_DATA Function and Procedure](#)- start the mail body

[WRITE_RAW_DATA Procedure](#) - write the mail body (multiple calls allowed)

[CLOSE_DATA Function and Procedure](#) - close the mail body and send the mail

The SMTP connection is closed by calling the `QUIT` Function and Procedure.

Related Topics

- [OPEN_CONNECTION Functions](#)
These functions open a connection to an SMTP server.
- [QUIT Function and Procedure](#)
This subprogram terminates an SMTP session and disconnects from the server.

280.7 UTL_SMTP Exceptions

This table lists the exceptions that can be raised by the interface of the UTL_SMTP package.

The network error is transferred to a reply code of 421- service not available.

Table 280-5 UTL_SMTP Exceptions

| Exception | Description |
|-------------------|--|
| INVALID_OPERATION | Raised when an invalid operation is made. In other words, calling API other than the WRITE_DATA Procedure , the WRITE_RAW_DATA Procedure or the CLOSE_DATA Function and Procedure after the OPEN_DATA Function and Procedure is called, or calling <code>WRITE_DATA</code> , <code>WRITE_RAW_DATA</code> or <code>CLOSE_DATA</code> without first calling <code>OPEN_DATA</code> . |
| TRANSIENT_ERROR | Raised when receiving a reply code in 400 range |
| PERMANENT_ERROR | Raised when receiving a reply code in 500 range |

280.8 UTL_SMTP Rules and Limits

The API imposes no imitation or range-checking. However, you must be aware of the limitations on various elements of SMTP. Sending data that exceed these limits may result in errors returned by the server.

The following table describes the size limitations encountered by the UTL_SMTP subprograms.

Table 280-6 SMTP Size Limitation

| Element | Size Limitation |
|--------------|--|
| user | Maximum total length of a user name is 64 characters |
| domain | Maximum total length of a domain name or number is 64 characters |
| path | Maximum total length of a reverse-path or forward-path is 256 characters (including the punctuation and element separators) |
| command line | Maximum total length of a command line including the command word and the <CRLF> is 512 characters |
| reply line | Maximum total length of a reply line including the reply code and the <CRLF> is 512 characters |
| text line | Maximum total length of a text line including the <CRLF> is 1000 characters (but not counting the leading dot duplicated for transparency) |

Table 280-6 (Cont.) SMTP Size Limitation

| Element | Size Limitation |
|-------------------|--|
| recipients buffer | Maximum total number of recipients that must be buffered is 100 recipients |

280.9 UTL SMTP Examples

This example illustrates how UTL SMTP is used by an application to send e-mail. The application connects to an SMTP server at port 25 and sends a simple text message.

```

DECLARE
  c UTL SMTP.CONNECTION;

  PROCEDURE send_header(name IN VARCHAR2, header IN VARCHAR2) AS
  BEGIN
    UTL SMTP.WRITE_DATA(c, name || ': ' || header || UTL_TCP.CRLF);
  END;

BEGIN
  c := UTL SMTP.OPEN_CONNECTION('smtp-server.acme.com');
  UTL SMTP.HELO(c, 'foo.com');
  UTL SMTP.MAIL(c, 'sender@foo.com');
  UTL SMTP.RCPT(c, 'recipient@foo.com');
  UTL SMTP.OPEN_DATA(c);
  send_header('From',      '"Sender" <sender@foo.com>');
  send_header('To',       '"Recipient" <recipient@foo.com>');
  send_header('Subject', 'Hello');
  UTL SMTP.WRITE_DATA(c, UTL_TCP.CRLF || 'Hello, world!');
  UTL SMTP.CLOSE_DATA(c);
  UTL SMTP.QUIT(c);
EXCEPTION
  WHEN utl_smtp.transient_error OR utl_smtp.permanent_error THEN
  BEGIN
    UTL SMTP.QUIT(c);
  EXCEPTION
    WHEN UTL SMTP.TRANSIENT_ERROR OR UTL SMTP.PERMANENT_ERROR THEN
      NULL; -- When the SMTP server is down or unavailable, we don't have
           -- a connection to the server. The QUIT call raises an
           -- exception that we can ignore.
  END;
  raise_application_error(-20000,
    'Failed to send mail due to the following error: ' || sqlerrm);
END;

```

280.10 Summary of UTL SMTP Subprograms

This table lists the UTL SMTP subprograms and briefly describes them.

Table 280-7 UTL SMTP Package Subprograms

| Subprogram | Description |
|---|---|
| AUTH Function and Procedure | Sends the AUTH command to authenticate to the SMTP server |

Table 280-7 (Cont.) UTL_SMTP Package Subprograms

| Subprogram | Description |
|---|---|
| CLOSE_CONNECTION Procedure | Closes the SMTP connection, causing the current SMTP operation to terminate |
| CLOSE_DATA Function and Procedure | Closes the data session |
| COMMAND Function and Procedure | Performs a generic SMTP command |
| COMMAND_REPLIES Function | Performs a generic SMTP command and retrieves multiple reply lines |
| DATA Function and Procedure | Sends the e-mail body |
| EHLO Function and Procedure | Performs the initial handshake with SMTP server using the <code>EHLO</code> command |
| HELO Function and Procedure | Performs the initial handshake with SMTP server using the <code>HELO</code> command |
| HELP Function | Sends <code>HELP</code> command |
| MAIL Function and Procedure | Initiates an e-mail transaction with the server, the destination is a mailbox |
| NOOP Function and Procedure | <code>NULL</code> command |
| OPEN_CONNECTION Functions | Opens a connection to an SMTP server |
| OPEN_DATA Function and Procedure | Sends the <code>DATA</code> command |
| QUIT Function and Procedure | Terminates an SMTP session and disconnects from the server |
| RCPT Function | Specifies the recipient of an e-mail message |
| RSET Function and Procedure | Terminates the current e-mail transaction |
| STARTTLS Function and Procedure | Sends <code>STARTTLS</code> command to secure the SMTP connection using SSL/TLS |
| VRFY Function | Verifies the validity of a destination e-mail address |
| WRITE_DATA Procedure | Writes a portion of the e-mail message |
| WRITE_RAW_DATA Procedure | Writes a portion of the e-mail message with <code>RAW</code> data |

280.10.1 AUTH Function and Procedure

This subprogram sends the `AUTH` command to authenticate to the SMTP server. The `UTL_SMTP` package goes through the user's choices of authentication schemes, skips any that is not supported by the SMTP server and uses the first supported.

To determine the schemes the SMTP server supports from its `EHLO` reply, the user must call the [EHLO Function and Procedure](#). Otherwise, `UTL_SMTP` uses the first scheme in the list.

Syntax

```

UTL_SMTP.AUTH (
  c          IN OUT NOCOPY connection,
  username   IN          VARCHAR2,
  password   IN          VARCHAR2,
  schemes    IN          VARCHAR2 DEFAULT NON_CLEARTEXT_PASSWORD_SCHEMES)
RETURN reply;

```

```

UTL_SMTP.AUTH (
  c          IN OUT NOCOPY connection,
  username   IN          VARCHAR2,
  password   IN          VARCHAR2,
  schemes    IN          VARCHAR2 DEFAULT NON_CLEARTEXT_PASSWORD_SCHEMES);

```

Parameters

Table 280-8 AUTH Function and Procedure Parameters

| Parameter | Description |
|-----------|---|
| c | SMTP connection |
| username | Username |
| password | Password |
| schemes | Space-separated list of authentication schemes UTL_SMTP is allowed to use in the preferred order. See the <code>ALL_SCHEMES</code> and <code>NON_CLEARTEXT_PASSWORD_SCHEMES</code> constants for suggestions. |

Return Values

Table 280-9 AUTH Function and Procedure Function Return Values

| Return Value | Description |
|--------------|---|
| reply | Reply of the command (see <code>REPLY_REPLIES</code> Record Types in UTL_SMTP Types). In cases where there are multiple replies, the last reply is returned. |

Usage Notes

- Currently only `PLAIN`, `LOGIN` and `CRAM-MD5` authentication schemes are supported by `UTL_SMTP`.
- Since the SMTP server may change the authentication schemes it supports after the SMTP connection is secured by SSL/TLS after the `STARTTLS` command (for example, adding `PLAIN` and `LOGIN`), the caller must call the [EHLO Function and Procedure](#) again for `UTL_SMTP` to update the list after the [STARTTLS Function and Procedure](#) is called.

Examples

```

DECLARE
  c utl_smtp.connection;
BEGIN
  c := utl_smtp.open_connection(
    host => 'smtp.example.com',
    port => 25,

```

```

        wallet_path => 'file:/oracle/wallets/smtp_wallet',
        wallet_password => 'password',
        secure_connection_before_smtp => FALSE);
UTL_SMTP.STARTTLS(c);
UTL_SMTP.AUTH(
    c => c,
    username => 'scott',
    password => 'password'
    schemes => utl_smtp.all_schemes);
END;
```

280.10.2 CLOSE_CONNECTION Procedure

This procedure closes the SMTP connection, causing the current SMTP operation to terminate. Use this procedure only to cancel an e-mail in the middle of the data session.

To end the SMTP connection properly, use the [QUIT Function and Procedure](#).

Syntax

```
UTL_SMTP.CLOSE_CONNECTION (
    c      IN OUT NOCOPY connection);
```

Parameters

Table 280-10 CLOSE_CONNECTION Procedure Parameters

| Parameter | Description |
|-----------|-----------------|
| c | SMTP connection |

280.10.3 CLOSE_DATA Function and Procedure

This subprogram ends the e-mail message by sending the sequence <CR><LF>.<CR><LF> (a single period at the beginning of a line).

Syntax

```
UTL_SMTP.CLOSE_DATA (
    c      IN OUT NOCOPY connection)
RETURN reply;

UTL_SMTP.CLOSE_DATA (
    c      IN OUT NOCOPY connection);
```

Parameters

Table 280-11 CLOSE_DATA Function and Procedure Parameters

| Parameter | Description |
|-----------|-----------------|
| c | SMTP connection |

Return Values

Table 280-12 CLOSE_DATA Function and Procedure Return Values

| Return Value | Description |
|--------------|---|
| reply | Reply of the command (see REPLY_ REPLIES Record Types in UTL_SMTP Types). In cases where there are multiple replies, the last reply is returned. |

Usage Notes

The calls to OPEN_DATA, WRITE_DATA, WRITE_RAW_DATA and CLOSE_DATA must be made in the right order. A program calls OPEN_DATA to send the DATA command to the SMTP server. After that, it can call WRITE_DATA or WRITE_RAW_DATA repeatedly to send the actual data. The data is terminated by calling CLOSE_DATA. After OPEN_DATA is called, the only subprograms that can be called are WRITE_DATA, WRITE_RAW_DATA, or CLOSE_DATA. A call to other subprograms results in an INVALID_OPERATION exception being raised.

CLOSE_DATA must be called only after OPEN_CONNECTION, HELO or EHLO, MAIL, and RCPT have been called. The connection to the SMTP server must be open and a mail transaction must be active when this routine is called.

Note that there is no function form of WRITE_DATA because the SMTP server does not respond until the data-terminator is sent during the call to CLOSE_DATA.

280.10.4 COMMAND Function and Procedure

This subprogram performs a generic SMTP command.

Syntax

```
UTL_SMTP.COMMAND (
    c      IN OUT NOCOPY    connection,
    cmd    IN               VARCHAR2,
    arg    IN               VARCHAR2 DEFAULT NULL)
RETURN reply;

UTL_SMTP.COMMAND (
    c      IN OUT NOCOPY    connection,
    cmd    IN               VARCHAR2,
    arg    IN               VARCHAR2 DEFAULT NULL);
```

Parameters

Table 280-13 COMMAND Function and Procedure Parameters

| Parameter | Description |
|-----------|--|
| c | SMTP connection |
| cmd | SMTP command to send to the server |
| arg | Optional argument to the SMTP argument. A space is inserted between cmd and arg. |

Return Values

Table 280-14 COMMAND Function and Procedure Return Values

| Return Value | Description |
|--------------|---|
| reply | Reply of the command (see REPLY_ REPLIES Record Types in UTL_SMTP Types). In cases where there are multiple replies, the last reply is returned. |

Usage Notes

This function is used to invoke generic SMTP commands. Use `COMMAND` if only a single reply line is expected. Use `COMMAND_REPLIES` if multiple reply lines are expected.

For `COMMAND`, if multiple reply lines are returned from the SMTP server, it returns the last reply line only.

280.10.5 COMMAND_REPLIES Function

This function performs a generic SMTP command and retrieves multiple reply lines.

Syntax

```
UTL_SMTP.COMMAND_REPLIES (
  c      IN OUT NOCOPY  connection,
  cmd    IN              VARCHAR2,
  arg    IN              VARCHAR2 DEFAULT NULL)
RETURN replies;
```

Parameters

Table 280-15 COMMAND_REPLIES Function Parameters

| Parameter | Description |
|-----------|--|
| c | SMTP connection |
| cmd | SMTP command to send to the server |
| arg | Optional argument to the SMTP argument. A space is inserted between cmd and arg. |

Return Values

Table 280-16 COMMAND_REPLIES Function Return Values

| Return Value | Description |
|--------------|---|
| replies | Reply of the command (see REPLY_ REPLIES Record Types in UTL_SMTP Types) |

Usage Notes

This function is used to invoke generic SMTP commands. Use `COMMAND` if only a single reply line is expected. Use `COMMAND_REPLIES` if multiple reply lines are expected.

For `COMMAND`, if multiple reply lines are returned from the SMTP server, it returns the last reply line only.

280.10.6 DATA Function and Procedure

This subprogram specifies the body of an e-mail message.

Syntax

```
UTL_SMTP.DATA (
    c      IN OUT NOCOPY connection
    body  IN  VARCHAR2 CHARACTER SET ANY_CS)
RETURN reply;
```

```
UTL_SMTP.DATA (
    c      IN OUT NOCOPY connection
    body  IN  VARCHAR2 CHARACTER SET ANY_CS);
```

Parameters

Table 280-17 DATA Function and Procedure Parameters

| Parameter | Description |
|-----------|---|
| c | SMTP Connection |
| body | Text of the message to be sent, including headers, in [RFC822] format |

Return Values

Table 280-18 DATA Function and Procedure Return Values

| Return Value | Description |
|--------------|--|
| reply | Reply of the command (see <code>REPLY_ REPLIES</code> Record Types in UTL_SMTP Types). In cases where there are multiple replies, the last reply is returned. |

Usage Notes

The application must ensure that the contents of the body parameter conform to the MIME(RFC822) specification. The `DATA` routine terminates the message with a `<CR><LF>.<CR><LF>` sequence (a single period at the beginning of a line), as required by RFC821. It also translates any sequence of `<CR><LF>.<CR><LF>` (single period) in body to `<CR><LF>..<CR><LF>` (double period). This conversion provides the transparency as described in Section 4.5.2 of RFC821.

The `DATA` subprogram must be called only after `OPEN_CONNECTION`, `HELO` or `EHLO`, `MAIL` and `RCPT` have been called. The connection to the SMTP server must be open, and a mail transaction must be active when this routine is called.

The expected response from the server is a message beginning with status code 250. The 354 response received from the initial `DATA` command is not returned to the caller.

280.10.7 EHLO Function and Procedure

This subprogram performs the initial handshake with SMTP server using the `EHLO` command.

Syntax

```
UTL_SMTP.EHLO (  
    c          IN OUT NOCOPY connection,  
    domain IN)  
RETURN replies;  
  
UTL_SMTP.EHLO (  
    c          IN OUT NOCOPY connection,  
    domain IN);
```

Parameters

Table 280-19 EHLO Function and Procedure Parameters

| Parameter | Description |
|---------------------|--|
| <code>c</code> | SMTP connection |
| <code>domain</code> | Domain name of the local (sending) host. Used for identification purposes. |

Return Values

Table 280-20 EHLO Function and Procedure Return Values

| Return Value | Description |
|----------------------|---|
| <code>replies</code> | Reply of the command (see <code>REPLY_ REPLIES</code> Record Types in UTL_SMTP Types). |

Usage Notes

The `EHLO` interface is identical to `HELO` except that it allows the server to return more descriptive information about its configuration. [RFC1869] specifies the format of the information returned, which the PL/SQL application can retrieve using the functional form of this call. For compatibility with `HELO`, each line of text returned by the server begins with status code 250.

Related Functions

[HELO Function and Procedure](#)

280.10.8 HELO Function and Procedure

This subprogram performs the initial handshake with SMTP server using the `HELO` command.

Syntax

```
UTL_SMTP.HELO (
  c          IN OUT NOCOPY  connection,
  domain    IN              VARCHAR2)
RETURN reply;
```

```
UTL_SMTP.HELO (
  c          IN OUT NOCOPY  connection,
  domain    IN              VARCHAR2);
```

Parameters

Table 280-21 HELO Function and Procedure Parameters

| Parameter | Description |
|---------------------|--|
| <code>c</code> | SMTP connection |
| <code>domain</code> | Domain name of the local (sending) host. Used for identification purposes. |

Return Values

Table 280-22 HELO Function and Procedure Return Values

| Return Value | Description |
|--------------------|--|
| <code>reply</code> | Reply of the command (see <code>REPLY_ REPLIES</code> Record Types in UTL_SMTP Types). In cases where there are multiple replies, the last reply is returned. |

Usage Notes

RFC 821 specifies that the client must identify itself to the server after connecting. This routine performs that identification. The connection must have been opened through a call to [OPEN_CONNECTION Functions](#) before calling this routine.

The expected response from the server is a message beginning with status code 250.

Related Functions

[EHLO Function and Procedure](#)

280.10.9 HELP Function

This function sends the `HELP` command.

Syntax

```
UTL_SMTP.HELP (
  c          IN OUT NOCOPY  connection,
```

```

    command IN          VARCHAR2 DEFAULT NULL)
RETURN replies;

```

Parameters

Table 280-23 HELP Function Parameters

| Parameter | Description |
|-----------|---------------------------------|
| c | SMTP connection |
| command | Command to get the help message |

Return Values

Table 280-24 HELP Function Return Values

| Return Value | Description |
|--------------|---|
| replies | Reply of the command (see REPLY_ REPLIES Record Types in UTL_SMTP Types) |

280.10.10 MAIL Function and Procedure

This subprogram initiate a mail transaction with the server. The destination is a mailbox.

Syntax

```

UTL_SMTP.MAIL (
    c          IN OUT NOCOPY   connection,
    sender     IN              VARCHAR2,
    parameters IN              VARCHAR2 DEFAULT NULL)
RETURN reply;

```

```

UTL_SMTP.MAIL (
    c          IN OUT NOCOPY   connection,
    sender     IN              VARCHAR2,
    parameters IN              VARCHAR2 DEFAULT NULL);

```

Parameters

Table 280-25 MAIL Function and Procedure Parameters

| Parameter | Description |
|------------|---|
| c | SMTP connection |
| sender | E-mail address of the user sending the message. |
| parameters | Additional parameters to mail command as defined in Section 6 of [RFC1869]. It must follow the format of "XXX=XXX (XXX=XXX ...)". |

Return Values

Table 280-26 MAIL Function and Procedure Return Values

| Return Value | Description |
|--------------|--|
| reply | Reply of the command (see <code>REPLY_ REPLIES</code> Record Types in UTL_SMTP Types). In cases where there are multiple replies, the last reply is returned. |

Usage Notes

This command does not send the message; it simply begins its preparation. It must be followed by calls to `RCPT` and `DATA` to complete the transaction. The connection to the SMTP server must be open and a `HELO` or `EHLO` command must have already been sent.

The expected response from the server is a message beginning with status code 250.

280.10.11 NOOP Function and Procedure

This subprogram issues the `NULL` command.

Syntax

```
UTL_SMTP.NOOP (
    c IN OUT NOCOPY connection)
RETURN reply;

UTL_SMTP.NOOP (
    c IN OUT NOCOPY connection);
```

Parameter

Table 280-27 NOOP Function and Procedure Parameters

| Parameter | Description |
|-----------|-----------------|
| c | SMTP connection |

Return Values

Table 280-28 NOOP Function and Procedure Return Values

| Return Value | Description |
|--------------|--|
| reply | Reply of the command (see <code>REPLY_ REPLIES</code> Record Types in UTL_SMTP Types). In cases where there are multiple replies, the last reply is returned. |

Usage Notes

- This command has no effect except to elicit a successful reply from the server. It can be issued at any time after the connection to the server has been established with `OPEN_CONNECTION`. The `NOOP` command can be used to verify that the server is still connected and is listening properly.

- This command replies with a single line beginning with status code 250.

280.10.12 OPEN_CONNECTION Functions

These functions open a connection to an SMTP server.

Syntax

```
UTL_SMTP.OPEN_CONNECTION (
    host          IN VARCHAR2,
    port         IN PLS_INTEGER DEFAULT 25,
    c            OUT connection,
    tx_timeout   IN PLS_INTEGER DEFAULT NULL,
    wallet_path  IN VARCHAR2 DEFAULT NULL,
    wallet_password IN VARCHAR2 DEFAULT NULL,
    secure_connection_before_smtp IN BOOLEAN DEFAULT FALSE,
    secure_host  IN VARCHAR2 DEFAULT NULL)
RETURN reply;
```

```
UTL_SMTP.OPEN_CONNECTION (
    host          IN VARCHAR2,
    port         IN PLS_INTEGER DEFAULT 25,
    tx_timeout   IN PLS_INTEGER DEFAULT NULL,
    wallet_path  IN VARCHAR2 DEFAULT NULL,
    wallet_password IN VARCHAR2 DEFAULT NULL,
    secure_connection_before_smtp IN BOOLEAN DEFAULT FALSE,
    secure_host  IN VARCHAR2 DEFAULT NULL)
RETURN connection;
```

Parameters

Table 280-29 OPEN_CONNECTION Functions Parameters

| Parameter | Description |
|-------------------------------|--|
| host | Name of the SMTP server host |
| port | Port number on which SMTP server is listening (usually 25) |
| c | SMTP connection |
| tx_timeout | Time in seconds that the UTL_SMTP package waits before timing out in a read or write operation for this connection. In read operations, this package times out if no data is available for reading immediately. In write operations, this package times out if the output buffer is full and no data is to be sent into the network without being blocked. 0 indicates not to wait at all. NULL indicates to wait forever. |
| wallet_path | Directory path that contains the Oracle wallet for SSL/TLS. The format is file: <directory-path> |
| wallet_password | Password to open the wallet. When the wallet is auto-login enabled, the password can be set to NULL. |
| secure_connection_before_smtp | If TRUE, a secure connection with SSL/TLS is made before SMTP communication. If FALSE, no connection is made. |
| secure_host | The host name to be matched against the common name (CN) of the SMTP server's certificate when a secure connection is used. It can also be a domain name like "*.example.com". If NULL, the SMTP host name to connect to will be used. |

Return Values

Table 280-30 OPEN_CONNECTION Functions Return Values

| Return Value | Description |
|--------------|---|
| reply | Reply of the command (see REPLY_ REPLIES Record Types in UTL_SMTP Types). In cases where there are multiple replies, the last reply is returned. |

Usage Notes

- The expected response from the server is a message beginning with status code 220.
- The version of `OPEN_CONNECTION` that returns `UTL_SMTP.CONNECTION` record checks the reply code returned by an SMTP server when the connection is first established. It raises an exception when the reply indicates an error. Otherwise, it discards the reply. If you want to examine the reply, invoke the version of `OPEN_CONNECTION` that returns `REPLY`.
- `tx_timeout` is intended to govern both the read operations and the write operations. However, an implementation restriction prevents `tx_timeout` from governing write operations in the current release.

Examples

```

DECLARE
  c utl_smtp.connection;
BEGIN
  c := UTL_SMTP.OPEN_CONNECTION(
    host => 'smtp.example.com',
    port => 465,
    wallet_path => 'file:/oracle/wallets/smtp_wallet',
    wallet_password => 'password',
    secure_connection_before_smtp => TRUE);
END;

```

280.10.13 OPEN_DATA Function and Procedure

This subprogram sends the `DATA` command after which you can use `WRITE_DATA` and `WRITE_RAW_DATA` to write a portion of the e-mail message.

Syntax

```

UTL_SMTP.OPEN_DATA (
  c      IN OUT NOCOPY connection)
RETURN reply;

UTL_SMTP.OPEN_DATA (
  c      IN OUT NOCOPY connection);

```

Parameters

Table 280-31 OPEN_DATA Function and Procedure Parameters

| Parameter | Description |
|-----------|---|
| c | SMTP connection |
| data | Portion of the text of the message to be sent, including headers, in RFC822 format. |

Return Values

Table 280-32 OPEN_DATA Function and Procedure Function Return Values

| Return Value | Description |
|--------------|---|
| reply | Reply of the command (see REPLY_ REPLIES Record Types in UTL_SMTP Types). In cases where there are multiple replies, the last reply is returned. |

Usage Notes

- The calls to `OPEN_DATA`, `WRITE_DATA`, `WRITE_RAW_DATA` and `CLOSE_DATA` must be made in the right order. A program calls `OPEN_DATA` to send the `DATA` command to the SMTP server. After that, it can call `WRITE_DATA` or `WRITE_RAW_DATA` repeatedly to send the actual data. The data is terminated by calling `CLOSE_DATA`. After `OPEN_DATA` is called, the only subprograms that can be called are `WRITE_DATA`, `WRITE_RAW_DATA`, or `CLOSE_DATA`. A call to other subprograms results in an `INVALID_OPERATION` exception being raised.
- `OPEN_DATA` must be called only after `OPEN_CONNECTION`, `HELO` or `EHLO`, `MAIL`, and `RCPT` have been called. The connection to the SMTP server must be open and a mail transaction must be active when this routine is called.

280.10.14 QUIT Function and Procedure

This subprogram terminates an SMTP session and disconnects from the server.

Syntax

```
UTL_SMTP.QUIT (
    c IN OUT NOCOPY connection)
RETURN reply;

UTL_SMTP.QUIT (
    c IN OUT NOCOPY connection);
```

Parameter

Table 280-33 QUIT Function and Procedure Parameters

| Parameter | Description |
|-----------|-----------------|
| c | SMTP connection |

Return Values

Table 280-34 QUIT Function and Procedure Function Return Values

| Return Value | Description |
|--------------|--|
| reply | Reply of the command (see <code>REPLY_ REPLIES</code> Record Types in UTL_SMTP Types). In cases where there are multiple replies, the last reply is returned. |

Usage Notes

The `QUIT` command informs the SMTP server of the client's intent to terminate the session. It then closes the connection established by `OPEN_CONNECTION` which must have been called before executing this command. If a mail transaction is in progress when `QUIT` is issued, it is canceled in the same manner as `RSET`.

The function form of this command returns a single line beginning with the status code 221 on successful termination. In all cases, the connection to the SMTP server is closed. The fields `REMOTE_HOST` and `REMOTE_PORT` of `c` are reset.

Related Functions

[RSET Function and Procedure](#)

280.10.15 RCPT Function

This subprogram specifies the recipient of an e-mail message.

Syntax

```
UTL_SMTP.RCPT (
    c          IN OUT NOCOPY    connection,
    recipient  IN              VARCHAR2,
    parameters IN              VARCHAR2 DEFAULT NULL)
RETURN reply;

UTL_SMTP.RCPT (
    c          IN OUT NOCOPY    connection,
    recipient  IN              VARCHAR2,
    parameters IN              VARCHAR2 DEFAULT NULL);
```

Table 280-35 RCPT Function and Procedure Parameters

| Parameter | Description |
|-------------------------|---|
| <code>c</code> | SMTP connection |
| <code>recipient</code> | E-mail address of the user to which the message is being sent |
| <code>parameters</code> | Additional parameters to <code>RCPT</code> command as defined in Section 6 of [RFC1869]. It must follow the format of "XXX=XXX (XXX=XXX)". |

Return Values

Table 280-36 RCPT Function and Procedure Function Return Values

| Return Value | Description |
|--------------|---|
| reply | Reply of the command (see REPLY_ REPLIES Record Types in UTI_SMTP Types). In cases where there are multiple replies, the last reply is returned. |

Usage Notes

To send a message to multiple recipients, call this routine multiple times. Each invocation schedules delivery to a single e-mail address. The message transaction must have been begun by a prior call to `MAIL`, and the connection to the mail server must have been opened and initialized by prior calls to `OPEN_CONNECTION` and `HELO` or `EHLO` respectively.

The expected response from the server is a message beginning with status code 250 or 251.

280.10.16 RSET Function and Procedure

This subprogram terminates the current mail transaction.

Syntax

```
UTL_SMTP.RSET (
    c IN OUT NOCOPY connection)
RETURN reply;

UTL_SMTP.RSET (
    c IN OUT NOCOPY connection);
```

Parameters

Table 280-37 RSET Function and Procedure Parameters

| Parameter | Description |
|-----------|-----------------|
| c | SMTP connection |

Return Values

Table 280-38 RSET Function and Procedure Return Values

| Return Value | Description |
|--------------|---|
| reply | Reply of the command (see REPLY_ REPLIES Record Types in UTI_SMTP Types). In cases where there are multiple replies, the last reply is returned. |

Usage Notes

- This command allows the client to cancel an e-mail message it was in the process of composing. No mail is sent. The client can call `RSET` at any time after the connection to the SMTP server has been opened by means of `OPEN_CONNECTION` until `DATA` or `OPEN_DATA` is called. Once the e-mail data has been sent, it is too late to prevent the e-mail from being sent.
- The server responds to `RSET` with a message beginning with status code 250.

Related Functions

[QUIT Function and Procedure](#)

280.10.17 STARTTLS Function and Procedure

This subprogram sends the `STARTTLS` command to secure the SMTP connection using SSL/TLS.

SSL/TLS requires an Oracle wallet which must be specified when the connection was opened by the [OPEN_CONNECTION Functions](#).

Syntax

```
UTL_SMTP.STARTTLS (
    c          IN OUT NOCOPY connection,
    secure_host IN      VARCHAR2 DEFAULT NULL)
RETURN reply;

UTL_SMTP.STARTTLS (
    c          IN OUT NOCOPY connection,
    secure_host IN      VARCHAR2 DEFAULT NULL);
```

Parameters

Table 280-39 STARTTLS Function and Procedure Parameters

| Parameter | Description |
|--------------------------|--|
| <code>c</code> | SMTP connection |
| <code>secure_host</code> | The host name to be matched against the common name (CN) of the SMTP server's certificate. It can also be a domain name like <code>"*.example.com"</code> . If <code>NULL</code> , the SMTP host name to connect to will be used. |

Return Values

Table 280-40 STARTTLS Function and Procedure Return Values

| Return Value | Description |
|--------------------|-------------|
| <code>reply</code> | SMTP reply |

Usage Notes

The `STARTTLS` command must only be issued on an unencrypted connection and when the SMTP server indicates the support of the command in the reply of the `EHLO` command. The wallet to be used for encryption must have been specified when the initial SMTP connection was opened by the `OPEN_CONNECTION` function.

Examples

```
DECLARE
  c utl_smtp.connection;
BEGIN
  c := utl_smtp.open_connection(
    host => 'smtp.example.com',
    port => 25,
    wallet_path => 'file:/oracle/wallets/smtp_wallet',
    wallet_password => 'password',
    secure_connection_before_smtp => FALSE);
  utl_smtp.starttls(c);
END
```

280.10.18 VRFY Function

This function verifies the validity of a destination e-mail address.

Syntax

```
UTL_SMTP.VRFY (
  c          IN OUT NOCOPY connection
  recipient IN VARCHAR2)
RETURN reply;
```

Parameters

Table 280-41 VRFY Function Parameters

| Parameter | Description |
|-----------|-------------------------------|
| c | SMTP connection |
| recipient | E-mail address to be verified |

Return Values

Table 280-42 VRFY Function Return Values

| Return Value | Description |
|--------------|---|
| reply | Reply of the command (see <code>REPLY_REPLIES</code> Record Types in UTL_SMTP Types). In cases where there are multiple replies, the last reply is returned. |

Usage Notes

The server attempts to resolve the destination address `recipient`. If successful, it returns the recipient's full name and fully qualified mailbox path. The connection to the

server must have already been established by means of `OPEN_CONNECTION` and `HELO` or `EHLO` before making this request.

Successful verification returns one or more lines beginning with status code 250 or 251.

280.10.19 WRITE_DATA Procedure

This procedure writes a portion of the e-mail message. A repeat call to `WRITE_DATA` appends data to the e-mail message.

Syntax

```
UTL_SMTP.WRITE_DATA (
  c      IN OUT NOCOPY connection,
  data  IN VARCHAR2 CHARACTER SET ANY_CS);
```

Parameters

Table 280-43 WRITE_DATA Procedure Parameters

| Parameter | Description |
|-----------|--|
| c | SMTP connection |
| data | Portion of the text of the message to be sent, including headers, in [RFC822] format |

Usage Notes

- The calls to the [OPEN_DATA Function and Procedure](#), [WRITE_DATA Procedure](#), [WRITE_RAW_DATA Procedure](#) and [CLOSE_DATA Function and Procedure](#) must be made in the correct order. A program calls `OPEN_DATA` to send the `DATA` command to the SMTP server. After that, it can call `WRITE_DATA` or `WRITE_RAW_DATA` repeatedly to send the actual data. The data is terminated by calling `CLOSE_DATA`. After `OPEN_DATA` is called, the only subprograms that can be called are `WRITE_DATA`, `WRITE_RAW_DATA`, or `CLOSE_DATA`. A call to other subprograms results in an `INVALID_OPERATION` exception being raised.
- The application must ensure that the contents of the body parameter conform to the MIME(RFC822) specification. The `DATA` routine terminates the message with a `<CR><LF>.<CR><LF>` sequence (a single period at the beginning of a line), as required by RFC821. It also translates any sequence of `<CR><LF>.<CR><LF>` (single period) in the body to `<CR><LF>..<CR><LF>` (double period). This conversion provides the transparency as described in Section 4.5.2 of RFC821.
- The [OPEN_DATA Function and Procedure](#), [WRITE_DATA Procedure](#), [WRITE_RAW_DATA Procedure](#) and [CLOSE_DATA Function and Procedure](#) must be called only after [OPEN_CONNECTION Functions](#), [HELO Function and Procedure](#), or [EHLO Function and Procedure](#), [MAIL Function and Procedure](#), and [RCPT Function](#) have been called. The connection to the SMTP server must be open and a mail transaction must be active when this routine is called.
- Note that there is no function form of the [WRITE_DATA Procedure](#) because the SMTP server does not respond until the data-terminator is sent during the call to [CLOSE_DATA Function and Procedure](#).
- Text (`VARCHAR2`) data sent using `WRITE_DATA` is converted to US7ASCII before it is sent. If the text contains multibyte characters, each multibyte character in the text that cannot be converted to US7ASCII is replaced by a '?' character. If 8BITMIME extension is

negotiated with the SMTP server using the `EHLO` subprogram, multibyte `VARCHAR2` data can be sent by first converting the text to `RAW` using the `UTL_RAW` package, and then sending the `RAW` data using `WRITE_RAW_DATA`.

280.10.20 WRITE_RAW_DATA Procedure

This procedure writes a portion of the e-mail message. A repeat call to `WRITE_RAW_DATA` appends data to the e-mail message.

Syntax

```
UTL_SMTP.WRITE_RAW_DATA (
  c      IN OUT NOCOPY connection
  data  IN RAW);
```

Parameters

Table 280-44 WRITE_RAW_DATA Procedure Parameters

| Parameter | Description |
|-----------|--|
| c | SMTP connection |
| data | Portion of the text of the message to be sent, including headers, in [RFC822] format |

Usage Notes

- The calls to the [OPEN_DATA Function and Procedure](#), [WRITE_DATA Procedure](#), [WRITE_RAW_DATA Procedure](#) and [CLOSE_DATA Function and Procedure](#) must be made in the correct order. A program calls `OPEN_DATA` to send the `DATA` command to the SMTP server. After that, it can call `WRITE_DATA` or `WRITE_RAW_DATA` repeatedly to send the actual data. The data is terminated by calling `CLOSE_DATA`. After `OPEN_DATA` is called, the only subprograms that can be called are `WRITE_DATA`, `WRITE_RAW_DATA`, or `CLOSE_DATA`. A call to other subprograms results in an `INVALID_OPERATION` exception being raised.
- The application must ensure that the contents of the body parameter conform to the MIME(RFC822) specification. The `DATA` routine terminates the message with a `<CR><LF>.<CR><LF>` sequence (a single period at the beginning of a line), as required by RFC821. It also translates any sequence of `<CR><LF>.<CR><LF>` (single period) in the body to `<CR><LF>..<CR><LF>` (double period). This conversion provides the transparency as described in Section 4.5.2 of RFC821.
- The [OPEN_DATA Function and Procedure](#), [WRITE_DATA Procedure](#), [WRITE_RAW_DATA Procedure](#) and [CLOSE_DATA Function and Procedure](#) must be called only after [OPEN_CONNECTION Functions](#), [HELO Function and Procedure](#), or [EHLO Function and Procedure](#), [MAIL Function and Procedure](#), and [RCPT Function](#) have been called. The connection to the SMTP server must be open and a mail transaction must be active when this routine is called.
- Note that there is no function form of the [WRITE_DATA Procedure](#) because the SMTP server does not respond until the data-terminator is sent during the call to [CLOSE_DATA Function and Procedure](#).

UTL_TCP

With the `UTL_TCP` package and its procedures and functions, PL/SQL applications can communicate with external TCP/IP-based servers using TCP/IP. Because many Internet application protocols are based on TCP/IP, this package is useful to PL/SQL applications that use Internet protocols and e-mail.

This chapter contains the following topics:

- [Overview](#)
- [Security Model](#)
- [Types](#)
- [Exceptions](#)
- [Rules and Limits](#)
- [Examples](#)
- [Summary of UTL_TCP Subprograms](#)

281.1 UTL_TCP Overview

The `UTL_TCP` package provides TCP/IP client-side access functionality in PL/SQL.

281.2 UTL_TCP Security Model

This package is an invoker's rights package and the invoking user needs the connect privilege granted in the access control list assigned to the remote network host to which he wants to connect.

**Note:**

For more information about managing fine-grained access, see *Oracle Database Security Guide*

281.3 UTL_TCP Types

The `UTL_TCP` package includes a `CONNECTION` type and a carriage-return line-feed (CRLF) type.

CONNECTION Type

This is a PL/SQL record type used to represent a TCP/IP connection.

Syntax

```

TYPE connection IS RECORD (
    remote_host    VARCHAR2(255),
    remote_port    PLS_INTEGER,
    local_host     VARCHAR2(255),
    local_port     PLS_INTEGER,
    charset        VARCHAR2(30),
    newline        VARCHAR2(2),
    tx_timeout     PLS_INTEGER,
    private_sd     PLS_INTEGER);

```

Fields

Table 281-1 Connection Record Type Fields

| Field | Description |
|-------------|---|
| remote_host | Name of the remote host when connection is established. NULL when no connection is established. |
| remote_port | Port number of the remote host connected. NULL when no connection is established. |
| local_host | Name of the local host used to establish the connection. NULL when no connection is established. |
| local_port | Port number of the local host used to establish the connection. NULL when no connection is established. |
| charset | The on-the-wire character set. Since text messages in the database may be encoded in a character set that is different from the one expected on the wire (that is, the character set specified by the communication protocol, or the one stipulated by the other end of the communication), text messages in the database are converted to and from the on-the-wire character set as they are sent and received on the network. |
| newline | Newline character sequence. This newline character sequence is appended to the text line sent by <code>WRITE_LINE</code> API. |
| tx_timeout | Time in seconds that the UTL_TCP package waits before giving up in a read or write operation in this connection. In read operations, this package gives up if no data is available for reading immediately. In write operations, this package gives up if the output buffer is full and no data is to be sent in the network without being blocked. Zero (0) indicates not to wait at all. NULL indicates to wait forever. |

Usage Notes

The fields in a connection record are used to return information about the connection, which is often made using `OPEN_CONNECTION`. Changing the values of those fields has no effect on the connection. The fields `private_XXXX` are for implementation use only. You should not modify the values.

In the current release of the UTL_TCP package, the parameters `local_host` and `local_port` are ignored when `open_connection` makes a TCP/IP connection. It does not attempt to use the specified local host and port number when the connection is made. The `local_host` and `local_port` fields are not set in the connection record returned by the function.

Time out on write operations is not supported in the current release of the UTL_TCP package.

CRLF

The character sequence carriage-return line-feed. It is the newline sequence commonly used by many communication standards.

Syntax

```
CRLF CONSTANT VARCHAR2(2 CHAR);
```

Usage Notes

This package variable defines the newline character sequence commonly used in many Internet protocols. This is the default value of the newline character sequence for `WRITE_LINE`, specified when a connection is opened. While such protocols use `<CR><LF>` to denote a new line, some implementations may choose to use just line-feed to denote a new line. In such cases, users can specify a different newline character sequence when a connection is opened.

281.4 UTL_TCP Exceptions

UTL_TCP will raise an exception when it encounters a processing issue.

The exceptions raised by the TCP/IP package are listed in the following table.

Table 281-2 TCP/IP Exceptions

| Exception | Description |
|------------------------|--|
| BUFFER_TOO_SMALL | Buffer is too small for input that requires look-ahead |
| END_OF_INPUT | Raised when no more data is available to read from the connection |
| NETWORK_ERROR | Generic network error |
| BAD_ARGUMENT | Bad argument passed in an API call (for example, a negative buffer size) |
| TRANSFER_TIMEOUT | No data is read and a read time out occurred |
| PARTIAL_MULTIBYTE_CHAR | No complete character is read and a partial multibyte character is found at the end of the input |

281.5 UTL_TCP Rules and Limits

The interface provided in the package only allows connections to be initiated by the PL/SQL program. It does not allow the PL/SQL program to accept connections initiated outside the program.

281.6 UTL_TCP Examples

Some possible uses for UTL_TCP include retrieving a Web page over HTTP or sending an e-mail.

The following code example illustrates how the TCP/IP package can be used to retrieve a Web page over HTTP. It connects to a Web server listening at port 80 (standard port for HTTP) and requests the root document.

```
DECLARE
  c      utl_tcp.connection; -- TCP/IP connection to the Web server
  ret_val pls_integer;
BEGIN
  c := utl_tcp.open_connection(remote_host => 'www.acme.com',
                              remote_port => 80,
                              charset    => 'US7ASCII'); -- open connection
  ret_val := utl_tcp.write_line(c, 'GET / HTTP/1.0'); -- send HTTP request
  ret_val := utl_tcp.write_line(c);
  BEGIN
    LOOP
      dbms_output.put_line(utl_tcp.get_line(c, TRUE)); -- read result
    END LOOP;
  EXCEPTION
    WHEN utl_tcp.end_of_input THEN
      NULL; -- end of input
  END;
  utl_tcp.close_connection(c);
END;
```

The following code example illustrates how the TCP/IP package can be used by an application to send e-mail (also known as email from PL/SQL). The application connects to an SMTP server at port 25 and sends a simple text message.

```
PROCEDURE send_mail (sender      IN VARCHAR2,
                    recipient IN VARCHAR2,
                    message   IN VARCHAR2) IS
  mailhost  VARCHAR2(30) := 'mailhost.mydomain.com';
  smtp_error EXCEPTION;
  mail_conn utl_tcp.connection;
  PROCEDURE smtp_command(command IN VARCHAR2,
                          ok      IN VARCHAR2 DEFAULT '250')
  IS
    response varchar2(3);
    len pls_integer;
  BEGIN
    len := utl_tcp.write_line(mail_conn, command);
    response := substr(utl_tcp.get_line(mail_conn), 1, 3);
    IF (response <> ok) THEN
      RAISE smtp_error;
    END IF;
  END;
END;

BEGIN
  mail_conn := utl_tcp.open_connection(remote_host => mailhost,
                                      remote_port => 25,
                                      charset    => 'US7ASCII');
  smtp_command('HELO ' || mailhost);
  smtp_command('MAIL FROM: ' || sender);
  smtp_command('RCPT TO: ' || recipient);
```

```

smtp_command('DATA', '354');
smtp_command(message);
smtp_command('QUIT', '221');
utl_tcp.close_connection(mail_conn);
EXCEPTION
  WHEN OTHERS THEN
    -- Handle the error
END;
```

281.7 Summary of UTL_TCP Subprograms

This table lists the UTL_TCP subprograms and briefly describes them.

Table 281-3 UTL_TCP Package Subprograms

| Subprogram | Description |
|---|--|
| AVAILABLE Function | Determines the number of bytes available for reading from a TCP/IP connection |
| CLOSE_ALL_CONNECTIONS Procedure | Closes all open TCP/IP connections |
| CLOSE_CONNECTION Procedure | Closes an open TCP/IP connection |
| FLUSH Procedure | Transmits immediately to the server all data in the output buffer, if a buffer is used |
| GET_LINE Function | Returns the line of data read |
| GET_LINE_NCHAR Function | Returns the line of data read in NCHAR form |
| GET_RAW Function | Return the data read instead of the amount of data read |
| GET_TEXT Function | Returns the text data read |
| GET_TEXT_NCHAR Function | Returns the text data read in NCHAR form |
| OPEN_CONNECTION Function | Opens a TCP/IP connection to a specified service |
| READ_LINE Function | Receives a text line from a service on an open connection |
| READ_RAW Function | Receives binary data from a service on an open connection |
| READ_TEXT Function | Receives text data from a service on an open connection |
| SECURE_CONNECTION Procedure | Secures a TCP/IP connection using SSL/TLS |
| WRITE_LINE Function | Transmits a text line to a service on an open connection |
| WRITE_RAW Function | Transmits a binary message to a service on an open connection |
| WRITE_TEXT Function | Transmits a text message to a service on an open connection |

281.7.1 AVAILABLE Function

This function determines the number of bytes available for reading from a TCP/IP connection. It is the number of bytes that can be read immediately without blocking. Determines if data is ready to be read from the connection.

Syntax

```

UTL_TCP.AVAILABLE (
  c          IN OUT NOCOPY connection,
```

```

    timeout IN PLS_INTEGER DEFAULT 0)
RETURN PLS_INTEGER;

```

Parameters

Table 281-4 AVAILABLE Function Parameters

| Parameter | Description |
|-----------|--|
| c | TCP connection to determine the amount of data that is available to be read |
| timeout | Time in seconds to wait before giving up and reporting that no data is available. Zero (0) indicates not to wait at all. NULL indicates to wait forever. |

Return Values

The number of bytes available for reading without blocking

Usage Notes

The connection must have already been opened through a call to `OPEN_CONNECTION`. Users may use this API to determine if data is available to be read before calling the read API so that the program are not blocked because data is not ready to be read from the input.

The number of bytes available for reading returned by this function may be less than what is actually available. On some platforms, this function may only return 1, to indicate that some data is available. If you are concerned about the portability of your application, then assume that this function returns a positive value when data is available for reading, and 0 when no data is available. This function returns a positive value when all the data at a particular connection has been read and the next read result in the `END_OF_INPUT` exception.

The following example illustrates using this function in a portable manner:

```

DECLARE
  c    utl_tcp.connection
  data VARCHAR2(256);
  len  PLS_INTEGER;
BEGIN
  c := utl_tcp.open_connection(...);
  LOOP
    IF (utl_tcp.available(c) > 0) THEN
      len := utl_tcp.read_text(c, data, 256);
    ELSE
      ---do some other things
      . . . .
    END IF
  END LOOP;
END;

```

281.7.2 CLOSE_ALL_CONNECTIONS Procedure

This procedure closes all open TCP/IP connections.

Syntax

```
UTL_TCP.CLOSE_ALL_CONNECTIONS;
```

Usage Notes

This call is provided to close all connections before a PL/SQL program ends to avoid dangling connections.

281.7.3 CLOSE_CONNECTION Procedure

This procedure closes an open TCP/IP connection.

Syntax

```
UTL_TCP.CLOSE_CONNECTION (  
    c IN OUT NOCOPY connection);
```

Parameters

Table 281-5 CLOSE_CONNECTION Procedure Parameters

| Parameter | Description |
|-----------|-------------------------|
| c | TCP connection to close |

Usage Notes

Connection must have been opened by a previous call to `OPEN_CONNECTION`. The fields `remote_host`, `remote_port`, `local_host`, `local_port` and `charset` of `c` are reset after the connection is closed.

An open connection must be closed explicitly. An open connection remains open when the PL/SQL record variable that stores the connection goes out-of-scope in the PL/SQL program. Failing to close unwanted connections may result in unnecessary tying up of local and remote system resources.

281.7.4 FLUSH Procedure

This procedure transfers immediately to the server all data in the output buffer, if a buffer is used.

Syntax

```
UTL_TCP.FLUSH (  
    c IN OUT NOCOPY connection);
```

Parameters

Table 281-6 FLUSH Procedure Parameters

| Parameter | Description |
|-----------|--------------------------------------|
| c | TCP connection to which to send data |

Usage Notes

The connection must have already been opened through a call to `OPEN_CONNECTION`.

281.7.5 GET_LINE Function

This function returns the line of data read.

Syntax

```
UTL_TCP.GET_LINE (
    c          IN OUT NOCOPY connection,
    remove_crlf IN          BOOLEAN DEFAULT FALSE,
    peek       IN          BOOLEAN DEFAULT FALSE)
RETURN VARCHAR2;
```

Parameters

Table 281-7 GET_LINE Function Parameters

| Parameter | Description |
|-------------|---|
| c | TCP connection from which to receive data |
| remove_crlf | If <code>TRUE</code> , then one or more trailing CRLF characters are removed from the received message. |
| peek | Normally, you want to read the data and remove it from the input queue, that is, consume it. In some situations, you may just want to look ahead at the data, that is, peek at it, without removing it from the input queue, so that it is still available for reading (or even peeking) in the next call. To keep the data in the input queue, set this flag to <code>TRUE</code> and set up an input buffer before the connection is opened. The amount of data you can peek at (that is, read but keep in the input queue) must be less than the size of input buffer. |

Return Values

The text line read

Usage Notes

- The connection must have already been opened through a call to `OPEN_CONNECTION`.
- See `READ_LINE` for the read time out, character set conversion, buffer size, and multibyte character issues.

281.7.6 GET_LINE_NCHAR Function

This function returns the line of data read in NCHAR form.

Syntax

```
UTL_TCP.GET_LINE_NCHAR (
  c          IN OUT NOCOPY connection,
  remove_crlf IN          BOOLEAN DEFAULT FALSE,
  peek      IN          BOOLEAN DEFAULT FALSE)
RETURN NVARCHAR2;
```

Parameters

Table 281-8 GET_LINE_NCHAR Function Parameters

| Parameter | Description |
|-------------|--|
| c | TCP connection from which to receive data |
| remove_crlf | If TRUE, then one or more trailing CRLF characters are removed from the received message. |
| peek | Normally, you want to read the data and remove it from the input queue, that is, consume it. In some situations, you may just want to look ahead at the data, that is, peek at it, without removing it from the input queue, so that it is still available for reading (or even peeking) in the next call. To keep the data in the input queue, set this flag to TRUE and set up an input buffer before the connection is opened. The amount of data you can peek at (that is, read but keep in the input queue) must be less than the size of input buffer. |

Return Values

The text line read

Usage Notes

- The connection must have already been opened through a call to `OPEN_CONNECTION`.
- See `READ_LINE` for the read time out, character set conversion, buffer size, and multibyte character issues.

281.7.7 GET_RAW Function

This function returns the data read instead of the amount of data read.

Syntax

```
UTL_TCP.GET_RAW (
  c          IN OUT NOCOPY connection,
  len      IN          PLS_INTEGER DEFAULT 1,
  peek     IN          BOOLEAN      DEFAULT FALSE)
RETURN RAW;
```

Parameters

Table 281-9 GET_RAW Function Parameters

| Parameter | Description |
|-------------|--|
| c | TCP connection from which to receive data |
| len | The number of bytes (or characters for VARCHAR2) of data to receive. Default is 1. |
| peek | Normally, you want to read the data and remove it from the input queue, that is, consume it. In some situations, you may just want to look ahead at the data, that is, peek at it, without removing it from the input queue, so that it is still available for reading (or even peeking) in the next call. To keep the data in the input queue, set this flag to TRUE and set up an input buffer before the connection is opened. The amount of data you can peek at (that is, read but keep in the input queue) must be less than the size of input buffer. |
| remove_crlf | If TRUE, then one or more trailing CRLF characters are removed from the received message. |

Return Values

The binary data read

Usage Notes

The connection must have already been opened through a call to OPEN_CONNECTION.

For all the get_* APIs described in this section, see the corresponding READ_* API for the read time out issue. For GET_TEXT and GET_LINE, see the corresponding READ_* API for character set conversion, buffer size, and multibyte character issues.

281.7.8 GET_TEXT Function

This function returns the text data read.

Syntax

```
UTL_TCP.GET_TEXT (
  c      IN OUT NOCOPY connection,
  len   IN          PLS_INTEGER DEFAULT 1,
  peek  IN          BOOLEAN      DEFAULT FALSE)
RETURN VARCHAR2;
```

Parameters

Table 281-10 GET_TEXT Function Parameters

| Parameter | Description |
|-----------|--|
| c | TCP connection from which to receive data |
| len | Number of bytes (or characters for VARCHAR2) of data to receive. Default is 1. |

Table 281-10 (Cont.) GET_TEXT Function Parameters

| Parameter | Description |
|-------------|---|
| peek | Normally, you want to read the data and remove it from the input queue, that is, consume it. In some situations, you may just want to look ahead at the data, that is, peek at it, without removing it from the input queue, so that it is still available for reading (or even peeking) in the next call. To keep the data in the input queue, set this flag to <code>TRUE</code> and set up an input buffer before the connection is opened. The amount of data you can peek at (that is, read but keep in the input queue) must be less than the size of input buffer. |
| remove_crlf | If <code>TRUE</code> , then one or more trailing CRLF characters are removed from the received message. |

Return Values

The text data read

Usage Notes

The connection must have already been opened through a call to `OPEN_CONNECTION`.

For all the `get_*` APIs described in this section, see the corresponding `read_*` API for the read time out issue. For `GET_TEXT` and `GET_LINE`, see the corresponding `READ_*` API for character set conversion, buffer size, and multibyte character issues.

281.7.9 GET_TEXT_NCHAR Function

This function returns the text data read in NCHAR form.

Syntax

```
UTL_TCP.GET_TEXT_NCHAR (
  c      IN OUT NOCOPY connection,
  len   IN          PLS_INTEGER DEFAULT 1,
  peek  IN          BOOLEAN      DEFAULT FALSE)
RETURN NVARCHAR2;
```

Parameters**Table 281-11 GET_TEXT_NCHAR Function Parameters**

| Parameter | Description |
|-----------|--|
| c | TCP connection from which to receive data |
| len | The number of bytes (or characters for <code>VARCHAR2</code>) of data to receive. Default is 1. |

Table 281-11 (Cont.) GET_TEXT_NCHAR Function Parameters

| Parameter | Description |
|-------------|---|
| peek | Normally, you want to read the data and remove it from the input queue, that is, consume it. In some situations, you may just want to look ahead at the data, that is, peek at it, without removing it from the input queue, so that it is still available for reading (or even peeking) in the next call. To keep the data in the input queue, set this flag to <code>TRUE</code> and set up an input buffer before the connection is opened. The amount of data you can peek at (that is, read but keep in the input queue) must be less than the size of input buffer. |
| remove_crlf | If <code>TRUE</code> , then one or more trailing CRLF characters are removed from the received message. |

Return Values

The text data read

Usage Notes

The connection must have already been opened through a call to `OPEN_CONNECTION`.

For all the `get_*` APIs described in this section, see the corresponding `read_*` API for the read time out issue. For `GET_TEXT` and `GET_LINE`, see the corresponding `READ_*` API for character set conversion, buffer size, and multibyte character issues.

281.7.10 OPEN_CONNECTION Function

This function opens a TCP/IP connection to a specified service.

Syntax

```
UTL_TCP.OPEN_CONNECTION (
    remote_host      IN VARCHAR2,
    remote_port     IN PLS_INTEGER,
    local_host      IN VARCHAR2 DEFAULT NULL,
    local_port      IN PLS_INTEGER DEFAULT NULL,
    in_buffer_size  IN PLS_INTEGER DEFAULT NULL,
    out_buffer_size IN PLS_INTEGER DEFAULT NULL,
    charset         IN VARCHAR2 DEFAULT NULL,
    newline         IN VARCHAR2 DEFAULT CRLF,
    tx_timeout      IN PLS_INTEGER DEFAULT NULL,
    wallet_path     IN VARCHAR2 DEFAULT NULL,
    wallet_password IN VARCHAR2 DEFAULT NULL,
    RETURN connection;
```

Parameters

Table 281-12 OPEN_CONNECTION Function Parameters

| Parameter | Description |
|-------------|---|
| remote_host | Name of the host providing the service. When <code>remote_host</code> is <code>NULL</code> , it connects to the local host. |

Table 281-12 (Cont.) OPEN_CONNECTION Function Parameters

| Parameter | Description |
|------------------------------|--|
| <code>remote_port</code> | Port number on which the service is listening for connections |
| <code>local_host</code> | Name of the host providing the service. <code>NULL</code> means does not care. |
| <code>local_port</code> | Port number on which the service is listening for connections. <code>NULL</code> means don't care. |
| <code>in_buffer_size</code> | The size of input buffer. The use of an input buffer can speed up execution performance in receiving data from the server. The appropriate size of the buffer depends on the flow of data between the client and the server, and the traffic/latency on the network. A zero value means no buffer should be used. A <code>NULL</code> value means the caller does not care if a buffer is used or not. The maximum size of the input buffer is 32767 bytes. |
| <code>out_buffer_size</code> | The size of output buffer. The use of an output buffer can speed up execution performance in sending data to the server. The appropriate size of buffer depends on the flow of data between the client and the server, and the network condition. A zero value means no buffer should be used. A <code>NULL</code> value means the caller does not care if a buffer is used or not. The maximum size of the output buffer is 32767 bytes. |
| <code>charset</code> | The on-the-wire character set. Since text messages in the database may be encoded in a character set that is different from the one expected on the wire (that is, the character set specified by the communication protocol, or the one stipulated by the other end of the communication), text messages in the database are converted to and from the on-the-wire character set as they are sent and received on the network using <code>READ_TEXT</code> , <code>READ_LINE</code> , <code>WRITE_TEXT</code> and <code>WRITE_LINE</code> . Set this parameter to <code>NULL</code> when no conversion is needed. |
| <code>newline</code> | Newline character sequence. This newline character sequence is appended to the text line sent by <code>WRITE_LINE</code> API. |
| <code>tx_timeout</code> | Time in seconds that the <code>UTL_TCP</code> package should wait before giving up in a read or write operations in this connection. In read operations, this package gives up if no data is available for reading immediately. In write operations, this package gives up if the output buffer is full and no data is to be sent in the network without being blocked. Zero (0) indicates not to wait at all. <code>NULL</code> indicates to wait forever. |
| <code>wallet_path</code> | Directory path that contains the Oracle wallet for SSL/TLS. The format is <code>file:directory-path</code> |
| <code>wallet_password</code> | Password to open the wallet. When the wallet is auto-login enabled, the password may be set to <code>NULL</code> . |

Return Values

A connection to the targeted TCP/IP service

Usage Notes

- Note that connections opened by this `UTL_TCP` package can remain open and be passed from one database call to another in a shared server configuration. However, the

connection must be closed explicitly. The connection remains open when the PL/SQL record variable that stores the connection goes out-of-scope in the PL/SQL program. Failing to close unwanted connections may result in unnecessary tying up of local and remote system resources.

- In the current release of the UTL_TCP package, the parameters `local_host` and `local_port` are ignored when `open_connection` makes a TCP/IP connection. It does not attempt to use the specified local host and port number when the connection is made. The `local_host` and `local_port` fields is not set in the connection record returned by the function.
- `tx_timeout` is intended to govern both the read operations and the write operations. However, an implementation restriction prevents `tx_timeout` from governing write operations in the current release.

Examples

```
DECLARE
  c UTL_TCP.CONNECTION;
BEGIN
  c := UTL_TCP.OPEN_CONNECTION(
    host      => 'www.example.com',
    port      => 443,
    wallet_path => 'file:/oracle/wallets/smtp_wallet',
    wallet_password => '****');
  UTL_TCP.SECURE_CONNECTION (c => c);
END;
```

281.7.11 READ_LINE Function

This function receives a text line from a service on an open connection.

A line is terminated by a line-feed, a carriage-return or a carriage-return followed by a line-feed.

Syntax

```
UTL_TCP.READ_LINE (
  c          IN OUT NOCOPY connection,
  data       IN OUT NOCOPY VARCHAR2 CHARACTER SET ANY_CS,
  peek       IN          BOOLEAN DEFAULT FALSE)
RETURN PLS_INTEGER;
```

Parameters

Table 281-13 READ_LINE Function Parameters

| Parameter | Description |
|--------------------------|--|
| <code>c</code> | TCP connection from which to receive data |
| <code>data</code> | Data received. |
| <code>remove_crlf</code> | If TRUE, then one ore more trailing CRLF characters are removed from the received message. |

Table 281-13 (Cont.) READ_LINE Function Parameters

| Parameter | Description |
|-----------|---|
| peek | Normally, you want to read the data and remove it from the input queue, that is, consume it. In some situations, you may just want to look ahead at the data, that is, peek at it, without removing it from the input queue, so that it is still available for reading (or even peeking) in the next call. To keep the data in the input queue, set this flag to <code>TRUE</code> and set up an input buffer before the connection is opened. The amount of data you can peek at (that is, read but keep in the input queue) must be less than the size of input buffer. |

Return Values

The number of characters of data received

Usage Notes

The connection must have already been opened through a call to `OPEN_CONNECTION`. This function does not return until the end-of-line have been reached, or the end of input has been reached. Text messages is converted from the on-the-wire character set, specified when the connection was opened, to the database character set before they are returned to the caller.

If transfer time out is set when the connection is opened, then this function waits for each data packet to be ready to read until time out occurs. If it occurs, then this function stops reading and returns all the data read successfully. If no data is read successfully, then the `transfer_timeout` exception is raised. The exception can be handled and the read operation can be retried later.

If a partial multibyte character is found at the end of input, then this function stops reading and returns all the complete multibyte characters read successfully. If no complete character is read successfully, then the `partial_multibyte_char` exception is raised. The exception can be handled and the bytes of that partial multibyte character can be read as binary by the `READ_RAW` function. If a partial multibyte character is seen in the middle of the input because the remaining bytes of the character have not arrived and read time out occurs, then the `transfer_timeout` exception is raised instead. The exception can be handled and the read operation can be retried later.

281.7.12 READ_RAW Function

This function receives binary data from a service on an open connection.

Syntax

```
UTL_TCP.READ_RAW (
  c      IN OUT NOCOPY connection,
  data   IN OUT NOCOPY RAW,
  len    IN          PLS_INTEGER DEFAULT 1,
  peek   IN          BOOLEAN      DEFAULT FALSE)
RETURN PLS_INTEGER;
```

Parameters

Table 281-14 READ_RAW Function Parameters

| Parameter | Description |
|--------------------|---|
| c | TCP connection from which to receive data |
| data (IN OUT COPY) | Data received |
| len | Number of bytes of data to receive |
| peek | Normally, you want to read the data and remove it from the input queue, that is, consume it. In some situations, you may just want to look ahead at the data, that is, peek at it, without removing it from the input queue, so that it is still available for reading (or even peeking) in the next call. To keep the data in the input queue, set this flag to <code>TRUE</code> and set up an input buffer before the connection is opened. The amount of data you can peek at (that is, read but keep in the input queue) must be less than the size of input buffer. |

Return Values

The number of bytes of data received

Usage Notes

The connection must have already been opened through a call to `OPEN_CONNECTION`. This function does not return until the specified number of bytes have been read, or the end of input has been reached.

If transfer time out is set when the connection is opened, then this function waits for each data packet to be ready to read until time out occurs. If it occurs, then this function stops reading and returns all the data read successfully. If no data is read successfully, then the `transfer_timeout` exception is raised. The exception can be handled and the read operation can be retried later.

281.7.13 READ_TEXT Function

This function receives text data from a service on an open connection.

Syntax

```
UTL_TCP.READ_TEXT (  
  c      IN OUT NOCOPY connection,  
  data  IN OUT NOCOPY VARCHAR2 CHARACTER SET ANY_CS,  
  len   IN           PLS_INTEGER DEFAULT 1,  
  peek  IN           BOOLEAN      DEFAULT FALSE)  
RETURN PLS_INTEGER;
```

Parameters

Table 281-15 READ_TEXT Function Parameters

| Parameter | Description |
|-------------------|---|
| <code>c</code> | TCP connection from which to receive data |
| <code>data</code> | Data received |
| <code>len</code> | Number of characters of data to receive |
| <code>peek</code> | Normally, users want to read the data and remove it from the input queue, that is, consume it. In some situations, users may just want to look ahead at the data without removing it from the input queue so that it is still available for reading (or even peeking) in the next call. To keep the data in the input queue, set this flag to <code>TRUE</code> and an input buffer must be set up when the connection is opened. The amount of data that you can peek at (that is, read but keep in the input queue) must be less than the size of input buffer. |

Return Values

The number of characters of data received

Usage Notes

The connection must have already been opened through a call to `OPEN_CONNECTION`. This function does not return until the specified number of characters has been read, or the end of input has been reached. Text messages is converted from the on-the-wire character set, specified when the connection was opened, to the database character set before they are returned to the caller.

Unless explicitly overridden, the size of a `VARCHAR2` buffer is specified in terms of bytes, while the parameter `len` refers to the maximum number of characters to be read. When the database character set is multibyte, where a single character may consist of more than 1 byte, you should ensure that the buffer can hold the maximum of characters. In general, the size of the `VARCHAR2` buffer should equal the number of characters to be read, multiplied by the maximum number of bytes of a character of the database character set.

If transfer time out is set when the connection is opened, then this function waits for each data packet to be ready to read until time out occurs. If it occurs, then this function stops reading and returns all the data read successfully. If no data is read successfully, then the `transfer_timeout` exception is raised. The exception can be handled and the read operation can be retried later.

If a partial multibyte character is found at the end of input, then this function stops reading and returns all the complete multibyte characters read successfully. If no complete character is read successfully, then the `partial_multibyte_char` exception is raised. The exception can be handled and the bytes of that partial multibyte character can be read as binary by the `READ_RAW` function. If a partial multibyte character is seen in the middle of the input because the remaining bytes of the character have not arrived and read time out occurs, then the `transfer_timeout` exception is raised instead. The exception can be handled and the read operation can be retried later.

281.7.14 SECURE_CONNECTION Procedure

This procedure secures a TCP/IP connection using SSL/TLS.

SSL/TLS requires an Oracle wallet which must be specified when the connection was opened by the [OPEN_CONNECTION Function](#).

Syntax

```
UTL_TCP.SECURE_CONNECTION (  
    c      IN OUT NOCOPY connection);
```

Parameters

Table 281-16 SECURE_CONNECTION Procedure Parameters

| Parameter | Description |
|-----------|---|
| c | TCP connection from which to receive data |

281.7.15 WRITE_LINE Function

This function transmits a text line to a service on an open connection. The `newline` character sequence is appended to the message before it is transmitted.

Syntax

```
UTL_TCP.WRITE_LINE (  
    c      IN OUT NOCOPY connection,  
    data IN          VARCHAR2 DEFAULT NULL CHARACTER SET ANY_CS)  
RETURN PLS_INTEGER;
```

Parameters

Table 281-17 WRITE_LINE Function Parameters

| Parameter | Description |
|-----------|---------------------------------------|
| c | TCP connection to which to send data |
| data | Buffer containing the data to be sent |

Return Values

The actual number of characters of data transmitted

Usage Notes

The connection must have already been opened through a call to `OPEN_CONNECTION`. Text messages are converted to the on-the-wire character set, specified when the connection was opened, before they are transmitted on the wire.

281.7.16 WRITE_RAW Function

This function transmits a binary message to a service on an open connection. The function does not return until the specified number of bytes have been written.

Syntax

```
UTL_TCP.WRITE_RAW (  
    c      IN OUT NOCOPY connection,  
    data  IN          RAW,  
    len   IN          PLS_INTEGER DEFAULT NULL)  
RETURN PLS_INTEGER;
```

Parameters

Table 281-18 WRITE_RAW Function Parameters

| Parameter | Description |
|-----------|---|
| c | TCP connection to which to send data |
| data | Buffer containing the data to be sent |
| len | The number of bytes of data to transmit. When len is NULL, the whole length of data is written. |

Return Values

The number of bytes of data transmitted

Usage Notes

The connection must have already been opened through a call to `OPEN_CONNECTION`.

281.7.17 WRITE_TEXT Function

This function transmits a text message to a service on an open connection.

Syntax

```
UTL_TCP.WRITE_TEXT (  
    c      IN OUT NOCOPY connection,  
    data  IN          VARCHAR2 CHARACTER SET ANY_CS,  
    len   IN          PLS_INTEGER DEFAULT NULL)  
RETURN num_chars PLS_INTEGER;
```

Parameters

Table 281-19 WRITE_TEXT Function Parameters

| Parameter | Description |
|-----------|---------------------------------------|
| c | TCP connection to which to send data |
| data | Buffer containing the data to be sent |

Table 281-19 (Cont.) WRITE_TEXT Function Parameters

| Parameter | Description |
|-----------|--|
| len | The number of characters of data to transmit. When len is NULL, the whole length of data is written. The actual amount of data written may be less because of network condition. |

Return Values

The actual number of characters of data transmitted

Usage Notes

The connection must have already been opened through a call to `OPEN_CONNECTION`. Text messages are converted to the on-the-wire character set, specified when the connection was opened, before they are transmitted on the wire.

UTL_URL

The `UTL_URL` package has two functions: `ESCAPE` and `UNESCAPE`.

This chapter contains the following topics:

- [Overview](#)
- [Exceptions](#)
- [Examples](#)
- [Summary of UTL_URL Subprograms](#)

See Also:

[UTL_HTTP](#)

282.1 UTL_URL Overview

A Uniform Resource Locator (URL) is a string that identifies a Web resource, such as a page or a picture. Use a URL to access such resources by way of the HyperText Transfer Protocol (HTTP).

For example, the URL for Oracle's Web site is:

```
http://www.oracle.com
```

Normally, a URL contains English alphabetic characters, digits, and punctuation symbols. These characters are known as the *unreserved characters*. Any other characters in URLs, including multibyte characters or binary octet codes, must be escaped to be accurately processed by Web browsers or Web servers. Some punctuation characters, such as dollar sign (\$), question mark (?), colon (:), and equals sign (=), are reserved as delimiters in a URL. They are known as the *reserved characters*. To literally process these characters, instead of treating them as delimiters, they must be escaped.

The unreserved characters are:

- A through Z, a through z, and 0 through 9
- Hyphen (-), underscore (_), period (.), exclamation point (!), tilde (~), asterisk (*), accent ('), left parenthesis ((), right parenthesis ())

The reserved characters are:

- Semi-colon (;) slash (/), question mark (?), colon (:), at sign (@), ampersand (&), equals sign (=), plus sign (+), dollar sign (\$), percentage sign (%), and comma (,)

The `UTL_URL` package has two functions that provide escape and unescape mechanisms for URL characters. Use the escape function to escape a URL before the URL is used fetch a

Web page by way of the UTL_HTTP package. Use the unescape function to unescape an escaped URL before information is extracted from the URL.

For more information, refer to the Request For Comments (RFC) document RFC2396. Note that this URL escape and unescape mechanism is different from the x-www-form-urlencoded encoding mechanism described in the HTML specification:

```
http://www.w3.org/TR/html
```

282.2 UTL_URL Exceptions

UTL_URL raises an exception when it encounter a processing issue.

The following table lists the exceptions that can be raised when the UTL_URL package API is invoked.

Table 282-1 UTL_URL Exceptions

| Exception | Error Code | Reason |
|-----------------------------|------------|--|
| BAD_URL | 29262 | The URL contains badly formed escape code sequences |
| BAD_FIXED_WIDT H_CHARSET | 29274 | Fixed-width multibyte character set is not allowed as a URL character set. |

282.3 UTL_URL Examples

UTL_URL can be used for encoding and decoding.

You can implement the x-www-form-urlencoded encoding using the UTL_URL.ESCAPE function as follows:

```
CREATE OR REPLACE FUNCTION form_url_encode (
    data    IN VARCHAR2,
    charset IN VARCHAR2) RETURN VARCHAR2 AS
BEGIN
    RETURN utl_url.escape(data, TRUE, charset); -- note use of TRUE
END;
```

For decoding data encoded with the form-URL-encode scheme, the following function implements the decoding scheme:

```
CREATE OR REPLACE FUNCTION form_url_decode (
    data    IN VARCHAR2,
    charset IN VARCHAR2) RETURN VARCHAR2 AS
BEGIN
    RETURN utl_url.unescape(
        replace(data, '+', ' '),
        charset);
END;
```

282.4 Summary of UTL_URL Subprograms

This table lists and briefly describes the UTL_URL subprograms.

Table 282-2 UTL_URL Package Subprograms

| Subprogram | Description |
|-----------------------------------|--|
| ESCAPE Function | Returns a URL with illegal characters (and optionally reserved characters) escaped using the %2-digit-hex-code format |
| UNESCAPE Function | Unescapes the escape character sequences to their original forms in a URL. Convert the %XX escape character sequences to the original characters |

282.4.1 ESCAPE Function

This function returns a URL with illegal characters (and optionally reserved characters) escaped using the %2-digit-hex-code format.

Syntax

```
UTL_URL.ESCAPE (
    url                IN VARCHAR2 CHARACTER SET ANY_CS,
    escape_reserved_chars IN BOOLEAN DEFAULT FALSE,
    url_charset        IN VARCHAR2 DEFAULT utl_http.body_charset)
RETURN VARCHAR2;
```

Parameters

Table 282-3 ESCAPE Function Parameters

| Parameter | Description |
|------------------------------------|--|
| <code>url</code> | The original URL |
| <code>escape_reserved_chars</code> | Indicates whether the URL reserved characters should be escaped. If set to <code>TRUE</code> , both the reserved and illegal URL characters are escaped. Otherwise, only the illegal URL characters are escaped. The default value is <code>FALSE</code> . |
| <code>url_charset</code> | When escaping a character (single-byte or multibyte), determine the target character set that character should be converted to before the character is escaped in %hex-code format. If <code>url_charset</code> is <code>NULL</code> , the database charset is assumed and no character set conversion will occur. The default value is the current default body character set of the <code>UTL_HTTP</code> package, whose default value is <code>ISO-8859-1</code> . The character set can be named in Internet Assigned Numbers Authority (IANA) or in the Oracle naming convention. |

Usage Notes

Use this function to escape URLs that contain illegal characters as defined in the URL specification RFC 2396. The legal characters in URLs are:

- A through Z, a through z, and 0 through 9
- Hyphen (-), underscore (_), period (.), exclamation point (!), tilde (~), asterisk (*), accent ('), left parenthesis ((), right parenthesis ())

The reserved characters consist of:

- Semi-colon (;) slash (/), question mark (?), colon (:), at sign (@), ampersand (&), equals sign (=), plus sign (+), dollar sign (\$), and comma (,)

Many of the reserved characters are used as delimiters in the URL. You should escape characters beyond those listed here by using `escape_url`. Also, to use the reserved characters in the name-value pairs of the query string of a URL, those characters must be escaped separately. An `escape_url` cannot recognize the need to escape those characters because once inside a URL, those characters become indistinguishable from the actual delimiters. For example, to pass a name-value pair `$logon=HR/<password>` into the query string of a URL, escape the `$` and `/` separately as `%24logon=HR%2F<password>` and use it in the URL.

Normally, you will escape the entire URL, which contains the reserved characters (delimiters) that should not be escaped. For example:

```
utl_url.escape('http://www.acme.com/a url with space.html')
```

Returns:

```
http://www.acme.com/a%20url%20with%20space.html
```

In other situations, you may want to send a query string with a value that contains reserved characters. In that case, escape only the value fully (with `escape_reserved_chars` set to `TRUE`) and then concatenate it with the rest of the URL. For example:

```
url := 'http://www.acme.com/search?check=' || utl_url.escape
('Is the use of the "$" sign okay?', TRUE);
```

This expression escapes the question mark (?), dollar sign (\$), and space characters in 'Is the use of the "\$" sign okay?' but not the ? after search in the URL that denotes the use of a query string.

The Web server that you intend to fetch Web pages from may use a character set that is different from that of your database. In that case, specify the `url_charset` as the Web server character set so that the characters that need to be escaped are escaped in the target character set. For example, a user of an EBCDIC database who wants to access an ASCII Web server should escape the URL using `US7ASCII` so that a space is escaped as `%20` (hex code of a space in ASCII) instead of `%40` (hex code of a space in EBCDIC).

This function does not validate a URL for the proper URL format.

282.4.2 UNESCAPE Function

This function unescapes the escape character sequences to its original form in a URL, to convert the `%XX` escape character sequences to the original characters.

Syntax

```
UTL_URL.UNESCAPE (
    url          IN VARCHAR2 CHARACTER SET ANY_CS,
    url_charset  IN VARCHAR2 DEFAULT utl_http.body_charset)
RETURN VARCHAR2;
```

Parameters

Table 282-4 UNESCAPE Function Parameters

| Parameter | Description |
|--------------------------|--|
| <code>url</code> | The URL to unescape |
| <code>url_charset</code> | After a character is unescaped, the character is assumed to be in the <code>source_charset</code> character set and it will be converted from the <code>source_charset</code> to the database character set before the URL is returned. If <code>source_charset</code> is NULL, the database charset is assumed and no character set conversion occurred. The default value is the current default body character set of the <code>UTL_HTTP</code> package, whose default value is "ISO-8859-1". The character set can be named in Internet Assigned Numbers Authority (IANA) or Oracle naming convention. |

Usage Notes

The Web server that you receive the URL from may use a character set that is different from that of your database. In that case, specify the `url_charset` as the Web server character set so that the characters that need to be unescaped are unescaped in the source character set. For example, a user of an EBCDIC database who receives a URL from an ASCII Web server should unescape the URL using `US7ASCII` so that `%20` is unescaped as a space (0x20 is the hex code of a space in ASCII) instead of a `?` (because 0x20 is not a valid character in EBCDIC).

This function does not validate a URL for the proper URL format.

WPG_DOCLOAD

The `WPG_DOCLOAD` package provides an interface to download files, BLOBs and BFILES.

See Also:

For more information about implementation of this package:

- [Oracle Fusion Middleware Administrator's Guide for Oracle HTTP Server](#)
- [Oracle Fusion Middleware User's Guide for mod_plsql](#)

The chapter contains the following topics:

- [Constants](#)
- [Summary of WPG_DOCLOAD Subprograms](#)

283.1 WPG_DOCLOAD Constants

`WPG_DOCLOAD` defines several constants to use when specifying parameter values.

The `WPG_DOCLOAD` constants are listed below:

- `NAME_COL_LEN`
- `MIMET_COL_LEN`
- `MAX_DOCTABLE_NAME_LEN`

NAME_COL_LEN

The `NAME` column in your document table must be the same as the value of `name_col_len`.

```
name_col_len CONSTANT pls_integer := 64;
```

MIMET_COL_LEN

The `MIME_TYPE` column in your document table must be the same as the value of `mimet_col_len`.

```
mimet_col_len CONSTANT pls_integer := 48;
```

MAX_DOCTABLE_NAME_LEN

The name length of your document table must be less than `max_doctable_name_len`.

```
max_doctable_name_len CONSTANT pls_integer := 256;
```

283.2 Summary of WPG_DOCLOAD Subprograms

The WPG_DOCLOAD package uses one subprogram, the `DOWNLOAD_FILE` procedure.

Table 283-1 WPG_DOCLOAD Package Subprograms

| Subprogram | Description |
|--|-----------------------------------|
| DOWNLOAD_FILE Procedures | Downloads files, BLOBS and BFILES |

283.2.1 DOWNLOAD_FILE Procedures

There are three versions of this download file procedure.

- The first version downloads files and is invoked from within a document download procedure to signal the PL/SQL Gateway that `p_filename` is to be downloaded from the document table to the client's browser.
- The second version can be called from within any procedure to signal the PL/SQL Gateway that `p_blob` is to be downloaded to the client's browser.
- The third version can be called from within any procedure to signal the PL/SQL Gateway that `p_bfile` is to be downloaded to the client's browser.

Syntax

```
WPG_DOCLOAD.DOWNLOAD_FILE (
  p_filename      IN          VARCHAR2,
  p_bcaching      IN          BOOLEAN DEFAULT TRUE);
```

```
WPG_DOCLOAD.DOWNLOAD_FILE (
  p_blob          IN OUT NOCOPY BLOB);
```

```
WPG_DOCLOAD.DOWNLOAD_FILE (
  p_bfile         IN OUT      BFILE);
```

Parameters

Table 283-2 DOWNLOAD_FILE Procedure Parameters

| Parameter | Description |
|-------------------------|--|
| <code>p_filename</code> | The file to download from the document table. |
| <code>p_blob</code> | The BLOB to download. |
| <code>p_bfile</code> | The BFILE to download (see Usage Notes). |
| <code>p_bcaching</code> | Whether browser caching is enabled (see Usage Notes). |

Usage Notes

- Normally, a document will be downloaded to the browser unless the browser sends an 'If-Modified-Since' header to the gateway indicating that it has the requested document in its cache. In that case, the gateway will determine if the browser's cached copy is up to date, and if it is, it will send an HTTP 304 status

message to the browser indicating that the browser should display the cached copy. However, because a document URL and a document do not necessarily have a one-to-one relationship in the PL/SQL Web Gateway, in some cases it may be undesirable to have the cached copy of a document displayed. In those cases, the `p_bcaching` parameter should be set to `FALSE` to indicate to the gateway to ignore the 'If-Modified-Since' header, and download the document.

- `p_bfile` and `p_blob` are declared as `IN OUT` because the locator is initially opened to check for file accessibility and existence. The open operation can only be performed if the locator is writable and readable.

ANYDATA TYPE

An ANYDATA TYPE contains an instance of a given type, plus a description of the type. In this sense, an ANYDATA is self-describing. An ANYDATA can be persistently stored in the database.

This chapter contains the following topics:

- [Restrictions](#)
- [Operational Notes](#)
- [Summary of ANYDATA Subprograms](#)

284.1 ANYDATA TYPE Restrictions

Persistent storage of ANYDATA instances whose type contains embedded LOBs other than BFILES is not currently supported.

284.2 ANYDATA TYPE Operational Notes

This section contains notes related to ANYDATA TYPE construction and access.

Construction

There are 2 ways to construct an ANYDATA. The CONVERT* calls enable construction of the ANYDATA in its entirety with a single call. They serve as explicit CAST functions from any type in the Oracle ORDBMS to ANYDATA.

```

STATIC FUNCTION ConvertBDouble(dbl IN BINARY_DOUBLE) return ANYDATA,
STATIC FUNCTION ConvertBfile(b IN BFILE) RETURN ANYDATA,
STATIC FUNCTION ConvertBFloat(fl IN BINARY_FLOAT) return ANYDATA,
STATIC FUNCTION ConvertBlob(b IN BLOB) RETURN ANYDATA,
STATIC FUNCTION ConvertChar(c IN CHAR) RETURN ANYDATA,
STATIC FUNCTION ConvertClob(c IN CLOB) RETURN ANYDATA,
STATIC FUNCTION ConvertCollection(col IN "collection_type") RETURN ANYDATA,
STATIC FUNCTION ConvertDate(dat IN DATE) RETURN ANYDATA,
STATIC FUNCTION ConvertIntervalDS(inv IN INTERVAL DAY TO SECOND) return ANYDATA,
STATIC FUNCTION ConvertIntervalYM(inv IN INTERVAL YEAR TO MONTH) return ANYDATA,
STATIC FUNCTION ConvertNchar(nc IN NCHAR) return ANYDATA,
STATIC FUNCTION ConvertNClob(nc IN NCLOB) return ANYDATA,
STATIC FUNCTION ConvertNumber(num IN NUMBER) RETURN ANYDATA,
STATIC FUNCTION ConvertNVarchar2(nc IN NVARCHAR2) return ANYDATA,
STATIC FUNCTION ConvertObject(obj IN "<object_type>") RETURN ANYDATA,
STATIC FUNCTION ConvertRaw(r IN RAW) RETURN ANYDATA,
STATIC FUNCTION ConvertRef(rf IN REF "<object_type>") RETURN ANYDATA,
STATIC FUNCTION ConvertTimestamp(ts IN TIMESTAMP) return ANYDATA,
STATIC FUNCTION ConvertTimestampTZ(ts IN TIMESTAMP WITH TIMEZONE) return ANYDATA,
STATIC FUNCTION ConvertTimestampLTZ(ts IN TIMESTAMP WITH LOCAL TIMEZONE) return
ANYDATA,
STATIC FUNCTION ConvertURowid(rid IN UROWID) return ANYDATA,
STATIC FUNCTION ConvertVarchar(c IN VARCHAR) RETURN ANYDATA,
STATIC FUNCTION ConvertVarchar2(c IN VARCHAR2) RETURN ANYDATA,

```

The second way to construct an ANYDATA is a piece by piece approach. The [BEGINCREATE Static Procedure](#) call begins the construction process and [ENDCREATE Member Procedure](#) call finishes the construction process. In between these two calls, the individual attributes of an object type or the elements of a collection can be set using SET* calls. For piece by piece access of the attributes of objects and elements of collections, the [PIECEWISE Member Procedure](#) should be invoked prior to GET* calls.

Note: The ANYDATA has to be constructed or accessed sequentially starting from its first attribute (or collection element). The BEGINCREATE call automatically begins the construction in a piece-wise mode. There is no need to call PIECEWISE immediately after BEGINCREATE. ENDCREATE should be called to finish the construction process (before which any access calls can be made).

Access

Access functions are available based on SQL. These functions do not throw exceptions on type-mismatch. Instead, they return NULL if the type of the ANYDATA does not correspond to the type of access. If you wish to use only ANYDATA functions of the appropriate types returned in a query, you should use a WHERE clause which uses GETTYPENAME and choose the type you are interested in (say "SYS.NUMBER"). Each of these functions returns the value of a specified datatype inside a SYS.ANYDATA wrapper.

```
MEMBER FUNCTION AccessBDouble(self IN ANYDATA) return BINARY_DOUBLE
    DETERMINISTIC,
MEMBER FUNCTION AccessBfile(self IN ANYDATA) return BFILE,
MEMBER FUNCTION AccessBFloat(self IN ANYDATA) return BINARY_FLOAT
    DETERMINISTIC,
MEMBER FUNCTION AccessBlob(self IN ANYDATA) return BLOB,
MEMBER FUNCTION AccessChar(self IN ANYDATA) return CHAR,
MEMBER FUNCTION AccessClob(self IN ANYDATA) return CLOB,
MEMBER FUNCTION AccessDate(self IN ANYDATA) return DATE,
MEMBER FUNCTION AccessIntervalYM(self IN ANYDATA) return INTERVAL YEAR TO MONTH,
MEMBER FUNCTION AccessIntervalDS(self IN ANYDATA) return INTERVAL DAY TO SECOND,
MEMBER FUNCTION AccessNchar(self IN ANYDATA) return NCHAR,
MEMBER FUNCTION AccessNClob(self IN ANYDATA) return NCLOB
MEMBER FUNCTION AccessNumber(self IN ANYDATA) return NUMBER,
MEMBER FUNCTION AccessNvarchar2(self IN ANYDATA) return NVARCHAR2,
MEMBER FUNCTION AccessRaw(self IN ANYDATA) return RAW,
MEMBER FUNCTION AccessTimestamp(self IN ANYDATA) return TIMESTAMP,
MEMBER FUNCTION AccessTimestampLTZ(self IN ANYDATA) return TIMESTAMP WITH LOCAL
    TIMEZONE,
MEMBER FUNCTION AccessTimestampTZ(self IN ANYDATA) return TIMESTAMP WITH
    TIMEZONE,
MEMBER FUNCTION AccessUrowid(self IN ANYDATA) return UROWID DETERMINISTIC
MEMBER FUNCTION AccessVarchar(self IN ANYDATA) return VARCHAR,
MEMBER FUNCTION AccessVarchar2(self IN ANYDATA) return VARCHAR2,
```

284.3 Summary of ANYDATA Subprograms

This table lists the ANYDATA subprograms in alphabetical order and briefly describes them.

Table 284-1 ANYDATA Type Subprograms

| Subprogram | Description |
|--|--|
| BEGINCREATE Static Procedure | Begins creation process on a new ANYDATA |
| ENDCREATE Member Procedure | Ends creation of an ANYDATA |
| GET* Member Functions | Gets the current data value (which should be of appropriate type) |
| GETTYPE Member Function | Gets the Type of the ANYDATA |
| GETTYPENAME Member Function | Get the fully qualified type name for the ANYDATA |
| PIECEWISE Member Procedure | Sets the MODE of access of the current data value to be an attribute at a time (if the data value is of TYPECODE_OBJECT) |
| SET* Member Procedures | Sets the current data value. |

284.3.1 BEGINCREATE Static Procedure

This procedure begins the creation process on a new ANYDATA.

Syntax

```
STATIC PROCEDURE BeginCreate(
    dtype          IN OUT NOCOPY AnyType,
    adata         OUT NOCOPY ANYDATA);
```

Parameters

Table 284-2 BEGINCREATE Procedure Parameters

| Parameter | Description |
|-----------|---|
| dtype | The type of the ANYDATA. (Should correspond to OCI_TYPECODE_OBJECT or a Collection typecode.) |
| adata | ANYDATA being constructed. |

Exception

DBMS_TYPES.INVALID_PARAMETERS: dtype is invalid (not fully constructed, and similar deficits.)

Usage Notes

There is no need to call `PIECEWISE` immediately after this call. The construction process begins in a piece-wise manner automatically.

284.3.2 ENDCREATE Member Procedure

This procedure ends creation of an ANYDATA. Other creation functions cannot be called after this call.

Syntax

```
MEMBER PROCEDURE EndCreate(
    self          IN OUT NOCOPY ANYDATA);
```

Parameters

Table 284-3 ENDCREATE Procedure Parameter

| Parameter | Description |
|-----------|-------------|
| self | An ANYDATA. |

284.3.3 GET* Member Functions

These functions get the current data value (which should be of appropriate type).

The type of the current data value depends on the MODE by which it is accessed (depending on whether the PIECEWISE call is invoked).

If PIECEWISE has NOT been called, the ANYDATA is accessed in its entirety and the type of the data value should match the type of the ANYDATA.

If PIECEWISE has been called, the ANYDATA is accessed piece-wise. The type of the data value should match the type of the attribute (or collection element) at the current position.

Syntax

```
MEMBER FUNCTION GetBDouble(
    self          IN ANYDATA,
    dbl          OUT NOCOPY BINARY_DOUBLE)
RETURN PLS_INTEGER;
```

```
MEMBER FUNCTION GetBfile(
    self          IN ANYDATA,
    b            OUT NOCOPY BFILE)
RETURN PLS_INTEGER;
```

```
MEMBER FUNCTION GetBFloat(
    self          IN ANYDATA,
    fl           OUT NOCOPY BINARY_FLOAT)
RETURN PLS_INTEGER;
```

```
MEMBER FUNCTION GetBlob(
    self          IN ANYDATA,
    b            OUT NOCOPY BLOB)
RETURN PLS_INTEGER;
```

```
MEMBER FUNCTION GetChar(
    self          IN ANYDATA,
    c            OUT NOCOPY CHAR)
```

```
        RETURN          PLS_INTEGER;

MEMBER FUNCTION GetClob(
    self          IN ANYDATA,
    c             OUT NOCOPY CLOB)
RETURN          PLS_INTEGER;

MEMBER FUNCTION GetCollection(
    self          IN ANYDATA,
    col          OUT NOCOPY "<collection_type>")
RETURN          PLS_INTEGER;

MEMBER FUNCTION GetDate(
    self          IN ANYDATA,
    dat          OUT NOCOPY DATE)
RETURN          PLS_INTEGER;

MEMBER FUNCTION GetIntervalDS(
    self          IN ANYDATA,
    inv          OUT NOCOPY INTERVAL DAY TO SECOND)
RETURN          PLS_INTEGER;

MEMBER FUNCTION GetIntervalYM(
    self          IN ANYDATA,
    inv          OUT NOCOPY INTERVAL YEAR TO MONTH)
RETURN          PLS_INTEGER;

MEMBER FUNCTION GetNchar(
    self          IN ANYDATA,
    nc           OUT NOCOPY NCHAR)
RETURN          PLS_INTEGER;

MEMBER FUNCTION GetNClob(
    self          IN ANYDATA,
    nc           OUT NOCOPY NCLOB)
RETURN          PLS_INTEGER;

MEMBER FUNCTION GetNumber(
    self          IN ANYDATA,
    num          OUT NOCOPY NUMBER)
RETURN          PLS_INTEGER;

MEMBER FUNCTION GetNVarchar2(
    self          IN ANYDATA,
    nc           OUT NOCOPY NVARCHAR2)
RETURN          PLS_INTEGER;

MEMBER FUNCTION GetObject(
    self          IN ANYDATA,
    obj          OUT NOCOPY "<object_type>")
RETURN          PLS_INTEGER;

MEMBER FUNCTION GetRaw(
    self          IN ANYDATA,
    r            OUT NOCOPY RAW)
RETURN          PLS_INTEGER;

MEMBER FUNCTION GetRef(
    self          IN ANYDATA,
    rf           OUT NOCOPY REF "<object_type>")
RETURN          PLS_INTEGER;
```

```

MEMBER FUNCTION GetTimestamp(
    self          IN ANYDATA,
    ts            OUT NOCOPY TIMESTAMP)
RETURN PLS_INTEGER;

MEMBER FUNCTION GetTimestampTZ(
    self          IN ANYDATA,
    ts            OUT NOCOPY TIMESTAMP WITH TIME ZONE)
RETURN PLS_INTEGER;

MEMBER FUNCTION GetTimestampLTZ(
    self          IN ANYDATA,
    ts            OUT NOCOPY TIMESTAMP WITH LOCAL TIME ZONE)
RETURN PLS_INTEGER;

MEMBER FUNCTION GetVarchar(
    self          IN ANYDATA,
    c             OUT NOCOPY VARCHAR)
RETURN          PLS_INTEGER;

MEMBER FUNCTION GetVarchar2(
    self          IN ANYDATA,
    c             OUT NOCOPY VARCHAR2)
RETURN          PLS_INTEGER;

```

Parameters

Table 284-4 GET* Function Parameter

| Parameter | Description |
|-----------|----------------------------|
| self | An ANYDATA. |
| num | The number to be obtained. |

Return Values

DBMS_TYPES.SUCCESS or DBMS_TYPES.NO_DATA

The return value is relevant only if `PIECEWISE` has been already called (for a collection). In such a case, `DBMS_TYPES.NO_DATA` signifies the end of the collection when all elements have been accessed.

Exceptions

DBMS_TYPES.TYPE_MISMATCH: When the expected type is different from the passed in type.

DBMS_TYPES.INVALID_PARAMETERS: Invalid Parameters (if it is not appropriate to add a number at this point in the creation process).

DBMS_TYPES.INCORRECT_USAGE: Incorrect usage.

284.3.4 GETTYPE Member Function

This function gets the typecode of the ANYDATA.

Syntax

```
MEMBER FUNCTION GETTYPE (  
    self          IN ANYDATA,  
    typ           OUT NOCOPY AnyType)  
RETURN          PLS_INTEGER;
```

Parameters

Table 284-5 GETTYPE Function Parameter

| Parameter | Description |
|-----------|---|
| self | An ANYDATA. |
| typ | The AnyType corresponding to the ANYDATA. May be NULL if it does not represent a user-defined type. |

Return Values

The typecode corresponding to the type of the ANYDATA.

284.3.5 GETTYPENAME Member Function

This function gets the fully qualified type name for the ANYDATA.

If the ANYDATA is based on a built-in type, this function will return NUMBER and other relevant information.

If it is based on a user defined type, this function will return *schema_name.type_name*, for example, SCOTT.FOO.

If it is based on a transient anonymous type, this function will return NULL.

Syntax

```
MEMBER FUNCTION GETTYPENAME (  
    self          IN ANYDATA)  
RETURN          VARCHAR2;
```

Parameters

Table 284-6 GETTYPENAME Function Parameter

| Parameter | Description |
|-----------|-------------|
| self | An ANYDATA. |

Return Values

Type name of the ANYDATA.

284.3.6 PIECEWISE Member Procedure

This procedure sets the **MODE** of access of the current data value to be an attribute at a time (if the data value is of `TYPECODE_OBJECT`).

It sets the **MODE** of access of the data value to be a collection element at a time (if the data value is of collection type). Once this call has been made, subsequent calls to `SET*` and `GET*` will sequentially obtain individual attributes or collection elements.

Syntax

```
MEMBER PROCEDURE PIECEWISE (
    self          IN OUT NOCOPY ANYDATA);
```

Parameters

Table 284-7 PIECEWISE Procedure Parameters

| Parameter | Description |
|-------------------|-------------------------|
| <code>self</code> | The current data value. |

Exceptions

- `DBMS_TYPES.INVALID_PARAMETERS`
- `DBMS_TYPES.INCORRECT_USAGE`: On incorrect usage.

Usage Notes

The current data value must be of an `OBJECT` or `COLLECTION` type before this call can be made.

Piece-wise construction and access of nested attributes that are of object or collection types is not supported.

284.3.7 SET* Member Procedures

This procedure sets the current data value.

This is a list of procedures that should be called depending on the type of the current data value. The type of the data value should be the type of the attribute at the current position during the piece-wise construction process.

Syntax

```
MEMBER PROCEDURE SETBDOUBLE (
    self          IN OUT NOCOPY ANYDATA,
    dbl           IN BINARY_DOUBLE,
    last_elem     IN boolean DEFAULT FALSE);
```

```
MEMBER PROCEDURE SETBFILE (
    self          IN OUT NOCOPY ANYDATA,
    b             IN BFILE,
    last_elem     IN boolean DEFAULT FALSE);
```

```
MEMBER PROCEDURE SETBFLOAT (
```

```
self      IN OUT NOCOPY ANYDATA,  
fl        IN          BINARY_FLOAT,  
last_elem IN          boolean DEFAULT FALSE);  
  
MEMBER PROCEDURE SETBLOB(  
self      IN OUT NOCOPY ANYDATA,  
b         IN BLOB,  
last_elem IN boolean DEFAULT FALSE);  
  
MEMBER PROCEDURE SETCHAR(  
self      IN OUT NOCOPY ANYDATA,  
c         IN CHAR,  
last_elem IN boolean DEFAULT FALSE);  
  
MEMBER PROCEDURE SETCLOB(  
self      IN OUT NOCOPY ANYDATA,  
c         IN CLOB,  
last_elem IN boolean DEFAULT FALSE);  
  
MEMBER PROCEDURE SETCOLLECTION(  
self      IN OUT NOCOPY ANYDATA,  
col       IN "<collection_type>",  
last_elem IN boolean DEFAULT FALSE);  
  
MEMBER PROCEDURE SETDATE(  
self      IN OUT NOCOPY ANYDATA,  
dat       IN DATE,  
last_elem IN boolean DEFAULT FALSE);  
  
MEMBER PROCEDURE SETINTERVALS(  
self      IN OUT NOCOPY ANYDATA,  
inv       IN INTERVAL DAY TO SECOND,  
last_elem IN boolean DEFAULT FALSE);  
  
MEMBER PROCEDURE SETINTERVALYM(  
self      IN OUT NOCOPY ANYDATA,  
inv       IN INTERVAL YEAR TO MONTH,  
last_elem IN boolean DEFAULT FALSE);  
  
MEMBER PROCEDURE SETNCHAR(  
self      IN OUT NOCOPY ANYDATA,  
nc        IN NCHAR,  
last_elem IN boolean DEFAULT FALSE);  
  
MEMBER PROCEDURE SETNCLOB(  
self      IN OUT NOCOPY ANYDATA,  
nc        IN NClob,  
last_elem IN boolean DEFAULT FALSE);  
  
MEMBER PROCEDURE SETNUMBER(  
self      IN OUT NOCOPY ANYDATA,  
num       IN NUMBER,  
last_elem IN boolean DEFAULT FALSE);  
  
MEMBER PROCEDURE SETNVARCHAR2(  
self      IN OUT NOCOPY ANYDATA,  
nc        IN NVarchar2,  
last_elem IN boolean DEFAULT FALSE),  
  
MEMBER PROCEDURE SETOBJECT(  
self      IN OUT NOCOPY ANYDATA,
```

```

obj          IN "<object_type>",
last_elem   IN boolean DEFAULT FALSE);

MEMBER PROCEDURE SETRAW(
  self       IN OUT NOCOPY ANYDATA,
  r          IN RAW,
  last_elem  IN boolean DEFAULT FALSE);

MEMBER PROCEDURE SETREF(
  self       IN OUT NOCOPY ANYDATA,
  rf         IN REF "<object_type>",
  last_elem  IN boolean DEFAULT FALSE);

MEMBER PROCEDURE SETTIMESTAMP(
  self       IN OUT NOCOPY ANYDATA,
  ts         IN TIMESTAMP,
  last_elem  IN BOOLEAN DEFAULT FALSE);

MEMBER PROCEDURE SETTIMESTAMPtz(self IN OUT NOCOPY ANYDATA,
  ts         IN TIMESTAMP WITH TIME ZONE,
  last_elem  IN BOOLEAN DEFAULT FALSE);

MEMBER PROCEDURE SETTIMESTAMPtz(
  self IN OUT NOCOPY ANYDATA,
  ts IN TIMESTAMP WITH LOCAL TIME ZONE,
  last_elem IN boolean DEFAULT FALSE),

MEMBER PROCEDURE SETVARCHAR(
  self       IN OUT NOCOPY ANYDATA,
  c          IN VARCHAR,
  last_elem  IN boolean DEFAULT FALSE);

MEMBER PROCEDURE SETVARCHAR2(
  self       IN OUT NOCOPY ANYDATA,
  c          IN VARCHAR2,
  last_elem  IN boolean DEFAULT FALSE);

```

Parameters

Table 284-8 SET* Procedure Parameters

| Parameter | Description |
|-----------|--|
| self | An ANYDATA. |
| num | The number, and associated information, that is to be set. |
| last_elem | Relevant only if ANYDATA represents a collection. Set to TRUE if it is the last element of the collection, FALSE otherwise. |

Exceptions

- DBMS_TYPES.INVALID_PARAMETERS: Invalid Parameters (if it is not appropriate to add a number at this point in the creation process).
- DBMS_TYPES.INCORRECT_USAGE: Incorrect usage.
- DBMS_TYPES.TYPE_MISMATCH: When the expected type is different from the passed in type.

Usage Notes

When `BEGINCREATE` is called, construction has already begun in a piece-wise fashion. Subsequent calls to `SET*` will set the successive attribute values.

If the `ANYDATA` is a standalone collection, the `SET*` call will set the successive collection elements.

ANYDATASET TYPE

An `ANYDATASET TYPE` contains a description of a given type plus a set of data instances of that type. An `ANYDATASET` can be persistently stored in the database if desired, or it can be used as interface parameters to communicate self-descriptive sets of data, all of which belong to a certain type.

This chapter contains the following topics:

- [Construction](#)
- [Summary of ANYDATASET TYPE Subprograms](#)

285.1 ANYDATASET TYPE Construction

The `ANYDATASET` needs to be constructed value by value, sequentially.

For each data instance (of the type of the `ANYDATASET`), the `ADDINSTANCE` function must be invoked. This adds a new data instance to the `ANYDATASET`. Subsequently, `SET*` can be called to set each value in its entirety.

The `MODE` of construction/access can be changed to attribute/collection element wise by making calls to `PIECEWISE`.

- If the type of the `ANYDATASET` is `TYPECODE_OBJECT`, individual attributes will be set with subsequent `SET*` calls. Likewise on access.
- If the type of the current data value is a collection type individual collection elements will be set with subsequent `SET*` calls. Likewise on access. This call is very similar to `ANYDATA.PIECEWISE` call defined for the type `ANYDATA`.

Note that there is no support for piece-wise construction and access of nested (not top level) attributes that are of object types or collection types.

`ENDCREATE` should be called to finish the construction process (before which no access calls can be made).

285.2 Summary of ANYDATASET TYPE Subprograms

This table lists the `ANYDATASET` Type subprograms and briefly describes them.

Table 285-1 *ANYDATASET Type Subprograms*

| Subprogram | Description |
|--|--|
| ADDINSTANCE Member Procedure | Adds a new data instance to an <code>ANYDATASET</code> . |
| BEGINCREATE Static Procedure | Creates a new <code>ANYDATASET</code> which can be used to create a set of data values of the given <code>ANYTYPE</code> . |

Table 285-1 (Cont.) ANYDATASET Type Subprograms

| Subprogram | Description |
|---|---|
| ENDCREATE Member Procedure | Ends Creation of a ANYDATASET. Other creation functions cannot be called after this call. |
| GET* Member Functions | Gets the current data value (which should be of appropriate type). |
| GETCOUNT Member Function | Gets the number of data instances in an ANYDATASET. |
| GETINSTANCE Member Function | Gets the next instance in an ANYDATASET. |
| GETTYPE Member Function | Gets the ANYTYPE describing the type of the data instances in an ANYDATASET. current data value (which should be of appropriate type). |
| GETTYPENAME Member Function | Gets the AnyType describing the type of the data instances in an ANYDATASET. |
| PIECEWISE Member Procedure | Sets the MODE of construction, access of the data value to be an attribute at a time (if the data value is of TYPECODE_OBJECT). |
| SET* Member Procedures | Sets the current data value. |

285.2.1 ADDINSTANCE Member Procedure

This procedure adds a new data instance to an ANYDATASET.

Syntax

```
MEMBER PROCEDURE AddInstance(
    self          IN OUT NOCOPY ANYDATASET);
```

Parameters

Table 285-2 ADDINSTANCE Procedure Parameter

| Parameter | Description |
|-----------|-----------------------------------|
| self | The ANYDATASET being constructed. |

Exceptions

DBMS_TYPES.invalid_parameters: Invalid parameters.
DBMS_TYPES.incorrect_usage: On incorrect usage.

Usage Notes

The data instances have to be added sequentially. The previous data instance must be fully constructed (or set to NULL) before a new one can be added.

This call DOES NOT automatically set the mode of construction to be piece-wise. The user has to explicitly call `PIECEWISE` if a piece-wise construction of the instance is intended.

285.2.2 BEGINCREATE Static Procedure

This procedure creates a new `ANYDATASET` which can be used to create a set of data values of the given `ANYTYPE`.

Syntax

```
STATIC PROCEDURE BeginCreate(
    typecode    IN PLS_INTEGER,
    rtype       IN OUT NOCOPY AnyType,
    aset        OUT NOCOPY ANYDATASET);
```

Parameters

Table 285-3 BEGINCREATE Procedure Parameter

| Parameter | Description |
|-----------|--|
| typecode | The typecode for the type of the <code>ANYDATASET</code> . |
| dtype | The type of the data values. This parameter is a must for user-defined types like <code>TYPECODE_OBJECT</code> , Collection typecodes, and similar others. |
| aset | The <code>ANYDATASET</code> being constructed. |

Exceptions

`DBMS_TYPES.invalid_parameters`: dtype is invalid (not fully constructed, and like errors.)

285.2.3 ENDCREATE Member Procedure

This procedure ends creation of a `ANYDATASET`. Other creation functions cannot be called after this call.

Syntax

```
MEMBER PROCEDURE ENDCREATE(
    self        IN OUT NOCOPY ANYDATASET);
```

Parameters

Table 285-4 ENDCREATE Procedure Parameter

| Parameter | Description |
|-----------|--|
| self | The <code>ANYDATASET</code> being constructed. |

285.2.4 GET* Member Functions

These functions get the current data value (which should be of the appropriate type).

The type of the current data value depends on the `MODE` used for accessing it (depending on how the `PIECEWISE` call is invoked). If `PIECEWISE` has not been called, the instance is

accessed in its entirety, and the type of the data value should match the type of the ANYDATASET.

If `PIECEWISE` has been called, the instance is accessed piece-wise. The type of the data value should match the type of the attribute (or collection element) at the current position.

Syntax

```
MEMBER FUNCTION GETBDOUBLE(  
    self          IN ANYDATASET,  
    dbl          OUT NOCOPY BINARY_DOUBLE)  
    RETURN PLS_INTEGER;
```

```
MEMBER FUNCTION GETBFLOAT(  
    self          IN ANYDATASET,  
    fl           OUT NOCOPY BINARY_FLOAT)  
    RETURN PLS_INTEGER;
```

```
MEMBER FUNCTION GETBFILE(  
    self          IN ANYDATASET,  
    b             OUT NOCOPY BFILE)  
    RETURN       PLS_INTEGER;
```

```
MEMBER FUNCTION GETBLOB(  
    self          IN ANYDATASET,  
    b             OUT NOCOPY BLOB)  
    RETURN       PLS_INTEGER;
```

```
MEMBER FUNCTION GETCHAR(  
    self          IN ANYDATASET,  
    c             OUT NOCOPY CHAR)  
    RETURN       PLS_INTEGER;
```

```
MEMBER FUNCTION GETCLOB(  
    self          IN ANYDATASET,  
    c             OUT NOCOPY CLOB)  
    RETURN       PLS_INTEGER;
```

```
MEMBER FUNCTION GETCOLLECTION(  
    self          IN ANYDATASET,  
    col          OUT NOCOPY "<collection_type>")  
    RETURN       PLS_INTEGER;
```

```
MEMBER FUNCTION GETDATE(  
    self          IN ANYDATASET,  
    dat          OUT NOCOPY DATE)  
    RETURN       PLS_INTEGER;
```

```
MEMBER FUNCTION GETINTERVALDS(  
    self          IN ANYDATASET,  
    inv          IN OUT NOCOPY INTERVAL DAY TO SECOND)  
    RETURN PLS_INTEGER;
```

```
MEMBER FUNCTION GETINTERVALYM(  
    self          IN ANYDATASET,  
    inv IN OUT NOCOPY INTERVAL YEAR TO MONTH)  
    RETURN PLS_INTEGER;
```

```
MEMBER FUNCTION GETNCHAR(  
    self          IN ANYDATASET,
```

```

        nc          OUT NOCOPY NCHAR)
RETURN PLS_INTEGER;

MEMBER FUNCTION GETNCLOB(
    self          IN ANYDATASET,
    nc          OUT NOCOPY NCLOB)
RETURN PLS_INTEGER;

MEMBER FUNCTION GETNUMBER(
    self          IN ANYDATASET,
    num          OUT NOCOPY NUMBER)
RETURN PLS_INTEGER;

MEMBER FUNCTION GETNVARCHAR2(
    self          IN ANYDATASET,
    nc          OUT NOCOPY NVARCHAR2)
RETURN PLS_INTEGER;

MEMBER FUNCTION GETOBJECT(
    self          IN ANYDATASET,
    obj          OUT NOCOPY "<object_type>")
RETURN PLS_INTEGER;

MEMBER FUNCTION GETRAW(
    self          IN ANYDATASET,
    r          OUT NOCOPY RAW)
RETURN PLS_INTEGER;

MEMBER FUNCTION GETREF(
    self          IN ANYDATASET,
    rf          OUT NOCOPY REF "<object_type>")
RETURN PLS_INTEGER;

MEMBER FUNCTION GETTIMESTAMP(
    self          IN ANYDATASET,
RETURN PLS_INTEGER;

MEMBER FUNCTION GETTIMESTAMPPLTZ(
    self          IN ANYDATASET,
    ts          OUT NOCOPY TIMESTAMP WITH LOCAL TIME ZONE)
RETURN PLS_INTEGER;

MEMBER FUNCTION GETTIMESTAMPPTZ(
    self          IN ANYDATASET,
    ts          OUT NOCOPY TIMESTAMP WITH TIME ZONE)
RETURN PLS_INTEGER;

MEMBER FUNCTION GETUROWID(
    self          IN ANYDATASET,
    rid          OUT NOCOPY UROWID)
RETURN PLS_INTEGER;

MEMBER FUNCTION GETVARCHAR(
    self          IN ANYDATASET,
    c          OUT NOCOPY VARCHAR)
RETURN PLS_INTEGER;

MEMBER FUNCTION GETVARCHAR2(
    self          IN ANYDATASET,
    c          OUT NOCOPY VARCHAR2)
RETURN PLS_INTEGER;

```

Parameters

Table 285-5 GET* Function Parameters

| Parameter | Description |
|-----------|--|
| self | The ANYDATASET being accessed. |
| num | The number, and associated information., that is to be obtained. |

Return Values

DBMS_TYPES.SUCCESS or DBMS_TYPES.NO_DATA

The return value is relevant only if `PIECEWISE` has been already called (for a collection). In such a case, `DBMS_TYPES.NO_DATA` signifies the end of the collection when all elements have been accessed.

Exceptions

DBMS_TYPES.INVALID_PARAMETERS: Invalid Parameters (if it is not appropriate to add a number at this point in the creation process).

DBMS_TYPES.INCORRECT_USAGE: Incorrect usage

DBMS_TYPES.TYPE_MISMATCH: When the expected type is different from the passed in type.

285.2.5 GETCOUNT Member Function

This function gets the number of data instances in an ANYDATASET.

Syntax

```
MEMBER FUNCTION GetCount(
    self          IN ANYDATASET)
RETURN          PLS_INTEGER;
```

Parameter

Table 285-6 GETCOUNT Function Parameter

| Parameter | Description |
|-----------|--------------------------------|
| self | The ANYDATASET being accessed. |

Return Values

The number of data instances.

285.2.6 GETINSTANCE Member Function

This function gets the next instance in an `ANYDATASET`. Only sequential access to the instances in an `ANYDATASET` is allowed.

After this function has been called, the `GET*` functions can be invoked on the `ANYDATASET` to access the current instance. If `PIECEWISE` is called before doing the `GET*` calls, the individual attributes (or collection elements) can be accessed.

It is an error to invoke this function before the `ANYDATASET` is fully created.

Syntax

```
MEMBER FUNCTION GETINSTANCE (
    self          IN OUT NOCOPY ANYDATASET)
RETURN          PLS_INTEGER;
```

Parameters

Table 285-7 GETINSTANCE Function Parameter

| Parameter | Description |
|-------------------|---|
| <code>self</code> | The <code>ANYDATASET</code> being accessed. |

Return Values

`DBMS_TYPES.SUCCESS` or `DBMS_TYPES.NO_DATA`

`DBMS_TYPES.NO_DATA` signifies the end of the `ANYDATASET` (all instances have been accessed).

Usage Notes

This function should be called even before accessing the first instance.

285.2.7 GETTYPE Member Function

This function gets the `AnyType` describing the type of the data instances in an `ANYDATASET`.

Syntax

```
MEMBER FUNCTION GETTYPE (
    self          IN ANYDATASET,
    typ           OUT NOCOPY AnyType)
RETURN          PLS_INTEGER;
```

Parameters

Table 285-8 GETTYPE Function Parameter

| Parameter | Description |
|-------------------|---|
| <code>self</code> | The <code>ANYDATASET</code> . |
| <code>typ</code> | The <code>ANYTYPE</code> corresponding to the <code>AnyData</code> . May be <code>NULL</code> if it does not represent a user-defined function. |

Return Values

The typecode corresponding to the type of the `ANYDATA`.

285.2.8 GETTYPENAME Member Function

This procedure gets the fully qualified type name for the `ANYDATASET`.

If the `ANYDATASET` is based on a built-in, this function will return `NUMBER` and associated information.

If it is based on a user defined type, this function will return `schema_name.type_name`. for example, `SCOTT.FOO`.

If it is based on a transient anonymous type, this function will return `NULL`.

Syntax

```
MEMBER FUNCTION GETTYPENAME (
    self          IN ANYDATASET)
RETURN          VARCHAR2;
```

Parameter

Table 285-9 GETTYPENAME Function Parameter

| Parameter | Description |
|-------------------|--|
| <code>self</code> | The <code>ANYDATASET</code> being constructed. |

Return Values

Type name of the `ANYDATASET`.

285.2.9 PIECEWISE Member Procedure

This procedure sets the `MODE` of construction, access of the data value to be an attribute at a time (if the data value is of `TYPECODE_OBJECT`).

It sets the `MODE` of construction, access of the data value to be a collection element at a time (if the data value is of a collection `TYPE`). Once this call has been made, subsequent `SET*` and `GET*` calls will sequentially obtain individual attributes or collection elements.

Syntax

```
MEMBER PROCEDURE PIECEWISE (
    self          IN OUT NOCOPY ANYDATASET);
```

Parameters

Table 285-10 PIECEWISE Procedure Parameter

| Parameter | Description |
|-----------|-----------------------------------|
| self | The ANYDATASET being constructed. |

Exceptions

DBMS_TYPES.INVALID_PARAMETERS: Invalid parameters.

DBMS_TYPES.INCORRECT_USAGE: On incorrect usage.

Usage Notes

The current data value must be of an object or collection type before this call can be made. There is no support for piece-wise construction or access of embedded object type attributes or nested collections.

285.2.10 SET* Member Procedures

This procedure sets the current data value.

The type of the current data value depends on the `MODE` with which we are constructing (depending on how we have invoked the `PIECEWISE` call). The type of the current data should be the type of the `ANYDATASET` if `PIECEWISE` has NOT been called. The type should be the type of the attribute at the current position if `PIECEWISE` has been called.

Syntax

```
MEMBER PROCEDURE SETBDOUBLE(
    self          IN OUT NOCOPY ANYDATASET,
    dbl           IN BINARY_DOUBLE,
    last_elem     IN BOOLEAN DEFAULT FALSE);

MEMBER PROCEDURE SETBFLOAT(
    self          IN OUT NOCOPY ANYDATASET,
    fl           IN BINARY_FLOAT,
    last_elem     IN BOOLEAN DEFAULT FALSE);

MEMBER PROCEDURE SETBFILE(
    self          IN OUT NOCOPY ANYDATASET,
    b             IN BFILE,
    last_elem     IN BOOLEAN DEFAULT FALSE);

MEMBER PROCEDURE SETBLOB(
    self          IN OUT NOCOPY ANYDATASET,
    b             IN BLOB,
    last_elem     IN BOOLEAN DEFAULT FALSE);

MEMBER PROCEDURE SETCHAR(
    self          IN OUT NOCOPY ANYDATASET,
    c             IN CHAR,
    last_elem     IN BOOLEAN DEFAULT FALSE);

MEMBER PROCEDURE SETCLOB(
```

```

    self          IN OUT NOCOPY ANYDATASET,
    c             IN CLOB,
    last_elem     BOOLEAN DEFAULT FALSE);

MEMBER PROCEDURE SETCOLLECTION(
    self          IN OUT NOCOPY ANYDATASET,
    col           IN "<collection_type>",
    last_elem     BOOLEAN DEFAULT FALSE);

MEMBER PROCEDURE SETDATE(
    self          IN OUT NOCOPY ANYDATASET,
    dat           IN DATE,
    last_elem     BOOLEAN DEFAULT FALSE);

MEMBER PROCEDURE SETINTERVALDS(
    self          IN OUT NOCOPY ANYDATASET,
    inv           IN INTERVAL DAY TO SECOND,
    last_elem     IN BOOLEAN DEFAULT FALSE);

MEMBER PROCEDURE SETINTERVALYM(
    self          IN OUT NOCOPY ANYDATASET,
    inv           IN INTERVAL YEAR TO MONTH,
    last_elem     IN BOOLEAN DEFAULT FALSE);

MEMBER PROCEDURE SETNCHAR(
    self          IN OUT NOCOPY ANYDATASET,
    nc           IN NCHAR,
    last_elem     IN BOOLEAN DEFAULT FALSE);

MEMBER PROCEDURE SETNCLOB(
    self          IN OUT NOCOPY ANYDATASET,
    nc           IN NCLOB,
    last_elem     IN BOOLEAN DEFAULT FALSE);

MEMBER PROCEDURE SETNUMBER(

    nc           IN NVARCHAR2,
    last_elem     IN BOOLEAN DEFAULT FALSE);

MEMBER PROCEDURE SETOBJECT(
    self          IN OUT NOCOPY ANYDATASET,
    obj          IN "<object_type>",
    last_elem     BOOLEAN DEFAULT FALSE);

MEMBER PROCEDURE SETRAW(
    self          IN OUT NOCOPY ANYDATASET,
    r            IN RAW,
    last_elem     BOOLEAN DEFAULT FALSE);

MEMBER PROCEDURE SETREF(
    self          IN OUT NOCOPY ANYDATASET,
    rf           IN REF "<object_type>",
    last_elem     BOOLEAN DEFAULT FALSE);

MEMBER PROCEDURE SETTIMESTAMP(
    self          IN OUT NOCOPY ANYDATASET,

```

```

        ts                IN TIMESTAMP,
        last_elem IN BOOLEAN DEFAULT FALSE);

MEMBER PROCEDURE SETTIMESTAMPPLTZ (
    self                IN OUT NOCOPY ANYDATASET,
    ts                IN TIMESTAMP WITH LOCAL TIME ZONE,
    last_elem          IN BOOLEAN DEFAULT FALSE);

MEMBER PROCEDURE SETTIMESTAMPPTZ (
    self                IN OUT NOCOPY ANYDATASET,
    ts                IN TIMESTAMP WITH TIME ZONE,
    last_elem          IN BOOLEAN DEFAULT FALSE);

MEMBER PROCEDURE SETUROWID (
    self                IN OUT NOCOPY ANYDATASET,
    rid                IN UROWID,
    last_elem IN BOOLEAN DEFAULT FALSE);

MEMBER PROCEDURE SETVARIABLE (
    self                IN OUT NOCOPY ANYDATASET,
    c                IN VARCHAR,
    last_elem BOOLEAN DEFAULT FALSE);

MEMBER PROCEDURE SETVARIABLE2 (
    self                IN OUT NOCOPY ANYDATASET,
    c                IN VARCHAR2,
    last_elem BOOLEAN DEFAULT FALSE);

```

Parameters

Table 285-11 SET* Procedure Parameters

| Parameter | Description |
|-----------|---|
| self | The ANYDATASET being accessed. |
| num | The number, and associated information, that is to be set. |
| last_elem | Relevant only if <code>PIECEWISE</code> has been already called (for a collection). Set to <code>TRUE</code> if it is the last element of the collection, <code>FALSE</code> otherwise. |

Exceptions

- `DBMS_TYPES.INVALID_PARAMETERS`: Invalid parameters (if it is not appropriate to add a number at this point in the creation process).
- `DBMS_TYPES.INCORRECT_USAGE`: Incorrect usage.
- `DBMS_TYPES.TYPE_MISMATCH`: When the expected type is different from the passed in type.

ANYTYPE TYPE

An `ANYTYPE TYPE` can contain a type description of any persistent SQL type, named or unnamed, including object types and collection types. It can also be used to construct new transient type descriptions.

New persistent types can only be created using the `CREATE TYPE` statement. Only new transient types can be constructed using the `ANYTYPE` interfaces.

Starting with Oracle Database 19c, the `GETANYTYPEFROMPERSISTENT` function replaces the `GETPERSISTENT` static function.

This chapter discusses the following:

- [Summary of ANYTYPE Subprograms](#)

286.1 Summary of ANYTYPE Subprograms

This table lists the `ANYTYPE` subprograms in alphabetical order and briefly describes them.

Table 286-1 *ANYTYPE Subprograms*

| Subprogram | Description |
|---|--|
| BEGINCREATE Static Procedure | Creates a new instance of <code>ANYTYPE</code> which can be used to create a transient type description. |
| SETINFO Member Procedure | Sets any additional information required for constructing a <code>COLLECTION</code> or builtin type. |
| ADDATTR Member Procedure | Adds an attribute to an <code>ANYTYPE</code> (of typecode <code>DBMS_TYPES.TYPECODE_OBJECT</code>). |
| ENDCREATE Member Procedure | Ends creation of a transient <code>ANYTYPE</code> . Other creation functions cannot be called after this call. |
| GETINFO Member Function | Gets the type information for the <code>ANYTYPE</code> . |
| GETATTRELEMINFO Member Function | Gets the type information for an attribute of the type (if it is of <code>TYPECODE_OBJECT</code>). Gets the type information for a collection's element type if the <i>self</i> parameter is of a collection type. |
| GETANYTYPEFROMPERSISTENT Function | This standalone function replaces the old static function <code>GETPERSISTENT</code> . This returns an <code>ANYTYPE</code> corresponding to a persistent type created earlier using the <code>CREATE TYPE SQL</code> statement. |

286.1.1 BEGINCREATE Static Procedure

This procedure creates a new instance of ANYTYPE which can be used to create a transient type description.

Syntax

```
STATIC PROCEDURE BEGINCREATE (
    typecode      IN          PLS_INTEGER,
    atype         OUT NOCOPY ANYTYPE);
```

Parameters

Table 286-2 BEGINCREATE Procedure Parameters

| Parameter | Description |
|-----------|--|
| typecode | Use a constant from DBMS_TYPES package. Typecodes for user-defined type: <ul style="list-style-type: none"> DBMS_TYPES.TYPECODE_OBJECT DBMS_TYPES.TYPECODE_VARRAY or DBMS_TYPES.TYPECODE_TABLE Typecodes for builtin types: <ul style="list-style-type: none"> DBMS_TYPES.TYPECODE_NUMBER, and similar types. |
| atype | ANYTYPE for a transient type |

286.1.2 SETINFO Member Procedure

This procedure sets any additional information required for constructing a COLLECTION or builtin type.

Syntax

```
MEMBER PROCEDURE SETINFO (
    self         IN OUT NOCOPY ANYTYPE,
    prec         IN PLS_INTEGER,
    scale        IN PLS_INTEGER,
    len          IN PLS_INTEGER,
    csid         IN PLS_INTEGER,
    csfrm        IN PLS_INTEGER,
    atype        IN ANYTYPE DEFAULT NULL,
    elem_tc      IN PLS_INTEGER DEFAULT NULL,
    elem_count   IN PLS_INTEGER DEFAULT 0);
```

Parameters

Table 286-3 SETINFO Procedure Parameters

| Parameter | Description |
|-----------|---|
| self | The transient ANYTYPE that is being constructed. |
| prec | Optional. Required if typecode represents a NUMBER. Give precision and scale. Ignored otherwise. |

Table 286-3 (Cont.) SETINFO Procedure Parameters

| Parameter | Description |
|-----------|--|
| scale | Optional. Required if typecode represents a NUMBER. Give precision and scale. Ignored otherwise. |
| len | Optional. Required if typecode represents a RAW, CHAR, VARCHAR, or VARCHAR2 type. Gives length. |
| csid | Required if typecode represents types requiring character information such as CHAR, VARCHAR, or VARCHAR2. |
| csfrm | Required if typecode represents types requiring character information such as CHAR, VARCHAR, or VARCHAR2. |
| atype | Optional. Required if collection element typecode is a user-defined type such as TYPECODE_OBJECT, and similar others. It is also required for a built-in type that needs user-defined type information such as TYPECODE_REF. This parameter is not needed otherwise. |

The Following Parameters Are Required For Collection Types

Table 286-4 SETINFO Procedure Parameters - Collection Types

| Parameter | Description |
|------------|--|
| elem_tc | Must be of the collection element's typecode (from DBMS_TYPES package). |
| elem_count | Pass 0 for elem_count if the self represents a nested table (TYPECODE_TABLE). Otherwise pass the collection count if self represents a VARRAY. |

Exceptions

- DBMS_TYPES.INVALID_PARAMETER: Invalid Parameters (typecode, typeinfo)
- DBMS_TYPES.INCORRECT_USAGE: Incorrect usage (cannot call after calling ENDCREATE, and similar actions.)

Usage Notes

It is an error to call this function on an ANYTYPE that represents a persistent user defined type.

286.1.3 ADDATTR Member Procedure

This procedure adds an attribute to an ANYTYPE (of typecode DBMS_TYPES.TYPECODE_OBJECT).

Syntax

```
MEMBER PROCEDURE ADDATTR(
  self      IN OUT NOCOPY ANYTYPE,
  aname     IN VARCHAR2,
  typecode  IN PLS_INTEGER,
  prec      IN PLS_INTEGER,
  scale     IN PLS_INTEGER,
  len       IN PLS_INTEGER,
```

```

csid          IN PLS_INTEGER,
csfrm         IN PLS_INTEGER,
attr_type     IN ANYTYPE DEFAULT NULL);

```

Parameters

Table 286-5 ADDATTR Procedure Parameters

| Parameter | Description |
|-----------|---|
| self | The transient ANYTYPE that is being constructed. Must be of type DBMS_TYPES.TYPECODE_OBJECT. |
| aname | Optional. Attribute's name. Could be NULL. |
| typecode | Attribute's typecode. Can be built-in or user-defined typecode (from DBMS_TYPES package). |
| prec | Optional. Required if typecode represents a NUMBER. Give precision and scale. Ignored otherwise. |
| scale | Optional. Required if typecode represents a NUMBER. Give precision and scale. Ignored otherwise. |
| len | Optional. Required if typecode represents a RAW, CHAR, VARCHAR, or VARCHAR2 type. Give length. |
| csid | Optional. Required if typecode represents a type requiring character information, such as CHAR, VARCHAR, or VARCHAR2. |
| csfrm | Optional. Required if typecode represents a type requiring character information, such as CHAR, VARCHAR, or VARCHAR2. |
| attr_type | Optional. ANYTYPE corresponding to a user-defined type. This parameter is required if the attribute is a user defined type. |

Exceptions

- DBMS_TYPES.INVALID_PARAMETERS: Invalid Parameters (typecode, typeinfo)
- DBMS_TYPES.INCORRECT_USAGE: Incorrect usage (cannot call after calling EndCreate, and similar actions.)

286.1.4 ENDCREATE Member Procedure

This procedure ends creation of a transient ANYTYPE. Other creation functions cannot be called after this call.

Syntax

```

MEMBER PROCEDURE ENDCREATE(
    self          IN OUT NOCOPY ANYTYPE);

```

Parameter

Table 286-6 ENDCREATE Procedure Parameter

| Parameter | Description |
|-----------|--|
| self | The transient ANYTYPE that is being constructed. |

286.1.5 GETINFO Member Function

This function gets the type information for the ANYTYPE.

Syntax

```
MEMBER FUNCTION GETINFO (  
    self          IN ANYTYPE,  
    prec          OUT PLS_INTEGER,  
    scale         OUT PLS_INTEGER,  
    len           OUT PLS_INTEGER,  
    csid          OUT PLS_INTEGER,  
    csfrm        OUT PLS_INTEGER,  
    schema_name  OUT VARCHAR2,  
    type_name     OUT VARCHAR2,  
    version       OUT varchar2,  
    numelems     OUT PLS_INTEGER)  
RETURN          PLS_INTEGER;
```

Parameters

Table 286-7 GETINFO Function Parameters

| Parameter | Description |
|-------------|--|
| self | The ANYTYPE. |
| prec | If typecode represents a number. Gives precision and scale. Ignored otherwise. |
| scale | If typecode represents a number. Gives precision and scale. Ignored otherwise. |
| len | If typecode represents a RAW, CHAR, VARCHAR, or VARCHAR2 type. Gives length. |
| csid | If typecode represents a type requiring character information such as: CHAR, VARCHAR, or VARCHAR2. |
| csid | If typecode represents a type requiring character information such as: CHAR, VARCHAR, or VARCHAR2. |
| schema_name | Type's schema (if persistent). |
| type_name | Type's typename. |
| version | Type's version. |
| numelems | If <i>self</i> is a TYPECODE_VARRAY, this gives the VARRAY count. If <i>self</i> is of TYPECODE_OBJECT, this gives the number of attributes. |

Return Values

The typecode of *self*.

Exceptions

- DBMS_TYPES.INVALID_PARAMETERS: Invalid Parameters (position is beyond bounds or the ANYTYPE is not properly Constructed).

286.1.6 GETATTRELEMINFO Member Function

This function gets the type information for an attribute of the type (if it is of TYPECODE_OBJECT). Gets the type information for a collection's element type if the *self* parameter is of a collection type.

Syntax

```
MEMBER FUNCTION GETATTRELEMINFO (
    self          IN ANYTYPE,
    pos           IN PLS_INTEGER,
    prec         OUT PLS_INTEGER,
    scale        OUT PLS_INTEGER,
    len          OUT PLS_INTEGER,
    csid         OUT PLS_INTEGER,
    csfrm        OUT PLS_INTEGER,
    attr_elt_type OUT ANYTYPE
    aname        OUT VARCHAR2)
RETURN         PLS_INTEGER;
```

Parameters

Table 286-8 GETATTRELEMINFO Function Parameters

| Parameter | Description |
|----------------------------|--|
| <i>self</i> | The ANYTYPE. |
| <i>pos</i> | If <i>self</i> is of TYPECODE_OBJECT, this gives the attribute position (starting at 1). It is ignored otherwise. |
| <i>prec</i> | If attribute/collection element typecode represents a NUMBER. Gives precision and scale. Ignored otherwise. |
| <i>scale</i> | If attribute/collection element typecode represents a NUMBER. Gives precision and scale. Ignored otherwise. |
| <i>len</i> | If typecode represents a RAW, CHAR, VARCHAR, or VARCHAR2 type. Gives length. |
| <i>csid</i> , <i>csfrm</i> | If typecode represents a type requiring character information such as: CHAR, VARCHAR, or VARCHAR2. Gives character set ID, character set form. |
| <i>attr_elt_type</i> | If attribute/collection element typecode represents a user-defined type, this returns the ANYTYPE corresponding to it. User can subsequently describe the <i>attr_elt_type</i> . |
| <i>aname</i> | Attribute name (if it is an attribute of an object type, NULL otherwise). |

Return Values

The typecode of the attribute or collection element.

Exceptions

DBMS_TYPES.INVALID_PARAMETERS: Invalid Parameters (position is beyond bounds or the ANYTYPE is not properly constructed).

286.1.7 GETANYTYPEFROMPERSISTENT Function

This standalone function returns an `ANYTYPE` corresponding to a persistent type created earlier using the `CREATE TYPE SQL` statement. Starting with Oracle Database 19c, the `GETANYTYPEFROMPERSISTENT` function replaces the `GETPERSISTENT` static function.

Syntax

```
GETANYTYPEFROMPERSISTENT (  
    schema_name      IN VARCHAR2,  
    type_name        IN VARCHAR2)  
RETURN               ANYTYPE;
```

Parameters

Table 286-9 GETANYTYPEFROMPERSISTENT Function Parameters

| Parameter | Description |
|--------------------------|--------------------------|
| <code>schema_name</code> | Schema name of the type. |
| <code>type_name</code> | Type name. |

Return Values

An `ANYTYPE` corresponding to a persistent type created earlier using the `CREATE TYPE SQL` statement.

Oracle Database Advanced Queuing (AQ) Types

This chapter describes the types used with Oracle Database Advanced Queuing (AQ) packages for PL/SQL, `DBMS_AQ`, and `DBMS_AQADM`.

This chapter contains the following topics:

- [Security Model](#)
- [Summary of Types](#)

See Also:

Oracle Database Advanced Queuing User's Guide for information about using Oracle Database Advanced Queuing.

287.1 Advanced Queuing (AQ) Types Security Model

`PUBLIC` is granted `EXECUTE` privilege on the types described in this chapter.

287.2 Oracle Database Advanced Queuing (AQ) Types — Summary of Types

Oracle Database Advanced Queuing (AQ) uses types to specify certain types of information.

- [AQ\\$_AGENT](#) Type
- [AQ\\$_AGENT_LIST_T](#) Type
- [AQ\\$_DESCRIPTOR](#) Type
- [AQ\\$_NTFN_DESCRIPTOR](#) Type
- [AQ\\$_NTFN_MSGID_ARRAY](#) Type
- [AQ\\$_POST_INFO](#) Type
- [AQ\\$_POST_INFO_LIST](#) Type
- [AQ\\$_PURGE_OPTIONS_T](#) Type
- [AQ\\$_RECIPIENT_LIST_T](#) Type
- [AQ\\$_REG_INFO](#) Type
- [AQ\\$_REG_INFO_LIST](#) Type
- [AQ\\$_SUBSCRIBER_LIST_T](#) Type
- [DEQUEUE_OPTIONS_T](#) Type

- ENQUEUE_OPTIONS_T Type
- QUEUE_PROPS_T Type
- SEEK_INPUT_T Type
- SEEK_OUTPUT_T Type
- SYS.MSG_PROP_T Type
- MESSAGE_PROPERTIES_T Type
- MESSAGE_PROPERTIES_ARRAY_T Type
- MSGID_ARRAY_T Type

287.2.1 AQ\$_AGENT Type

This type identifies a producer or a consumer of a message.

Syntax

```
TYPE SYS.AQ$_AGENT IS OBJECT (
  name      VARCHAR2(512),
  address   VARCHAR2(1024),
  protocol  NUMBER);
```

Attributes

Table 287-1 AQ\$_AGENT Attributes

| Attribute | Description |
|-----------|--|
| name | Name of a producer or consumer of a message. The name must follow object name guidelines in the <i>Oracle Database SQL Language Reference</i> with regard to reserved characters. |
| address | Protocol-specific address of the recipient. If the protocol is 0, then the address is of the form <code>[schema.] queue[@dblink]</code> . For example, a queue named <code>emp_messages</code> in the HR queue at the site <code>dbs1.net</code> has the address: <code>hr.emp_messages@dbs1.net</code> |
| protocol | Protocol to interpret the address and propagate the message. Protocols 1-127 are reserved for internal use. If the protocol number is in the range 128 - 255, the address of the recipient is not interpreted by Oracle Database Advanced Queuing. |

287.2.2 AQ\$_AGENT_LIST_T Type

This type identifies the list of agents for which `DBMS_AQ.LISTEN` listens.

See Also:

"AQ\$_AGENT Type"

Syntax

```
TYPE SYS.AQ$_AGENT_LIST_T IS TABLE OF SYS.AQ$_AGENT
INDEX BY BINARY_INTEGER;
```

287.2.3 AQ\$_DESCRIPTOR Type

This type specifies the Oracle Database Advanced Queuing descriptor received by the AQ PL/SQL callbacks upon notification.

**See Also:**

"MESSAGE_PROPERTIES_T Type"

Syntax

```
TYPE SYS.AQ$_DESCRIPTOR IS OBJECT (
  queue_name      VARCHAR2(261),
  consumer_name   VARCHAR2(512),
  msg_id          RAW(16),
  msg_prop        MSG_PROP_T,
  gen_desc        AQ$_NTFN_DESCRIPTOR,
  msgid_array     SYS.AQ$_NTFN_MSGID_ARRAY,
  ntfnsRecdInGrp NUMBER);
```

Attributes**Table 287-2 AQ\$_DESCRIPTOR Attributes**

| Attribute | Description |
|----------------|--|
| queue_name | Name of the queue in which the message was enqueued which resulted in the notification |
| consumer_name | Name of the consumer for the multiconsumer queue |
| msg_id | Identification number of the message |
| msg_prop | Message properties specified by the MSG_PROP_T type |
| gen_desc | Indicates the timeout specifications |
| msgid_array | Group notification message ID list |
| ntfnsRecdInGrp | Notifications received in group |

287.2.4 AQ\$_NTFN_DESCRIPTOR Type

This type is for storing a generic notification descriptor regarding PL/SQL notification flags.

Syntax

```
TYPE SYS.AQ$_NTFN_DESCRIPTOR IS OBJECT( ntfn_flags NUMBER)
```

Attributes

Table 287-3 AQ\$_NTFN_DESCRIPTOR Attributes

| Attribute | Description |
|------------|---|
| ntfn_flags | Set to 1 if the notifications are already removed after a stipulated timeout. Set 2 to denote grouping. Default is 0. |

287.2.5 AQ\$_NTFN_MSGID_ARRAY Type

This type is for storing grouping notification data for AQ namespace, value 2³⁰ which is the max varray size.

Syntax

```
TYPE SYS.AQ$_NTFN_MSGID_ARRAY AS VARRAY(1073741824) OF RAW(16);
```

287.2.6 AQ\$_POST_INFO Type

This type specifies anonymous subscriptions to which you want to post messages.

Syntax

```
TYPE SYS.AQ$_POST_INFO IS OBJECT (
    name          VARCHAR2(512),
    namespace     NUMBER,
    payload       RAW(32767));
```

Attributes

Table 287-4 AQ\$_POST_INFO Attributes

| Attribute | Description |
|-----------|---|
| name | Name of the anonymous subscription to which you want to post |
| namespace | To receive notifications from other applications through DBMS_AQ.POST or OCISubscriptionPost(), the namespace must be DBMS_AQ.NAMESPACE_ANONYMOUS |
| payload | The payload to be posted to the anonymous subscription |

287.2.7 AQ\$_POST_INFO_LIST Type

This type identifies the list of anonymous subscriptions to which you want to post messages.

 **See Also:**
[AQ\\$_POST_INFO Type](#)

Syntax

```
TYPE SYS.AQ$_POST_INFO_LIST AS VARRAY(1024) OF SYS.AQ$_POST_INFO;
```

287.2.8 AQ\$_PURGE_OPTIONS_T Type

This type specifies the options available for purging a queue table.

 **See Also:**
[PURGE_QUEUE_TABLE Procedure.](#)

Syntax

```
TYPE AQ$_PURGE_OPTIONS_T is RECORD (
    block          BOOLEAN          DEFAULT FALSE
    delivery_mode  PLS_INTEGER      DEFAULT PERSISTENT);
```

Table 287-5 AQ\$_PURGE_OPTIONS_T Type Attributes

| Attribute | Description |
|---------------|--|
| block | TRUE/FALSE. <ul style="list-style-type: none"> If block is TRUE, then an exclusive lock on all the queues in the queue table is held while purging the queue table. This will cause concurrent enqueueers and dequeuers to block while the queue table is purged. The purge call always succeeds if block is TRUE. The default for block is FALSE. This will not block enqueueers and dequeuers, but it can cause the purge to fail with an error during high concurrency times. |
| delivery_mode | Kind of messages to purge, either DBMS_AQ.BUFFERED or DBMS_AQ.PERSISTENT |

287.2.9 AQ\$_RECIPIENT_LIST_T Type

Identifies the list of agents that receive the message. This type can be used only when the queue is enabled for multiple dequeues.

 **See Also:**
"AQ\$_AGENT Type"

Syntax

```
TYPE SYS.AQ$_RECIPIENT_LIST_T IS TABLE OF SYS.AQ$_AGENT
INDEX BY BINARY_INTEGER;
```

287.2.10 AQ\$_REG_INFO Type

This type identifies a producer or a consumer of a message.

Syntax

```
TYPE SYS.AQ$_REG_INFO IS OBJECT (
    name                VARCHAR2(512),
    namespace           NUMBER,
    callback            VARCHAR2(4000),
    context             RAW(2000) DEFAULT NULL,
    anyctx              ANYDATA,
    ctxtype             NUMBER,
    payloadcbk         VARCHAR2(4000),
    timeout             NUMBER,
    ntfn_grouping_class NUMBER,
    ntfn_grouping_value NUMBER DEFAULT 600,
    ntfn_grouping_type  NUMBER,
    ntfn_grouping_start_time  TIMESTAMP(6) WITH TIME ZONE,
    ntfn_grouping_repeat_count  NUMBER);
```

Attributes

Table 287-6 AQ\$_REG_INFO Type Attributes

| Attribute | Description |
|-----------|---|
| name | Specifies the name of the subscription. The subscription name is of the form <i>schema.queue</i> if the registration is for a single consumer queue or <i>schema.queue:consumer_name</i> if the registration is for a multiconsumer queues. |

Table 287-6 (Cont.) AQ\$_REG_INFO Type Attributes

| Attribute | Description |
|---------------------|---|
| namespace | Specifies the namespace of the subscription. To receive notification from Oracle Database Advanced Queuing queues, the namespace must be <code>DBMS_AQ.NAMESPACE_AQ</code> . To receive notifications from other applications through <code>DBMS_AQ.POST</code> or <code>OCISubscriptionPost()</code> , the namespace must be <code>DBMS_AQ.NAMESPACE_ANONYMOUS</code> . |
| callback | Specifies the action to be performed on message notification. For HTTP notifications, use <code>http://www.company.com:8080</code> . For e-mail notifications, use <code>mailto://xyz@company.com</code> . For raw message payload for the <code>PLSQLCALLBACK</code> procedure, use <code>plsql://schema.procedure?PR=0</code> . For user-defined type message payload converted to XML for the <code>PLSQLCALLBACK</code> procedure, use <code>plsql://schema.procedure?PR=1</code> . |
| context | Specifies the context that is to be passed to the callback function |
| anyctx | Specifies the <code>ANYDATA</code> type context that is passed to the callback function |
| ctxtype | Specifies the context type. Valid values are 0 (<code>RAW</code>) or 1 (<code>ANYDATA</code>) |
| payloadcbk | Specifies payload for the callback function |
| timeout | Specifies the time in seconds |
| ntfn_grouping_class | Currently, only the following flag can be set to specify criterion for grouping. The default value will be 0. If <code>ntfn_grouping_class</code> is 0, all other notification grouping attributes must be 0. <ul style="list-style-type: none"> <code>NTFN_GROUPING_CLASS_TIME</code> - Notifications grouped by time, that is, the user specifies a time value and a single notification gets published at the end of that time. |
| ntfn_grouping_value | Time-period of grouping notifications specified in seconds, meaning the time after which grouping notification would be sent periodically until <code>ntfn_grouping_repeat_count</code> is exhausted. |
| ntfn_grouping_type | <ul style="list-style-type: none"> <code>NTFN_GROUPING_TYPE_SUMMARY</code> - Summary of all notifications that occurred in the time interval. (Default) <code>NTFN_GROUPING_TYPE_LAST</code> - Last notification that occurred in the interval. |

Table 287-6 (Cont.) AQ\$_REG_INFO Type Attributes

| Attribute | Description |
|----------------------------|--|
| ntfn_grouping_start_time | Notification grouping start time. Notification grouping can start from a user-specified time that should be a valid timestamp with time zone. If ntnfn_grouping_start_time is not specified when using grouping, the default is to current timestamp with time zone |
| ntfn_grouping_repeat_count | Grouping notifications will be sent as many times as specified by the notification grouping repeat count and after that revert to regular notifications. The ntnfn_grouping_repeat_count, if not specified, will default to <ul style="list-style-type: none"> • NTFN_GROUPING_FOREVER - Keep sending grouping notifications forever. |

Usage Notes

You can use the following notification mechanisms:

- OCI callback
- e-mail callback
- PL/SQL callback

[Table 287-7](#) shows the actions performed for nonpersistent queues for different notification mechanisms when RAW presentation is specified. [Table 287-8](#) shows the actions performed when XML presentation is specified.

Table 287-7 Actions Performed for Nonpersistent Queues When RAW Presentation Specified

| Queue Payload Type | OCI Callback | E-mail | PL/SQL Callback |
|--------------------|--|---------------|---|
| RAW | OCI callback receives the RAW data in the payload. | Not supported | PL/SQL callback receives the RAW data in the payload. |
| Oracle object type | Not supported | Not supported | Not supported |

Table 287-8 Actions Performed for Nonpersistent Queues When XML Presentation Specified

| Queue Payload Type | OCI Callback | E-mail | PL/SQL Callback |
|--------------------|--|--|---|
| RAW | OCI callback receives the XML data in the payload. | XML data is formatted as a SOAP message and e-mailed to the registered e-mail address. | PL/SQL callback receives the XML data in the payload. |
| Oracle object type | OCI callback receives the XML data in the payload. | XML data is formatted as a SOAP message and e-mailed to the registered e-mail address. | PL/SQL callback receives the XML data in the payload. |

287.2.11 AQ\$_REG_INFO_LIST Type

Identifies the list of registrations to a queue.

 **See Also:**
"AQ\$_REG_INFO Type"

Syntax

```
TYPE SYS.AQ$_REG_INFO_LIST AS VARRAY(1024) OF SYS.AQ$_REG_INFO;
```

287.2.12 AQ\$_SUBSCRIBER_LIST_T Type

This type identifies the list of subscribers that subscribe to a queue.

 **See Also:**
"AQ\$_AGENT Type"

Syntax

```
TYPE SYS.AQ$_SUBSCRIBER_LIST_T IS TABLE OF SYS.AQ$_AGENT  
INDEX BY BINARY_INTEGER;
```

287.2.13 DEQUEUE_OPTIONS_T Type

DEQUEUE_OPTIONS_T specifies the options available for the dequeue operation.

Syntax

```
TYPE DEQUEUE_OPTIONS_T IS RECORD (  
    consumer_name    VARCHAR2(30)    DEFAULT NULL,  
    dequeue_mode     BINARY_INTEGER  DEFAULT REMOVE,  
    navigation       BINARY_INTEGER  DEFAULT NEXT_MESSAGE,  
    visibility       BINARY_INTEGER  DEFAULT ON_COMMIT,  
    wait             BINARY_INTEGER  DEFAULT FOREVER,  
    msgid            RAW(16)         DEFAULT NULL,  
    correlation      VARCHAR2(128)   DEFAULT NULL,  
    deq_condition    VARCHAR2(4000)  DEFAULT NULL,  
    signature        aq$_sig_prop    DEFAULT NULL,  
    transformation   VARCHAR2(61)    DEFAULT NULL,  
    delivery_mode    PLS_INTEGER     DEFAULT PERSISTENT);
```

Attributes

Table 287-9 DEQUEUE_OPTIONS_T Attributes

| Attribute | Description |
|---------------|--|
| consumer_name | <p>Name of the consumer. Only those messages matching the consumer name are accessed. If a queue is not set up for multiple consumers, then this field should be set to NULL.</p> <p>For secure queues, consumer_name must be a valid AQ agent name, mapped to the database user performing the dequeue operation, through dbms_aqadm.enable_db_access procedure call.</p> |
| dequeue_mode | <p>Specifies the locking behavior associated with the dequeue. Possible settings are:</p> <p>BROWSE: Read the message without acquiring any lock on the message. This specification is equivalent to a select statement.</p> <p>LOCKED: Read and obtain a write lock on the message. The lock lasts for the duration of the transaction. This setting is equivalent to a select for update statement.</p> <p>REMOVE: Read the message and delete it. This setting is the default. The message can be retained in the queue table based on the retention properties.</p> <p>REMOVE_NODATA: Mark the message as updated or deleted. The message can be retained in the queue table based on the retention properties.</p> |
| navigation | <p>Specifies the position of the message that will be retrieved. First, the position is determined. Second, the search criterion is applied. Finally, the message is retrieved. Possible settings are:</p> <p>NEXT_MESSAGE: Retrieve the next message that is available and matches the search criteria. If the previous message belongs to a message group, then AQ retrieves the next available message that matches the search criteria and belongs to the message group. This setting is the default.</p> <p>NEXT_TRANSACTION: Skip the remainder of the current transaction group (if any) and retrieve the first message of the next transaction group. This setting can only be used if message grouping is enabled for the current queue.</p> <p>FIRST_MESSAGE: Retrieves the first message which is available and matches the search criteria. This setting resets the position to the beginning of the queue.</p> <p>FIRST_MESSAGE_MULTI_GROUP: indicates that a call to DBMS_AQ.DEQUEUE_ARRAY will reset the position to the beginning of the queue and dequeue messages (possibly across different transaction groups) that are available and match the search criteria, until reaching the ARRAY_SIZE limit. Refer to the TRANSACTION_GROUP attribute for the message to distinguish between transaction groups.</p> <p>NEXT_MESSAGE_MULTI_GROUP: indicates that a call to DBMS_AQ.DEQUEUE_ARRAY will dequeue the next set of messages (possibly across different transaction groups) that are available and match the search criteria, until reaching the ARRAY_SIZE limit. Refer to the TRANSACTION_GROUP attribute for the message to distinguish between transaction groups.</p> |

Table 287-9 (Cont.) DEQUEUE_OPTIONS_T Attributes

| Attribute | Description |
|----------------|---|
| visibility | <p>Specifies whether the new message is dequeued as part of the current transaction. The visibility parameter is ignored when using the <code>BROWSE</code> dequeue mode. Possible settings are:</p> <p><code>ON_COMMIT</code>: The dequeue will be part of the current transaction. This setting is the default.</p> <p><code>IMMEDIATE</code>: The dequeue operation is not part of the current transaction, but an autonomous transaction which commits at the end of the operation.</p> |
| wait | <p>Specifies the wait time if there is currently no message available which matches the search criteria. Possible settings are:</p> <p><code>FOREVER</code>: Wait forever. This setting is the default.</p> <p><code>NO_WAIT</code>: Do not wait.</p> <p><code>NUMBER</code>: Wait time in seconds.</p> |
| msgid | Specifies the message identifier of the message to be dequeued. |
| correlation | <p>Specifies the correlation identifier of the message to be dequeued. Special pattern matching characters, such as the percent sign (%) and the underscore (_) can be used. If more than one message satisfies the pattern, then the order of dequeuing is undetermined.</p> |
| deq_condition | <p>A conditional expression based on the message properties, the message data properties, and PL/SQL functions.</p> <p>A <code>deq_condition</code> is specified as a Boolean expression using syntax similar to the <code>WHERE</code> clause of a SQL query. This Boolean expression can include conditions on message properties, user data properties (object payloads only), and PL/SQL or SQL functions (as specified in the <code>WHERE</code> clause of a SQL query). Message properties include <code>priority</code>, <code>corrid</code> and other columns in the queue table</p> <p>To specify dequeue conditions on a message payload (object payload), use attributes of the object type in clauses. You must prefix each attribute with <code>tab.user_data</code> as a qualifier to indicate the specific column of the queue table that stores the payload. The <code>deq_condition</code> parameter cannot exceed 4000 characters. If more than one message satisfies the dequeue condition, then the order of dequeuing is undetermined.</p> |
| signature | Currently not implemented |
| transformation | Specifies a transformation that will be applied after dequeuing the message. The source type of the transformation must match the type of the queue. |
| delivery_mode | The dequeuer specifies the delivery mode of the messages it wishes to dequeue in the dequeue options. It can be <code>BUFFERED</code> or <code>PERSISTENT</code> or <code>PERSISTENT_OR_BUFFERED</code> . The message properties of the dequeued message indicate the delivery mode of the dequeued message. Array dequeue is only supported for buffered messages with an array size of '1'. |

287.2.14 ENQUEUE_OPTIONS_T Type

ENQUEUE_OPTIONS_T Type specifies the options available for the enqueue operation.

Syntax

```
TYPE SYS.ENQUEUE_OPTIONS_T IS RECORD (
  visibility          BINARY_INTEGER  DEFAULT ON_COMMIT,
  relative_msgid     RAW(16)          DEFAULT NULL,
  sequence_deviation BINARY_INTEGER  DEFAULT NULL,
  transformation      VARCHAR2(61)    DEFAULT NULL,
  delivery_mode      PLS_INTEGER     NOT NULL DEFAULT PERSISTENT);
```

Attributes

Table 287-10 ENQUEUE_OPTIONS_T Attributes

| Attribute | Description |
|--------------------|---|
| visibility | Specifies the transactional behavior of the enqueue request. Possible settings are: ON_COMMIT: The enqueue is part of the current transaction. The operation is complete when the transaction commits. This setting is the default. IMMEDIATE: The enqueue operation is not part of the current transaction, but an autonomous transaction which commits at the end of the operation. This is the only value allowed when enqueueing to a non-persistent queue. |
| relative_msgid | Specifies the message identifier of the message which is referenced in the sequence deviation operation. This field is valid only if BEFORE is specified in sequence_deviation. This parameter is ignored if sequence deviation is not specified. |
| sequence_deviation | Specifies whether the message being enqueued should be dequeued before other messages already in the queue. Possible settings are: BEFORE: The message is enqueued ahead of the message specified by relative_msgid. TOP: The message is enqueued ahead of any other messages. |
| transformation | Specifies a transformation that will be applied before enqueueing the message. The return type of the transformation function must match the type of the queue. |
| delivery_mode | The enqueuer specifies the delivery mode of the messages it wishes to enqueue in the enqueue options. It can be BUFFERED or PERSISTENT. The message properties of the enqueued message indicate the delivery mode of the enqueued message. Array enqueue is only supported for buffered messages with an array size of '1'. |

287.2.15 QUEUE_PROPS_T Type

This type specifies the Oracle Database Advanced Queuing descriptor received by the AQ PL/SQL callbacks upon notification.

Syntax

```
TYPE QUEUE_PROPS_T IS RECORD (
  retry_delay      NUMBER          DEFAULT 0,
  retention_time   NUMBER          DEFAULT 0,
  sort_list        VARCHAR2(30)    DEFAULT NULL,
  cache_hint       BINARY_INTEGER DEFAULT AUTO,
  retention_type   BINARY_INTEGER DEFAULT DBMS_AQ.DEQUEUE_TIME
);
```

Attributes

Table 287-11 QUEUE_PROPS_T Attributes

| Attribute | Description |
|----------------|--|
| retry_delay | Specifies the number of seconds after which this message is scheduled for processing again after an application rollback |
| retention_time | Specifies the number of seconds a message is retained in the queue table after being dequeued from the queue |
| sort_list | Sharded queues can be sorted by ENQ_TIME or PRIORITY, ENQ_TIME . |
| cache_hint | Specifies a hint to sharded queue whether to cache messages or not. User can specify following: <ul style="list-style-type: none"> UNCACHED: Message cache will not cache messages CACHED: Message cache will cache messages and give preference to those queues with CACHED hint. AUTO: Message cache does best effort based on available memory |
| retention_type | Specifies the type of retention. DBMS_AQ.DEQUEUE_TIME (default): The retention time starts after a subshard is dequeued by all the subscribers. If a new subscriber seeks back before or to this subshard, then the retention clock is reset. |

287.2.16 SEEK_INPUT_T Type

This type specifies the seek input per shard.

Syntax

```
TYPE SEEK_INPUT_T IS RECORD(
  shard              binary_integer DEFAULT DBMS_AQ.ALL_SHARDS,
  priority           binary_integer DEFAULT DBMS_AQ.ALL_PRIORITIES,
  seek_msgid         raw(16)        DEFAULT NULL,
  seek_time          TIMESTAMP WITH TIME ZONE DEFAULT NULL
);
```

Attributes

Table 287-12 SEEK_INPUT_T Attributes

| Attribute | Description |
|------------|---|
| shard | Shard identifier on which seek operation needs to be performed. Possible values are DBMS_AQ.ALL_SHARDS or a specific shard on which seek is to be performed If value is DBMS_AQ.ALL_SHARDS, then seek is performed on requested shards, otherwise it is performed on the specific shard mentioned in this field. |
| priority | Seek is performed on all priorities of the shard individually. If value is DBMS_AQ.ALL_PRIORITIES, then seek is performed on all priorities, otherwise it is performed on the specific priority mentioned in this field |
| seek_msgid | Input message id when seek_type is DBMS_AQ.MESSAGE. |
| seek_time | Specifies the input time when seek_type is DBMS_AQ.TIME. |

287.2.17 SEEK_OUTPUT_T Type

This type specifies the seek output of a seek call.

Syntax

```
TYPE SEEK_OUTPUT_T IS RECORD(
    shard          binary_integer,
    priority       binary_integer,
    seeked_from    raw(16),
    seeked_to      raw(16));
```

Attributes

Table 287-13 SEEK_OUTPUT_T Attributes

| Attribute | Description |
|-------------|--|
| shard | Specifies the shard identifier on which the seek operation is performed for the subscriber. |
| priority | Specifies the priority of the shard, which is applicable only for priority queues, else value is null. |
| seeked_from | Secifies the message id of dequeue position before seek. NULL value signifies seeking from end of shard. |
| seeked_to | Specifies the message id of dequeue position after seek. NULL value signifies seeking to end of shard. |

287.2.18 SYS.MSG_PROP_T Type

This type is used in PL/SQL notification, as one field in `aq$_descriptor`, to pass message properties of an AQ message to the PL/SQL notification client callback.

Syntax

```
CREATE or replace TYPE sys.msg_prop_t AS OBJECT (
  priority          NUMBER,
  delay             NUMBER,
  expiration        NUMBER,
  correlation       VARCHAR2(128),
  attempts          NUMBER,
  exception_queue   VARCHAR2(51),
  enqueue_time     DATE,
  state             NUMBER,
  sender_id         aq$_agent,
  original_msgid    RAW(16),
  delivery_mode     NUMBER);
```

Parameters

Table 287-14 SYS.MSG_PROP_T Type Attributes

| Parameter | Description |
|-------------|---|
| priority | Specifies the priority of the message. A smaller number indicates higher priority. The priority can be any number, including negative numbers. |
| delay | Specifies the delay of the enqueued message. The delay represents the number of seconds after which a message is available for dequeuing. Dequeuing by <code>msgid</code> overrides the delay specification. A message enqueued with <code>delay</code> set is in the <code>WAITING</code> state, and when the delay expires, the message goes to the <code>READY</code> state. <code>DELAY</code> processing requires the queue monitor to be started. However the queue monitor is started automatically by the system if needed. Delay is set by the producer who enqueues the message. The possible settings follow: <code>NO_DELAY</code> : The message is available for immediate dequeuing number: The number of seconds to delay the message |
| expiration | Specifies the expiration of the message. It determines, in seconds, the duration the message is available for dequeuing. This parameter is an offset from the time the message is ready for dequeue. Expiration processing requires the queue monitor to be running. However the queue monitor is started automatically by the system if needed. The possible settings follow: <code>NEVER</code> : The message does not expire number: The number of seconds message remains in <code>READY</code> state. If the message is not dequeued before it expires, then it is moved to the exception queue in the <code>EXPIRED</code> state. |
| correlation | Returns the identifier supplied by the producer of the message at enqueue time. |
| attempts | Returns the number of attempts that have been made to dequeue the message. This parameter cannot be set at enqueue time. |

Table 287-14 (Cont.) SYS.MSG_PROP_T Type Attributes

| Parameter | Description |
|-----------------|---|
| exception_queue | <p>Specifies the name of the queue into which the message is moved if it cannot be processed successfully.</p> <p>Messages are moved automatically into the exception queue. Messages are moved into the exception queue in the following cases:</p> <ul style="list-style-type: none"> • <code>RETRY_COUNT</code>, the number of unsuccessful dequeue attempts, has exceeded the specification for the <code>MAX_RETRIES</code> parameter in the <code>DBMS_AQADM.CREATE_QUEUE</code> procedure during queue creation. <p>For multiconsumer queues, the message becomes eligible to be moved to the exception queue even if failed dequeue attempts exceeds the <code>MAX_RETRIES</code> parameter for only one of the consumers. But the message will not be moved until either all other consumers have successfully consumed the message or failed more than <code>MAX_RETRIES</code>. You can view <code>MAX_RETRIES</code> for a queue in the <code>ALL_QUEUES</code> data dictionary view.</p> <p>If a dequeue transaction fails because the server process dies (including <code>ALTER SYSTEM KILL SESSION</code>) or <code>SHUTDOWN ABORT</code> on the instance, then <code>RETRY_COUNT</code> is not incremented.</p> <ul style="list-style-type: none"> • A message was not dequeued before the expiration time elapsed. • Message propagation to the specified destination queue failed with one of the following errors: <ul style="list-style-type: none"> * There were no recipients for the multiconsumer destination queue. * Recipients were specified for a single-consumer destination queue. * Destination queue was an exception queue * There was an error when applying transformation. <p>The default is the exception queue associated with the queue table. If the exception queue specified does not exist at the time of the move, then the message is moved to the default exception queue associated with the queue table, and a warning is logged in the alert log. If the default exception queue is specified, then the parameter returns a <code>NULL</code> value at dequeue time.</p> |
| enqueue_time | <p>Specifies the time the message was enqueued. This value is determined by the system and cannot be set by the user at enqueue time.</p> |
| state | <p>Specifies the state of the message at the time of the dequeue. This parameter cannot be set at enqueue time. The possible states follow:</p> <ul style="list-style-type: none"> • <code>DBMS_AQ.READY</code>: The message is ready to be processed. • <code>DBMS_AQ.WAITING</code>: The message delay has not yet been reached. • <code>DBMS_AQ.PROCESSED</code>: The message has been processed and is retained. • <code>DBMSAQ.EXPIRED</code>: The message has been moved to the exception queue. |

Table 287-14 (Cont.) SYS.MSG_PROP_T Type Attributes

| Parameter | Description |
|----------------|--|
| sender_id | The application-sender identification specified at enqueue time by the message producer. Sender id is of type aq\$_agent. Sender name is required for secure queues at enqueue time. This must be a valid AQ agent name, mapped to the database user performing the enqueue operation, through dbms_aqadm.enable_db_access procedure call. Sender address and protocol should not be specified. The Sender id in the message properties returned at dequeue time may have a sender address if the message was propagated from another queue. The value of the address is the source_queue, source database name if it was a remote database [format source_queue@source_database_name] |
| original_msgid | This parameter is used by Oracle Database Advanced Queuing for propagating messages. |
| delivery_mode | DBMS_AQ.BUFFERED or DBMS_AQ.PERSISTENT. |

287.2.19 MESSAGE_PROPERTIES_T Type

This type is defined inside the DBMS_AQ package, and describes the information that AQ uses to convey the state of individual messages. These are set at enqueue time, and their values are returned at dequeue time.

See Also:

[AQ\\$_RECIPIENT_LIST_T Type](#)

Syntax

```
TYPE message_properties_t IS RECORD (
    priority          BINARY_INTEGER NOT NULL DEFAULT 1,
    delay            BINARY_INTEGER NOT NULL DEFAULT NO_DELAY,
    expiration       BINARY_INTEGER NOT NULL DEFAULT NEVER,
    correlation      VARCHAR2(128)   DEFAULT NULL,
    attempts         BINARY_INTEGER,
    recipient_list   AQ$_RECIPIENT_LIST_T,
    exception_queue  VARCHAR2(61)   DEFAULT NULL,
    enqueue_time     DATE,
    state            BINARY_INTEGER,
    sender_id        SYS.AQ$_AGENT   DEFAULT NULL,
    original_msgid   RAW(16)         DEFAULT NULL,
    signature        aq$_sig_prop    DEFAULT NULL,
    transaction_group VARCHAR2(30)   DEFAULT NULL,
    user_property    SYS.ANYDATA     DEFAULT NULL,
    delivery_mode    PLS_INTEGER     NOT NULL DEFAULT DBMS_AQ.PERSISTENT);
```

Attributes

Table 287-15 MESSAGE_PROPERTIES_T Attributes

| Attribute | Description |
|----------------|---|
| priority | Specifies the priority of the message. A smaller number indicates higher priority. The priority can be any number, including negative numbers. |
| delay | <p>Specifies the delay of the enqueued message. The delay represents the number of seconds after which a message is available for dequeuing. Dequeuing by <code>msgid</code> overrides the delay specification. A message enqueued with <code>delay</code> set is in the <code>WAITING</code> state, and when the delay expires, the message goes to the <code>READY</code> state. <code>DELAY</code> processing requires the queue monitor to be started. However the queue monitor is started automatically by the system if needed. Delay is set by the producer who enqueues the message.</p> <p>The possible settings follow:</p> <p><code>NO_DELAY</code>: The message is available for immediate dequeuing</p> <p>number: The number of seconds to delay the message</p> |
| expiration | <p>Specifies the expiration of the message. It determines, in seconds, the duration the message is available for dequeuing. This parameter is an offset from the time the message is ready for dequeue. Expiration processing requires the queue monitor to be running. However the queue monitor is started automatically by the system if needed.</p> <p>The possible settings follow:</p> <p><code>NEVER</code>: The message does not expire</p> <p>number: The number of seconds message remains in <code>READY</code> state. If the message is not dequeued before it expires, then it is moved to the exception queue in the <code>EXPIRED</code> state.</p> |
| correlation | Returns the identifier supplied by the producer of the message at enqueue time. |
| attempts | Returns the number of attempts that have been made to dequeue the message. This parameter cannot be set at enqueue time. |
| recipient_list | <p>This parameter is only valid for queues that allow multiple consumers. The default recipients are the queue subscribers. This parameter is not returned to a consumer at dequeue time.</p> <p>For type definition, see the "AQ\$_AGENT Type".</p> |

Table 287-15 (Cont.) MESSAGE_PROPERTIES_T Attributes

| Attribute | Description |
|-----------------|--|
| exception_queue | <p>Specifies the name of the queue into which the message is moved if it cannot be processed successfully.</p> <p>Messages are moved automatically into the exception queue. Messages are moved into the exception queue in the following cases:</p> <ul style="list-style-type: none"> RETRY_COUNT, the number of unsuccessful dequeue attempts, has exceeded the specification for the MAX_RETRIES parameter in the DBMS_AQADM.CREATE_QUEUE procedure during queue creation. <p>For multiconsumer queues, the message becomes eligible to be moved to the exception queue even if failed dequeue attempts exceeds the MAX_RETRIES parameter for only one of the consumers. But the message will not be moved until either all other consumers have successfully consumed the message or failed more than MAX_RETRIES. You can view MAX_RETRIES for a queue in the ALL_QUEUES data dictionary view.</p> <p>If a dequeue transaction fails because the server process dies (including ALTER SYSTEM KILL SESSION) or SHUTDOWN ABORT on the instance, then RETRY_COUNT is not incremented.</p> <ul style="list-style-type: none"> A message was not dequeued before the expiration time elapsed. Message propagation to the specified destination queue failed with one of the following errors: <ul style="list-style-type: none"> * There were no recipients for the multiconsumer destination queue. * Recipients were specified for a single-consumer destination queue. * Destination queue was an exception queue * There was an error when applying transformation. <p>The default is the exception queue associated with the queue table. If the exception queue specified does not exist at the time of the move, then the message is moved to the default exception queue associated with the queue table, and a warning is logged in the alert log. If the default exception queue is specified, then the parameter returns a NULL value at dequeue time.</p> |
| enqueue_time | <p>The enqueue_time attribute specifies the time the message was enqueued. This value is always in Universal Coordinated Time (UTC), and is determined by the system and cannot be set by the user at enqueue time.</p> |
| state | <p>Specifies the state of the message at the time of the dequeue. This parameter cannot be set at enqueue time. The possible states follow:</p> <ul style="list-style-type: none"> DBMS_AQ.READY: The message is ready to be processed. DBMS_AQ.WAITING: The message delay has not yet been reached. DBMS_AQ.PROCESSED: The message has been processed and is retained. DBMSAQ.EXPIRED: The message has been moved to the exception queue. |

Table 287-15 (Cont.) MESSAGE_PROPERTIES_T Attributes

| Attribute | Description |
|-------------------|--|
| sender_id | The application-sender identification specified at enqueue time by the message producer. Sender id is of type aq\$_agent. Sender name is required for secure queues at enqueue time. This must be a valid AQ agent name, mapped to the database user performing the enqueue operation, through dbms_aqadm.enable_db_access procedure call. Sender address and protocol should not be specified. The Sender id in the message properties returned at dequeue time may have a sender address if the message was propagated from another queue. The value of the address is the source_queue, source database name if it was a remote database [format source_queue@source_database_name] |
| original_msgid | This parameter is used by Oracle Database Advanced Queuing for propagating messages. |
| signature | Currently not implemented |
| transaction_group | Specifies the transaction_group for the dequeued message. Messages belonging to the same transaction group will have the same value for this attribute. This attribute is only set by the DBMS_AQ.DEQUEUE_ARRAY. This attribute cannot be used to set the transaction group of a message through DBMS_AQ.ENQUEUE or DBMS_AQ.ENQUEUE_ARRAY calls. |
| user_property | This optional attribute is used to store additional information about the payload. |
| delivery_mode | The message publisher specifies the delivery mode in the message_properties. This can be DBMS_AQ.BUFFERED or DBMS_AQ.PERSISTENT. Array enqueue is only supported for buffered messages with an array size of '1'. |

287.2.20 MESSAGE_PROPERTIES_ARRAY_T Type

This type is used by dbms_aq.enqueue_array and dbms_aq.dequeue_array calls to hold the set of message properties.

Each element in the payload_array should have a corresponding element in the MESSAGE_PROPERTIES_ARRAY_T VARRAY.

See Also:

["MESSAGE_PROPERTIES_T Type"](#)

Syntax

```
TYPE MESSAGE_PROPERTIES_ARRAY_T IS VARRAY (2147483647)
OF MESSAGE_PROPERTIES_T;
```

287.2.21 MSGID_ARRAY_T Type

The `msgid_array_t` type is used in `dbms_aq.enqueue_array` and `dbms_aq.dequeue_array` calls to hold the set of message IDs that correspond to the enqueued or dequeued messages.

Syntax

```
TYPE MSGID_ARRAY_T IS TABLE OF RAW(16) INDEX BY BINARY_INTEGER
```

DBFS Content Interface Types

DBFS Content Interface Types are public types that support the `DBMS_DBFS_CONTENT` interface.

This chapter contains the following topics:

- [Overview](#)
- [Security Model](#)
- [Data Structures](#)

Related Topics

- [DBMS_DBFS_CONTENT](#)
The `DBMS_DBFS_CONTENT` package provides an interface comprising a file system-like abstraction backed by one or more Store Providers.

288.1 DDBFS Content Interface Types Overview

The type definitions described in this chapter support the `DBMS_DBFS_CONTENT` interface in implementing metadata tables, packages, views, dependent application-side entities, and service-provider entities.

288.2 DBFS Content Interface Types Security Model

The user can access the content operational and administrative interfaces (packages, types, tables, and so on) with the `DBFS_ROLE`. This role can be granted to users as needed.

288.3 DBFS Content Interface Types —Data Structures

Types that support the `DBMS_DBFS_CONTENT` interface include both Object and Table types.

Object Types

- [DBMS_DBFS_CONTENT_CONTEXT_T](#) Object Type
- [DBMS_DBFS_CONTENT_LIST_ITEM_T](#) Object Type
- [DBMS_DBFS_CONTENT_PROPERTY_T](#) Object Type

Table Types

- [DBMS_DBFS_CONTENT_LIST_ITEMS_T](#) Table Type
- [DBMS_DBFS_CONTENT_PROPERTIES_T](#) Table Type
- [DBMS_DBFS_CONTENT_RAW_T](#) Table Type

288.3.1 DBMS_DBFS_CONTENT_CONTEXT_T Object Type

This type describes the execution context for the providers. It provides the user performing the operation with the Access Control List, the owner of the item(s), a timestamp for doing `asof` queries, and whether or not the item(s) are `read_only`. This type can be used both as input, in the case of path item creation functions, and output, in the case of path item query, or both.

Syntax

```
CREATE OR REPLACE TYPE dbms_dbfs_content_context_t
  AUTHID DEFINER
AS OBJECT (
  principal    VARCHAR2(32),
  acl          VARCHAR2(1024),
  owner        VARCHAR2(32),
  asof         TIMESTAMP,
  read_only    INTEGER);
```

Fields

Table 288-1 DBMS_DBFS_CONTENT_CONTEXT_T Fields

| Field | Description |
|------------------------|---------------------------------------|
| <code>principal</code> | File system user |
| <code>acl</code> | Access control list |
| <code>owner</code> | Path item owner |
| <code>asof</code> | Timestamp |
| <code>read_only</code> | Nonzero if the path item is read-only |

288.3.2 DBMS_DBFS_CONTENT_LIST_ITEM_T Object Type

This type describes a type to assist in listing the contents of a directory.

Syntax

```
CREATE OR REPLACE TYPE dbms_dbfs_content_list_item_t
  AUTHID DEFINER
AS OBJECT (
  path          VARCHAR2(1024),
  item_name     VARCHAR2(256),
  item_type     INTEGER);
```

Fields

Table 288-2 DBMS_DBFS_CONTENT_LIST_ITEM_T Fields

| Field | Description |
|------------------------|-----------------------|
| <code>path</code> | Path to the path item |
| <code>item_name</code> | Name of the path item |

Table 288-2 (Cont.) DBMS_DBFS_CONTENT_LIST_ITEM_T Fields

| Field | Description |
|-----------|--|
| item_type | Type of path item. (See Table 57-4) |

288.3.3 DBMS_DBFS_CONTENT_PROPERTY_T Object Type

This type describes a single (name, value, typecode) property tuple. All properties (standard, optional, and user-defined) are described using such tuples.

The type is used by both the client-facing interfaces and by store providers for the DBMS_DBFS_CONTENT interface.

Syntax

```
CREATE OR REPLACE TYPE dbms_dbfs_content_property_t
  AUTHID DEFINER
AS OBJECT (
  propname      VARCHAR2(32),
  propvalue     VARCHAR2(1024),
  typecode      INTEGER);
```

Fields

Table 288-3 DBMS_DBFS_CONTENT_PROPERTY_T Fields

| Field | Description |
|------------|---|
| prop_name | Name of property |
| prop_value | Value of property |
| typecode | Property type (See Constants in DBMS_TYPES) |

288.3.4 DBMS_DBFS_CONTENT_LIST_ITEMS_T Table Type

This type is a variable-sized array of DBMS_DBFS_CONTENT_LIST_ITEM_T Object Type. It is used by both the client-facing interfaces and by store providers for the DBMS_DBFS_CONTENT interface.

Syntax

```
CREATE OR REPLACE TYPE dbms_dbfs_content_list_items_t AS
  TABLE OF dbms_dbfs_content_list_item_t;
```

This type describes a single (name, value, typecode) property tuple. All properties (standard, optional, and user-defined) are described using such tuples.

288.3.6 DBMS_DBFS_CONTENT_RAW_T Table Type

This type is an array of `RAW`. It is to enable `RAW` data transport for batch interfaces in the `DBMS_DBFS_CONTENT` interface.

Syntax

```
CREATE OR REPLACE TYPE dbms_dbfs_content_raw_t AS
  TABLE OF RAW(32767);
```

The `DBMS_DBFS_CONTENT` package provides an interface comprising a file system-like abstraction backed by one or more Store Providers.

Database URI TYPEs

Oracle supports the `UriType` family of types that can be used to store and query Uri-refs inside the database. The `UriType` itself is an abstract object type and the `HTTPURITYPE`, `XDBURITYPE` and `DBURITYPE` are subtypes of it.

You can create a `UriType` column and store instances of the `DBURITYPE`, `XDBURITYPE` or the `HTTPURITYPE` inside of it. You can also define your own subtypes of the `UriType` to handle different URL protocols.

Oracle also provides a `UriFactory` package that can be used as a factory method to automatically generate various instances of these `UriTypes` by scanning the prefix, such as `http://` or `/oradb`. You can also register your subtype and provide the prefix that you support. For instance, if you have written a subtype to handle the gopher protocol, you can register the prefix `gopher://` to be handled by your subtype. The `UriFactory` will then generate your subtype instance for any URL starting with that prefix.

This chapter contains the following topics:

289.1 Summary of URITYPE Supertype Subprograms

The `UriType` is the abstract super type. It provides a standard set of functions to get the value pointed to by the URI. The actual implementation of the protocol must be defined by the subtypes of this type.

Instances of this type cannot be created directly. However, you can create columns of this type and store subtype instances in it, and also select from columns without knowing the instance of the URL stored.

Table 289-1 URITYPE Type Subprograms

| Method | Description |
|----------------------|--|
| <code>GETBLOB</code> | Returns the <code>BLOB</code> located at the address specified by the URL. |

Table 289-1 (Cont.) URITYPE Type Subprograms

| Method | Description |
|--------------------------------|---|
| GETCLOB | Returns the CLOB located at the address specified by the URL. |
| GETCONTENTTYPE | Returns the URL, in escaped format, stored inside the UriType instance. |
| GETEXTERNALURL | Returns the URL, in escaped format, stored inside the UriType instance. |
| GETURL | Returns the URL, in non-escaped format, stored inside the UriType instance. |
| GETXML | Returns the XMLType located at the address specified by the URL. |

289.1.1 UriType Supertype GETBLOB

This function returns the BLOB located at the address specified by the URL.

This function can be overridden in the subtype instances. The options are described below.

This function returns the BLOB located at the address specified by the URL.

Syntax

```
MEMBER FUNCTION getBlob()
    RETURN BLOB;
```

This function returns the BLOB located at the address specified by the URL and the content type.

Syntax

```
MEMBER FUNCTION getBlob(content OUT VARCHAR2)
    RETURN BLOB;
```

This function returns the BLOB located at the address specified by the URL in the specified character set.

Syntax

```
FUNCTION getBlob(csid IN NUMBER)
    RETURN BLOB;
```

Table 289-2 UriType Supertype GETBLOB Parameters

| Parameter | IN / OUT | Description |
|-----------|----------|--|
| content | (OUT) | Content type of the document to which URI is pointing. |
| csid | (IN) | Character set id of the document. Must be a valid Oracle id and greater than 0; otherwise returns an error |

289.1.2 UriType Supertype GETCLOB

This function returns the CLOB located at the address specified by the URL.

This function can be overridden in the subtype instances. This function returns either a permanent CLOB or a temporary CLOB. If a temporary CLOB is returned, it must be freed. The options are described below.

This function returns the CLOB located at the address specified by the URL.

Syntax

```
MEMBER FUNCTION getClob()  
    RETURN CLOB;
```

This function returns the CLOB located at the address specified by the URL and the content type.

Syntax

```
MEMBER FUNCTION getClob(content OUT VARCHAR2)  
    RETURN CLOB;
```

Table 289-3 UriType Supertype GETCLOB Parameters

| Parameter | IN / OUT | Description |
|-----------|----------|--|
| content | (OUT) | Content type of the document to which URI is pointing. |

289.1.3 UriType Supertype GETCONTENTTYPE

This function returns the content type of the document pointed to by the URI.

This function can be overridden in the subtype instances. This function returns the content type as VARCHAR2.

Syntax

```
MEMBER FUNCTION getContentType()  
    RETURN VARCHAR2;
```

289.1.4 UriType Supertype GETEXTERNALURL

This function returns the URL, in escaped format, stored inside the UriType instance.

The subtype instances override this member function to provide additional semantics. For instance, the HTTPURITYPE function does not store the prefix `http://` in the URL itself. When generating the external URL, it appends the prefix and generates it. For this reason, use the `getExternalUrl` function or the `getUrl` function to get to the URL value instead of using the attribute present in the UriType instance.

Syntax

```
MEMBER FUNCTION getExternalUrl()  
    RETURN varchar2;
```

289.1.5 UriType Supertype GETURL

This function returns the URL, in non-escaped format, stored inside the `UriType` instance.

The subtype instances override this member function to provide additional semantics. For instance, the `HTTPURITYPE` function does not store the prefix `http://` in the URL itself. When generating the external URL, it appends the prefix and generates it. For this reason, use the `getExternalUrl` function or the `getUrl` function to get to the URL value instead of using the attribute present in the `UriType` instance.

Syntax

```
MEMBER FUNCTION getUrl()
RETURN varchar2;
```

289.1.6 UriType Supertype GETXML

This function returns the `XMLType` located at the address specified by the URL.

This function can be overridden in the subtype instances. The options are described below.

This function returns the `XMLType` located at the address specified by the URL.

Syntax

```
MEMBER FUNCTION getXML()
RETURN XMLType;
```

This function returns the `XMLType` located at the address specified by the URL and the content type.

Syntax

```
MEMBER FUNCTION getXML(content OUT VARCHAR2)
RETURN XMLType;
```

Table 289-4 UriType Supertype GETXML Parameters

| Parameter | IN / OUT | Description |
|-----------|----------|--|
| content | (OUT) | Content type of the document to which URI is pointing. |

289.2 Summary of HTTPURITYPE Subtype Subprograms

The `HTTPURITYPE` is a subtype of the `UriType` that provides support for the HTTP protocol. This uses the `UTL_HTTP` package underneath to access the HTTP URLs. Proxy and secure wallets are not supported in this release.

Table 289-5 HTTPURITYPE Type Subprorgams

| Method | Description |
|--------------------------------|--|
| CREATEURI | Creates an instance of <code>HTTPURITYPE</code> from the given URI. |
| GETBLOB | Returns the <code>BLOB</code> located at the address specified by the URL. |
| GETCLOB | Returns the <code>CLOB</code> located at the address specified by the URL. |
| GETCONTENTTYPE | Returns the content type of the document pointed to by the URI. |
| GETEXTERNALURL | Returns the URL, in escaped format, stored inside the <code>UriType</code> instance. |
| GETURL | Returns the URL, in non-escaped format, stored inside the <code>UriType</code> instance. |
| GETXML | Returns the <code>XMLType</code> located at the address specified by the URL. |
| HTTPURITYPE | Creates an instance of <code>HTTPURITYPE</code> from the given URI. |

289.2.1 HttpUriType Subtype CREATEURI

This static function constructs a `HTTPURITYPE` instance. The `HTTPURITYPE` instance does not contain the prefix `http://` in the stored URL.

Syntax

```
STATIC FUNCTION createUri(
    url IN varchar2)
RETURN HTTPURITYPE;
```

Table 289-6 HttpUriType Subtype CREATEURI Parameters

| Parameter | IN / OUT | Description |
|------------------|----------|---|
| <code>url</code> | (IN) | The URL string containing a valid HTTP URL; escaped format. |

289.2.2 HttpUriType Subtype GETBLOB

This function returns the `BLOB` located at the address specified by the HTTP URL.

The subprograms of the URI Subtype `HTTPURITYPE` member subprogram `GETBLOB` are described below.

This function returns the `BLOB` located at the address specified by the HTTP URL.

Syntax

```
MEMBER FUNCTION getBlob()
RETURN BLOB;
```

This function returns the `BLOB` located at the address specified by the HTTP URL and the content type.

Syntax

```
MEMBER FUNCTION getBlob(content OUT VARCHAR2)
  RETURN BLOB;
```

This function returns the `BLOB` located at the address specified by the URL in the specified character set.

Syntax

```
FUNCTION getBlob(csid IN NUMBER)
  RETURN BLOB;
```

Table 289-7 HttpUriType Subtype GETBLOB Parameters

| Parameter | IN / OUT | Description |
|-----------|----------|---|
| content | (OUT) | Content type of the document to which URI is pointing. |
| csid | (IN) | Character set id of the document. Must be a valid Oracle id and greater than 0; otherwise returns an error. |

289.2.3 HttpUriType Subtype GETCLOB

This function returns the `CLOB` located by the HTTP URL address. If a temporary `CLOB` is returned, it must be freed.

The subprograms of the URI Subtype HTTPURITYPE member subprogram GETCLOB are described below.

Returns the `CLOB` located at the address specified by the HTTP URL.

Syntax

```
MEMBER FUNCTION getClob()
  RETURN CLOB;
```

Returns the `CLOB` located at the address specified by the HTTP URL and the content type.

Syntax

```
MEMBER FUNCTION getClob(content OUT VARCHAR2)
  RETURN CLOB;
```

Table 289-8 HttpUriType Subtype GETCLOB Parameters

| Parameter | IN / OUT | Description |
|-----------|----------|--|
| content | (OUT) | Content type of the document to which URI is pointing. |

289.2.4 HttpUriType Subtype GETCONTENTTYPE

This function returns the content type of the document pointed to by the URI.

Syntax

```
MEMBER FUNCTION getContentTypes()  
RETURN VARCHAR2;
```

289.2.5 HttpUriType Subtype GETEXTERNALURL

This function returns the URL, in escaped format, stored inside the HTTPURITYPE instance. The subtype instances override this member function.

The HTTPURITYPE function does not store the prefix `http://`, but generates it for the external URL.

Syntax

```
MEMBER FUNCTION getExternalUrl()  
RETURN varchar2;
```

289.2.6 HttpUriType Subtype GETURL

This function returns the URL, in non-escaped format, stored inside the HTTPURITYPE instance.

Syntax

```
MEMBER FUNCTION getUrl()  
RETURN varchar2;
```

289.2.7 HttpUriType Subtype GETXML

This function returns the XMLType located at the address specified by the URL. An error is thrown if the address does not point to a valid XML document.

The subprograms of the URI Subtype HttpUriType member subprogram GETXML are described below.

This function returns the XMLType located at the address specified by the URL.

Syntax

```
MEMBER FUNCTION getXML()  
RETURN XMLType;
```

This function returns the XMLType located at the address specified by the URL and the content type.

Syntax

```
MEMBER FUNCTION getXML(content OUT VARCHAR2)  
RETURN XMLType;
```

Table 289-9 HttpUriType Subtype GETXML Parameters

| Parameter | IN / OUT | Description |
|-----------|----------|--|
| content | (OUT) | Content type of the document to which URI is pointing. |

289.2.8 HttpUriType Subtype HTTPURITYPE

This constructs a `HTTPURITYPE` instance. The `HTTPURITYPE` instance does not contain the prefix `http://` in the stored URL.

Syntax

```
CONSTRUCTOR FUNCTION HTTPURITYPE (
    url IN VARCHAR2);
```

Table 289-10 HttpUriType Subtype HTTPURITYPE Parameters

| Parameter | IN / OUT | Description |
|-----------|----------|--|
| url | (IN) | The URL string containing a valid HTTP URL. The URL string is expected in escaped format. For example, non-url characters are represented as the hexadecimal value for the UTF-8 encoding of those characters. |

289.3 Summary of DBURITYPE Subtype Subprograms

The `DBURITYPE` is a subtype of the `UriType` that provides support for `DBUri-refs`. A `DBUri-ref` is an intra-database URL that can be used to reference any row or row-column data in the database.

The URL is specified as an XPath expression over a XML visualization of the database. The schemas become elements which contain tables and views. These tables and views further contain the rows and columns inside them.

Table 289-11 DBURITYPE Type Subprograms

| Method | Description |
|-----------------------------|--|
| <code>CREATEURI</code> | Constructs a <code>DBURITYPE</code> instance. |
| <code>DBURITYPE</code> | Creates an instance of <code>DBURITYPE</code> from the given URI. |
| <code>GETBLOB</code> | Returns the <code>BLOB</code> located at the address specified by the <code>DBURITYPE</code> instance. |
| <code>GETCLOB</code> | Returns the <code>CLOB</code> located at the address specified by the <code>DBURITYPE</code> instance. |
| <code>GETCONTENTTYPE</code> | Returns the content type of the document pointed to by the URI. |
| <code>GETEXTERNALURL</code> | Returns the URL, in escaped format, stored inside the <code>DBURITYPE</code> instance. |
| <code>GETURL</code> | Returns the URL, in non-escaped format, stored inside the <code>DBURITYPE</code> instance. |

Table 289-11 (Cont.) DBURITYPE Type Subprograms

| Method | Description |
|------------------------|--|
| GETXML | Returns the <code>XMLType</code> located at the address specified by the URL |

289.3.1 DBUriType Subtype CREATEURI

This static function constructs a `DBURITYPE` instance. Parses the URL given and creates a `DBURITYPE` instance.

Syntax

```
STATIC FUNCTION createUri(
    url IN varchar2)
RETURN DBURITYPE;
```

Table 289-12 DBUriType Subtype CREATEURI Parameters

| Parameter | IN / OUT | Description |
|------------------|----------|--|
| <code>url</code> | (IN) | The URL string, in escaped format, containing a valid <code>DBURITYPE</code> . |

289.3.2 DBUriType Subtype DBURITYPE

This constructs a `DBURITYPE` instance.

Syntax

```
CONSTRUCTOR FUNCTION DBURITYPE(
    url IN varchar2);
```

Table 289-13 DBUriType Subtype DBURITYPE Parameters

| Parameter | IN / OUT | Description |
|------------------|----------|---|
| <code>url</code> | (IN) | The URL string containing a valid <code>DBURITYPE</code> . The URL string is expected in escaped format. For example, non-URL characters are represented as the hexadecimal value for the UTF-8 encoding of those characters. |

289.3.3 DBUriType Subtype GETBLOB

This function returns the `BLOB` located at the address specified by the URL.

The subprograms of the URI Subtype `DBURITYPE` member subprogram `GETBLOB` are described below. The options are described in the following table.

This function returns the `BLOB` located at the address specified by the URL.

Syntax

```
MEMBER FUNCTION getBlob()
    RETURN BLOB;
```

This function returns the `BLOB` located at the address specified by the URL and the content type.

Syntax

```
MEMBER FUNCTION getBlob(content OUT VARCHAR2)
    RETURN BLOB;
```

This function returns the `BLOB` located at the address specified by the URL in the specified character set.

Syntax

```
FUNCTION getBlob(csid IN NUMBER)
    RETURN BLOB;
```

Table 289-14 DBUriType Subtype GETBLOB Parameters

| Parameter | IN / OUT | Description |
|-----------|----------|---|
| content | (OUT) | Content type of the document to which URI is pointing. |
| csid | (IN) | Character set id of the document. Must be a valid Oracle id and greater than 0; otherwise returns an error. |

289.3.4 DBUriType Subtype GETCLOB

This function returns the `CLOB` located at the address specified by the `DBURITYPE` instance.

If a temporary `CLOB` is returned, it must be freed. The document returned may be an XML document or a text document. When the `DBUri-ref` identifies an element in the XPath, the result is a well-formed XML document. On the other hand, if it identifies a text node, then what is returned is only the text content of the column or attribute. The options are described below.

The following function returns the `CLOB` located at the address specified by the `DBURITYPE` instance.

Syntax

```
MEMBER FUNCTION getClob()
    RETURN CLOB;
```

The following function returns the `CLOB` located at the address specified by the `DBURITYPE` instance and the content type.

Syntax

```
MEMBER FUNCTION getClob(content OUT VARCHAR2)
    RETURN CLOB;
```

Table 289-15 DBUriType Subtype GETCLOB Parameters

| Parameter | IN / OUT | Description |
|-----------|----------|--|
| content | (OUT) | Content type of the document to which URI is pointing. |

289.3.5 DBUriType Subtype GETCONTENTTYPE

This function returns the content type of the document pointed to by the URI.

Syntax

```
MEMBER FUNCTION getContentType()  
RETURN VARCHAR2;
```

289.3.6 DBUriType Subtype GETEXTERNALURL

This function returns the URL, in escaped format, stored inside the `DBURITYPE` instance. The `DBUri` servlet URL that processes the `DBURITYPE` has to be appended before using the escaped URL in Web pages.

Syntax

```
MEMBER FUNCTION getExternalUrl()  
RETURN varchar2;
```

289.3.7 DBUriType Subtype GETURL

This function returns the URL, in non-escaped format, stored inside the `DBURITYPE` instance.

Syntax

```
MEMBER FUNCTION getUrl()  
RETURN varchar2;
```

289.3.8 DBUriType Subtype GETXML

This function returns the `XMLType` located at the address specified by the URL.

The subprograms of the URI Subtype `DBPURITYPE` member subprogram `GETXML` are described below. The options are described in the following table.

This function returns the `XMLType` located at the address specified by the URL.

Syntax

```
MEMBER FUNCTION getXML()  
RETURN XMLType;
```

This function returns the `XMLType` located at the address specified by the URL and the content type.

Syntax

```
MEMBER FUNCTION getXML(content OUT VARCHAR2)
  RETURN XMLType;
```

Table 289-16 DBUriType Subtype GETXML Parameters

| Parameter | IN / OUT | Description |
|-----------|----------|--|
| content | (OUT) | Content type of the document to which URI is pointing. |

289.4 Summary of XDBURITYPE Subtype Subprograms

XDBURITYPE is a new subtype of URITYPE. It provides a way to expose documents in the Oracle XML DB hierarchy as URIs that can be embedded in any URITYPE column in a table.

The URL part of the URI is the hierarchical name of the XML document it refers to. The optional fragment part uses the XPath syntax, and is separated from the URL part by '#'. The more general XPointer syntax for specifying a fragment is not currently supported.

Table 289-17 XDBURITYPE Type Subprograms

| Method | Description |
|--------------------------------|--|
| CREATEURI | Returns the <code>UriType</code> corresponding to the specified URL. |
| GETBLOB | Returns the <code>BLOB</code> corresponding to the contents of the document specified by the <code>XDBURITYPE</code> instance. |
| GETCLOB | Returns the <code>CLOB</code> corresponding to the contents of the document specified by the <code>XDBURITYPE</code> instance. |
| GETCONTENTTYPE | Returns the content type of the document pointed to by the URI. |
| GETEXTERNALURL | Returns the URL, in escaped format, stored inside the <code>XDBURITYPE</code> instance. |
| GETURL | Returns the URL, in non-escaped format, stored inside the <code>XDBURITYPE</code> instance. |
| GETXML | Returns the <code>XMLType</code> corresponding to the contents of the document specified by the URL. |
| XDBURITYPE | Creates an instance of <code>XDBURITYPE</code> from the given URI. |

289.4.1 XDBUriType Subtype CREATEURI

This static function constructs a `XDBURITYPE` instance. It parses the given URL and creates a `XDBURITYPE` instance.

Syntax

```
STATIC FUNCTION createUri(
  url IN varchar2)
  RETURN XDBURITYPE
```

| Parameter | IN / OUT | Description |
|-----------|----------|---|
| url | (IN) | The URL string, in escaped format, containing a valid XDBURITYPE. |

289.4.2 XDBUriType Subtype GETBLOB

This function returns the BLOB located at the address specified by the XDBURITYPE instance.

The subprograms of the URI Subtype XDBURITYPE member subprogram GETBLOB are described below. The options are described in the following table.

This function returns the BLOB located at the address specified by the URL.

Syntax

```
MEMBER FUNCTION getBlob()
    RETURN BLOB;
```

This function returns the BLOB located at the address specified by the URL and the content type.

Syntax

```
MEMBER FUNCTION getBlob(content OUT VARCHAR2)
    RETURN BLOB;
```

This function returns the BLOB located at the address specified by the URL in the specified character set.

Syntax

```
FUNCTION getBlob(csId IN NUMBER)
    RETURN BLOB;
```

Table 289-18 XDBUriType Subtype GETBLOB Parameters

| Parameter | IN / OUT | Description |
|-----------|----------|---|
| content | (OUT) | Content type of the document to which URI is pointing. |
| csid | (IN) | Character set id of the document. Must be a valid Oracle id and greater than 0; otherwise returns an error. |

289.4.3 XDBUriType Subtype GETCLOB

This function returns the CLOB located at the address specified by the XDBURITYPE instance. If a temporary CLOB is returned, it must be freed.

The subprograms of the URI Subtype XDBURITYPE member subprogram GETCLOB are described below. The options are described in the following table.

Returns the CLOB located at the address specified by the XDBUriType instance.

Syntax

```
MEMBER FUNCTION getClob()
    RETURN CLOB;
```

Returns the `CLOB` located at the address specified by the `XDBUriType` instance and the content type.

Syntax

```
MEMBER FUNCTION getClob(content OUT VARCHAR2)
  RETURN CLOB;
```

Table 289-19 XDBUriType Subtype GETCLOB Parameters

| Parameter | IN / OUT | Description |
|-----------|----------|--|
| content | (OUT) | Content type of the document to which URI is pointing. |

289.4.4 XDBUriType Subtype GETCONTENTTYPE

This function returns the content type of the document pointed to by the URI. This function returns the content type as `VARCHAR2`.

Syntax

```
MEMBER FUNCTION getContentType()
  RETURN VARCHAR2;
```

289.4.5 XDBUriType Subtype GETEXTERNALURL

This function returns the URL, in escaped format, stored inside the `XDBURITYPE` instance.

Syntax

```
MEMBER FUNCTION getExternalUrl()
  RETURN varchar2;
```

289.4.6 XDBUriType Subtype GETURL

This function returns the URL, in non-escaped format, stored inside the `XDBURITYPE` instance.

Syntax

```
MEMBER FUNCTION getUrl()
  RETURN varchar2;
```

289.4.7 XDBUriType Subtype GETXML

This function returns the `XMLType` located at the address specified by the URL.

The subprograms of the URI Subtype `XDBURITYPE` member subprogram `GETXML` are described below. The options are described in the following table.

This function returns the `XMLType` located at the address specified by the URL.

Syntax

```
MEMBER FUNCTION getXML()
  RETURN XMLType;
```

This function returns the XMLType located at the address specified by the URL and the content type.

Syntax

```
MEMBER FUNCTION getXML(content OUT VARCHAR2)
  RETURN XMLType;
```

Table 289-20 XDBUriType Subtype GETXML Parameters

| Parameter | IN / OUT | Description |
|-----------|----------|--|
| content | (OUT) | Content type of the document to which URI is pointing. |

289.4.8 XDBUriType subtype XDBURITYPE

This constructs a XDBURITYPE instance.

Syntax

```
CONSTRUCTOR FUNCTION XDBURITYPE(
  url      IN  VARCHAR2,
  flags    IN  RAW := NULL)
  RETURN self AS RESULT;
```

Table 289-21 XDBUriType subtype XDBURITYPE Parameters

| Parameter | IN / OUT | Description |
|-----------|----------|---|
| url | (IN) | The URL string containing a valid XDBUriType. The URL string is expected in escaped format. For example, non-URL characters are represented as the hexadecimal value for the UTF-8 encoding of those characters. |
| flags | (IN) | Possible values are: <ul style="list-style-type: none"> • 1 - Expand all XInclude elements before returning the result contents. If any XInclude element cannot be successfully resolved according to the XInclude fallback semantics, then an error is raised. • 2 - Indicates that any errors during document retrieval should be suppressed • 3 - Both flag bits (1, 2) are enabled |

289.5 Summary of URIFACTORY Package Subprograms

The `UriFactory` package contains factory methods that can be used to generate the appropriate instance of the URI types without having to hard code the implementation in the program.

The `UriFactory` package also provides the ability to register new subtypes of the `UriType` to handle various other protocols. For example, you can invent a new protocol `ecom://` and define a subtype of the `UriType` to handle that protocol and register it with `UriFactory`. After that any factory method would generate the new subtype instance if it sees the `ecom://` prefix.

Table 289-22 URIFACTORY Type Subprograms

| Method | Description |
|--------------------------------------|---|
| GETURI | Returns the correct URL handler for the given URL string. |
| ESCAPEURI | Returns a URL in escaped format. |
| UNESCAPEURI | Returns a URL in unescaped format. |
| REGISTERURLHANDLER | Registers a particular type name for handling a particular URL. |
| UNREGISTERURLHANDLER | Unregisters a URL handler. |

289.5.1 UriFactory Package GETURI

This factory method returns the correct URI handler for the given URI string.

It returns a subtype instance of the `UriType` that can handle the protocol. By default, it always creates an `XDBURITYPE` instance, if it cannot resolve the URL. A URL handler can be registered for a particular prefix using the [REGISTERURLHANDLER](#) function. If the prefix matches, [GETURI](#) would then use that subtype.

Syntax

```
FUNCTION getUri(
    url IN Varchar2)
RETURN UriType;
```

Table 289-23 UriFactory Package GETURI Parameters

| Parameter | IN / OUT | Description |
|------------------|----------|---|
| <code>uri</code> | (IN) | The URL string, in escaped format, containing a valid HTTP URL. |

289.5.2 UriFactory Package ESCAPEURI

This function returns a URL in escaped format.

The subtype instances override this member function to provide additional semantics. For instance, the `HTTPURITYPE` does not store the prefix `http://` in the URL itself. When generating the external URL, it appends the prefix and generates it. For this

reason, use the [GETEXTERNALURL](#) function or the [GETURI](#) function to get to the URL value instead of using the attribute present in the `UriType`.

Syntax

```
MEMBER FUNCTION escapeUri()
RETURN varchar2;
```

Table 289-24 UriFactory Package ESCAPEURI Parameters

| Parameter | IN / OUT | Description |
|------------------|----------|--|
| <code>url</code> | (IN) | The URL string to be returned in escaped format. |

289.5.3 UriFactory Package UNESCAPEURI

This function returns a URL in unescaped format.

This function is the reverse of the [ESCAPEURI](#) function. This function scans the string and converts any non-URL hexadecimal characters into the equivalent UTF-8 characters. Since the return type is a `VARCHAR2`, the characters would be converted into the equivalent characters as defined by the database character set.

Syntax

```
FUNCTION unescapeUri()
RETURN varchar2;
```

Table 289-25 UriFactory Package UNESCAPEURI Parameters

| Parameter | IN / OUT | Description |
|------------------|----------|--|
| <code>url</code> | (IN) | The URL string to be returned in unescaped format. |

289.5.4 UriFactory Package REGISTERURLHANDLER

This package registers a particular type name for handling a particular URL.

The type specified must be valid and must be a subtype of the `UriType` or one of its subtypes. It must also implement the `createUri` static member function. This function is called by the [GETURI](#) function to generate an instance of the type. The `striprefix` parameter indicates that the prefix must be stripped off before calling this function.

Syntax

```
PROCEDURE registerUrlHandler(
  prefix IN varchar2,
  schemaName IN varchar2,
  typename IN varchar2,
  ignoreCase IN boolean := true,
  striprefix IN boolean := true);
```

Table 289-26 UriFactory Package REGISTERURLHANDLER Parameters

| Parameter | IN / OUT | Description |
|-------------|----------|--|
| prefix | (IN) | The prefix to handle; for example, <code>http://</code> . |
| schemaName | (IN) | Name of the schema where the type resides; case sensitive. |
| typename | (IN) | The name of the type to handle the URL; case sensitive. |
| ignoreCase | (IN) | Ignore case when matching prefixes. |
| stripprefix | (IN) | Strip prefix before generating the instance of the type. |

289.5.5 UriFactory Package UNREGISTERURLHANDLER

This procedure unregisters a URL handler. This only unregisters user registered handler prefixes and not predefined system prefixes such as `http://`.

Syntax

```
PROCEDURE unregisterUrlHandler(  
    prefix IN VARCHAR2);
```

Table 289-27 UriFactory Package UNREGISTERURLHANDLER Parameters

| Parameter | IN / OUT | Description |
|-----------|----------|--------------------------------|
| prefix | (IN) | The prefix to be unregistered. |

JMS Types

PL/SQL users can use the `DBMS_AQ` package to enqueue and dequeue messages from JMS queues.

The JMS types member and static functions and procedures in this chapter are needed to populate JMS messages for enqueueing or to interpret a dequeued JMS message.

This chapter contains these topics:

- [Overview](#)
- [Security Model](#)
- [Java Versus PL/SQL Datatypes](#)
- [More on Bytes_ Stream and Map Messages](#)
- [Upcasting and Downcasting Between General and Specific Messages](#)
- [JMS Types Error Reporting](#)
- [Oracle JMS Type Constants](#)
- [JMS Types Error Reporting](#)
- [Oracle JMS Type Constants](#)
- [CONVERT_JMS_SELECTOR](#)
- [Summary of JMS Types](#)

290.1 JMS Types Overview

Java Message Service (JMS) is a well known public standard interface for accessing messaging systems. Oracle JMS (OJMS) implements JMS based on Oracle Advanced Queuing (AQ) and a relational database system (RDBMS). Messages are stored in queues as OJMS specific ADTs. Java clients use OJMS packages to enqueue, dequeue, and manipulate these messages.

PL/SQL users, on the other hand, use the `DBMS_AQ` package to enqueue and dequeue JMS messages and the member functions in this chapter to populate and interpret them. Oracle Database Advanced Queuing offers such member functions for the following JMS ADTs:

- `aq$_jms_header`
- `aq$_jms_message`
- `aq$_jms_text_message`
- `aq$_jms_bytes_message`
- `aq$_jms_map_message`
- `aq$_jms_stream_message`

In addition to these populating and interpreting member functions, Oracle Database Advanced Queuing offers:

- Casting between `aq$_jms_message` and other message ADTs.
- PL/SQL stored procedures for converting JMS selectors to equivalent Oracle Database Advanced Queuing rules

290.2 JMS Types Security Model

`PUBLIC` is granted `EXECUTE` privilege in these JMS types.

- `SYS.AQ$_JMS_MESSAGE` Type
- `SYS.AQ$_JMS_TEXT_MESSAGE` Type
- `SYS.AQ$_JMS_BYTES_MESSAGE` Type
- `SYS.AQ$_JMS_MAP_MESSAGE` Type
- `SYS.AQ$_JMS_STREAM_MESSAGE` Type
- `SYS.AQ$_JMS_OBJECT_MESSAGE` Type
- `SYS.AQ$_JMS_NAMEARRAY` Type
- `SYS.AQ$_JMS_VALUE` Type
- `SYS.AQ$_JMS_EXCEPTION` Type

290.3 Java Versus PL/SQL Datatypes

Datatypes do not map one-to-one between PL/SQL and Java.

Some Java types, such as `BYTE` and `SHORT`, are not present in PL/SQL. PL/SQL type `INT` was chosen to represent these types. If a PL/SQL `INT` value intended to hold a Java `BYTE` or `SHORT` value exceeds the corresponding range Java enforces, an out-of-range error is thrown.

Other Java types have more than one counterpart in PL/SQL with different capabilities. A Java String can be represented by both `VARCHAR2` and `CLOB`, but `VARCHAR2` has a maximum limit of 4000 bytes. When retrieving `TEXT` data from map, stream, and bytes message types, a `CLOB` is always returned. When updating the map, stream and bytes message types, users can submit either a `VARCHAR2` or `CLOB`.

Similarly, a Java `BYTE ARRAY` can be represented by both `RAW` and `BLOB`, with `RAW` having a maximum size of 32767. When retrieving `BYTE ARRAY` data from map, stream, and bytes message types, a `BLOB` is always returned. When updating the map, stream and bytes message types, users can submit either a `RAW` or `BLOB`.

JMS specification 3.11.3, Conversion Provided by `StreamMessage` and `MapMessage`

New JMS Support in Oracle Database 10g

In Oracle Database 10g, a new `AQ$_JMS_VALUE` ADT has been added in the `SYS` schema for OJMS PL/SQL users. It is specifically used to implement the `read_object`

procedure of `aq$_jms_stream_message` and `get_object` procedure of `aq$_jms_map_message`, to mimic the Java general object class `Object`. `AQ$_JMS_VALUE` ADT can represent any datatype that JMS `StreamMessage` and `MapMessage` can hold.

The collection ADT `AQ$_JMS_NAMEARRAY` was added for the `getNames` method of `MapMessage`. It holds an array of names.

In this release the ADT `AQ$_JMS_EXCEPTION` was added to represent a Java exception thrown in an OJMS JAVA stored procedure on the PL/SQL side. Now you can retrieve a Java exception thrown by an OJMS stored procedure and analyze it on the PL/SQL side.

290.4 More on Bytes, Stream and Map Messages

Oracle uses Java stored procedure to implement some of the procedures of `AQ$_MAP_MESSAGE`, `AQ$_JMS_STREAM_MESSAGE`, and `AQ$_JMS_BYTES_MESSAGE` types. These types have some common functionality that are different from `AQ$_JMS_TEXT_MESSAGE` type. This section discusses this common functionality.

This section contains these topics:

- Using Java Stored Procedures to Encode and Decode Oracle Database Advanced Queuing Messages
- Initialize the `Jserv` Static Variable
- Get the Payload Data Back to PL/SQL
- Garbage Collect the Static Variable
- Use a Message Store: A Static Variable Collection
- Typical Calling Sequences
- Read-Only and Write-Only Modes Enforced for Stream and Bytes Messages
- Differences Between Bytes and Stream Messages
- Getting and Setting Bytes, Map, and Stream Messages as RAW Bytes

Using Java Stored Procedures to Encode and Decode Oracle Database Advanced Queuing Messages

The major difference between map, stream, bytes, and other messages is that the message payload is encoded as a byte stream by JAVA. Retrieving and updating these payloads in PL/SQL therefore requires Oracle JAVA stored procedures.

A message payload is stored in two places during processing. On the PL/SQL side it is stored as the data members of a JMS message ADT, and on the `Jserv` side it is stored as a static variable. (`Jserv` is the JVM inside Oracle Database.) When the payload is processed, the payload data is first transformed to a static variable on the `Jserv` side. Once the static variable is initialized, all later updates on the message payload are performed on this static variable. At the end of processing, payload data is flushed back to the PL/SQL side.

Oracle provides member procedures that maintain the status of the `Jserv` static variable and enforce rules when calling these member procedures. These procedures are in the following ADTs:

- `aq$_jms_bytes_message`
- `aq$_jms_map_message`

- `aq$_jms_stream_message`

Initialize the Jserv Static Variable

Before you make any other calls to manipulate the payload data, the Jserv static variable must be properly initialized. This is done by calling the `prepare` or `clear_body` procedure. The `prepare` procedure uses the payload data in PL/SQL ADTs to initialize the static variable, while `clear_body` initializes the static variable to an empty payload (empty hashtable or stream).

Note:

It is important to call the `prepare` or `clear_body` procedure before any other calls to properly initialize the Jserv static variables. Usually these two methods are called once at the beginning. But they can be called multiple times for one message. Any call of these two methods without first calling the `flush` procedure wipes out all updates made to the messages.

Get the Payload Data Back to PL/SQL

Calling the `flush` procedure synchronizes changes made to the Jserv static variable back to the PL/SQL ADTs. The `flush` call is required when you want the changes made to be reflected in the ADT payload. It is important to synchronize the changes back to the ADT, because it is the ADT payload that matters.

Garbage Collect the Static Variable

The `clean` procedure forces garbage collection of the static variable. It is there to do cleanup and free JVM memory. You can avoid memory leaks by doing it immediately after finishing processing the message.

Use a Message Store: A Static Variable Collection

Instead of a single static variable, Oracle uses a collection of static variables to process the message payload on the Jserv side. This collection is called the message store. Each map, bytes, or stream message type has its own message store within one session.

Oracle uses the operation ID parameter to locate the correct static variable to work on within the message store. Initialization calls such as `prepare` and `clear_body` give users an operation ID, which is used in later message access.

After users complete message processing, they must call the `clean` procedure with the operation ID to clean up the message store. This avoids possible memory leaks. The `clean_all` static procedures of message ADTs `aq$_jms_bytes_message`, `aq$_jms_map_message`, and `aq$_jms_stream_message` clean up all static variables of their corresponding message stores.

Typical Calling Sequences

This section describes typical procedures for retrieving and populating messages.

Here is a typical procedure for retrieving messages

1. Call `prepare` for a message.

This call also gives you an operation ID if you do not specify one.

2. Call multiple retrieving procedures with the provided operation ID.
3. Call the `clean` procedure with the provided operation ID.

Here is a typical procedure for populating messages:

1. Call `clear_body` for a message.

For `aq$_jms_map_message`, you can also call `prepare` to update the message based on the existing payload. This call also gives you an operation ID if you do not specify one.

2. Call multiple updating procedures with the provided operation ID.
3. Call the `flush` method with the provided operation ID.
4. Call the `clean` procedure with the provided operation ID.

Read-Only and Write-Only Modes Enforced for Stream and Bytes Messages

According to the JMS specification, when a message is received, its body is read-only. Users can call the `clear_body` method to make the body writable. This method erases the current message body and sets the message body to be empty.

The OJMS JAVA API follows the rule set by JMS specification. In updating the JMS message ADTs in PL/SQL, however, Oracle enforces the rule selectively:

- Map messages

The restriction is relaxed, because adding more entries on top of a existing map payload is a convenient way for users to update the payload. Therefore there are no read-only or write-only modes for map messages.

- Stream and bytes messages

The restriction is not relaxed, because these payloads use a stream when reading and writing data. It is difficult to update the payload while in the middle of a stream. Oracle enforces read-only and write-only modes in processing stream and bytes message payloads. Calling the `prepare` procedure initializes the message payload in read-only mode. Calling the `clear_body` procedure initializes the message payload in write-only mode.

Calling the `reset` procedure resets the pointer to the beginning of the stream and switches the mode from write-only to read-only. The `reset` procedure keeps the updates made to the message payload in the `Jserv` static variable.

The `prepare` procedure, on the other hand, overwrites the message payload in the `Jserv` static variable with the payload in the PL/SQL ADT.

Oracle provides member function `get_mode` for users to query the mode.

Differences Between Bytes and Stream Messages

Member functions of bytes messages are not exactly the same as those of stream messages. Stream messages are encoded using `Java ObjectOutputStream` and bytes messages are encoded using `Java DataOutputStream`. In stream messages each primitive type is written and read as a `Java Object`, but in a bytes message they are written and read as raw bytes according to the encoding mechanism of `DataOutputStream`.

For stream messages, the `read_bytes` method works on a stream of bytes to the end of the byte array field written by the corresponding `write_bytes` method. The `read_bytes` method

of bytes message works on a stream of bytes to the end of the whole byte stream. This is why the `read_bytes` member procedure of `aq$_bytes_message` also requires a `length` parameter to tell how long it is to read.

You will not see a type conversion error raised by bytes message, because bytes messages do not support type conversion.

Methods `get_unsigned_byte` and `get_unsigned_short` are available for bytes messages, but not for stream messages. This is because stream messages read Java objects, and there are no Java objects as unsigned bytes or unsigned shorts.

Methods `read_string` and `write_string` methods are not available for bytes messages. The bytes message ADT must enforce some character encoding. It has methods `read_utf` and `write_utf` which support utf-8 encoding.

Note:

All data written by bytes messages use `DataOutputStream` as the basis. See JDK API documentation JavaSoft.com for details on how the data is encoded into bytes.

Getting and Setting Bytes, Map, and Stream Messages as RAW Bytes

The payloads of bytes, map, and stream message types are stored as either `RAW` or `BLOB` in the database. In this release Oracle Database Advanced Queuing provides the following member functions to set and get these payloads as raw bytes without interpreting them:

```
set_bytes(payload IN BLOB)
set_bytes(payload IN RAW)
get_bytes(payload OUT BLOB)
get_bytes(payload OUT RAW)
```

These functions were provided for bytes messages in Oracle9i Release 2 (9.2).

290.5 Upcasting and Downcasting Between General and Specific Messages

OJMS ADT `aq$_jms_message` is used to represent a general message, so that different types of messages can reside on the same Oracle Database Advanced Queuing queue. Oracle Database Advanced Queuing supports retrieving and populating of `aq$_jms_message` by supporting upcasting and downcasting between this ADT and ADTs of specific message types.

To read an `aq$_jms_message`, you must first downcast it to a specific message type according to its `message_type` field

To populate an `aq$_jms_message`, you must first populate a specific message and upcast it to `aq$_jms_message`. This avoids copying all member functions of other specific message ADTs to this ADT. It also guarantees that the manipulation of this ADT is consistent with other specific message ADTs.

290.6 JMS Types Error Reporting

This table lists Oracle JMS types related errors.

Table 290-1 Oracle JMS Types Errors

| ORA error number | dbms_jms_plsql package constants | Explanation |
|------------------|----------------------------------|---|
| ORA-24190 | ERROR_DATA_OVERFLOW | The payload data exceeds the size that an out parameter can hold. For example, the <code>get_text</code> procedure with a <code>VARCHAR2</code> parameter of <code>aq\$_jms_text_message</code> or <code>get_bytes</code> procedure with a <code>RAW</code> parameter of <code>aq\$_jms_bytes_message</code> . |
| ORA-24191 | ERROR_PROP_NAME_EXIST | Setting a property that is previous set |
| ORA-24192 | ERROR_PROP_NAME_NULL | Occurs when setting a property with null property name. |
| ORA-24193 | ERROR_EXCEED_RANGE | PL/SQL number type exceeds the valid range of the respective Java type. For example <code>set_byte_property</code> , <code>set_short_property</code> of <code>aq\$_jms_head</code> ADT; <code>set_byte</code> and <code>set_short</code> of <code>aq\$_jms_map_message</code> ADT; <code>write_byte</code> and <code>write_short</code> of <code>aq\$_jms_stream_message</code> and <code>aq\$_jms_bytes_message</code> ADT. |
| ORA-24194 | ERROR_TYPE_MISMATCH | The type conversion between the Java type of the retrieving method and the Java type of a field of the payload is not valid. |
| ORA-24195 | ERROR_MAP_TOO_LARGE | The size of the map exceeds the <code>aq\$_jms_namearray</code> ADT capacity. The current size limit is 1024. You can use the <code>get_names</code> function with <code>offset</code> and <code>length</code> parameters to retrieve the name array in multiple small chunks. |
| ORA-24196 | ERROR_WRONG_MODE | The message payload is being accessed with a wrong access mode. For example, trying to read a message payload with write-only mode or trying to write a message payload with the read-only mode. |
| ORA-24197 | ERROR_JAVA_EXCEPTION | ORA-24197 error is raised when a Java exception is raised that does not fit in any of the other error categories. You can use the <code>get_exception</code> static procedure of <code>aq\$_jms_map_message</code> , <code>aq\$_jms_bytes_message</code> , and <code>aq\$_jms_stream_message</code> to retrieve the exception information last thrown by the Java stored procedure. A single static variable is used to store the last exception and is overwritten if another exception is thrown before you retrieve it. A new ADT <code>aq\$_jms_exception</code> is created to represent the exception information on the PL/SQL side. |
| ORA-24198 | ERROR_INVALID_ID | An invalid operation ID is being provided to access a message. |
| ORA-24199 | ERROR_STORE_OVERFLOW | The number of messages (with the same type) that users are trying to manipulate exceeds the size of the message store on the Java stored procedure side. The current size of the store is 20. It unusual to need to manipulate more than 20 messages at the same time. A common mistake is to forget to call the <code>clean</code> procedure after using one message. The <code>clean</code> procedure frees the message slot for use by other messages attempting access. |

290.7 Oracle JMS Type Constants

These constants can be useful when dealing with message type functions.

DBMS_AQ Package Constants

DBMS_AQ package constants specify different types of JMS messages. They are useful when dealing with general message types during upcasting and downcasting or constructing a general message with a specific message type:

```
JMS_TEXT_MESSAGE      CONSTANT BINARY_INTEGER;
JMS_BYTES_MESSAGE     CONSTANT BINARY_INTEGER;
JMS_STREAM_MESSAGE    CONSTANT BINARY_INTEGER;
JMS_MAP_MESSAGE       CONSTANT BINARY_INTEGER;
JMS_OBJECT_MESSAGE    CONSTANT BINARY_INTEGER;
```

SYS.DBMS_JMS_PLSQL Package Constants

SYS.DBMS_JMS_PLSQL package constants are new in Oracle Database 10g.

These constants specify the mode of message payload. They are useful when interpreting the mode of the message payload returned from the `get_mode` function:

```
MESSAGE_ACCESS_READONLY CONSTANT PLS_INTEGER;
MESSAGE_ACCESS_WRITEONLY CONSTANT PLS_INTEGER;
```

These constants specify the ADT type of an Oracle Database Advanced Queuing queue. They are useful during the conversion of JMS selectors to Oracle Database Advanced Queuing rules:

```
DESTPLOAD_JMSTYPE CONSTANT PLS_INTEGER;
DESTPLOAD_USERADT  CONSTANT PLS_INTEGER;
DESTPLOAD_ANYDATA  CONSTANT PLS_INTEGER;
```

These constants specify the type of data that can be held by a `aq$_jms_value` type. They are useful when interpreting the `aq$_jms_value` returned by the `get_object` method of `AQ$_JMS_MAP_MESSAGE` or `read_object` method of `AQ$_JMS_STREAM_MESSAGE`:

```
DATA_TYPE_BYTE          CONSTANT PLS_INTEGER;
DATA_TYPE_SHORT         CONSTANT PLS_INTEGER;
DATA_TYPE_INTEGER       CONSTANT PLS_INTEGER;
DATA_TYPE_LONG          CONSTANT PLS_INTEGER;
DATA_TYPE_FLOAT         CONSTANT PLS_INTEGER;
DATA_TYPE_DOUBLE        CONSTANT PLS_INTEGER;
DATA_TYPE_BOOLEAN       CONSTANT PLS_INTEGER;
DATA_TYPE_CHARACTER     CONSTANT PLS_INTEGER;
DATA_TYPE_STRING        CONSTANT PLS_INTEGER;
DATA_TYPE_BYTES         CONSTANT PLS_INTEGER;
DATA_TYPE_UNSIGNED_BYTE CONSTANT PLS_INTEGER;
DATA_TYPE_UNSIGNED_SHORT CONSTANT PLS_INTEGER;
```

These constants specify the error number of the ORA errors that can be raised by the functions of message type ADTs. They are useful in user error handlers:

```
ERROR_DATA_OVERFLOW    CONSTANT PLS_INTEGER := -24190;
ERROR_PROP_NAME_EXIST  CONSTANT PLS_INTEGER := -24191;
ERROR_PROP_NAME_NULL   CONSTANT PLS_INTEGER := -24192;
ERROR_EXCEED_RANGE     CONSTANT PLS_INTEGER := -24193;
ERROR_TYPE_MISMATCH    CONSTANT PLS_INTEGER := -24194;
```

```
ERROR_MAP_TOO_LARGE    CONSTANT PLS_INTEGER := -24195;  
ERROR_WRONG_MODE       CONSTANT PLS_INTEGER := -24196;  
ERROR_JAVA_EXCEPTION   CONSTANT PLS_INTEGER := -24197;  
ERROR_INVALID_ID       CONSTANT PLS_INTEGER := -24198;  
ERROR_STORE_OVERFLOW   CONSTANT PLS_INTEGER := -24199;
```

290.8 CONVERT_JMS_SELECTOR

Oracle Database includes three stored procedures to help users convert JMS selectors into Oracle Database Advanced Queuing rules. These rules can be used in `ADD_SUBSCRIBER` operations as subscriber rules or in `DEQUEUE` operations as dequeue conditions. These procedures are in the `SYS.dbms_jms_plsql` package.

Convert with Minimal Specification

The first procedure assumes the destination payload type is one of the JMS ADTs whose corresponding constant is `dbms_jms_plsql.DESTLOAD_JMSTYPE` and also assumes that the J2EE compliant mode is true.

Syntax

```
Function convert_jms_selector(selector IN VARCHAR2) RETURN VARCHAR2
```

Returns

The converted Oracle Database Advanced Queuing rule or null if there is any conversion error.

Exceptions

ORA-24197 if the Java stored procedure throws an exception during execution.

Convert with Destination Payload Type Specified

The second procedure takes one more parameter: `dest_pload_type`. The conversion of a JMS selector to an Oracle Database Advanced Queuing rule happens only if this parameter is `SYS.dbms_jms_plsql.DESTLOAD_JMSTYPE` or `SYS.dbms_jms_plsql.DESTLOAD_ANYDATA`. The function returns exactly the same `VARCHAR2` value as the selector parameter if the `dest_pload_type` parameter is `SYS.dbms_jms_plsql.DESTLOAD_USERADT`. The function returns null if `dest_pload_type` parameter is none of these three constants.

This function assumes that the J2EE compliant mode is true.

Syntax

```
Function convert_jms_selector(  
    selector IN VARCHAR2,  
    dest_pload_type IN PLS_INTEGER)  
RETURN VARCHAR2
```

Returns

The converted Oracle Database Advanced Queuing rule or null if there is any conversion error.

Exceptions

ORA-24197 if the Java stored procedure throws an exception during execution.

Convert with Destination Payload Type and Compliant Mode Specified

The third procedure takes a `dest_pload_type` parameter and a `compliant` parameter. The conversion of a JMS selector to an Oracle Database Advanced Queuing rule happens only if the `dest_pload_type` parameter is

`SYS.dbms_jms_plsql.DESTPLOAD_JMSTYPE` or `SYS.dbms_jms_plsql.DESTPLOAD_ANYDATA`. The function returns exactly the same `VARCHAR2` value as the selector parameter if the `dest_pload_type` parameter is `SYS.dbms_jms_plsql.DESTPLOAD_USERADT`. The function returns null if the `dest_pload_type` parameter is none of these three constants.

The `compliant` parameter controls if the conversion is in J2EE compliant mode or not. The noncompliant conversion of a JMS selector is for backward compatibility.

Syntax

```
Function convert_jms_selector(  
    selector          IN  VARCHAR2,  
    dest_pload_type  IN  PLS_INTEGER,  
    compliant        IN  BOOLEAN )
```

Returns

The converted Oracle Database Advanced Queuing rule or null if there is any conversion error.

Exceptions

ORA-24197 if the Java stored procedure throws an exception during execution.

290.9 Summary of JMS Types

This lists shows the JMS types.

- [SYS.AQ\\$_JMS_MESSAGE Type](#)
- [SYS.AQ\\$_JMS_TEXT_MESSAGE Type](#)
- [SYS.AQ\\$_JMS_BYTES_MESSAGE Type](#)
- [SYS.AQ\\$_JMS_MAP_MESSAGE Type](#)
- [SYS.AQ\\$_JMS_STREAM_MESSAGE Type](#)
- [SYS.AQ\\$_JMS_OBJECT_MESSAGE Type](#)
- [SYS.AQ\\$_JMS_NAMEARRAY Type](#)
- [SYS.AQ\\$_JMS_VALUE Type](#)
- [SYS.AQ\\$_JMS_EXCEPTION Type](#)

290.9.1 SYS.AQ\$_JMS_MESSAGE Type

This ADT type can represent any of five different JMS message types: text message, bytes message, stream message, map message, or object message. Queues created using this ADT can therefore store all five types of JMS messages.

This section contains these topics:

- [CONSTRUCT Static Functions](#)
- [Cast Methods](#)
- [JMS Header Methods](#)
- [System Properties Methods](#)
- [User Properties Methods](#)
- [Payload Methods](#)

Syntax

```

TYPE AQ$_JMS_MESSAGE AS OBJECT(
  header          aq$_jms_header,
  senderid        varchar2(100),
  message_type    INT,
  text_len        INT,
  bytes_len       INT,
  text_vc         varchar2(4000),
  bytes_raw       raw(2000),
  text_lob        clob,
  bytes_lob       blob,

```

CONSTRUCT Static Functions

There are six `CONSTRUCT` static functions in this type.

STATIC FUNCTION construct (mtype IN INT) RETURN aq\$_jms_message

Creates an instance of `aq$_jms_message`, which can hold a specific type of JMS message (`TextMessage`, `BytesMessage`, `MapMessage`, `StreamMessage` or `ObjectMessage`). The message type of the created `aq$_jms_message` instance depends on the `mtype` parameter passed to the `construct` method. Once a message has been constructed, it can be used to store JMS messages of the type it has been constructed to hold.

The `mtype` parameter must be one of the following constants described in "[Oracle JMS Type Constants](#)":

```

DBMS_AQ.JMS_TEXT_MESSAGE
DBMS_AQ.JMS_BYTES_MESSAGE
DBMS_AQ.JMS_STREAM_MESSAGE
DBMS_AQ.JMS_MAP_MESSAGE
DBMS_AQ.JMS_OBJECT_MESSAGE

```

STATIC FUNCTION construct (text_msg IN aq\$_jms_text_message) RETURN aq\$_jms_message

Creates an `aq$_jms_message` from an `aq$_jms_text_message`.

STATIC FUNCTION construct (bytes_msg IN aq\$_jms_bytes_message) RETURN aq\$_jms_message;

Creates an `aq$_jms_message` from an `aq$_jms_bytes_message`.

STATIC FUNCTION construct (stream_msg IN aq\$_jms_stream_message) RETURN aq\$_jms_message;

Creates an `aq$_jms_message` from an `aq$_jms_stream_message`.

STATIC FUNCTION construct (map_msg IN aq\$_jms_map_message) RETURN aq\$_jms_message;

Creates an aq\$_jms_message from an aq\$_jms_map_message.

STATIC FUNCTION construct (object_msg IN aq\$_jms_object_message) RETURN aq\$_jms_message;

Creates an aq\$_jms_message from an aq\$_jms_object_message.

Cast Methods

cast_to_bytes_msg RETURN aq\$_jms_bytes_message

Casts an aq\$_jms_message to an aq\$_jms_bytes_message. Returns an aq\$_jms_bytes_message or null if the message_type attribute of the aq\$_jms_message is not DBMS_AQ.JMS_BYTES_MESSAGE. This function raises ORA-24198 if the message_type field of the aq\$_jms_message is not DBMS_AQJMS.JMS_BYTES_MESSAGE.

cast_to_map_msg RETURN aq\$_jms_map_message

Casts an aq\$_jms_message to an aq\$_jms_map_message. Returns an aq\$_jms_map_message or null if the message_type attribute of the aq\$_jms_message is not DBMS_AQ.JMS_MAP_MESSAGE. This function raises ORA-24198 if the message_type field of the aq\$_jms_message is not DBMS_AQJMS.JMS_MAP_MESSAGE.

cast_to_object_msg RETURN aq\$_jms_object_message

Casts an aq\$_jms_message to an aq\$_jms_object_message. Returns an aq\$_jms_object_message or null if the message_type attribute of the aq\$_jms_message is not DBMS_AQ.JMS_OBJECT_MESSAGE. This function raises ORA-24198 if the message_type field of the aq\$_jms_message is not DBMS_AQJMS.JMS_OBJECT_MESSAGE.

cast_to_stream_msg RETURN aq\$_jms_stream_message

Casts an aq\$_jms_message to an aq\$_jms_stream_message. Returns an aq\$_jms_stream_message or null if the message_type attribute of the aq\$_jms_message is not DBMS_AQ.JMS_STREAM_MESSAGE. This function raises ORA-24198 if the message_type field of the aq\$_jms_message is not DBMS_AQJMS.JMS_STREAM_MESSAGE.

cast_to_text_msg RETURN aq\$_jms_text_message

Casts an aq\$_jms_message to an aq\$_jms_text_message. Returns an aq\$_jms_text_message or null if the message_type attribute of the aq\$_jms_message is not DBMS_AQ.JMS_TEXT_MESSAGE. This function raises ORA-24198 if the message_type field of the aq\$_jms_message is not DBMS_AQJMS.JMS_TEXT_MESSAGE.

JMS Header Methods

set_replyto (replyto IN sys.aq\$_agent)

Sets the replyto parameter, which corresponds to JMSReplyTo.

get_replyto RETURN sys.aq\$_agent

Returns replyto, which corresponds to JMSReplyTo.

set_type (type IN VARCHAR)

Sets the JMS type, which can be any text and corresponds to JMSType.

get_type RETURN VARCHAR

Returns type, which corresponds to JMSType.

System Properties Methods

set_userid (userid IN VARCHAR)

Sets `userid`, which corresponds to `JMSXUserID`.

set_appid (appid IN VARCHAR)

Sets `appid`, which corresponds to `JMSXAppID`.

set_groupid (groupid IN VARCHAR)

Sets `groupid`, which corresponds to `JMSXGroupID`.

set_groupseq (groupseq IN INT)

Sets `groupseq`, which corresponds to `JMSXGroupSeq`.

get_userid RETURN VARCHAR

Returns `userid`, which corresponds to `JMSXUserID`.

get_appid RETURN VARCHAR

Returns `appid`, which corresponds to `JMSXAppID`.

get_groupid RETURN VARCHAR

Returns `groupid`, which corresponds to `JMSXGroupID`.

get_groupseq RETURN VARCHAR

Returns `groupseq`, which corresponds to `JMSXGroupSeq`.

User Properties Methods

clear_properties

Clears all user properties. This procedure does not affect system properties.

set_boolean_property (property_name IN VARCHAR, property_value IN BOOLEAN)

Checks whether `property_name` is null or exists. If it is not null, the procedure stores `property_value` in an internal representation (a `NUMBER` type). Raises exception `ORA-24191` if the property name exists or `ORA-24192` if the property name is null.

set_byte_property (property_name IN VARCHAR, property_value IN INT)

Checks whether `property_name` is null or exists. If it is not null, the procedure checks whether `property_value` is within -128 to 127 (8-bits). This check is necessary because neither PL/SQL nor RDBMS defines the `byte` datatype. Raises exception `ORA-24191` if the property name exists, `ORA-24192` if the property name is null, or `ORA-24193` if the property value exceeds the valid range.

set_double_property (property_name IN VARCHAR, property_value IN DOUBLE PRECISION)

Checks whether `property_name` is null or exists. If it is not null, the procedure stores `property_value`. Raises exception `ORA-24191` if the property name exists or `ORA-24192` if the property name is null.

set_float_property (property_name IN VARCHAR, property_value IN FLOAT)

Checks whether `property_name` is null or exists. If it is not null, the procedure stores `property_value`. Raises exception `ORA-24191` if the property name exists or `ORA-24192` if the property name is null.

set_int_property (property_name IN VARCHAR, property_value IN INT)

Checks whether `property_name` is null or exists. If it is not null, the procedure checks whether `property_value` is within -2147483648 to 2147483647 (32-bits). This check is necessary because the `INT` datatype is 38 bits in PL/SQL and Oracle Database. Raises exception ORA-24191 if the property name exists, ORA-24192 if the property name is null, or ORA-24193 if the property value exceeds the valid range.

set_long_property (property_name IN VARCHAR, property_value IN NUMBER)

Checks whether `property_name` is null or exists. If it is not null, the procedure stores `property_value`. In PL/SQL and Oracle Database, the `NUMBER` datatype is 38 bits. In Java, the long datatype is 64 bits. Therefore, no range check is needed. Raises exception ORA-24191 if the property name exists or ORA-24192 if the property name is null.

set_short_property (property_name IN VARCHAR, property_value IN INT)

Checks whether `property_name` is null or exists. If it is not null, the procedure checks whether `property_value` is within -32768 to 32767 (16-bits). This check is necessary because neither PL/SQL nor RDBMS defines the `short` datatype. Raises exception ORA-24191 if the property name exists, ORA-24192 if the property name is null, or ORA-24193 if the property value exceeds the valid range.

set_string_property (property_name IN VARCHAR, property_value IN VARCHAR)

Checks whether `property_name` is null or exists. If it is not null, the procedure stores `property_value`. Raises exception ORA-24191 if the property name exists or ORA-24192 if the property name is null.

get_boolean_property (property_name IN VARCHAR) RETURN BOOLEAN

If the property with the corresponding property name passed in exists, and if it is a `BOOLEAN` property, then this function returns the value of the property. Otherwise it returns a null.

get_byte_property (property_name IN VARCHAR) RETURN INT

If the property with the corresponding property name passed in exists, and if it is a `BYTE` property, then this function returns the value of the property. Otherwise it returns a null.

get_double_property (property_name IN VARCHAR) RETURN DOUBLE PRECISION

If the property with the corresponding property name passed in exists, and if it is a `DOUBLE` property, then this function returns the value of the property. Otherwise it returns a null.

get_float_property (property_name IN VARCHAR) RETURN FLOAT

If the property with the corresponding property name passed in exists, and if it is a `FLOAT` property, then this function returns the value of the property. Otherwise it returns a null.

get_int_property (property_name IN VARCHAR) RETURN INT

If the property with the corresponding property name passed in exists, and if it is a `Integer` property, then this function returns the value of the property. Otherwise it returns a null.

get_long_property (property_name IN VARCHAR) RETURN NUMBER

If the property with the corresponding property name passed in exists, and if it is a `long` property, then this function returns the value of the property. Otherwise it returns a null.

get_short_property (property_name IN VARCHAR) RETURN INT

If the property with the corresponding property name passed in exists, and if it is a `short` property, then this function returns the value of the property. Otherwise it returns a null.

get_string_property (property_name IN VARCHAR) RETURN VARCHAR

If the property with the corresponding property name passed in exists, and if it is a `STRING` property, then this function returns the value of the property. Otherwise it returns a null.

Payload Methods**set_text (payload IN VARCHAR2)**

Sets the payload, a `VARCHAR2` value, to an internal representation.

set_text (payload IN CLOB),

Sets the payload, a `CLOB` value, to an internal representation.

set_bytes (payload IN RAW)

Sets the payload, a `RAW` value, to an internal representation.

set_bytes (payload IN BLOB)

Sets the payload, a `BLOB` value, to an internal representation.

get_text (payload OUT VARCHAR2)

Puts the internal representation of the payload into a `VARCHAR2` variable payload.

get_text (payload OUT CLOB)

Puts the internal representation of the payload into a `CLOB` variable payload.

get_bytes (payload OUT RAW)

Puts the internal representation of the payload into a `RAW` variable payload.

get_bytes (payload OUT BLOB)

Puts the internal representation of the payload into a `BLOB` variable payload.

290.9.2 SYS.AQ\$_JMS_TEXT_MESSAGE Type

This type is the ADT used to store a `TextMessage` in an Oracle Database Advanced Queuing queue.

```

CONSTRUCT aq\$_jms_text_message Function**STATIC FUNCTION construct RETURN aq\$_jms_text_message**

Creates an empty aq\$_jms_text_message.

JMS Header Methods**set_replyto (replyto IN sys.aq\$_agent)**

Sets the replyto parameter, which corresponds to JMSReplyTo in JMS.

set_type (type IN VARCHAR)

Sets the JMS type, which can be any text, and which corresponds to JMSType in JMS.

get_replyto RETURN sys.aq\$_agent

Returns replyto, which corresponds to JMSReplyTo.

get_type RETURN VARCHAR

Returns `type`, which corresponds to `JMSType`.

System Properties Methods

set_userid (userid IN VARCHAR)

Sets `userid`, which corresponds to `JMSXUserID` in JMS.

set_appid (appid IN VARCHAR)

Sets `appid`, which corresponds to `JMSXAppID` in JMS.

set_groupid (groupid IN VARCHAR)

Sets `groupid`, which corresponds to `JMSXGroupID` in JMS.

set_groupseq (groupseq IN INT)

Sets `groupseq`, which corresponds to `JMSXGroupSeq` in JMS.

get_userid RETURN VARCHAR

Returns `userid`, which corresponds to `JMSXUserID`.

get_appid RETURN VARCHAR

Returns `appid`, which corresponds to `JMSXAppID`.

get_groupid RETURN VARCHAR

Returns `groupid`, which corresponds to `JMSXGroupID`.

get_groupseq RETURN INT

Returns `groupseq`, which corresponds to `JMSXGroupSeq`.

User Properties Methods

clear_properties

Clears all user properties. This procedure does not affect system properties.

set_boolean_property (property_name IN VARCHAR, property_value IN BOOLEAN)

Checks whether `property_name` is null or exists. If not, the procedure stores `property_value` in an internal representation. Raises exception ORA-24191 if the property name exists or ORA-24192 if the property name is null.

set_byte_property (property_name IN VARCHAR, property_value IN INT)

Checks whether `property_name` is null or exists. If not, the procedure checks whether `property_value` is within -128 to 127 (8-bits). This check is necessary because neither PL/SQL nor RDBMS defines the `BYTE` datatype. Raises exception ORA-24191 if the property name exists, ORA-24192 if the property name is null, or ORA-24193 if the property value exceeds the valid range.

set_double_property (property_name IN VARCHAR, property_value IN DOUBLE PRECISION)

Checks whether `property_name` is null or exists. If not, the procedure stores `property_value`. Raises exception ORA-24191 if the property name exists or ORA-24192 if the property name is null.

set_float_property (property_name IN VARCHAR, property_value IN FLOAT)

Checks whether `property_name` is null or exists. If not, the procedure stores `property_value`. Raises exception ORA-24191 if the property name exists or ORA-24192 if the property name is null.

set_int_property (property_name IN VARCHAR, property_value IN INT)

Checks whether `property_name` is null or exists. If not, the procedure checks whether `property_value` is within -2147483648 to 2147483647 (32-bits). This check is necessary because in PL/SQL and Oracle Database, the `INT` datatype is 38 bits. Raises exception ORA-24191 if the property name exists, ORA-24192 if the property name is null, or ORA-24193 if the property value exceeds the valid range.

set_long_property (property_name IN VARCHAR, property_value IN NUMBER)

Checks whether `property_name` is null or exists. If not, the procedure stores `property_value`. In PL/SQL and Oracle Database, the `NUMBER` datatype is 38 bits. In Java, the `long` datatype is 64 bits. Therefore, no range check is needed. Raises exception ORA-24191 if the property name exists or ORA-24192 if the property name is null.

set_short_property (property_name IN VARCHAR, property_value IN INT)

Checks whether `property_name` is null or exists. If not, the procedure checks whether `property_value` is within -32768 to 32767 (16-bits). This check is necessary because neither PL/SQL nor RDBMS defines the `short` datatype. Raises exception ORA-24191 if the property name exists, ORA-24192 if the property name is null, or ORA-24193 if the property value exceeds the valid range.

set_string_property (property_name IN VARCHAR, property_value IN VARCHAR)

Checks whether `property_name` is null or exists. If not, the procedure stores `property_value`. Raises exception ORA-24191 if the property name exists or ORA-24192 if the property name is null.

get_boolean_property (property_name IN VARCHAR) RETURN BOOLEAN

If the property with the corresponding property name passed in exists, and if it is a `BOOLEAN` property, then this function returns the value of the property. Otherwise it returns a null.

get_byte_property (property_name IN VARCHAR) RETURN INT

If the property with the corresponding property name passed in exists, and if it is a `BYTE` property, then this function returns the value of the property. Otherwise it returns a null.

get_double_property (property_name IN VARCHAR) RETURN DOUBLE PRECISION

If the property with the corresponding property name passed in exists, and if it is a `DOUBLE` property, then this function returns the value of the property. Otherwise it returns a null.

get_float_property (property_name IN VARCHAR) RETURN FLOAT

If the property with the corresponding property name passed in exists, and if it is a `FLOAT` property, then this function returns the value of the property. Otherwise it returns a null.

get_int_property (property_name IN VARCHAR) RETURN INT

If the property with the corresponding property name passed in exists, and if it is a `Integer` property, then this function returns the value of the property. Otherwise it returns a null.

get_long_property (property_name IN VARCHAR) RETURN NUMBER

If the property with the corresponding property name passed in exists, and if it is a `long` property, then this function returns the value of the property. Otherwise it returns a null.

get_short_property (property_name IN VARCHAR) RETURN INT

If the property with the corresponding property name passed in exists, and if it is a `short` property, then this function returns the value of the property. Otherwise it returns a null.

get_string_property (property_name IN VARCHAR) RETURN VARCHAR

If the property with the corresponding property name passed in exists, and if it is a `STRING` property, then this function returns the value of the property. Otherwise it returns a null.

Payload Methods**set_text (payload IN VARCHAR2)**

Sets the payload, a `VARCHAR2` value, to an internal representation.

set_text (payload IN CLOB)

Sets the payload, a `CLOB` value, to an internal representation.

get_text (payload OUT VARCHAR2)

Puts the internal representation of the payload into a `VARCHAR2` variable payload.

get_text (payload OUT CLOB)

Puts the internal representation of the payload into a `CLOB` variable payload.

290.9.3 SYS.AQ\$_JMS_BYTES_MESSAGE Type

The `SYS.AQ$_JMS_BYTES_MESSAGE` type is the ADT used to store a `BytesMessage` in an Oracle Database Advanced Queuing queue.

```

CONSTRUCT aq\$_jms_bytes_message Function

STATIC FUNCTION construct RETURN aq\$_jms_bytes_message

Creates an empty aq\$_jms_bytes_message.

JMS Header Methods

set_replyto (replyto IN sys.aq\$_agent)

Sets the `replyto` parameter, which corresponds to `JMSReplyTo` in JMS.

set_type (type IN VARCHAR)

Sets the JMS type, which can be any text, and which corresponds to `JMSType` in JMS.

get_replyto RETURN sys.aq\$_agent

Returns `replyto`, which corresponds to `JMSReplyTo`.

get_type RETURN VARCHAR

Returns `type`, which corresponds to `JMSType`.

System Properties Methods

set_userid (userid IN VARCHAR)

Sets `userid`, which corresponds to `JMSXUserID` in JMS.

set_appid (appid IN VARCHAR)

Sets `appid`, which corresponds to `JMSXAppID` in JMS.

set_groupid (groupid IN VARCHAR)

Sets `groupid`, which corresponds to `JMSXGroupID` in JMS.

set_groupseq (groupseq IN INT)

Sets `groupseq`, which corresponds to `JMSXGroupSeq` in JMS.

get_userid RETURN VARCHAR

Returns `userid`, which corresponds to `JMSXUserID`.

get_appid RETURN VARCHAR

Returns `appid`, which corresponds to `JMSXAppID`.

get_groupid RETURN VARCHAR

Returns `groupid`, which corresponds to `JMSXGroupID`.

get_groupseq RETURN NUMBER

Returns `groupseq`, which corresponds to `JMSXGroupSeq`.

User Properties Methods

clear_properties

Clears all user properties. This procedure does not affect system properties.

set_boolean_property (property_name IN VARCHAR, property_value IN BOOLEAN)

Checks whether `property_name` is null or exists. If not, the procedure stores `property_value` in an internal representation. Raises exception ORA-24191 if the property name exists or ORA-24192 if the property name is null.

set_byte_property (property_name IN VARCHAR, property_value IN INT)

Checks whether `property_name` is null or exists. If not, the procedure checks whether `property_value` is within -128 to 127 (8-bits). This check is necessary because neither PL/SQL nor RDBMS defines the `BYTE` datatype. Raises exception ORA-24191 if the property name exists, ORA-24192 if the property name is null, or ORA-24193 if the property value exceeds the valid range.

set_double_property (property_name IN VARCHAR, property_value IN DOUBLE PRECISION)

Checks whether `property_name` is null or exists. If not, the procedure stores `property_value`. Raises exception ORA-24191 if the property name exists or ORA-24192 if the property name is null.

set_float_property (property_name IN VARCHAR, property_value IN FLOAT)

Checks whether `property_name` is null or exists. If not, the procedure stores `property_value`. Raises exception ORA-24191 if the property name exists or ORA-24192 if the property name is null.

set_int_property (property_name IN VARCHAR, property_value IN INT)

Checks whether `property_name` is null or exists. If not, the procedure checks whether `property_value` is within -2147483648 to 2147483647 (32-bits). This check is necessary because in PL/SQL and Oracle Database, the `INT` datatype is 38 bits. Raises exception ORA-24191 if the property name exists, ORA-24192 if the property name is null, or ORA-24193 if the property value exceeds the valid range.

set_long_property (property_name IN VARCHAR, property_value IN NUMBER)

Checks whether `property_name` is null or exists. If not, the procedure stores `property_value`. In PL/SQL and Oracle Database, the `NUMBER` datatype is 38 bits. In Java, the `long` datatype is 64 bits. Therefore, no range check is needed. Raises exception ORA-24191 if the property name exists or ORA-24192 if the property name is null.

set_short_property (property_name IN VARCHAR, property_value IN INT)

Checks whether `property_name` is null or exists. If not, the procedure checks whether `property_value` is within -32768 to 32767 (16-bits). This check is necessary because neither PL/SQL nor RDBMS defines the `short` datatype. Raises exception ORA-24191 if the property name exists, ORA-24192 if the property name is null, or ORA-24193 if the property value exceeds the valid range.

set_string_property (property_name IN VARCHAR, property_value IN VARCHAR)

Checks whether `property_name` is null or exists. If not, the procedure stores `property_value`. Raises exception ORA-24191 if the property name exists or ORA-24192 if the property name is null.

get_boolean_property (property_name IN VARCHAR) RETURN BOOLEAN

If the property with the corresponding property name passed in exists, and if it is a `BOOLEAN` property, then this function returns the value of the property. Otherwise it returns a null.

get_byte_property (property_name IN VARCHAR) RETURN INT

If the property with the corresponding property name passed in exists, and if it is a `BYTE` property, then this function returns the value of the property. Otherwise it returns a null.

get_double_property (property_name IN VARCHAR) RETURN DOUBLE PRECISION

If the property with the corresponding property name passed in exists, and if it is a `DOUBLE` property, then this function returns the value of the property. Otherwise it returns a null.

get_float_property (property_name IN VARCHAR) RETURN FLOAT

If the property with the corresponding property name passed in exists, and if it is a `FLOAT` property, then this function returns the value of the property. Otherwise it returns a null.

get_int_property (property_name IN VARCHAR) RETURN INT

If the property with the corresponding property name passed in exists, and if it is a `Integer` property, then this function returns the value of the property. Otherwise it returns a null.

get_long_property (property_name IN VARCHAR) RETURN NUMBER

If the property with the corresponding property name passed in exists, and if it is a `long` property, then this function returns the value of the property. Otherwise it returns a null.

get_short_property (property_name IN VARCHAR) RETURN INT

If the property with the corresponding property name passed in exists, and if it is a `short` property, then this function returns the value of the property. Otherwise it returns a null.

get_string_property (property_name IN VARCHAR) RETURN VARCHAR

If the property with the corresponding property name passed in exists, and if it is a `STRING` property, then this function returns the value of the property. Otherwise it returns a null.

Payload Methods

set_bytes (payload in RAW)

Sets the payload, a `RAW` value, to an internal representation.

set_bytes (payload in BLOB)

Sets the payload, a `BLOB` value, to an internal representation.

get_bytes (payload out RAW)

Puts the internal representation of the payload into a `RAW` variable payload. Raises exception ORA-24190 if the length of the internal payload is more than 32767 (the maximum length of `RAW` in PL/SQL).

get_bytes (payload out BLOB)

Puts the internal representation of the payload into a `BLOB` variable payload.

prepare (id IN PLS_INTEGER) RETURN PLS_INTEGER

Takes the byte array stored in `aq$_jms_bytes_message` and decodes it as a Java object in the Java stored procedure. The result of the decoding is stored as a static variable in `Jserv` session memory. Parameter `id` is used to identify the slot where the Java object is stored in the Oracle Database JVM session memory. If `id` is null, then a new slot is created for this PL/SQL object. Subsequent JMS operations on the payload need to provide this operation ID.

This function also sets the message access mode to `MESSAGE_ACCESS_READONLY`.

Subsequent calls of `write_XXX` procedure raise an ORA-24196 error. Users can call the `clear_body` procedure to set the message access mode to `MESSAGE_ACCESS_READONLY`.

This function raises ORA-24197 if the Java stored procedure throws an exception during execution, ORA-24198 if the operation ID is invalid, or ORA-24199 if the Java stored procedure message store overflows.

reset (id IN PLS_INTEGER)

Resets the starting position of the stream to the beginning and puts the bytes message in read-only mode. Raises exception ORA-24197 if the Java stored procedure throws an exception during execution or ORA-24198 if the operation ID is invalid.

flush (id IN PLS_INTEGER)

Takes the static variable in `Jserv` and synchronizes the content back to the `aq$_jms_bytes_message`. This procedure will not affect the underlying access mode. This procedure raises ORA-24197 if the Java stored procedure throws an exception during execution or ORA-24198 if the operation ID is invalid.

clear_body (id IN PLS_INTEGER)

Sets the Java stored procedure static variable to empty payload. Parameter `id` is used to identify the slot where the Java object is stored in the Oracle Database JVM session memory. If `id` is null, a new slot is created for this PL/SQL object. Subsequent JMS operations on the payload need to provide this operation ID.

It also sets the message access mode to `MESSAGE_ACCESS_WRITEONLY`. Later calls of `read_XXX` procedure raise ORA-24196 error. Users can call the `reset` or `prepare` procedures to set the message access mode to `MESSAGE_ACCESS_READONLY`. Write-only and read-only modes affect only the payload functions of `AQ$_JMS_BYTES_MESSAGE`. They do not affect the header functions.

This function raises ORA-24197 if the Java stored procedure throws an exception during execution, ORA-24198 if the operation ID is invalid, or ORA-24199 if the Java stored procedure message store overflows.

clean (id IN PLS_INTEGER)

Closes and cleans up the `DataInputStream` or `DataOutputStream` at the Java stored procedure side corresponding to the operation ID. It is very important to call this procedure to avoid memory leaks. This procedure raises ORA-24197 if the Java stored procedure throws an exception during execution or ORA-24198 if the operation ID is invalid.

clean_all

Closes and cleans up all the messages in the corresponding type of message store at the Java stored procedure side. This procedure raises ORA-24197 if the Java stored procedure throws an exception during execution.

get_mode (id IN PLS_INTEGER) RETURN PLS_INTEGER

Returns the current mode of this message. The return value is either `SYS.dbms_jms.plsql.MESSAGE_ACCESS_READONLY` or `SYS.dbms_jms.plsql.MESSAGE_ACCESS_WRITEONLY`. Raises exception ORA-24197 if the Java stored procedure throws an exception during execution or ORA-24198 if the operation ID is invalid.

read_boolean (id IN PLS_INTEGER) RETURN BOOLEAN

Reads a Boolean value from the bytes message and returns the Boolean value read. Null is returned if the end of the message stream has been reached. Parameter `id` is the operation ID. Raises exception ORA-24196 if the bytes message is in write-only mode, ORA-24197 if the Java stored procedure throws an exception during execution, or ORA-24198 if the operation ID is invalid.

read_byte (id IN PLS_INTEGER) RETURN PLS_INTEGER

Reads a `BYTE` value from the bytes message and returns the `BYTE` value read. Null is returned if the end of the stream has been reached. Because there is no `BYTE` type in PL/SQL, Oracle Database uses `PLS_INTEGER` to represent a `BYTE`. Although PL/SQL users get a `PLS_INTEGER`, they are guaranteed that the value is in the Java `BYTE` value range. If this value is issued with a `write_byte` function, then there will not be an out of range error. Parameter `id` is the operation ID. Raises exception ORA-24196 if the bytes message is in write-only mode, ORA-24197 if the Java stored procedure throws an exception during execution, or ORA-24198 if the operation ID is invalid.

read_bytes (id IN PLS_INTEGER, value OUT NO COPY BLOB, length IN PLS_INTEGER) RETURN PLS_INTEGER

Reads length of the bytes from bytes message stream into value and returns the total number of bytes read. If there is no more data (because the end of the stream has been reached), then it returns -1. Raises exceptions ORA-24196 if the bytes message is in write-only mode, ORA-24197 if the Java stored procedure throws an exception during execution, or ORA-24198 if the operation ID is invalid.

read_char (id IN PLS_INTEGER) RETURN CHAR

Reads a character value from the bytes message and returns the character value read. Null is returned if the end of the stream has been reached. Raises exception ORA-24196 if the bytes message is in write-only mode, ORA-24197 if the Java stored procedure throws an exception during execution, or ORA-24198 if the operation ID is invalid.

read_double (id IN PLS_INTEGER) RETURN DOUBLE PRECISION

Reads a double from the bytes message and returns the character value read. Null is returned if the end of the stream has been reached. Raises exception ORA-24196 if the bytes message is in write-only mode, ORA-24197 if the Java stored procedure throws an exception during execution, or ORA-24198 if the operation ID is invalid.

read_float (id IN PLS_INTEGER) RETURN FLOAT

Reads a float from the bytes message and returns the float read. Null is returned if the end of the stream has been reached. Raises exception ORA-24196 if the bytes message is in write-only mode, ORA-24197 if the Java stored procedure throws an exception during execution, or ORA-24198 if the operation ID is invalid.

read_int (id IN PLS_INTEGER) RETURN INT

Reads an `INT` from the bytes message and returns the `INT` read. Null is returned if the end of the stream has been reached. Raises exception ORA-24196 if the bytes

message is in write-only mode, ORA-24197 if the Java stored procedure throws an exception during execution, or ORA-24198 if the operation ID is invalid.

read_long (id IN PLS_INTEGER) RETURN NUMBER

Reads a long from the bytes message and returns the long read. Null is returned if the end of the stream has been reached. Raises exception ORA-24196 if the bytes message is in write-only mode, ORA-24197 if the Java stored procedure throws an exception during execution, or ORA-24198 if the operation ID is invalid.

read_short (id IN PLS_INTEGER) RETURN PLS_INTEGER

Reads a short value from the bytes message and returns the short value read. Null is returned if the end of the stream has been reached. Because there is no short type in PL/SQL, `PLS_INTEGER` is used to represent a `SHORT`. Although PL/SQL users get an `PLS_INTEGER`, they are guaranteed that the value is in the Java short value range. If this value is issued with a `write_short` function, then there will not be an out of range error. Raises exception ORA-24196 if the bytes message is in write-only mode, ORA-24197 if the Java stored procedure throws an exception during execution, or ORA-24198 if the operation ID is invalid.

read_unsigned_byte (id IN PLS_INTEGER) RETURN PLS_INTEGER

Reads an unsigned 8-bit number from the bytes message stream and returns the next byte from the bytes message stream, interpreted as an unsigned 8-bit number. Null is returned if the end of the stream has been reached. Raises exception ORA-24196 if the bytes message is in write-only mode, ORA-24197 if the Java stored procedure throws an exception during execution, or ORA-24198 if the operation ID is invalid.

read_unsigned_short (id IN PLS_INTEGER) RETURN PLS_INTEGER

Reads an unsigned 16-bit number from the bytes message stream and returns the next two bytes from the bytes message stream, interpreted as an unsigned 16-bit integer. Null is returned if the end of the stream has been reached. Raises exception ORA-24196 if the bytes message is in write-only mode, ORA-24197 if the Java stored procedure throws an exception during execution, or ORA-24198 if the operation ID is invalid.

read_utf (id IN PLS_INTEGER, value OUT NOCOPY CLOB)

Reads a string that has been encoded using a UTF-8 format from the bytes message. Null is returned if the end of the stream has been reached. Raises exception ORA-24196 if the bytes message is in write-only mode, ORA-24197 if the Java stored procedure throws an exception during execution, or ORA-24198 if the operation ID is invalid.

write_boolean (id IN PLS_INTEGER, value IN BOOLEAN)

Writes a Boolean to the bytes message stream as a 1-byte value. The value `true` is written as the value (byte)1. The value `false` is written as the value (byte)0. Raises exception ORA-24196 if the bytes message is in read-only mode, ORA-24197 if the Java stored procedure throws an exception during execution, or ORA-24198 if the operation ID is invalid.

write_byte (id IN PLS_INTEGER, value IN PLS_INTEGER)

Writes a byte to the bytes message. Because there is no `BYTE` type in PL/SQL, `PLS_INTEGER` is used to represent a `BYTE`. Raises exception ORA-24196 if the bytes message is in read-only mode, ORA-24197 if the Java stored procedure throws an exception during execution, or ORA-24198 if the operation ID is invalid.

write_bytes (id IN PLS_INTEGER, value IN RAW)

Writes an array of bytes to the bytes message. Raises exception ORA-24196 if the bytes message is in read-only mode, ORA-24197 if the Java stored procedure throws an exception during execution, or ORA-24198 if the operation ID is invalid.

write_bytes (id IN PLS_INTEGER, value IN BLOB)

Writes an array of bytes to the bytes message. Raises exception ORA-24196 if the bytes message is in read-only mode, ORA-24197 if the Java stored procedure throws an exception during execution, or ORA-24198 if the operation ID is invalid.

write_bytes (id IN PLS_INTEGER, value IN RAW, offset IN PLS_INTEGER, length IN PLS_INTEGER)

Writes a portion of a byte array to the bytes message stream. Parameter *offset* is the initial offset within the byte array. If the range [*offset*, *offset*+*length*] exceeds the boundary of the byte array value, then a Java IndexOutOfBoundsException exception is thrown in the Java stored procedure and this procedure raises error ORA-24197. The index starts from 0. Raises exception ORA-24196 if the bytes message is in read-only mode, ORA-24197 if the Java stored procedure throws an exception during execution, or ORA-24198 if the operation ID is invalid.

write_bytes (id IN PLS_INTEGER, value IN BLOB, offset IN INT, length IN INT)

Writes a portion of a byte array to the bytes message stream. Parameter *offset* is the initial offset within the byte array. If the range [*offset*, *offset*+*length*] exceeds the boundary of the byte array value, then a Java IndexOutOfBoundsException exception is thrown in the Java stored procedure and this procedure raises error ORA-24197. The index starts from 0. Raises exception ORA-24196 if the bytes message is in read-only mode, ORA-24197 if the Java stored procedure throws an exception during execution, or ORA-24198 if the operation ID is invalid.

write_char (id IN PLS_INTEGER, value IN CHAR)

Writes a character value to the bytes message. If this value has multiple characters, it is the first character that is written. Raises exception ORA-24196 if the bytes message is in read-only mode, ORA-24197 if the Java stored procedure throws an exception during execution, or ORA-24198 if the operation ID is invalid.

write_double (id IN PLS_INTEGER, value IN DOUBLE PRECISION)

Writes a double to the bytes message. Raises exception ORA-24196 if the bytes message is in read-only mode, ORA-24197 if the Java stored procedure throws an exception during execution, or ORA-24198 if the operation ID is invalid.

write_float (id IN PLS_INTEGER, value IN FLOAT)

Writes a float to the bytes message. Raises exception ORA-24196 if the bytes message is in read-only mode, ORA-24197 if the Java stored procedure throws an exception during execution, or ORA-24198 if the operation ID is invalid.

write_int (id IN PLS_INTEGER, value IN PLS_INTEGER)

Writes an `INT` to the bytes message. Raises exception ORA-24196 if the bytes message is in read-only mode, ORA-24197 if the Java stored procedure throws an exception during execution, or ORA-24198 if the operation ID is invalid.

write_long (id IN PLS_INTEGER, value IN NUMBER)

Writes a long to the bytes message. Raises exception ORA-24196 if the bytes message is in read-only mode, ORA-24197 if the Java stored procedure throws an exception during execution, or ORA-24198 if the operation ID is invalid.

write_short (id IN PLS_INTEGER, value IN PLS_INTEGER)

Writes a short to the bytes message as two bytes, high byte first. Because there is no short type in PL/SQL, `INT` is used to represent a short. Raises exception ORA-24193 if the parameter value exceeds the valid range, ORA-24196 if the bytes message is in

read-only mode, ORA-24197 if the Java stored procedure throws an exception during execution, or ORA-24198 if the operation ID is invalid.

write_utf (id IN PLS_INTEGER, value IN VARCHAR2)

Writes a string to the bytes message stream using UTF-8 encoding in a machine-independent manner. Raises exception ORA-24196 if the bytes message is in read-only mode, ORA-24197 if the Java stored procedure throws an exception during execution, or ORA-24198 if the operation ID is invalid.

write_utf (id IN PLS_INTEGER, value IN CLOB)

Writes a string to the bytes message stream using UTF-8 encoding in a machine-independent manner. Raises exception ORA-24196 if the bytes message is in read-only mode, ORA-24197 if the Java stored procedure throws an exception during execution, or ORA-24198 if the operation ID is invalid.

290.9.4 SYS.AQ\$_JMS_MAP_MESSAGE Type

This type is the ADT used to store a `MapMessage` in an Oracle Database Advanced Queuing queue.

This section contains these topics:

- [CONSTRUCT aq\\$_jms_map_message Function](#)
- [JMS Header Methods](#)
- [System Properties Methods](#)
- [User Properties Methods](#)
- [Payload Methods](#)

Syntax

```
TYPE aq$_jms_map_message AS object(
  header      aq$_jms_header,

    RETURN BOOLEAN);

```

CONSTRUCT aq\$_jms_map_message Function

STATIC FUNCTION construct RETURN aq\$_jms_map_message

Creates an empty aq\$_jms_map_message object.

JMS Header Methods

set_replyto (replyto IN sys.aq\$_agent)

Sets the `replyto` parameter, which corresponds to `JMSReplyTo` in JMS.

set_type (type IN VARCHAR)

Sets the JMS type, which can be any text, and which corresponds to `JMSType` in JMS.

get_replyto RETURN sys.aq\$_agent

Returns `replyto`, which corresponds to `JMSReplyTo`.

get_type RETURN VARCHAR

Returns `type`, which corresponds to `JMSType`.

System Properties Methods

set_userid (userid IN VARCHAR)

Sets `userid`, which corresponds to `JMSXUserID` in JMS.

set_appid (appid IN VARCHAR)

Sets `appid`, which corresponds to `JMSXAppID` in JMS.

set_groupid (groupid IN VARCHAR)

Sets `groupid`, which corresponds to `JMSXGroupID` in JMS.

set_groupseq (groupseq IN INT)

Sets `groupseq`, which corresponds to `JMSXGroupSeq` in JMS.

get_userid RETURN VARCHAR

Returns `userid`, which corresponds to `JMSXUserID`.

get_appid RETURN VARCHAR

Returns `appid`, which corresponds to `JMSXAppID`.

get_groupid RETURN VARCHAR

Returns `groupid`, which corresponds to `JMSXGroupID`.

get_groupseq RETURN NUMBER

Returns `groupseq`, which corresponds to `JMSXGroupSeq`.

User Properties Methods**clear_properties**

Clears all user properties. This procedure does not affect system properties.

set_boolean_property (property_name IN VARCHAR, property_value IN BOOLEAN)

Checks whether `property_name` is null or exists. If not, the procedure stores `property_value` in an internal representation. Raises exception ORA-24191 if the property name exists or ORA-24192 if the property name is null.

set_byte_property (property_name IN VARCHAR, property_value IN INT)

Checks whether `property_name` is null or exists. If not, the procedure checks whether `property_value` is within -128 to 127 (8-bits). This check is necessary because neither PL/SQL nor RDBMS defines the `BYTE` datatype. Raises exception ORA-24191 if the property name exists, ORA-24192 if the property name is null, or ORA-24193 if the property value exceeds the valid range.

set_double_property (property_name IN VARCHAR, property_value IN DOUBLE PRECISION)

Checks whether `property_name` is null or exists. If not, the procedure stores `property_value`. Raises exception ORA-24191 if the property name exists or ORA-24192 if the property name is null.

set_float_property (property_name IN VARCHAR, property_value IN FLOAT)

Checks whether `property_name` is null or exists. If not, the procedure stores `property_value`. Raises exception ORA-24191 if the property name exists or ORA-24192 if the property name is null.

set_int_property (property_name IN VARCHAR, property_value IN INT)

Checks whether `property_name` is null or exists. If not, the procedure checks whether `property_value` is within -2147483648 to 2147483647 (32-bits). This check is necessary because in PL/SQL and Oracle Database, the `INT` datatype is 38 bits. Raises exception ORA-24191 if the property name exists, ORA-24192 if the property name is null, or ORA-24193 if the property value exceeds the valid range.

set_long_property (property_name IN VARCHAR, property_value IN NUMBER)

Checks whether `property_name` is null or exists. If not, the procedure stores `property_value`. In PL/SQL and Oracle Database, the `NUMBER` datatype is 38 bits. In Java, the `long` datatype is 64 bits. Therefore, no range check is needed. Raises exception ORA-24191 if the property name exists or ORA-24192 if the property name is null.

set_short_property (property_name IN VARCHAR, property_value IN INT)

Checks whether `property_name` is null or exists. If not, the procedure checks whether `property_value` is within -32768 to 32767 (16-bits). This check is necessary because

neither PL/SQL nor RDBMS defines the `short` datatype. Raises exception ORA-24191 if the property name exists, ORA-24192 if the property name is null, or ORA-24193 if the property value exceeds the valid range.

set_string_property (property_name IN VARCHAR, property_value IN VARCHAR)

Checks whether `property_name` is null or exists. If not, the procedure stores `property_value`. Raises exception ORA-24191 if the property name exists or ORA-24192 if the property name is null.

get_boolean_property (property_name IN VARCHAR) RETURN BOOLEAN

If the property with the corresponding property name passed in exists, and if it is a `BOOLEAN` property, then this function returns the value of the property. Otherwise it returns a null.

get_byte_property (property_name IN VARCHAR) RETURN INT

If the property with the corresponding property name passed in exists, and if it is a `BYTE` property, then this function returns the value of the property. Otherwise it returns a null.

get_double_property (property_name IN VARCHAR) RETURN DOUBLE PRECISION

If the property with the corresponding property name passed in exists, and if it is a `DOUBLE` property, then this function returns the value of the property. Otherwise it returns a null.

get_float_property (property_name IN VARCHAR) RETURN FLOAT

If the property with the corresponding property name passed in exists, and if it is a `FLOAT` property, then this function returns the value of the property. Otherwise it returns a null.

get_int_property (property_name IN VARCHAR) RETURN INT

If the property with the corresponding property name passed in exists, and if it is a `Integer` property, then this function returns the value of the property. Otherwise it returns a null.

get_long_property (property_name IN VARCHAR) RETURN NUMBER

If the property with the corresponding property name passed in exists, and if it is a `long` property, then this function returns the value of the property. Otherwise it returns a null.

get_short_property (property_name IN VARCHAR) RETURN INT

If the property with the corresponding property name passed in exists, and if it is a `short` property, then this function returns the value of the property. Otherwise it returns a null.

get_string_property (property_name IN VARCHAR) RETURN VARCHAR

If the property with the corresponding property name passed in exists, and if it is a `STRING` property, then this function returns the value of the property. Otherwise it returns a null.

Payload Methods

set_bytes (payload IN RAW)

Sets the internal payload as a `RAW` variable without any interpretation. The payload of `aq$_jms_map_message` is stored as either `RAW` or `BLOB` in the database. This member function sets a payload as a `RAW` variable without interpreting it.

set_bytes (payload IN BLOB)

Sets the internal payload as a `BLOB` variable without any interpretation. The payload of `aq$_jms_map_message` is stored as either `RAW` or `BLOB` in the database. This member function sets a payload as a `BLOB` variable without interpreting it.

get_bytes (payload OUT RAW)

Puts the internal payload into a `RAW` variable without any interpretation. The payload of `aq$_jms_map_message` is stored as either `RAW` or `BLOB` in the database. This member function gets a payload as raw bytes without interpreting it. Raises exceptions `ORA-24190` if the length of internal payload is more than 32767.

get_bytes (payload OUT BLOB)

Puts the internal payload into a `BLOB` variable without any interpretation. The payload of `aq$_jms_map_message` is stored as either `RAW` or `BLOB` in the database. This member function gets a payload as a `BLOB` without interpreting it.

prepare (id IN PLS_INTEGER) RETURN PLS_INTEGER

Takes the byte array stored in `aq$_jms_map_message` and decodes it as a Java object in the Java stored procedure. The result of the decoding is stored as a static variable in Jserv session memory. Parameter `id` is used to identify the slot where the Java object is stored in the Oracle Database JVM session memory. If `id` is null, then a new slot is created for this PL/SQL object. Subsequent JMS operations on the payload need to provide this operation ID.

This function raises `ORA-24197` if the Java stored procedure throws an exception during execution, `ORA-24198` if the operation ID is invalid, or `ORA-24199` if the Java stored procedure message store overflows.

flush (id IN PLS_INTEGER)

Takes the static variable in Jserv and synchronizes the content back to `aq$_jms_map_message`. This procedure raises `ORA-24197` if the Java stored procedure throws an exception during execution or `ORA-24198` if the operation ID is invalid.

clear_body (id IN PLS_INTEGER)

Sets the Java stored procedure static variable to empty payload. Parameter `id` is used to identify the slot where the Java object is stored in the Oracle Database JVM session memory. If `id` is null, a new slot is created for this PL/SQL object. Subsequent JMS operations on the payload need to provide this operation ID.

This function raises `ORA-24197` if the Java stored procedure throws an exception during execution, `ORA-24198` if the operation ID is invalid, or `ORA-24199` if the Java stored procedure message store overflows.

clean (id IN PLS_INTEGER)

Closes and cleans up the `DataInputStream` or `DataOutputStream` at the Java stored procedure side corresponding to the operation ID. It is very important to call this procedure to avoid memory leaks. This procedure raises `ORA-24197` if the Java stored procedure throws an exception during execution or `ORA-24198` if the operation ID is invalid.

clean_all

Closes and cleans up all the messages in the corresponding type of message store at the Java stored procedure side. This procedure raises `ORA-24197` if the Java stored procedure throws an exception during execution.

set_boolean (id IN PLS_INTEGER, name IN VARCHAR2, value IN BOOLEAN)

Sets the Boolean value with the specified name in the map. Raises exception `ORA-24197` if the Java stored procedure throws an exception during execution or `ORA-24198` if the operation ID is invalid.

set_byte (id IN PLS_INTEGER, name IN VARCHAR2, value IN PLS_INTEGER)

Sets the `BYTE` value with the specified name in the map. Because there is no `BYTE` type in PL/SQL, `PLS_INTEGER` is used to represent a byte. Raises exception ORA-24197 if the Java stored procedure throws an exception during execution or ORA-24198 if the operation ID is invalid.

set_bytes (id IN PLS_INTEGER, name IN VARCHAR2, value IN RAW)

Sets the byte array value with the specified name in the map. Raises exception ORA-24197 if the Java stored procedure throws an exception during execution or ORA-24198 if the operation ID is invalid.

set_bytes (id IN PLS_INTEGER, name IN VARCHAR2, value IN RAW, offset IN INT, length IN INT)

Sets a portion of the byte array value with the specified name in the map. Parameter `offset` is the initial offset within the byte array, and parameter `length` is the number of bytes to use. If the range [`offset ... offset+length`] exceeds the boundary of the byte array value, then a Java `IndexOutOfBoundsException` exception is thrown in the Java stored procedure and this procedure raises an ORA-24197 error. The index starts from 0. Raises exception ORA-24197 if the Java stored procedure throws an exception during execution or ORA-24198 if the operation ID is invalid.

set_bytes (id IN PLS_INTEGER, name IN VARCHAR2, value IN BLOB)

Sets the byte array value with the specified name in the map. Raises exception ORA-24197 if the Java stored procedure throws an exception during execution or ORA-24198 if the operation ID is invalid.

set_bytes (id IN PLS_INTEGER, name IN VARCHAR2, value IN BLOB, offset IN INT, length IN INT)

Sets a portion of the byte array value with the specified name in the map. Parameter `offset` is the initial offset within the byte array, and parameter `length` is the number of bytes to use. If the range [`offset ... offset+length`] exceeds the boundary of the byte array value, then a Java `IndexOutOfBoundsException` exception is thrown in the Java stored procedure, and this procedure raises an ORA-24197 error. The index starts from 0. Raises exception ORA-24197 if the Java stored procedure throws an exception during execution or ORA-24198 if the operation ID is invalid.

set_char (id IN PLS_INTEGER, name IN VARCHAR2, value IN CHAR)

Sets the character value with the specified name in the map. If this value has multiple characters, then it is the first character that is used. Raises exception ORA-24197 if the Java stored procedure throws an exception during execution or ORA-24198 if the operation ID is invalid.

set_double (id IN PLS_INTEGER, name IN VARCHAR2, value IN DOUBLE PRECISION)

Sets the double value with the specified name in the map. Raises exception ORA-24197 if the Java stored procedure throws an exception during execution or ORA-24198 if the operation ID is invalid.

set_float (id IN PLS_INTEGER, name IN VARCHAR2, value IN FLOAT)

This procedure is to set the float value with the specified name in the map. Raises exception ORA-24197 if the Java stored procedure throws an exception during execution or ORA-24198 if the operation ID is invalid.

set_int (id IN PLS_INTEGER, name IN VARCHAR2, value IN PLS_INTEGER)

Sets the int value with the specified name in the map. Raises exception ORA-24197 if the Java stored procedure throws an exception during execution or ORA-24198 if the operation ID is invalid.

set_long (id IN PLS_INTEGER, name IN VARCHAR2, value IN NUMBER)

Sets the long value with the specified name in the map. Raises exception ORA-24197 if the Java stored procedure throws an exception during execution or ORA-24198 if the operation ID is invalid.

set_short (id IN PLS_INTEGER, name IN VARCHAR2, value IN PLS_INTEGER)

Sets the short value with the specified name in the map. Because there is no short type in PL/SQL, `PLS_INTEGER` is used to represent a short. Raises exception ORA-24197 if the Java stored procedure throws an exception during execution or ORA-24198 if the operation ID is invalid.

set_string (id IN PLS_INTEGER, name IN VARCHAR2, value IN VARCHAR2)

Sets the string value with the specified name in the map. Raises exception ORA-24197 if the Java stored procedure throws an exception during execution or ORA-24198 if the operation ID is invalid.

set_string (id IN PLS_INTEGER, name IN VARCHAR2, value IN CLOB)

Sets the string value with the specified name in the map. Raises exception ORA-24197 if the Java stored procedure throws an exception during execution or ORA-24198 if the operation ID is invalid.

get_boolean (id IN PLS_INTEGER, name IN VARCHAR2) RETURN BOOLEAN

Retrieves the Boolean value with the specified name. If there is no item by this name, then null is returned. Raises exception ORA-24194 if the type conversion between the type of real value and the expected type is invalid, ORA-24197 if the Java stored procedure throws an exception during execution, or ORA-24198 if the operation ID is invalid.

get_byte (id IN PLS_INTEGER, name IN VARCHAR2) RETURN PLS_INTEGER

Retrieves the `BYTE` value with the specified name. If there is no item by this name, then null is returned. Because there is no `BYTE` type in PL/SQL, `PLS_INTEGER` is used to represent a byte. Although the PL/SQL users get an `PLS_INTEGER`, they are guaranteed that the value is in the Java `BYTE` value range. If this value is issued with a `set_byte` function, then there will not be an out of range error. Raises exception ORA-24194 if the type conversion between the type of real value and the expected type is invalid, ORA-24197 if the Java stored procedure throws an exception during execution, or ORA-24198 if the operation ID is invalid.

get_bytes (id IN PLS_INTEGER, name IN VARCHAR2, value OUT NOCOPY BLOB)

Retrieves the byte array value with the specified name. If there is no item by this name, then null is returned. Because the size of the array might be larger than the limit of PL/SQL `RAW` type, a `BLOB` is always returned here. The `BLOB` returned is a copy, which means it can be modified without affecting the message payload. Raises exception ORA-24194 if the type conversion between the type of real value and the expected type is invalid, ORA-24197 if the Java stored procedure throws an exception during execution, or ORA-24198 if the operation ID is invalid.

get_char (id IN PLS_INTEGER, name IN VARCHAR2) RETURN CHAR

Retrieves and returns the character value with the specified name. If there is no item by this name, then null is returned. Raises exception ORA-24194 if the type conversion between the type of real value and the expected type is invalid.

get_double (id IN PLS_INTEGER, name IN VARCHAR2) RETURN DOUBLE PRECISION

Retrieves and returns the double value with the specified name. If there is no item by this name, then null is returned. Raises exception ORA-24194 if the type conversion between the type of real value and the expected type is invalid.

get_float (id IN PLS_INTEGER, name IN VARCHAR2) RETURN FLOAT

Retrieves the float value with the specified name. If there is no item by this name, then null is returned. Raises exception ORA-24194 if the type conversion between the type of real value and the expected type is invalid, ORA-24197 if the Java stored procedure throws an exception during execution, or ORA-24198 if the operation ID is invalid.

get_int (id IN PLS_INTEGER, name IN VARCHAR2) RETURN PLS_INTEGER

Retrieves the `INT` value with the specified name. If there is no item by this name, then null is returned. Raises exception ORA-24194 if the type conversion between the type of real value and the expected type is invalid, ORA-24197 if the Java stored procedure throws an exception during execution, or ORA-24198 if the operation ID is invalid.

get_long (id IN PLS_INTEGER, name IN VARCHAR2) RETURN NUMBER

Retrieves the long value with the specified name. If there is no item by this name, then null is returned. Raises exception ORA-24194 if the type conversion between the type of real value and the expected type is invalid, ORA-24197 if the Java stored procedure throws an exception during execution, or ORA-24198 if the operation ID is invalid.

get_short (id IN PLS_INTEGER, name IN VARCHAR2) RETURN PLS_INTEGER

Retrieves the short value with the specified name. If there is no item by this name, then null is returned. Because there is no `short` type in PL/SQL, `INT` is used to represent a `short`. Although the PL/SQL users get an `PLS_INTEGER`, they are guaranteed that the value is in the Java short value range. If this value is issued with a `set_short` function, then there will not be an out of range error. Raises exception ORA-24194 if the type conversion between the type of real value and the expected type is invalid, ORA-24197 if the Java stored procedure throws an exception during execution, or ORA-24198 if the operation ID is invalid.

get_string (id IN PLS_INTEGER, name IN VARCHAR2, value OUT NOCOPY CLOB)

Retrieves the string value with the specified name. If there is no item by this name, then null is returned. Raises exception ORA-24194 if the type conversion between the type of real value and the expected type is invalid, ORA-24197 if the Java stored procedure throws an exception during execution, or ORA-24198 if the operation ID is invalid.

get_names (id IN PLS_INTEGER) RETURN aq\$_jms_namearray

Retrieves all the names within the map message and returns them in a varray. Because `aq$_jms_namearray` has a size as 1024 and each element is a `VARCHAR(200)`, this function will return an error if the size of the name array of the payload exceeds the limit. Raises exception ORA-24195 if the size of the name array or the size of a name exceeds the limit.

get_names (id IN PLS_INTEGER, names OUT aq\$_jms_namearray, offset IN PLS_INTEGER, length IN PLS_INTEGER) RETURN PLS_INTEGER

Retrieves a portion of the names within the map message. Because `aq$_jms_namearray` has a size as 1024 and each element is a `VARCHAR(200)`, this function will return an error if either limits are exceeded during the retrieval. (This means there is no sense to put a `length`

parameter greater than 1024.) The index of the names of a map messages begins from 0. Parameter `offset` is the offset from which to start retrieving.

The function returns the number of names that have been retrieved. The names retrieved is the intersection of the interval `[offset, offset+length-1]` and interval `[0, size-1]` where `size` is the size of this map message. If the intersection is an empty set, then names will be returned as null and the function returns 0 as the number of names retrieved. If users iterate the names by retrieving in small steps, then this can be used to test that there are no more names to read from map message.

Raises exception ORA-24195 if the size of the name array or the size of a name exceed the limit, ORA-24197 if the Java stored procedure throws an exception during execution or ORA-24198 if the operation ID is invalid.

get_object (id IN PLS_INTEGER, name IN VARCHAR2, value OUT NOCOPY AQ\$_JMS_VALUE)

Returns a general value ADT `AQ$_JMS_VALUE`. If there is no item by this name, then null is returned. Users can use the `type` attribute of this ADT to interpret the data. See the map in the `AQ$_JMS_VALUE` ADT for the correspondence among `dbms_jms_plsql` package constants, Java datatype and `AQ$_JMS_VALUE` attribute. Note this member procedure might bring additional overhead compared to other `get` member procedures or functions. It is used only if the user does not know the datatype of the fields within a message before hand. Otherwise it is a good idea to use a specific `get` member procedure or function. Raises exception ORA-24197 if the Java stored procedure throws an exception during execution or ORA-24198 if the operation ID is invalid.

get_size (id IN PLS_INTEGER) RETURN PLS_INTEGER

Retrieves the size of the map message. Raises exception ORA-24197 if the Java stored procedure throws an exception during execution or ORA-24198 if the operation ID is invalid.

item_exists (id IN PLS_INTEGER, name IN VARCHAR2) RETURN BOOLEAN

Indicates that an item exists in this map message by returning `TRUE`. Raises exception ORA-24197 if the Java stored procedure throws an exception during execution or ORA-24198 if the operation ID is invalid.

290.9.5 SYS.AQ\$_JMS_STREAM_MESSAGE Type

This type is the ADT used to store a `StreamMessage` in an Oracle Database Advanced Queuing queue.

This section contains these topics:

- [CONSTRUCT `aq\$_jms_stream_message` Function](#)
- [JMS Header Methods](#)
- [System Properties Methods](#)
- [User Properties Methods](#)
- [Payload Methods](#)

Syntax

```
TYPE aq$_jms_stream_message AS object(
  header      aq$_jms_header,
  bytes_len   int,
  bytes_raw   raw(2000),
```

```

```

CONSTRUCT aq\$_jms_stream_message Function**STATIC FUNCTION construct RETURN aq\$_jms_stream_message**

Creates an empty aq\$_jms_stream_message object.

JMS Header Methods**set_replyto (replyto IN sys.aq\$_agent)**

Sets the replyto parameter, which corresponds to JMSReplyTo in JMS.

set_type (type IN VARCHAR)

Sets the JMS type, which can be any text, and which corresponds to JMSType in JMS.

get_replyto RETURN sys.aq\$_agent

Returns replyto, which corresponds to JMSReplyTo.

get_type RETURN VARCHAR

Returns type, which corresponds to JMSType.

System Properties Methods**set_userid (userid IN VARCHAR)**

Sets userid, which corresponds to JMSXUserID in JMS.

set_appid (appid IN VARCHAR)

Sets appid, which corresponds to JMSXAppID in JMS.

set_groupid (groupid IN VARCHAR)

Sets groupid, which corresponds to JMSXGroupID in JMS.

set_groupseq (groupseq IN INT)

Sets groupseq, which corresponds to JMSXGroupSeq in JMS.

get_userid RETURN VARCHAR

Returns userid, which corresponds to JMSXUserID.

get_appid RETURN VARCHAR

Returns `appid`, which corresponds to `JMSXAppID`.

get_groupid RETURN VARCHAR

Returns `groupid`, which corresponds to `JMSXGroupID`.

get_groupseq RETURN NUMBER

Returns `groupseq`, which corresponds to `JMSXGroupSeq`.

User Properties Methods**clear_properties**

Clears all user properties. This procedure does not affect system properties.

set_boolean_property (property_name IN VARCHAR, property_value IN BOOLEAN)

Checks whether `property_name` is null or exists. If not, the procedure stores `property_value` in an internal representation. Raises exception ORA-24191 if the property name exists or ORA-24192 if the property name is null.

set_byte_property (property_name IN VARCHAR, property_value IN INT)

Checks whether `property_name` is null or exists. If not, the procedure checks whether `property_value` is within -128 to 127 (8-bits). This check is necessary because neither PL/SQL nor RDBMS defines the `BYTE` datatype. Raises exception ORA-24191 if the property name exists, ORA-24192 if the property name is null, or ORA-24193 if the property value exceeds the valid range.

set_double_property (property_name IN VARCHAR, property_value IN DOUBLE PRECISION)

Checks whether `property_name` is null or exists. If not, the procedure stores `property_value`. Raises exception ORA-24191 if the property name exists or ORA-24192 if the property name is null.

set_float_property (property_name IN VARCHAR, property_value IN FLOAT)

Checks whether `property_name` is null or exists. If not, the procedure stores `property_value`. Raises exception ORA-24191 if the property name exists or ORA-24192 if the property name is null.

set_int_property (property_name IN VARCHAR, property_value IN INT)

Checks whether `property_name` is null or exists. If not, the procedure checks whether `property_value` is within -2147483648 to 2147483647 (32-bits). This check is necessary because in PL/SQL and Oracle Database, the `INT` datatype is 38 bits. Raises exception ORA-24191 if the property name exists, ORA-24192 if the property name is null, or ORA-24193 if the property value exceeds the valid range.

set_long_property (property_name IN VARCHAR, property_value IN NUMBER)

Checks whether `property_name` is null or exists. If not, the procedure stores `property_value`. In PL/SQL and Oracle Database, the `NUMBER` datatype is 38 bits. In Java, the `long` datatype is 64 bits. Therefore, no range check is needed. Raises exception ORA-24191 if the property name exists or ORA-24192 if the property name is null.

set_short_property (property_name IN VARCHAR, property_value IN INT)

Checks whether `property_name` is null or exists. If not, the procedure checks whether `property_value` is within -32768 to 32767 (16-bits). This check is necessary because neither PL/SQL nor RDBMS defines the `short` datatype. Raises exception ORA-24191 if the

property name exists, ORA-24192 if the property name is null, or ORA-24193 if the property value exceeds the valid range.

set_string_property (property_name IN VARCHAR, property_value IN VARCHAR)

Checks whether `property_name` is null or exists. If not, the procedure stores `property_value`. Raises exception ORA-24191 if the property name exists or ORA-24192 if the property name is null.

get_boolean_property (property_name IN VARCHAR) RETURN BOOLEAN

If the property with the corresponding property name passed in exists, and if it is a `BOOLEAN` property, then this function returns the value of the property. Otherwise it returns a null.

get_byte_property (property_name IN VARCHAR) RETURN INT

If the property with the corresponding property name passed in exists, and if it is a `BYTE` property, then this function returns the value of the property. Otherwise it returns a null.

get_double_property (property_name IN VARCHAR) RETURN DOUBLE PRECISION

If the property with the corresponding property name passed in exists, and if it is a `DOUBLE` property, then this function returns the value of the property. Otherwise it returns a null.

get_float_property (property_name IN VARCHAR) RETURN FLOAT

If the property with the corresponding property name passed in exists, and if it is a `FLOAT` property, then this function returns the value of the property. Otherwise it returns a null.

get_int_property (property_name IN VARCHAR) RETURN INT

If the property with the corresponding property name passed in exists, and if it is a `Integer` property, then this function returns the value of the property. Otherwise it returns a null.

get_long_property (property_name IN VARCHAR) RETURN NUMBER

If the property with the corresponding property name passed in exists, and if it is a `long` property, then this function returns the value of the property. Otherwise it returns a null.

get_short_property (property_name IN VARCHAR) RETURN INT

If the property with the corresponding property name passed in exists, and if it is a `short` property, then this function returns the value of the property. Otherwise it returns a null.

get_string_property (property_name IN VARCHAR) RETURN VARCHAR

If the property with the corresponding property name passed in exists, and if it is a `STRING` property, then this function returns the value of the property. Otherwise it returns a null.

Payload Methods

get_bytes (payload OUT RAW)

Puts the internal payload into a `RAW` variable without any interpretation. The payload of type `aq$_jms_stream_message` is stored as either `RAW` or `BLOB` in the database. This

member function gets a payload as raw bytes without interpreting it. Raises exception ORA-24190 if the length of internal payload is more than 32767.

get_bytes (payload OUT BLOB)

Puts the internal payload into a BLOB variable without any interpretation. The payload of type `aq$_jms_stream_message` is stored as either RAW or BLOB in the database. This member function gets a payload as a BLOB variable without interpreting it.

set_bytes (payload IN RAW)

Sets the internal payload as the RAW variable without any interpretation. The payload of type `aq$_jms_stream_message` is stored as either RAW or BLOB in the database. This member function sets a payload as raw bytes without interpreting it.

set_bytes (payload IN BLOB)

Sets the internal payload as the BLOB variable without any interpretation. The payload of type `aq$_jms_stream_message` is stored as either RAW or BLOB in the database. This member function sets a payload as a BLOB variable without interpreting it.

prepare (id IN PLS_INTEGER) RETURN PLS_INTEGER

Takes the byte array stored in `aq$_jms_stream_message` and decodes it as a Java object in the Java stored procedure. The result of the decoding is stored as a static variable in Jserv session memory. Parameter `id` is used to identify the slot where the Java object is stored in the Oracle Database JVM session memory. If `id` is null, then a new slot is created for this PL/SQL object. Subsequent JMS operations on the payload need to provide this operation ID.

This function also sets the message access mode to `MESSAGE_ACCESS_READONLY`.

Subsequent calls of `write_XXX` procedure raise an ORA-24196 error. Users can call the `clear_body` procedure to set the message access mode to `MESSAGE_ACCESS_READONLY`.

This function raises ORA-24197 if the Java stored procedure throws an exception during execution, ORA-24198 if the operation ID is invalid, or ORA-24199 if the Java stored procedure message store overflows.

reset (id IN PLS_INTEGER)

Resets the starting position of the stream to the beginning and puts the stream message in `MESSAGE_ACCESS_READONLY` mode.

flush (id IN PLS_INTEGER)

Takes the static variable in Jserv and synchronizes the content back to `aq$_jms_stream_message`. This procedure will not affect the underlying access mode. This procedure raises ORA-24197 if the Java stored procedure throws an exception during execution or ORA-24198 if the operation ID is invalid.

clear_body (id IN PLS_INTEGER)

Sets the Java stored procedure static variable to empty payload. Parameter `id` is used to identify the slot where the Java object is stored in the Oracle Database JVM session memory. If `id` is null, a new slot is created for this PL/SQL object. Subsequent JMS operations on the payload need to provide this operation ID.

It also sets the message access mode to `MESSAGE_ACCESS_WRITEONLY`. Later calls of `read_XXX` procedure raise ORA-24196 error. Users can call the `reset` or `prepare` procedures to set the message access mode to `MESSAGE_ACCESS_READONLY`. Write-only and read-only modes affect only the payload functions of `AQ$_JMS_BYTES_MESSAGE`. They do not affect the header functions.

This function raises ORA-24197 if the Java stored procedure throws an exception during execution, ORA-24198 if the operation ID is invalid, or ORA-24199 if the Java stored procedure message store overflows.

clean (id IN PLS_INTEGER)

Closes and cleans up the `DataInputStream` or `DataOutputStream` at the Java stored procedure side corresponding to the operation ID. It is very important to call this procedure to avoid memory leaks. This procedure raises ORA-24197 if the Java stored procedure throws an exception during execution or ORA-24198 if the operation ID is invalid.

clean_all

Closes and cleans up all the messages in the corresponding type of message store at the Java stored procedure side. This procedure raises ORA-24197 if the Java stored procedure throws an exception during execution.

get_mode (id IN PLS_INTEGER) RETURN PLS_INTEGER

Returns the current mode of this message. The return value is either `SYS.dbms_aqjms.READ_ONLY` or `SYS.dbms_aqjms.WRITE_ONLY`. Raises exception ORA-24197 if the Java stored procedure throws an exception during execution or ORA-24198 if the operation ID is invalid.

read_boolean (id IN PLS_INTEGER) RETURN BOOLEAN

Reads and returns a Boolean value from the stream message. If the end of the message stream has been reached, then null is returned. Raises exception ORA-24194 if the type conversion between the type of real value and the expected type is invalid, ORA-24196 if the stream message is in write-only mode, ORA-24197 if the Java stored procedure throws an exception during execution, or ORA-24198 if the operation ID is invalid.

read_byte (id IN PLS_INTEGER) RETURN PLS_INTEGER

Reads and returns a byte value from the stream message. If the end of the message stream has been reached, then null is returned. Because there is no `BYTE` type in PL/SQL, `INT` is used to represent a byte. Although PL/SQL users get an `INT`, they are guaranteed that the value is in the Java `BYTE` value range. If this value is issued with a `write_byte` function, then there will not be an out of range error. Raises exception ORA-24194 if the type conversion between the type of real value and the expected type is invalid, ORA-24196 if the stream message is in write-only mode, ORA-24197 if the Java stored procedure throws an exception during execution, or ORA-24198 if the operation ID is invalid.

read_bytes (id IN PLS_INTEGER) RETURN BLOB

Reads and returns a byte array from the stream message. If the end of the message stream has been reached, then null is returned. Raises exception ORA-24194 if the type conversion between the type of real value and the expected type is invalid or ORA-24196 if the stream message is in write-only mode.

read_bytes (id IN PLS_INTEGER, value OUT NOCOPY BLOB)

Reads a byte array from the stream message. If the end of the message stream has been reached, then null is returned. Raises exception ORA-24194 if the type conversion between the type of real value and the expected type is invalid, ORA-24196 if the stream message is in write-only mode, ORA-24197 if the Java stored procedure throws an exception during execution, or ORA-24198 if the operation ID is invalid.

read_char (id IN PLS_INTEGER) RETURN CHAR

Reads and returns a character value from the stream message. If the end of the message stream has been reached, then null is returned. Raises exception ORA-24194 if the type conversion between the type of real value and the expected type is invalid, ORA-24196 if the stream message is in write-only mode, ORA-24197 if the Java stored procedure throws an exception during execution, or ORA-24198 if the operation ID is invalid.

read_double (id IN PLS_INTEGER) RETURN DOUBLE PRECISION

Reads and returns a double from the stream message. If the end of the message stream has been reached, then null is returned. Raises exception ORA-24194 if the type conversion between the type of real value and the expected type is invalid, ORA-24196 if the stream message is in write-only mode, ORA-24197 if the Java stored procedure throws an exception during execution, or ORA-24198 if the operation ID is invalid.

read_float (id IN PLS_INTEGER) RETURN FLOAT

Reads and returns a float from the stream message. If the end of the message stream has been reached, then null is returned. Raises exception ORA-24194 if the type conversion between the type of real value and the expected type is invalid, ORA-24196 if the stream message is in write-only mode, ORA-24197 if the Java stored procedure throws an exception during execution, or ORA-24198 if the operation ID is invalid.

read_int (id IN PLS_INTEGER) RETURN PLS_INTEGER

Reads and returns an `INT` from the stream message. If the end of the message stream has been reached, then null is returned. Raises exception ORA-24194 if the type conversion between the type of real value and the expected type is invalid, ORA-24196 if the stream message is in write-only mode, ORA-24197 if the Java stored procedure throws an exception during execution, or ORA-24198 if the operation ID is invalid.

read_long (id IN PLS_INTEGER) RETURN NUMBER

Reads and returns a long from the stream message. If the end of the message stream has been reached, then null is returned. Raises exception ORA-24194 if the type conversion between the type of real value and the expected type is invalid, ORA-24196 if the stream message is in write-only mode, ORA-24197 if the Java stored procedure throws an exception during execution, or ORA-24198 if the operation ID is invalid.

read_short (id IN PLS_INTEGER) RETURN PLS_INTEGER

Reads and returns a short value from the stream message. If the end of the message stream has been reached, then null is returned. Because there is no short type in PL/SQL, `PLS_INTEGER` is used to represent a `SHORT`. Although PL/SQL users get an `INT`, they are guaranteed that the value is in the Java short value range. If this value is issued with a `write_short` function, then there will not be an out of range error. Raises exception ORA-24194 if the type conversion between the type of real value and the expected type is invalid, ORA-24196 if the stream message is in write-only mode, ORA-24197 if the Java stored procedure throws an exception during execution, or ORA-24198 if the operation ID is invalid.

read_string RETURN CLOB

Reads and returns a string from the stream message. If the end of the message stream has been reached, then null is returned. Raises exception ORA-24194 if the type conversion between the type of real value and the expected type is invalid or ORA-24196 if the stream message is in write-only mode.

read_string (id IN PLS_INTEGER, value OUT NOCOPY CLOB)

Reads a string from the stream message. If the end of the message stream has been reached, then null is returned. Raises exception ORA-24194 if the type conversion between

the type of real value and the expected type is invalid, ORA-24196 if the stream message is in write-only mode, ORA-24197 if the Java stored procedure throws an exception during execution, or ORA-24198 if the operation ID is invalid.

read_object (id IN PLS_INTEGER, value OUT NOCOPY AQ\$_JMS_VALUE)

Returns a general value ADT AQ\$_JMS_VALUE. Users can use the type attribute of this ADT to interpret the data. See [Table 290-2](#) for the correspondence among `dbms_jms_plsql` package constants, Java datatype and AQ\$_JMS_VALUE attribute. This member procedure might bring additional overhead compared to other read member procedures or functions. It is used only if the user does not know the datatype of the fields within a message beforehand. Otherwise it is a good idea to use a specific read member procedure or function.

Raises exception ORA-24194 if the type conversion between the type of real value and the expected type is invalid, ORA-24196 if the stream message is in write-only mode, ORA-24197 if the Java stored procedure throws an exception during execution, or ORA-24198 if the operation ID is invalid.

write_boolean (id IN PLS_INTEGER, value IN BOOLEAN)

Writes a Boolean to the stream message. Raises exceptions ORA-24196 if the stream message is in read-only mode, ORA-24197 if the Java stored procedure throws an exception during execution, or ORA-24198 if the operation ID is invalid.

write_byte (id IN PLS_INTEGER, value IN INT)

Writes a byte to the stream message. Because there is no `BYTE` type in PL/SQL, `INT` is used to represent a byte. Raises exceptions ORA-24196 if the stream message is in read-only mode, ORA-24197 if the Java stored procedure throws an exception during execution, or ORA-24198 if the operation ID is invalid.

write_bytes (id IN PLS_INTEGER, value IN RAW)

Writes a byte array field to the stream message. Consecutively written byte array fields are treated as two distinct fields when the fields are read. Raises exceptions ORA-24196 if the stream message is in read-only mode, ORA-24197 if the Java stored procedure throws an exception during execution, or ORA-24198 if the operation ID is invalid.

write_bytes (id IN PLS_INTEGER, value IN RAW, offset IN INT, length IN INT)

Writes a portion of a byte array as a byte array field to the stream message. Consecutively written byte array fields are treated as two distinct fields when the fields are read. Parameter `offset` is the initial offset within the byte array, and parameter `length` is the number of bytes to use. If the range `[offset, offset+length]` exceeds the boundary of the byte array value, then a Java `IndexOutOfBoundsException` exception is thrown in the Java stored procedure. The index starts from 0.

Raises exceptions ORA-24196 if the stream message is in read-only mode, ORA-24197 if the Java stored procedure throws an exception during execution, or ORA-24198 if the operation ID is invalid.

write_bytes (id IN PLS_INTEGER, value IN BLOB)

Writes a byte array field to the stream message. Consecutively written byte array fields are treated as two distinct fields when the fields are read. Raises exceptions ORA-24196 if the stream message is in read-only mode, ORA-24197 if the Java stored procedure throws an exception during execution, or ORA-24198 if the operation ID is invalid.

write_bytes (id IN PLS_INTEGER, value IN BLOB, offset IN INT, length IN INT)

Writes a portion of a byte array as a byte array field to the stream message. Consecutively written byte array fields are treated as two distinct fields when the fields are read. Parameter `offset` is the initial offset within the byte array, and parameter `length` is the number of bytes to use. If the range `[offset, offset+length]` exceeds the boundary of the byte array value, then a Java `IndexOutOfBoundsException` exception is thrown in the Java stored procedure. The index starts from 0.

Raises exceptions ORA-24196 if the stream message is in read-only mode, ORA-24197 if the Java stored procedure throws an exception during execution, or ORA-24198 if the operation ID is invalid.

write_char (id IN PLS_INTEGER, value IN CHAR)

Writes a character value to the stream message. If this value has multiple characters, then it is the first character that is written. Raises exceptions ORA-24196 if the stream message is in read-only mode, ORA-24197 if the Java stored procedure throws an exception during execution, or ORA-24198 if the operation ID is invalid.

write_double (id IN PLS_INTEGER, value IN DOUBLE PRECISION)

Writes a double to the stream message. Raises exceptions ORA-24196 if the stream message is in read-only mode, ORA-24197 if the Java stored procedure throws an exception during execution, or ORA-24198 if the operation ID is invalid.

write_float (id IN PLS_INTEGER, value IN FLOAT)

Writes a float to the stream message. Raises exceptions ORA-24196 if the stream message is in read-only mode, ORA-24197 if the Java stored procedure throws an exception during execution, or ORA-24198 if the operation ID is invalid.

write_int (id IN PLS_INTEGER, value IN PLS_INTEGER)

Writes an `INT` to the stream message. Raises exceptions ORA-24196 if the stream message is in read-only mode, ORA-24197 if the Java stored procedure throws an exception during execution, or ORA-24198 if the operation ID is invalid.

write_long (id IN PLS_INTEGER, value IN NUMBER)

Writes a long to the stream message. Raises exceptions ORA-24196 if the stream message is in read-only mode, ORA-24197 if the Java stored procedure throws an exception during execution, or ORA-24198 if the operation ID is invalid.

write_short (id IN PLS_INTEGER, value IN PLS_INTEGER)

Writes a short to the stream message. Because there is no short type in PL/SQL, `INT` is used to represent a short. Raises exceptions ORA-24196 if the stream message is in read-only mode, ORA-24197 if the Java stored procedure throws an exception during execution, or ORA-24198 if the operation ID is invalid.

write_string (id IN PLS_INTEGER, value IN VARCHAR2)

Writes a string to the stream message. Raises exceptions ORA-24196 if the stream message is in read-only mode, ORA-24197 if the Java stored procedure throws an exception during execution, or ORA-24198 if the operation ID is invalid.

write_string (id IN PLS_INTEGER, value IN CLOB)

Writes a string to the stream message. Raises exceptions ORA-24196 if the stream message is in read-only mode, ORA-24197 if the Java stored procedure throws an exception during execution, or ORA-24198 if the operation ID is invalid.

290.9.6 SYS.AQ\$_JMS_OBJECT_MESSAGE Type

This type is the ADT used to store an `ObjectMessage` in an Oracle Database Advanced Queuing queue.

Syntax

```
TYPE aq$_jms_object_message AS object(  
    header      aq$_jms_header,  
    bytes_len   int,  
    bytes_raw   raw(2000),  
    bytes_lob   blob);
```

290.9.7 SYS.AQ\$_JMS_NAMEARRAY Type

This type represents the name array returned by the `get_names` procedure of `aq$_jms_map_message`.

The maximum number of names this type can hold is 1024. The maximum length of each name is 200 characters.

Syntax

```
CREATE OR REPLACE TYPE AQ$_JMS_NAMEARRAY AS VARRAY(1024) OF VARCHAR(100);
```

Usage Notes

If the names array in the message payload is greater than 1024, then use the following function to retrieve the names in multiple portions:

```
MEMBER FUNCTION get_names(id IN PLS_INTEGER, names OUT aq$_jms_namearray,  
    offset IN PLS_INTEGER, length IN PLS_INTEGER) RETURN PLS_INTEGER;
```

290.9.8 SYS.AQ\$_JMS_VALUE Type

This type represents the general data returned by the `get_object` procedure of `aq$_jms_map_message` and the `read_object` procedure of `aq$_jms_stream_message`.

The `type` field in this ADT is used to decide which type of data this object is really holding. The following table lists the mapping between the `sys.dbms_jms_plsql` type constants, the corresponding Java type, and the data field of ADT `aq$_jms_value` which effectively holds the data.

Syntax

```
CREATE OR REPLACE TYPE AQ$_JMS_VALUE AS object(  
    type      number(2),  
    num_val   number,  
    char_val  char(1),  
    text_val  clob,  
    bytes_val blob);
```

Table 290-2 AQ\$_JMS_VALUE Type Fields and Java Fields

| Type | Java Type | aq\$_jms_value Data Field |
|------------------------------------|------------------|-----------------------------|
| DBMS_JMS_PLSQL.DATA_TYPE_BYTE | byte | num_val |
| DBMS_JMS_PLSQL.DATA_TYPE_SHORT | short | num_val |
| DBMS_JMS_PLSQL.DATA_TYPE_INTEGER | int | num_val |
| DBMS_JMS_PLSQL.DATA_TYPE_LONG | long | num_val |
| DBMS_JMS_PLSQL.DATA_TYPE_FLOAT | float | num_val |
| DBMS_JMS_PLSQL.DATA_TYPE_DOUBLE | double | num_val |
| DBMS_JMS_PLSQL.DATA_TYPE_BOOLEAN | boolean | num_val: 0 FALSE, 1 TRUE |
| DBMS_JMS_PLSQL.DATA_TYPE_CHARACTER | char | char_val |
| DBMS_JMS_PLSQL.DATA_TYPE_STRING | java.lang.String | text_val |
| DBMS_JMS_PLSQL.DATA_TYPE_BYTES | byte[] | bytes_val |

290.9.9 SYS.AQ\$_JMS_EXCEPTION Type

This type represents a Java exception thrown on the Java stored procedure side.

The `id` field is reserved for future use. The `exp_name` stores the Java exception name, the `err_msg` field stores the Java exception error message, and the `stack` field stores the stack trace of the Java exception.

Syntax

```
CREATE OR REPLACE TYPE AQ$_JMS_EXCEPTION AS OBJECT (
  id          number, -- Reserved and not used. Right now always return 0.
  exp_name    varchar(200),
  err_msg     varchar(500),
  stack       varchar(4000));
```

JSON Data Structures

To work with JSON data in PL/SQL, you can use these data structures.

- [JSON_ELEMENT_T Object Type](#)
- [JSON_OBJECT_T Object Type](#)
- [JSON_ARRAY_T Object Type](#)
- [JSON_SCALAR_T Object Type](#)
- [JSON_KEY_LIST Type](#)

Note:

The time component in the `DATE` value of the `get_Date` function is truncated. If you want to preserve the time component, use `get_Timestamp` and then use `CAST AS DATE` to convert to a SQL date with the time component.

291.1 JSON_ELEMENT_T Object Type

`JSON_ELEMENT_T` is the supertype for the `JSON_OBJECT_T`, `JSON_SCALAR_T`, and `JSON_ARRAY_T` object types.

Description

Note the following:

- To create an instance of `JSON_ELEMENT_T`, use the `parse` or `load` function. See the “Constructors” section below for details.
- You cannot create an empty `JSON_ELEMENT_T` instance. To create an empty JSON container, create it based on one of the subtypes.
- To cast a `JSON_ELEMENT_T` into a subtype (for example, `JSON_OBJECT_T`), you need to perform an explicit cast using `TREAT AS`. For example:

```
TREAT (elem AS JSON_OBJECT_T)
```

Constructors

You create a `JSON_ELEMENT_T` instance using the `parse` or `load` function. The `parse` function takes as input `VARCHAR2`, `CLOB`, or `BLOB` data, and returns a `JSON_ELEMENT_T` instance. Similarly, the `load` function takes JSON type as an input.

```

STATIC FUNCTION parse(jsn VARCHAR2) RETURN JSON_ELEMENT_T
STATIC FUNCTION parse(jsn CLOB)      RETURN JSON_ELEMENT_T
STATIC FUNCTION parse(jsn BLOB)      RETURN JSON_ELEMENT_T
STATIC FUNCTION parse(jsn BLOB, FORMAT IN VARCHAR2) RETURN JSON_ELEMENT_T
STATIC FUNCTION load(jsn JSON)       RETURN JSON_Element_T,

```

Only UTF8-encoded JSON is passed as a BLOB.

The `parse` function takes a JSON string as input and sets up an internal representation of the JSON data. If the provided input is not valid JSON, then an error message is raised. Valid JSON has to pass the lax check of the “IS JSON” SQL condition. The input for the `load` function is a JSON type, therefore, no JSON syntax check is needed.

Serialization and Conversions

A `JSON_ELEMENT_T` instance (and all subtypes) can be serialized to a JSON string, converted to a JSON type or (if it is a scalar value) converted to a SQL value like `Date` or `Number`. Serialization is the inverse of the `parse` function: a string representation of the in-memory representation of the JSON data is being generated and returned as an appropriate SQL type.

The serialization and conversion functions are:

```

MEMBER FUNCTION to_String      RETURN VARCHAR2
MEMBER FUNCTION stringify     RETURN VARCHAR2

MEMBER FUNCTION to_Clob       RETURN CLOB
MEMBER FUNCTION to_Blob      RETURN BLOB
MEMBER PROCEDURE to_Clob(c IN OUT CLOB)
MEMBER PROCEDURE to_Blob(c IN OUT BLOB)

MEMBER FUNCTION to_Json       RETURN JSON

MEMBER FUNCTION to_Number     RETURN NUMBER
MEMBER FUNCTION to_Date      RETURN DATE
MEMBER FUNCTION to_Timestamp RETURN TIMESTAMP
MEMBER FUNCTION to_Boolean   RETURN BOOLEAN

```

The FUNCTION `stringify` is synonym of `to_String`. It has the same functionality.

The `to_Clob` and `to_Blob` *procedures* accept a CLOB or BLOB input and enable you to provide a LOB to be used as the serialization destination. For instance, `EMPTY_LOB` can be provided. The input LOB cannot be `NULL`.

If the `to_Clob` *function* is used, then a new CLOB is created. If you do not want to create a CLOB first, then you can use the `to_Clob` or `to_Blob` *functions*, which take no parameter and generate a temp LOB.

`to_Blob` serializes to UTF8 format only.

Introspection

Introspection enables you to discover properties of JSON objects without modifying them. The introspection functions are:

```

MEMBER FUNCTION has(key VARCHAR2) RETURN BOOLEAN,

```

```

MEMBER FUNCTION is_Object          RETURN BOOLEAN
MEMBER FUNCTION is_Array          RETURN BOOLEAN
MEMBER FUNCTION is_Scalar         RETURN BOOLEAN
MEMBER FUNCTION is_String         RETURN BOOLEAN
MEMBER FUNCTION is_Number         RETURN BOOLEAN
MEMBER FUNCTION is_Boolean        RETURN BOOLEAN
MEMBER FUNCTION is_True           RETURN BOOLEAN
MEMBER FUNCTION is_False          RETURN BOOLEAN
MEMBER FUNCTION is_Null           RETURN BOOLEAN
MEMBER FUNCTION is_Date           RETURN BOOLEAN
MEMBER FUNCTION is_Timestamp      RETURN BOOLEAN
MEMBER FUNCTION get_Size          RETURN NUMBER

```

The `has` function checks if a given name exists in the `JSON_OBJECT_T` object.

The return value of the `get_size` function depends on the JSON type:

- For a scalar, it returns 1.
- For an object, it returns the number of keys.
- For an array, it returns the number of items.

Note that textual JSON does not support dates and timestamps natively. Instead they are typically modeled as strings. You can use the JSON type to preserve dates and timestamps natively. The Document Object Model (DOM) interface enables you to add dates and timestamps as scalar values and preserve them until serialization to JSON, where they are printed as string following the ISO 8601 format. If a SQL value of type date or timestamp has been added, then the `is_Date` and `is_Timestamp` functions return true. If a date has been added as a string (e.g. as ISO 8601), then the `is_Date` and `is_Timestamp` functions return false. You can use Oracle conversion function `to_Date` and `to_Timestamp` to convert a string representation of a date, and timestamp to the Oracle representation.

Error Handling

You can set the level of error handling for JSON processing. You might not want an error to be raised for every mismatch. The `on_Error` procedure enables you to specify when errors should be raised:

```
MEMBER PROCEDURE on_Error(value NUMBER)
```

The `on_Error` procedure defines what happens if an error is encountered during a PL/SQL operation, for instance, a `get` call.

The default is to not raise an error but to return NULL instead.

You invoke `On_error` on a `JSON_ELEMENT_T` instance and it sets the error behavior for all subsequent calls. To reset the behavior to the default, you can call `on_Error(0)`.

Values for the `value` parameter are:

Table 291-1 Values for the value Parameter in the ON_ERROR Procedure

| Value | Description |
|-------|---|
| 0 | Reset to the default behavior, which is to return NULL instead of raising an error. |
| 1 | Raise all errors. |
| 2 | Raise an error if no value is detected. |

Table 291-1 (Cont.) Values for the value Parameter in the ON_ERROR Procedure

| Value | Description |
|-------|---|
| 3 | Raise an error if the data types do not match, for example, if you call GET_NUMBER on a string value. |
| 4 | Raise an error if the input is invalid, for example, if the array is out of bounds. |

You can combine values. For example, you can specify 7 to indicate a combination of 3 and 4.

In the following example, an error is raised because the value of "a" is "xyz", which cannot be converted to a number. If the `on_error` procedure had not been called, then NULL would be returned, and no error would be raised.

```
declare
    jo JSON_OBJECT_T;
begin
    jo := JSON_OBJECT_T.parse('{a:"xyz"}');
    jo.On_error(1);
    dbms_output.put_line(jo.get_Number('a'));
end;
/
```

291.2 JSON_OBJECT_T Object Type

JSON_OBJECT_T is a subtype of the JSON_ELEMENT_T object type. It corresponds to the JSON object structure.

Constructors

You can create an empty JSON_OBJECT_T instance using the following constructor.

```
CONSTRUCTOR FUNCTION JSON_OBJECT_T RETURN SELF AS RESULT
```

You can create a JSON_OBJECT_T instance using one of the following `parse` functions:

```
STATIC FUNCTION parse(jsn VARCHAR2) RETURN JSON_OBJECT_T
STATIC FUNCTION parse(jsn CLOB) RETURN JSON_OBJECT_T
STATIC FUNCTION parse(jsn BLOB) RETURN JSON_OBJECT_T
STATIC FUNCTION parse(jsn BLOB, FORMAT IN VARCHAR2) RETURN JSON_OBJECT_T
```

You can also create a JSON_OBJECT_T instance using one of the following constructors:

```
CONSTRUCTOR FUNCTION JSON_OBJECT_T(jsn VARCHAR2) RETURN SELF AS RESULT
CONSTRUCTOR FUNCTION JSON_OBJECT_T(jsn CLOB) RETURN SELF AS RESULT
CONSTRUCTOR FUNCTION JSON_OBJECT_T(jsn BLOB) RETURN SELF AS RESULT
CONSTRUCTOR FUNCTION JSON_Object_T(jsn BLOB, FORMAT IN VARCHAR2) RETURN SELF AS RESULT
CONSTRUCTOR FUNCTION JSON_OBJECT_T(jsn JSON) RETURN SELF AS RESULT
CONSTRUCTOR FUNCTION JSON_OBJECT_T(e JSON_ELEMENT_T) RETURN SELF AS RESULT
```

Only UTF8-encoded JSON is passed as a BLOB.

The `parse` function takes a JSON string as input and sets up an internal representation of the JSON data. If the provided input is not a valid JSON object, then an error message is raised. The input has to specify a JSON object, not an array.

Get Functions and Procedures

The following functions and procedures enable you to retrieve the value of the JSON object:

```
MEMBER FUNCTION get(key VARCHAR2) RETURN JSON_ELEMENT_T
MEMBER FUNCTION get_String(key VARCHAR2) RETURN VARCHAR2
MEMBER FUNCTION get_Number(key VARCHAR2) RETURN NUMBER
MEMBER FUNCTION get_Date(key VARCHAR2) RETURN DATE
MEMBER FUNCTION get_Timestamp(key VARCHAR2) RETURN TIMESTAMP
MEMBER FUNCTION get_TimestampTZ(key VARCHAR2) RETURN TIMESTAMP WITH TIME ZONE
MEMBER FUNCTION get_Boolean(key VARCHAR2) RETURN BOOLEAN
MEMBER FUNCTION get_Clob(key VARCHAR2) RETURN CLOB
MEMBER FUNCTION get_Blob(key VARCHAR2) RETURN BLOB
MEMBER FUNCTION get_Object(key VARCHAR2) RETURN JSON_OBJECT_T
MEMBER FUNCTION get_Array(key VARCHAR2) RETURN JSON_ARRAY_T
MEMBER FUNCTION get_Json(key NUMBER) RETURN JSON

MEMBER PROCEDURE get_Json(key NUMBER, j OUT NOCOPY JSON)
MEMBER PROCEDURE get_Clob(key NUMBER, c IN OUT CLOB)
MEMBER PROCEDURE get_Blob(key NUMBER, c IN OUT BLOB)
```

Note:

- The `get` function has reference semantics. This means that if the returned `JSON_ELEMENT_T` is modified, then the containing `JSON_ELEMENT_T` is also changed. See the [Reference Semantics](#) section below for details.
- The `GET_STRING` function converts the value to a string if it is not already a string. Thus, the `GET_STRING` function returns a non-null value even if `IS_STRING` returns false.
- All the “get” functions perform a conversion if possible. If no conversion is possible, then an error might be raised, depending on what `ON_ERROR` is set to.

The `GET_CLOB` and `GET_BLOB` *procedures*, which accept a CLOB or BLOB as input, enable you to provide a LOB to be used as serialization destination. For instance, `EMPTY_LOB` can be provided. If you use the `GET_CLOB` *function* instead, then a new CLOB will be created implicitly. The input LOB cannot be NULL. If you do not want to create a BLOB or CLOB first, you can use the `GET_CLOB` or `GET_BLOB` functions, which take no parameter and generates a temp LOB.

`GET_BLOB` serializes to UTF8 format only.

Set Procedures

The following procedures enable you to set the value of a JSON object. Existing values, if present, will be overwritten.

```
MEMBER PROCEDURE put(key VARCHAR2, val JSON_ELEMENT_T)
MEMBER PROCEDURE put(key VARCHAR2, val VARCHAR2)
MEMBER PROCEDURE put(key VARCHAR2, val NUMBER)
MEMBER PROCEDURE put(key VARCHAR2, val BOOLEAN)
MEMBER PROCEDURE put(key VARCHAR2, val DATE)
MEMBER PROCEDURE put(key VARCHAR2, val TIMESTAMP)
MEMBER PROCEDURE put_Null(key VARCHAR2)
MEMBER PROCEDURE put(key VARCHAR2, val JSON)
```

Introspection Functions

Introspection enables you to discover properties of JSON objects without modifying them. The introspection functions are:

```
MEMBER FUNCTION has(key VARCHAR2)          RETURN BOOLEAN
MEMBER FUNCTION get_Type(key VARCHAR2)     RETURN VARCHAR2
MEMBER FUNCTION get_Keys                   RETURN JSON_KEY_LIST
```

The `get_Keys` function returns an object type of `JSON_KEY_LIST`, which is a varray of `VARCHAR2(4000)`. The varray contains the names of keys in the JSON object. The `get_Keys` function returns at most 32767 field names for a given JSON object. An error is raised if it is applied to an object with more than 32767 fields.

The example below walks through the items of the varray to build a `JSON_ARRAY_T` object that contains all key names.

```
declare
  jo JSON_OBJECT_T;
  ja JSON_ARRAY_T;
  keys JSON_KEY_LIST;
  keys_string VARCHAR2(100);

begin
  ja := new JSON_ARRAY_T;
  jo := JSON_OBJECT_T.parse('{"name":"fred",
                           "jobTitle":"codemonkey",
                           "projects":["json", "xml"]}');

  keys := jo.get_keys;
  for i in 1..keys.count loop
    ja.append(keys(i));
  end loop;

  keys_string := ja.to_string;
  dbms_output.put_line(keys_string);
end;
/
```

The output is:

```
["name","jobTitle","projects"]
```

Modification Procedures

The following procedures enable you to remove or rename keys in a JSON object.

```
MEMBER PROCEDURE remove(key VARCHAR2)
MEMBER PROCEDURE rename_Key(keyOld VARCHAR2, keyNew VARCHAR2)
```

Duplicate key names are not supported and will raise an error.

Clone Function

This function makes a copy of the JSON object. Reference semantics is changed to value semantics.

```
MEMBER FUNCTION clone RETURN JSON_OBJECT_T
```

Reference Semantics

Calling the `get` function that returns a `JSON_ELEMENT_T` object always returns a reference to the complex values instead of a copy. This means that changing the returned value affects its container. See the example below.

```
declare
  data      JSON_OBJECT_T;
  address   JSON_OBJECT_T;
  zip       number;

begin

  data := new JSON_OBJECT_T('{
    "first": "John",
    "last": "Doe",
    "address": {
      "country": "USA",
      "zip": "94065"
    }
  }');

  address := data.get_object('address');
  dbms_output.put_line(address.to_string);

  -- 1) VALUE SEMANTICS for scalar values
  -- (changing the value has no effect on container)
  zip := address.get_number('zip');
  dbms_output.put_line(zip);
  zip := 12345;
  dbms_output.put_line(zip);
  -- address is still the same
  dbms_output.put_line(address.to_string);

  -- 2) REFERENCE SEMANTICS for complex values
  -- 'address' is a reference to the complex address values inside 'data'
  address.put('zip', 12345);
  address.put('street', 'Detour Road');
  dbms_output.put_line(data.to_string);
end;
/
```

In cases where you do not want the reference semantics, you can use the `clone` function to create a copy of the returned object. This decouples the value from its container. In the example above, you can create a copy of the “address” object by replacing this line:

```
address := data.get_object('address');
```

with this line:

```
address := data.get_object('address').clone;
```

After this, changing the address will have no effect on the value of the ‘data’ containing object.

Update Example

The following example updates the price of an item by 10%.

```

WITH
  FUNCTION updatePrice(jsonTxt in VARCHAR2 ) RETURN VARCHAR2 IS
    jo JSON_OBJECT_T;
    oldPrice NUMBER;

  BEGIN
    jo := new JSON_OBJECT_T(jsonTxt);
    oldPrice := jo.get_number('price');
    jo.put('price', oldPrice * 1.1);
    RETURN jo.to_string();
  END;
SELECT updatePrice(col)
FROM   t1;

```

291.3 JSON_ARRAY_T Object Type

JSON_ARRAY_T is a subtype of the JSON_ELEMENT_T object type. JSON_ARRAY_T corresponds to the JSON array structure.

Constructors

You can create an empty JSON_ARRAY_T instance using the following constructor.

```
CONSTRUCTOR FUNCTION JSON_ARRAY_T RETURN SELF AS RESULT
```

You can create a JSON_ARRAY_T instance using one the following parse functions:

```

STATIC FUNCTION parse(jsn VARCHAR2)          RETURN JSON_ARRAY_T
STATIC FUNCTION parse(jsn CLOB)             RETURN JSON_ARRAY_T
STATIC FUNCTION parse(jsn BLOB)             RETURN JSON_ARRAY_T
STATIC FUNCTION parse(jsn BLOB, FORMAT IN VARCHAR2) RETURN JSON_ARRAY_T

```

You can also create a JSON_ARRAY_T instance using one the following constructors:

```

CONSTRUCTOR FUNCTION JSON_Array_T(jsn VARCHAR2) RETURN SELF AS RESULT
CONSTRUCTOR FUNCTION JSON_Array_T(jsn CLOB) RETURN SELF AS RESULT
CONSTRUCTOR FUNCTION JSON_Array_T(jsn BLOB) RETURN SELF AS RESULT
CONSTRUCTOR FUNCTION JSON_Array_T(e JSON_ELEMENT_T) RETURN SELF AS RESULT

```

Only UTF8-encoded JSON is passed as a BLOB.

The parse function takes a JSON string as input and sets up an internal representation of the JSON data. If the provided input is not valid JSON, then an error message is raised. The input has to specify a JSON array, not an object.

Get Functions and Procedures

The following functions and procedures enable you to retrieve the value of the JSON array:

```

MEMBER FUNCTION get(pos NUMBER)          RETURN JSON_ELEMENT_T
MEMBER FUNCTION get_String(pos NUMBER)   RETURN VARCHAR2
MEMBER FUNCTION get_Number(pos NUMBER)   RETURN NUMBER
MEMBER FUNCTION get_Date(pos NUMBER)     RETURN DATE
MEMBER FUNCTION get_Timestamp(pos NUMBER) RETURN TIMESTAMP
MEMBER FUNCTION get_Boolean(pos NUMBER)  RETURN BOOLEAN
MEMBER FUNCTION get_Clob(pos NUMBER)     RETURN CLOB
MEMBER FUNCTION get_Blob(pos NUMBER)     RETURN BLOB

```

```
MEMBER FUNCTION get_Json(pos NUMBER) RETURN JSON
```

```
MEMBER PROCEDURE get_Json(pos NUMBER, j IN OUT NOCOPY JSON)
```

```
MEMBER PROCEDURE get_Clob(pos NUMBER, c IN OUT CLOB)
```

```
MEMBER PROCEDURE get_Blob(pos NUMBER, c IN OUT BLOB)
```

Note:

- The `get` function has reference semantics. This means that if the returned `JSON_ELEMENT_T` is modified, then the containing `JSON_ELEMENT_T` is changed too.
- The `GET_STRING` function converts the value to a string if it is not already a string. The function returns a non-null value even if `IS_STRING` returns false.
- All the “get” functions perform a conversion if possible. If no conversion is possible, then an error might be raised, depending on what `ON_ERROR` is set to.

The `GET_CLOB` and `GET_BLOB` *procedures*, which accept a `CLOB` or `BLOB` as input, enable you to provide a `LOB` to be used as serialization destination. For instance, `EMPTY_LOB` can be provided. If you use the `GET_CLOB` *function* instead, then a new `CLOB` will be created implicitly. The input `LOB` cannot be `NULL`. If you do not want to create a `BLOB` or `CLOB` first, you can use the `GET_CLOB` or `GET_BLOB` functions, which take no parameter and generates a temp `LOB`.

`GET_BLOB` serializes to UTF8 format only.

Set Procedures

The following procedures enable you to set the value at the specified position in the JSON array. These procedures insert (not overwrite) at the specified position unless overwrite is requested.

```
MEMBER PROCEDURE put(pos NUMBER, val VARCHAR2, overwrite BOOLEAN DEFAULT FALSE)
MEMBER PROCEDURE put(pos NUMBER, val NUMBER, overwrite BOOLEAN DEFAULT FALSE)
MEMBER PROCEDURE put(pos NUMBER, val BOOLEAN, overwrite BOOLEAN DEFAULT FALSE)
MEMBER PROCEDURE put(pos NUMBER, val DATE, overwrite BOOLEAN DEFAULT FALSE)
MEMBER PROCEDURE put(pos NUMBER, val JSON_ELEMENT_T, overwrite BOOLEAN DEFAULT FALSE)
MEMBER PROCEDURE put(pos NUMBER, val JSON, overwrite BOOLEAN DEFAULT FALSE)
MEMBER PROCEDURE put(pos NUMBER, val TIMESTAMP, overwrite BOOLEAN DEFAULT FALSE)
MEMBER PROCEDURE put_Null(pos NUMBER, overwrite BOOLEAN DEFAULT FALSE)
```

The following procedures append the specified value to the end of the JSON array:

```
MEMBER PROCEDURE append(val JSON_ELEMENT_T)
MEMBER PROCEDURE append(val VARCHAR2)
MEMBER PROCEDURE append(val NUMBER)
MEMBER PROCEDURE append(val BOOLEAN)
MEMBER PROCEDURE append(val DATE)
MEMBER PROCEDURE append(val JSON)
MEMBER PROCEDURE append(val TIMESTAMP)
MEMBER PROCEDURE append_Null
```

Introspection Function

Introspection enables you to discover properties of the JSON array without modifying them.

```
MEMBER FUNCTION get_Type(pos NUMBER) RETURN VARCHAR2
```

Modification Procedure

The following procedure enables you to remove the value at the specified position in the JSON array.

```
MEMBER PROCEDURE remove(pos NUMBER)
```

Clone Function

This function makes a copy of the JSON array. Reference semantics is changed to value semantics.

```
MEMBER FUNCTION clone RETURN JSON_ARRAY_T
```

291.4 JSON_SCALAR_T Object Type

JSON_SCALAR_T is a subtype of the JSON_ELEMENT_T object type.

Description

A JSON_SCALAR_T instance captures one scalar values, for example, the string “fred” or the number 1. This type does not have any functions or procedures other than the ones inherited from JSON_ELEMENT_T. You cannot create an instance of this type directly.

291.5 JSON_KEY_LIST Type

JSON_KEY_LIST is a varray of VARCHAR2(4000).

Description

This type is used by the `get_Keys` function in the [JSON_OBJECT_T Object Type](#).

Logical Change Record TYPEs

This chapter describes the logical change record (LCR) types.

This chapter contains these topics:

- [Overview](#)
- [Security Model](#)
- [Summary of Logical Change Record Types](#)
- [Common Subprograms for LCR\\$_DDL_RECORD and LCR\\$_ROW_RECORD](#)

292.1 Logical Change Record TYPEs Overview

In Replication (Oracle GoldenGate and XStream), logical change records (LCRs) are message payloads that contain information about changes to a database. These changes can include changes to the data, which are data manipulation language (DML) changes, and changes to database objects, which are data definition language (DDL) changes.

When you use Replication (Oracle GoldenGate and XStream), the capture process captures changes in the form of LCRs and enqueues them into a queue. Finally, the apply process can apply LCRs at a destination database. You also have the option of creating, enqueueing, and dequeuing LCRs manually.

292.2 Logical Change Record Types Security Model

PUBLIC is granted EXECUTE privilege on the types described in this chapter.

292.3 Summary of Logical Change Record Types

This table lists the Logical Change Record TYPEs and briefly describes them.

Table 292-1 Logical Change Record (LCR) Types

| Type | Description |
|---------------------------------------|---|
| LCR\$_DDL_RECORD Type | Represents a data definition language (DDL) change to a database object |
| LCR\$_ROW_RECORD Type | Represents a data manipulation language (DML) change to a database object |
| LCR\$_ROW_LIST Type | Identifies a list of column values for a row in a table |
| LCR\$_ROW_UNIT Type | Identifies the value for a column in a row |

These logical change record (LCR) types can be used with the following Oracle-supplied PL/SQL packages:

- DBMS_APPLY_ADM

- DBMS_AQ
- DBMS_AQADM
- DBMS_CAPTURE_ADM
- DBMS_PROPAGATION_ADM
- DBMS_RULE
- DBMS_RULE_ADM
- DBMS_STREAMS
- DBMS_STREAMS_ADM
- DBMS_TRANSFORM

292.3.1 LCR\$_DDL_RECORD Type

This type represents a data definition language (DDL) change to a database object.

 **Note:**

A multitenant container database is the only supported architecture in Oracle Database 20c. While the documentation is being revised, legacy terminology may persist. In most cases, "database" and "non-CDB" refer to a CDB or PDB, depending on context. In some contexts, such as upgrades, "non-CDB" refers to a non-CDB from a previous release.

If you create or modify a DDL logical change record (DDL LCR), then make sure the `ddl_text` is consistent with the `base_table_name`, `base_table_owner`, `object_type`, `object_owner`, `object_name`, and `command_type` attributes.

This topic contains information about the constructor for row LCRs and information about the member subprograms for this type.

 **Note:**

- When passing a name as a parameter to an LCR constructor, you can enclose the name in double quotes to handle names that use mixed case or lower case for database objects. For example, if a name contains any lower case characters, then you must enclose it in double quotes.
- The application does not need to specify a transaction identifier or SCN when it creates an LCR because the apply process generates these values and stores them in memory. If a transaction identifier or SCN is specified in the LCR, then the apply process ignores it and assigns a new value.

LCR\$_DDL_RECORD Constructor

Creates a SYS.LCR\$_DDL_RECORD object with the specified information.

```

STATIC FUNCTION CONSTRUCT(
    source_database_name IN VARCHAR2,
    command_type         IN VARCHAR2,
    object_owner         IN VARCHAR2,
    object_name          IN VARCHAR2,
    object_type          IN VARCHAR2,
    ddl_text             IN CLOB,
    logon_user           IN VARCHAR2,
    current_schema       IN VARCHAR2,
    base_table_owner     IN VARCHAR2,
    base_table_name      IN VARCHAR2,
    tag                  IN RAW          DEFAULT NULL,
    transaction_id       IN VARCHAR2   DEFAULT NULL,
    scn                  IN NUMBER     DEFAULT NULL,
    position             IN RAW          DEFAULT NULL,
    edition_name         IN VARCHAR2   DEFAULT NULL,
    root_name            IN VARCHAR2   DEFAULT NULL)
RETURN SYS.LCR$_DDL_RECORD;

```

LCR\$_DDL_RECORD Constructor Function Parameters

Table 292-2 Constructor Function Parameters for LCR\$_DDL_RECORD

| Parameter | Description |
|----------------------|--|
| source_database_name | <p>The database where the DDL statement occurred</p> <p>If the LCRs originated in a multitenant container database (CDB), then this field specifies the global name of the container where the DDL change occurred.</p> <p>If you do not include the domain name, then the function appends the local domain to the database name automatically. For example, if you specify DBS1 and the local domain is EXAMPLE.COM, then the function specifies DBS1.EXAMPLE.COM automatically. Set this parameter to a non-NULL value.</p> |

Table 292-2 (Cont.) Constructor Function Parameters for LCR\$_DDL_RECORD

| Parameter | Description |
|--------------|---|
| command_type | <p>The type of command executed in the DDL statement Set this parameter to a non-NULL value.</p> <p>See Also: The "SQL Command Codes" table in the <i>Oracle Call Interface Programmer's Guide</i> for a complete list of command types The following command types <i>are not supported</i> in DDL LCRs:</p> <p>ALTER MATERIALIZED VIEW ALTER MATERIALIZED VIEW LOG ALTER SUMMARY CREATE SCHEMA CREATE MATERIALIZED VIEW CREATE MATERIALIZED VIEW LOG CREATE SUMMARY DROP MATERIALIZED VIEW DROP MATERIALIZED VIEW LOG DROP SUMMARY RENAME</p> <p>The snapshot equivalents of the materialized view command types are also not supported.</p> |
| object_owner | The user who owns the object on which the DDL statement was executed |
| object_name | The database object on which the DDL statement was executed |
| object_type | <p>The type of object on which the DDL statement was executed The following are valid object types:</p> <p>CLUSTER FUNCTION INDEX LINK OUTLINE PACKAGE PACKAGE BODY PROCEDURE SEQUENCE SYNONYM TABLE TRIGGER TYPE USER VIEW</p> <p>LINK represents a database link. NULL is also a valid object type. Specify NULL for all object types not listed. The GET_OBJECT_TYPE member procedure returns NULL for object types not listed.</p> |
| ddl_text | <p>The text of the DDL statement Set this parameter to a non-NULL value.</p> |
| logon_user | The user whose session executed the DDL statement |

Table 292-2 (Cont.) Constructor Function Parameters for LCR\$_DDL_RECORD

| Parameter | Description |
|------------------|--|
| current_schema | The schema that is used if no schema is specified explicitly for the modified database objects in <code>ddl_text</code> If a schema is specified in <code>ddl_text</code> that differs from the one specified for <code>current_schema</code> , then the function uses the schema specified in <code>ddl_text</code> . Set this parameter to a non-NULL value. |
| base_table_owner | If the DDL statement is a table-related DDL (such as <code>CREATE TABLE</code> and <code>ALTER TABLE</code>), or if the DDL statement involves a table (such as creating a trigger on a table), then <code>base_table_owner</code> specifies the owner of the table involved. Otherwise, <code>base_table_owner</code> is NULL. |
| base_table_name | If the DDL statement is a table-related DDL (such as <code>CREATE TABLE</code> and <code>ALTER TABLE</code>), or if the DDL statement involves a table (such as creating a trigger on a table), then <code>base_table_name</code> specifies the name of the table involved. Otherwise, <code>base_table_name</code> is NULL. |
| tag | A binary tag that enables tracking of the LCR For example, this tag can be used to determine the original source database of the DDL statement if apply forwarding is used. |
| transaction_id | The identifier of the transaction |
| scn | The SCN at the time when the change record for a captured LCR was written to the redo log The SCN value is meaningless for a user-created LCR. |
| position | The position of the LCR LCR position is commonly used in XStream configurations. Using XStream requires purchasing a license for the Oracle GoldenGate product. See Also: <i>Oracle Database XStream Guide</i> |
| edition_name | The name of the edition in which the DDL statement was executed |
| root_name | If the LCRs is associated with a CDB, then this field specifies the global name of the root in the CDB. If the LCR is associated with a non-CDB, then this field is NULL. |

Summary of LCR\$_DDL_RECORD Subprograms

Table 292-3 LCR\$_DDL_RECORD Type Subprograms

| Subprogram | Description |
|--|--|
| EXECUTE Member Procedure | Executes the LCR under the security domain of the current user |
| GET_BASE_TABLE_NAME Member Function | Gets the base (dependent) table name |
| GET_BASE_TABLE_OWNER Member Function | Gets the base (dependent) table owner |
| GET_CURRENT_SCHEMA Member Function | Gets the default schema (user) name |

Table 292-3 (Cont.) LCR\$_DDL_RECORD Type Subprograms

| Subprogram | Description |
|---|--|
| GET_DDL_TEXT Member Procedure | Gets the DDL text in a CLOB |
| GET_EDITION_NAME Member Function | Gets the name of the edition in which the DDL statement was executed |
| GET_LOGON_USER Member Function | Gets the logon user name |
| GET_OBJECT_TYPE Member Function | Gets the type of the object involved for the DDL |
| SET_BASE_TABLE_NAME Member Procedure | Sets the base (dependent) table name |
| SET_BASE_TABLE_OWNER Member Procedure | Sets the base (dependent) table owner |
| SET_CURRENT_SCHEMA Member Procedure | Sets the default schema (user) name |
| SET_DDL_TEXT Member Procedure | Sets the DDL text |
| SET_EDITION_NAME Member Procedure | Sets the name of the edition in which the DDL statement was executed |
| SET_LOGON_USER Member Procedure | Sets the logon user name |
| SET_OBJECT_TYPE Member Procedure | Sets the object type |
| Common Subprograms | See " Common Subprograms for LCR\$_DDL_RECORD and LCR\$_ROW_RECORD " for a list of subprograms common to the SYS.LCR\$_ROW_RECORD and SYS.LCR\$_DDL_RECORD types |

EXECUTE Member Procedure

Executes the DDL LCR under the security domain of the current user. Apply handlers are not run when the LCR is applied using this procedure.

Syntax

```
MEMBER PROCEDURE EXECUTE;
```

GET_BASE_TABLE_NAME Member Function

Gets the base (dependent) table name.

Syntax

```
MEMBER FUNCTION GET_BASE_TABLE_NAME ()  
RETURN VARCHAR2;
```

GET_BASE_TABLE_OWNER Member Function

Gets the base (dependent) table owner.

Syntax

```
MEMBER FUNCTION GET_BASE_TABLE_OWNER ()  
RETURN VARCHAR2;
```

GET_CURRENT_SCHEMA Member Function

Gets the current schema name.

Syntax

```
MEMBER FUNCTION GET_CURRENT_SCHEMA()  
RETURN VARCHAR2;
```

GET_DDL_TEXT Member Procedure

Gets the DDL text in a CLOB.

For example, the following PL/SQL code uses this procedure to get the DDL text in a DDL LCR:

```
CREATE OR REPLACE PROCEDURE ddl_in_lcr (ddl_lcr IN SYS.LCR$_DDL_RECORD)  
IS  
    ddl_text    CLOB;  
BEGIN  
    DBMS_OUTPUT.PUT_LINE( ' -----' );  
    DBMS_OUTPUT.PUT_LINE( ' Displaying DDL text in a DDL LCR: ' );  
    DBMS_OUTPUT.PUT_LINE( ' -----' );  
    DBMS_LOB.CREATETEMPORARY(ddl_text, true);  
    ddl_lcr.GET_DDL_TEXT(ddl_text);  
    DBMS_OUTPUT.PUT_LINE('DDL text:' || ddl_text);  
    DBMS_LOB.FREETEMPORARY(ddl_text);  
END;  
/
```

Note:

GET_DDL_TEXT is a member procedure and not a member function to make it easier for you to manage the space used by the CLOB. Notice that the previous example creates temporary space for the CLOB and then frees the temporary space when it is no longer needed.

Syntax

```
MEMBER FUNCTION GET_DDL_TEXT(  
    ddl_text IN/OUT CLOB);
```

Parameter

Table 292-4 GET_DDL_TEXT Procedure Parameter

| Parameter | Description |
|-----------|-----------------------------|
| ddl_text | The DDL text in the DDL LCR |

GET_EDITION_NAME Member Function

Gets the name of the edition in which the DDL statement was executed.

See Also:

Oracle Database Development Guide

Syntax

```
MEMBER FUNCTION GET_EDITION_NAME()
RETURN VARCHAR2;
```

GET_LOGON_USER Member Function

Gets the logon user name.

Syntax

```
MEMBER FUNCTION GET_LOGON_USER()
RETURN VARCHAR2;
```

GET_OBJECT_TYPE Member Function

Gets the type of the object involved for the DDL.

Syntax

```
MEMBER FUNCTION GET_OBJECT_TYPE()
RETURN VARCHAR2;
```

SET_BASE_TABLE_NAME Member Procedure

Sets the base (dependent) table name.

Syntax

```
MEMBER PROCEDURE SET_BASE_TABLE_NAME(
    base_table_name IN VARCHAR2);
```

Parameter

Table 292-5 SET_BASE_TABLE_NAME Procedure Parameter

| Parameter | Description |
|-----------------|----------------------------|
| base_table_name | The name of the base table |

SET_BASE_TABLE_OWNER Member Procedure

Sets the base (dependent) table owner.

Syntax

```
MEMBER PROCEDURE SET_BASE_TABLE_OWNER(
    base_table_owner IN VARCHAR2);
```

Parameter

Table 292-6 SET_BASE_TABLE_OWNER Procedure Parameter

| Parameter | Description |
|-------------------------------|----------------------------------|
| <code>base_table_owner</code> | The name of the base table owner |

SET_CURRENT_SCHEMA Member Procedure

Sets the default schema (user) name.

Syntax

```
MEMBER PROCEDURE SET_CURRENT_SCHEMA(  
    current_schema IN VARCHAR2);
```

Parameter

Table 292-7 SET_CURRENT_SCHEMA Procedure Parameter

| Parameter | Description |
|-----------------------------|--|
| <code>current_schema</code> | The name of the schema to set as the current schema Set this parameter to a non-NULL value. |

SET_DDL_TEXT Member Procedure

Sets the DDL text.

Syntax

```
MEMBER PROCEDURE SET_DDL_TEXT(  
    ddl_text IN CLOB);
```

Parameter

Table 292-8 SET_DDL_TEXT Procedure Parameter

| Parameter | Description |
|-----------------------|---|
| <code>ddl_text</code> | The DDL text Set this parameter to a non-NULL value. |

SET_EDITION_NAME Member Procedure

Sets the name of the edition in which the DDL statement was executed.

See Also:

Oracle Database Development Guide

Syntax

```
MEMBER PROCEDURE SET_EDITION_NAME(  
    edition_name IN VARCHAR2);
```

Parameter

Table 292-9 SET_EDITION_NAME Procedure Parameter

| Parameter | Description |
|--------------|---------------------|
| edition_name | Name of the edition |

SET_LOGON_USER Member Procedure

Sets the logon user name.

Syntax

```
MEMBER PROCEDURE SET_LOGON_USER(  
    logon_user IN VARCHAR2);
```

Parameter

Table 292-10 SET_LOGON_USER Procedure Parameter

| Parameter | Description |
|------------|---|
| logon_user | The name of the schema to set as the logon user |

SET_OBJECT_TYPE Member Procedure

Sets the object type.

Syntax

```
MEMBER PROCEDURE SET_OBJECT_TYPE(  
    object_type IN VARCHAR2);
```

Parameter

Table 292-11 SET_OBJECT_TYPE Procedure Parameter

| Parameter | Description |
|-------------|---|
| object_type | <p>The object type</p> <p>The following are valid object types:</p> <p>CLUSTER FUNCTION INDEX LINK OUTLINE PACKAGE PACKAGE BODY PROCEDURE SEQUENCE SYNONYM TABLE TRIGGER TYPE USER VIEW</p> <p>LINK represents a database link.</p> <p>NULL is also a valid object type. Specify NULL for all object types not listed. The GET_OBJECT_TYPE member procedure returns NULL for object types not listed.</p> |

292.3.2 LCR\$_ROW_RECORD Type

This type represents a data manipulation language (DML) change to a row in a table. This type uses the LCR\$_ROW_LIST type.

 **Note:**

A multitenant container database is the only supported architecture in Oracle Database 20c. While the documentation is being revised, legacy terminology may persist. In most cases, "database" and "non-CDB" refer to a CDB or PDB, depending on context. In some contexts, such as upgrades, "non-CDB" refers to a non-CDB from a previous release.

If you create or modify a row logical change record (row LCR), then make sure the `command_type` attribute is consistent with the presence or absence of old column values and the presence or absence of new column values.

This topic contains information about the constructor for DDL LCRs and information about the member subprograms for this type.

 **Note:**

- When passing a name as a parameter to an LCR constructor, you can enclose the name in double quotes to handle names that use mixed case or lower case for database objects. For example, if a name contains any lower case characters, then you must enclose it in double quotes.
- The application does not need to specify a transaction identifier or SCN when it creates an LCR because the apply process generates these values and stores them in memory. If a transaction identifier or SCN is specified in the LCR, then the apply process ignores it and assigns a new value.

 **See Also:**[LCR\\$_ROW_LIST Type](#)**LCR\$_ROW_RECORD Constructor**

Creates a SYS.LCR\$_ROW_RECORD object with the specified information.

```

STATIC FUNCTION CONSTRUCT(
  source_database_name IN VARCHAR2,
  command_type         IN VARCHAR2,
  object_owner         IN VARCHAR2,
  object_name          IN VARCHAR2,
  tag                  IN RAW           DEFAULT NULL,
  transaction_id       IN VARCHAR2     DEFAULT NULL,
  scn                  IN NUMBER       DEFAULT NULL,
  old_values           IN SYS.LCR$_ROW_LIST DEFAULT NULL,
  new_values           IN SYS.LCR$_ROW_LIST DEFAULT NULL,
  position             IN RAW           DEFAULT NULL,

  statement            IN VARCHAR2     DEFAULT NULL,

  bind_variables       IN SYS.LCR$_ROW_LIST DEFAULT NULL,

  bind_by_position    IN VARCHAR2     DEFAULT 'N',

  root_name            IN VARCHAR2     DEFAULT NULL)
RETURN SYS.LCR$_ROW_RECORD;

```

LCR\$_ROW_RECORD Constructor Function Parameters

Table 292-12 Constructor Function Parameters for LCR\$_ROW_RECORD

| Parameter | Description |
|----------------------|--|
| source_database_name | <p>The database where the row change occurred</p> <p>If the LCRs originated in a CDB, then this field specifies the global name of the container where the row change occurred.</p> <p>If you do not include the domain name, then the function appends the local domain to the database name automatically. For example, if you specify <code>DBS1</code> and the local domain is <code>EXAMPLE.COM</code>, then the function specifies <code>DBS1.EXAMPLE.COM</code> automatically. Set this parameter to a non-NULL value.</p> |
| command_type | <p>The type of command executed in the DML statement</p> <p>Set this parameter to a non-NULL value.</p> <p>Valid values are the following:</p> <p>INSERT UPDATE DELETE LOB ERASE LOB WRITE LOB TRIM</p> <p>If INSERT, then ensure that the LCR has a <code>new_values</code> collection that is not empty and an empty or NULL <code>old_values</code> collection.</p> <p>If UPDATE, then ensure that the LCR has a <code>new_values</code> collection that is not empty and an <code>old_values</code> collection that is not empty.</p> <p>If DELETE, then ensure that the LCR has a NULL or empty <code>new_values</code> collection and an <code>old_values</code> collection that is not empty.</p> <p>If LOB ERASE, LOB WRITE, or LOB TRIM, then ensure that the LCR has a <code>new_values</code> collection that is not empty and an empty or NULL <code>old_values</code> collection.</p> |
| object_owner | <p>The user who owns the table on which the row change occurred</p> <p>Set this parameter to a non-NULL value.</p> |
| object_name | <p>The table on which the DML statement was executed</p> <p>Set this parameter to a non-NULL value.</p> |
| tag | <p>A binary tag that enables tracking of the LCR</p> <p>For example, this tag can be used to determine the original source database of the DML change when apply forwarding is used.</p> |
| transaction_id | <p>The identifier of the transaction</p> |
| scn | <p>The SCN at the time when the change record was written to the redo log</p> <p>The SCN value is meaningless for a user-created LCR.</p> |
| old_values | <p>The column values for the row before the DML change</p> <p>If the DML statement is an UPDATE or a DELETE statement, then this parameter contains the values of columns in the row before the DML statement. If the DML statement is an INSERT statement, then there are no old values.</p> |

Table 292-12 (Cont.) Constructor Function Parameters for LCR\$_ROW_RECORD

| Parameter | Description |
|------------------|---|
| new_values | The column values for the row after the DML change If the DML statement is an UPDATE or an INSERT statement, then this parameter contains the values of columns in the row after the DML statement. If the DML statement is a DELETE statement, then there are no new values. If the LCR reflects a LOB operation, then this parameter contains the supplementally logged columns and any relevant LOB information. |
| position | The position of the LCR LCR position is commonly used in XStream configurations. Using XStream requires purchasing a license for the Oracle GoldenGate product. See Also: <i>Oracle Database XStream Guide</i> |
| statement | This parameter is reserved for internal use only. |
| bind_variables | This parameter is reserved for internal use only. |
| bind_by_position | This parameter is reserved for internal use only. |
| root_name | If the LCRs is associated with a CDB, then this field specifies the global name of the root in the CDB. If the LCR is associated with a non-CDB, then this field is NULL. |

Summary of LCR\$_ROW_RECORD Subprograms

Table 292-13 LCR\$_ROW_RECORD Type Subprograms

| Subprogram | Description |
|--|--|
| ADD_COLUMN Member Procedure | Adds the value as old or new, depending on the value type specified, for the column |
| CONVERT_LONG_TO_LOB_CHUNK Member Procedure | Converts LONG data in a row LCR into fixed width CLOB, or converts LONG RAW data in a row LCR into a BLOB |
| DELETE_COLUMN Member Procedure | Deletes the old value, the new value, or both, for the specified column, depending on the value type specified |
| EXECUTE Member Procedure | Executes the LCR under the security domain of the current user |
| GET_JSON_INFORMATION Member Function | Gets JSON information. |
| GET_LOB_INFORMATION Member Function | Gets the LOB information for the column |
| GET_LOB_OFFSET Member Function | Gets the LOB offset for the specified column |
| GET_LOB_OPERATION_SIZE Member Function | Gets the operation size for the LOB column |
| GET_LONG_INFORMATION Member Function | Gets the LONG information for the column |
| GET_ROW_TEXT Member Procedure | Gets the SQL statement for the change that is encapsulated in the LCR |

Table 292-13 (Cont.) LCR\$_ROW_RECORD Type Subprograms

| Subprogram | Description |
|---|--|
| GET_VALUE Member Function | Gets the old or new value for the specified column, depending on the value type specified |
| GET_VALUES Member Function | Gets a list of old or new values, depending on the value type specified |
| GET_WHERE_CLAUSE Member Procedure | Gets a WHERE clause for the change that is encapsulated in the row LCR |
| GET_XML_INFORMATION Member Function | Gets the XML information for the specified column |
| IS_STATEMENT_LCR Member Function | Reserved for internal use only |
| KEEP_COLUMNS Member Procedure | Keeps a list of columns a row LCR |
| RENAME_COLUMN Member Procedure | Renames a column in an LCR |
| SET_JSON_INFORMATION Member Procedure | Sets the JSON information for a column. |
| SET_LOB_INFORMATION Member Procedure | Sets LOB information for the column |
| SET_LOB_OFFSET Member Procedure | Sets the LOB offset for the specified column |
| SET_LOB_OPERATION_SIZE Member Procedure | Sets the operation size for the LOB column |
| SET_ROW_TEXT Member Procedure | Reserved for internal use only |
| SET_VALUE Member Procedure | Overwrites the value of the specified column |
| SET_VALUES Member Procedure | Replaces the existing old or new values for the LCR, depending on the value type specified |
| SET_XML_INFORMATION Member Procedure | Sets the XML information for the column |
| Common Subprograms | See Common Subprograms for LCR\$_DDL_RECORD and LCR\$_ROW_RECORD for a list of subprograms common to the SYS.LCR\$_ROW_RECORD and SYS.LCR\$_DDL_RECORD types |

ADD_COLUMN Member Procedure

Adds the value as old or new, depending on the value type specified, for the column. An error is raised if a value of the same type already exists for the column.

**Note:**

To set a column value that already exists, run `SET_VALUE`.

**See Also:**

[SET_VALUE Member Procedure](#)

Considerations for LOB Columns

When processing a row LCR with LOB columns with a procedure DML handler or error handler and the handler is using LOB assembly (the `assemble_lob` parameter is set to `TRUE` for the handler), you use this member procedure in the handler procedure to add a LOB column to a row LCR. If `assemble_lob` is set to `FALSE` for the handler, then you cannot use this member procedure to add a LOB column to a row LCR.

To use a DML or error handler to add a LOB column, specify the LOB locator for the `column_value` parameter in the member procedure. The `ADD_COLUMN` member procedure verifies that an `ANYDATA` encapsulated LOB locator is processed with a DML or error handler that is using LOB assembly. An error is raised under the following conditions:

- The handler attempts to enqueue a row LCR with an `ANYDATA` encapsulated LOB locator.
- An attempt is made to add an LOB column that is set incorrectly.

If an error is raised because of one of these conditions, then the transaction that includes the row LCR is moved to the error queue, and the LOB is represented by the original (nonassembled) row LCRs.

 **Note:**

- Database compatibility must be 10.2.0 or higher to use LOB assembly.
- When you are processing a row LCR with a rule-based transformation, you cannot use this member procedure to add a LOB column.
- When you are processing a row LCR with a rule-based transformation, procedure DML handler, or error handler, you cannot use this member procedure to add a `LONG` or `LONG RAW` column.

Syntax

```
MEMBER PROCEDURE ADD_COLUMN(
    value_type    IN  VARCHAR2,
    column_name   IN  VARCHAR2,
    column_value  IN  ANYDATA);
```

Parameters

Table 292-14 `ADD_COLUMN` Procedure Parameters

| Parameter | Description |
|--------------------------|--|
| <code>value_type</code> | The type of value to add for the column Specify <code>old</code> to add the old value of the column. Specify <code>new</code> to add the new value of the column. |
| <code>column_name</code> | The column name This name is not validated. An error can be raised during application of the LCRs if an invalid name is specified. |

Table 292-14 (Cont.) ADD_COLUMN Procedure Parameters

| Parameter | Description |
|---------------------------|--|
| <code>column_value</code> | <p>The value of the column</p> <p>If <code>NULL</code>, then this procedure raises an error.</p> <p>If the member procedure is used in a procedure DML handler or error handler that uses LOB assembly, then a LOB locator can be specified.</p> <p>A <code>NULL</code> column value can be specified by encapsulating the <code>NULL</code> value in an <code>ANYDATA</code> wrapper.</p> |

CONVERT_LONG_TO_LOB_CHUNK Member Procedure

Converts `LONG` data in a row LCR into a `CLOB`, or converts `LONG RAW` data in a row LCR into a `BLOB`.

This procedure can change the operation code from `LONG WRITE` to `LOB WRITE` for the row LCR.

This member procedure can be used in rule-based transformations.

The following restrictions apply to this member procedure:

- This member procedure cannot be used in apply handlers.
- `LONG` data can be sent as a part of a row LCR with one of the following operation codes: `INSERT`, `UPDATE`, or `LONG_WRITE`. Because `LONG` data can be sent in multiple pieces, make sure that this method is invoked on either none or all `LONG` pieces.
- `LOB` to `LONG` conversion is not supported.
- A row LCR on which this procedure is executed must have been created by a capture process. That is, this procedure does not support persistent row LCRs.

Syntax

```
MEMBER PROCEDURE CONVERT_LONG_TO_LOB_CHUNK;
```

DELETE_COLUMN Member Procedure

Deletes the old value, the new value, or both, for the specified column, depending on the value type specified.

Syntax

```
MEMBER PROCEDURE DELETE_COLUMN(
    column_name IN VARCHAR2,
    value_type  IN VARCHAR2 DEFAULT '*');
```

Parameters

Table 292-15 DELETE_COLUMN Procedure Parameters

| Parameter | Description |
|--------------------------|---|
| <code>column_name</code> | The column name An error is raised if the column does not exist in the LCR. |
| <code>value_type</code> | The type of value to delete for the column Specify <code>old</code> to delete the old value of the column. Specify <code>new</code> to delete the new value of the column. If <code>*</code> is specified, then the procedure deletes both the old and new values. |

EXECUTE Member Procedure

Executes the row LCR under the security domain of the current user. Any apply handlers that would be run for an LCR are not run when the LCR is applied using this procedure.

This member procedure can be run on a row LCR under any of the following conditions:

- The LCR is being processed by an apply handler.
- The LCR has been constructed using the `LCR$_ROW_RECORD` constructor function but has not been enqueued.
- The LCR is in the error queue.

 **Note:**

Do not run this member procedure in a custom rule-based transformation on a row LCR. Doing so could execute the row LCR outside of its transactional context.

Considerations for LOB Columns

When processing a row LCR with LOB columns with a procedure DML handler or error handler, and the handler is using LOB assembly (the `assemble_lobs` parameter is set to `TRUE` for the handler), this member procedure executes the assembled row LCR. An assembled row LCR represents a LOB value with a LOB locator or `NULL`.

If `assemble_lobs` is set to `FALSE` for the handler, then this member procedure executes the nonassembled row LCRs. Nonassembled row LCRs represent LOB values with `VARCHAR2` and `RAW` data types. These nonassembled row LCRs might have been modified by the handler.

An error is raised under the following conditions:

- A DML or error handler configured with `assemble_lobs` set to `FALSE` attempts to execute a row LCR that contains a LOB locator.

- A DML or error handler configured with `assemble_lob` set to `TRUE` attempts to execute a row LCR that contains one or more LOB values represented with `VARCHAR2` or `RAW` data types.

If an error is raised because of one of these conditions, then the transaction that includes the row LCR is moved to the error queue, and the LOB is represented by the original (nonassembled) row LCRs.

Syntax

```
MEMBER PROCEDURE EXECUTE(
    conflict_resolution IN BOOLEAN);
```

Parameters

Table 292-16 EXECUTE Procedure Parameters

| Parameter | Description |
|----------------------------------|--|
| <code>conflict_resolution</code> | <p>If <code>TRUE</code>, then any conflict resolution defined for the table using the <code>SET_UPDATE_CONFLICT_HANDLER</code> procedure in the <code>DBMS_APPLY_ADM</code> package is used to resolve conflicts resulting from the execution of the LCR.</p> <p>If <code>FALSE</code>, then conflict resolution is not used.</p> <p>An error is raised if this parameter is not specified or is set to <code>NULL</code>.</p> |

GET_JSON_INFORMATION Member Function

Gets JSON information.

The return value can be one of the following:

```
DBMS_LCR.NOT_OSON CONSTANT NUMBER := 1;
DBMS_LCR.OSON_DOC CONSTANT NUMBER := 2;
```

Note:

OSON is Oracle binary format for JSON column.

They represent either a column not containing `OSON` data or full `OSON` document.

Syntax

```
MEMBER FUNCTION GET_JSON_INFORMATION(
    column_name IN VARCHAR2)
RETURN NUMBER;
```

Parameters

Table 292-17 GET_JSON_INFORMATION Member Function Parameter

| Parameter | Description |
|--------------------------|--|
| <code>column_name</code> | Name of column to obtain JSON information. |

GET_LOB_INFORMATION Member Function

Gets the LOB information for the column.

The return value can be one of the following:

```
DBMS_LCR.NOT_A_LOB          CONSTANT NUMBER := 1;
DBMS_LCR.NULL_LOB         CONSTANT NUMBER := 2;
DBMS_LCR.INLINE_LOB       CONSTANT NUMBER := 3;
DBMS_LCR.EMPTY_LOB        CONSTANT NUMBER := 4;
DBMS_LCR.LOB_CHUNK        CONSTANT NUMBER := 5;
DBMS_LCR.LAST_LOB_CHUNK   CONSTANT NUMBER := 6;
```

Returns NULL if the specified column does not exist.

If the command type of the row LCR is UPDATE, then specifying 'Y' for the use_old parameter is a convenient way to get the value of the columns.

Syntax

```
MEMBER FUNCTION GET_LOB_INFORMATION(
    value_type IN VARCHAR2,
    column_name IN VARCHAR2,
    use_old IN VARCHAR2 DEFAULT 'Y')
RETURN NUMBER;
```

Parameters

Table 292-18 GET_LOB_INFORMATION Function Parameters

| Parameter | Description |
|-------------|--|
| value_type | The type of value to return for the column, either old or new |
| column_name | The name of the column |
| use_old | If Y and value_type is new, and no new value exists, then the function returns the corresponding old value. If N and value_type is new, then the function does not return the old value if no new value exists. If value_type is old or if the command type of the row LCR is not UPDATE, then the function ignores the value of the use_old parameter. NULL is not a valid specification for the use_old parameter. |

GET_LOB_OFFSET Member Function

Gets the LOB offset for the specified column in the number of characters for CLOB columns and the number of bytes for BLOB columns. Returns a non-NULL value only if all of the following conditions are met:

- The value exists for the column
- The column value is an out-of-line LOB. That is, the information is DBMS_LCR.LAST_LOB_CHUNK or DBMS_LCR.LOB_CHUNK
- The command type is LOB ERASE or LOB WRITE

Otherwise, returns NULL.

Syntax

```
GET_LOB_OFFSET(
    value_type IN VARCHAR2,
    column_name IN VARCHAR2)
RETURN NUMBER;
```

Parameters**Table 292-19 GET_LOB_OFFSET Function Parameters**

| Parameter | Description |
|-------------|--|
| value_type | The type of value to return for the column Currently, only <code>new</code> can be specified. |
| column_name | The name of the LOB column |

GET_LOB_OPERATION_SIZE Member Function

Gets the operation size for the LOB column in the number of characters for `CLOB` columns and the number of bytes for `BLOB` columns. Returns a non-NULL value only if all of the following conditions are met:

- The value exists for the column
- The column value is an out-of-line LOB
- The command type is `LOB ERASE` or `LOB TRIM`
- The information is `DBMS_LCR.LAST_LOB_CHUNK`

Otherwise, returns NULL.

Syntax

```
MEMBER FUNCTION GET_LOB_OPERATION_SIZE(
    value_type IN VARCHAR2,
    column_name IN VARCHAR2)
RETURN NUMBER,
```

Parameters**Table 292-20 GET_LOB_OPERATION_SIZE Function Parameters**

| Parameter | Description |
|-------------|--|
| value_type | The type of value to return for the column Currently, only <code>new</code> can be specified. |
| column_name | The name of the LOB column |

GET_LONG_INFORMATION Member Function

Gets the `LONG` information for the column.

The return value can be one of the following:

```
DBMS_LCR.NOT_A_LONG          CONSTANT NUMBER := 1;
DBMS_LCR.NULL_LONG         CONSTANT NUMBER := 2;
DBMS_LCR.INLINE_LONG       CONSTANT NUMBER := 3;
DBMS_LCR.LONG_CHUNK        CONSTANT NUMBER := 4;
DBMS_LCR.LAST_LONG_CHUNK   CONSTANT NUMBER := 5;
```

Returns NULL if the specified column does not exist.

If the command type of the row LCR is UPDATE, then specifying 'Y' for the use_old parameter is a convenient way to get the value of the columns.

Syntax

```
MEMBER FUNCTION GET_LONG_INFORMATION(
    value_type IN VARCHAR2,
    column_name IN VARCHAR2,
    use_old IN VARCHAR2 DEFAULT 'Y')
RETURN NUMBER;
```

Parameters

Table 292-21 GET_LONG_INFORMATION Function Parameters

| Parameter | Description |
|-------------|--|
| value_type | The type of value to return for the column, either old or new |
| column_name | The name of the column |
| use_old | If Y and value_type is new, and no new value exists, then the function returns the corresponding old value. If N and value_type is new, then the function does not return the old value if no new value exists. If value_type is old or if the command_type of the row LCR is not UPDATE, then the function ignores the value of the use_old parameter. NULL is not a valid specification for the use_old parameter. |

GET_ROW_TEXT Member Procedure

Gets the SQL statement for the change that is encapsulated in the row LCR. This method performs SQL generation in PL/SQL.

This method is overloaded. The different functionality of each form of syntax is presented along with the definitions.

Syntax

The following procedure returns the SQL statement in a CLOB datatype.

```
MEMBER PROCEDURE GET_ROW_TEXT(
    row_text IN/OUT CLOB);
```

The following procedure returns the SQL statement with bind variables in a CLOB datatype.

```
MEMBER PROCEDURE GET_ROW_TEXT(
    row_text IN/OUT CLOB,
    variable_list IN/OUT LCR$_ROW_LIST,
    bind_var_syntax IN VARCHAR2 DEFAULT ':');
```

See Also:

"LCR\$_ROW_LIST Type"

Parameters

Table 292-22 GET_ROW_TEXT Procedure Parameters

| Parameter | Description |
|------------------------------|--|
| <code>row_text</code> | The SQL statement for the change that is encapsulated in the LCR |
| <code>variable_list</code> | The values for the bind variables in the order of the bind variables |
| <code>bind_var_syntax</code> | The syntax for the bind variables One of the following values is valid: <ul style="list-style-type: none"> Specify <code>:</code>, the default, for bind values to be in the form <code>:1</code>, <code>:2</code>, and so on. Specify <code>?</code> for bind values to be in the form <code>?.</code> |

GET_VALUE Member Function

Gets the old or new value for the specified column, depending on the value type specified.

If the command type of the row LCR is `UPDATE`, then specifying `'Y'` for the `use_old` parameter is a convenient way to get the value of a column.

Syntax

```
MEMBER FUNCTION GET_VALUE (
    value_type IN VARCHAR2,
    column_name IN VARCHAR2,
    use_old IN VARCHAR2 DEFAULT 'Y')
RETURN ANYDATA;
```

Parameters

Table 292-23 GET_VALUE Function Parameters

| Parameter | Description |
|--------------------------|--|
| <code>value_type</code> | The type of value to return for the column Specify <code>old</code> to get the old value for the column. Specify <code>new</code> to get the new value for the column. |
| <code>column_name</code> | The column name If the column is present and has a <code>NULL</code> value, then the function returns an <code>ANYDATA</code> instance containing a <code>NULL</code> value. If the column value is absent, then the function returns a <code>NULL</code> . |

Table 292-23 (Cont.) GET_VALUE Function Parameters

| Parameter | Description |
|-----------|---|
| use_old | <p>If Y and value_type is new, and no new value exists, then the function returns the corresponding old value.</p> <p>If N and value_type is new, then the function returns NULL if no new value exists.</p> <p>If value_type is old or if the command_type of the row LCR is not UPDATE, then the function ignores the value of the use_old parameter.</p> <p>NULL is not a valid specification for the use_old parameter.</p> |

GET_VALUES Member Function

Gets a list of old or new values, depending on the value type specified.

If the command type of the row LCR is UPDATE, then specifying 'Y' for the use_old parameter is a convenient way to get the values of all columns.

Syntax

```
MEMBER FUNCTION GET_VALUES(
    value_type IN VARCHAR2,
    use_old    IN VARCHAR2 DEFAULT 'Y')
RETURN SYS.LCR$_ROW_LIST;
```

Parameters

Table 292-24 GET_VALUES Function Parameters

| Parameter | Description |
|------------|---|
| value_type | <p>The type of values to return</p> <p>Specify old to return a list of old values. Specify new to return a list of new values.</p> |
| use_old | <p>If Y and value_type is new, then the function returns a list of all new values in the LCR. If a new value does not exist in the list, then the function returns the corresponding old value. Therefore, the returned list contains all existing new values and the old values where there are no new values.</p> <p>If N and value_type is new, then the function returns a list of all new values in the LCR without returning any old values.</p> <p>If value_type is old or if the command_type of the row LCR is not UPDATE, then the function ignores the value of the use_old parameter.</p> <p>NULL is not a valid specification for the use_old parameter.</p> |

GET_WHERE_CLAUSE Member Procedure

Gets a WHERE clause for the change that is encapsulated in the row LCR.

Use the `WHERE` clause returned by `GET_WHERE_CLAUSE` instead of using the `ROWID`, because the `ROWID` is not ANSI compatible. The generated `WHERE` clause might not match the `WHERE` clause in the original DML operation.

The `ROWID` of an `INSERT` statement is the `ROWID` of the new row created by the `INSERT`. The `WHERE` clause generated for an `INSERT` operation identifies the new row. Therefore, the generated `WHERE` clause includes all of the new values inserted.

For example, consider the following insert into the `hr.departments` table:

```
INSERT INTO hr.departments (
    department_id, department_name, manager_id, location_id)
VALUES (10, 'HR', 20, 40);
```

The generated `WHERE` clause represents the row with the values 10, 'HR', 20, and 40. Hence, the generated `WHERE` clause is the following:

```
WHERE "DEPARTMENT_ID" = 10 AND "DEPARTMENT_NAME" = 'HR' AND
      "MANAGER_ID" = 20 AND "LOCATION_ID" = 40
```

The `ROWID` of an `UPDATE` statement is the `ROWID` of the row that was updated. The `WHERE` clause generated for an `UPDATE` operation identifies the row after the `UPDATE` executes. The generated `WHERE` clause is based on the old and new values of the `UPDATE`.

For example, consider the following update to the `hr.departments` table:

```
UPDATE hr.departments SET department_name='Management'
WHERE department_name='Administration' AND location_id = 20 AND
      manager_id = 30 AND department_id = 10;
```

The values of the row after the `UPDATE` are 10, 'Management', 30, and 20. Hence, the generated `WHERE` clause to identify the row is the following:

```
WHERE "DEPARTMENT_ID" = 10 AND "DEPARTMENT_NAME" = 'MANAGEMENT' AND
      "MANAGER_ID" = 30 AND "LOCATION_ID" = 20
```

Notice that the new value is used for `"DEPARTMENT_NAME"`, because the new value is the value of the column after the `UPDATE`. For the rest of the columns, the old values are used.

The `ROWID` of a `DELETE` operation is the row that existed before it was deleted. The generated `WHERE` clause consists of all the old column values present in the `DELETE` operation.

LOB columns do not appear in generated `WHERE` clauses. The generated `WHERE` clause is not affected by the presence of LOB columns in the LCR.

This method is overloaded. The different functionality of each form of syntax is presented along with the definitions.

Syntax

The following procedure returns the `WHERE` clause of a SQL statement in a `CLOB` datatype.

```
MEMBER PROCEDURE GET_WHERE_CLAUSE(
    where_clause IN/OUT CLOB);
```

The following procedure returns the `WHERE` clause of a SQL statement with bind variables in a `CLOB` datatype.

```
MEMBER PROCEDURE GET_WHERE_CLAUSE(
    where_clause IN/OUT CLOB,
```

```
variable_list    IN/OUT  LCR$_ROW_LIST,
bind_var_syntax IN      VARCHAR2  DEFAULT ':');
```

 **See Also:**
[LCR\\$_ROW_LIST Type](#)

Parameters

Table 292-25 GET_WHERE_CLAUSE Procedure Parameters

| Parameter | Description |
|-----------------|---|
| where_clause | The WHERE clause of the SQL statement for the change that is encapsulated in the LCR |
| variable_list | The values for the bind variables in the order of the bind variables |
| bind_var_syntax | The syntax for the bind variables One of the following values is valid: <ul style="list-style-type: none"> Specify :, the default, for bind values to be in the form :1, :2, and so on. Specify ? for bind values to be in the form ?. |

GET_XML_INFORMATION Member Function

Gets the XML information for the specified column.

The return value can be one of the following:

```
DBMS_LCR.NOT_XML    CONSTANT NUMBER := 1;
DBMS_LCR.XML_DOC    CONSTANT NUMBER := 2;
DBMS_LCR.XML_DIFF   CONSTANT NUMBER := 3;
```

```
DBMS_LCR.XML_DIFF   CONSTANT NUMBER := 3;
```

DBMS_LCR.NOT_XML indicates that the column is not an XMLType column.

DBMS_LCR.XML_DOC indicates that the column contains an XML document.

DBMS_LCR.XML_DIFF indicates that the column contains an XML document that describes a change made by an update operation. This XML document describes the differences in the column's XML document. The entire XML document is not replaced.

DBMS_LCR.XML_DIFF indicates that the column contains differences between old and new XML documents for an update operation.

Returns NULL if the specified column does not exist.

Syntax

```
MEMBER FUNCTION GET_XML_INFORMATION (
    column_name IN VARCHAR2)
RETURN NUMBER;
```

Parameter

Table 292-26 GET_XML_INFORMATION Function Parameter

| Parameter | Description |
|-------------|-----------------|
| column_name | The column name |

IS_STATEMENT_LCR Member Function

This function is reserved for internal use only.

KEEP_COLUMNS Member Procedure

This procedure keeps a list of columns in a row LCR. The procedure deletes columns that are not in the list from the row LCR.

Syntax

```
MEMBER PROCEDURE KEEP_COLUMNS(
    column_list IN VARCHAR2,
    value_type  IN VARCHAR2 DEFAULT '*');
```

Parameters

Table 292-27 KEEP_COLUMNS Procedure Parameters

| Parameter | Description |
|-------------|---|
| column_list | The names of the columns kept for the row LCR Specify a comma-delimited list of type VARCHAR2. This procedure removes columns that are not in the list from the current row LCR. |
| value_type | The type of value for which to keep the columns Specify <i>old</i> to keep the old values of the columns. An error is raised if the old values do not exist in the LCR. Specify <i>new</i> to keep the new values of the columns. An error is raised if the new values do not exist in the LCR. If <i>*</i> is specified, then the procedure keeps both the old and the new columns. |

RENAME_COLUMN Member Procedure

Renames a column in a row LCR.

Syntax

```
MEMBER PROCEDURE RENAME_COLUMN(
    from_column_name IN VARCHAR2,
    to_column_name   IN VARCHAR2,
    value_type       IN VARCHAR2 DEFAULT '*');
```

Parameters

Table 292-28 RENAME_COLUMN Procedure Parameters

| Parameter | Description |
|-------------------------------|---|
| <code>from_column_name</code> | The existing column name |
| <code>to_column_name</code> | The new column name An error is raised if a column with the specified name already exists. |
| <code>value_type</code> | The type of value for which to rename the column Specify <code>old</code> to rename the old value of the column. An error is raised if the old value does not exist in the LCR. Specify <code>new</code> to rename the new value of the column. An error is raised if the new value does not exist in the LCR. If <code>*</code> is specified, then the procedure renames the column names for both old and new value. The procedure raises an error if either column value does not exist in the LCR. |

SET_JSON_INFORMATION Member Procedure

Sets the JSON information for a column.

Syntax

```
MEMBER PROCEDURE SET_JSON_INFORMATION(
    self          IN OUT NOCOPY LCR$_ROW_RECORD,
    value_type    IN VARCHAR2,
    column_name   IN VARCHAR2,
    json_information IN NUMBER);
```

Parameters

Table 292-29 SET_JSON_INFORMATION Procedure Parameters

| Parameter | Description |
|-------------------------------|--|
| <code>self</code> | |
| <code>value_type</code> | The type of value to set for the column. The supported values are: <ul style="list-style-type: none"> NEW OLD |
| <code>column_name</code> | The name of the column. An exception is raised if the column does not exist in the LCR. |
| <code>json_information</code> | The supported values are: <ul style="list-style-type: none"> DBMS_LCR.NOT_OSON DBMS_LCR.OSON_DOC |

SET_LOB_INFORMATION Member Procedure

Sets LOB information for the column.

Note:

When you are processing a row LCR with a rule-based transformation, procedure DML handler, or error handler, you cannot use this member procedure.

Syntax

```
MEMBER PROCEDURE SET_LOB_INFORMATION(
    value_type      IN VARCHAR2,
    column_name     IN VARCHAR2,
    lob_information IN NUMBER);
```

Parameters

Table 292-30 SET_LOB_INFORMATION Procedure Parameters

| Parameter | Description | | | | | | | | | | | | |
|-------------------------|--|--------------------|-----------------------|-------------------|-----------------------|---------------------|-----------------------|--------------------|-----------------------|--------------------|-----------------------|-------------------------|-----------------------|
| value_type | The type of value to set for the column, either old or new Specify old only if lob_information is set to DBMS_LCR.NOT_A_LOB. | | | | | | | | | | | | |
| column_name | The name of the column. An exception is raised if the column value does not exist. You might need to set this parameter for non-LOB columns. | | | | | | | | | | | | |
| lob_information | Specify one of the following values: <table border="0"> <tr> <td>DBMS_LCR.NOT_A_LOB</td> <td>CONSTANT NUMBER := 1;</td> </tr> <tr> <td>DBMS_LCR.NULL_LOB</td> <td>CONSTANT NUMBER := 2;</td> </tr> <tr> <td>DBMS_LCR.INLINE_LOB</td> <td>CONSTANT NUMBER := 3;</td> </tr> <tr> <td>DBMS_LCR.EMPTY_LOB</td> <td>CONSTANT NUMBER := 4;</td> </tr> <tr> <td>DBMS_LCR.LOB_CHUNK</td> <td>CONSTANT NUMBER := 5;</td> </tr> <tr> <td>DBMS_LCR.LAST_LOB_CHUNK</td> <td>CONSTANT NUMBER := 6;</td> </tr> </table> | DBMS_LCR.NOT_A_LOB | CONSTANT NUMBER := 1; | DBMS_LCR.NULL_LOB | CONSTANT NUMBER := 2; | DBMS_LCR.INLINE_LOB | CONSTANT NUMBER := 3; | DBMS_LCR.EMPTY_LOB | CONSTANT NUMBER := 4; | DBMS_LCR.LOB_CHUNK | CONSTANT NUMBER := 5; | DBMS_LCR.LAST_LOB_CHUNK | CONSTANT NUMBER := 6; |
| DBMS_LCR.NOT_A_LOB | CONSTANT NUMBER := 1; | | | | | | | | | | | | |
| DBMS_LCR.NULL_LOB | CONSTANT NUMBER := 2; | | | | | | | | | | | | |
| DBMS_LCR.INLINE_LOB | CONSTANT NUMBER := 3; | | | | | | | | | | | | |
| DBMS_LCR.EMPTY_LOB | CONSTANT NUMBER := 4; | | | | | | | | | | | | |
| DBMS_LCR.LOB_CHUNK | CONSTANT NUMBER := 5; | | | | | | | | | | | | |
| DBMS_LCR.LAST_LOB_CHUNK | CONSTANT NUMBER := 6; | | | | | | | | | | | | |

SET_LOB_OFFSET Member Procedure

Sets the LOB offset for the specified column in the number of characters for CLOB columns and the number of bytes for BLOB columns.

Note:

When you are processing a row LCR with a rule-based transformation, procedure DML handler, or error handler, you cannot use this member procedure.

Syntax

```
MEMBER PROCEDURE SET_LOB_OFFSET(
    value_type      IN VARCHAR2,
    column_name     IN VARCHAR2,
    lob_offset      IN NUMBER);
```

Parameters

Table 292-31 SET_LOB_OFFSET Procedure Parameters

| Parameter | Description |
|-------------|---|
| value_type | The type of value to set for the column Currently, only <code>new</code> can be specified. |
| column_name | The column name An error is raised if the column value does not exist in the LCR. |
| lob_offset | The LOB offset number Valid values are <code>NULL</code> or a positive integer less than or equal to <code>DBMS_LOB.LOBLMAXSIZE</code> . |

SET_LOB_OPERATION_SIZE Member Procedure

Sets the operation size for the LOB column in the number of characters for `CLOB` columns and bytes for `BLOB` columns.

Note:

When you are processing a row LCR with a rule-based transformation, procedure DML handler, or error handler, you cannot use this member procedure.

Syntax

```
MEMBER PROCEDURE SET_LOB_OPERATION_SIZE (
  value_type      IN  VARCHAR2,
  column_name     IN  VARCHAR2,
  lob_operation_size IN NUMBER);
```

Parameters

Table 292-32 SET_LOB_OPERATION_SIZE Procedure Parameters

| Parameter | Description |
|-------------|---|
| value_type | The type of value to set for the column Currently, only <code>new</code> can be specified. |
| column_name | The name of the LOB column An exception is raised if the column value does not exist in the LCR. |

Table 292-32 (Cont.) SET_LOB_OPERATION_SIZE Procedure Parameters

| Parameter | Description |
|---------------------------------|---|
| <code>lob_operation_size</code> | If <code>lob_information</code> for the LOB is or will be <code>DBMS_LCR.LAST_LOB_CHUNK</code> , then this parameter can be set to either a valid LOB ERASE value or a valid LOB TRIM value. A LOB ERASE value must be a positive integer less than or equal to <code>DBMS_LOB.LOBMAXSIZE</code> . A LOB TRIM value must be a nonnegative integer less than or equal to <code>DBMS_LOB.LOBMAXSIZE</code> . Otherwise, set to <code>NULL</code> . |

SET_ROW_TEXT Member Procedure

This procedure is reserved for internal use only.

SET_VALUE Member Procedure

Overwrites the old or new value of the specified column.

One reason to overwrite an old value for a column is to resolve an error that resulted from a conflict.

 **Note:**

To add a column to a row LCR, run `ADD_COLUMN`.

 **See Also:**

[ADD_COLUMN Member Procedure](#)

Considerations for LOB Columns

When processing a row LCR with LOB columns with a procedure DML handler or error handler, and the handler is using LOB assembly (the `assemble_lob` parameter is set to `TRUE` for the handler), you can use this member procedure in the handler procedure on a LOB column in a row LCR. If `assemble_lob` is set to `FALSE` for the handler, then you cannot use this member procedure on a LOB column.

To use a DML or error handler to set the value of a LOB column, specify the LOB locator for the `column_value` parameter in the member procedure. The `SET_VALUE` member procedure verifies that an `ANYDATA` encapsulated LOB locator is processed with a DML or error handler that is using LOB assembly. An error is raised under the following conditions:

- The handler attempts to enqueue a row LCR with an `ANYDATA` encapsulated LOB locator.
- An attempt is made to set a LOB column incorrectly.

If an error is raised because of one of these conditions, then the transaction that includes the row LCR is moved to the error queue, and the LOB is represented by the original (nonassembled) row LCRs.

 **Note:**

- Database compatibility must be 10.2.0 or higher to use LOB assembly.
- When you are processing a row LCR with a rule-based transformation, you cannot use this member procedure on a LOB column.
- When you are processing a row LCR with a rule-based transformation, procedure DML handler, or error handler, you cannot use this member procedure on a LONG or LONG RAW column.

Considerations for XMLType Columns

When processing a row LCR with XMLType columns with a procedure DML handler or error handler, any XMLType columns and LOB columns in the LCR are always assembled using LOB assembly. You can use this member procedure in the handler procedure on a row LCR that contains one or more XMLType columns.

To use a DML or error handler to set the value an XMLType column, specify the XMLType for the column_value parameter. The SET_VALUE member procedure verifies that an ANYDATA encapsulated XMLType is processed with a DML or error handler. An error is raised under the following conditions:

- The handler attempts to enqueue a row LCR with an ANYDATA encapsulated XMLType.
- An attempt is made to set a XMLType column incorrectly.

If an error is raised because of one of these conditions, then the transaction that includes the row LCR is moved to the error queue, and the XMLType column is represented by the original (nonassembled) row LCRs.

 **Note:**

- Database compatibility must be 11.1.0 or higher to process row LCRs with XMLType columns.
- When you are processing a row LCR with a rule-based transformation, you cannot use this member procedure on XMLType columns.

Syntax

```
MEMBER PROCEDURE SET_VALUE (  
    value_type    IN  VARCHAR2,  
    column_name   IN  VARCHAR2,  
    column_value  IN  ANYDATA);
```

Parameters

Table 292-33 SET_VALUE Procedure Parameters

| Parameter | Description |
|---------------------------|--|
| <code>value_type</code> | The type of value to set Specify <code>old</code> to set the old value of the column. Specify <code>new</code> to set the new value of the column. |
| <code>column_name</code> | The column name An error is raised if the specified <code>column_value</code> does not exist in the LCR for the specified <code>column_type</code> . |
| <code>column_value</code> | The new value of the column If <code>NULL</code> is specified, then this procedure raises an error. To set the value to <code>NULL</code> , encapsulate the <code>NULL</code> in an <code>ANYDATA</code> instance. If the member procedure is used in a procedure DML handler or error handler that uses LOB assembly, then specify a LOB locator for LOB columns. |

SET_VALUES Member Procedure

Replaces all old values or all new values for the LCR, depending on the value type specified.

Considerations for LOB Columns

You can use this procedure when processing a row LCR with LOB columns with a procedure DML handler or error handler. If the handler is using LOB assembly (the `assemble_lob` parameter is set to `TRUE` for the handler), then you can use this member procedure in the handler procedure. If `assemble_lob` is set to `FALSE` for the handler, then you cannot use this member procedure on a row LCR.

To use a DML or error handler to set the value of one or more LOB columns in a row LCR, specify a LOB locator for each LOB column in the `value_list` parameter. The `SET_VALUES` member procedure verifies that an `ANYDATA` encapsulated LOB locator is processed with a DML or error handler that is using LOB assembly. An error is raised under the following conditions:

- The handler attempts to enqueue a row LCR with an `ANYDATA` encapsulated LOB locator.
- An attempt is made to set a LOB column incorrectly.

If an error is raised because of one of these conditions, then the transaction that includes the row LCR is moved to the error queue, and the LOB columns are represented by the original (nonassembled) row LCRs.

 **Note:**

- Database compatibility must be 10.2.0 or higher to use LOB assembly.
- When you are processing a row LCR with a rule-based transformation, you cannot use this member procedure on LOB columns.
- When you are processing a row LCR with a rule-based transformation, procedure DML handler, or error handler, you cannot use this member procedure on LONG or LONG RAW columns.

Considerations for XMLType Columns

When processing a row LCR with XMLType columns with a procedure DML handler or error handler, any XMLType and LOB columns in the LCR are always assembled using LOB assembly. You can use this member procedure in the handler procedure on a row LCR that contains one or more XMLType columns.

To use a DML or error handler to set the value of one or more XMLType columns in a row LCR, specify an XMLType for each XMLType column in the `value_list` parameter. The `SET_VALUES` member procedure verifies that an ANYDATA encapsulated XMLType is processed with a DML or error handler. An error is raised under the following conditions:

- The handler attempts to enqueue a row LCR with an ANYDATA encapsulated XMLType.
- An attempt is made to set a XMLType incorrectly.

If an error is raised because of one of these conditions, then the transaction that includes the row LCR is moved to the error queue, and the XMLType columns are represented by the original (nonassembled) row LCRs.

 **Note:**

- Database compatibility must be 11.1.0 or higher to process row LCRs with XMLType columns.
- When you are processing a row LCR with a rule-based transformation, you cannot use this member procedure on XMLType columns.

Syntax

```
MEMBER PROCEDURE SET_VALUES(  
    value_type IN VARCHAR2,  
    value_list IN SYS.LCR$_ROW_LIST);
```

Parameters

Table 292-34 SET_VALUES Procedure Parameters

| Parameter | Description |
|------------|---|
| value_type | The type of values to replace Specify <code>old</code> to replace the old values. Specify <code>new</code> to replace the new values. |
| value_list | List of values to replace the existing list Use a <code>NULL</code> or an empty list to remove all values. If the member procedure is used in a procedure DML handler or error handler that uses LOB assembly, then specify one or more LOB locators for LOB columns. |

SET_XML_INFORMATION Member Procedure

Sets the XML information for the column.

Syntax

```
MEMBER PROCEDURE SET_XML_INFORMATION(
    column_name      IN VARCHAR2,
    xml_information  IN NUMBER);
```

Parameters

Table 292-35 SET_XML_INFORMATION Procedure Parameters

| Parameter | Description |
|-----------------|--|
| column_name | The name of the column An exception is raised if the column value does not exist in the LCR. |
| xml_information | Specify one of the following values: DBMS_LCR.NOT_XML CONSTANT NUMBER := 1; DBMS_LCR.XML_DOC CONSTANT NUMBER := 2; DBMS_LCR.XML_DIFF CONSTANT NUMBER := 3; DBMS_LCR.XML_DIFF CONSTANT NUMBER := 3; DBMS_LCR.NOT_XML indicates that the column is not an XMLType column. DBMS_LCR.XML_DOC indicates that the column contains an XML document. DBMS_LCR.XML_DIFF indicates that the column contains differences between old and new XML documents for an update operation. DBMS_LCR.XML_DIFF indicates that the column contains an XML document that describes a change made by an update operation. This XML document describes the differences in the column's XML document. The entire XML document is not replaced. |

292.3.3 Common Subprograms for LCR\$_DDL_RECORD and LCR\$_ROW_RECORD

These functions and procedures are common to both the LCR\$_DDL_RECORD and LCR\$_ROW_RECORD type.

See Also:

For descriptions of the subprograms for these types that are exclusive to each type:

- ["LCR\\$_DDL_RECORD Type"](#)
- ["LCR\\$_ROW_RECORD Type"](#)

Table 292-36 Summary of Common Subprograms for DDL and Row LCR Types

| Subprogram | Description |
|--|---|
| GET_COMMAND_TYPE Member Function | Gets the command type of the logical change record (LCR) |
| GET_COMMIT_SCN Member Function | Gets the commit system change number (SCN) of the transaction to which the current LCR belongs |
| GET_COMMIT_SCN_FROM_POSITION Static Function | Gets the commit SCN of a transaction from the input position, which is generated by an XStream outbound server |
| GET_COMMIT_TIME | Gets the commit time of the transaction to which the current LCR belongs |
| GET_COMPATIBLE Member Function | Gets the minimal database compatibility required to support the LCR |
| GET_EXTRA_ATTRIBUTE Member Function | Gets the value for the specified extra attribute in the LCR |
| GET_OBJECT_NAME Member Function | Gets the name of the object that is changed by the LCR |
| GET_OBJECT_OWNER Member Function | Gets the owner of the object that is changed by the LCR |
| GET_POSITION Member Function | Gets the position of the current LCR |
| GET_ROOT_NAME Member Function | Gets the global name of the root for a CDB. |
| GET_SCN Member Function | Gets the SCN of the LCR |
| GET_SCN_FROM_POSITION Static Function | Gets the SCN from the input position, which is generated by an XStream outbound server |
| GET_SOURCE_DATABASE_NAME Member Function | Gets the source database name. |
| GET_SOURCE_TIME Member Function | Gets the time when the change in an LCR captured by a capture process was generated in the redo log of the source database, or the time when a persistent LCR was created |
| GET_TAG Member Function | Gets the tag for the LCR |

Table 292-36 (Cont.) Summary of Common Subprograms for DDL and Row LCR Types

| Subprogram | Description |
|---|--|
| GET_THREAD_NUMBER Member Function | Gets the thread number of the database instance that made the change that is encapsulated in the LCR |
| GET_TRANSACTION_ID Member Function | Gets the transaction identifier of the LCR |
| IS_NULL_TAG Member Function | Returns Y if the tag for the LCR is NULL, or returns N if the tag for the LCR is not NULL |
| SET_COMMAND_TYPE Member Procedure | Sets the command type in the LCR |
| SET_EXTRA_ATTRIBUTE Member Procedure | Sets the value for the specified extra attribute in the LCR |
| SET_OBJECT_NAME Member Procedure | Sets the name of the object that is changed by the LCR |
| SET_OBJECT_OWNER Member Procedure | Sets the owner of the object that is changed by the LCR |
| SET_ROOT_NAME Member Procedure | Sets the global name of the root in a CDB. |
| SET_SOURCE_DATABASE_NAME Member Procedure | Sets the source database name of the object that is changed by the LCR |
| SET_TAG Member Procedure | Sets the tag for the LCR |

GET_COMMAND_TYPE Member Function

Gets the command type of the LCR.

 **See Also:**

The "SQL Command Codes" table in the *Oracle Call Interface Programmer's Guide* for a complete list of command types

Syntax

```
MEMBER FUNCTION GET_COMMAND_TYPE ()
RETURN VARCHAR2;
```

GET_COMMIT_SCN Member Function

Gets the commit system change number (SCN) of the transaction to which the current LCR belongs.

The commit SCN for a transaction is available only during apply or during error transaction execution. This function can be used only in a procedure DML handler, DDL handler, or error handler.

The commit SCN might not be available for an LCR that is part of an incomplete transaction. For example, persistent LCRs might not have a commit SCN. If the commit SCN is not available for an LCR, then this function returns NULL.

Syntax

```
MEMBER FUNCTION GET_COMMIT_SCN()
RETURN NUMBER;
```

GET_COMMIT_SCN_FROM_POSITION Static Function

Gets the commit system change number (SCN) of a transaction from the input position, which is generated by an XStream outbound server.

Syntax

```
STATIC FUNCTION GET_COMMIT_SCN_FROM_POSITION(
    position IN RAW)
RETURN NUMBER;
```

Parameters**Table 292-37 GET_COMMIT_SCN_FROM_POSITION Function Parameter**

| Parameter | Description |
|-----------|--|
| position | The position You can obtain the position by using the <code>GET_POSITION</code> member function or by querying the <code>DBA_XSTREAM_OUTBOUND_PROGRESS</code> data dictionary view. |

**Note:**

Using XStream requires purchasing a license for the Oracle GoldenGate product. See *Oracle Database XStream Guide*.

GET_COMMIT_TIME

Gets the commit time of the transaction to which the current LCR belongs.

The commit time for a transaction is available only during apply or during error transaction execution. This function can be used only in a procedure DML handler, DDL handler, or error handler.

The commit time might not be available for an LCR that is part of an incomplete transaction. For example, persistent LCRs might not have a commit time. If the commit time is not available for an LCR, then this function returns `NULL`.

Syntax

```
MEMBER FUNCTION GET_COMMIT_TIME()
RETURN DATE;
```

GET_COMPATIBLE Member Function

Gets the minimal database compatibility required to support the LCR. You control the compatibility of an Oracle database using the `COMPATIBLE` initialization parameter.

The return value for this function can be one of the following:

| Return Value | COMPATIBLE Initialization Parameter Equivalent |
|------------------------------|--|
| DBMS_STREAMS.COMPATIBLE_9_2 | 9.2.0 |
| DBMS_STREAMS.COMPATIBLE_10_1 | 10.1.0 |
| DBMS_STREAMS.COMPATIBLE_10_2 | 10.2.0 |
| DBMS_STREAMS.COMPATIBLE_11_1 | 11.1.0 |
| DBMS_STREAMS.COMPATIBLE_11_2 | 11.2.0 |

DDL LCRs always return `DBMS_STREAMS.COMPATIBLE_9_2`.

You can use the following functions in the `DBMS_STREAMS` package for constant compatibility return values:

- The `COMPATIBLE_9_2` function returns the `DBMS_STREAMS.COMPATIBLE_9_2` constant.
- The `COMPATIBLE_10_1` function returns `DBMS_STREAMS.COMPATIBLE_10_1` constant.
- The `COMPATIBLE_10_2` function returns `DBMS_STREAMS.COMPATIBLE_10_2` constant.
- The `COMPATIBLE_11_1` function returns `DBMS_STREAMS.COMPATIBLE_11_1` constant.
- The `COMPATIBLE_11_2` function returns `DBMS_STREAMS.COMPATIBLE_11_2` constant.
- The `MAX_COMPATIBLE` function returns an integer that is greater than the highest possible compatibility constant for the current release of Oracle Database.

You can use these functions with the `GET_COMPATIBLE` member function for an LCR in rule conditions and apply handlers.

See Also:

- *Oracle Database Reference* and *Oracle Database Upgrade Guide* for more information about the `COMPATIBLE` initialization parameter

Syntax

```
MEMBER FUNCTION GET_COMPATIBLE ()
RETURN NUMBER;
```

GET_EXTRA_ATTRIBUTE Member Function

Gets the value for the specified extra attribute in the LCR. The returned extra attribute is contained within an `ANYDATA` instance. You can use the `INCLUDE_EXTRA_ATTRIBUTE` procedure in the `DBMS_CAPTURE_ADM` package to instruct a capture process to capture one or more extra attributes.

See Also:

[INCLUDE_EXTRA_ATTRIBUTE Procedure](#)

Syntax

```
MEMBER FUNCTION GET_EXTRA_ATTRIBUTE(
    attribute_name IN VARCHAR2)
RETURN ANYDATA;
```

Parameters**Table 292-38 GET_EXTRA_ATTRIBUTE Function Parameter**

| Parameter | Description |
|----------------|---|
| attribute_name | <p>The name of the extra attribute to return</p> <p>Valid names are:</p> <ul style="list-style-type: none"> • row_id The rowid of the row changed in a row LCR. This attribute is not included in DDL LCRs, nor in row LCRs for index-organized tables. The type is UROWID. • serial# The serial number of the session that performed the change captured in the LCR. The type is NUMBER. • session# The identifier of the session that performed the change captured in the LCR. The type is NUMBER. • thread# The thread number of the instance in which the change captured in the LCR was performed. Typically, the thread number is relevant only in an Oracle Real Application Clusters (Oracle RAC) environment. The type is NUMBER. • tx_name The name of the transaction that includes the LCR. The type is VARCHAR2. • username The name of the current user who performed the change captured in the LCR. The type is VARCHAR2. <p>An error is raised if the specified attribute_name is not valid. If no value exists for the specified extra attribute, then the function returns a NULL.</p> <p>See Also: <i>Oracle Database PL/SQL Language Reference</i> for more information about the current user</p> |

GET_OBJECT_NAME Member Function

Gets the name of the object that is changed by the LCR.

Syntax

```
MEMBER FUNCTION GET_OBJECT_NAME()
RETURN VARCHAR2;
```

GET_OBJECT_OWNER Member Function

Gets the owner of the object that is changed by the LCR.

Syntax

```
MEMBER FUNCTION GET_OBJECT_OWNER()  
RETURN VARCHAR2;
```

GET_POSITION Member Function

Gets the position of the current LCR. The position uniquely identifies each LCR. The position strictly increases within each transaction and across transactions.

LCR position is commonly used in XStream configurations.

Syntax

```
MEMBER FUNCTION GET_POSITION()  
RETURN RAW;
```

Note:

Using XStream requires purchasing a license for the Oracle GoldenGate product. See *Oracle Database XStream Guide*.

GET_ROOT_NAME Member Function

Gets the global name of the root in a CDB, which is the root name for the LCR.

Syntax

```
MEMBER FUNCTION GET_ROOT_NAME()  
RETURN VARCHAR2;
```

GET_SCN Member Function

Gets the system change number (SCN) of the LCR.

Syntax

```
MEMBER FUNCTION GET_SCN()  
RETURN NUMBER;
```

GET_SCN_FROM_POSITION Static Function

Gets the system change number (SCN) from the input position, which is generated by an XStream outbound server.

Syntax

```
STATIC FUNCTION GET_SCN_FROM_POSITION(  
    position IN RAW)  
RETURN NUMBER;
```

Parameters

Table 292-39 GET_SCN_FROM_POSITION Function Parameter

| Parameter | Description |
|-----------|--|
| position | The position You can obtain the position by using the GET_POSITION member function or by querying the DBA_XSTREAM_OUTBOUND_PROGRESS data dictionary view. |

 **Note:**

Using XStream requires purchasing a license for the Oracle GoldenGate product. See *Oracle Database XStream Guide*.

GET_SOURCE_DATABASE_NAME Member Function

Gets the global name of the source database. The source database is the database where the change occurred.

Syntax

```
MEMBER FUNCTION GET_SOURCE_DATABASE_NAME ()  
RETURN VARCHAR2;
```

GET_SOURCE_TIME Member Function

Gets the time when the change in an LCR captured by a capture process was generated in the redo log of the source database, or the time when a persistent LCR was created.

Syntax

```
MEMBER FUNCTION GET_SOURCE_TIME ()  
RETURN DATE;
```

GET_TAG Member Function

Gets the tag for the LCR. An LCR tag is a binary tag that enables tracking of the LCR. For example, this tag can be used to determine the original source database of the DML or DDL change when apply forwarding is used.

Syntax

```
MEMBER FUNCTION GET_TAG ()  
RETURN RAW;
```

GET_THREAD_NUMBER Member Function

Gets the thread number of the database instance that made the change that is encapsulated in the LCR. Typically, the thread number is relevant in an Oracle Real Application Clusters configuration.

**See Also:**

Oracle Real Application Clusters Administration and Deployment Guide

Syntax

```
MEMBER FUNCTION GET_THREAD_NUMBER()  
RETURN NUMBER;
```

GET_TRANSACTION_ID Member Function

Gets the transaction identifier of the LCR.

Syntax

```
MEMBER FUNCTION GET_TRANSACTION_ID()  
RETURN VARCHAR2;
```

IS_NULL_TAG Member Function

Returns **Y** if the tag for the LCR is **NULL**, or returns **N** if the tag for the LCR is not **NULL**.

Syntax

```
MEMBER FUNCTION IS_NULL_TAG()  
RETURN VARCHAR2;
```

SET_COMMAND_TYPE Member Procedure

Sets the command type in the LCR. If the command type specified cannot be interpreted, then this procedure raises an error. For example, changing **INSERT** to **GRANT** would raise an error.

**See Also:**

- The description of the `command_type` parameter in [LCR\\$_DDL_RECORD Constructor Function Parameters](#)
- The description of the `command_type` parameter in [LCR\\$_ROW_RECORD Type](#)
- The "SQL Command Codes" table in the *Oracle Call Interface Programmer's Guide* for a complete list of command types

Syntax

```
MEMBER PROCEDURE SET_COMMAND_TYPE(  
    command_type IN VARCHAR2);
```

Parameter

Table 292-40 SET_COMMAND_TYPE Procedure Parameter

| Parameter | Description |
|--------------|---|
| command_type | The command type Set this parameter to a non-NULL value. |

SET_EXTRA_ATTRIBUTE Member Procedure

Sets the value for the specified extra attribute in the LCR. You can use the `INCLUDE_EXTRA_ATTRIBUTE` procedure in the `DBMS_CAPTURE_ADM` package to instruct a capture process to capture one or more extra attributes.

See Also:

[INCLUDE_EXTRA_ATTRIBUTE Procedure](#)

Syntax

```
MEMBER PROCEDURE SET_EXTRA_ATTRIBUTE(  
    attribute_name IN VARCHAR2,  
    attribute_value IN ANYDATA);
```

Parameters

Table 292-41 SET_EXTRA_ATTRIBUTE Procedure Parameter

| Parameter | Description |
|------------------------------|---|
| <code>attribute_name</code> | <p>The name of the extra attribute to set</p> <p>Valid names are:</p> <ul style="list-style-type: none"> <code>row_id</code> The rowid of the row changed in a row LCR. This attribute is not included in DDL LCRs, nor in row LCRs for index-organized tables. The type is <code>VARCHAR2</code>. <code>serial#</code> The serial number of the session that performed the change captured in the LCR. The type is <code>NUMBER</code>. <code>session#</code> The identifier of the session that performed the change captured in the LCR. The type is <code>NUMBER</code>. <code>thread#</code> The thread number of the instance in which the change captured in the LCR was performed. Typically, the thread number is relevant only in an Oracle Real Application Clusters (Oracle RAC) environment. The type is <code>NUMBER</code>. <code>tx_name</code> The name of the transaction that includes the LCR. The type is <code>VARCHAR2</code>. <code>username</code> The name of the current user who performed the change captured in the LCR. The type is <code>VARCHAR2</code>. <p>An error is raised if the specified <code>attribute_name</code> is not valid.</p> <p>See Also: <i>Oracle Database PL/SQL Language Reference</i> for more information about the current user</p> |
| <code>attribute_value</code> | <p>The value to which the specified extra attribute is set</p> <p>If set to <code>NULL</code>, then this procedure removes the specified extra attribute from the LCR. To set to <code>NULL</code>, encapsulate the <code>NULL</code> in an <code>ANYDATA</code> instance.</p> |

SET_OBJECT_NAME Member Procedure

Sets the name of the object that is changed by the LCR.

Syntax

```
MEMBER PROCEDURE SET_OBJECT_NAME (
    object_name IN VARCHAR2);
```

Parameter

Table 292-42 SET_OBJECT_NAME Procedure Parameter

| Parameter | Description |
|-------------|------------------------|
| object_name | The name of the object |

SET_OBJECT_OWNER Member Procedure

Sets the owner of the object that is changed by the LCR.

Syntax

```
MEMBER PROCEDURE SET_OBJECT_OWNER(
    object_owner IN VARCHAR2);
```

Parameter

Table 292-43 SET_OBJECT_OWNER Procedure Parameter

| Parameter | Description |
|--------------|-------------------------------------|
| object_owner | The schema that contains the object |

SET_ROOT_NAME Member Procedure

Sets the global name of the root in a CDB. The setting is the root name for the LCR.

Syntax

```
MEMBER PROCEDURE SET_ROOT_NAME(
    root_name IN VARCHAR2);
```

Parameter

Table 292-44 SET_ROOT_NAME Procedure Parameter

| Parameter | Description |
|-----------|------------------------------|
| root_name | The global name of the root. |

SET_SOURCE_DATABASE_NAME Member Procedure

Sets the source database name of the object that is changed by the LCR.

Syntax

```
MEMBER PROCEDURE SET_SOURCE_DATABASE_NAME(
    source_database_name IN VARCHAR2);
```

Parameter

Table 292-45 SET_SOURCE_DATABASE_NAME Procedure Parameter

| Parameter | Description |
|----------------------|--|
| source_database_name | The source database of the change If you do not include the domain name, then the procedure appends the local domain to the database name automatically. For example, if you specify DBS1 and the local domain is EXAMPLE.COM, then the procedure specifies DBS1.EXAMPLE.COM automatically. Set this parameter to a non-NULL value. |

SET_TAG Member Procedure

Sets the tag for the LCR. An LCR tag is a binary tag that enables tracking of the LCR. For example, this tag can be used to determine the original source database of the change when apply forwarding is used.

Syntax

```
MEMBER PROCEDURE SET_TAG(
    tag IN RAW);
```

Parameter

Table 292-46 SET_TAG Procedure Parameter

| Parameter | Description |
|-----------|--|
| tag | The binary tag for the LCR The size limit for a tag value is two kilobytes. |

292.3.4 LCR\$_ROW_LIST Type

This type identifies a list of column values for a row in a table.

It uses the LCR\$_ROW_UNIT type and is used in the LCR\$_ROW_RECORD type.

See Also:

- [LCR\\$_ROW_UNIT Type](#)
- [LCR\\$_ROW_RECORD Type](#)

Syntax

```
CREATE TYPE SYS.LCR$_ROW_LIST AS TABLE OF SYS.LCR$_ROW_UNIT
/
```

292.3.5 LCR\$_ROW_UNIT Type

This type identifies the value for a column in a row.

It is used in the LCR\$_ROW_LIST type.

See Also:

[LCR\\$_ROW_LIST Type](#)

Syntax

```
CREATE TYPE LCR$_ROW_UNIT AS OBJECT (
  column_name      VARCHAR2(4000),
  data             ANYDATA,
  lob_information  NUMBER,
  lob_offset       NUMBER,
  lob_operation_size NUMBER
  long_information NUMBER);
/
```

Attributes

Table 292-47 LCR\$_ROW_UNIT Attributes

| Attribute | Description | | | | | | | | | | | | |
|-------------------------|---|--------------------|-----------------------|-------------------|-----------------------|---------------------|-----------------------|--------------------|-----------------------|--------------------|-----------------------|-------------------------|-----------------------|
| column_name | The name of the column | | | | | | | | | | | | |
| data | The data contained in the column | | | | | | | | | | | | |
| lob_information | Contains the LOB information for the column and contains one of the following values: <table border="0" style="margin-left: 20px;"> <tr> <td>DBMS_LCR.NOT_A_LOB</td> <td>CONSTANT NUMBER := 1;</td> </tr> <tr> <td>DBMS_LCR.NULL_LOB</td> <td>CONSTANT NUMBER := 2;</td> </tr> <tr> <td>DBMS_LCR.INLINE_LOB</td> <td>CONSTANT NUMBER := 3;</td> </tr> <tr> <td>DBMS_LCR.EMPTY_LOB</td> <td>CONSTANT NUMBER := 4;</td> </tr> <tr> <td>DBMS_LCR.LOB_CHUNK</td> <td>CONSTANT NUMBER := 5;</td> </tr> <tr> <td>DBMS_LCR.LAST_LOB_CHUNK</td> <td>CONSTANT NUMBER := 6;</td> </tr> </table> | DBMS_LCR.NOT_A_LOB | CONSTANT NUMBER := 1; | DBMS_LCR.NULL_LOB | CONSTANT NUMBER := 2; | DBMS_LCR.INLINE_LOB | CONSTANT NUMBER := 3; | DBMS_LCR.EMPTY_LOB | CONSTANT NUMBER := 4; | DBMS_LCR.LOB_CHUNK | CONSTANT NUMBER := 5; | DBMS_LCR.LAST_LOB_CHUNK | CONSTANT NUMBER := 6; |
| DBMS_LCR.NOT_A_LOB | CONSTANT NUMBER := 1; | | | | | | | | | | | | |
| DBMS_LCR.NULL_LOB | CONSTANT NUMBER := 2; | | | | | | | | | | | | |
| DBMS_LCR.INLINE_LOB | CONSTANT NUMBER := 3; | | | | | | | | | | | | |
| DBMS_LCR.EMPTY_LOB | CONSTANT NUMBER := 4; | | | | | | | | | | | | |
| DBMS_LCR.LOB_CHUNK | CONSTANT NUMBER := 5; | | | | | | | | | | | | |
| DBMS_LCR.LAST_LOB_CHUNK | CONSTANT NUMBER := 6; | | | | | | | | | | | | |
| lob_offset | The LOB offset specified in the number of characters for CLOB columns and the number of bytes for BLOB columns Valid values are NULL or a positive integer less than or equal to DBMS_LOB.LOBMAXSIZE. | | | | | | | | | | | | |
| lob_operation_size | If lob_information for the LOB is DBMS_LCR.LAST_LOB_CHUNK, then this parameter can be set to either a valid LOB ERASE value or a valid LOB TRIM value. A LOB ERASE value must be a positive integer less than or equal to DBMS_LOB.LOBMAXSIZE. A LOB TRIM value must be a nonnegative integer less than or equal to DBMS_LOB.LOBMAXSIZE. If lob_information is not DBMS_LCR.LAST_LOB_CHUNK and for all other operations, is NULL. | | | | | | | | | | | | |

Table 292-47 (Cont.) LCR\$_ROW_UNIT Attributes

| Attribute | Description |
|-------------------------------|--|
| <code>long_information</code> | Contains the LONG information for the column and contains one of the following values: DBMS_LCR.not_a_long CONSTANT NUMBER := 1; DBMS_LCR.null_long CONSTANT NUMBER := 2; DBMS_LCR.inline_long CONSTANT NUMBER := 3; DBMS_LCR.long_chunk CONSTANT NUMBER := 4; DBMS_LCR.last_long_chunk CONSTANT NUMBER := 5; |

MGD_ID Package Types

The `MGD_ID` package provides an extensible framework that supports current radio-frequency ID (RFID) tags with the standard family of EPC bit encodings for the supported encoding types. The `MGD_ID` Package also supports new and evolving tag encodings that are not included in the current EPC standard (EPC v1.1 specification).

The `MGD_ID` package contains several predefined types.

See Also:

Oracle Database Development Guide for more information.

This chapter contains the following topics:

- [Security Model](#)
- [Summary of Types](#)
- [Summary of MGD_ID Subprograms](#)

The method described in this reference chapter show examples based on the examples shown in the constructor functions.

The examples in this chapter assume that the you have run the following set of commands before running the contents of each script:

```
SQL> connect / as sysdba;
Connected.
SQL> create user mgduser identified by mgduser;
SQL> grant connect, resource to mgduser;
SQL> connect mgduser
Enter password: mgduserpassword
Connected.
SQL> set serveroutput on;
```

293.1 MGD_ID Package Types Security Model

You must run the `catmgd.sql` script to load the `DBMS_MGD_ID_UTL` package and create the required Identity Code Package schema objects in the `MGDSYS` schema.

`MGD_ID` is a `MGDSYS`-owned object type. Any `MGD_ID` subprogram called from an anonymous PL/SQL block is run using the privileges of the current user.

A user must be granted connect and resource roles to use the `MGD_ID` object type and its subprograms.

`EXECUTE` privilege is granted to `PUBLIC` for this ADT: `MGD_ID`.

A public synonym, by the same name, is created for this ADT: `MGD_ID`.

293.2 Summary of Types

This table lists and briefly describes the `MGD_ID` Package object types.

Table 293-1 MGD_ID Package Object Types

| Object Type Name | Description |
|---|--|
| MGD_ID_COMPONENT Object Type | Datatype that specifies the name and value pair attributes that define a component |
| MGD_ID_COMPONENT_VARRAY Object Type | Datatype that specifies a list of up to 128 components as name-value attribute pairs used in two constructor functions for creating an identity code type object |
| MGD_ID Object Type | Represents an <code>MGD_ID</code> object that specifies the category identifier for the code category for this identity code and its list of components |

293.2.1 MGD_ID_COMPONENT Object Type

The `MGD_ID_COMPONENT` type is a datatype that specifies the name and value pair attributes that define a component.

Syntax

```
MGD_ID_COMPONENT as object (name VARCHAR2(256),
                             value VARCHAR2(1024));
```

Attributes

Table 293-2 MGD_ID_COMPONENT Attributes

| Attribute | Description |
|-----------|---------------------------------------|
| name | Name of component |
| value | Value of the component as a character |

Examples

See the [MGD_ID Constructor Function](#) for an example.

293.2.2 MGD_ID_COMPONENT_VARRAY Object Type

The `MGD_ID_COMPONENT_VARRAY` type is a datatype that specifies a list of up to 128 components as name-value attribute pairs for use in two constructor functions for creating a product code type object with its list of components.

Syntax

```
MGD_ID_COMPONENT_VARRAY is VARRAY (128) of MGD_ID_COMPONENT;
```

Examples

See the [MGD_ID Constructor Function](#) for an example.

293.2.3 MGD_ID Object Type

The `MGD_ID` type represents an identity code in an RFID application. This type represents RFID tags with standard EPC bit encoding as well as tag encodings that are not included in the EPC standard.

Syntax

```
MGD_ID as object (category_id VARCHAR2(256),
                 components  MGD_ID_COMPONENT_VARRAY);
```

Attributes

Table 293-3 MGD_ID Object Type Attributes

| Attribute | Description |
|--------------------------|--|
| <code>category_id</code> | Category identifier for the code category of this code |
| <code>components</code> | List of components as name-value attributes |

Methods

[Table 293-5](#) describes the methods of the `MGD_ID` object type.

Table 293-4 MGD_ID Methods

| Method | Description |
|--|--|
| <code>MGD_ID</code> constructor function | Creates an <code>MGD_ID</code> object based on the parameters passed in and returns self as a result |
| <code>FORMAT</code> function | Returns the string representation of the <code>MGD_ID</code> in the specified format |
| <code>GET_COMPONENT</code> function | Returns the string value of the specified <code>MGD_ID</code> component |
| <code>TO_STRING</code> function | Returns the string value of semicolon (;) separated component name value pairs of the <code>MGD_ID</code> object |
| <code>TRANSLATE</code> function | Returns the result of the conversion of the identifier from one format to the specified format |

Examples

See the [Summary of MGD_ID Subprograms](#) section and the section about using the Identity Code package in Using the Identity Code Package in *Oracle Database Development Guide* for examples.

293.3 Summary of MGD_ID Subprograms

This table describes the subprograms in the `MGD_ID` object type.

All the values and names passed to the procedures defined in the `MGD_ID` object type are case insensitive unless otherwise mentioned. To preserve the case, enclose the values with double quotation marks.

Table 293-5 MGD_ID Object Type Subprograms

| Subprogram | Description |
|---|--|
| MGD_ID Constructor Function | Creates an <code>MGD_ID</code> object based on the parameters passed in and returns self as a result |
| FORMAT Function | Returns the string representation of the <code>MGD_ID</code> object in the specified format |
| GET_COMPONENT Function | Returns the string value of the specified <code>MGD_ID</code> component |
| TO_STRING Function | Returns the string value of semicolon (;) separated component name value pairs of the <code>MGD_ID</code> object |
| TRANSLATE Function | Returns the result of the conversion of the identifier from one format to the specified format |

293.3.1 MGD_ID Constructor Function

This constructor function constructs an identity code type object, `MGD_ID`. The constructor function is overloaded. The different functionality of each form of syntax is presented along with the definitions.

Syntax

Constructs an `MGD_ID` object type based on the category ID and a list of components.

```
MGD_ID (
    category_id      IN VARCHAR2,
    components       IN MGD_ID_COMPONENT_VARRAY)
RETURN SELF AS RESULT DETERMINISTIC;
```

Constructs an `MGD_ID` object type based on the category ID, the identifier string, and the list of additional parameters required to create it.

```
MGD_ID (
    category_id      VARCHAR2,
    identifier        VARCHAR2,
    parameter_list   VARCHAR2)
RETURN SELF AS RESULT DETERMINISTIC;
```

Constructs an `MGD_ID` object type based on the category name, category version, and a list of components.

```
MGD_ID (
    category_name    VARCHAR2,
    category_version VARCHAR2,
```

```

    components          MGD_ID_COMPONENT_VARRAY)
RETURN SELF AS RESULT DETERMINISTIC;

```

Constructs an `MGD_ID` object type based on the category name, category version, the identifier string, and the list of additional parameters required to create it.

```

MGD_ID (
    category_name      VARCHAR2,
    category_version   VARCHAR2,
    identifier         VARCHAR2,
    parameter_list     VARCHAR2)
RETURN SELF AS RESULT DETERMINISTIC;

```

Parameters

Table 293-6 MGD_ID Constructor Function Parameters

| Parameter | Description |
|-------------------------------|---|
| <code>category_id</code> | Category identifier |
| <code>components</code> | List of component name value pairs |
| <code>category_name</code> | Category name, such as EPC |
| <code>category_version</code> | Category version. If <code>NULL</code> , the latest version for the specified category name will be used. |
| <code>identifier</code> | <p>Identifier string in any format of an encoding scheme in the specified category. For example, for SGTIN-96 encoding, the identifier can be in the format of <code>BINARY</code>, <code>PURE_IDENTITY</code>, <code>TAG_ENCODING</code>, or <code>LEGACY</code>.</p> <p>Express this identifier as a string according to the appropriate grammar or pattern in the tag data translation (TDT) markup file. For example, a binary string consisting of characters 0 and 1, a URI (either tag-encoding or pure-identity formats), or a serialized legacy code expressed as a string format for input, such as <code>gtin=00037000302414;serial=10419703</code> for a SGTIN coding scheme.</p> |
| <code>parameter_list</code> | <p>List of additional parameters required to create the object in the representation. The list is expressed as a parameter string containing key-value pairs, separated by the semicolon (;) as a delimiter between key-value pairs. For example, for a GTIN code, the parameter string would look as follows:</p> <pre>filter=3;companyprefixlength=7;taglength=96</pre> |

Usage Notes

- Use `MGD_ID_UTL.EPC_ENCODING_CATEGORY_ID` as `category_id`.
- If the category is not already registered, an error is raised.
- If the `bit_length` parameter is `NULL`, the `bit_length` is 8* the length of `bit_encoding`.
- If the component list does not contain all required components, an exception `MGD_ID_UTL.e_LackComponent` will be thrown.

Examples

The following examples construct identity code type objects.

Construct an MGD_ID object (SGTIN-64) passing in the category ID and a list of components.

```
--Contents of constructor11.sql
call DBMS_MGD_ID_UTL.set_proxy('www-proxy.example.com', '80');
call DBMS_MGD_ID_UTL.refresh_category('1');
select MGD_ID('1',
             MGD_ID_COMPONENT_VARRAY(
               MGD_ID_COMPONENT('companyprefix','0037000'),
               MGD_ID_COMPONENT('itemref','030241'),
               MGD_ID_COMPONENT('serial','1041970'),
               MGD_ID_COMPONENT('schemes','SGTIN-64')
             )
             ) from dual;
call DBMS_MGD_ID_UTL.remove_proxy();

SQL> @constructor11.sql
.
.
.
MGD_ID('1', MGD_ID_COMPONENT_VARRAY(MGD_ID_COMPONENT('companyprefix', '0037000'),
                                     MGD_ID_COMPONENT('itemref', '030241'),
                                     MGD_ID_COMPONENT('serial', '1041970'),
                                     MGD_ID_COMPONENT('schemes', 'SGTIN-64'))
.
.
.
```

Constructs an MGD_ID object (SGTIN-64) passing in the category ID, the tag identifier, and the list of additional parameters that may be required to create it.

```
--Contents of constructor22.sql
call DBMS_MGD_ID_UTL.set_proxy('www-proxy.example.com', '80');
call DBMS_MGD_ID_UTL.refresh_category('1');
select MGD_ID('1',
             'urn:epc:id:sgtin:0037000.030241.1041970',
             'filter=3;scheme=SGTIN-64') from dual;
call DBMS_MGD_ID_UTL.remove_proxy();

SQL> @constructor22.sql
.
.
.
MGD_ID('1', MGD_ID_COMPONENT_VARRAY(MGD_ID_COMPONENT('filter', '3'),
                                     MGD_ID_COMPONENT('schemes', 'SGTIN-64'),
                                     MGD_ID_COMPONENT('companyprefixlength', '7'),
                                     MGD_ID_COMPONENT('companyprefix', '0037000'),
                                     MGD_ID_COMPONENT('scheme', 'SGTIN-64'),
                                     MGD_ID_COMPONENT('serial', '1041970'),
                                     MGD_ID_COMPONENT('itemref', '030241'))
.
.
.
```

Construct an MGD_ID object (SGTIN-64) passing in the category name, category version (if NULL, then the latest version will be used), and a list of components.

```
--Contents of constructor33.sql
call DBMS_MGD_ID_UTL.set_proxy('www-proxy.example.com', '80');
call DBMS_MGD_ID_UTL.refresh_category(DBMS_MGD_ID_UTL.get_category_id('EPC', NULL));
select MGD_ID('EPC', NULL,
```

```

        MGD_ID_COMPONENT_VARRAY (
        MGD_ID_COMPONENT('companyprefix','0037000'),
        MGD_ID_COMPONENT('itemref','030241'),
        MGD_ID_COMPONENT('serial','1041970'),
        MGD_ID_COMPONENT('schemes','SGTIN-64')
        )
    ) from dual;
call DBMS_MGD_ID_UTL.remove_proxy();

SQL> @constructor33.sql
.
.
.
MGD_ID('1', MGD_ID_COMPONENT_VARRAY (MGD_ID_COMPONENT('companyprefix', '0037000'),
                                     MGD_ID_COMPONENT('itemref', '030241'),
                                     MGD_ID_COMPONENT('serial', '1041970'),
                                     MGD_ID_COMPONENT('schemes', 'SGTIN-64')))
.
.
.

```

Constructs an MGD_ID object (SGTIN-64) passing in the category name and category version, the tag identifier, and the list of additional parameters that may be required to create it.

```

--Contents of constructor44.sql
call DBMS_MGD_ID_UTL.set_proxy('www-proxy.example.com', '80');
call DBMS_MGD_ID_UTL.refresh_category(DBMS_MGD_ID_UTL.get_category_id('EPC', NULL));
select MGD_ID('EPC', NULL,
             'urn:epc:id:sgtin:0037000.030241.1041970',
             'filter=3;scheme=SGTIN-64') from dual;
call DBMS_MGD_ID_UTL.remove_proxy();

SQL> @constructor4.sql
.
.
.
MGD_ID('1', MGD_ID_COMPONENT_VARRAY (MGD_ID_COMPONENT('filter', '3'),
                                     MGD_ID_COMPONENT('schemes', 'SGTIN-64'),
                                     MGD_ID_COMPONENT('companyprefixlength', '7'),
                                     MGD_ID_COMPONENT('companyprefix', '0037000'),
                                     MGD_ID_COMPONENT('scheme', 'SGTIN-64'),
                                     MGD_ID_COMPONENT('serial', '1041970'),
                                     MGD_ID_COMPONENT('itemref', '030241')))
.
.
.

```

293.3.2 FORMAT Function

This function returns the string representation of the MGD_ID object in the specified format.

Syntax

```

FORMAT (parameter_list IN VARCHAR2,
       output_format   IN VARCHAR2)
RETURN VARCHAR2 DETERMINISTIC;

```

Parameters

Table 293-7 FORMAT Function Parameters

| Parameter | Description |
|-----------------------------|---|
| <code>parameter_list</code> | List of additional parameters required to create the object in the representation. The list is expressed as a parameter string containing key-value pairs, separated by the semicolon (;) as a delimiter between key-value pairs. For example, for a GTIN code, the parameter string would look as follows: <code>filter=3;companyprefixlength=7;taglength=96</code> |
| <code>output_format</code> | One of the supported output formats into which an MGD_ID component is formatted: <ul style="list-style-type: none"> • BINARY • LEGACY • TAG_ENCODING • PURE_IDENTITY • ONS_HOSTNAME |

Examples

See the example for the [GET_COMPONENT Function](#).

293.3.3 GET_COMPONENT Function

This function returns the value of the specified MGD_ID component.

Syntax

```
GET_COMPONENT (
    component_name IN VARCHAR2)
RETURN VARCHAR2 DETERMINISTIC;
```

Parameters

Table 293-8 GET_COMPONENT Function Parameter

| Parameter | Description |
|-----------------------------|-------------------|
| <code>component_name</code> | Name of component |

Usage Notes

- If the code is an invalid code, meaning its structure is not defined in the metadata table, an error is raised.
- If the code is valid, but it does not contain the required component, NULL is returned.

Examples

The following example returns the general manager, object class, and serial number components for this GID-96 identity component:

```

--Contents of get_components.sql file
call DBMS_MGD_ID_UTL.set_proxy('www-proxy.example.com', '80');
DECLARE
id MGD_ID;
BEGIN
  DBMS_MGD_ID_UTL.set_java_logging_level(DBMS_MGD_ID_UTL.LOGGING_LEVEL_OFF);
  DBMS_MGD_ID_UTL.refresh_category(DBMS_MGD_ID_UTL.get_category_id('EPC', NULL));
  -----
  --PURE_IDENTIT
  -----
  dbms_output.put_line('..Testing constructor with pure identity');
  -----
  -- PURE_IDENTITY representation can be translated to BINARY and
  -- TAG_ENCODING ONLY when BOTH scheme and filer are provided.
  -----
  id := MGD_ID('EPC', NULL, 'urn:epc:id:sgtin:0037000.030241.1041970', 'scheme=SGTIN-64;filter=3');
  dbms_output.put_line(id.to_string);
  dbms_output.put_line('filter          = ' || id.get_component('filter'));
  dbms_output.put_line('company prefix = ' || id.get_component('companyprefix'));
  dbms_output.put_line('itemref       = ' || id.get_component('itemref'));
  dbms_output.put_line('serial        = ' || id.get_component('serial'));
  dbms_output.put_line('BINARY format = ' || id.format(NULL, 'BINARY'));
  dbms_output.put_line('PURE_IDENTITY format = ' || id.format(NULL, 'PURE_IDENTITY'));

293.3.4 TO_STRING Function

This function returns the semicolon (;) separated component name value pairs of the MGD_ID object.

Syntax

```

TO_STRING
RETURN VARCHAR2;

```

Examples

The following example converts the MGD_ID object into a string value:

```

-- Contents of toString3.sql file
call DBMS_MGD_ID_UTL.set_proxy('www-proxy.example.com', '80');
DECLARE
id          MGD_ID;
BEGIN
  DBMS_MGD_ID_UTL.refresh_category(DBMS_MGD_ID_UTL.get_category_id('EPC', NULL));
  dbms_output.put_line('..Testing to_string');
  id := mgd_id('EPC', NULL, 'urn:epc:id:gid:0037000.30241.1041970', 'scheme=GID-96');
  DBMS_OUTPUT.PUT_LINE('mgd_id object as a string');
  DBMS_OUTPUT.PUT_LINE(id.to_string);
END;
/
SHOW ERRORS;
call DBMS_MGD_ID_UTL.remove_proxy();

```

293.3.5 TRANSLATE Function

This static function translates between different representations directly without first constructing an `MGD_ID` object.

This method is overloaded. The different functionality of each form of syntax is presented along with the definitions.

Syntax

Converts the identifier in one format to another given the category name, the tag identifier, the parameter list, and the output format.

```

TRANSLATE (
  category_name    IN VARCHAR2,
  identifier        IN VARCHAR2,
  parameter_list   IN VARCHAR2,
  output_format    IN VARCHAR2)
RETURN VARCHAR2 DETERMINISTIC;

```

Converts the identifier in one format to another given the category name, category version, the tag identifier, the parameter list, and the output format.

```

TRANSLATE (
  category_name    IN VARCHAR2,
  category_version IN VARCHAR2,
  identifier        IN VARCHAR2,
  parameter_list   IN VARCHAR2,
  output_format    IN VARCHAR2)
RETURN VARCHAR2 DETERMINISTIC;

```

Parameters

Table 293-9 TRANSLATE Function Parameters

| Parameter | Description |
|------------------|---|
| category_name | Name of category |
| category_version | Category version. If NULL, the latest version of the specified category name will be used. |
| identifier | EPC identifier, expressed as a string in accordance with one of the grammars or patterns in the TDT markup file. For example, a binary string consisting of characters 0 and 1, a URI (either tag-encoding or pure-identity formats), or a serialized legacy code expressed as a string format for input, such as <code>gtin=00037000302414;serial=10419703</code> for a SGTIN coding scheme. |
| parameter_list | List of additional parameters required to create the object in the representation. The list is expressed as a parameter string containing key-value pairs, separated by the semicolon (;) as a delimiter between key-value pairs. For example, for a GTIN code, the parameter string would look as follows: <code>filter=3;companyprefixlength=7;taglength=96</code> |
| output_format | One of the supported output formats into which an MGD_ID component shall be converted: <ul style="list-style-type: none"> • BINARY • LEGACY • TAG_ENCODING • PURE_IDENTITY • ONS_HOSTNAME |

Usage Notes

When converting from a pure identity representation to a binary representation, the filter value must be supplied as a value using the `parameter_list` parameter.

Examples

The following examples translates one GID-96 representation into another:

```
-- Contents of translatel.sql file
call DBMS_MGD_ID_UTL.set_proxy('www-proxy.example.com', '80');
DECLARE
id          MGD_ID;
BEGIN
  DBMS_MGD_ID_UTL.refresh_category(DBMS_MGD_ID_UTL.get_category_id('EPC', NULL));
  dbms_output.put_line('Category ID is EPC, Identifier is BINARY, Output format is BINARY');
  dbms_output.put_line(
    mgd_id.translate('EPC',
  NULL,'001101010000000000001001000010001000000000001110110001000010000000000000011111110011000110010'
, NULL, 'BINARY'));
  dbms_output.put_line('Category ID is EPC, Identifier is BINARY, Output format is PURE_IDENTITY');
  dbms_output.put_line(
    mgd_id.translate('EPC',
  NULL,'001101010000000000001001000010001000000000001110110001000010000000000000011111110011000110010'
, NULL, 'PURE_IDENTITY'));
```

```

Rule TYPES

This chapter describes the types used with rules, rule sets, and evaluation contexts.

This chapter contains the following topics:

- [Overview](#)
- [Security Model](#)
- [Summary of Rule Types](#)

294.1 Rule TYPES Overview

These types are used in rules and enable clients to evaluate rules with the rules engine.

See Also:

- [DBMS_RULE](#)
- [DBMS_RULE_ADM](#)

294.2 Rule TYPES Security Model

`PUBLIC` is granted `EXECUTE` privilege on these `RULE` types.

See Also:

Oracle Database Security Guide for more information about user group `PUBLIC`

294.3 Summary of Rule Types

This table lists the `Rule Types` and briefly describes them.

Table 294-1 Rule Types

| Type | Description |
|---|---|
| RE\$ATTRIBUTE_VALUE Type | Specifies the value of a variable attribute |
| RE\$ATTRIBUTE_VALUE_LIST Type | Identifies a list of attribute values |
| RE\$COLUMN_VALUE Type | Specifies the value of a table column |
| RE\$COLUMN_VALUE_LIST Type | Identifies a list of column values |

Table 294-1 (Cont.) Rule Types

| Type | Description |
|--|---|
| RE\$NAME_ARRAY Type | Identifies a list of names |
| RE\$NAME_ARRAY Type | Identifies a list of name-value pairs |
| RE\$NV_LIST Type | Identifies an object containing a list of name-value pairs and methods that operate on this list. This object type is used to represent the event context and the action context for a rule |
| RE\$NV_NODE Type | Identifies a name-value pair |
| RE\$RULE_HIT Type | Specifies a rule found because of evaluation |
| RE\$RULE_HIT_LIST Type | Identifies a list of rules found because of evaluation |
| RE\$RULE_NAME Type | Allows users to pass a list of rule as argument. |
| RE\$RULE_NAME_LIST Type | Identifies a list of Rule Name values |
| RE\$TABLE_ALIAS Type | Provides the table corresponding to an alias used in a rule evaluation context |
| RE\$TABLE_ALIAS_LIST Type | Identifies a list of table aliases used in a rule evaluation context |
| RE\$TABLE_VALUE Type | Specifies the value of a table row using a ROWID |
| RE\$TABLE_VALUE_LIST Type | Identifies a list of table values |
| RE\$VALUE Type | Represents one datapoint value element |
| RE\$VALUE_LIST Type | Defines a list of RE\$VALUE type |
| RE\$VARIABLE_TYPE Type | Provides the type of a variable used in a rule evaluation context |
| RE\$VARIABLE_TYPE_LIST Type | Identifies a list of variables and their types used in a rule evaluation context |
| RE\$VARIABLE_VALUE Type | Specifies the value of a variable |
| RE\$VARIABLE_VALUE_LIST Type | Identifies a list of variable values |

Rule types are used with the following Oracle-supplied PL/SQL packages:

- `DBMS_RULE`
- `DBMS_RULE_ADM`

You can use the `DBMS_RULE_ADM` package to create and administer rules, rule sets, and evaluation contexts, and you can use the `DBMS_RULE` package to evaluate rules.

When you use Replication (Oracle GoldenGate and XStream), rules determine which changes are captured by a capture process, which messages are propagated by a propagation, which messages are applied by an apply process, and which messages are dequeued by a messaging client. The following Replication (Oracle GoldenGate and XStream) packages use rules:

- `DBMS_APPLY_ADM`
- `DBMS_CAPTURE_ADM`
- `DBMS_PROPAGATION_ADM`

294.3.1 RE\$ATTRIBUTE_VALUE Type

RE\$ATTRIBUTE_VALUE type specifies the value of a variable attribute.

Note:

Enclose the variable name and attribute name in double quotation marks (") if the name contains special characters.

Syntax

```
TYPE SYS.RE$ATTRIBUTE_VALUE (
  variable_name  VARCHAR2(32),
  attribute_name VARCHAR2(4000),
  attribute_value ANYDATA);
```

Attributes

Table 294-2 RE\$ATTRIBUTE_VALUE Attributes

| Attribute | Description |
|-----------------|---|
| variable_name | Specifies the variable used in a rule |
| attribute_name | Specifies the attribute name. The attribute name can be a multi-component name, such as a1.b2.c3. |
| attribute_value | Specifies the attribute value |

294.3.2 RE\$ATTRIBUTE_VALUE_LIST Type

The RE\$ATTRIBUTE_VALUE_LIST type identifies a list of attribute values.

Syntax

```
TYPE SYS.RE$ATTRIBUTE_VALUE_LIST AS VARRAY(1024) OF SYS.RE$ATTRIBUTE_VALUE;
```

294.3.3 RE\$COLUMN_VALUE Type

RE\$COLUMN_VALUE type specifies the value of a table column.

Note:

Enclose the column name in double quotation marks (") if the name contains special characters.

Syntax

```
TYPE SYS.RE$COLUMN_VALUE (
  table_alias  VARCHAR2(32),
```

```
column_name  VARCHAR2(4000),
column_value ANYDATA);
```

Attributes

Table 294-3 RE\$COLUMN_VALUE Attributes

| Attribute | Description |
|--------------|--|
| table_alias | Specifies the alias used for the table in a rule |
| column_name | Specifies the column name |
| column_value | Specifies the column value |

294.3.4 RE\$COLUMN_VALUE_LIST Type

RE\$COLUMN_VALUE_LIST type identifies a list of column values.

Syntax

```
TYPE SYS.RE$COLUMN_VALUE_LIST AS VARRAY(1024) OF SYS.RE$COLUMN_VALUE;
```

294.3.5 RE\$NAME_ARRAY Type

RE\$NAME_ARRAY type identifies a list of names.

Syntax

```
TYPE SYS.RE$NAME_ARRAY AS VARRAY(1024) OF VARCHAR2(30);
```

294.3.6 RE\$NV_ARRAY Type

RE\$NV_ARRAY type identifies a list of name-value pairs.

Syntax

```
TYPE SYS.RE$NV_ARRAY AS VARRAY(1024) OF SYS.RE$NV_NODE;
```

294.3.7 RE\$NV_LIST Type

identifies an object containing a list of name-value pairs and methods that operate on this list.

This object type is used to represent the event context for rule set evaluation and the action context for a rule.

Syntax

```
TYPE SYS.RE$NV_LIST AS OBJECT(
  actx_list SYS.RE$NV_ARRAY);
```

Attributes

Table 294-4 RE\$NV_LIST Attributes

| Attribute | Description |
|-----------|------------------------------|
| actx_list | The list of name-value pairs |

RE\$NV_LIST Subprograms

This section describes the following member procedures and member functions of the SYS.RE\$NV_LIST type:

- [ADD_PAIR Member Procedure](#)
- [GET_ALL_NAMES Member Function](#)
- [GET_VALUE Member Function](#)
- [REMOVE_PAIR Member Procedure](#)

ADD_PAIR Member Procedure

Adds a name-value pair to the list of name-value pairs.

**Note:**

Enclose the name in double quotation marks (") if the name contains special characters.

Syntax

```
MEMBER PROCEDURE ADD_PAIR(
    name   IN VARCHAR2,
    value  IN ANYDATA);
```

Parameters

Table 294-5 ADD_PAIR Procedure Parameters

| Parameter | Description |
|-----------|---|
| name | The name in the name-value pair being added to the list. If the name exists in the list, then this procedure raises an error. |
| value | The value in the name-value pair being added to the list |

GET_ALL_NAMES Member Function

Returns a list of all the names in the name-value pair list.

Syntax

```
MEMBER FUNCTION GET_ALL_NAMES()
RETURN SYS.RE$NAME_ARRAY;
```

GET_VALUE Member Function

Returns the value for the specified name in a name-value pair list.

Note:

Enclose the name in double quotation marks (") if the name contains special characters.

Syntax

```
MEMBER FUNCTION GET_VALUE (  
    name IN VARCHAR2)  
RETURN ANYDATA;
```

Parameters

Table 294-6 GET_VALUE Function Parameters

| Parameter | Description |
|-----------|--------------------------------|
| name | The name whose value to return |

REMOVE_PAIR Member Procedure

Removes the name-value pair with the specified name from the name-value pair list.

Note:

Enclose the name in double quotation marks (") if the name contains special characters.

Syntax

```
MEMBER PROCEDURE REMOVE_PAIR (  
    name IN VARCHAR2);
```

Parameters

Table 294-7 REMOVE_PAIR Procedure Parameters

| Parameter | Description |
|-----------|--------------------------------|
| name | The name of the pair to remove |

294.3.8 RE\$NV_NODE Type

RE\$COLUMN_VALUE type identifies a name-value pair.

Note:

Enclose the name in double quotation marks (") if the name contains special characters.

Syntax

```
TYPE SYS.RE$NV_NODE (  
    nvn_name    VARCHAR2(30),  
    nvn_value   ANYDATA);
```

Attributes

Table 294-8 RE\$NV_NODE Attributes

| Attribute | Description |
|-----------|--|
| nvn_name | Specifies the name in the name-value pair |
| nvn_value | Specifies the value in the name-value pair |

294.3.9 RE\$RULE_HIT Type

The RE\$RULE_HIT type specifies a rule found because of an evaluation.

See Also:

- [CREATE_RULE Procedure](#)
- [ALTER_RULE Procedure](#)

Syntax

```
TYPE SYS.RE$RULE_HIT (  
    rule_name          VARCHAR2(65),  
    rule_action_context RE$NV_LIST);
```

Attributes**Table 294-9 RE\$RULE_HIT Attributes**

| Attribute | Description |
|---------------------|---|
| rule_name | The rule name in the form <i>schema_name.rule_name</i> . For example, a rule named <code>employee_rule</code> in the <code>hr</code> schema is returned in the form <code>"hr"."employee_rule"</code> . |
| rule_action_context | The rule action context as specified in the <code>CREATE_RULE</code> or <code>ALTER_RULE</code> procedure of the <code>DBMS_RULE_ADM</code> package |

294.3.10 RE\$RULE_HIT_LIST Type

The `RE$RULE_HIT_LIST` type identifies a list of rules found because of an evaluation.

Syntax

```
TYPE SYS.RE$RULE_HIT_LIST AS VARRAY(1024) OF SYS.RE$RULE_HIT;
```

294.3.11 RE\$RULE_NAME Type

The `RE$RULE_HIT` type is create to allow use to pass a list of rule as argument.

Syntax

```
CREATE OR REPLACE TYPE SYS.RE$RULE_NAME AS OBJECT (
  rule_name          IN          varchar2,
  evaluation_context IN          varchar2);
```

Attributes**Table 294-10 RE\$RULE_NAME Attributes**

| Attribute | Description |
|--------------------|---|
| rule_name | The rule name in the form <i>SCHEMA_NAME.RULE_NAME</i> . For example, a rule named <code>employee_rule</code> in the <code>hr</code> schema is returned in the form <code>"hr"."employee_rule"</code> . |
| Evaluation_context | The evaluation context as specified in the <code>CREATE_RULE</code> or <code>ALTER_RULE</code> procedure of the <code>DBMS_RULE_ADM</code> package |

294.3.12 RE\$RULE_NAME_LIST Type

`RE$RULE_HIT_LIST` type Identifies a list of Rule Name values.

Syntax

```
CREATE OR REPLACE TYPE SYS.RE$RULE_NAME_LIST AS VARRAY(1024) OF SYS.RE$RULE_NAME;
```

294.3.13 RE\$TABLE_ALIAS Type

RE\$TABLE_ALIAS type provides the table corresponding to an alias used in a rule evaluation context.

A specified table name must satisfy the schema object naming rules.

Note:

Enclose the table name in double quotation marks (") if the name contains special characters.

See Also:

Oracle Database SQL Language Reference for information about schema object naming rules

Syntax

```
TYPE SYS.RE$TABLE_ALIAS IS OBJECT(  
    table_alias VARCHAR2(32),  
    table_name  VARCHAR2(194));
```

Attributes

Table 294-11 RE\$TABLE_ALIAS Attributes

| Attribute | Description |
|-------------|--|
| table_alias | The alias used for the table in a rule |
| table_name | The table name referred to by the alias. A synonym can be specified. The table name is resolved in the evaluation context schema. The format is one of the following: <i>schema_name.table_name</i> <i>table_name</i> For example, if the <i>schema_name</i> is <i>hr</i> and the <i>table_name</i> is <i>employees</i> , then enter the following: <i>hr.employees</i> |

294.3.14 RE\$TABLE_ALIAS_LIST Type

The RE\$TABLE_ALIAS_LIST type identifies a list of table aliases used in a rule evaluation context.

Syntax

```
TYPE SYS.RE$TABLE_ALIAS_LIST AS VARRAY(1024) OF SYS.RE$TABLE_ALIAS;
```

294.3.15 RE\$TABLE_VALUE Type

The RE\$TABLE_VALUE type specifies the value of a table row using a ROWID.

Syntax

```
TYPE SYS.RE$TABLE_VALUE(  
    table_alias VARCHAR2(32),  
    table_rowid VARCHAR2(18));
```

Attributes

Table 294-12 RE\$TABLE_VALUE Attributes

| Attribute | Description |
|-------------|--|
| table_alias | Specifies the alias used for the table in a rule |
| table_rowid | Specifies the rowid for the table row |

294.3.16 RE\$TABLE_VALUE_LIST Type

The RE\$TABLE_VALUE_LIST type identifies a list of table values.

Note:

Each table alias in the list in the list must be unique.

Syntax

```
TYPE SYS.RE$TABLE_VALUE_LIST AS VARRAY(1024) OF SYS.RE$TABLE_VALUE;
```

294.3.17 RE\$VALUE Type

The RE\$VALUE type represents one datapoint value element.

Syntax

```
TYPE SYS.RE$VALUE (  
    table_values          IN      SYS.RE$TABLE_VALUE_LIST:= NULL,  
    column_values        IN      SYS.RE$COLUMN_VALUE_LIST:=NULL,  
    variable_values      IN      SYS.RE$VARIABLE_VALUE_LIST:=NULL,  
    attribute_values     IN      SYS.RE$ATTRIBUTE_VALUE_LIST:=NULL)
```

Attributes

Table 294-13 RE\$VALUE Attributes

| Attribute | Description |
|------------------|--|
| table_values | ROWID of table row for expression evaluation |
| column_values | Values of columns referred in the expression |
| variable_values | Values of variables referred in expression |
| attribute_values | Values of attributes referred in expression |

294.3.18 RE\$VALUE_LIST Type

RE\$TABLE_VALUE_LIST type is a varray for defining a list of RE\$VALUE type. It represents a list of datapoint element.

Syntax

```
CREATE OR REPLACE TYPE SYS.RE$VALUE_LIST AS VARRAY(1024) OF SYS.RE$VALUE;
```

294.3.19 RE\$VARIABLE_TYPE Type

The RE\$VARIABLE_TYPE type provides the type of a variable used in a rule evaluation context. A specified variable name must satisfy the schema object naming rules.

Note:

Enclose the variable name in double quotation marks (") if the name contains special characters.

See Also:

Oracle Database SQL Language Reference for information about schema object naming rules

Syntax

```
TYPE SYS.RE$VARIABLE_TYPE (
  variable_name          VARCHAR2(32),
  variable_type          VARCHAR2(4000),
  variable_value_function VARCHAR2(228),
  variable_method_function VARCHAR2(228));
```

Attributes

Table 294-14 RE\$VARIABLE_TYPE Attributes

| Attribute | Description |
|---------------------------------------|--|
| <code>variable_name</code> | The variable name used in a rule |
| <code>variable_type</code> | The type that is resolved in the evaluation context schema. Any valid Oracle built-in datatype, user-defined type, or Oracle-supplied type can be specified. See the <i>Oracle Database SQL Language Reference</i> for more information about these types. |
| <code>variable_value_function</code> | A value function that can be specified for implicit variables. A synonym can be specified. The function name is resolved in the evaluation context schema. It is executed on behalf of the owner of a rule set using the evaluation context or containing a rule that uses the evaluation context. See the " Usage Notes " for more information. |
| <code>variable_method_function</code> | Specifies a value function, which can return the result of a method invocation. Specifying such a function can speed up evaluation, if there are many simple rules that invoke the method on the variable. The function can be a synonym or a remote function. The function name is resolved in the evaluation context schema. It is executed on behalf of the owner of a rule set using the evaluation context or containing a rule that uses the evaluation context. See the " Usage Notes " for more information. |

Usage Notes

The functions for both the `variable_value_function` parameter and `variable_method_function` parameter have the following format:

```
schema_name.package_name.function_name@dblink
```

Any of the following parts of the format can be omitted: *schema_name*, *package_name*, and *@dblink*.

For example, if the *schema_name* is *hr*, the *package_name* is *var_pac*, the *function_name* is *func_value*, and the *dblink* is *dbs1.net*, then enter the following:

```
hr.var_pac.func_value@dbs1.net
```

The following sections describe the signature of the functions.

Signature for `variable_value_function`

The function must have the following signature:

```
FUNCTION variable_value_function_name(
  evaluation_context_schema IN VARCHAR2,
  evaluation_context_name   IN VARCHAR2,
  variable_name             IN VARCHAR2,
  event_context             IN SYS.RE$NV_LIST )
RETURN SYS.RE$VARIABLE_VALUE;
```

Signature for variable_method_function

This function must have the following signature:

```
FUNCTION variable_method_function_name(
  evaluation_context_schema IN VARCHAR2,
  evaluation_context_name  IN VARCHAR2,
  variable_value           IN SYS.RE$VARIABLE_VALUE,
  method_name             IN VARCHAR2,
  event_context           IN SYS.RE$NV_LIST)
RETURN SYS.RE$ATTRIBUTE_VALUE;
```

294.3.20 RE\$VARIABLE_TYPE_LIST Type

The RE\$VARIABLE_TYPE_LIST type identifies a list of variables and their types used in a rule evaluation context.

Syntax

```
TYPE SYS.RE$VARIABLE_TYPE_LIST AS VARRAY(1024) OF SYS.RE$VARIABLE_TYPE;
```

294.3.21 RE\$VARIABLE_VALUE Type

The RE\$VARIABLE_VALUE type specifies the value of a variable.

**Note:**

Enclose the variable name in double quotation marks (") if the name contains special characters.

Syntax

```
TYPE SYS.RE$VARIABLE_VALUE (
  variable_name VARCHAR2(32),
  variable_data ANYDATA);
```

Attributes**Table 294-15 RE\$VARIABLE_VALUE Attributes**

| Attribute | Description |
|---------------|--|
| variable_name | Specifies the variable name used in a rule |
| variable_data | Specifies the data for the variable value |

294.3.22 RE\$VARIABLE_VALUE_LIST Type

The RE\$VARIABLE_VALUE_LIST type identifies a list of variable values.

Syntax

```
TYPE SYS.RE$VARIABLE_VALUE_LIST AS VARRAY(1024) OF SYS.RE$VARIABLE_VALUE;
```

SODA Types

There are several SODA types: `SODA_DOCUMENT_T`, `SODA_COLLECTION_T`, `SODA_OPERATION_T`, and `SODA_CURSOR_T`. `SODA_DOCUMENT_T` and `SODA_COLLECTION_T` represent two primary abstractions provided by SODA: document and collections. `SODA_OPERATION_T` is used for specifying condition of operations on the collection. `SODA_CURSOR_T` is a cursor over results of read operations on the collection.

This chapter contains the following topics:

- [SODA Types Overview](#)
- [SODA Types Security Model](#)

295.1 SODA Types Overview

There are several SODA types: `SODA_DOCUMENT_T`, `SODA_COLLECTION_T`, `SODA_OPERATION_T`, and `SODA_CURSOR_T`. `SODA_DOCUMENT_T` and `SODA_COLLECTION_T` represent two primary abstractions provided by SODA: document and collections. `SODA_OPERATION_T` is used for specifying condition of operations on the collection. `SODA_CURSOR_T` is a cursor over results of read operations on the collection.

See Also:

- [Oracle Database SODA for PL/SQL Developer's Guide](#)
- [DBMS_SODA](#)

295.2 SODA Types Security Model

The SODA Types are available to users with the `SODA_APP` role.

All SODA types are `SYS` types. `PUBLIC` is granted `EXECUTE` privilege on the SODA types described in this chapter:

- `TYPE SODA_Collection_T`
- `TYPE SODA_Document_T`
- `TYPE SODA_Operation_T`
- `TYPE SODA_Cursor_T`

295.3 Summary of SODA Types

This chapter lists the SODA types and describes them.

Table 295-1 SODA Types

| Type | Description |
|--|--|
| SODA_Collection_T Type | This SODA type represents a SODA collection. This type is not persistable. |
| SODA_Document_T Type | This SODA type represents a document with content, usually in JSON format. This type is not persistable. |
| SODA_OPERATION_T Type | This SODA type performs read/write operations, such as document finds with filtering and pagination, removes, and replaces on a SODA collection. This type is not persistable. |
| SODA_Cursor_T Type | This SODA type represents the result set of documents. This type is not persistable. |

295.3.1 SODA_Collection_T Type

This SODA type represents a SODA collection. A reference of SODA collection can only be obtained by either calling `DBMS_SODA.CREATE_COLLECTION()` or `DBMS_SODA.OPEN_COLLECTION()`.

Table 295-2 SODA_Collection_T Type Subprograms

| Subprogram | Description |
|--|---|
| CREATE_INDEX Function | Creates an index using an index specification expressed in JSON. Three types of specifications are supported. Each specifying a different type of index: for B-tree, JSON search with Data Guide, and Spatial. |
| CREATE_VIEW_FROM_DG Function | Creates a view with relational columns, using scalar JSON fields as specified in the data guide. |
| DROP_INDEX Function | Drops the named index. |
| FIND Function | Returns the <code>SODA_OPERATION_T</code> object. This is the only way to get the reference of <code>SODA_Operation_T</code> as there is no constructor. |
| FIND_ONE Function | Fetches the document matching the key. |
| GET_DATA_GUIDE Function | Returns the JSON data guide as a CLOB. |
| GET_INDEX Function | This function returns the specification for the supplied index created on the collection. |

Table 295-2 (Cont.) SODA_Collection_T Type Subprograms

| Subprogram | Description |
|--|---|
| GET_METADATA Function | Returns the metadata of the collection in JSON format. |
| GET_NAME Function | Returns the name of the collection. |
| INSERT_ONE Function | Inserts a document into the collection. |
| INSERT_ONE_AND_GET Function | Inserts a document into the collection and returns a result document with all components except for content. |
| LIST_INDEXES Function | This function returns the specifications for all the indexes created on the collection. |
| REMOVE_ONE Function | Removes the document matching the key. |
| REPLACE_ONE Function | Replaces the content and (optionally) the media type of the document matching the key. |
| REPLACE_ONE_AND_GET Function | Replaces the content and (optionally) the media type of the document matching the key and returns a result document with all components (except content). |
| SAVE Function | Saves a document into the collection. |
| SAVE_AND_GET Function | Saves a document into the collection. |
| TRUNCATE Function | Deletes all documents in the collection. |

295.3.1.1 CREATE_INDEX Function

This function creates an index using an index specification expressed in JSON. Three types of specifications are supported. Each specifying a different type of index: for B-tree, JSON search with Data Guide, and Spatial.

Syntax

```
CREATE_INDEX (
    specification VARCHAR2)
RETURN NUMBER;
```

Parameters

Table 295-3 CREATE_INDEX Function Parameters

| Parameter | Description |
|---------------|--------------------------|
| specification | The index specification. |

Example 295-1 Return Values

The function returns:

- 1—if the index was successfully created
- 0—if the index was not created

Exceptions

Error—If an error occurs creating the index.

See Also:

For more information about SODA Index specifications, see:

- Overview of SODA Indexing
- SODA Index Specifications (Reference)

295.3.1.2 CREATE_VIEW_FROM_DG Function

This function creates a view with relational columns, using scalar `JSON` fields as specified in the data guide. A data guide enabled `JSON` search index is not required for this function; the data guide is passed to the function. An error is thrown if the data guide passed to the function is invalid.

This procedure is available only for Autonomous Database starting 19c release.

Syntax

```
CREATE_VIEW_FROM_DG (
  data_guide          IN  CLOB,
  view_name           IN  VARCHAR2,
  materialize         IN  BOOLEAN DEFAULT FALSE,
  mv_refresh_mode     IN  NUMBER DEFAULT 1,
  path                IN  VARCHAR2 DEFAULT '$',
  resolve_name_conflicts IN  BOOLEAN  DEFAULT FALSE,
  col_name_prefix     IN  VARCHAR2 DEFAULT NULL,
  mixed_case_columns  IN  BOOLEAN DEFAULT FALSE)
RETURN NUMBER;
```

Parameters

Table 295-4 CREATE_VIEW_FROM_DG Function Parameters

| Parameter | Description |
|------------------------------|---|
| <code>data_guide</code> | Data guide of the collection. |
| <code>view_name</code> | Name of the view to be created. |
| <code>materialize</code> | A boolean value to indicate if the view should be materialized or not. The default value is <code>FALSE</code> . |
| <code>mv_refresh_mode</code> | The materialized view refresh mode. Possible values are: <ul style="list-style-type: none"> • <code>DBMS_SODA.MV_REFRESH_ON_STATEMENT</code> (default) • <code>DBMS_SODA.MV_REFRESH_ON_COMMIT</code> • <code>DBMS_SODA.MV_REFRESH_ON_DEMAND</code> |

Table 295-4 (Cont.) CREATE_VIEW_FROM_DG Function Parameters

| Parameter | Description |
|-------------------------------------|---|
| <code>path</code> | <p>The path of the JSON field to be expanded. It uses JSON path expression syntax. For example:</p> <ul style="list-style-type: none"> • <code>\$</code> will create a view starting from the JSON document root • <code>\$.purchaseOrder</code> will create a view starting from <code>purchaseOrder</code>. It expands the children or descendants under <code>purchaseOrder</code>, and create view columns for every scalar value. <p>The default value is <code>\$</code>.</p> |
| <code>resolve_name_conflicts</code> | <p>By default, if there are conflicts among <code>o:preferred_column_name</code>, an error is raised. If you set this parameter to <code>TRUE</code>, the procedure automatically resolves the view column name conflicts by appending a sequence number.</p> <p>The default value is <code>FALSE</code>.</p> |
| <code>col_name_prefix</code> | <p>By default, the view column name is the same as the JSON field name. This parameter allows you to provide a prefix to prepend to the view column names.</p> <p>The default value is <code>NULL</code>.</p> |
| <code>mixed_case_columns</code> | <p>By default, the view column names are case sensitive. This parameter allows you to change the behavior to case insensitive. The default value is <code>FALSE</code>.</p> |

Return Values

The function returns:

- 1—if the procedure is successfully completed
- 0—if the procedure could not be successfully completed

Exceptions

Error—If an error occurs if the function was unable to create a view.

**See Also:**

For more info on the JSON data guide, see [JSON Data Guide](#)

295.3.1.3 DROP_INDEX Function

This function drops the named index.

Syntax

```
DROP_INDEX (  
    index_Name IN VARCHAR2,  
    force      IN BOOLEAN DEFAULT FALSE)  
RETURN NUMBER;
```

Example 295-2 Parameters

Table 295-5 DROP_INDEX Function Parameters

| Parameter | Description |
|------------|--|
| index_Name | The name of the index. |
| force | The force parameter can be TRUE or FALSE. Should only be set to TRUE for dropping a JSON search index or spatial index (not B-tree index). For more information, see DROP INDEX |

Return Values

The function returns:

- 1—If the index was successfully dropped
- 0—If the index was not dropped. For example, if there was no existing index with the specified name.

Exceptions

Error—if an error occurs while dropping the index.

295.3.1.4 FIND Function

This function returns the operation type for the collection. The operation type allows building and executing various read/write operations. This is the only way to get the reference of `SODA_Operation_T` as there is no constructor.

Syntax

```
FIND ()  
RETURN SODA_Operation_T;
```

Return Values

This function returns `SODA_OPERATION_T` object.

Exceptions

This function does not throw any exception.

295.3.1.5 FIND_ONE Function

This function fetches the document matching the given key.

Syntax

```
FIND_ONE (  
    key          IN VARCHAR2)  
RETURN SODA_Document_T;
```

Parameters

Table 295-6 FIND_ONE Function Parameters

| Parameter | Description |
|-----------|--|
| key | The key of the document to be fetched. |

Return Values

This function returns the document that matches the key. Returns `NULL` if no match is found.

Exceptions

`Error`—If an error occurs while finding the document.

295.3.1.6 GET_DATA_GUIDE Function

This function fetches the JSON data guide as a CLOB. The JSON data guide is essentially inferred schema for the JSON documents in the collection. In order to be able to return the JSON data guide, a collection must have a JSON Search Index defined on it, with the data guide enabled.

Syntax

```
GET_DATA_GUIDE (  
RETURN CLOB;
```

Return Values

The function returns the JSON data guide as a CLOB.

See Also:

For more info on the JSON data guide, see [JSON Data Guide](#)

Exceptions

`Error`—If an error occurs while fetching the data guide.

295.3.1.7 GET_INDEX Function

This function returns the specification for the supplied index created on the collection.

Syntax

```
GET_INDEX (  
    index_name          IN VARCHAR2,  
    schema_name        IN VARCHAR2 DEFAULT NULL)  
RETURN VARCHAR2;
```

Parameters

Table 295-7 GET_INDEX Function Parameters

| Parameter | Description |
|-------------|--|
| index_name | The name of the index to be described. |
| schema_name | Name of the schema containing the index. This parameter is optional. If this parameter is not set, the method will look for the specified index in the schema from which this method is called. |

Return Values

The function returns the index specification in JSON format.

Exceptions

Error—If an error occurs while returning the index specification.

295.3.1.8 GET_METADATA Function

This function returns the metadata of the collection in JSON format.

Syntax

```
GET_METADATA ()  
RETURN VARCHAR2;
```

Return Values

This function returns the metadata of the collection in JSON format.

295.3.1.9 GET_NAME Function

This function returns the name of the collection.

Syntax

```
GET_NAME ()  
RETURN NVARCHAR2;
```

Return Values

This function returns the name of the collection.

295.3.1.10 INSERT_ONE Function

This function inserts a document into the collection.

Syntax

```
INSERT_ONE (
    document      IN SODA_Document_T)
RETURN NUMBER;
```

Parameters**Table 295-8 INSERT_ONE Function Parameters**

| Parameter | Description |
|-----------|---------------------|
| document | The input document. |

Return Values

The function returns a number— 1 if the doc was inserted successfully, 0 otherwise.

Exceptions

Error—If an error occurs while inserting the document into the collection.

295.3.1.11 INSERT_ONE_AND_GET Function

This function inserts a document into the collection.

Syntax

```
INSERT_ONE_AND_GET (
    document      IN SODA_Document_T,
    hint         IN VARCHAR2 DEFAULT NULL)
RETURN SODA_Document_T;
```

Parameters**Table 295-9 INSERT_ONE_AND_GET Function Parameters**

| Parameter | Description |
|-----------|---|
| document | The input document. |
| hint | A hint string in Oracle SQL format, without the enclosing /*+ and */. This parameter is optional. |

Return Values

The function returns the result document containing all document components supported by the given collection, with the exception of content.

Exceptions

Error—If an error occurs while inserting the document into the collection.

295.3.1.12 LIST_INDEXES Function

This function returns the specifications for all the indexes created on the collection.

Syntax

```
LIST_INDEXES ( )  
  RETURN SODA_Index_List_T;
```

Return Values

The function returns index specifications in `JSON` format as an instance of `SODA_Index_List_T`.

Exceptions

Error—If an error occurs while returning the index specification.

295.3.1.13 REMOVE_ONE Function

This function removes the document matching the given key.

Syntax

```
REMOVE_ONE (   
  key          IN VARCHAR2)   
  RETURN NUMBER;
```

Parameters

Table 295-10 REMOVE_ONE Function Parameters

| Parameter | Description |
|-----------|--------------------------|
| key | The key of the document. |

Return Values

This function returns the following values:

- 1—If the document was successfully removed.
- 0—If the document with the specified key was not found.

Exceptions

Error—If an error occurs while deleting the document from the collection.

295.3.1.14 REPLACE_ONE Function

This function updates the existing document with a new content and media type using the key. Any components set in `document` with the exception of content and media type are not used during the replace. They are ignored.

Syntax

```
REPLACE_ONE (  
    key          IN VARCHAR2,  
    document     IN SODA_Document_T)  
RETURN NUMBER;
```

Parameters

Table 295-11 REPLACE_ONE Parameters

| Parameter | Description |
|-----------------------|--|
| <code>key</code> | The key of the document. |
| <code>document</code> | The document with the new content and media type to replace the old one. |

Return Values

This function returns a number—1 if the document was replaced, 0 otherwise.

Exceptions

Error—If an error occurs while replacing the document in the collection.

295.3.1.15 REPLACE_ONE_AND_GET Function

This function updates the existing document with a new content and media type using the key. Any components set in `document` with the exception of content and media type are not used during the replace. They are ignored.

Syntax

```
REPLACE_ONE_AND_GET (  
    key          IN VARCHAR2,  
    document     IN SODA_Document_T)  
RETURN SODA_Document_T;
```

Parameters

Table 295-12 REPLACE_ONE_AND_GET Function Parameters

| Parameter | Description |
|-----------------------|--|
| <code>key</code> | The key of the document. |
| <code>document</code> | The document with the new content and media type to replace the old one. |

Return Values

The function returns the result document containing all document components supported by the given collection, with the exception of content. Last-modified and version components, if supported by the given collection, will be updated with new values. If no document in the collection had the supplied key, `NULL` is returned instead of the result document.

Exceptions

Error—If an error occurs while replacing the document in the collection.

295.3.1.16 SAVE Function

This function saves a document into the collection. This function is equivalent to `INSERT_ONE(document) Function` except that if client-assigned keys are used, and the document with the specified key already exists in the collection, it will be replaced with the input document. The key is automatically created, unless this collection is configured with client-assigned keys and the key is provided in the input document.

Syntax

```
SAVE (
    document IN SODA_Document_T)
RETURN NUMBER;
```

Parameters**Table 295-13 SAVE Parameters**

| Parameter | Description |
|-----------|--|
| document | The input document. This cannot be null. |

Return Values

The function returns a number- 1 if the function successfully completed, 0 otherwise.

Exceptions

Error—If an error occurs while saving the document.

295.3.1.17 SAVE_AND_GET Function

This function saves a document into the collection. This method is equivalent to `INSERT_ONE_AND_GET(document)` except that if client-assigned keys are used, and the document with the specified key already exists in the collection, it will be replaced with the input document. The key will be automatically created, unless this collection is configured with client-assigned keys and the key is provided in the input document.

Syntax

```
SAVE_AND_GET (
    document      IN SODA_Document_T,
    hint         IN VARCHAR2 DEFAULT NULL)
RETURN SODA_Document_T;
```

Parameters

Table 295-14 SAVE_AND_GET Function Parameters

| Parameter | Description |
|-----------|---|
| document | The input document. This cannot be null. |
| hint | A hint string in Oracle SQL format, without the enclosing /*+ and */. This parameter is optional. |

Return Values

The function returns the result document containing all document components supported by the given collection, with the exception of content.

Exceptions

Error—If an error occurs while saving or getting the document.

295.3.1.18 TRUNCATE Function

This function deletes all documents in the collection.

Syntax

```
TRUNCATE ( )
  RETURN Number;
```

Return Values

The function returns:

- 1—if the function is successfully completed
- 0—if the function could not be successfully completed

Exceptions

Error—if an error occurs while deleting the documents in the collection.

295.3.2 SODA_Document_T Type

This SODA type represents a document with content, that is usually in JSON format.

This type is not persistable pl/sql type. However, SODA is a system that basically provides persistence — it has read and write operations. So you do not persist SODA_DOCUMENT_T directly, but you pass it to a write operation (like insert or replace), which is defined on SODA_COLLECTION_T, in order to write the document content and other components to the database.

A document has the following components:

- key
- content
- created-on timestamp

- last-modified timestamp
- version
- media type

Table 295-15 SODA_Document_T Type Subprograms

| Subprogram | Description |
|--|---|
| GET_BLOB Function | Fetches the BLOB content of a BLOB-based document. |
| GET_CLOB Function | Fetches the CLOB content of a CLOB-based document. |
| GET_CREATED_ON Function | Fetches the created-on timestamp in VARCHAR2. |
| GET_DATA_TYPE Function | Fetches the SQL datatype of the document content with which it was created. |
| GET_JSON Function | Fetches the JSON content of a JSON-based document. |
| GET_KEY Function | Fetches the document key in VARCHAR2. |
| GET_LAST_MODIFIED Function | Fetches the last modified timestamp in VARCHAR2. |
| GET_MEDIA_TYPE Function | Fetches the media type of the document content in VARCHAR2. |
| GET_VARCHAR2 Function | Fetches the VARCHAR2 content of a VARCHAR2-based document. |
| GET_VERSION Function | Fetches the version of the document in VARCHAR2. |
| SODA_Document_T Function | There are three different SODA_DOCUMENT_T constructor functions. Each constructor function instantiates a document object using key, content, and media type. |

295.3.2.1 GET_BLOB Function

This functions fetches the BLOB content of the document. It assumes that the document was constructed with BLOB content, or was returned from a collection with BLOB content. Otherwise, an error is returned.

Syntax

```
GET_BLOB ()
RETURN BLOB;
```

Return Values

This function returns the BLOB content of a document.

Exceptions

SODA Error: If the document was initially not created with BLOB content.

295.3.2.2 GET_CLOB Function

The function fetches CLOB content of the document. It assumes that the document was constructed with CLOB content, or was returned from a collection with CLOB content. Otherwise, an error is returned.

Syntax

```
GET_CLOB ()
  RETURN CLOB;
```

Return Values

This function returns the CLOB content of a document.

Exceptions

SODA Error: If the document was initially not created with CLOB content.

295.3.2.3 GET_CREATED_ON Function

This function fetches the created-on timestamp. The timestamp string is in ISO-8601 format, in particular this form: YYYY-MM-DDThh:mm:ss.ssssssZ format. As indicated by the Z at the end, timestamps are returned in UTC (Z indicates zero UTC offset).

Syntax

```
GET_CREATED_ON ()
  RETURN VARCHAR2;
```

Return Values

This function returns the created-on timestamp.

295.3.2.4 GET_DATA_TYPE Function

This function fetches the SQL datatype of the document content with which it was created.

Syntax

```
GET_DATA_TYPE ()
  RETURN PLS_INTEGER;
```

Return Values

Table 295-16 GET_DATA_TYPE Return Values

| Constant | Value | Description |
|--------------------------------------|-------|-------------|
| DOC_VARCHAR2 CONSTANT PLS_INTEGER | 1 | VARCHAR2 |
| DOC_BLOB CONSTANT PLS_INTEGER | 2 | BLOB |

Table 295-16 (Cont.) GET_DATA_TYPE Return Values

| Constant | Value | Description |
|----------------------------------|-------|-------------|
| DOC_CLOB CONSTANT PLS_INTEGER | 3 | CLOB |
| DOC_JSON CONSTANT PLS_INTEGER | 4 | JSON |

295.3.2.5 GET_JSON Function

This function fetches the `JSON` content of the document. It assumes that the document was constructed with `JSON` type content, or was returned from a collection with `JSON` type content. Otherwise, an error is returned.

Syntax

```
GET_JSON ()  
RETURN JSON;
```

Return Values

This function returns the `JSON` content of a document.

Exceptions

`SODA Error`: If the document was initially not created with `JSON` content.

295.3.2.6 GET_KEY Function

This function fetches the document key.

Syntax

```
GET_KEY ()  
RETURN VARCHAR2;
```

Return Values

This function returns the document key.

295.3.2.7 GET_LAST_MODIFIED Function

This function fetches the last modified timestamp. The timestamp string is in `ISO-8601` format, in particular this form: `YYYY-MM-DDThh:mm:ss.ssssssZ` format. As indicated by the `Z` at the end, timestamps are returned in `UTC` (`Z` indicates zero `UTC` offset).

Syntax

```
GET_LAST_MODIFIED ()  
RETURN VARCHAR2;
```

Return Values

This function returns the last modified timestamp.

295.3.2.8 GET_MEDIA_TYPE Function

This function fetches the media type of the document content.

Syntax

```
GET_MEDIA_TYPE ()  
RETURN VARCHAR2;
```

Return Values

This function returns the media type of the document content. `application/JSON` is the media type for `JSON` documents (default).

295.3.2.9 GET_VARCHAR2 Function

This function fetches the `VARCHAR2` content of the document. It assumes that the document was constructed with `VARCHAR2` content, or was returned from a collection with `VARCHAR2` content. Otherwise, an error is returned.

Syntax

```
GET_VARCHAR2 ()  
RETURN VARCHAR2;
```

Return Values

This function returns the `VARCHAR2` content of a document.

Exceptions

SODA Error: If the document was initially not created with `VARCHAR2` content.

295.3.2.10 GET_VERSION Function

This function fetches the version of the document.

Syntax

```
GET_VERSION ()  
RETURN VARCHAR2;
```

Return Values

This function returns the version of the document.

295.3.2.11 SODA_Document_T Function

This function instantiates a document object using key, content, and media type. There are three different `SODA_DOCUMENT_T` constructor functions. The second parameter (`<v|b|c>_Content`) is different in each constructor. It is `VARCHAR2` in the first variant, `BLOB` in the second, and `CLOB` in the third.

Key and media type are optional parameters (will be defaulted to `NULL`). All three parameters can be set to `NULL`. If `media_Type` is set to `NULL`, it will be defaulted to `application/json`.

Use `key` and `j_Content` with the constructor to instantiate a document object using `key` and `content`. Media type parameter is not present in this constructor as the data is of `JSON` type. Therefore, media type is understood to be `application/json`.

Syntax

```
SODA_DOCUMENT_T (
    key          IN VARCHAR2 DEFAULT NULL,
    v_Content    IN VARCHAR2,
    media_Type   IN VARCHAR2 DEFAULT NULL)
RETURN SODA_Document_T;
```

```
SODA_DOCUMENT_T (
    key          IN VARCHAR2 DEFAULT NULL,
    b_Content    IN BLOB,
    media_Type   IN VARCHAR2 DEFAULT NULL)
RETURN SODA_Document_T;
```

```
SODA_DOCUMENT_T (
    key          IN VARCHAR2 DEFAULT NULL,
    c_Content    IN CLOB,
    media_Type   IN VARCHAR2 DEFAULT NULL)
RETURN SODA_Document_T;
```

```
SODA_DOCUMENT_T (
    key          IN VARCHAR2 DEFAULT NULL,
    j_Content    IN JSON)
RETURN SODA_Document_T;
```

Parameters

Table 295-17 SODA_Document_T Parameters

| Parameter | Description |
|-------------------------|---|
| <code>key</code> | The key of the document. |
| <code>v_Content</code> | The content of the document in <code>VARCHAR2</code> format. |
| <code>b_Content</code> | The content of the document in <code>BLOB</code> format. |
| <code>c_Content</code> | The content of the document in <code>CLOB</code> format. |
| <code>j_Content</code> | The content of the document as <code>JSON</code> type instance. |
| <code>media_Type</code> | The media type of the document. The media type could be <code>application/json</code> for <code>JSON</code> documents. |

Note:

`v_Content`, `b_Content`, and `c_Content` are not all parameters of a single `SODA_DOCUMENT_T` constructor function. Each one corresponds to a particular variant of the constructor function as shown in the `Syntax` section.

Return Values

This function returns a document of type `SODA_Document_T`.

295.3.3 SODA_OPERATION_T Type

This `SODA` type is used to perform read/write operations, such as document finds with filtering and pagination, removes, and replaces on a `SODA` collection.

Table 295-18 SODA_OPERATION_T Type Subprograms

| Subprogram | Description |
|--|---|
| ACQUIRE_LOCK Function | This function ensures that the document(s) affected by a <code>read</code> operation are locked for update (which is equivalent to SQL <code>'select for update'</code>). |
| AS_OF_SCN Function | This function sets the SCN value for the operation. |
| AS_OF_TIMESTAMP Function | This function sets the the timestamp value for the operation. |
| COUNT Function | Returns a count of the number of documents in the collection that match the criteria. If <code>skip(...)</code> or <code>limit(...)</code> were chained together with this <code>count()</code> , an exception is raised. |
| FILTER Function | Sets the filter (also known as QBE or query-by-example) criteria on the operation. Returns the same <code>SODA_OPERATION_T</code> object so that further criteria can be chained together if required. |
| GET_CURSOR Function | Returns a <code>SODA_CURSOR_T</code> object that can be used to iterate over the documents that match the criteria. |
| GET_DATA_GUIDE Function | This function gets the data guide. |
| GET_ONE Function | Returns a single <code>SODA_DOCUMENT_T</code> object that matches the criteria. Note that, if multiple documents match the criteria, only the first document is returned. |
| HINT Function | This function sets the hint attribute of the operation. |
| KEY Function | Specifies that the document with the specified key should be returned. This causes any previous calls made to this function and <code>KEYS(...)</code> , when they appear in the same chain, to be ignored. Returns the same <code>SODA_OPERATION_T</code> object so that further operation criteria can be chained together, if needed. |

Table 295-18 (Cont.) SODA_OPERATION_T Type Subprograms

| Subprogram | Description |
|------------------------------|---|
| KEYS Function | <p>Specifies that documents that match the keys supplied to this function should be returned. This causes any previous calls made to this function and <code>KEY(...)</code>, when they appear in the same chain, to be ignored.</p> <p>Returns the same <code>SODA_OPERATION_T</code> object, so that further operation criteria can be chained together, if needed.</p> |
| LIMIT Function | <p>Sets a limit on the specified number of documents the operation should return. This setting is only usable for read operations such as <code>GET_CURSOR</code>. For write operations, any value set using this method is ignored.</p> <p>Returns the same <code>SODA_OPERATION_T</code> object so that further operation criteria can be chained together, if needed.</p> |
| REMOVE Function | <p>Removes all of the documents in the collection that match the criteria. Returns the number of documents that was removed.</p> |
| REPLACE_ONE Function | <p>Replaces a single document in the collection with the specified document. Returns a number that indicates if the document was replaced or not.</p> <p>Currently, before calling this function, you must call the function <code>KEY(...)</code> to uniquely identify the document being replaced. Any components set in the input document with the exception of content and media type are not used during the replace. They are ignored.</p> |
| REPLACE_ONE_AND_GET Function | <p>Replaces a single document in the collection with the specified document. Returns a result document if the document was replaced, <code>NULL</code> otherwise.</p> <p>Currently, before calling this function, you must call the function <code>KEY(...)</code> to uniquely identify the document being replaced.</p> <p>This function is similar to <code>REPLACE_ONE</code>. The only difference is that <code>REPLACE_ONE_AND_GET</code> also returns the result document with updated components, such as version and last-modified timestamp. The result document does not contain the content component.</p> <p>Any components set in the input document with the exception of content and media type are not used during the replace. They are ignored.</p> |
| SAMPLE Function | <p>Sets the sampling parameters to be used for the operation.</p> |

Table 295-18 (Cont.) SODA_OPERATION_T Type Subprograms

| Subprogram | Description |
|----------------------------------|--|
| SKIP Function | <p>Sets the number of documents that match the operation criteria that will be skipped from the operation result. This setting is only usable for read operations such as <code>GET_CURSOR</code>. For write operations, any value set using this method is ignored.</p> <p>Returns the same <code>SODA_OPERATION_T</code> object so that further operation criteria can be chained together, if needed.</p> |
| VERSION Function | <p>Specifies that only documents with the supplied version should be returned. Typically, this is chained together with <code>KEY(...)</code> to implement optimistic locking for write operations such as <code>REMOVE</code> and <code>REPLACE</code>.</p> <p>Returns the same <code>SODA_OPERATION_T</code> object so that further operation criteria can be chained together, if needed.</p> |

295.3.3.1 ACQUIRE_LOCK Function

This function sets the lock attribute of the operation to `TRUE`.

Syntax

```
ACQUIRE_LOCK ( )
  RETURN SODA_Operation_T;
```

Return Values

This function returns the same `SODA_OPERATION_T` object it was invoked on.

295.3.3.2 AS_OF_SCN Function

This function sets the SCN value for the operation.

Syntax

```
AS_OF_SCN (
  scn          IN NUMBER)
  RETURN SODA_Operation_T;
```

Parameters

Table 295-19 AS_OF_SCN Function Parameters

| Parameter | Description |
|------------------|---|
| <code>scn</code> | The input value for SCN. This cannot be <code>NULL</code> . |

Return Values

This function returns the same `SODA_OPERATION_T` object it was invoked on.

295.3.3.3 AS_OF_TIMESTAMP Function

This function sets the the timestamp value for the operation.

Syntax

```
AS_OF_TIMESTAMP (  
    timestamp          IN VARCHAR2)  
RETURN SODA_Operation_T;
```

Parameters

Table 295-20 AS_OF_TIMESTAMP Function Parameters

| Parameter | Description |
|-----------|---|
| timestamp | The input timestamp. This cannot be NULL. |

Return Values

This function returns the same `SODA_OPERATION_T` object it was invoked on.

295.3.3.4 COUNT Function

This function returns a count of the number of documents in the collection that match the criteria. If `skip(...)` or `limit(...)` were chained together with this `count()`, an exception is raised.

Syntax

```
COUNT (  
RETURN NUMBER;
```

Return Values

This function returns the number of documents matching the criteria specified in the operation.

Exceptions

Error—If an error occurs while finding the count.

295.3.3.5 FILTER Function

Sets the filter (also known as QBE or query-by-example) criteria on the operation. Returns the same `SODA_OPERATION_T` object so that further criteria can be attached if needed.

Syntax

```
FILTER (
  qbe          IN VARCHAR2)
RETURN SODA_Operation_T;
```

Parameters**Table 295-21** FILTER Function Parameters

| Parameter | Description |
|-----------|---|
| qbe | The string representing the query by example. |

Return Values

This function returns the same SODA_OPERATION_T object it was invoked on.

 **See Also:**

- Overview of SODA Filter Specifications (QBEs)
- SODA Filter Specifications (Reference)

295.3.3.6 GET_CURSOR Function

Returns a SODA_CURSOR_T object that can be used to iterate over the documents that match the criteria.

Syntax

(Optional) Enter syntax information here.

```
GET_CURSOR ()
RETURN SODA_Cursor_T;
```

Return Values

This function returns a SODA_CURSOR_T object that can be used to iterate over the documents that match the read operation criteria.

Exceptions

SODA Error: If an error occurs while fetching the cursor.

295.3.3.7 GET_DATA_GUIDE Function

This function gets the data guide.

Syntax

```
GET_DATA_GUIDE (
  format      IN PLS_INTEGER DEFAULT 1,
```

```

    flag          IN PLS_INTEGER DEFAULT 0)
RETURN CLOB;

```

Parameters

Table 295-22 GET_DATA_GUIDE Function Parameters

| Parameter | Description |
|-----------|---|
| format | <p>The format of the data guide. This parameter can have one of the following values:</p> <ul style="list-style-type: none"> DEMS_SODA.DATAGUIDE_FORMAT_HIERARCHICAL CONSTANT PLS_INTEGER := 1; DEMS_SODA.DATAGUIDE_FORMAT_FLAT CONSTANT PLS_INTEGER := 2; <p>The default value is 1.</p> |
| flag | <p>This parameter can have one of the following values:</p> <ul style="list-style-type: none"> DEMS_SODA.DATAGUIDE_PRETTY CONSTANT PLS_INTEGER := 1; DEMS_SODA.DATAGUIDE_GEOJSON CONSTANT PLS_INTEGER := 2; DEMS_SODA.DATAGUIDE_GATHER_STATS CONSTANT PLS_INTEGER := 4; <p>The default value is 0.</p> |

Return Values

This function returns the same `SODA_OPERATION_T` object it was invoked on.

295.3.3.8 GET_ONE Function

Returns a single `SODA_DOCUMENT_T` object that matches the criteria. Note that, if multiple documents match the criteria, only the first document is returned.

Syntax

```

GET_ONE ()
RETURN SODA_Document_T;

```

Return Values

The first matching document.

Exceptions

Error—If an error occurs while fetching the document.

295.3.3.9 HINT Function

This function sets the hint attribute of the operation.

Syntax

```
HINT (
    hint          IN VARCHAR2)
RETURN SODA_Operation_T;
```

Parameters**Table 295-23 HINT Function Parameters**

| Parameter | Description |
|-----------|--|
| hint | A hint string in Oracle SQL format, with out the enclosing /*+ and */. |

Return Values

This function returns the same `SODA_OPERATION_T` object it was invoked on.

295.3.3.10 KEY Function

Specifies that the document with the specified key should be returned. This causes any previous calls made to this function and `KEYS(...)`, when they appear in the same chain, to be ignored. Returns the same `SODA_OPERATION_T` object so that further operation criteria can be chained together, if needed.

Syntax

```
KEY (
    key          IN VARCHAR2)
RETURN SODA_Operation_T;
```

Parameters**Table 295-24 KEY Function Parameters**

| Parameter | Description |
|-----------|--|
| key | The key to be used for the operations. |

Return Values

This function returns the same `SODA_OPERATION_T` object it was invoked on.

295.3.3.11 KEYS Function

Specifies that documents that match the keys supplied to this function should be returned. This causes any previous calls made to this function and `key(...)`, when they appear in the

same chain, to be ignored. Returns the same `SODA_OPERATION_T` object, so that further operation criteria can be chained together, if needed.

Syntax

```
KEYS (
    key_list IN SODA_Key_List_T)
RETURN SODA_Operation_T;
```

Parameters

Table 295-25 KEYS Function Parameters

| Parameter | Description |
|-----------------------|--|
| <code>key_list</code> | The parameter is a <code>SODA_Key_List_T</code> which is a list of <code>VARCHAR2</code> values representing keys. Assuming <code>key_list</code> is a variable of type <code>SODA_Key_List_T</code> , it can be initialized as follows: <code>key_list := SODA_Key_List_T('key1', 'key2', 'key3', etc);</code> |

Return Values

This function returns the same `SODA_OPERATION_T` object it was invoked on.

295.3.3.12 LIMIT Function

This function sets a limit on the specified number of documents the operation should return. This setting is only usable for read operations such as `GET_CURSOR`. For write operations, any value set using this method is ignored. Returns the same `SODA_OPERATION_T` object so that further operation criteria can be chained together, if needed.

Syntax

```
LIMIT (
    limit IN NUMBER)
RETURN SODA_Operation_T;
```

Parameters

Table 295-26 LIMIT Function Parameters

| Parameter | Description |
|--------------------|---|
| <code>limit</code> | A limit on the number of results returned by read operations. |

Return Values

This function returns the same `SODA_OPERATION_T` object it was invoked on.

295.3.3.13 REMOVE Function

This function removes all of the documents in the collection that match the criteria. Returns the number of documents that was removed.

Syntax

```
REMOVE ()
  RETURN NUMBER;
```

Return Values

This function returns the number of matching documents that were removed in the operation.

Exceptions

Error—If an error occurs while removing the documents.

295.3.3.14 REPLACE_ONE Function

This function replaces a single document in the collection with the specified document. Returns a number that indicates if the document was replaced or not. Currently, before calling this function, you must call the function `KEY(...)` to uniquely identify the document being replaced. Any components set in the input document with the exception of content and media type are not used during the replace. They are ignored.

Syntax

```
REPLACE_ONE (
  document IN SODA_Document_T)
  RETURN NUMBER;
```

Parameters

Table 295-27 REPLACE_ONE Function Parameters

| Parameter | Description |
|-----------|---|
| document | The document object with the new content and media type to be used for replacement. |

Return Values

This function returns a number—1 if the document was replaced, 0 otherwise.

Exceptions

Error—If an error occurs while updating the collection.

295.3.3.15 REPLACE_ONE_AND_GET Function

Replaces a single document in the collection with the specified document. Returns a result document if the document was replaced, `NULL` otherwise. Currently, before calling this function, you must call the function `KEY(...)` to uniquely identify the document being replaced. This function is similar to `REPLACE_ONE`. The only difference is that `REPLACE_ONE_AND_GET` also

returns the result document with updated components, such as version and last-modified timestamp. The result document does not contain the content component. Any components set in the input document with the exception of content and media type are not used during the replace. They are ignored.

Syntax

```
REPLACE_ONE_AND_GET (
    document      IN SODA_Document_T)
RETURN SODA_Document_T;
```

Parameters

Table 295-28 REPLACE_ONE_AND_GET Function Parameters

| Parameter | Description |
|-----------|---|
| document | The document object with the new content and media type to be used for replacement. |

Return Values

The function returns the result document containing all document components supported by the given collection, with the exception of content. Last-modified and version components, if supported by the given collection, will be updated with new values. If no document in the collection had the supplied key, `NULL` is returned instead of the result document.

Exceptions

Error—If an error occurs while updating the collection

295.3.3.16 SAMPLE Function

This function sets the sampling parameters to be used for the operation.

Syntax

```
SAMPLE (
    pct      IN  DOUBLE,
    seed     IN  NUMBER      DEFAULT NULL,
    method   IN  PLS_INTREFER DEFAULT DBMS_SODA.SAMPLE_ROW)
RETURN SODA_Operation_T;
```

Parameters

Table 295-29 SAMPLE Function Parameters

| Parameter | Description |
|-----------|---|
| pct | The percentage of the total documents or block count to be included in the sample. The value must be in the range .000001 to, but not including, 100. This percentage indicates the probability of each row or each cluster of rows in the case of block sampling, being selected as part of the sample. It does not mean that the database will retrieve exactly the percentage of documents in the collection. |
| seed | Specify this attribute to instruct the database to attempt to return the same sample from one execution to the next. The seed value must be an integer between 0 and 4294967295. If you omit this attribute, then the resulting sample will change from one execution to the next. |
| method | The type of sampling method to be used. Valid values are: <ul style="list-style-type: none"> DBMS_SODA.SAMPLE_ROW DBMS_SODA.SAMPLE_BLOCK |

Return Values

This function returns the `SELF` operation object.

295.3.3.17 SKIP Function

This function sets the number of documents that match the operation criteria that will be skipped from the operation result. This setting is only usable for read operations such as `GET_CURSOR`. For write operations, any value set using this method is ignored. Returns the same `SODA_OPERATION_T` object so that further operation criteria can be chained together, if needed.

Syntax

```
SKIP (
    offset          IN NUMBER)
RETURN SODA_Operation_T;
```

Parameters

Table 295-30 SKIP Function Parameters

| Parameter | Description |
|-----------|----------------------------------|
| offset | The number of documents to skip. |

Return Values

This function returns the same `SODA_OPERATION_T` object it was invoked on

295.3.3.18 VERSION Function

This function specifies that only documents with the supplied version should be returned. Typically, this is chained together with `KEY(...)` to implement optimistic locking for write operations such as `REMOVE` and `REPLACE`. Returns the same `SODA_OPERATION_T` object so that further operation criteria can be chained together, if needed.

Syntax

```
VERSION (
    version          IN VARCHAR2)
RETURN SODA_Operation_T;
```

Parameters**Table 295-31** VERSION Function Parameters

| Parameter | Description |
|----------------------|--|
| <code>version</code> | Document version to be used for the operation. |

Return Values

This function returns the same `SODA_OPERATION_T` object it was invoked on

295.3.4 SODA_Cursor_T Type

This SODA type is used to represent a result set of documents.

Table 295-32 SODA_Cursor_T Type Subprograms

| Subprogram | Description |
|-----------------------------------|---|
| CLOSE Function | Closes the cursor. |
| HAS_NEXT Function | Returns <code>TRUE</code> , if the next document is available for the cursor. Otherwise, returns <code>FALSE</code> . |
| NEXT Function | Returns the next SODA documented pointed by the cursor. |

295.3.4.1 CLOSE Function

This function closes the cursor.

Syntax

```
CLOSE ()
RETURN BOOLEAN;
```

Example 295-3 Return Values

This function returns a boolean value.

295.3.4.2 HAS_NEXT Function

This function returns `TRUE`, if the next document is available for the cursor. Otherwise, returns `FALSE`.

Syntax

```
HAS_NEXT ()  
  RETURN BOOLEAN;
```

Return Values

This function returns a boolean value. `TRUE`, if the next document is available for the cursor. Otherwise, returns `FALSE`.

Exceptions

`Error`—If an error occurs while checking if the next document is available.

295.3.4.3 NEXT Function

This function returns the next `SODA` documented pointed by the cursor.

Syntax

```
NEXT ()  
  RETURN SODA_Document_T;
```

Return Values

This function returns the next `SODA` documented pointed by the cursor. Returns `NULL` when the `HAS_NEXT` function returns `FALSE`.

Exceptions

`Error`—If an error occurs while getting the next document.

UTL Streams Types

UTL Streams Types describe abstract types used with Oracle XML functionality.

Four abstract PL/SQL streams are introduced and defined within the 'SYS' schema. The streams may be referenced by PUBLIC and are described in the following sections.

This chapter contains the following topics:

- [Security Model](#)
- [Summary of UTL Binary Streams Types](#)

See Also:

For more information, see Oracle XML DB Developer's Guide

296.1 UTL Streams Types Security Model

EXECUTE on UTL Streams Types is granted to PUBLIC.

296.2 Summary of UTL Binary Streams Types

This table lists the UTL Binary Streams Types and briefly describes them.

Table 296-1 UTL Streams Types

| Type | Description |
|--|-----------------------------------|
| UTL_BINARYINPUTSTREAM Type | Reads bytes and closes a stream. |
| UTL_BINARYOUTPUTSTREAM Type | Writes bytes and closes a stream. |
| UTL_CHARACTERINPUTSTREAM Type | Reads chars and closes a stream. |
| UTL_CHARACTEROUTPUTSTREAM Type | Writes chars and closes a stream. |

296.2.1 UTL_BINARYINPUTSTREAM Type

This type is similar to `java.io.InputStream` in that it can only read and close a stream.

Syntax

```
CREATE OR REPLACE TYPE Utl_BinaryInputStream AS OBJECT (
```

```

MEMBER FUNCTION available (
    self    IN OUT NOCOPY Utl_BinaryInputStream)
RETURN INTEGER,

MEMBER FUNCTION read (
    self    IN OUT NOCOPY Utl_BinaryInputStream,
    numBytes IN           INTEGER DEFAULT 1)
RETURN RAW,

MEMBER PROCEDURE read (
    self    IN OUT NOCOPY Utl_BinaryInputStream,
    bytes   IN OUT NOCOPY RAW,
    numBytes IN OUT      INTEGER),

MEMBER PROCEDURE read (
    self    IN OUT NOCOPY Utl_BinaryInputStream,
    bytes   IN OUT NOCOPY RAW,
    offset  IN INTEGER,
    numBytes IN OUT      INTEGER),

member function close (
    self    In Out Nocopy Utl_BinaryInputStream)

) NOT FINAL;

```

Attributes

Table 296-2 UTL_BINARYINPUTSTREAM Type Member Subprograms

| Member Subprogram | Description |
|-------------------|---|
| AVAILABLE | Returns the number of bytes available to be read |
| READ | <ul style="list-style-type: none"> #1 - Reads the number of bytes specified by <code>numBytes</code> (default is 1) and returns the bytes as a RAW. If there are no remaining bytes a value of NULL is returned. #2 - Reads the number of bytes specified in <code>numBytes</code> into the parameter <code>bytes</code>. Additionally, the actual number of bytes read is returned in parameter <code>numBytes</code>. If this parameter is set to 0 then there are no more bytes to be read. #3 - Reads the number of bytes specified in <code>numBytes</code> into the parameter <code>bytes</code>, beginning at the offset specified by parameter <code>offset</code>. The actual number of bytes read is returned in parameter <code>numBytes</code>. If this value is 0, then there are no additional bytes to be read. |
| CLOSE | Releases all resources held on the node to support the stream |

296.2.2 UTL_BINARYOUTPUTSTREAM Type

This type is similar to `java.io.OutputStream` in that it can only write and close a stream.

Syntax

```

CREATE OR REPLACE TYPE Utl_BinaryOutputStream AS OBJECT (

    MEMBER FUNCTION write (
        self    IN OUT NOCOPY sys.utl_BinaryOutputStream,

```

```

        bytes      IN          RAW,
        numBytes   IN          INTEGER DEFAULT 1)
RETURN INTEGER,

MEMBER PROCEDURE write (                                -- #2
    self          IN OUT NOCOPY sys.utl_BinaryOutputStream,
    bytes         IN NOCOPY    RAW,
    numBytes      IN OUT      INTEGER),

MEMBER PROCEDURE write (                                -- #3
    self          IN OUT NOCOPY utl_BinaryOutputStream,    bytes      IN
NOCOPY          RAW,
    offset        IN          INTEGER,
    numBytes      IN OUT      INTEGER),

MEMBER PROCEDURE flush (
    self          IN OUT NOCOPY utl_BinaryOutputStream),

MEMBER PROCEDURE close (
    self          IN OUT NOCOPY utl_BinaryOutputStream)

) NOT FINAL;
```

Attributes

Table 296-3 UTL_BINARYOUTPUTSTREAM Type Member Subprograms

| Member Subprogram | Description |
|-------------------|--|
| WRITE | <ul style="list-style-type: none"> #1 - Writes the number of bytes specified by <code>numBytes</code> (default is 1) from <code>RAW</code> into the stream. The actual number of bytes written is returned. #2 - Writes the number of bytes specified in parameter <code>numBytes</code> from parameter <code>bytes</code> to the stream. The actual number of bytes written is returned in parameter <code>numBytes</code>. #3 - Writes the number of bytes specified by <code>numBytes</code> to the stream, beginning at the offset specified by parameter <code>offset</code>. The actual number of bytes written is returned in parameter <code>numBytes</code>. |
| FLUSH | Insures that any buffered bytes are copied to the node destination |
| CLOSE | Frees all resources associated with the stream |

296.2.3 UTL_CHARACTERINPUTSTREAM Type

This type is similar to `java.io.Reader` in that it can only read characters (chars) and close a stream.

Syntax

```

CREATE OR REPLACE TYPE Utl_CharacterInputStream AS OBJECT (

MEMBER FUNCTION available (
    self          IN OUT NOCOPY    utl_CharacterInputStream)
RETURN INTEGER,

MEMBER FUNCTION read (                                -- #1
    self          IN OUT NOCOPY    utl_CharacterInputStream,
    numChars      IN              INTEGER DEFAULT 1,
```

```

        lineFeed IN          BOOLEAN DEFAULT FALSE)
RETURN VARCHAR2,

MEMBER PROCEDURE read (                                -- #2
    self      IN OUT NOCOPY utl_CharacterInputStream,
    chars     IN OUT NOCOPY VARCHAR2,
    numChars  IN OUT        INTEGER,
    lineFeed  IN BOOLEAN DEFAULT FALSE),

MEMBER PROCEDURE read (                                -- #3
    self      IN OUT NOCOPY utl_CharacterInputStream,
    chars     IN OUT NOCOPY VARCHAR2,
    offset    IN            INTEGER,
    numChars  IN OUT        INTEGER,
    lineFeed  IN            BOOLEAN DEFAULT FALSE),

MEMBER PROCEDURE close (
    self      IN OUT NOCOPY utl_CharacterInputStream)
) NOT FINAL;

```

Attributes

Table 296-4 UTL_CHARACTERINPUTSTREAM Type Member Subprograms

| Member Subprogram | Description |
|-------------------|--|
| AVAILABLE | Returns the number of bytes available to be read |
| READ | <ul style="list-style-type: none"> • #1 - Returns the number of characters remaining to be read • #2 - Reads the number of characters specified by numChars (default value is 1) and returns the characters as a VARCHAR2. If the value of lineFeed is true (default value is FALSE) then the reading stops if a linefeed character is found. If there are no remaining characters a value of NULL is returned. • #3 - Reads reads the number of characters specified by parameter numChars into the parameter chars. Additionally, the actual number of characters read is returned in parameter numChars. If this value is 0, then there are no more characters to be read. If the value of lineFeed is TRUE (default is FALSE), then reading stops if a linefeed character is encountered. |
| CLOSE | Releases all resources held by the stream |

296.2.4 UTL_CHARACTEROUTPUTSTREAM Type

This type is similar to `java.io.Reader` in that it can only read characters (chars) and close a stream.

Syntax

```

CREATE OR REPLACE TYPE utl_CharacterOutputStream AS OBJECT (

MEMBER FUNCTION write (                                -- #1
    self      IN OUT NOCOPY utl_CharacterOutputStream,

) NOT FINAL;

```

Attributes

Table 296-5 UTL_CHARACTEROUTPUTSTREAM Type Member Subprograms

| Member Subprogram | Description |
|-------------------|--|
| WRITE | <ul style="list-style-type: none"> • #1 - Writes the number of characters specified by <code>numChars</code> (default is 1) from parameter <code>chars</code> into the stream and returns the actual number of characters written. If the value of <code>lineFeed</code> is TRUE (default is FALSE) a <code>lineFeed</code> character is inserted after the last character. • #2 - writes the number of characters specified by parameter <code>numChars</code>, from parameter <code>chars</code> into the stream. The actual number of characters written is returned in parameter <code>numChars</code>. If the value of <code>lineFeed</code> is true (default is FALSE) a <code>lineFeed</code> character is inserted after the last character. • #3 - Writes the number of characters specified by parameter <code>numChars</code>, from parameter <code>chars</code>, beginning at <code>offset</code> specified by parameter <code>offset</code>. The actual number of characters written is returned in parameter <code>numChars</code>. If the value of <code>lineFeed</code> is true (default is FALSE) a <code>lineFeed</code> character is inserted after the last character . |
| FLUSH | Copies all characters that may be contained within buffers to the node value |
| CLOSE | Releases all resources held by the stream |

XMLTYPE

`XMLType` is a system-defined opaque type for handling XML data. It has predefined member functions on it to extract XML nodes and fragments.

You can create columns of `XMLType` and insert XML documents into it. You can also generate XML documents as `XMLType` instances dynamically using the `SYS_XMLAGG` SQL function.

This chapter contains the following topics:

- [Summary of XMLType Subprograms](#)

See Also:

- *Oracle XML DB Developer's Guide*

297.1 Summary of XMLType Subprograms

This table summarizes functions and procedures of `XMLType`.

Table 297-1 XMLTYPE Subprograms

| Method | Description |
|--|---|
| CREATENONSCHMABASEDXML | Creates a non schema based XML from the input schema based instance. |
| CREATESCHMABASEDXML | Creates a schema based <code>XMLType</code> instance from the non-schema based instance using the input schema URL. |
| CREATEXML | Static function for creating and returning an <code>XMLType</code> instance. |
| EXISTSNODE | Takes a <code>XMLType</code> instance and a <code>XPath</code> and returns 1 or 0 indicating if applying the <code>XPath</code> returns a non-empty set of nodes. |
| EXTRACT | Takes a <code>XMLType</code> instance and an <code>XPath</code> , applies the <code>XPath</code> expression and returns the results as an <code>XMLType</code> . |
| GETBLOBVAL | Returns the value of the <code>XMLType</code> instance as a <code>BLOB</code> . |
| GETCLOBVAL | Returns the value of the <code>XMLType</code> instance as a <code>CLOB</code> . |
| GETNAMESPACE | Returns the namespace for the top level element in a schema based document. |
| GETNUMBERVAL | Returns the value of the <code>XMLType</code> instance as a <code>NUMBER</code> . This is only valid if the input <code>XMLType</code> instance contains a simple text node and is convertible to a number. |
| GETROOTELEMENT | Returns the root element of the input instance. Returns <code>NULL</code> if the instance is a fragment. |

Table 297-1 (Cont.) XMLTYPE Subprograms

| Method | Description |
|------------------------------------|---|
| GETSCHEMAURL | Returns the XML schema URL if the input is an XML Schema based. |
| GETSTRINGVAL | Returns the value of the XMLType instance as a string. |
| ISFRAGMENT | Checks if the input XMLType instance is a fragment or not. A fragment is a XML instance, which has more than one root element. |
| ISSCHEMABASED | Returns 1 or 0 indicating if the input XMLType instance is a schema based one or not. |
| ISSCHEMAVALID | Checks if the input instance is schema valid according to the given schema URL. |
| ISSCHEMAVALIDATED | Checks if the instance has been validated against the schema. |
| SCHEMAVALIDATE | Validates the input instance according to the XML Schema. Raises error if the input instance is non-schema based. |
| SETSCHEMAVALIDATED | Sets the schema valid flag to avoid costly schema validation. |
| TOOBJECT | Converts the XMLType instance to an object type. |
| TRANSFORM | Takes an XMLType instance and an associated stylesheet (which is also an XMLType instance), applies the stylesheet and returns the result as XML. |
| XMLTYPE | Constructs an instance of the XMLType datatype. The constructor can take in the XML as a CLOB, VARCHAR2 or take in a object type. |

297.1.1 CREATENONSCHEMABASEDXML

This member function creates a non-schema based XML document from a schema based instance.

Syntax

```
MEMBER FUNCTION CREATENONSCHEMABASEDXML
return XMLType deterministic;
```

297.1.2 CREATESCHEMABASEDXML

This member function creates a schema based XMLType instance from a non-schema based XMLType value.

It uses either the supplied SCHEMA URL, or the SCHEMALOCATION attribute of the instance.

Syntax

```
MEMBER FUNCTION createSchemaBasedXML(
schema IN varchar2 := NULL)
return XMLType deterministic;
```

Table 297-2 CREATESCHEMABASEDXML Subprogram Parameters

| Parameter | Description |
|-----------|---|
| schema | Optional XMLSchema URL used to convert the value to the specified schema. |

297.1.3 CREATEXML

This static function creates and returns an XMLType instance. The string and CLOB parameters used to pass in the data must contain well-formed and valid XML documents.

The options are described in the following table.

Table 297-3 CREATEXML Subprograms

| Syntax | Description |
|---|--|
| <pre> STATIC FUNCTION createXML(xmlData IN varchar2) RETURN XMLType deterministic; </pre> | Creates the XMLType instance from a string. |
| <pre> STATIC FUNCTION createXML(xmlData IN clob) RETURN XMLType deterministic; </pre> | Creates the XMLType instance from a CLOB. |
| <pre> STATIC FUNCTION createXML (xmlData IN clob, schema IN varchar2, validated IN number := 0, wellformed IN number := 0) RETURN XMLType deterministic; </pre> | This static function creates a schema-based XMLType instance using the specified schema and xml data parameters. |
| <pre> STATIC FUNCTION createXML (xmlData IN varchar2, schema IN varchar2, validated IN number := 0, wellformed IN number := 0) RETURN XMLType deterministic; </pre> | This static function creates a schema-based XMLType instance using the specified schema and xml data parameters. |
| <pre> STATIC FUNCTION createXML (xmlData IN "<ADT_1>", schema IN varchar2 := NULL, element IN varchar2 := NULL, validated IN NUMBER := 0) RETURN XMLType deterministic; </pre> | Creates an XML instance from an instance of an user-defined type. |

Table 297-3 (Cont.) CREATEXML Subprograms

| Syntax | Description |
|--|---|
| <pre> STATIC FUNCTION createXML (xmlData IN SYS_REFCURSOR, schema IN VARCHAR2 := NULL, element IN VARCHAR2 := NULL, validated IN NUMBER := 0) RETURN XMLType DETERMINISTIC; </pre> | <p>Creates an XML instance from a cursor reference. You can pass in any arbitrary SQL query as a CURSOR.</p> |
| <pre> STATIC FUNCTION createXML (xmlData IN AnyData, schema IN VARCHAR2 := NULL, element IN VARCHAR2 := NULL, validated IN NUMBER := 0) RETURN sys.XMLType DETERMINISTIC PARALLEL_ENABLE </pre> | <p>Creates an XML instance from ANYDATA. If the ANYDATA instance contains an ADT, the XMLType returned is the same as would be returned for a call directly on the ADT. If the ANYDATA contains a scalar, the XMLType contains a leaf node with the scalar value. The element name for this node is taken from the optional element string if present, and is "ANYDATA" if it is not.</p> |
| <pre> STATIC FUNCTION createXML (xmlData IN BLOB, csid IN NUMBER, schema IN VARCHAR2, validated IN NUMBER := 0, wellformed IN NUMBER := 0) RETURN sys.XMLType DETERMINISTIC </pre> | <p>Creates an XML instance from a BLOB.</p> |
| <pre> STATIC FUNCTION createXML (xmlData IN BFILE, csid IN NUMBER, schema IN VARCHAR2, validated IN NUMBER := 0, wellformed IN NUMBER := 0) RETURN sys.XMLType DETERMINISTIC </pre> | <p>Creates an XML instance from a BFILE.</p> |

Table 297-4 CREATEXML Parameters

| Parameter | Description |
|-----------|--|
| xmlData | The actual data in the form of a BFILE, BLOB, CLOB, REF cursor, VARCHAR2 or object type. |
| schema | Optional Schema URL to be used to make the input conform to the given schema. Caution: Oracle does not support use of types generated by Schema Registration (see <i>Oracle XML DB Developer's Guide</i>). |
| validated | Flag to indicate that the instance is valid according to the given XML Schema. (Default is 0) |

Table 297-4 (Cont.) CREATEXML Parameters

| Parameter | Description |
|------------|--|
| wellformed | Flag to indicate that the input is well formed. If set, then the database would not do well formed check on the input instance. (Default is 0) |
| element | Optional element name in the case of the ADT_1 or REF CURSOR constructors. (Default is NULL). Caution: Oracle does not support use of types generated by Schema Registration (see <i>Oracle XML DB Developer's Guide</i>). |
| csid | The character set id of input XML data. |

297.1.4 EXISTSNODE

This member function checks if the node exists.

If the XPath string is NULL or the document is empty, then a value of 0 is returned, otherwise returns 1.

The options are described in the following table.

| Syntax | Description |
|---|--|
| <pre>MEMBER FUNCTION existsNode(xpath IN varchar2) RETURN number deterministic;</pre> | Given an XPath expression, checks if the XPath applied over the document can return any valid nodes. |
| <pre>MEMBER FUNCTION existsNode(xpath in varchar2, nsmap in varchar2) RETURN number deterministic;</pre> | This member function uses the XPath expression with the namespace information and checks if applying the XPath returns any nodes or not. |

Table 297-5 EXISTSNODE Subprogram Parameters

| Parameter | Description |
|-----------|-------------------------------|
| xpath | The XPath expression to test. |
| nsmap | Optional namespace mapping. |

297.1.5 EXTRACT

This member function extracts an XMLType fragment and returns an XMLType instance containing the result nodes. If the XPath does not result in any nodes, it then returns NULL.

The options are described in the following table.

| Syntax | Description |
|--|--|
| <pre>MEMBER FUNCTION extract(xpath IN varchar2) RETURN XMLType deterministic;</pre> | Given an XPath expression, applies the XPath to the document and returns the fragment as an XMLType. |
| <pre>MEMBER FUNCTION extract(xpath IN varchar2, nsmmap IN varchar2) RETURN XMLType deterministic;</pre> | This member function applies the XPath expression and namespace mapping, over the XML data to return a XMLType instance containing the resultant fragment. |

Table 297-6 EXTRACT Subprogram Parameters

| Parameter | Description |
|-----------|---|
| xpath | The XPath expression to apply. |
| nsmmap | Optional prefix to namespace mapping information. |

297.1.6 GETBLOBVAL

This member function returns a BLOB containing the serialized XML representation. If the BLOB returned is temporary, it must be freed after use.

Syntax

```
MEMBER FUNCTION getBlobVal(
  csid IN NUMBER)
RETURN BLOB DETERMINISTIC;
```

Table 297-7 GETBLOBVAL Subprogram Parameters

| Parameter | Description |
|-----------|---|
| csid | The desired character set ID of output BLOB |

297.1.7 GETCLOBVAL

This member function returns a CLOB containing the serialized XML representation. If the CLOB returned is temporary, it must be freed after use. The CLOBs returned by this function are read-only.

Syntax

```
MEMBER FUNCTION getClobVal()
RETURN clob deterministic;
```

297.1.8 GETNAMESPACE

GETNAMESPACE is a member function. It returns the namespace of the top level element in the instance. It returns NULL if the input is a fragment or is a non-schema based instance.

Syntax

```
MEMBER FUNCTION getNamespace  
return varchar2 deterministic;
```

297.1.9 GETNUMBERVAL

This is a member function. It returns a numeric value, formatted from the text value pointed to by the XMLType instance. The XMLType must point to a valid text node that contains a numerical value.

The options are described in the following table.

Syntax

```
MEMBER FUNCTION getNumberVal()  
RETURN number deterministic;
```

297.1.10 GETROOTELEMENT

this member function gets the root element of the XMLType instance. It returns NULL if the instance is a fragment.

Syntax

```
MEMBER FUNCTION getRootElement  
return varchar2 deterministic;
```

297.1.11 GETSCHEMAURL

This member function returns the XML Schema URL corresponding to the XMLType instance, if the XMLType instance is a schema-based document. Otherwise, it returns NULL.

Syntax

```
MEMBER FUNCTION getSchemaURL  
return varchar2 deterministic;
```

297.1.12 GETSTRINGVAL

This member function returns the document as a string. It returns a string containing the serialized XML representation, or in the case of text nodes, the text itself.

If the XML document exceeds the VARCHAR2 maximum size (4000), then an error is raised at run time.

Syntax

```
MEMBER FUNCTION getStringVal()  
RETURN varchar2 deterministic;
```

297.1.13 ISFRAGMENT

ISFRAGMENT determines if the XMLType instance corresponds to a well-formed document, or a fragment. It returns 1 or 0 indicating if the XMLType instance contains a fragment or a well-formed document.

Syntax

```
MEMBER FUNCTION isFragment()  
RETURN number deterministic;
```

297.1.14 ISSCHEMABASED

This member function determines whether the XMLType instance is schema-based or not. It returns 1 or 0 depending on whether the XMLType instance is schema-based.

Syntax

```
MEMBER FUNCTION isSchemaBased  
return number deterministic;
```

297.1.15 ISSCHEMAVALID

This member function checks if the input instance conforms to a specified schema. It does not change the validation status of the XML instance.

If an XML Schema URL is not specified and the xml document is schema based, the conformance is checked against the XMLType instance's own schema.

Syntax

```
member function isSchemaValid(  
schurl IN VARCHAR2 := NULL,  
elem IN VARCHAR2 := NULL)  
return NUMBER deterministic;
```

Table 297-8 ISSCHEMAVALID Subprogram Parameters

| Parameter | IN / OUT | Description |
|-----------|----------|--|
| schurl | (IN) | The URL of the XML Schema against which to check conformance. |
| elem | (IN) | Element of a specified schema, against which to validate. This is useful when we have a XML Schema which defines more than one top level element, and we want to check conformance against a specific one of these elements. |

297.1.16 ISSCHEMAVALIDATED

This member function returns the validation status of the `XMLType` instance to tell if a schema-based instance has been actually validated against its schema. It returns 1 if the instance has been validated against the schema, 0 otherwise.

Syntax

```
MEMBER FUNCTION isSchemaValidated
return NUMBER deterministic;
```

297.1.17 SCHEMAVALIDATE

This member procedure validates the XML instance against its schema, if it has not already been done.

For non-schema based documents an error is raised. If validation fails an error is raised; else, the document's status is changed to validated.

Syntax

```
MEMBER PROCEDURE schemaValidate(
    self IF OUT NOCOPY XMLType);
```

Table 297-9 SCHEMAVALIDATE Subprogram Parameters

| Parameter | IN / OUT | Description |
|-----------|----------|--|
| self | (OUT) | XML instance being validated against the schema. |

297.1.18 SETSCHEMAVALIDATED

This member function sets the `VALIDATION` state of the input XML instance.

Syntax

```
MEMBER PROCEDURE setSchemaValidated(
    self IF OUT NOCOPY XMLType,
    flag IN BINARY_INTEGER := 1);
```

Table 297-10 SERTSSCHEMAVALIDATED Subprogram Parameters

| Parameter | IN / OUT | Description |
|-----------|----------|--|
| self | (OUT) | XML instance. |
| flag | (IN) | 0 - NOT VALIDATED; 1 - VALIDATED (Default) |

297.1.19 TOOBJECT

This member procedure converts the XML value to an object type using the `XMLSCHEMA` mapping, if available. If a `SCHEMA` is not supplied or the input is a non-schema based XML, the procedure uses canonical mapping between elements and object type attributes.

Syntax

```
MEMBER PROCEDURE toObject(
  SELF in XMLType,
  object OUT "<ADT_1>",
  schema in varchar2 := NULL,
  element in varchar2 := NULL);
```

Table 297-11 TOOBJECT Subprogram Parameters

| Parameter | IN / OUT | Description |
|-----------|----------|---|
| SELF | (IN) | Instance to be converted. Implicit if used as a member procedure. |
| object | (IN) | Converted object. An object instance of the required type may be passed in to this function |
| schema | (IN) | Schema URL. The mapping of the <code>XMLType</code> instance to the converted object instance may be specified using a schema. Caution: Oracle does not support use of types generated by Schema Registration (see <i>Oracle XML DB Developer's Guide</i>). |
| element | (IN) | Top-level element name. An XML Schema document does not specify the top-level element for a conforming XML instance document without this parameter. Caution: Oracle does not support use of types generated by Schema Registration (see <i>Oracle XML DB Developer's Guide</i>). |

297.1.20 TRANSFORM

This member function transforms the XML data using the XSL stylesheet argument and the top-level parameters passed as a string of name=value pairs

If any of the arguments other than the parammap is `NULL`, then a `NULL` is returned.

Syntax

```
MEMBER FUNCTION transform(
  xsl IN XMLType,
  parammap in varchar2 := NULL)
RETURN XMLType deterministic;
```

Table 297-12 TRANSFORM Subprogram Parameters

| Parameter | IN / OUT | Description |
|-----------|----------|--|
| xsl | (IN) | The XSL stylesheet describing the transformation |
| parammap | (IN) | Top level parameters to the XSL - string of name=value pairs |

297.1.21 XMLTYPE

This is an XMLType constructor.

The options are described in the following table.

Table 297-13 XMLTYPE Member Subprogram Parameters

| Syntax | Description |
|--|---|
| <pre> constructor function XMLType(xmlData IN clob, schema IN varchar2 := NULL, validated IN number := 0, wellformed IN Number := 0) return self as result deterministic;</pre> | <p>This constructor function creates an optionally schema-based XMLType instance using the specified schema and xml data parameters.</p> |
| <pre> constructor function XMLType(xmlData IN varchar2, schema IN varchar2 := NULL, validated IN number := 0, wellformed IN number := 0) return self as result deterministic;</pre> | <p>This constructor function creates an optionally schema-based XMLType instance using the specified schema and xml data parameters.</p> |
| <pre> constructor function XMLType (xmlData IN "w<ADT_1>", schema IN varchar2 := NULL, element IN varchar2 := NULL, validated IN number := 0) return self as result deterministic;</pre> | <p>This constructor function creates an optionally schema-based XMLType instance from the specified object type parameter.</p> |
| <pre> constructor function XMLType(xmlData IN SYS_REFCURSOR, schema in varchar2 := NULL, element in varchar2 := NULL, validated in number := 0) return self as result deterministic;</pre> | <p>This constructor function creates an optionally schema-based XMLType instance from the specified REF CURSOR parameter.</p> |
| <pre> constructor function XMLType(xmlData IN AnyData, schema IN varchar2 := NULL, element IN varchar2 := NULL, validated IN number := 0) return self as result deterministic parallel_enable</pre> | <p>This constructor function creates an optionally schema-based XMLType instance from the specified ANYDATA parameter. If the ANYDATA instance contains an ADT, the XMLType returned is the same as would be returned for a call directly on the ADT. If the ANYDATA contains a scalar, the XMLType contains a leaf node with the scalar value. The element name for this node is taken from the optional element string if present, and is "ANYDATA" if it is not.</p> |

Table 297-13 (Cont.) XMLTYPE Member Subprogram Parameters

| Syntax | Description |
|---|--|
| <pre> constructor function XMLType(xmlData IN blob, csid IN number, schema IN varchar2 := NULL, validated IN number := 0, wellformed IN number := 0) return self as result deterministic </pre> | <p>This constructor function creates an optionally schema-based XMLType instance from the specified BLOB parameter.</p> |
| <pre> constructor function XMLType(xmlData IN bfile, csid IN number, schema IN varchar2 := NULL, validated IN number := 0, wellformed IN number := 0) return self as result deterministic </pre> | <p>This constructor function creates an optionally schema-based XMLType instance from the specified BFILE parameter.</p> |

Table 297-14 XMLTYPE Constructor Subprogram Parameters

| Parameter | Description |
|------------|--|
| xmlData | The data in the form of a BFILE, BLOB, CLOB, REFS, VARCHAR2 or object type. |
| schema | Optional Schema URL to be used to make the input conform to the given schema. Caution: Oracle does not support use of types generated by Schema Registration (see <i>Oracle XML DB Developer's Guide</i>). |
| validated | Indicates that the instance is valid to the given XML Schema. |
| wellformed | Indicates that the input is well formed. If set, then the database would not do well formed check on the input instance. |
| element | Optional element name in the case of the ADT_1 or REF CURSOR constructors. (Default is NULL). Caution: Oracle does not support use of types generated by Schema Registration (see <i>Oracle XML DB Developer's Guide</i>). |
| csid | The character set id of input XML data. |
