- [Summary of DBMS_PROFILER Subprograms](#)

139.1 DBMS_PROFILER Overview

This package enables the collection of profiler (performance) data for performance improvement or for determining code coverage for PL/SQL applications. Application developers can use code coverage data to focus their incremental testing efforts.

With this interface, you can generate profiling information for all named library units that are executed in a session. The profiler gathers information at the PL/SQL virtual machine level. This information includes the total number of times each line has been executed, the total amount of time that has been spent executing that line, and the minimum and maximum times that have been spent on a particular execution of that line.

Note:

It is possible to infer the code coverage figures for PL/SQL units for which data has been collected.

The profiling information is stored in database tables. This enables querying on the data: you can build customizable reports (summary reports, hottest lines, code coverage data, and so on. And you can analyze the data.

The `PROFTAB.SQL` script creates tables with the columns, datatypes, and definitions as shown in the following tables.

Table 139-1 Columns in Table PLSQL_PROFILER_RUNS

| Column | Datatype | Definition |
|-------------|--------------------|--|
| runid | NUMBER PRIMARY KEY | Unique run identifier from plsql_profiler_runnumber |
| related_run | NUMBER | Runid of related run (for client/server correlation) |

Table 139-1 (Cont.) Columns in Table PLSQL_PROFILER_RUNS

| Column | Datatype | Definition |
|-----------------|-----------------|--|
| run_owner | VARCHAR2 (128) | User who started run |
| run_date | DATE | Start time of run |
| run_comment | VARCHAR2 (2047) | User provided comment for this run |
| run_total_time | NUMBER | Elapsed time for this run in nanoseconds |
| run_system_info | VARCHAR2 (2047) | Currently unused |
| run_comment1 | VARCHAR2 (2047) | Additional comment |
| spare1 | VARCHAR2 (256) | Unused |

Table 139-2 Columns in Table PLSQL_PROFILER_UNITS

| Column | Datatype | Definition |
|----------------|----------------|---|
| runid | NUMBER | Primary key, references plsql_profiler_runs, |
| unit_number | NUMBER | Primary key, internally generated library unit # |
| unit_type | VARCHAR2 (128) | Library unit type |
| unit_owner | VARCHAR2 (128) | Library unit owner name |
| unit_name | VARCHAR2 (128) | Library unit name timestamp on library unit |
| unit_timestamp | DATE | In the future will be used to detect changes to unit between runs |
| total_time | NUMBER | Total time spent in this unit in nanoseconds. The profiler does not set this field, but it is provided for the convenience of analysis tools. |
| spare1 | NUMBER | Unused |
| spare2 | NUMBER | Unused |

Table 139-3 Columns in Table PLSQL_PROFILER_DATA

| Column | Datatype | Definition |
|-------------|----------|---|
| runid | NUMBER | Primary key, unique (generated) run identifier |
| unit_number | NUMBER | Primary key, internally generated library unit number |
| line# | NUMBER | Primary key, not null, line number in unit |
| total_occur | NUMBER | Number of times line was executed |
| total_time | NUMBER | Total time spent executing line in nanoseconds |
| min_time | NUMBER | Minimum execution time for this line in nanoseconds |
| max_time | NUMBER | Maximum execution time for this line in nanoseconds |
| spare1 | NUMBER | Unused |
| spare2 | NUMBER | Unused |
| spare3 | NUMBER | Unused |
| spare4 | NUMBER | Unused |

With Oracle database version 8.x, a sample textual report writer(`profrep.sql`) is provided with the PL/SQL demo scripts.

Note that prior to Oracle Database 10g, the `DBMS_PROFILER` package was not automatically loaded when the database was created, and the Oracle-supplied `PROFLOAD.SQL` script was used to create it. In 10g and beyond, the `DBMS_PROFILER` package is loaded automatically when the database is created, and `PROFLOAD.SQL` is no longer needed.

139.2 DBMS_PROFILER Security Model

The profiler only gathers data for units for which a user has `CREATE` privilege; you cannot use the package to profile units for which `EXECUTE ONLY` access has been granted. In general, if a user can debug a unit, the same user can profile it. However, a unit can be profiled whether or not it has been compiled `DEBUG`. Oracle advises that modules that are being profiled should be compiled `DEBUG`, since this provides additional information about the unit in the database.

Note:

`DBMS_PROFILER` treats any program unit that is compiled in `NATIVE` mode as if you do not have `CREATE` privilege, that is, you will not get any output.

139.3 DBMS_PROFILER Operational Notes

These notes describe a typical run, how to interpret output, and two methods of exception generation.

Typical Run

Improving application performance is an iterative process. Each iteration involves the following steps:

1. Running the application with one or more benchmark tests with profiler data collection enabled.
2. Analyzing the profiler data and identifying performance problems.
3. Fixing the problems.

The PL/SQL profiler supports this process using the concept of a "run". A run involves running the application through benchmark tests with profiler data collection enabled. You can control the beginning and the ending of a run by calling the `START_PROFILER` and `STOP_PROFILER` functions.

The user must first create database tables in the profiler user's schema to collect the data. The `PROFTAB.SQL` script creates the tables and other data structures required for persistently storing the profiler data.

Note that running `PROFTAB.SQL` drops the current tables. The `PROFTAB.SQL` script is in the `RDBMS/ADMIN` directory. Some PL/SQL operations, such as the first execution of a PL/SQL unit, may involve I/O to catalog tables to load the byte code for the PL/SQL unit being executed. Also, it may take some time executing package initialization code the first time a package procedure or function is called.

To avoid timing this overhead, "warm up" the database before collecting profile data. To do this, run the application once without gathering profiler data.

You can allow profiling across all users of a system, for example, to profile all users of a package, independent of who is using it. In such cases, the `SYSADMIN` should use a modified `PROFTAB.SQL` script which:

- Creates the profiler tables and sequence
- Grants `SELECT/INSERT/UPDATE` on those tables and sequence to all users
- Defines public synonyms for the tables and sequence

 **Note:**

Do not alter the actual fields of the tables.

A typical run then involves:

- Starting profiler data collection in the run.
- Executing PL/SQL code for which profiler and code coverage data is required.
- Stopping profiler data collection, which writes the collected data for the run into database tables

 **Note:**

The collected profiler data is not automatically stored when the user disconnects. You must issue an explicit call to the `FLUSH_DATA` or the `STOP_PROFILER` function to store the data at the end of the session. Stopping data collection stores the collected data.

As the application executes, profiler data is collected in memory data structures that last for the duration of the run. You can call the `FLUSH_DATA` function at intermediate points during the run to get incremental data and to free memory for allocated profiler data structures. Flushing the collected data involves storing collected data in the database tables created earlier.

 **See Also:**

"[FLUSH_DATA Function and Procedure](#)".

Interpreting Output

The table `plsql_profiler_data` contains one row for each line of the source unit for which code was generated. The `line#` value specifies which source line. If the row exists, and the `total_occur` value in that row is > 0 , some code associated with that line was executed. If the row exists, and `total_occur` value is 0, no code associated with that line was executed. If the row doesn't exist in the table, no code was generated for that line, and therefore it should not be mentioned in reports

If the source of a single statement is on a single line, any code generated for that statement will be attributed to that line number. (In some cases, such as a simple declaration, or because of optimization, no code will be needed). To get coverage information, units should be compiled with `PLSQL_OPTIMIZE_LEVEL=1`.

If a statement spans multiple lines, any code generated for that statement will be attributed to some line in the range, but it is not guaranteed that every line in the range will have code attributed to it. In such a case there will be gaps in the set of line# values. In particular, multi-line SQL-related statements may appear to be on a single line (usually the first). This is because PL/SQL passes the processed text of the cursor to the SQL engine; therefore, as far as PL/SQL is concerned, the entire SQL statement is a single indivisible operation.

When multiple statements are on the same line, the profiler will combine the occurrences for each statement. This may be confusing if a line has embedded control flow. For example, if 'then ...' and 'else ...' are on the same line, it will not be possible to determine whether the 'then' or the 'else' was taken.

In general, profiler and coverage reports are most easily interpreted if each statement is on its own line.

Two Methods of Exception Generation

Each routine in this package has two versions that allow you to determine how errors are reported.

- A function that returns success/failure as a status value and will never raise an exception
- A procedure that returns normally if it succeeds and raises an exception if it fails

In each case, the parameters of the function and procedure are identical. Only the method by which errors are reported differs. If there is an error, there is a correspondence between the error codes that the functions return, and the exceptions that the procedures raise.

To avoid redundancy, the following section only provides details about the functional form.

139.4 DBMS_PROFILER Exceptions

DBMS_PROFILER throws the exceptions described in this topic.

Table 139-4 DBMS_PROFILER Exceptions

| Exception | Description |
|-------------------------------|--|
| <code>version_mismatch</code> | Corresponds to <code>error_version</code> . |
| <code>profiler_error</code> | Corresponds to either "error_param" or "error_io". |

A 0 return value from any function denotes successful completion; a nonzero return value denotes an error condition. The possible errors are as follows:

- 'A subprogram was called with an incorrect parameter.'
`error_param constant binary_integer := 1;`
- 'Data flush operation failed. Check whether the profiler tables have been created, are accessible, and that there is adequate space.'

```
error_io    constant binary_integer := 2;
```

- There is a mismatch between package and database implementation. Oracle returns this error if an incorrect version of the `DBMS_PROFILER` package is installed, and if the version of the profiler package cannot work with this database version. The only recovery is to install the correct version of the package.

```
error_version constant binary_integer := -1;
```

139.5 Summary of DBMS_PROFILER Subprograms

This table lists the `DBMS_PROFILER` subprograms and briefly describes them.

Table 139-5 DBMS_PROFILER Package Subprograms

| Subprogram | Description |
|---|---|
| FLUSH_DATA Function and Procedure | Flushes profiler data collected in the user's session |
| GET_VERSION Procedure | Gets the version of this API |
| INTERNAL_VERSION_CHECK Function | Verifies that this version of the <code>DBMS_PROFILER</code> package can work with the implementation in the database |
| PAUSE_PROFILER Function and Procedure | Pauses profiler data collection |
| RESUME_PROFILER Function and Procedure | Resumes profiler data collection |
| START_PROFILER Functions and Procedures | Starts profiler data collection in the user's session |
| STOP_PROFILER Function and Procedure | Stops profiler data collection in the user's session |

139.5.1 FLUSH_DATA Function and Procedure

This function flushes profiler data collected in the user's session. The data is flushed to database tables, which are expected to preexist.

Note:

Use the `PROFTAB.SQL` script to create the tables and other data structures required for persistently storing the profiler data.

Syntax

```
DBMS_PROFILER.FLUSH_DATA
    RETURN BINARY_INTEGER;

DBMS_PROFILER.FLUSH_DATA;
```

139.5.2 GET_VERSION Procedure

This procedure gets the version of this API.

Syntax

```
DBMS_PROFILER.GET_VERSION (  
    major OUT BINARY_INTEGER,  
    minor OUT BINARY_INTEGER);
```

Parameters

Table 139-6 GET_VERSION Procedure Parameters

| Parameter | Description |
|-----------|---------------------------------|
| major | Major version of DBMS_PROFILER. |
| minor | Minor version of DBMS_PROFILER. |

139.5.3 INTERNAL_VERSION_CHECK Function

This function verifies that this version of the DBMS_PROFILER package can work with the implementation in the database.

Syntax

```
DBMS_PROFILER.INTERNAL_VERSION_CHECK  
    RETURN BINARY_INTEGER;
```

139.5.4 PAUSE_PROFILER Function and Procedure

This function pauses profiler data collection.

Syntax

```
DBMS_PROFILER.PAUSE_PROFILER  
    RETURN BINARY_INTEGER;
```

```
DBMS_PROFILER.PAUSE_PROFILER;
```

139.5.5 RESUME_PROFILER Function and Procedure

This function resumes profiler data collection.

Syntax

```
DBMS_PROFILER.RESUME_PROFILER  
    RETURN BINARY_INTEGER;
```

```
DBMS_PROFILER.RESUME_PROFILER;
```

139.5.6 START_PROFILER Functions and Procedures

This function starts profiler data collection in the user's session.

There are two overloaded forms of the `START_PROFILER` function; one returns the run number of the started run, as well as the result of the call. The other does not return the run number. The first form is intended for use with GUI-based tools controlling the profiler.

Syntax

```
DBMS_PROFILER.START_PROFILER(
  run_comment    IN VARCHAR2 := sysdate,
  run_comment1   IN VARCHAR2 := '',
  run_number     OUT BINARY_INTEGER)
RETURN BINARY_INTEGER;
```

```
DBMS_PROFILER.START_PROFILER(
  run_comment IN VARCHAR2 := sysdate,
  run_comment1 IN VARCHAR2 := '')
RETURN BINARY_INTEGER;
```

```
DBMS_PROFILER.START_PROFILER(
  run_comment    IN VARCHAR2 := sysdate,
  run_comment1   IN VARCHAR2 := '',
  run_number     OUT BINARY_INTEGER);
```

```
DBMS_PROFILER.START_PROFILER(
  run_comment IN VARCHAR2 := sysdate,
  run_comment1 IN VARCHAR2 := '');
```

Parameters

Table 139-7 START_PROFILER Function Parameters

| Parameter | Description |
|---------------------------|--|
| <code>run_comment</code> | Each profiler run can be associated with a comment. For example, the comment could provide the name and version of the benchmark test that was used to collect data. |
| <code>run_number</code> | Stores the number of the run so you can store and later recall the run's data. |
| <code>run_comment1</code> | Allows you to make interesting comments about the run. |

139.5.7 STOP_PROFILER Function and Procedure

This function stops profiler data collection in the user's session.

This function has the side effect of flushing data collected so far in the session, and it signals the end of a run.

Syntax

```
DBMS_PROFILER.STOP_PROFILER
RETURN BINARY_INTEGER;
```

```
DBMS_PROFILER.STOP_PROFILER;
```

DBMS_PROPAGATION_ADM

The `DBMS_PROPAGATION_ADM` package, one of a set of Oracle Replication packages, provides administrative interfaces for configuring a propagation from a source queue to a destination queue.

This chapter contains the following topics:

- [Overview](#)
- [Security Model](#)
- [Summary of DBMS_PROPAGATION_ADM Subprograms](#)

140.1 DBMS_PROPAGATION_ADM Overview

This package provides interfaces to start, stop, and configure a propagation.

140.2 DBMS_PROPAGATION_ADM Security Model

Security on this package can be controlled by granting `EXECUTE` on this package to selected users or roles, or by granting `EXECUTE_CATALOG_ROLE` to selected users or roles.

If subprograms in the package are run from within a stored procedure, then the user who runs the subprograms must be granted `EXECUTE` privilege on the package directly. It cannot be granted through a role.

When the `DBMS_PROPAGATION_ADM` package is used to manage an Oracle Replication configuration, it requires that the user is granted the privileges of an Oracle Replication administrator.

140.3 Summary of DBMS_PROPAGATION_ADM Subprograms

This table lists the `DBMS_PROPAGATION_ADM` subprograms and briefly describes them.

Table 140-1 DBMS_PROPAGATION_ADM Package Subprograms

| Subprogram | Description |
|--|---|
| ALTER_PROPAGATION Procedure | Adds, alters, or removes a rule set for a propagation |
| CREATE_PROPAGATION Procedure | Creates a propagation and specifies the source queue, destination queue, and rule set for the propagation |
| DROP_PROPAGATION Procedure | Drops a propagation |
| START_PROPAGATION Procedure | Starts a propagation |
| STOP_PROPAGATION Procedure | Stops a propagation |

**Note:**

All subprograms commit unless specified otherwise.

140.3.1 ALTER_PROPAGATION Procedure

This procedure adds, alters, or removes a rule set for a propagation.

Syntax

```
DBMS_PROPAGATION_ADM.ALTER_PROPAGATION (
  propagation_name      IN  VARCHAR2,
  rule_set_name         IN  VARCHAR2  DEFAULT NULL,
  remove_rule_set      IN  BOOLEAN   DEFAULT FALSE,
  negative_rule_set_name IN  VARCHAR2  DEFAULT NULL,
  remove_negative_rule_set IN BOOLEAN  DEFAULT FALSE);
```

Parameters

Table 140-2 ALTER_PROPAGATION Procedure Parameters

| Parameter | Description |
|------------------|--|
| propagation_name | The name of the propagation you are altering. You must specify an existing propagation name. Do not specify an owner. |
| rule_set_name | <p>The name of the positive rule set for the propagation. The positive rule set contains the rules that instruct the propagation to propagate messages.</p> <p>If you want to use a positive rule set for the propagation, then you must specify an existing rule set in the form <code>[schema_name.]rule_set_name</code>. For example, to specify a positive rule set in the <code>hr</code> schema named <code>prop_rules</code>, enter <code>hr.prop_rules</code>. If the schema is not specified, then the current user is the default.</p> <p>An error is returned if the specified rule set does not exist. You can create a rule set and add rules to it using the <code>DBMS_RULE_ADM</code> package.</p> <p>If you specify <code>NULL</code> and the <code>remove_rule_set</code> parameter is set to <code>FALSE</code>, then the procedure retains any existing positive rule set. If you specify <code>NULL</code> and the <code>remove_rule_set</code> parameter is set to <code>TRUE</code>, then the procedure removes any existing positive rule set.</p> |

Table 140-2 (Cont.) ALTER_PROPAGATION Procedure Parameters

| Parameter | Description |
|---------------------------------------|---|
| <code>remove_rule_set</code> | <p>If <code>TRUE</code>, then the procedure removes the positive rule set for the specified propagation. If you remove a positive rule set for a propagation, and the propagation does not have a negative rule set, then the propagation propagates all messages.</p> <p>If you remove a positive rule set for a propagation, and a negative rule set exists for the propagation, then the propagation propagates all messages in its queue that are not discarded by the negative rule set.</p> <p>If <code>FALSE</code>, then the procedure retains the positive rule set for the specified propagation.</p> <p>If the <code>rule_set_name</code> parameter is non-NULL, then this parameter should be set to <code>FALSE</code>.</p> |
| <code>negative_rule_set_name</code> | <p>The name of the negative rule set for the propagation. The negative rule set contains the rules that instruct the propagation to discard messages.</p> <p>If you want to use a negative rule set for the propagation, then you must specify an existing rule set in the form <code>[schema_name.]rule_set_name</code>. For example, to specify a negative rule set in the <code>hr</code> schema named <code>neg_rules</code>, enter <code>hr.neg_rules</code>. If the schema is not specified, then the current user is the default.</p> <p>An error is returned if the specified rule set does not exist. You can create a rule set and add rules to it using the <code>DBMS_RULE_ADM</code> package.</p> <p>If you specify <code>NULL</code> and the <code>remove_negative_rule_set</code> parameter is set to <code>FALSE</code>, then the procedure retains any existing negative rule set. If you specify <code>NULL</code> and the <code>remove_negative_rule_set</code> parameter is set to <code>TRUE</code>, then the procedure removes any existing negative rule set.</p> <p>If you specify both a positive and a negative rule set for a propagation, then the negative rule set is always evaluated first.</p> |
| <code>remove_negative_rule_set</code> | <p>If <code>TRUE</code>, then the procedure removes the negative rule set for the specified propagation. If you remove a negative rule set for a propagation, and the propagation does not have a positive rule set, then the propagation propagates all messages.</p> <p>If you remove a negative rule set for a propagation, and a positive rule set exists for the propagation, then the propagation propagates all messages in its queue that are not discarded by the positive rule set.</p> <p>If <code>FALSE</code>, then the procedure retains the negative rule set for the specified propagation.</p> <p>If the <code>negative_rule_set_name</code> parameter is non-NULL, then this parameter should be set to <code>FALSE</code>.</p> |

140.3.2 CREATE_PROPAGATION Procedure

This procedure creates a propagation and specifies the source queue, destination queue, and any rule set for the propagation. A propagation propagates messages in a local source queue to a destination queue. The destination queue might or might not be in the same database as the source queue.

Syntax

```
DBMS_PROPAGATION_ADM.CREATE_PROPAGATION (
    propagation_name      IN  VARCHAR2,
    source_queue          IN  VARCHAR2,
    destination_queue     IN  VARCHAR2,
    destination_dblink    IN  VARCHAR2  DEFAULT NULL,
    rule_set_name         IN  VARCHAR2  DEFAULT NULL,
    negative_rule_set_name IN  VARCHAR2  DEFAULT NULL,
    queue_to_queue        IN  BOOLEAN   DEFAULT NULL,
    original_propagation_name IN VARCHAR2  DEFAULT NULL,
    auto_merge_threshold  IN  NUMBER    DEFAULT NULL);
```

Parameters

Table 140-3 CREATE_PROPAGATION Procedure Parameters

| Parameter | Description |
|--------------------|---|
| propagation_name | The name of the propagation you are creating. A NULL setting is not allowed. Do not specify an owner. Note: The propagation_name setting cannot be altered after the propagation is created. |
| source_queue | The name of the source queue, specified as [schema_name.]queue_name. The current database must contain the source queue. For example, to specify a source queue named streams_queue in the strmadmin schema, enter strmadmin.streams_queue for this parameter. If the schema is not specified, then the current user is the default. |
| destination_queue | The name of the destination queue, specified as [schema_name.]queue_name. For example, to specify a destination queue named streams_queue in the strmadmin schema, enter strmadmin.streams_queue for this parameter. If the schema is not specified, then the current user is the default. |
| destination_dblink | The name of the database link that will be used by the propagation. The database link is from the database that contains the source queue to the database that contains the destination queue. If NULL, then the source queue and destination queue must be in the same database. Note: Connection qualifiers are not allowed. |

Table 140-3 (Cont.) CREATE_PROPAGATION Procedure Parameters

| Parameter | Description |
|-------------------------------------|--|
| <code>rule_set_name</code> | <p>The name of the positive rule set for the propagation. The positive rule set contains the rules that instruct the propagation to propagate messages.</p> <p>If you want to use a positive rule set for the propagation, then you must specify an existing rule set in the form <code>[schema_name.]rule_set_name</code>. For example, to specify a positive rule set in the <code>hr</code> schema named <code>prop_rules</code>, enter <code>hr.prop_rules</code>. If the schema is not specified, then the current user is the default.</p> <p>An error is returned if the specified rule set does not exist. You can create a rule set and add rules to it using the <code>DBMS_RULE_ADM</code> package.</p> <p>If you specify <code>NULL</code>, and no negative rule set exists for the propagation, then the propagation propagates all messages in its queue.</p> <p>If you specify <code>NULL</code>, and a negative rule set exists for the propagation, then the propagation propagates all messages in its queue that are not discarded by the negative rule set.</p> |
| <code>negative_rule_set_name</code> | <p>The name of the negative rule set for the propagation. The negative rule set contains the rules that instruct the propagation to discard messages.</p> <p>If you want to use a negative rule set for the propagation, then you must specify an existing rule set in the form <code>[schema_name.]rule_set_name</code>. For example, to specify a negative rule set in the <code>hr</code> schema named <code>neg_rules</code>, enter <code>hr.neg_rules</code>. If the schema is not specified, then the current user is the default.</p> <p>An error is returned if the specified rule set does not exist. You can create a rule set and add rules to it using the <code>DBMS_RULE_ADM</code> package.</p> <p>If you specify <code>NULL</code>, and no positive rule set exists for the propagation, then the propagation propagates all messages in its queue.</p> <p>If you specify <code>NULL</code>, and a positive rule set exists for the propagation, then the propagation propagates all messages in its queue that are not discarded by the positive rule set.</p> <p>If you specify both a positive and a negative rule set for a propagation, then the negative rule set is always evaluated first.</p> |

Table 140-3 (Cont.) CREATE_PROPAGATION Procedure Parameters

| Parameter | Description |
|---------------------------|---|
| queue_to_queue | <p>If TRUE or NULL, then the propagation is a queue to queue propagation. A queue-to-queue propagation always has its own propagation job and uses a service for automatic failover when the destination queue is a buffered queue in an Oracle Real Application Clusters (Oracle RAC) database.</p> <p>If FALSE, then the propagation is a queue-to-dblink propagation. A queue-to-dblink propagation can share a propagation job with other propagations that use the same database link and does not support automatic failover in an Oracle RAC environment.</p> |
| original_propagation_name | <p>Specify the original propagation name if the propagation being created is part of a split and merge operation. The split operation clones the original propagation under a new name. The name of the original propagation is important when the cloned propagation is copied back to the original stream.</p> <p>Specify NULL if the propagation being created is not part of a split and merge operation.</p> |
| auto_merge_theshold | <p>Specify a positive number if both of the following conditions are met:</p> <ul style="list-style-type: none"> • The propagation being created is part of a split and merge operation. • The stream will be merged back to the original stream automatically. <p>Specify NULL if either of the following conditions are met:</p> <ul style="list-style-type: none"> • The propagation being created is not part of a split and merge operation. • The propagation being created is part of a split and merge operation, but the stream being split off will not be merged back to the original stream automatically. |

Usage Notes

This procedure starts propagation and might create a propagation job. If this procedure creates a propagation job, then it establishes a default schedule for the propagation job. Each propagation job is an Oracle Scheduler job. You can adjust the schedule of a propagation job using Oracle Scheduler.

The user who owns the source queue is the user who propagates messages. This user must have the necessary privileges to propagate messages.

See Also:

[DBMS_RULE_ADM](#)

140.3.3 DROP_PROPAGATION Procedure

This procedure drops a propagation and deletes all messages for the destination queue in the source queue. This procedure also removes the schedule for propagation from the source queue to the destination queue.

Syntax

```
DBMS_PROPAGATION_ADM.DROP_PROPAGATION(
    propagation_name      IN  VARCHAR2,
    drop_unused_rule_sets IN  BOOLEAN  DEFAULT FALSE);
```

Parameters

Table 140-4 DROP_PROPAGATION Procedure Parameters

| Parameter | Description |
|-----------------------|---|
| propagation_name | The name of the propagation you are dropping. You must specify an existing propagation name. Do not specify an owner. |
| drop_unused_rule_sets | If TRUE, then the procedure drops any rule sets, positive and negative, used by the specified propagation if these rule sets are not used by any other Oracle Replication client, which includes capture processes, propagations, apply processes, and messaging clients. If this procedure drops a rule set, then this procedure also drops any rules in the rule set that are not in another rule set. If FALSE, then the procedure does not drop the rule sets used by the specified propagation, and the rule sets retain their rules. |

Usage Notes

When you use this procedure to drop a propagation, information about rules created for the propagation is removed from the data dictionary views for Oracle Replication rules. Information about such a rule is removed even if the rule is not in either rule set for the propagation.

The following are the data dictionary views for Oracle Replication rules:

- ALL_STREAMS_GLOBAL_RULES
- DBA_STREAMS_GLOBAL_RULES
- ALL_STREAMS_SCHEMA_RULES
- DBA_STREAMS_SCHEMA_RULES
- ALL_STREAMS_TABLE_RULES
- DBA_STREAMS_TABLE_RULES

Note:

When you drop a propagation, the propagation job used by the propagation is dropped automatically, if no other propagations are using the propagation job.

140.3.4 START_PROPAGATION Procedure

This procedure starts a propagation.

Syntax

```
DBMS_PROPAGATION_ADM.START_PROPAGATION(  
    propagation_name IN VARCHAR2);
```

Parameter

Table 140-5 START_PROPAGATION Procedure Parameter

| Parameter | Description |
|------------------|---|
| propagation_name | The name of the propagation you are starting. You must specify an existing propagation name. Do not specify an owner. |

Usage Notes

The propagation status is persistently recorded. Hence, if the status is `ENABLED`, then the propagation is started upon database instance startup.

140.3.5 STOP_PROPAGATION Procedure

This procedure stops a propagation.

Syntax

```
DBMS_PROPAGATION_ADM.STOP_PROPAGATION(  
    propagation_name IN VARCHAR2,  
    force            IN BOOLEAN DEFAULT FALSE);
```

Parameter

Table 140-6 STOP_PROPAGATION Procedure Parameter

| Parameter | Description |
|------------------|---|
| propagation_name | The name of the propagation you are stopping. You must specify an existing propagation name. Do not specify an owner. |
| force | If <code>TRUE</code> , then the procedure stops the propagation and clears the statistics for the propagation. If <code>FALSE</code> , then the procedure stops the propagation without clearing the statistics for the propagation. |

Usage Notes

The propagation status is persistently recorded. Hence, if the status is `DISABLED` or `ABORTED`, then the propagation is not started upon database instance startup.

DBMS_QOPATCH

The `DBMS_QOPATCH` package provides an interface to view the installed database patches.

This chapter contains the following topics:

- [Overview](#)
- [Security Model](#)
- [Operational Notes](#)
- [Error Messages](#)
- [Summary of DBMS_QOPATCH Subprograms](#)

141.1 DBMS_QOPATCH Overview

The `DBMS_QOPATCH` package provides a PLSQL/SQL interface to view the installed database patches. The interface provides all the patch information available as part of the `OPATCH LSINVENTORY -XML` command. The package accesses the OUI patch inventory in real time to provide patch and meta-information.

141.2 DBMS_QOPATCH Security Model

The `DBMS_QOPATCH` package is created as part of SYS schema and SYS is the only user who can execute these subprograms.

141.3 DBMS_QOPATCH Operational Notes

The following operational notes apply to `DBMS_QOPATCH`.

- The package will work only if the database is `OPEN`.
- In an Oracle Real Application Clusters (RAC) environment, if the subprogram requires to fetch data from other RAC nodes it spawns a job in the other node(s) to get the data. In this case `JOB_QUEUE_PROCESSES` needs to be `>0` for the package to fetch the data from other RAC nodes.
- If there is a delay in the job execution, the package returns `ORA-20008` error.

141.4 DBMS_QOPATCH Exceptions

This table lists the exceptions raised by the `DBMS_QOPATCH` package.

Table 141-1 DBMS_QOPATCH Error Messages

| Error Code | Description |
|------------|--|
| ORA-20001 | Latest XML inventory is not loaded into table. |

Table 141-1 (Cont.) DBMS_QOPATCH Error Messages

| Error Code | Description |
|------------|---|
| ORA-20002 | Directory creation failed. |
| ORA-20003 | Configuration of a job on a node failed. |
| ORA-20004 | Job configuration failed as node is inactive. |
| ORA-20005 | Job is not configured with given node, instance name. |
| ORA-20006 | Number of RAC active instances and opatch jobs configured are not same. |
| ORA-20007 | Job configuration failed as node or instance is not active. |
| ORA-20008 | Timed out - job execution time is more than 120Secs. |
| ORA-20009 | Job execution failed. |
| ORA-20010 | Node is inactive and job cannot be executed. |
| ORA-20011 | Job name is NULL and inventory cannot be loaded. |
| ORA-20012 | JOB_QUEUE_PROCESSES is set to zero and the inventory cannot be loaded. |
| ORA-20013 | DBMS_QOPATCH ran mostly in non-install area. |
| ORA-20014 | Database is not opened. |
| ORA-20015 | Database opened as read-only. |

141.5 Summary of DBMS_QOPATCH Subprograms

This table lists and briefly describes the DBMS_QOPATCH package subprograms.

Table 141-2 DBMS_QOPATCH Package Subprograms

| Subprogram | Description |
|--|---|
| CHECK_PATCH_INSTALLED Function | Checks if a patch is installed. |
| GET_OPATCH_BUGS Function | Provides a bugs list for a patch in XML format if the patch number is given. If patch is not given then it lists all the bugs installed in all the patches in XML format. |
| GET_OPATCH_COUNT Function | Provides the total number of installed patches in XML format |
| GET_OPATCH_DATA Function | Provides top level patch information for the patch (such as Patch ID, patch creation time) in the XML element |
| GET_OPATCH_FILES Function | Provides the list of files modified in the given patch number in XML format |
| GET_OPATCH_INSTALL_INFO Function | Returns the XML element containing the ORACLE_HOME details such as patch and inventory location |
| GET_OPATCH_LIST Function | Provides list of patches installed as an XML element from the XML inventory |
| GET_OPATCH_LSINVENTORY | Returns whole opatch inventory as XML instance document. |
| GET_OPATCH_OLAYS Function | Provides overlay patches for a given patch as XML element |

Table 141-2 (Cont.) DBMS_QOPATCH Package Subprograms

| Subprogram | Description |
|--|---|
| GET_OPATCH_PREQS Function | Provides prerequisite patches for a given patch as XML element |
| GET_OPATCH_XSLT | Returns the style-sheet for the opatch XML inventory presentation |
| GET_PATCH_DETAILS Function | Displays the detailed patch information from <code>opatch lsinventory</code> . |
| GET_SQLPATCH_STATU S Procedure | Displays the SQL patch status by querying from SQL patch registry to produce complete patch level information |
| IS_PATCH_INSTALLED Function | Provides information (such as patchID, application date, and SQL patch information) on the installed patch as XML node by querying the XML inventory |
| OPATCH_COMPARE_CU RRENT Function | Compares the current database with a list of bugs. |
| OPATCH_COMPARE_NO DES Function | Compares the given RAC node(s) with the instance to the present connected node with current node. The return value indicates whether the data was refreshed or not. |
| SET_CURRENT_OPINST Procedure | Sets the node name and instance to get the inventory details specific to it in an Oracle Real Application Clusters (RAC) environment |

141.5.1 CHECK_PATCH_INSTALLED Function

Checks if the patch is installed.

Syntax

```
DBMS_QOPATCH.CHECK_PATCH_INSTALLED (
    bugs      IN QOPATCH_LIST);
RETURN VARCHAR2;
```

Parameters

Table 141-3 CHECK_PATCH_INSTALLED Parameters

| Parameter | Description |
|-------------------|--------------------------------|
| <code>bugs</code> | List of patches to be checked. |

141.5.2 GET_OPATCH_BUGS Function

This function provides a bugs list in a patch if the patch number is given. If a patch number is not given, it lists all the bugs in the specified XML format.

Syntax

```
DBMS_QOPATCH.GET_OPATCH_BUGS (
    patchnum IN VARCHAR2 DEFAULT NULL);
RETURN XMLTYPE;
```

Parameters

Table 141-4 GET_OPATCH_BUGS Function Parameters

| Parameter | Description |
|-----------|--------------|
| patchnum | Patch number |

141.5.3 GET_OPATCH_COUNT Function

This function provides the total number of installed patches in XML format.

Syntax

```
DBMS_QOPATCH.GET_OPATCH_COUNT (
    patchnum IN VARCHAR2);
RETURN XMLTYPE;
```

Parameters

Table 141-5 GET_OPATCH_COUNT Function Parameters

| Parameter | Description |
|-----------|--------------|
| patchnum | Patch number |

141.5.4 GET_OPATCH_DATA Function

This function provides top level patch information for the patch (such as Patch ID, patch creation time) in the XML element.

Syntax

```
DBMS_QOPATCH.GET_OPATCH_DATA (
    patchnum IN VARCHAR2);
RETURN XMLTYPE;
```

Parameters

Table 141-6 GET_OPATCH_DATA Function Parameters

| Parameter | Description |
|-----------|--------------|
| patchnum | Patch number |

141.5.5 GET_OPATCH_FILES Function

This function provides the list of files modified in the given patch number in XML format.

Syntax

```
DBMS_QOPATCH.GET_OPATCH_FILES (  
    patchnum IN VARCHAR2);  
RETURN XMLTYPE;
```

Parameters

Table 141-7 GET_OPATCH_FILES Function Parameters

| Parameter | Description |
|-----------|--------------|
| patchnum | Patch number |

141.5.6 GET_OPATCH_INSTALL_INFO Function

This function returns the XML element containing the ORACLE_HOME details such as patch and inventory location.

Syntax

```
DBMS_QOPATCH.GET_OPATCH_INSTALL_INFO  
RETURNS XMLTYPE;
```

141.5.7 GET_OPATCH_LIST Function

This function provides list of patches installed as an XML element from the XML inventory.

Syntax

```
DBMS_QOPATCH.GET_OPATCH_LIST  
RETURN XMLTYPE;
```

141.5.8 GET_OPATCH_LSINVENTORY

This function returns whole opatch inventory as XML instance document.

Syntax

```
DBMS_QOPATCH.GET_OPATCH_LSINVENTORY  
RETURN XMLTYPE;
```

141.5.9 GET_OPATCH_OLAYS Function

This function provides overlay patches for a given patch as XML element.

Syntax

```
DBMS_QOPATCH.GET_OPATCH_OLAYS (  
    patchnum IN VARCHAR2);  
RETURN XMLTYPE;
```

Parameters

Table 141-8 GET_OPATCH_OLAYS Function Parameters

| Parameter | Description |
|-----------|--------------|
| patchnum | Patch number |

141.5.10 GET_OPATCH_PREQS Function

This function provides prerequisite patches for a given patch as XML element.

Syntax

```
DBMS_QOPATCH.GET_OPATCH_PREQS (  
    patchnum IN VARCHAR2);  
RETURN XMLTYPE;
```

Parameters

Table 141-9 GET_OPATCH_PREQS Function Parameters

| Parameter | Description |
|-----------|--------------|
| patchnum | Patch number |

141.5.11 GET_OPATCH_XSLT

This function returns the style-sheet for the opatch XML inventory presentation. You can use the return type of this subprogram to perform XMLTRANSFORM and the transformed result has the same appearance as opatch text output.

Syntax

```
DBMS_QOPATCH.GET_OPATCH_XSLT  
RETURN XMLTYPE;
```

141.5.12 GET_PATCH_DETAILS Function

Displays the detailed patch information from `opatch lsinventory`.

Syntax

```
DBMS_QOPATCH.GET_PATCH_DETAILS (
    patch    IN VARCHAR2);
RETURN XMLTYPE;
```

Parameters**Table 141-10** GET_PATCH_DETAILS Function Parameters

| Parameter | Description |
|-----------|-------------------|
| patch | The patch number. |

141.5.13 GET_SQLPATCH_STATUS Procedure

This procedure displays the SQL patch status by querying from SQL patch registry to produce complete patch level information. If the patch number is given, it displays the information specific to the given SQL patch, otherwise information for all SQL patches.

Syntax

```
DBMS_QOPATCH.GET_SQLPATCH_STATUS (
    patchnum IN VARCHAR2 DEFAULT NULL);
```

Parameters**Table 141-11** GET_SQLPATCH_STATUS Procedure Parameters

| Parameter | Description |
|-----------|--------------|
| patchnum | Patch number |

141.5.14 IS_PATCH_INSTALLED Function

This function provides information (such as patchID, application date, and SQL patch information) on the installed patch as XML node by querying the XML inventory.

Syntax

```
DBMS_QOPATCH.IS_PATCH_INSTALLED (
    patchnum IN VARCHAR2);
RETURN XMLTYPE;
```

Parameters**Table 141-12** IS_PATCH_INSTALLED Function Parameters

| Parameter | Description |
|-----------|--------------|
| patchnum | Patch number |

141.5.15 OPATCH_COMPARE_CURRENT Function

Compares the current database with a list of bugs.

Syntax

```
DBMS_QOPATCH.OPATCH_COMPARE_CURRENT Function (
    bugs      IN QOPATCH_LIST);
RETURN VARCHAR2;
```

Parameters

Table 141-13 OPATCH_COMPARE_CURRENT Function Parameters

| Parameter | Description |
|-----------|--|
| bugs | List of bugs to compare with the current database. |

141.5.16 OPATCH_COMPARE_NODES Function

Compares the given RAC node(s) with the instance to the present connected node with current node. The return value indicates whether the data was refreshed or not.

Syntax

```
DBMS_QOPATCH.OPATCH_COMPARE_NODES (
    node      IN VARCHAR2 DEFAULT NULL,
    inst      IN VARCHAR2 DEFAULT NULL);
RETURN VARCHAR2;
```

Parameters

Table 141-14 OPATCH_COMPARE_NODES Function Parameters

| Parameter | Description |
|-----------|---------------|
| node | Node name |
| inst | Instance name |

141.5.17 SET_CURRENT_OPINST Procedure

This procedure sets the node name and instance to get the inventory details specific to it in an Oracle Real Application Clusters (RAC) environment.

Syntax

```
DBMS_QOPATCH.SET_CURRENT_OPINST (
    node_name  IN VARCHAR2 DEFAULT NULL,
    inst_name  IN VARCHAR2 DEFAULT NULL);
```

Parameters

Table 141-15 SET_CURRENT_OPINST Procedure Parameters

| Parameter | Description |
|------------------|--------------------|
| node_name | Name of node |
| inst_name | Name of instance |

DBMS_RANDOM

The `DBMS_RANDOM` package provides a built-in random number generator. `DBMS_RANDOM` is not intended for cryptography.

This chapter contains the following topics:

- [Deprecated Subprograms](#)
- [Security Model](#)
- [Operational Notes](#)
- [Summary of DBMS_RANDOM Subprograms](#)

142.1 DBMS_RANDOM Deprecated Subprograms

These subprograms are deprecated with Oracle Database 11g. Oracle recommends that you do not use deprecated procedures in new applications. Support for deprecated features is for backward compatibility only.

- [INITIALIZE Procedure](#)
- [RANDOM Function](#)
- [TERMINATE Procedure](#)

142.2 DBMS_RANDOM Security Model

This package should be installed as `SYS`. By default, the package is initialized with the current user name, current time down to the second, and the current session. Oracle recommends that users who need to execute this package should be given `EXECUTE` privilege explicitly and should not rely on `PUBLIC EXECUTE` privilege.

142.3 DBMS_RANDOM Operational Notes

These operational notes apply to `DBMS_RANDOM`.

- `DBMS_RANDOM.RANDOM` produces integers in $[-2^{31}, 2^{31}]$.
- `DBMS_RANDOM.VALUE` produces numbers in $[0,1)$ with 38 digits of precision.

`DBMS_RANDOM` can be explicitly initialized, but does not need to be initialized before calling the random number generator. It will automatically initialize with the date, user ID, and process ID if no explicit initialization is performed.

If this package is seeded twice with the same seed, then accessed in the same way, it will produce the same results in both cases.

In some cases, such as when testing, you may want the sequence of random numbers to be the same on every run. In that case, you seed the generator with a constant value by calling

one of the overloads of `DBMS_RANDOM.SEED`. To produce different output for every run, simply to omit the call to "Seed" and the system will choose a suitable seed for you.

142.4 Summary of DBMS_RANDOM Subprograms

This table lists the `DBMS_RANDOM` subprograms and briefly describes them.

Table 142-1 *DBMS_RANDOM Package Subprograms*

| Subprogram | Description |
|--------------------------------------|---|
| INITIALIZE Procedure | Initializes the package with a seed value |
| NORMAL Function | Returns random numbers in a normal distribution |
| RANDOM Function | Generates a random number |
| SEED Procedures | Resets the seed |
| STRING Function | Gets a random string |
| TERMINATE Procedure | Terminates package |
| VALUE Functions | Gets a random number, greater than or equal to 0 and less than 1, with 38 digits to the right of the decimal (38-digit precision), while the overloaded function gets a random Oracle number <i>x</i> , where <i>x</i> is greater than or equal to <i>low</i> and less than <i>high</i> |

142.4.1 INITIALIZE Procedure

This deprecated procedure initializes the generator.

Note:

This procedure is deprecated with Release 11gR1 and, although currently supported, it should not be used.

Syntax

```
DBMS_RANDOM.INITIALIZE (
    val IN BINARY_INTEGER);
```

Pragmas

```
PRAGMA restrict_references (initialize, WNDS);
```

Parameters

Table 142-2 *INITIALIZE Procedure Parameters*

| Parameter | Description |
|------------------|--|
| <code>val</code> | Seed number used to generate a random number |

Usage Notes

This procedure is obsolete as it simply calls the [SEED Procedures](#).

142.4.2 NORMAL Function

This function returns random numbers in a standard normal distribution.

Syntax

```
DBMS_RANDOM.NORMAL  
RETURN NUMBER;
```

Pragmas

```
PRAGMA restrict_references (normal, WNDS);
```

Return Values

Table 142-3 NORMAL Function Parameters

| Parameter | Description |
|-----------|-------------------------|
| number | Returns a random number |

142.4.3 RANDOM Function

This deprecated procedure generates a random number.

Note:

This function is deprecated with Release 11gR1 and, although currently supported, it should not be used.

Syntax

```
DBMS_RANDOM.RANDOM  
RETURN binary_integer;
```

Pragmas

```
PRAGMA restrict_references (random, WNDS);
```

Return Values

Table 142-4 RANDOM Function Parameters

| Parameter | Description |
|----------------|---|
| binary_integer | Returns a random integer greater or equal to $-power(2,31)$ and less than $power(2,31)$ |

142.4.4 SEED Procedures

This procedure resets the seed.

Syntax

```
DBMS_RANDOM.SEED (
    val IN BINARY_INTEGER);
```

```
DBMS_RANDOM.SEED (
    val IN VARCHAR2);
```

Pragmas

```
PRAGMA restrict_references (seed, WNDS);
```

Parameters

Table 142-5 SEED Procedure Parameters

| Parameter | Description |
|-----------|--|
| val | Seed number or string used to generate a random number |

Usage Notes

The seed can be a string up to length 2000.

142.4.5 STRING Function

This function gets a random string.

Syntax

```
DBMS_RANDOM.STRING
    opt IN CHAR,
    len IN NUMBER)
RETURN VARCHAR2;
```

Pragmas

```
PRAGMA restrict_references (string, WNDS);
```

Parameters

Table 142-6 STRING Function Parameters

| Parameter | Description |
|-----------|--|
| opt | Specifies what the returning string looks like: <ul style="list-style-type: none"> 'u', 'U' - returning string in uppercase alpha characters 'l', 'L' - returning string in lowercase alpha characters 'a', 'A' - returning string in mixed case alpha characters 'x', 'X' - returning string in uppercase alpha-numeric characters 'p', 'P' - returning string in any printable characters. Otherwise the returning string is in uppercase alpha characters. |
| len | Length of the returning string |

Return Values

Table 142-7 STRING Function Return Values

| Parameter | Description |
|-----------|--------------------|
| VARCHAR2 | Returns a VARCHAR2 |

142.4.6 TERMINATE Procedure

When you are finished with the package, call the `TERMINATE` procedure.

**Note:**

This procedure is deprecated with Release 11gR1 and, although currently supported, it should not be used.

Syntax

```
DBMS_RANDOM.TERMINATE;
```

142.4.7 VALUE Functions

The basic function gets a random number, greater than or equal to 0 and less than 1, with 38 digits to the right of the decimal (38-digit precision). Alternatively, you can get a random Oracle number *x*, where *x* is greater than or equal to *low* and less than *high*.

Syntax

```
DBMS_RANDOM.VALUE
RETURN NUMBER;
```

```
DBMS_RANDOM.VALUE (
  low IN NUMBER,
  high IN NUMBER)
RETURN NUMBER;
```

Parameters

Table 142-8 VALUE Function Parameters

| Parameter | Description |
|-----------|--|
| low | Lowest number in a range from which to generate a random number. The number generated may be equal to <code>low</code> |
| high | Highest number below which to generate a random number. The number generated will be less than <code>high</code> |

Return Values

Table 142-9 VALUE Function Return Values

| Parameter | Description |
|-----------|--------------------------|
| NUMBER | Returns an Oracle Number |

DBMS_REDACT

The `DBMS_REDACT` package provides an interface to Oracle Data Redaction, which enables you to mask (redact) data that is returned from queries issued by low-privileged users or an application.

This chapter contains the following topics:

- [Overview](#)
- [Security Model](#)
- [Constants](#)
- [Operating Procedures](#)
- [Summary of DBMS_REDACT Subprograms](#)

See Also:

- *Oracle Database Advanced Security Guide* regarding using Data Redaction to protect sensitive data

143.1 DBMS_REDACT Overview

Data redaction provides a way to define masking policies for an application. Oracle Data Redaction provides functionality to mask (redact) data that is returned from user `SELECT` queries in an application. The masking takes place in real time. The Data Redaction policy applies to the querying user, depending on this user's `SYS_CONTEXT` or `XS_SYS_CONTEXT` values. This redaction process does not require that the queried data be static or unchanging, or for the entire data set to be redacted at one time in an off-line manner. Oracle Database redacts only the data for the rows specified by the user's query, not the data for the entire column. The redaction takes place immediately before the data is returned to the querying user or application.

143.2 DBMS_REDACT Security Model

If the querying user has the `EXEMPT REDACTION POLICY` system privilege, redaction will not be performed. If the user does not have the `EXEMPT REDACTION POLICY` system privilege, the policy expression will be evaluated in the current user's environment. If the policy expression evaluates to `TRUE`, then redaction will be performed, otherwise no redaction will be performed.

You must have the `EXECUTE` privilege on the `DBMS_REDACT` package in order to execute its subprograms. Procedures in the interface are executed with privileges of the current user.

In addition to the `EXECUTE` privilege on the `DBMS_REDACT` package to execute its subprograms, you must have the following privileges:

- The `CREATE TABLE` or `CREATE ANY TABLE` privilege when the data redaction policy is on an object in your own schema. This requirement applies to the following procedures:
 - `DBMS_REDACT.ADD_POLICY`
 - `DBMS_REDACT.DROP_POLICY`
 - `DBMS_REDACT.ALTER_POLICY`
 - `DBMS_REDACT.DISABLE_POLICY`
 - `DBMS_REDACT.ENABLE_POLICY`
 - `DBMS_REDACT.APPLY_POLICY_EXPR_TO_COL`
- The `CREATE ANY TABLE` privilege when the data redaction policy is on an object in another user's schema. This requirement applies to the following procedures:
 - `DBMS_REDACT.UPDATE_FULL_REDACTION_VALUES`
 - `DBMS_REDACT.CREATE_POLICY_EXPRESSION`
 - `DBMS_REDACT.DROP_POLICY_EXPRESSION`
 - `DBMS_REDACT.UPDATE_POLICY_EXPRESSION`

143.3 DBMS_REDACT Constants

The `DBMS_REDACT` package defines several constants for specifying parameter values.

Table 143-1 Values for function_type Parameter of DBMS_REDACT.ADD_POLICY

| Constant | Value | Type | Description |
|--------------|-------|----------------|---|
| NONE | 0 | BINARY_INTEGER | No redaction |
| FULL | 1 | BINARY_INTEGER | Redact to fixed values |
| NULLIFY | 6 | BINARY_INTEGER | Returns a null value as a redacted value |
| PARTIAL | 2 | BINARY_INTEGER | Partial redaction, redact a portion of the column data |
| RANDOM | 4 | BINARY_INTEGER | Random redaction, each query results in a different random value |
| REGEXP | 5 | BINARY_INTEGER | Regular expression based redaction |
| REGEXP_WIDTH | 7 | BINARY_INTEGER | Regular expression based redaction that preserves the width of a column that uses a regular expression; designed for applications use the <code>OCI_ATTR_CHAR_SIZE</code> attribute of the Oracle OLE DB Provider interface |

Table 143-2 Values for action Parameter of DBMS_REDACT.ALTER_POLICY

| Constant | Value | Type | Description |
|------------------------|-------|----------------|---|
| ADD_COLUMN | 1 | BINARY_INTEGER | Add a column to the redaction policy |
| DROP_COLUMN | 2 | BINARY_INTEGER | Drop a column from the redaction policy |
| MODIFY_EXPRESSION | 3 | BINARY_INTEGER | Modify the expression of a redaction policy (the expression evaluates to a BOOLEAN value: if TRUE then redaction is applied, otherwise not) |
| MODIFY_COLUMN | 4 | BINARY_INTEGER | Modify a column in the redaction policy to change the redaction function_type or the function_parameters |
| SET_POLICY_DESCRIPTION | 5 | BINARY_INTEGER | Set a description for the redaction policy |
| SET_COLUMN_DESCRIPTION | 6 | BINARY_INTEGER | Set a description for the redaction performed on the column |

143.4 DBMS_REDACT Operating Procedures

The following table presents the relationship between the type of redaction function and its parameters, based on the datatype of the column being redacted. Examples of the various format strings are provided, showing how to perform some commonplace redaction for a string datatype (in this case, a Social Security Number (SSN)), a DATE datatype, and various examples of redaction for the number datatype.

Table 143-3 Data Redaction Function Types

| function_type | function_parameters | Examples |
|---|---|--|
| DBMS_REDACT.NONE | - | - |
| DBMS_REDACT.FULL | - | - |
| DBMS_REDACT.PARTIAL (for character types) | <p>A comma-separated list, containing the following five fields (with no spaces after the commas delimiting the fields):</p> <ul style="list-style-type: none"> REDACT_PARTIAL_INPUT_FORMAT REDACT_PARTIAL_OUTPUT_FORMAT REDACT_PARTIAL_MASKCHAR REDACT_PARTIAL_MASKFROM REDACT_PARTIAL_MASKTO <p>See Table 143-4.</p> | <p>'VVVFVVVFVVVV, VVV-VV-VVVV, X, 1, 5' for masking the first 5 digits of SSN strings like 123-45-6789, adding dashes back to format it, resulting in strings like XXX-XX-6789</p> <p>'VVVFVVVFVVVV, VVV VV-VVVV, X, 1, 5' for masking the first 5 digits of SSN strings like 123-45-6789, adding spaces to format it, resulting in strings like XXX XX 6789</p> |

Table 143-3 (Cont.) Data Redaction Function Types

| function_type | function_parameters | Examples |
|--|--|--|
| DBMS_REDACT.PARTIAL (for character types), continued | REDACT_PARTIAL_INPUT_FORMAT - the input format: V for value to be possibly redacted, F for formatting character to be ignored | The REDACT_PARTIAL_INPUT_FORMAT field value VVVFVVVFVVVV for matching SSN strings like 123-45-6789 |
| DBMS_REDACT.PARTIAL (for character types), continued | REDACT_PARTIAL_OUTPUT_FORMAT - the output format: V for output of redaction. Any other character will be treated as a formatting character and output literally. | The REDACT_PARTIAL_OUTPUT_FORMAT field value VVV-VV-VVVV can be used to redact SSN strings into XXX-XX-6789 (X comes from REDACT_PARTIAL_MASKCHAR field). |
| DBMS_REDACT.PARTIAL (for character types), continued | REDACT_PARTIAL_MASKCHAR - the character used to redact the input | The value X for redacting SSN strings into XXX-XX-6789. |
| DBMS_REDACT.PARTIAL (for character types), continued | REDACT_PARTIAL_MASKFROM - specifies which V within the REDACT_PARTIAL_INPUT_FORMAT from which to start the redaction (see explanation following the next entry, REDACT_PARTIAL_MASKTO) | The value 1 for redacting SSN strings starting at the first V of REDACT_PARTIAL_INPUT_FORMAT of VVVFVVVFVVVV into strings like XXX-XX-6789 |
| DBMS_REDACT.PARTIAL (for character types), continued | REDACT_PARTIAL_MASKTO - specifies which V within the REDACT_PARTIAL_INPUT_FORMAT at which to end the redaction | The value 5 for redacting SSN strings up to and including the fifth V within REDACT_PARTIAL_INPUT_FORMAT of VVVFVVVFVVVV into strings like XXX-XX-6789. Note how the format character '-' (corresponding to the first F within REDACT_PARTIAL_INPUT_FORMAT) is ignored as far as redaction is concerned, so the value here is 5 as opposed to 6. |

Table 143-3 (Cont.) Data Redaction Function Types

| function_type | function_parameters | Examples |
|--|--|---|
| DBMS_REDACT.PARTIAL (for character types), continued | <p>The REDACT_PARTIAL_MASKFROM and REDACT_PARTIAL_MASKTO field values are specified as counts of the number of V characters in the REDACT_PARTIAL_INPUT_FORMAT field, up to and including the intended position, starting from the leftmost V. This way, REDACT_PARTIAL_MASKFROM and REDACT_PARTIAL_MASKTO are independent of the specific formatting of the data. For example, in the common use case of masking an SSN to show only the last four digits, data like 123456789 (with REDACT_PARTIAL_INPUT_FORMAT of VVVVVVVVV) and data like 123-45-6789 (with REDACT_PARTIAL_INPUT_FORMAT of VVVFVVFVVVV), would both use REDACT_PARTIAL_MASKFROM of 1 and REDACT_PARTIAL_MASKTO of 5.</p> | - |
| DBMS_REDACT.PARTIAL (for number types) | <p>A comma-separated list, containing the following three fields (with no spaces after the commas delimiting the fields):</p> <ul style="list-style-type: none"> • REDACT_PARTIAL_MASKCHAR • REDACT_PARTIAL_MASKFROM • REDACT_PARTIAL_MASKTO <p>See Table 143-4.</p> | '9,1,5' for redacting the first 5 digits of an SSN number 123456789 into 999996789; or '0,1,2' for redacting a number 1.23 to 0.03. |
| DBMS_REDACT.PARTIAL (for number types), continued | <p>REDACT_PARTIAL_MASKCHAR - the character used to redact the input, in the range between 0 and 9</p> <p>REDACT_PARTIAL_MASKFROM - the position, starting from 1, from which to start the redaction. The position does not include the decimal point if it is present.</p> <p>REDACT_PARTIAL_MASKTO - the position at which to end the redaction</p> | - |

Table 143-3 (Cont.) Data Redaction Function Types

| function_type | function_parameters | Examples |
|---|--|---|
| DBMS_REDACT.PARTIAL (for datetime datatypes) | <p>A list, containing the following five fields (concatenated so that there is no space between the fields):</p> <ul style="list-style-type: none"> • REDACT_PARTIAL_DATE_MONTH • REDACT_PARTIAL_DATE_DAY • REDACT_PARTIAL_DATE_YEAR • REDACT_PARTIAL_DATE_HOUR • REDACT_PARTIAL_DATE_MINUTE • REDACT_PARTIAL_DATE_SECOND <p>See Table 143-4.</p> | 'm12DYHMS', which changes 01-May-01 01:01:01 to 01-Dec-01 01:01:01. |
| DBMS_REDACT.PARTIAL (for datetime datatypes), continued | <p>REDACT_PARTIAL_DATE_MONTH: - 'M' (no masking of month) or 'm#' (mask month to a specific month, if possible), where # (the month specified by its number) is between 1 and 12</p> <p>REDACT_PARTIAL_DATE_DAY: 'D' (no masking of date) or 'd#' (mask day to #, if possible), # between 1 and 31</p> <p>REDACT_PARTIAL_DATE_YEAR: 'Y' (no masking of year) or 'y#' (mask year to #, if possible), # between 1 and 9999</p> <p>REDACT_PARTIAL_DATE_HOUR: 'H' (no masking of hour) or 'h#' (mask hour to #, if possible), # between 0 and 23</p> <p>REDACT_PARTIAL_DATE_MINUTE: 'M' (no masking of minute) or 'm#' (mask minute to #, if possible), # between 0 and 59</p> <p>REDACT_PARTIAL_DATE_SECOND: 'S' (no masking of second) or 's#' (mask second to #, if possible), # between 0 and 59</p> | - |
| DBMS_REDACT.PARTIAL_WITH | Same as DBMS_REDACT.PARTIAL | - |
| DBMS_REDACT.RANDOM | - | - |

Table 143-4 Format Descriptors with Component Field Names and Delimiters

| Datatype | Format Descriptor for Partial redaction |
|-----------|--|
| Character | REDACT_PARTIAL_INPUT_FORMAT ', ' REDACT_PARTIAL_OUTPUT_FORMAT ', ' REDACT_PARTIAL_MASKCHAR ', ' REDACT_PARTIAL_MASKFROM ', ' REDACT_PARTIAL_MASKTO |
| Number | REDACT_PARTIAL_MASKCHAR ', ' REDACT_PARTIAL_MASKFROM ', ' REDACT_PARTIAL_MASKTO |
| Datetime | REDACT_PARTIAL_DATE_MONTH REDACT_PARTIAL_DATE_DAY REDACT_PARTIAL_DATE_YEAR REDACT_PARTIAL_DATE_HOUR REDACT_PARTIAL_DATE_MINUTE REDACT_PARTIAL_DATE_SECOND |

143.5 Summary of DBMS_REDACT Subprograms

This table lists and briefly describes the DBMS_REDACT package subprograms.

Table 143-5 DBMS_REDACT Package Subprograms

| Subprogram | Description |
|--|--|
| ADD_POLICY Procedure | Defines a Data Redaction policy for a table or view |
| ALTER_POLICY Procedure | Alters a Data Redaction policy for a table or view |
| APPLY_POLICY_EXPR_TO_COL Procedure | Applies a Data Redaction policy expression to a redacted column |
| CREATE_POLICY_EXPRESSION Procedure | Creates a Data Redaction policy expression |
| DISABLE_POLICY Procedure | Disables a Data Redaction policy |
| DROP_POLICY Procedure | Drops a Data Redaction policy |
| DROP_POLICY_EXPRESSION Procedure | Drops a Data Redaction policy expression |
| ENABLE_POLICY Procedure | Enables a Data Redaction policy |
| UPDATE_FULL_REDACTION_VALUES Procedure | Modifies the default displayed values for a Data Redaction policy for full redaction |
| UPDATE_POLICY_EXPRESSION Procedure | Updates a Data Redaction policy expression |

143.5.1 ADD_POLICY Procedure

This procedure defines a Data Redaction policy for a table or view.

Syntax

```
DBMS_REDACT.ADD_POLICY (
    object_schema          IN    VARCHAR2 := NULL,
```

```

object_name          IN    VARCHAR2,
policy_name          IN    VARCHAR2,
column_name          IN    VARCHAR2 := NULL,
function_type        IN    BINARY_INTEGER := DBMS_REDACT.FULL,
function_parameters  IN    VARCHAR2 := NULL,
expression            IN    VARCHAR2,
enable               IN    BOOLEAN := TRUE,
regexp_pattern       IN    VARCHAR2 := NULL,
regexp_replace_string IN  VARCHAR2 := NULL,
regexp_position      IN    BINARY_INTEGER := 1,
regexp_occurrence    IN    BINARY_INTEGER := 0,
regexp_match_parameter IN  VARCHAR2 := NULL,
policy_description   IN    VARCHAR2 := NULL,
column_description   IN    VARCHAR2 := NULL);

```

Parameters

Table 143-6 *ADD_POLICY Procedure Parameters*

| Parameter | Description |
|---------------|--|
| object_schema | Schema owning the table, current user if NULL |
| object_name | Name of table or view to which to add a Data Redaction policy |
| policy_name | Name of policy |
| column_name | [Optional] Name of one column to which the redaction policy applies. If you must redact more than one column, use the ALTER_POLICY Procedure to add the additional columns. |
| function_type | Type of redaction function to use. Possible values are: <ul style="list-style-type: none"> - DBMS_REDACT.NONE - DBMS_REDACT.FULL (default) - DBMS_REDACT.NULLIFY - DBMS_REDACT.PARTIAL - DBMS_REDACT.RANDOM - DBMS_REDACT.REGEXP - DBMS_REDACT.REGEXP_WIDTH <p>If the function_type is DBMS_REDACT.REGEXP or DBMS_REDACT.REGEXP_WIDTH, then you must omit the function_parameters parameter, and use the regexp_* parameters to define the Data Redaction policy.</p> <p>See Table 143-1 for an overview of the meanings of these values, and for some examples of their use.</p> |

Table 143-6 (Cont.) ADD_POLICY Procedure Parameters

| Parameter | Description |
|---------------------|--|
| function_parameters | <p>Parameters to the redaction function. The possible values depend on the value of the <code>function_type</code> provided.</p> <p>If the <code>function_type</code> is <code>DBMS_REDACT.REGEXP</code> or <code>DBMS_REDACT.REGEXP_WIDTH</code>, then you must omit the <code>function_parameters</code> parameter, and use the <code>regexp_*</code> parameters to define the Data Redaction policy.</p> <ul style="list-style-type: none"> - <code>DBMS_REDACT.NONE</code>: Can be omitted entirely and defaults to <code>NULL</code> - <code>DBMS_REDACT.FULL</code>: Can be omitted entirely and defaults to <code>NULL</code> - Masking parameters for partial character masking. For character datatypes, a comma-separated list containing these fields: <ul style="list-style-type: none"> • Input format: 'V' for value to be possibly masked, 'F' for formatting character to be ignored • Output format: 'V' for output of masking, any other characters will be treated as formatting characters. • Mask character: a character that will be used to replace the actual values. Examples are '*' and 'x'. • Starting digit position: specifies the starting (character) position to begin replacing actual values with the masking character. The beginning of the string is position 1. Positions do not include formatting characters. • Ending digit position: specifies the ending (character) position to end masking. An example is 'VVVFVVFVVVV,VVV-VV-VVVV,X,1,5' for masking the first 5 digits of SSN string 123-45-6789, and adding dashes back to format it like an SSN, resulting in XXX-XX-6789. <p>For number datatypes, a comma-separated list containing these fields:</p> <ul style="list-style-type: none"> • Mask character: this is a character between '0' to '9' that will be used to replace the actual values. • Starting digit position: specifies the starting (digit) position to begin replacing actual values with the masking character. The beginning of the string is position 1. Positions do not include the decimal point. • Ending digit position: this specifies the ending digit position to end masking. An example is '9,1,5' for masking the first 5 digits of a Social Security number 123456789, resulting in 999996789. <p>For datetime datatypes, the format is a packed string (no spaces or commas) containing the following sequence of fields. Please note that each field can consist of one or more characters, and the field length depends on whether masking is required. The one-character fields are used to specify that no redaction of that component of the datetime value is to take place. The longer fields indicate a specific time or date to use as the redacted value of that component of the datetime value.</p> |

Table 143-6 (Cont.) ADD_POLICY Procedure Parameters

| Parameter | Description |
|------------|--|
| | <ul style="list-style-type: none"> Month: 'M' (no masking of month) or 'm#' (mask month to a specific month, if possible), where # (the month specified by its number) is between 1 and 12 Day: 'D' (no masking of date) or 'd#' (mask day to #, if possible), # between 1 and 31 Year: 'Y' (no masking of year) or 'y#' (mask year to #, if possible), # between 1 and 9999 Hour: 'H' (no masking of hour) or 'h#' (mask hour to #, if possible), # between 0 and 23 Minute: 'M' (no masking of minute) or 'm#' (mask minute to #, if possible), # between 0 and 59 Second: 'S' (no masking of second) or 's#' (mask second to #, if possible), # between 0 and 59 <p>An example is 'm12d1y2001h1m1s1', which changes 02-May-13 12:30:23 to 01-Dec-01 01:01:01.</p> <p>For partial character and number-masking shortcuts, see <i>Oracle Database Advanced Security Guide</i>.</p> |
| expression | <p>Default boolean expression for the table or view. If this expression is used, then redaction takes place only if this policy expression evaluates to TRUE.</p> <p>See</p> <p>The following functions are supported:</p> <ul style="list-style-type: none"> SYS_CONTEXT XS_SYS_CONTEXT SUBSTR functions (includes SUBSTRB, SUBSTRC, SUBSTR2, SUBSTR4) LENGTH functions (includes LENGTHB, LENGTHC, LENGTH2, LENGTH4) V (APEX_UTIL.GET_SESSION_STATE) NV (APEX_UTIL.GET_NUMERIC_SESSION_STATE) OLS_LABEL_DOMINATES DOMINATES OLS_DOMINATES OLS_DOM DOM OLS_STRICTLY_DOMINATES STRICTLY_DOMINATES S_DOM SA_UTL.DOMINATES SA_UTL.CHECK_READ SA_UTL.NUMERIC_LABEL CHAR_TO_LABEL SA_SESSION.LABEL <p>See <i>Oracle Database Advanced Security Guide</i> for more information about these supported functions</p> |

Table 143-6 (Cont.) ADD_POLICY Procedure Parameters

| Parameter | Description |
|------------------------|---|
| enable | Boolean value that determines whether the Data Redaction policy is enabled on creation. The default value is TRUE, which means that the policy is automatically enabled upon creation. If the enable parameter is set to FALSE, the policy takes effect only when it is subsequently enabled by calling the DBMS_REDACT.ENABLE_POLICY procedure. |
| regexp_pattern | Regular expression pattern up to 512 bytes. Use only if the function_type parameter is DBMS_REDACT.REGEXP. Also, do not specify the function_parameters parameter when function_type is DBMS_REDACT.REGEXP. See <i>Oracle Database SQL Language Reference</i> for more information and examples on using regular expression patterns. |
| regexp_replace_string | Replacement string (up to 4000 characters in length) with up to 500 back-references to subexpressions in the form \n, where n is a number between 1 and 9. Use only if the function_type parameter is DBMS_REDACT.REGEXP |
| regexp_position | Integer counting from 1, specifies the position where the search must begin. Use only if the function_type parameter is DBMS_REDACT.REGEXP |
| regexp_occurrence | <ul style="list-style-type: none"> Use 0 to replace all occurrences of the match Use positive integer n to replace the n-th occurrence of the match. Use only if the function_type parameter is DBMS_REDACT.REGEXP |
| regexp_match_parameter | Changes the default matching behavior, possible values are a combination of 'i', 'c', 'n', 'm', 'x' Use only if the function_type parameter is DBMS_REDACT.REGEXP See <i>Oracle Database SQL Language Reference</i> for more information and examples on using regular expression match parameters. |
| policy_description | Description of redaction policy |
| column_description | Description of the column being redacted |

Exceptions

- ORA-28060 - A Data Redaction policy already exists on this column.
- ORA-28061 - This object cannot have a Data Redaction policy defined on it.
- ORA-28062 - The policy expression is too long.
- ORA-28063 - The policy expression is empty.

- ORA-28064 - The type of redaction function is not valid.
- ORA-28066 - Invalid column *column*
- ORA-28069 - A Data Redaction policy already exists on this object.
- ORA-28073 - The column *column_name* has an unsupported datatype.
- ORA-28074 - The field *field_name* of the masking parameters is not valid

The field can be any of the following:

- REDACT_PARTIAL_INPUT_FORMAT
- REDACT_PARTIAL_OUTPUT_FORMAT
- REDACT_PARTIAL_MASKCHAR
- REDACT_PARTIAL_MASKFROM
- REDACT_PARTIAL_MASKTO
- REDACT_PARTIAL_DATE_MONTH
- REDACT_PARTIAL_DATE_DAY
- REDACT_PARTIAL_DATE_YEAR
- REDACT_PARTIAL_DATE_HOUR
- REDACT_PARTIAL_DATE_MINUTE
- REDACT_PARTIAL_DATE_SECOND

See [Table 143-3](#) and [Table 143-4](#) for examples of the field contents and field ordering.

- ORA-28075 - The policy expression has unsupported functions
- ORA-28076 - An attribute was not specified for SYS_SESSION_ROLES
- ORA-28077 - The attribute specified (*attribute*) exceeds the maximum length
- ORA-28078 - A regular expression parameter is missing or invalid
- ORA-28082 - The parameter *parameter* is invalid (where the possible values are *function_parameters*, *column_description*, *policy_name* and *policy_description*)
- ORA-28085 - The input and output lengths of the redaction do not match.

Usage Notes

See [DBMS_REDACT Security Model](#) for a list of the required privileges for this procedure.

See [Operating Procedures](#) for more information regarding function types and function parameters with related examples.

A named Data Redaction policy expression that has been applied to a redacted column takes precedence over the expression defined in the *expression* parameter. To find redacted columns that are affected by named policy expressions, query the REDACTION_EXPRESSIONS data dictionary view.

Example

Partial redaction policy:

```

BEGIN
  DBMS_REDACT.ADD_POLICY (
    object_schema      => 'hr',
    object_name        => 'employees',
    column_name        => 'employee_id',
    policy_name        => 'mask_emp_id_nums',
    function_type      => DBMS_REDACT.PARTIAL,
    function_parameters => '7,1,5',
    expression         => '1=1');
END;

```

Full redaction policy:

```

BEGIN
  DBMS_REDACT.ADD_POLICY (
    object_schema      => 'hr',
    object_name        => 'employees',
    column_name        => 'employee_id',
    policy_name        => 'mask_emp_ids',
    function_type      => DBMS_REDACT.FULL,
    expression         => 'SYS_CONTEXT(''SYS_SESSION_ROLES'', ''CLERK'')
                        = ''FALSE''');
END;

```

143.5.2 ALTER_POLICY Procedure

This procedure alters an existing Data Redaction policy for a table or view.

It alters a the policy in one or more of the following ways:

- By changing the policy expression
- By changing the type of redaction for a specified column
- By changing the parameters to the redaction function for a specified column
- By adding a column to the redaction policy (the redaction type and any parameters must be specified).
- By removing a column from the redaction policy

Syntax

```

DBMS_REDACT.ALTER_POLICY (
  object_schema      IN      VARCHAR2 := NULL,
  object_name        IN      VARCHAR2,
  policy_name        IN      VARCHAR2,
  action             IN      BINARY_INTEGER := DBMS_REDACT.ADD_COLUMN,
  column_name        IN      VARCHAR2 := NULL,
  function_type      IN      BINARY_INTEGER := DBMS_REDACT.FULL,
  function_parameters IN      VARCHAR2 := NULL,
  expression         IN      VARCHAR2,
  regexp_pattern     IN      VARCHAR2 := NULL,
  regexp_replace_string IN    VARCHAR2 := NULL,
  regexp_position    IN      BINARY_INTEGER := 1,
  regexp_occurrence  IN      BINARY_INTEGER := 0,
  regexp_match_parameter IN   VARCHAR2 := NULL,

```

```

policy_description      IN    VARCHAR2 := NULL,
column_description     IN    VARCHAR2 := NULL);

```

Parameters

Table 143-7 ALTER_POLICY Procedure Parameters

| Parameter | Description |
|---------------|--|
| object_schema | Schema owning the table, current user if NULL |
| object_name | Name of table or view to which to alter a Data Redaction policy |
| policy_name | Name of policy limited to 30 bytes |
| action | Action to take. For more information see Table 143-2 . |
| column_name | [Optional] Name of one column to which the redaction policy applies. |
| function_type | <p>Type of redaction function to use. Possible values are:</p> <ul style="list-style-type: none"> - DBMS_REDACT.NONE - DBMS_REDACT.FULL (default) - DBMS_REDACT.NULLIY - DBMS_REDACT.PARTIAL - DBMS_REDACT.RANDOM - DBMS_REDACT.REGEXP - DBMS_REDACT.REGEXP_WIDTH <p>If the function_type is DBMS_REDACT.REGEXP or DBMS_REDACT.REGEXP_WIDTH, then you must omit the function_parameters parameter, and use the regexp_pattern, regexp_replace_string, regexp_position, regexp_occurrence, and regexp_match_parameter to define the Data Redaction policy.</p> <p>See Table 143-1 for an overview of the meanings of these values, and for some examples of their use.</p> |

Table 143-7 (Cont.) ALTER_POLICY Procedure Parameters

| Parameter | Description |
|---------------------|---|
| function_parameters | <p>Parameters to the redaction function. The possible values depend on the value of the function_type provided.</p> <p>If the function_type is DBMS_REDACT.REGEXP or DBMS_REDACT.REGEXP_WIDTH, then you must omit the function_parameters parameter, and use the regexp_pattern, regexp_replace_string, regexp_position, regexp_occurrence, and regexp_match_parameter to define the Data Redaction policy.</p> <ul style="list-style-type: none"> - If the function_type is DBMS_REDACT.NONE, the function_parameters parameter can be omitted entirely and defaults to NULL. - If the function_type is DBMS_REDACT.FULL, the function_parameters parameter can be omitted entirely and defaults to NULL. - If the function_type is DBMS_REDACT.PARTIAL, the function_parameters parameter represents the masking parameters for partial masking. <ul style="list-style-type: none"> • Input format: 'V' for value to be possibly masked, 'F' for formatting character to be ignored • Output format: 'V' for output of masking, any other characters will be treated as formatting characters. • Mask character: a character that will be used to replace the actual values. Examples are '*' and 'x'. • Starting digit position: specifies the starting (character) position to begin replacing actual values with the masking character. The beginning of the string is position 1. Positions do not include formatting characters. • Ending digit position: specifies the ending (character) position to end masking. An example is 'VVVFVVVFVVVV, VVV-VV-VVVV, X, 1, 5' for masking the first 5 digits of SSN string 123-45-6789, and adding dashes back to format it like an SSN, resulting in XXX-XX-6789. <p>For number datatypes, a comma-separated list containing these fields:</p> <ul style="list-style-type: none"> • Mask character: this is a character between '0' to '9' that will be used to replace the actual values. • Starting digit position: specifies the starting (digit) position to begin replacing actual values with the masking character. | expression | <p>Default boolean expression for the table or view. If this expression is used, then redaction takes place only if this policy expression evaluates to TRUE.</p> <p>The following functions are supported:</p> <ul style="list-style-type: none"> • SYS_CONTEXT • NV (APEX_UTIL.GET_NUMERIC_SESSION_STATE) • V (APEX_UTIL.GET_SESSION_STATE) • OLS_LABEL_DOMINATES • DOMINATES • OLS_DOMINATES • OLS_DOM • DOM • OLS_STRICTLY_DOMINATES • STRICTLY_DOMINATES • S_DOM • SA_UTL.DOMINATES • SA_UTL.CHECK_READ • SA_UTL.NUMERIC_LABEL • CHAR_TO_LABEL • SA_SESSION.LABEL |
| regexp_pattern | <p>Regular expression pattern up to 512 bytes.</p> <p>Use only if the function_type parameter is DBMS_REDACT.REGEXP. Also, do not specify the function_parameters parameter when function_type is DBMS_REDACT.REGEXP.</p> <p>See <i>Oracle Database SQL Language Reference</i> for more information and examples on using regular expression patterns</p> |

Table 143-7 (Cont.) ALTER_POLICY Procedure Parameters

| Parameter | Description |
|------------------------|---|
| regexp_replace_string | Replacement string (up to 4000 characters in length) with up to 500 back-references to subexpressions in the form \n, where n is a number between 1 and 9. Use only if the function_type parameter is DBMS_REDACT.REGEXP |
| regexp_position | Integer counting from 1, specifies the position where the search must begin. Use only if the function_type parameter is DBMS_REDACT.REGEXP |
| regexp_occurrence | <ul style="list-style-type: none"> Use 0 to replace all occurrences of the match Use positive integer n to replace the n-th occurrence of the match. Use only if the function_type parameter is DBMS_REDACT.REGEXP |
| regexp_match_parameter | Changes the default matching behavior, possible values are a combination of 'i', 'c', 'n', 'm', 'x' Use only if the function_type parameter is DBMS_REDACT.REGEXP See <i>Oracle Database SQL Language Reference</i> for more information and examples on using regular expression match parameters. |
| policy_description | Description of redaction policy |
| column_description | Description of the column being redacted |

Exceptions

- ORA-28062 - The policy expression is too long.
- ORA-28063 - The policy expression is empty.
- ORA-28064 - The type of redaction function is not valid.
- ORA-28066 - Invalid column *column*
- ORA-28067 - Missing or invalid column name
- ORA-28068 - The object *object* does not have a Data Redaction policy.
- ORA-28070 - The column *column* does not have a Data Redaction policy.
- ORA-28071 - The action is not valid.
- ORA-28072 - The specified policy name is incorrect.
- ORA-28073 - The column *column_name* has an unsupported datatype.
- ORA-28074 - The field *field_name* of the masking parameters is not valid

The field can be any of the following:

- REDACT_PARTIAL_INPUT_FORMAT
- REDACT_PARTIAL_OUTPUT_FORMAT

- REDACT_PARTIAL_MASKCHAR
- REDACT_PARTIAL_MASKFROM
- REDACT_PARTIAL_MASKTO
- REDACT_PARTIAL_DATE_MONTH
- REDACT_PARTIAL_DATE_DAY
- REDACT_PARTIAL_DATE_YEAR
- REDACT_PARTIAL_DATE_HOUR
- REDACT_PARTIAL_DATE_MINUTE
- REDACT_PARTIAL_DATE_SECOND

See [Table 143-3](#) and [Table 143-4](#) for examples of the field contents and field ordering.

- ORA-28075 - The policy expression has unsupported functions.
- ORA-28076 - An attribute was not specified for SYS_SESSION_ROLES.
- ORA-28077 - The attribute specified (*attribute*) exceeds the maximum length.
- ORA-28078 - A regular expression parameter is missing or invalid.
- ORA-28082 - The parameter *parameter* is invalid (where the possible values are *function_parameters*, *column_description*, *policy_name* and *policy_description*)
- ORA-28085 - The input and output lengths of the redaction do not match.

Usage Notes

See [DBMS_REDACT Security Model](#) for a list of the required privileges for this procedure.

See [Operating Procedures](#) for more information regarding Function Types and Function Parameters with related examples.

A named Data Redaction policy expression that has been applied to a redacted column takes precedence over the expression defined in the *expression* parameter. To find redacted columns that are affected by named policy expressions, query the REDACTION_EXPRESSIONS data dictionary view.

Examples

```
BEGIN
  DBMS_REDACT.ALTER_POLICY(
    object_schema      => 'HR',
    object_name        => 'EMPLOYEES',
    policy_name        => 'mask_emp_id_nums',
    action              => DBMS_REDACT.DROP_COLUMN,
    column_name        => 'EMAIL');
END;
```

143.5.3 APPLY_POLICY_EXPR_TO_COL Procedure

This procedure associates a named Oracle Data Redaction policy expression with a redacted column from a table or view.

Syntax

```
DBMS_REDACT.APPLY_POLICY_EXPR_TO_COL (
  object_schema      IN VARCHAR2 := NULL,
  object_name        IN VARCHAR2,
  column_name        IN VARCHAR2,
  policy_expression_name IN VARCHAR2 := NULL);
```

Parameters

Table 143-8 *APPLY_POLICY_EXPR_TO_COL Procedure Parameters*

| Parameter | Description |
|------------------------|---|
| object_schema | Name of the schema that contains the redacted column |
| object_name | Name of the object (table or view) that contains the redacted column |
| column_name | Name of the redacted column to which the policy expression is applied |
| policy_expression_name | Name of the policy expression |

Exceptions

- ORA-28068 - The object *object* does not have a Data Redaction policy.
- ORA-28082 - The parameter *parameter* is invalid.
- ORA-28092 - The parameter *parameter* with value *value* has an error.

Usage Notes

See [DBMS_REDACT Security Model](#) for a list of the required privileges for this procedure.

You can find existing Data Redaction policy expressions by querying the REDACTION_EXPRESSIONS data dictionary view. To find columns that have been redacted, query the REDACTION_COLUMNS data dictionary view.

Example

```
BEGIN
  DBMS_REDACT.APPLY_POLICY_EXPR_TO_COL(
    object_schema      => 'OE',
    object_name        => 'CUSTOMERS',
    column_name        => 'INCOME_LEVEL',
    policy_expression_name => 'oe_redact_pol');
END;
```

143.5.4 CREATE_POLICY_EXPRESSION Procedure

This procedure creates a named Oracle Data Redaction policy expression.

Syntax

```
DBMS_REDACT.CREATE_POLICY_EXPRESSION (
  policy_expression_name      IN   VARCHAR2,
  expression                  IN   VARCHAR2,
  policy_expression_description IN   VARCHAR2 := NULL);
```

Parameters

Table 143-9 CREATE_POLICY_EXPRESSION Procedure Parameters

| Parameter | Description |
|-------------------------------|--------------------------------------|
| policy_expression_name | Name of the policy expression |
| expression | Definition of the policy expression |
| policy_expression_description | Description of the policy expression |

Exceptions

- ORA-28082 - The parameter *parameter* is invalid.
- ORA-28092 - The parameter *parameter* with value *value* has an error.

Usage Notes

See [DBMS_REDACT Security Model](#) for a list of the required privileges for this procedure.

See [Operating Procedures](#) for more information regarding function types and function parameters with related examples.

After you create a policy expression, you can associate it with a redacted table or view column by running the `DBMS_REDACT.APPLY_POLICY_EXPR_TO_COL` procedure. To find existing redacted columns, query the `REDACTION_COLUMNS` data dictionary view.

Example

```
BEGIN
  DBMS_REDACT.CREATE_POLICY_EXPRESSION(
    policy_expression_name => 'oe_redact_pol',
    expression              =>
'SYS_CONTEXT(''USERENV'', ''SESSION_USER'') = ''OE'',
    policy_expression_description => 'Enables policy for user OE ');
END;
```

143.5.5 DISABLE_POLICY Procedure

This procedure disables a Data Redaction policy.

Syntax

```
DBMS_REDACT.DISABLE_POLICY (
  object_schema      IN    VARCHAR2 := NULL,
  object_name        IN    VARCHAR2,
  policy_name        IN    VARCHAR2);
```

Parameters

Table 143-10 *DISABLE_POLICY Procedure Parameters*

| Parameter | Description |
|---------------|--|
| object_schema | Schema owning the table or view, current user if NULL |
| object_name | Name of table or view for which to disable a Data Redaction policy |
| policy_name | Name of policy to be disabled |

Exceptions

- ORA-28068 - The object *object* does not have a Data Redaction policy.
- ORA-28072 - The specified policy name is incorrect.
- ORA-28080 - The policy was already disabled.

Usage Notes

See [DBMS_REDACT Security Model](#) for a list of the required privileges for this procedure.

Examples

```
BEGIN
  DBMS_REDACT.DISABLE_POLICY (
    object_schema => 'hr',
    object_name   => 'employees',
    policy_name   => 'mask_emp_ids');
END;
```

143.5.6 DROP_POLICY Procedure

This procedure drops a Data Redaction policy by removing a masking policy from the table or view.

Syntax

```
DBMS_REDACT.DROP_POLICY (
  object_schema      IN    VARCHAR2 := NULL,
  object_name        IN    VARCHAR2,
  policy_name        IN    VARCHAR2);
```

Parameters

Table 143-11 *DROP_POLICY Procedure Parameters*

| Parameter | Description |
|---------------|--|
| object_schema | Schema owning the table or view, current user if NULL |
| object_name | Name of table or view from which to drop a Data Redaction policy |
| policy_name | Name of policy to be dropped |

Exceptions

- ORA-28068 - The object *object* does not have a Data Redaction policy.
- ORA-28072 - The specified policy name is incorrect.

Usage Notes

See [DBMS_REDACT Security Model](#) for a list of the required privileges for this procedure.

Examples

```
BEGIN
  DBMS_REDACT.DROP_POLICY (
    object_schema => 'hr',
    object_name   => 'employees',
    policy_name   => 'mask_emp_ids');
END;
```

143.5.7 DROP_POLICY_EXPRESSION Procedure

This procedure drops a named policy expression.

Syntax

```
DBMS_REDACT.DROP_POLICY_EXPRESSION (
  policy_expression_name IN VARCHAR2);
```

Parameters

Table 143-12 *DROP_POLICY_EXPRESSION Procedure Parameters*

| Parameter | Description |
|------------------------|-------------------------------|
| policy_expression_name | Name of the policy expression |

Exceptions

- ORA-28082 - The parameter *parameter* is invalid.
- ORA-28092 - The parameter *parameter* with value *value* has an error.

Usage Notes

See [DBMS_REDACT Security Model](#) for a list of the required privileges for this procedure.

You can find existing Data Redaction policy expressions by querying the REDACTION_EXPRESSIONS data dictionary view.

Example

```

BEGIN
    DBMS_REDACT.DROP_POLICY_EXPRESSION(
        policy_expression_name => 'oe_redact_pol');
END;

```

143.5.8 ENABLE_POLICY Procedure

This procedure re-enables a Data Redaction policy.

Syntax

```

DBMS_REDACT.ENABLE_POLICY (
    object_schema          IN    VARCHAR2 := NULL,
    object_name            IN    VARCHAR2,
    policy_name           IN    VARCHAR2);

```

Parameters

Table 143-13 ENABLE_POLICY Procedure Parameters

| Parameter | Description |
|---------------|--|
| object_schema | Schema owning the table or view, current user if NULL |
| object_name | Name of table or view to which to enable a Data Redaction policy |
| policy_name | Name of policy to be enabled |

Exceptions

- ORA-28068 - The object *object* does not have a Data Redaction policy.
- ORA-28071 - The action is not valid.
- ORA-28072 - The specified policy name is incorrect.
- ORA-28079 - The policy was already enabled.

Usage Notes

See [DBMS_REDACT Security Model](#) for a list of the required privileges for this procedure.

Examples

```

BEGIN
    DBMS_REDACT.ENABLE_POLICY (
        object_schema => 'hr',
        object_name   => 'employees',
        policy_name   => 'mask_emp_ids');
END;

```

143.5.9 UPDATE_FULL_REDACTION_VALUES Procedure

This procedure modifies the default displayed values for a Data Redaction policy for full redaction.

Syntax

```
DBMS_REDACT.UPDATE_FULL_REDACTION_VALUES (
    number_val      IN NUMBER           := NULL,
    binfloat_val    IN BINARY_FLOAT     := NULL,
    bindouble_val   IN BINARY_DOUBLE    := NULL,
    char_val        IN CHAR             := NULL,
    varchar_val     IN VARCHAR2         := NULL,
    nchar_val       IN NCHAR            := NULL,
    nvarchar_val    IN NVARCHAR2       := NULL,
    date_val        IN DATE             := NULL,
    ts_val          IN TIMESTAMP        := NULL,
    tswtz_val       IN TIMESTAMP WITH TIME ZONE := NULL,
    blob_val        IN BLOB             := NULL,
    clob_val        IN CLOB             := NULL,
    nclob_val       IN NCLOB           := NULL);
```

Parameters

Table 143-14 UPDATE_FULL_REDACTION_VALUES Procedure Parameters

| Parameter | Description |
|---------------|---|
| number_val | Modifies the default value for columns of the NUMBER datatype |
| binfloat_val | Modifies the default value for columns of the BINARY_FLOAT datatype |
| bindouble_val | Modifies the default value for columns of the BINARY_DOUBLE datatype |
| char_val | Modifies the default value for columns of the CHAR datatype |
| varchar_val | Modifies the default value for columns of the VARCHAR2 datatype |
| nchar_val | Modifies the default value for columns of the NCHAR datatype |
| nvarchar_val | Modifies the default value for columns of the NVARCHAR2 datatype |
| date | Modifies the default value for columns of the DATE datatype |
| ts_val | Modifies the default value for columns of the TIMESTAMP datatype |
| tswtz_val | Modifies the default value for columns of the TIMESTAMP WITH TIME ZONE datatype |
| blob_val | Modifies the default value for columns of the BLOB datatype |
| clob_val | Modifies the default value for columns of the CLOB datatype |
| nclob_val | Modifies the default value for columns of the NCLOB datatype |

Exceptions

ORA-28082 - The parameter *parameter* is invalid (where the possible values are char_val, nchar_val, varchar_val and nvarchar_val)

Usage Notes

See [DBMS_REDACT Security Model](#) for a list of the required privileges for this procedure.

143.5.10 UPDATE_POLICY_EXPRESSION Procedure

This procedure updates a named Oracle Data Redaction policy expression.

Syntax

```
DBMS_REDACT.UPDATE_POLICY_EXPRESSION (
  policy_expression_name      IN   VARCHAR2,
  expression                  IN   VARCHAR2,
  policy_expression_description IN   VARCHAR2 := NULL);
```

Parameters

Table 143-15 UPDATE_POLICY_EXPRESSION Procedure Parameters

| Parameter | Description |
|-------------------------------|--------------------------------------|
| policy_expression_name | Name of the policy expression |
| expression | Definition of the policy expression |
| policy_expression_description | Description of the policy expression |

Exceptions

- ORA-28082 - The parameter *parameter* is invalid.
- ORA-28092 - The parameter *parameter* with value *value* has an error.

Usage Notes

See [DBMS_REDACT Security Model](#) for a list of the required privileges for this procedure.

You can find existing policy expressions by querying the REDACTION_EXPRESSIONS data dictionary view.

Example

```
BEGIN
  DBMS_REDACT.UPDATE_POLICY_EXPRESSION(
    policy_expression_name      => 'oe_redact_pol',
    expression                  => 'SYS_CONTEXT(''USERENV'', ''SESSION_USER'') !=
''OE'',
    policy_expression_description => 'Disables policy for user OE ');
END;
```

DBMS_REDEFINITION

The `DBMS_REDEFINITION` package provides an interface to perform an online redefinition of tables.

This chapter contains the following topics:

- [Overview](#)
- [Security Model](#)
- [Constants](#)
- [Operational Notes](#)
- [Rules and Limits](#)
- [Examples](#)
- [Summary of DBMS_REDEFINITION Subprograms](#)

See Also:

Oracle Database Administrator's Guide for more information about online redefinition of tables

144.1 DBMS_REDEFINITION Overview

To achieve online redefinition, incrementally maintainable local materialized views are used. These logs keep track of the changes to the master tables and are used by the materialized views during refresh synchronization.

144.2 DBMS_REDEFINITION Security Model

Subprograms in the `DBMS_REDEFINITION` package are run with invokers' rights (with the privileges of the current user).

There are two modes:

- In `USER` mode, the user who has the `CREATE TABLE` and `CREATE MVIEW` privileges may redefine a table residing in his own schema.
- In `FULL` mode, the user who has the `ANY` privilege may redefine tables in any schema.

144.3 DBMS_REDEFINITION Constants

The `DBMS_REDEFINITION` package defines several constants for specifying parameter values.

Table 144-1 DBMS_REDEFINITION Constants

| Constant | Type | Value | Description |
|------------------|----------------|-------|---|
| CONS_CONSTRAINT | PLS_INTEGER | 3 | Used to specify that dependent object type is a constraint |
| CONS_INDEX | PLS_INTEGER | 2 | Used to specify that dependent object type is a index |
| CONS_MVLOG | PLS_INTEGER | 10 | Used to (un)register a materialized view log, as a dependent object of the table, through the REGISTER_DEPENDENT_OBJECT Procedure and the UNREGISTER_DEPENDENT_OBJECT Procedure . |
| CONS_ORIG_PARAMS | PLS_INTEGER | 1 | Used to specify that indexes should be cloned with their original storage parameters |
| CONS_TRIGGER | PLS_INTEGER | 4 | Used to specify that dependent object type is a trigger |
| CONS_USE_PK | BINARY_INTEGER | 1 | Used to indicate that the redefinition should be done using primary keys or pseudo-primary keys (unique keys with all component columns having not-NULL constraints) |
| CONS_USE_ROWID | BINARY_INTEGER | 2 | Used to indicate that the redefinition should be done using rowids |
| CONS_VPD_AUTO | BINARY_INTEGER | 2 | Used to indicate to copy VPD policies automatically |
| CONS_VPD_MANUAL | BINARY_INTEGER | 4 | Used to indicate to copy VPD policies manually |
| CONS_VPD_NONE | BINARY_INTEGER | 1 | Used to indicate that there are no VPD policies on the original table |

144.4 DBMS_REDEFINITION Operational Notes

The following operational notes apply to DBMS_REDEFINITION.

- `CONS_USE_PK` and `CONS_USE_ROWID` are constants used as input to the "options_flag" parameter in both the [START_REDEF_TABLE Procedure](#) and [CAN_REDEF_TABLE Procedure](#). `CONS_USE_ROWID` is used to indicate that the redefinition should be done using rowids while `CONS_USE_PK` implies that the redefinition should be done using primary keys or pseudo-primary keys (which are unique keys with all component columns having NOT NULL constraints).
- `CONS_INDEX`, `CONS_MVLOG`, `CONS_TRIGGER` and `CONS_CONSTRAINT` are used to specify the type of the dependent object being (un)registered in [REGISTER_DEPENDENT_OBJECT Procedure](#) and [UNREGISTER_DEPENDENT_OBJECT Procedure](#) (parameter "dep_type").

`CONS_INDEX` ==> dependent object is of type INDEX

`CONS_TRIGGER` ==> dependent object is of type TRIGGER

CONS_CONSTRAINT==> dependent object type is of type CONSTRAINT

CONS_MVLOG ==> dependent object is of type MATERIALIZED VIEW LOG

- CONS_ORIG_PARAMS as used as input to the "copy_indexes" parameter in [COPY_TABLE_DEPENDENTS Procedure](#). Using this parameter implies that the indexes on the original table be copied onto the interim table using the same storage parameters as that of the original index.

144.5 DBMS_REDEFINITION Rules and Limits

Various rules and limits apply to implementation of the DBMS_REDEFINITION package.

For more information about these, see the *Oracle Database Administrator's Guide*.

144.6 DBMS_REDEFINITION Examples

The following examples demonstrate DBMS_REDEFINITION functionality.

We create two tables EMP and EMP_INT as the original and the interim tables, respectively:

```
CREATE TABLE "EMP"
( "EMPNO" NUMBER(4,0) PRIMARY KEY,
  "ENAME" VARCHAR2(10),
  "JOB" VARCHAR2(9),
  "MGR" NUMBER(4,0),
  "HIREDATE" DATE,
  "SAL" NUMBER(7,2),
  "COMM" NUMBER(7,2),
  "DEPTNO" NUMBER(2,0))
```

```
TABLESPACE myts;
```

```
CREATE TABLE "EMP_INT"
( "EMPNO" NUMBER(4,0) PRIMARY KEY,
  "ENAME" VARCHAR2(10),
  "JOB" VARCHAR2(9),
  "MGR" NUMBER(4,0),
  "HIREDATE" DATE,
  "SAL" NUMBER(7,2),
  "COMM" NUMBER(7,2),
  "DEPTNO" NUMBER(2,0))
```

```
TABLESPACE compressed_ts;
```

Regular Multi-Step Redefinition

```
DBMS_REDEFINITION.START_REDEF_TABLE('SCOTT', 'EMP', 'EMP_INT',
  ENABLE_ROLLBACK => TRUE);
DBMS_REDEFINITION.FINISH_REDEF_TABLE('SCOTT', 'EMP', 'EMP_INT');
```

Assume the DBA wants to evaluate the performance of the application for 2 days, after moving the table EMP from tablespace myts to compressed_ts. One can run

sync_interim_table [SYNC_INTERIM_TABLE Procedure](#) to keep both the tables in sync (say, every hour).

```
DBMS_REDEFINITION.SYNC_INTERIM_TABLE('SCOTT', 'EMP', 'EMP_INT');
```

Case 1 — DBA is not happy with the performance, so decides to rollback.

```
DBMS_REDEFINITION.ROLLBACK('SCOTT', 'EMP', 'EMP_INT');
```

Case 2 — DBA is happy with the performance, so decides not to rollback.

```
DBMS_REDEFINITION.ABORT_ROLLBACK('SCOTT', 'EMP', 'EMP_INT');
```

This terminates the possibility of rollback.

Single-Step Redefinition

```
DBMS_REDEFINITION.REDEF_TABLE('SCOTT','EMP','ROW STORE COMPRESS  
ADVANCED', enable_rollback => TRUE);
```

Note:

Online table redefinition rollback is not supported when the `REDEF_TABLE` procedure is used to redefine a table.

144.7 Summary of DBMS_REDEFINITION Subprograms

This table lists the `DBMS_REDEFINITION` subprograms and briefly describes them.

Table 144-2 DBMS_REDEFINITION Package Subprograms

| Subprogram | Description |
|---|---|
| ABORT_REDEF_TABLE Procedure | Cleans up errors that occur during the redefinition process and removes all temporary objects created by the reorganization process |
| ABORT_ROLLBACK Procedure | Aborts rollback |
| ABORT_UPDATE Procedure | Aborts an update started with the <code>EXECUTE_UPDATE</code> procedure |
| CAN_REDEF_TABLE Procedure | Determines if a given table can be redefined online |
| COPY_TABLE_DEPENDENTS Procedure | Copies the dependent objects of the original table onto the interim table |
| EXECUTE_UPDATE Procedure | Optimizes the performance of bulk updates to a table |
| FINISH_REDEF_TABLE Procedure | Completes the redefinition process |

Table 144-2 (Cont.) DBMS_REDEFINITION Package Subprograms

| Subprogram | Description |
|---|---|
| REDEF_TABLE Procedure | Provides a single push-button interface that integrates several redefinition steps |
| REGISTER_DEPENDENT_OBJECT Procedure | Registers a dependent object (index, trigger, constraint or materialized view log) on the table being redefined and the corresponding dependent object on the interim table |
| ROLLBACK Procedure | Performs rollback |
| SET_PARAM Procedure | Sets a new value for a specified parameter used by the redefinition process identified by a redefinition ID |
| START_REDEF_TABLE Procedure | Initiates the redefinition process |
| SYNC_INTERIM_TABLE Procedure | Keeps the interim table synchronized with the original table |
| UNREGISTER_DEPENDENT_OBJECT Procedure | Unregisters a dependent object (index, trigger, constraint or materialized view log) on the table being redefined and the corresponding dependent object on the interim table |

144.7.1 ABORT_REDEF_TABLE Procedure

This procedure cleans up errors that occur during the redefinition process.

This procedure can also be used to terminate the redefinition process any time after the [START_REDEF_TABLE Procedure](#) has been called and before the [FINISH_REDEF_TABLE Procedure](#) is called. This process will remove the temporary objects that are created by the redefinition process such as materialized view logs.

Syntax

```
DBMS_REDEFINITION.ABORT_REDEF_TABLE (
  uname          IN VARCHAR2,
  orig_table     IN VARCHAR2,
  int_table      IN VARCHAR2,
  part_name      IN VARCHAR2 := NULL);
```

Parameters

Table 144-3 ABORT_REDEF_TABLE Procedure Parameters

| Parameter | Description |
|------------|---|
| uname | Schema name of the tables |
| orig_table | Name of the table to be redefined |
| int_table | Name of the interim table. Can take a comma-delimited list of interim table names. |
| part_name | Name of the partition being redefined. If redefining only a single partition of a table, specify the partition name in this parameter. <code>NULL</code> implies the entire table is being redefined. Can take a comma-delimited list of partition names to be redefined. |

144.7.2 ABORT_ROLLBACK Procedure

This procedure aborts rollback for a table that was redefined.

When online redefinition of a table is started with the `START_REDEF_TABLE` procedure, rollback can be enabled for the changes performed by online redefinition of a table by setting the `enable_rollback` parameter to `TRUE`. If you want to retain the changes made by online redefinition, you can abort the rollback to clean up the database objects that enable rollback.

Syntax

```
DBMS_REDEFINITION.ABORT_ROLLBACK (
  uname          IN VARCHAR2,
  orig_table     IN VARCHAR2,
  int_table      IN VARCHAR2 := NULL,
  part_name      IN VARCHAR2 := NULL);
```

Parameters

Table 144-4 ABORT_ROLLBACK Procedure Parameters

| Parameter | Description |
|-------------------------|---------------------------------------|
| <code>uname</code> | Schema name of the tables |
| <code>orig_table</code> | Name of the table to be redefined |
| <code>int_table</code> | Name of the interim table |
| <code>part_name</code> | Name of the partition being redefined |

144.7.3 ABORT_UPDATE Procedure

This procedure can aborts an update started with the `EXECUTE_UPDATE` procedure in the `RDBMS_REDEFINITION` package.

Syntax

```
DBMS_REDEFINITION.ABORT_UPDATE (
  update_stmt IN CLOB);
```

Parameters

Table 144-5 ABORT_UPDATE Procedure Parameters

| Parameter | Description |
|--------------------------|---|
| <code>update_stmt</code> | The SQL <code>UPDATE</code> statement to be aborted The SQL statement must exactly match the SQL statement in the <code>EXECUTE_UPDATE</code> procedure. |

**See Also:***Oracle Database Administrator's Guide*

144.7.4 CAN_REDEF_TABLE Procedure

This procedure determines if a given table can be redefined online. This is the first step of the online redefinition process. If the table is not a candidate for online redefinition, an error message is raised.

Syntax

```
DBMS_REDEFINITION.CAN_REDEF_TABLE (
  uname          IN VARCHAR2,
  tname          IN VARCHAR2,
  options_flag   IN PLS_INTEGER := 1,
  part_name      IN VARCHAR2 := NULL);
```

Parameters

Table 144-6 CAN_REDEF_TABLE Procedure Parameters

| Parameter | Description |
|--------------|--|
| uname | Schema name of the table |
| tname | Name of the table to be re-organized |
| options_flag | Indicates the type of redefinition method to use. <ul style="list-style-type: none"> If <code>dbms_redefinition.cons_use_pk</code>, the redefinition is done using primary keys or pseudo-primary keys (unique keys with all component columns having <code>NOT NULL</code> constraints). The default method of redefinition is using primary keys. If <code>dbms_redefinition.cons_use_rowid</code>, the redefinition is done using rowids. |
| part_name | Name of the partition being redefined. If redefining only a single partition of a table, specify the partition name in this parameter. <code>NULL</code> implies the entire table is being redefined. |

Exceptions

If the table is not a candidate for online redefinition, an error message is raised.

144.7.5 COPY_TABLE_DEPENDENTS Procedure

This procedure clones the dependent objects of the table being redefined onto the interim table and registers the dependent objects. This procedure does not clone the already registered dependent objects.

This subprogram is used to clone the dependent objects like grants, triggers, constraints and privileges from the table being redefined to the interim table (which represents the post-redefinition table).

Syntax

```
DBMS_REDEFINITION.COPY_TABLE_DEPENDENTS (
    uname                IN  VARCHAR2,
    orig_table           IN  VARCHAR2,
    int_table            IN  VARCHAR2,
    copy_indexes         IN  PLS_INTEGER := 1,
    copy_triggers        IN  BOOLEAN   := TRUE,
    copy_constraints     IN  BOOLEAN   := TRUE,
    copy_privileges     IN  BOOLEAN   := TRUE,
    ignore_errors       IN  BOOLEAN   := FALSE,
    num_errors           OUT PLS_INTEGER,
    copy_statistics     IN  BOOLEAN   := FALSE,
    copy_mvlog          IN  BOOLEAN   := FALSE);
```

Parameters

Table 144-7 COPY_TABLE_DEPENDENTS Procedure Parameters

| Parameter | Description |
|------------------|--|
| uname | Schema name of the tables |
| orig_table | Name of the table being redefined |
| int_table | Name of the interim table |
| copy_indexes | Flag indicating whether to copy the indexes <ul style="list-style-type: none"> 0 - do not copy any index dbms_redefinition.cons_orig_params – copy the indexes using the physical parameters of the source indexes |
| copy_triggers | TRUE = clone triggers, FALSE = do nothing |
| copy_constraints | TRUE = clone constraints, FALSE = do nothing. If compatibility setting is 10.2 or higher, then clone CHECK and NOT NULL constraints |
| copy_privileges | TRUE = clone privileges, FALSE = do nothing |
| ignore_errors | TRUE = if an error occurs while cloning a particular dependent object, then skip that object and continue cloning other dependent objects. FALSE = that the cloning process should stop upon encountering an error. |
| num_errors | Number of errors that occurred while cloning dependent objects |
| copy_statistics | TRUE = copy statistics, FALSE = do nothing |
| copy_mvlog | TRUE = copy materialized view log, FALSE = do nothing |

Usage Notes

- The user must check the column `num_errors` before proceeding to ensure that no errors occurred during the cloning of the objects.
- In case of an error, the user should fix the cause of the error and call the [COPY_TABLE_DEPENDENTS Procedure](#) again to clone the dependent object. Alternatively the user can manually clone the dependent object and then register the manually cloned dependent object using the [REGISTER_DEPENDENT_OBJECT Procedure](#).

- All cloned referential constraints involving the interim tables will be created disabled (they will be automatically enabled after the redefinition) and all triggers on interim tables will not fire till the redefinition is completed. After the redefinition is complete, the cloned objects will be renamed to the corresponding pre-redefinition names of the objects (from which they were cloned from).
- It is the user's responsibility that the cloned dependent objects are unaffected by the redefinition. All the triggers will be cloned and it is the user's responsibility that the cloned triggers are unaffected by the redefinition.

144.7.6 EXECUTE_UPDATE Procedure

This procedure can optimize the performance of bulk updates to a table. Performance is optimized because the updates are not logged in the redo log.

The `EXECUTE_UPDATE` procedure automatically uses the components of online table redefinition, such as an interim table, a materialized view, and a materialized view log, to enable optimized bulk updates to a table. The `EXECUTE_UPDATE` procedure also removes fragmentation of the affected rows and ensures that the update is atomic. If the bulk updates raise any errors, then you can use the `ABORT_UPDATE` procedure to undo the changes made by the `EXECUTE_UPDATE` procedure.

Syntax

```
DBMS_REDEFINITION.EXECUTE_UPDATE (
    update_stmt IN CLOB);
```

Parameters

Table 144-8 EXECUTE_UPDATE Procedure Parameters

| Parameter | Description |
|-------------|--------------------------|
| update_stmt | The SQL UPDATE statement |

See Also:

Oracle Database Administrator's Guide

144.7.7 FINISH_REDEF_TABLE Procedure

This procedure completes the redefinition process.

Before this step, you can create new indexes, triggers, grants, and constraints on the interim table. The referential constraints involving the interim table must be disabled. After completing this step, the original table is redefined with the attributes and data of the interim table. The original table is locked briefly during this procedure.

Syntax

```
DBMS_REDEFINITION.FINISH_REDEF_TABLE (
    uname          IN VARCHAR2,
    orig_table     IN  VARCHAR2,
```

```

int_table          IN  VARCHAR2,
part_name          IN  VARCHAR2 := NULL,
dml_lock_timeout  IN  PLS_INTEGER := NULL,
continue_after_errors IN  BOOLEAN := FALSE,
disable_rollback  IN  PLS_INTEGER := FALSE);

```

Parameters

Table 144-9 FINISH_REDEF_TABLE Procedure Parameters

| Parameters | Description |
|-----------------------|--|
| uname | Schema name of the tables |
| orig_table | Name of the table to be redefined |
| int_table | Name of the interim table. Can take a comma-delimited list of interim table names. |
| part_name | Name of the partition being redefined. If redefining only a single partition of a table, specify the partition name in this parameter. NULL implies the entire table is being redefined. Can take a comma-delimited list of partition names to be redefined. |
| dml_lock_timeout | Specifies the number of seconds the procedure waits for its required locks before failing. The permissible range of values for timeout is 0 to 1,000,000. The default is NULL (wait mode). |
| continue_after_errors | When redefining multiple partitions allows operation execution to continue on the next partition (applies only to batched partition redefinition). |
| disable_rollback | When set to TRUE, disables the rollback option if it was enabled in the START_REDEF_TABLE procedure. Specifying TRUE cleans up the database objects that enable rollback. |

Examples

Wait up to 600 seconds for required locks on SH.SALES:

```

EXECUTE DBMS_REDEFINITION.FINISH_REDEF_TABLE (
  'SH', 'SALES', 'INT_SALES', 600);

```

144.7.8 REDEF_TABLE Procedure

This procedure provides a single interface that integrates several redefinition steps including the CAN_REDEF_TABLE Procedure, the START_REDEF_TABLE Procedure, the COPY_TABLE_DEPENDENTS Procedure and the FINISH_REDEF_TABLE Procedure.

This procedure can change data storage properties including tablespaces (for table, partition, subpartition, index, LOB column), compress type (for table, partition, subpartition, index, LOB column) and STORE_AS clause for the LOB column.

Syntax

```

DBMS_REDEFINITION.REDEF_TABLE (
  uname          IN  VARCHAR2,
  tname          IN  VARCHAR2,
  table_compression_type  IN  VARCHAR2 := NULL,
  table_part_tablespace  IN  VARCHAR2 := NULL,
  index_key_compression_type  IN  VARCHAR2 := NULL,

```

```

index_tablespace      IN VARCHAR2 := NULL,
lob_compression_type  IN VARCHAR2 := NULL,
lob_tablespace        IN VARCHAR2 := NULL,
lob_store_as          IN VARCHAR2 := NULL,
refresh_dep_mviews    IN VARCHAR2 := 'N',
dml_lock_timeout      IN PLS_INTEGER := NULL);

```

Parameters

Table 144-10 REDEF_TABLE Procedure Parameters

| Parameter | Description |
|----------------------------|--|
| uname | Schema name of the table |
| tname | Name of the table to be redefined |
| table_compression_type | Text string of the table compression clause. NULL means there is no change. |
| table_part_tablespace | Tablespace name for the entire table or partitions. NULL means there is no change. |
| index_key_compression_type | Text string of the compression clause for all indexes on the table. NULL means there is no change. |
| index_tablespace | Tablespace name for all indexes on the table. NULL means there is no change. |
| lob_compression_type | Text string of the compression clause for all LOBs in the entire table. NULL means there is no change. |
| lob_tablespace | Tablespace name for all LOBs in the table. NULL means there is no change. |
| lob_store_as | Specifies LOB store as 'SECUREFILE' or 'BASICFILE'. NULL means there is no change. |
| refresh_dep_mviews | When set to 'Y', fast refresh of dependent materialized views is performed once at the end of the redefinition operation. |
| dml_lock_timeout | Specifies the number of seconds the procedure waits for its required locks before failing. The permissible range of values for timeout is 0 to 1,000,000. The default is NULL (wait mode). |

Examples

```

BEGIN
  DBMS_REDEFINITION.REDEF_TABLE (
    uname           => 'TABOWNER2',
    tname           => 'EMP2',
    table_compression_type => 'ROW STORE COMPRESS ADVANCED',
    table_part_tablespace => 'NEWTBS',
    index_key_compression_type => 'COMPRESS 1',
    index_tablespace   => 'NEWIDXTBS',
    lob_compression_type   => 'COMPRESS HIGH',
    lob_tablespace     => 'SLOBTBS',
    lob_store_as      => 'SECUREFILE');
END;

```

Related Topics

- [CAN_REDEF_TABLE Procedure](#)
This procedure determines if a given table can be redefined online. This is the first step of the online redefinition process. If the table is not a candidate for online redefinition, an error message is raised.
- [START_REDEF_TABLE Procedure](#)
This procedure starts a table redefinition.
- [COPY_TABLE_DEPENDENTS Procedure](#)
This procedure clones the dependent objects of the table being redefined onto the interim table and registers the dependent objects. This procedure does not clone the already registered dependent objects.
- [FINISH_REDEF_TABLE Procedure](#)
This procedure completes the redefinition process.

See Also:

Oracle Database Administrator's Guide regarding "Performing Online Redefinition with the REDEF_TABLE Procedure"

144.7.9 REGISTER_DEPENDENT_OBJECT Procedure

This procedure registers a dependent object (index, trigger, constraint or materialized view log) on the table being redefined and the corresponding dependent object on the interim table.

This can be used to have the same object on each table but with different attributes. For example: for an index, the storage and tablespace attributes could be different but the columns indexed remain the same

Syntax

```
DBMS_REDEFINITION.REGISTER_DEPENDENT_OBJECT(
  uname          IN   VARCHAR2,
  orig_table     IN   VARCHAR2,
  int_table      IN   VARCHAR2,
  dep_type       IN   PLS_INTEGER,
  dep_owner      IN   VARCHAR2,
  dep_orig_name  IN   VARCHAR2,
  dep_int_name   IN   VARCHAR2);
```

Parameters

Table 144-11 REGISTER_DEPENDENT_OBJECT Procedure Parameters

| Parameters | Description |
|------------|-----------------------------------|
| uname | Schema name of the tables |
| orig_table | Name of the table to be redefined |
| int_table | Name of the interim table |

Table 144-11 (Cont.) REGISTER_DEPENDENT_OBJECT Procedure Parameters

| Parameters | Description |
|---------------|---|
| dep_type | Type of the dependent object (see Constants and Operational Notes) |
| dep_owner | Owner of the dependent object |
| dep_orig_name | Name of the original dependent object |
| dep_int_name | Name of the interim dependent object |

Usage Notes

- Attempting to register an already registered object will raise an error.
- Registering a dependent object will automatically remove that object from DBA_REDEFINITION_ERRORS if an entry exists for that object.

144.7.10 ROLLBACK Procedure

This procedure rolls back changes to a table after online table redefinition to return the table to its original definition and preserve DML changes made to the table.

Syntax

```
DBMS_REDEFINITION.ROLLBACK (
  uname           IN VARCHAR2,
  orig_table      IN VARCHAR2,
  int_table       IN VARCHAR2 := NULL,
  part_name       IN VARCHAR2 := NULL,
  dml_lock_timeout IN PLS_INTEGER := NULL,
  continue_after_errors IN BOOLEAN := FALSE);
```

Parameters

Table 144-12 ROLLBACK Procedure Parameters

| Parameter | Description |
|-----------------------|--|
| uname | Schema name of the table to be redefined |
| orig_table | Name of the table to be redefined |
| int_table | Name of the interim table. |
| part_name | Name of the partition being redefined. |
| dml_lock_timeout | Specifies the number of seconds the procedure waits for its required locks before failing. The permissible range of values for timeout is 0 to 1,000,000. The default is NULL (wait mode). |
| continue_after_errors | When rolling back redefinition changes on multiple partitions, allows operation execution to continue on the next partition (applies only to batched partition redefinition). |

144.7.11 SET_PARAM Procedure

This procedure sets a new value for a specified parameter used by the redefinition process identified by a redefinition ID.

Note:

Currently, the only value that can be changed by this procedure is the value for the `refresh_dep_mviews` parameter that is specified in the `REDEF_TABLE` procedure or the `START_REDEF_TABLE` procedure. You can determine the redefinition ID and check the value of the `refresh_dep_mviews` parameter for an online table redefinition operation by querying the `DBA_REDEFINITION_STATUS` view.

Syntax

```
DBMS_REDEFINITION.SET_PARAM (  
    redefinition_id IN VARCHAR2,  
    param_name      IN VARCHAR2,  
    param_value     IN VARCHAR2);
```

Parameters

Table 144-13 SET_PARAM Procedure Parameters

| Parameter | Description |
|------------------------------|--|
| <code>redefinition_id</code> | The redefinition ID that identifies the redefinition process |
| <code>param_name</code> | The parameter name |
| <code>param_value</code> | The new parameter value |

See Also:

Oracle Database Administrator's Guide

144.7.12 START_REDEF_TABLE Procedure

This procedure starts a table redefinition.

Prior to calling this procedure, you must manually create an empty interim table (in the same schema as the table to be redefined) with the desired attributes of the post-redefinition table, and then call this procedure to initiate the redefinition.

Syntax

```
DBMS_REDEFINITION.START_REDEF_TABLE (  
    uname          IN VARCHAR2,  
    orig_table     IN VARCHAR2,
```

```

int_table          IN VARCHAR2,
col_mapping        IN VARCHAR2 := NULL,
options_flag       IN BINARY_INTEGER := 1,
orderby_cols       IN VARCHAR2 := NULL,
part_name          IN VARCHAR2 := NULL,
continue_after_errors IN BOOLEAN := FALSE,
copy_vpd_opt       IN BINARY_INTEGER := CONS_VPD_NONE,
refresh_dep_mviews IN VARCHAR2 := 'N',
enable_rollback    IN BOOLEAN := FALSE);

```

Parameters

Table 144-14 START_REDEF_TABLE Procedure Parameters

| Parameter | Description |
|-----------------------|---|
| uname | Schema name of the tables |
| orig_table | Name of the table to be redefined |
| int_table | Name of the interim table. Can take a comma-delimited list of interim table names. |
| col_mapping | Mapping information from the columns in the original table to the columns in the interim table. (This is similar to the column list on the SELECT clause of a query.) If NULL, all the columns in the original table are selected and have the same name after redefinition. |
| options_flag | Indicates the type of redefinition method to use: <ul style="list-style-type: none"> If dbms_redefinition.cons_use_pk, the redefinition is done using primary keys or pseudo-primary keys (unique keys with all component columns having NOT NULL constraints). The default method of redefinition is using primary keys. If dbms_redefinition.cons_use_rowid, the redefinition is done using rowids. |
| orderby_cols | This optional parameter accepts the list of columns (along with the optional keyword(s) ascending/descending) with which to order by the rows during the initial instantiation of the interim table (the order by is only done for the initial instantiation and not for subsequent synchronizations) |
| part_name | Name of the partition being redefined. If redefining only a single partition of a table, specify the partition name in this parameter. NULL implies the entire table is being redefined. Can take a comma-delimited list of partition names to be redefined. |
| continue_after_errors | When redefining multiple partitions allows operation execution to continue on the next partition (applies only to batched partition redefinition) |
| copy_vpd_opt | Specifies how VPD policies are handled in online redefinition |
| refresh_dep_mviews | When set to 'Y', fast refresh of dependent materialized views is performed when the START_REDEF_TABLE procedure is run, each time the SYNC_INTERIM_TABLE procedure is run, and when the FINISH_REDEF_TABLE procedure is run. |

Table 144-14 (Cont.) START_REDEF_TABLE Procedure Parameters

| Parameter | Description |
|------------------------------|--|
| <code>enable_rollback</code> | When set to <code>TRUE</code> , enables the rollback option. When this parameter is set to <code>true</code> , Oracle Database maintains the interim table created during redefinition after redefinition is complete. You can run the <code>SYNC_INTERIM_TABLE</code> procedure to synchronize the interim table periodically to apply DML changes made to the redefined table to the interim table. An internal materialized view and materialized view log enables maintenance of the interim table. If you decide to roll back the online table redefinition with the <code>ROLLBACK</code> procedure, then the interim table is synchronized, and Oracle Database switches back to it so that the table has its original definition. |

Examples

Start redefinition of three partitions (`sal03q1`, `sal03q2`, `sal03q3`) in table 'STEVE.salestable' using three interim tables of `int_salestable1`, `int_salestable2` and `int_salestable3`, respectively. The operation will continue on `sal03q3` even if it fails on `sal03q1`.

```
DBMS_REDEFINITION.START_REDEF_TABLE (
  uname           => 'STEVE',
  orig_table      => 'salestable',
  int_table       => 'int_salestable1, int_salestable2, int_salestable3',
  col_mapping     => NULL,
  options_flag    => DBMS_REDEFINITION.CONST_USE_ROWID,
  part_name       => 'sal03q1,sal03q2,sal03q3',
  continue_after_errors => TRUE);
```

Specify to copy VPD policies automatically:

```
EXECUTE DBMS_REDEFINITION.START_REDEF_TABLE (
  uname           => 'SCOTT',
  orig_table      => 'T',
  int_table       => 'INT_T',
  copy_vpd_opt    => DBMS_REDEFINITION.CONST_VPD_AUTO);
```

144.7.13 SYNC_INTERIM_TABLE Procedure

This procedure keeps the interim table synchronized with the original table.

Syntax

```
DBMS_REDEFINITION.SYNC_INTERIM_TABLE (
  uname           IN  VARCHAR2,
  orig_table      IN  VARCHAR2,
  int_table       IN  VARCHAR2,
  part_name       IN  VARCHAR2 := NULL,
  continue_after_errors IN  BOOLEAN := FALSE);
```

Parameters

Table 144-15 SYNC_INTERIM_TABLE Procedure Parameters

| Parameter | Description |
|-----------------------|---|
| uname | Schema name of the table |
| orig_table | Name of the table to be redefined |
| int_table | Name of the interim table. Can take a comma-delimited list of interim table names. |
| part_name | Name of the partition being redefined. If redefining only a single partition of a table, specify the partition name in this parameter. <code>NULL</code> implies the entire table is being redefined. Can take a comma-delimited list of partition names to be redefined. |
| continue_after_errors | When redefining multiple partitions allows operation execution to continue on the next partition (applies only to batched partition redefinition) |

Usage Notes

- This step is useful in minimizing the amount of synchronization needed to be done by the [FINISH_REDEF_TABLE Procedure](#) before completing the online redefinition.
- This procedure can be called between long running operations (such as `CREATE INDEX`) on the interim table to sync it up with the data in the original table and speed up subsequent operations.

144.7.14 UNREGISTER_DEPENDENT_OBJECT Procedure

This procedure unregisters a dependent object (index, trigger, constraint or materialized view log) on the table being redefined and the corresponding dependent object on the interim table.

Syntax

```
DBMS_REDEFINITION.UNREGISTER_DEPENDENT_OBJECT (
  uname          IN VARCHAR2,
  orig_table     IN VARCHAR2,
  int_table      IN VARCHAR2,
  dep_type       IN PLS_INTEGER,
  dep_owner      IN VARCHAR2,
  dep_orig_name  IN VARCHAR2,
  dep_int_name   IN VARCHAR2);
```

Parameters

Table 144-16 UNREGISTER_DEPENDENT_OBJECT Procedure Parameters

| Parameters | Description |
|------------|-----------------------------------|
| uname | Schema name of the tables |
| orig_table | Name of the table to be redefined |
| int_table | Name of the interim table |

Table 144-16 (Cont.) UNREGISTER_DEPENDENT_OBJECT Procedure Parameters

| Parameters | Description |
|-------------------|---------------------------------------|
| dep_type | Type of the dependent object |
| dep_owner | Owner of the dependent object |
| dep_orig_name | Name of the original dependent object |
| dep_int_name | Name of the interim dependent object |

DBMS_REFRESH

The `DBMS_REFRESH` package enables you to create groups of materialized views that can be refreshed together to a transactionally consistent point in time. These groups are called refresh groups.

This chapter contains the following topics:

- [DBMS_REFRESH Overview](#)
- [DBMS_REFRESH Security Model](#)

145.1 DBMS_REFRESH Overview

When it is important for materialized views to be transactionally consistent with each other, you can organize them into refresh groups.

By refreshing the refresh group, you can ensure that the data in all of the materialized views in the refresh group correspond to the same transactionally consistent point in time. A materialized view in a refresh group still can be refreshed individually, but doing so nullifies the benefits of the refresh group because refreshing the materialized view individually does not refresh the other materialized views in the refresh group.

145.2 DBMS_REFRESH Security Model

Users must have the `EXECUTE` privilege to run the procedures of `DBMS_REFRESH` package.

145.3 Summary of DBMS_REFRESH Subprograms

This table lists the `DBMS_REFRESH` subprograms and briefly describes them.

Table 145-1 DBMS_REFRESH Package Subprograms

| Subprogram | Description |
|------------------------------------|--|
| ADD Procedure | Adds materialized views to a refresh group |
| CHANGE Procedure | Changes the refresh interval for a refresh group |
| DESTROY Procedure | Removes all of the materialized views from a refresh group and deletes the refresh group |
| MAKE Procedure | Specifies the members of a refresh group and the time interval used to determine when to refresh the members of this group |
| REFRESH Procedure | Manually refreshes a refresh group |
| SUBTRACT Procedure | Removes materialized views from a refresh group |

145.3.1 ADD Procedure

This procedure adds materialized views to a refresh group.

Syntax

```
DBMS_REFRESH.ADD (
  name      IN VARCHAR2,
  { list    IN VARCHAR2,
    | tab    IN DBMS_UTILITY.UNCL_ARRAY, }
  lax       IN BOOLEAN := FALSE);
```

Note:

This procedure is overloaded. The `list` and `tab` parameters are mutually exclusive.

Parameters

Table 145-2 ADD Procedure Parameters

| Parameter | Description |
|-------------------|--|
| <code>name</code> | Name of the refresh group to which you want to add members, specified as <code>[schema_name.]refresh_group_name</code> . If the schema is not specified, then the current user is the default. |
| <code>list</code> | Comma-delimited list of materialized views that you want to add to the refresh group. Synonyms are not supported. Each materialized view is specified as <code>[schema_name.]materialized_view_name</code> . If the schema is not specified, then the refresh group owner is the default. |
| <code>tab</code> | Instead of a comma-delimited list, you can supply a PL/SQL associative array of type <code>DBMS_UTILITY.UNCL_ARRAY</code> , where each element is the name of a materialized view. The first materialized view should be in position 1. The last position must be <code>NULL</code> . Each materialized view is specified as <code>[schema_name.]materialized_view_name</code> . If the schema is not specified, then the refresh group owner is the default. |
| <code>lax</code> | A materialized view can belong to only one refresh group at a time. If you are moving a materialized view from one group to another, then you must set the <code>lax</code> flag to <code>TRUE</code> to succeed. Oracle then automatically removes the materialized view from the other refresh group and updates its refresh interval to be that of its new group. Otherwise, the call to <code>ADD</code> generates an error message. |

145.3.2 CHANGE Procedure

This procedure changes the refresh interval for a refresh group.

Syntax

```
DBMS_REFRESH.CHANGE (
    name                IN VARCHAR2,
    next_date           IN DATE           := NULL,
    interval            IN VARCHAR2      := NULL,
    implicit_destroy    IN BOOLEAN       := NULL,
    rollback_seg        IN VARCHAR2      := NULL,
    push_deferred_rpc   IN BOOLEAN       := NULL,
    refresh_after_errors IN BOOLEAN      := NULL,
    purge_option        IN BINARY_INTEGER := NULL,
    parallelism         IN BINARY_INTEGER := NULL,
    heap_size           IN BINARY_INTEGER := NULL);
```

Parameters

Table 145-3 CHANGE Procedure Parameters

| Parameter | Description |
|----------------------|--|
| name | Name of the refresh group for which you want to alter the refresh interval. |
| next_date | Next date that you want a refresh to occur. By default, this date remains unchanged. |
| interval | Function used to calculate the next time to refresh the materialized views in the refresh group. This interval is evaluated immediately before the refresh. Thus, select an interval that is greater than the time it takes to perform a refresh. By default, the interval remains unchanged. |
| implicit_destroy | Allows you to reset the value of the <code>implicit_destroy</code> flag. If this flag is set, then Oracle automatically deletes the group if it no longer contains any members. By default, this flag remains unchanged. |
| rollback_seg | Allows you to change the rollback segment used. By default, the rollback segment remains unchanged. To reset this parameter to use the default rollback segment, specify <code>NULL</code> , including the quotes. Specifying <code>NULL</code> without quotes indicates that you do not want to change the rollback segment currently being used. |
| push_deferred_rpc | Starting with Oracle Database 12c Release 2 (12.2), this parameter is ignored. |
| refresh_after_errors | Starting with Oracle Database 12c Release 2 (12.2), this parameter is ignored. |
| purge_option | Starting with Oracle Database 12c Release 2 (12.2), this parameter is ignored. |
| parallelism | <ul style="list-style-type: none"> 0 specifies serial propagation. $n > 1$ specifies parallel propagation with n parallel processes. 1 specifies parallel propagation using only one parallel process. |

Table 145-3 (Cont.) CHANGE Procedure Parameters

| Parameter | Description |
|-----------|--|
| heap_size | Maximum number of transactions to be examined simultaneously for parallel propagation scheduling. Oracle automatically calculates the default setting for optimal performance. |

 **Note:**

Do not set this parameter unless directed to do so by Oracle Support Services.

145.3.3 DESTROY Procedure

This procedure removes all of the materialized views from a refresh group and delete the refresh group.

Syntax

```
DBMS_REFRESH.DESTROY (
    name IN VARCHAR2);
```

Parameters

Table 145-4 DESTROY Procedure Parameters

| Parameter | Description |
|-----------|---|
| name | Name of the refresh group that you want to destroy. |

145.3.4 MAKE Procedure

This procedure specifies the members of a refresh group and the time interval used to determine when to refresh the members of this group.

Syntax

```
DBMS_REFRESH.MAKE (
    name                IN    VARCHAR2
    { list              IN    VARCHAR2,
      | tab             IN    DBMS_UTILITY.UNCL_ARRAY, }
    next_date          IN    DATE,
    interval            IN    VARCHAR2,
    implicit_destroy   IN    BOOLEAN      := FALSE,
    lax                 IN    BOOLEAN      := FALSE,
    job                 IN    BINARY_INTEGER := 0,
    rollback_seg       IN    VARCHAR2     := NULL,
    push_deferred_rpc  IN    BOOLEAN      := TRUE,
    refresh_after_errors IN  BOOLEAN      := FALSE
    purge_option        IN    BINARY_INTEGER := NULL,
    parallelism        IN    BINARY_INTEGER := NULL,
    heap_size           IN    BINARY_INTEGER := NULL
```

```

job_name          IN    VARCHAR2          := NULL,
auto_commit       IN    BOOLEAN           := NULL);

```

 **Note:**

This procedure is overloaded. The `list` and `tab` parameters are mutually exclusive.

Parameters

Table 145-5 MAKE Procedure Parameters

| Parameter | Description |
|-------------------------------|--|
| <code>name</code> | Unique name used to identify the refresh group, specified as <code>[schema_name.]refresh_group_name</code> . If the schema is not specified, then the current user is the default. Refresh groups must follow the same naming conventions as tables. |
| <code>list</code> | Comma-delimited list of materialized views that you want to refresh. Synonyms are not supported. These materialized views can be located in different schemas and have different master tables or master materialized views. However, all of the listed materialized views must be in your current database. Each materialized view is specified as <code>[schema_name.]materialized_view_name</code> . If the schema is not specified, then the refresh group owner is the default. |
| <code>tab</code> | Instead of a comma-delimited list, you can supply a PL/SQL associative array of names of materialized views that you want to refresh using the data type <code>DBMS_UTILITY.UNCL_ARRAY</code> . If the table contains the names of n materialized views, then the first materialized view should be in position 1 and the $n + 1$ position should be set to <code>NULL</code> . Each materialized view is specified as <code>[schema_name.]materialized_view_name</code> . If the schema is not specified, then the refresh group owner is the default. |
| <code>next_date</code> | Next date that you want a refresh to occur. |
| <code>interval</code> | Function used to calculate the next time to refresh the materialized views in the group. This field is used with the <code>next_date</code> value. For example, if you specify <code>NEXT_DAY(SYSDATE+1, "MONDAY")</code> as your interval, and if your <code>next_date</code> evaluates to Monday, then Oracle refreshes the materialized views every Monday. This interval is evaluated immediately before the refresh. Thus, select an interval that is greater than the time it takes to perform a refresh. |
| <code>implicit_destroy</code> | Set this to <code>TRUE</code> to delete the refresh group automatically when it no longer contains any members. Oracle checks this flag only when you call the <code>SUBTRACT</code> procedure. That is, setting this flag still enables you to create an empty refresh group. |
| <code>lax</code> | A materialized view can belong to only one refresh group at a time. If you are moving a materialized view from an existing group to a new refresh group, then you must set this to <code>TRUE</code> to succeed. Oracle then automatically removes the materialized view from the other refresh group and updates its refresh interval to be that of its new group. Otherwise, the call to <code>MAKE</code> generates an error message. |
| <code>job</code> | Needed by the Import utility. Use the default value, 0. |

Table 145-5 (Cont.) MAKE Procedure Parameters

| Parameter | Description |
|----------------------|--|
| rollback_seg | Name of the rollback segment to use while refreshing materialized views. The default, NULL, uses the default rollback segment. |
| push_deferred_rpc | Starting with Oracle Database 12c Release 2 (12.2), this parameter is ignored. |
| refresh_after_errors | Starting with Oracle Database 12c Release 2 (12.2), this parameter is ignored. |
| purge_option | Starting with Oracle Database 12c Release 2 (12.2), this parameter is ignored. |
| parallelism | <ul style="list-style-type: none"> • 0 specifies serial propagation. • $n > 1$ specifies parallel propagation with n parallel processes. • 1 specifies parallel propagation using only one parallel process. |
| heap_size | Maximum number of transactions to be examined simultaneously for parallel propagation scheduling. Oracle automatically calculates the default setting for optimal performance. |

 **Note:**
Do not set this parameter unless directed to do so by Oracle Support Services.

| | |
|-------------|---|
| job_name | This parameter is needed by the import utility. User should use the default value, NULL. |
| auto_commit | <p>Supported values are NULL, TRUE, and FALSE.</p> <ul style="list-style-type: none"> • NULL—allows the user to continue using DBMS_JOB. • TRUE—commit statement will be automatically issued after the job of the refresh group are created by DBMS_REFRESH.MAKE. • FALSE—user must issue a commit statement to finish the transaction after calling DBMS_REFRESH.MAKE. <p>The default value is NULL.</p> |

Usage Notes

Import utility and export utility need CREATE JOB privilege if DBMS_SCHEDULER jobs are used.

145.3.5 REFRESH Procedure

This procedure manually refreshes a refresh group.

Syntax

```
DBMS_REFRESH.REFRESH (
    name IN VARCHAR2);
```

Parameters

Table 145-6 REFRESH Procedure Parameters

| Parameter | Description |
|-----------|--|
| name | Name of the refresh group that you want to refresh manually. |

145.3.6 SUBTRACT Procedure

This procedure removes materialized views from a refresh group.

Syntax

```
DBMS_REFRESH.SUBTRACT (
  name      IN      VARCHAR2,
  { list    IN      VARCHAR2,
    | tab    IN      DBMS_UTILITY.UNCL_ARRAY, }
  lax       IN      BOOLEAN := FALSE);
```

**Note:**

This procedure is overloaded. The `list` and `tab` parameters are mutually exclusive.

Parameters

Table 145-7 SUBTRACT Procedure Parameters

| Parameter | Description |
|-----------|---|
| name | Name of the refresh group from which you want to remove members, specified as <code>[schema_name.]refresh_group_name</code> . If the schema is not specified, then the current user is the default. |
| list | Comma-delimited list of materialized views that you want to remove from the refresh group. (Synonyms are not supported.) These materialized views can be located in different schemas and have different master tables or master materialized views. However, all of the listed materialized views must be in your current database. Each materialized view is specified as <code>[schema_name.]materialized_view_name</code> . If the schema is not specified, then the refresh group owner is the default. |
| tab | Instead of a comma-delimited list, you can supply a PL/SQL associative array of type <code>DBMS_UTILITY.UNCL_ARRAY</code> , where each element is the name of a materialized view. The first materialized view should be in position 1. The last position must be <code>NULL</code> . Each materialized view is specified as <code>[schema_name.]materialized_view_name</code> . If the schema is not specified, then the refresh group owner is the default. |
| lax | Set this to <code>FALSE</code> if you want Oracle to generate an error message if the materialized view you are attempting to remove is not a member of the refresh group. |

DBMS_REPAIR

The `DBMS_REPAIR` package contains data corruption repair procedures that enable you to detect and repair corrupt blocks in tables and indexes. You can address corruptions where possible and continue to use objects while you attempt to rebuild or repair them.

This chapter contains the following topics:

- [Overview](#)
- [Security Model](#)
- [Constants](#)
- [Operating Notes](#)
- [Exceptions](#)
- [Examples](#)
- [Summary of DBMS_REPAIR Subprograms](#)

See Also:

For detailed information about using the `DBMS_REPAIR` package, see *Oracle Database Administrator's Guide*

146.1 DBMS_REPAIR Overview

The `DBMS_REPAIR` package is intended for use by database administrators only. It is not intended for use by application developers.

146.2 DBMS_REPAIR Security Model

The package is owned by `SYS`. Execution privilege is not granted to other users.

146.3 DBMS_REPAIR Constants

The `DBMS_REPAIR` package defines several enumerated constants that should be used for specifying parameter values. Enumerated constants must be prefixed with the package name. For example, `DBMS_REPAIR.TABLE_OBJECT`.

The following table lists the parameters and the enumerated constants.

Table 146-1 DBMS_REPAIR Parameters with Enumerated Constants

| Parameter | Option | Type | Description |
|---------------|---------------------|--------------------|--|
| object_type | • TABLE_OBJECT | BINARY_INTEGE | - |
| | • INDEX_OBJECT | R | |
| | • CLUSTER_OBJECT | | |
| action | • CREATE_ACTION | BINARY_INTEGE | - |
| | • DROP_ACTION | R | |
| | • PURGE_ACTION | | |
| table_type | • REPAIR_TABLE | BINARY_INTEGE | - |
| | • ORPHAN_TABLE | R | |
| flags | • SKIP_FLAG | BINARY_INTEGE | - |
| | • NOSKIP_FLAG | R | |
| object_id | • ALL_INDEX_ID := 0 | BINARY_INTEGE R | Clean up all objects that qualify |
| wait_for_lock | • LOCK_WAIT := 1 | BINARY_INTEGE | Specifies whether to try getting DML locks on underlying table [[sub]partition] object |
| | • LOCK_NOWAIT := 0 | R | |

 **Note:**

The default table_name will be REPAIR_TABLE when table_type is REPAIR_TABLE, and will be ORPHAN_KEY_TABLE when table_type is ORPHAN_TABLE.

146.4 DBMS_REPAIR Operating Notes

The procedure to create the ORPHAN_KEYS_TABLE is similar to the one used to create the REPAIR_TABLE.

```
CONNECT / AS SYSDBA;
EXEC DBMS_REPAIR.ADMIN_TABLES('ORPHAN_KEYS_TABLE', DBMS_REPAIR.ORPHAN_TABLE,
                             DBMS_REPAIR.CREATE_ACTION);
EXEC DBMS_REPAIR.ADMIN_TABLES('REPAIR_TABLE', DBMS_REPAIR.REPAIR_TABLE,
                             DBMS_REPAIR.CREATE_ACTION);

DESCRIBE ORPHAN_KEYS_TABLE;
DESCRIBE REPAIR_TABLE;
SELECT * FROM ORPHAN_KEYS_TABLE;
SELECT * FROM REPAIR_TABLE;
```

The DBA would create the repair and orphan keys tables once. Subsequent executions of the [CHECK_OBJECT Procedure](#) would add rows into the appropriate table indicating the types of errors found.

The name of the repair and orphan keys tables can be chosen by the user, with the following restriction: the name of the repair table must begin with the 'REPAIR_' prefix, and the name of the orphan keys table must begin with the 'ORPHAN_' prefix. The following code is also legal:

```

CONNECT / AS SYSDBA;
EXEC DBMS_REPAIR.ADMIN_TABLES('ORPHAN_FOOBAR', DBMS_REPAIR.ORPHAN_TABLE,
                             DBMS_REPAIR.CREATE_ACTION);
EXEC DBMS_REPAIR.ADMIN_TABLES('REPAIR_ABCD', DBMS_REPAIR.REPAIR_TABLE,
                             DBMS_REPAIR.CREATE_ACTION);

DESCRIBE ORPHAN_FOOBAR;
DESCRIBE REPAIR_ABCD;
SELECT * FROM ORPHAN_FOOBAR;
SELECT * FROM REPAIR_ABCD;

```

When invoking the [CHECK_OBJECT Procedure](#) the name of the repair and orphan keys tables that were created should be specified correctly, especially if the default values were not used in the [ADMIN_TABLES Procedure](#) or `CREATE_ACTION`.

Other actions in the [ADMIN_TABLES Procedure](#) can be used to purge/delete the `REPAIR_TABLE` and the `ORPHAN_KEYS_TABLE`.

146.5 DBMS_REPAIR Exceptions

The table in this topic describes the exceptions raised by the `DDBMS_REPAIR` subprograms.

Table 146-2 DBMS_REPAIR Exceptions

| Exception | Description | Action |
|-----------|--|--|
| 942 | Reported by <code>DBMS_REPAIR.ADMIN_TABLES</code> during a <code>DROP_ACTION</code> when the specified table doesn't exist. | - |
| 955 | Reported by <code>DBMS_REPAIR.CREATE_ACTION</code> when the specified table already exists. | - |
| 24120 | An invalid parameter was passed to the specified <code>DBMS_REPAIR</code> procedure. | Specify a valid parameter value or use the parameter's default. |
| 24122 | An incorrect block range was specified. | Specify correct values for the <code>BLOCK_START</code> and <code>BLOCK_END</code> parameters. |
| 24123 | An attempt was made to use the specified feature, but the feature is not yet implemented. | Do not attempt to use the feature. |
| 24124 | An invalid <code>ACTION</code> parameter was specified. | Specify <code>CREATE_ACTION</code> , <code>PURGE_ACTION</code> or <code>DROP_ACTION</code> for the <code>ACTION</code> parameter. |
| 24125 | An attempt was made to fix corrupt blocks on an object that has been dropped or truncated since <code>DBMS_REPAIR.CHECK_OBJECT</code> was run. | Use <code>DBMS_REPAIR.ADMIN_TABLES</code> to purge the repair table and run <code>DBMS_REPAIR.CHECK_OBJECT</code> to determine whether there are any corrupt blocks to be fixed. |
| 24127 | <code>TABLESPACE</code> parameter specified with an <code>ACTION</code> other than <code>CREATE_ACTION</code> . | Do not specify <code>TABLESPACE</code> when performing actions other than <code>CREATE_ACTION</code> . |
| 24128 | A partition name was specified for an object that is not partitioned. | Specify a partition name only if the object is partitioned. |

Table 146-2 (Cont.) DBMS_REPAIR Exceptions

| Exception | Description | Action |
|-----------|--|---|
| 24129 | An attempt was made to pass a table name parameter without the specified prefix. | Pass a valid table name parameter. |
| 24130 | An attempt was made to specify a repair or orphan table that does not exist. | Specify a valid table name parameter. |
| 24131 | An attempt was made to specify a repair or orphan table that does not have a correct definition. | Specify a table name that refers to a properly created table. |
| 24132 | An attempt was made to specify a table name is greater than 30 characters long. | Specify a valid table name parameter. |

146.6 DBMS_REPAIR Examples

This topic shows examples of DBMS_REPAIR usage.

```
/* Fix the bitmap status for all the blocks in table mytab in schema sys */
EXECUTE DBMS_REPAIR.SEGMENT_FIX_STATUS('SYS', 'MYTAB');

/* Mark block number 45, filenumber 1 for table mytab in sys schema as FULL.*/
EXECUTE DBMS_REPAIR.SEGMENT_FIX_STATUS('SYS', 'MYTAB', TABLE_OBJECT,1, 45, 1);
```

146.7 Summary of DBMS_REPAIR Subprograms

This table lists the DBMS_REPAIR subprograms and briefly describes them.

Table 146-3 DBMS_REPAIR Package Subprograms

| Subprogram | Description |
|--|---|
| ADMIN_TABLES Procedure | Provides administrative functions for the DBMS_REPAIR package repair and orphan key tables, including create, purge, and drop functions |
| CHECK_OBJECT Procedure | Detects and reports corruptions in a table or index |
| DUMP_ORPHAN_KEYS Procedure | Reports on index entries that point to rows in corrupt data blocks |
| FIX_CORRUPT_BLOCKS Procedure | Marks blocks software corrupt that have been previously detected as corrupt by CHECK_OBJECT |
| ONLINE_INDEX_CLEAN Function | Performs a manual cleanup of failed or interrupted online index builds or rebuilds |
| REBUILD_FREELISTS Procedure | Rebuilds an object's freelists |
| SEGMENT_FIX_STATUS Procedure | Fixes the corrupted state of a bitmap entry |

Table 146-3 (Cont.) DBMS_REPAIR Package Subprograms

| Subprogram | Description |
|---|--|
| SKIP_CORRUPT_BLOCKS Procedure | Sets whether to ignore blocks marked corrupt during table and index scans or to report ORA-1578 when blocks marked corrupt are encountered |

146.7.1 ADMIN_TABLES Procedure

This procedure provides administrative functions for the DBMS_REPAIR package repair and orphan key tables.

Syntax

```
DBMS_REPAIR.ADMIN_TABLES (
  table_name IN VARCHAR2,
  table_type IN BINARY_INTEGER,
  action IN BINARY_INTEGER,
  tablespace IN VARCHAR2 DEFAULT NULL);
```

Parameters

Table 146-4 ADMIN_TABLES Procedure Parameters

| Parameter | Description |
|------------|---|
| table_name | Name of the table to be processed. Defaults to ORPHAN_KEY_TABLE or REPAIR_TABLE based on the specified table_type. When specified, the table name must have the appropriate prefix: ORPHAN_ or REPAIR_. |
| table_type | Type of table; must be either ORPHAN_TABLE or REPAIR_TABLE. See " Constants ". |
| action | Indicates what administrative action to perform. Must be either CREATE_ACTION, PURGE_ACTION, or DROP_ACTION. If the table already exists, and if CREATE_ACTION is specified, then an error is returned. PURGE_ACTION indicates to delete all rows in the table that are associated with non-existent objects. If the table does not exist, and if DROP_ACTION is specified, then an error is returned. When CREATE_ACTION and DROP_ACTION are specified, an associated view named DBA_<table_name> is created and dropped respectively. The view is defined so that rows associated with non-existent objects are eliminated. Created in the SYS schema. See " Constants ". |
| tablespace | Indicates the tablespace to use when creating a table. By default, the SYS default tablespace is used. An error is returned if the tablespace is specified and if the action is not CREATE_ACTION. |

146.7.2 CHECK_OBJECT Procedure

This procedure checks the specified objects and populates the repair table with information about corruptions and repair directives.

Validation consists of block checking all blocks in the object.

Syntax

```
DBMS_REPAIR.CHECK_OBJECT (
  schema_name      IN VARCHAR2,
  object_name      IN VARCHAR2,
  partition_name   IN VARCHAR2      DEFAULT NULL,
  object_type      IN BINARY_INTEGER DEFAULT TABLE_OBJECT,
  repair_table_name IN VARCHAR2      DEFAULT 'REPAIR_TABLE',
  flags           IN BINARY_INTEGER DEFAULT NULL,
  relative_fno    IN BINARY_INTEGER DEFAULT NULL,
  block_start     IN BINARY_INTEGER DEFAULT NULL,
  block_end       IN BINARY_INTEGER DEFAULT NULL,
  corrupt_count   OUT BINARY_INTEGER);
```

Parameters

Table 146-5 CHECK_OBJECT Procedure Parameters

| Parameter | Description |
|-------------------|---|
| schema_name | Schema name of the object to be checked. |
| object_name | Name of the table or index to be checked. |
| partition_name | Partition or subpartition name to be checked. If this is a partitioned object, and if <code>partition_name</code> is not specified, then all partitions and subpartitions are checked. If this is a partitioned object, and if the specified partition contains subpartitions, then all subpartitions are checked. |
| object_type | Type of the object to be processed. This must be either <code>TABLE_OBJECT</code> (default) or <code>INDEX_OBJECT</code> . See " Constants ". |
| repair_table_name | Name of the repair table to be populated. The table must exist in the <code>SYS</code> schema. Use the <code>ADMIN_TABLES</code> Procedure to create a repair table. The default name is <code>REPAIR_TABLE</code> . |
| flags | Reserved for future use. |
| relative_fno | Relative file number: Used when specifying a block range. |
| block_start | First block to process if specifying a block range. May be specified only if the object is a single table, partition, or subpartition. |
| block_end | Last block to process if specifying a block range. May be specified only if the object is a single table, partition, or subpartition. If only one of <code>block_start</code> or <code>block_end</code> is specified, then the other defaults to the first or last block in the file respectively. |
| corrupt_count | Number of corruptions reported. |

Usage Notes

You may optionally specify a DBA range, partition name, or subpartition name when you want to check a portion of an object.

146.7.3 DUMP_ORPHAN_KEYS Procedure

This procedure reports on index entries that point to rows in corrupt data blocks. For each such index entry encountered, a row is inserted into the specified orphan table.

If the repair table is specified, then any corrupt blocks associated with the base table are handled in addition to all data blocks that are marked software corrupt. Otherwise, only blocks that are marked corrupt are handled.

This information may be useful for rebuilding lost rows in the table and for diagnostic purposes.

Syntax

```
DBMS_REPAIR.DUMP_ORPHAN_KEYS (
  schema_name      IN VARCHAR2,
  object_name      IN VARCHAR2,
  partition_name   IN VARCHAR2      DEFAULT NULL,
  object_type      IN BINARY_INTEGER DEFAULT INDEX_OBJECT,
  repair_table_name IN VARCHAR2      DEFAULT 'REPAIR_TABLE',
  orphan_table_name IN VARCHAR2      DEFAULT 'ORPHAN_KEYS_TABLE',
  flags           IN BINARY_INTEGER DEFAULT NULL,
  key_count       OUT BINARY_INTEGER);
```

Parameters

Table 146-6 DUMP_ORPHAN_KEYS Procedure Parameters

| Parameter | Description |
|-------------------|---|
| schema_name | Schema name. |
| object_name | Object name. |
| partition_name | Partition or subpartition name to be processed. If this is a partitioned object, and if <code>partition_name</code> is not specified, then all partitions and subpartitions are processed. If this is a partitioned object, and if the specified partition contains subpartitions, then all subpartitions are processed. |
| object_type | Type of the object to be processed. The default is <code>INDEX_OBJECT</code> . See " Constants ". |
| repair_table_name | Name of the repair table that has information regarding corrupt blocks in the base table. The specified table must exist in the <code>SYS</code> schema. The <code>ADMIN_TABLES</code> Procedure is used to create the table. |
| orphan_table_name | Name of the orphan key table to populate with information regarding each index entry that refers to a row in a corrupt data block. The specified table must exist in the <code>SYS</code> schema. The <code>ADMIN_TABLES</code> Procedure is used to create the table. |
| flags | Reserved for future use. |

Table 146-6 (Cont.) DUMP_ORPHAN_KEYS Procedure Parameters

| Parameter | Description |
|-----------|------------------------------------|
| key_count | Number of index entries processed. |

146.7.4 FIX_CORRUPT_BLOCKS Procedure

This procedure fixes the corrupt blocks in specified objects based on information in the repair table that was previously generated by the CHECK_OBJECT Procedure.

Prior to effecting any change to a block, the block is checked to ensure the block is still corrupt. Corrupt blocks are repaired by marking the block software corrupt. When a repair is effected, the associated row in the repair table is updated with a fix timestamp.

Syntax

```
DBMS_REPAIR.FIX_CORRUPT_BLOCKS (
  schema_name      IN  VARCHAR2,
  object_name      IN  VARCHAR2,
  partition_name   IN  VARCHAR2      DEFAULT NULL,
  object_type      IN  BINARY_INTEGER DEFAULT TABLE_OBJECT,
  repair_table_name IN  VARCHAR2      DEFAULT 'REPAIR_TABLE',
  flags           IN  BINARY_INTEGER DEFAULT NULL,
  fix_count       OUT BINARY_INTEGER);
```

Parameters

Table 146-7 FIX_CORRUPT_BLOCKS Procedure Parameters

| Parameter | Description |
|-------------------|--|
| schema_name | Schema name. |
| object_name | Name of the object with corrupt blocks to be fixed. |
| partition_name | Partition or subpartition name to be processed. If this is a partitioned object, and if partition_name is not specified, then all partitions and subpartitions are processed. If this is a partitioned object, and if the specified partition contains subpartitions, then all subpartitions are processed. |
| object_type | Type of the object to be processed. This must be either TABLE_OBJECT (default) or INDEX_OBJECT. See " Constants ". |
| repair_table_name | Name of the repair table with the repair directives. Must exist in the SYS schema. |
| flags | Reserved for future use. |
| fix_count | Number of blocks fixed. |

Related Topics

- [CHECK_OBJECT Procedure](#)
This procedure checks the specified objects and populates the repair table with information about corruptions and repair directives.

146.7.5 ONLINE_INDEX_CLEAN Function

This function performs a manual cleanup of failed or interrupted online index builds or rebuilds.

This action is also performed periodically by SMON, regardless of user-initiated cleanup.

This function returns `TRUE` if all indexes specified were cleaned up and `FALSE` if one or more indexes could not be cleaned up.

Syntax

```
DBMS_REPAIR.ONLINE_INDEX_CLEAN (
    object_id      IN BINARY_INTEGER DEFAULT ALL_INDEX_ID,
    wait_for_lock  IN BINARY_INTEGER DEFAULT LOCK_WAIT)
RETURN BOOLEAN;
```

Parameters

Table 146-8 ONLINE_INDEX_CLEAN Function Parameters

| Parameter | Description |
|----------------------------|--|
| <code>object_id</code> | Object id of index to be cleaned up. The default cleans up all object ids that qualify. |
| <code>wait_for_lock</code> | This parameter specifies whether to try getting DML locks on underlying table [[sub]partition] object. The default retries up to an internal retry limit, after which the lock get will give up. If <code>LOCK_NOWAIT</code> is specified, then the lock get does not retry. |

146.7.6 REBUILD_FREELISTS Procedure

This procedure rebuilds the freelists for the specified object.

All free blocks are placed on the master freelist. All other freelists are zeroed.

If the object has multiple freelist groups, then the free blocks are distributed among all freelists, allocating to the different groups in round-robin fashion.

Syntax

```
DBMS_REPAIR.REBUILD_FREELISTS (
    schema_name    IN VARCHAR2,
    object_name    IN VARCHAR2,
    partition_name IN VARCHAR2 DEFAULT NULL,
    object_type    IN BINARY_INTEGER DEFAULT TABLE_OBJECT);
```

Parameters

Table 146-9 REBUILD_FREELISTS Procedure Parameters

| Parameter | Description |
|--------------------------|---|
| <code>schema_name</code> | Schema name. |
| <code>object_name</code> | Name of the object whose freelists are to be rebuilt. |

Table 146-9 (Cont.) REBUILD_FREELISTS Procedure Parameters

| Parameter | Description |
|----------------|--|
| partition_name | Partition or subpartition name whose freelists are to be rebuilt. If this is a partitioned object, and partition_name is not specified, then all partitions and subpartitions are processed. If this is a partitioned object, and the specified partition contains subpartitions, then all subpartitions are processed. |
| object_type | Type of the object to be processed. This must be either TABLE_OBJECT (default) or INDEX_OBJECT. See " Constants ". |

146.7.7 SEGMENT_FIX_STATUS Procedure

With this procedure you can fix the corrupted state of a bitmap entry. The procedure either recalculates the state based on the current contents of the corresponding block or sets the state to a specific value.

Syntax

```
DBMS_REPAIR.SEGMENT_FIX_STATUS (
    segment_owner  IN VARCHAR2,
    segment_name   IN VARCHAR2,
    segment_type   IN BINARY_INTEGER DEFAULT TABLE_OBJECT,
    file_number    IN BINARY_INTEGER DEFAULT NULL,
    block_number   IN BINARY_INTEGER DEFAULT NULL,
    status_value   IN BINARY_INTEGER DEFAULT NULL,
    partition_name IN VARCHAR2 DEFAULT NULL,);
```

Parameters

Table 146-10 SEGMENT_FIX_STATUS Procedure Parameters

| Parameter | Description |
|----------------|---|
| schema_owner | Schema name of the segment. |
| segment_name | Segment name. |
| partition_name | Optional. Name of an individual partition. NULL for nonpartitioned objects. Default is NULL. |
| segment_type | Optional Type of the segment (for example, TABLE_OBJECT or INDEX_OBJECT). Default is NULL. |
| file_number | (optional) The tablespace-relative file number of the data block whose status has to be fixed. If omitted, all the blocks in the segment will be checked for state correctness and fixed. |
| block_number | (optional) The file-relative block number of the data block whose status has to be fixed. If omitted, all the blocks in the segment will be checked for state correctness and fixed. |

Table 146-10 (Cont.) SEGMENT_FIX_STATUS Procedure Parameters

| Parameter | Description |
|--------------|---|
| status_value | <p>(optional) The value to which the block status described by the <code>file_number</code> and <code>block_number</code> will be set. If omitted, the status will be set based on the current state of the block. This is almost always the case, but if there is a bug in the calculation algorithm, the value can be set manually. Status values:</p> <ul style="list-style-type: none"> • 1 = block is full • 2 = block is 0-25% free • 3 = block is 25-50% free • 4 = block is 50-75% free • 5 = block is 75-100% free <p>The status for bitmap blocks, segment headers, and extent map blocks cannot be altered. The status for blocks in a fixed hash area cannot be altered. For index blocks, there are only two possible states: 1 = block is full and 3 = block has free space.</p> |

146.7.8 SKIP_CORRUPT_BLOCKS Procedure

This procedure enables or disables the skipping of corrupt blocks during index and table scans of the specified object.

When the object is a table, skip applies to the table and its indexes. When the object is a cluster, it applies to all of the tables in the cluster, and their respective indexes.

Note:

When Oracle performs an index range scan on a corrupt index after DBMS_REPAIR.SKIP_CORRUPT_BLOCKS has been set for the base table, corrupt branch blocks and root blocks are not skipped. Only corrupt non-root leaf blocks are skipped.

Syntax

```
DBMS_REPAIR.SKIP_CORRUPT_BLOCKS (
  schema_name  IN VARCHAR2,
  object_name  IN VARCHAR2,
  object_type  IN BINARY_INTEGER DEFAULT TABLE_OBJECT,
  flags        IN BINARY_INTEGER DEFAULT SKIP_FLAG);
```

Parameters

Table 146-11 SKIP_CORRUPT_BLOCKS Procedure Parameters

| Parameter | Description |
|-------------|--|
| schema_name | Schema name of the object to be processed. |
| object_name | Name of the object. |

Table 146-11 (Cont.) SKIP_CORRUPT_BLOCKS Procedure Parameters

| Parameter | Description |
|-------------|---|
| object_type | Type of the object to be processed. This must be either TABLE_OBJECT (default) or CLUSTER_OBJECT. See "Constants". |
| flags | If SKIP_FLAG is specified, then it turns on the skip of software corrupt blocks for the object during index and table scans. If NOSKIP_FLAG is specified, then scans that encounter software corrupt blocks return an ORA-1578. See "Constants". |

DBMS_RESCONFIG

The `DBMS_RESCONFIG` package provides an interface to operate on the resource configuration list, and to retrieve listener information for a resource.

This chapter contains the following topics:

- [Overview](#)
- [Summary of DBMS_RESCONFIG Subprograms](#)

See Also:

Oracle XML DB Developer's Guide for more information about "Resource Configuration".

147.1 DBMS_RESCONFIG Overview

The `DBMS_RESCONFIG` package contains functions and procedures to manage the resource configuration lists of individual resources and the repository.

147.2 Summary of DBMS_RESCONFIG Subprograms

This table lists and briefly describes the `DBMS_RESCONFIG` package subprograms.

Table 147-1 DBMS_RESCONFIG Package Subprograms

| Subprogram | Description |
|---|--|
| ADDREPOSITORYRESCONFIG Procedure | Inserts the resource configuration specified by absolute path at the given position of the repository's configuration list |
| ADDRESCONFIG Procedure | Inserts the resource configuration specified by the absolute path at the given position in the target resource's configuration list |
| APPENDRESCONFIG Procedure | Appends the resource configuration specified by rcpath to the target resource's configuration list if it is not already included in the list |
| DELETEREPOSITORYRESCONFIG Procedure | Removes the configuration at the given position in the repository's configuration list. |
| DELETERESCONFIG Procedures | Removes the configuration at the given position in the target resource's configuration list. |
| GETLISTENERS Function | Returns the list of listeners applicable for a given resource |
| GETREPOSITORYRESCONFIG Function | Returns the resource configuration at the specified position of the repository's configuration list |

Table 147-1 (Cont.) DBMS_RESCONFIG Package Subprograms

| Subprogram | Description |
|--|--|
| GETREPOSITORYRESCONFIGPATHS Function | Returns a list of resource configuration paths defined for the repository |
| GETRESCONFIG Function | Returns the resource configuration at the specified position of the target resource's configuration list |
| GETRESCONFIGPATHS Function | Returns a list of resource configuration paths defined in the target resource's configuration list |
| PATCHREPOSITORYRESCONFIGLIST Procedure | Removes invalid references from the repository resource configuration list, and makes the repository available |

147.2.1 ADDREPOSITORYRESCONFIG Procedure

This procedure inserts the resource configuration specified by absolute path of the resource configuration at the specified position of the repository's configuration list. It shifts the element currently at that position (if any) and any subsequent elements to the right.

Syntax

```
DBMS_RESCONFIG.ADDREPOSITORYRESCONFIG (
    rcpath      IN   VARCHAR2,
    pos         IN   PLS_INTEGER := NULL);
```

Parameters

Table 147-2 ADDREPOSITORYRESCONFIG Function Parameters

| Parameter | Description |
|-----------|---|
| rcpath | Absolute path of the resource configuration to be inserted. An exception is raised if <code>rcpath</code> already exists in the target's configuration list. |
| pos | Index at which the new configuration is to be inserted. If this parameter is not specified then the new configuration is appended to the end of the list. An exception is raised if the index is out of range (<code>pos < 0</code> or <code>pos ></code> the size of the target resource's configuration list). |

Usage Notes

- An error is raised if the document referenced by `rcpath` is not based on `XDBResConfig.xsd` schema.
- Users must have `XDBADMIN` role and `READ` privilege on the resource configuration to be inserted; otherwise, an error is returned.

147.2.2 ADDRESCONFIG Procedure

This procedure inserts the resource configuration specified by the absolute path of the resource configuration at the given position in the target resource's configuration list. It

shifts the element currently at that position (if any) and any subsequent elements to the right.

Syntax

```
DBMS_RESCONFIG.ADDRESCONFIG (
    respath    IN    VARCHAR2,
    rcpath     IN    VARCHAR2,
    pos        IN    PLS_INTEGER := NULL);
```

Parameters

Table 147-3 ADDRESCONFIG Function Parameters

| Parameter | Description |
|-----------|---|
| respath | Absolute path of the target resource |
| rcpath | Absolute path of the resource configuration to be inserted. An exception is raised if rcpath already exists in the target's configuration list. |
| pos | Index at which the new configuration is to be inserted. If this parameter is not specified then the new configuration is appended to the end of the list. An exception is raised if the index is out of range ($pos < 0$ or $pos >$ the size of the target resource's configuration list). |

Usage Notes

- An error is raised if the document referenced by rcpath is not based on XDBResConfig.xsd schema.
- Users must have WRITE-CONFIG privilege on the target resource and read privilege on the resource configuration to be inserted; otherwise, an error is returned.

147.2.3 APPENDRESCONFIG Procedure

This procedure appends the resource configuration specified by rcpath to the target resource's configuration list if it is not already included in the list.

Syntax

```
DBMS_RESCONFIG.ADDRESCONFIG (
    respath      IN    VARCHAR2,
    rcpath       IN    VARCHAR2,
    appendOption IN    PLS_INTEGER);
```

Parameters

Table 147-4 ADDRESCONFIG Function Parameters

| Parameter | Description |
|-----------|--|
| respath | Absolute path of the target resource |
| rcpath | Absolute path of the resource configuration to be appended at the end of the target's configuration list. If rcpath already exists in the list then nothing is appended. |

Table 147-4 (Cont.) ADDRESCONFIG Function Parameters

| Parameter | Description |
|--------------|--|
| appendOption | Either APPEND_RESOURCE or APPEND_RECURSIVE. If APPEND_RESOURCE is specified then only the target resource is affected. If APPEND_RECURSIVE is specified then the target resource and all its descendents will be affected. |

Usage Notes

- An error is raised if the document referenced by rcpath is not based on XDBResConfig.xsd schema.
- Users must have WRITE-CONFIG privilege on all affected resources and required read privilege on the resource configuration to be inserted; otherwise, an error is returned.

147.2.4 DELETEREPOSITORYRESCONFIG Procedure

This procedure removes the configuration at the given position in the repository's configuration list. It shifts any subsequent elements to the left.

Syntax

```
DBMS_RESCONFIG.DELETEREPOSITORYRESCONFIG (
    pos          IN    PLS_INTEGER);
```

Parameters

Table 147-5 DELETEREPOSITORYRESCONFIG Function Parameters

| Parameter | Description |
|-----------|---|
| pos | The index of the configuration to be removed. An exception is raised if the index is out of range (pos < 0 or pos >= the size of the target resource's configuration list). |

Usage Notes

- Users must have XDBADMIN role to execute this.
- This statement is treated as if it is a DDL statement. This means the system will implicitly commit before and after this statement.

147.2.5 DELETERESCONFIG Procedures

This procedure removes the configuration at the given position in the target resource's configuration list. It shifts any subsequent elements to the left. Users can use the overloaded for recursive deletion.

Syntax

```
DBMS_RESCONFIG.DELETERESCONFIG (
    respath      IN  VARCHAR2,
    pos          IN  PLS_INTEGER);
```

```
DBMS_RESCONFIG.DELETERESCONFIG (
    respath      IN  VARCHAR2,
    rcpath       IN  VARCHAR2,
    deleteOption IN  PLS_INTEGER);
```

Parameters

Table 147-6 DELETERESCONFIG Procedure Parameters

| Parameter | Description |
|--------------|---|
| respath | Absolute path of the target resource |
| pos | The index of the configuration to be removed. An exception is raised if the index is out of range ($pos < 0$ or $pos \geq$ the size of the target resource's configuration list). |
| rcpath | Absolute path of the resource configuration to be deleted if found in list. |
| deleteOption | Either <code>DELETE_RESOURCE</code> or <code>DELETE_RECURSIVE</code> . If <code>DELETE_RESOURCE</code> is specified then only the configuration list of the target resource is affected. If <code>DELETE_RECURSIVE</code> is specified then the configuration list of the target resource and all its descendents will be affected. |

Usage Notes

Users must have `WRITE-CONFIG` privilege on the target resource to execute this.

147.2.6 GETLISTENERS Function

This function returns the list of listeners applicable for a given resource.

The value returned by this function is an XML document containing the `<event-listeners>` element of the `XDBResconfig.xsd` schema. It contains all the listeners applicable to the target resource, including repository-level listeners. From the returned XML document users can use the `EXTRACT` operator to retrieve the listeners defined for a specific event.

Syntax

```
DBMS_RESCONFIG.GETLISTENERS (
    path  IN  VARCHAR2)
RETURN XMLTYPE;
```

Parameters

Table 147-7 GETLISTENERS Function Parameters

| Parameter | Description |
|-----------|--------------------------------------|
| path | Absolute path of the target resource |

Usage Notes

Users must have the required access privilege on all resource configurations referenced by the repository and the target resource; otherwise, an error is returned.

147.2.7 GETREPOSITORYRESCONFIG Function

This function returns the resource configuration at the specified position of the repository's configuration list.

Syntax

```
DBMS_RESCONFIG.GETREPOSITORYRESCONFIG (
    pos    IN    PLS_INTEGER)
RETURN XMLTYPE;
```

Parameters

Table 147-8 GETREPOSITORYRESCONFIG Function Parameters

| Parameter | Description |
|-----------|---|
| pos | Index of element to return. An exception is raised if the index is out of range ($pos < 0$ or $pos \geq$ the size of the repository's configuration list). |

Usage Notes

Users must have the required read privilege on the requested resource configuration; otherwise, an error is returned.

147.2.8 GETREPOSITORYRESCONFIGPATHS Function

This function returns a list of resource configuration paths defined for the repository.

Syntax

```
DBMS_RESCONFIG.GETREPOSITORYRESCONFIGPATHS
RETURN XDB$STRING_LIST_T;
```

Usage Notes

Users must be able to access all the referenced resource configurations; otherwise, an error is returned.

147.2.9 GETRESCONFIG Function

This function returns the resource configuration at the specified position of the target resource's configuration list.

Syntax

```
DBMS_RESCONFIG.GETRESCONFIG(  
    respath IN VARCHAR2,  
    pos IN PLS_INTEGER)  
RETURN XMLTYPE;
```

Parameters

Table 147-9 GETRESCONFIG Function Parameters

| Parameter | Description |
|-----------|--|
| respath | Absolute path of the target resource |
| pos | Index of element to return. An exception is raised if the index is out of range ($pos < 0$ or $pos \geq$ the size of the target resource's configuration list). |

Usage Notes

Users must have the required read privilege on the requested resource configuration; otherwise, an error is returned.

147.2.10 GETRESCONFIGPATHS Function

This function returns a list of resource configuration paths defined in the target resource's configuration list.

Syntax

```
DBMS_RESCONFIG.GETRESCONFIGPATHS(  
    respath IN VARCHAR2)  
RETURN XDB$STRING_LIST_T;
```

Parameters

Table 147-10 GETRESCONFIGPATHS Function Parameters

| Parameter | Description |
|-----------|--------------------------------------|
| respath | Absolute path of the target resource |

Usage Notes

Users must be able to access all the referenced resource configurations; otherwise, an error is returned.

147.2.11 PATCHREPOSITORYRESCONFIGLIST Procedure

This procedure removes invalid references from the repository resource configuration list, and makes the repository available.

Under normal circumstances, deletion of a resource configuration resource cannot be performed if it is part of the repository resource configuration list. If, for some reason, the deletion of a resource configuration resource that is part of the repository resource configuration list succeeds, then any repository operation results in a 'dangling reference' error. This procedure removes those invalid references.

This procedure must be run as `SYS`.

Syntax

```
DBMS_RESCONFIG.PATCHREPOSITORYRESCONFIGLIST;
```

DBMS_RESOURCE_MANAGER

The `DBMS_RESOURCE_MANAGER` package maintains plans, consumer groups, and plan directives. It also provides semantics so that you may group together changes to the plan schema.

This chapter contains the following topics:

- [Deprecated Subprograms](#)
- [Security Model](#)
- [Constants](#)
- [Summary of DBMS_RESOURCE_MANAGER Subprograms](#)

 **See Also:**

For more information on using the Database Resource Manager, see *Oracle Database Administrator's Guide*

148.1 DBMS_RESOURCE_MANAGER Deprecated Subprograms

The `SET_INITIAL_CONSUMER_GROUP` Procedure has been deprecated with Oracle Database 11g.

- [SET_INITIAL_CONSUMER_GROUP Procedure](#)

 **Note:**

Oracle recommends that you do not use deprecated procedures in new applications. Support for deprecated features is for backward compatibility only.

148.2 DBMS_RESOURCE_MANAGER Security Model

The invoker must have the `ADMINISTER_RESOURCE_MANAGER` system privilege to execute these procedures.

The procedures to grant and revoke this privilege are in the package [DBMS_RESOURCE_MANAGER_PRIVS](#).

148.3 DBMS_RESOURCE_MANAGER Constants

The `DBMS_RESOURCE_MANAGER` package defines several constants for specifying parameter values.

These are shown in the following table.

Table 148-1 DBMS_RESOURCE_MANAGER Constants

| Constant | Type | Value | Description |
|---------------------------------|----------------------------|---------------------------------|--|
| <code>CLIENT_ID</code> | <code>VARCHAR2 (30)</code> | <code>CLIENT_ID</code> | Client identifier of the session |
| <code>CLIENT_MACHINE</code> | <code>VARCHAR2 (30)</code> | <code>CLIENT_MACHINE</code> | Name of the computer from which the client is making the connection |
| <code>CLIENT_OS_USER</code> | <code>VARCHAR2 (30)</code> | <code>CLIENT_OS_USER</code> | Operating system user name of the client that is logging in |
| <code>CLIENT_PROGRAM</code> | <code>VARCHAR2 (30)</code> | <code>CLIENT_PROGRAM</code> | Name of the client program used to log in to the server |
| <code>MODULE_NAME</code> | <code>VARCHAR2 (30)</code> | <code>MODULE_NAME</code> | Module name in the currently running application as set by the SET_MODULE Procedure in the DBMS_APPLICATION_INFO package, or the equivalent OCI attribute setting |
| <code>MODULE_NAME_ACTION</code> | <code>VARCHAR2 (30)</code> | <code>MODULE_NAME_ACTION</code> | A combination of the current module and the action being performed as set by either of the following procedures in the DBMS_APPLICATION_INFO package, or their equivalent OCI attribute setting: <ul style="list-style-type: none"> SET_MODULE Procedure SET_ACTION Procedure The attribute is specified as the module name followed by a period (<code>.</code>), followed by the action name (<code>module_name.action_name</code>). |
| <code>ORACLE_FUNCTION</code> | <code>VARCHAR2 (30)</code> | <code>ORACLE_FUNCTION</code> | Function the session is currently executing. Valid functions are the <code>BACKUP</code> , <code>COPY</code> , <code>DATALOAD</code> , and <code>INMEMORY</code> . <code>BACKUP</code> is set for sessions that are doing backup operations using <code>RMAN</code> . <code>COPY</code> is set for sessions that are doing image copies using <code>RMAN</code> . <code>DATALOAD</code> is set for sessions that are loading data using Oracle Data Pump. |
| <code>ORACLE_USER</code> | <code>VARCHAR2 (30)</code> | <code>ORACLE_USER</code> | Oracle Database user name |

Table 148-1 (Cont.) DBMS_RESOURCE_MANAGER Constants

| Constant | Type | Value | Description |
|-----------------------|---------------|-----------------------|--|
| SERVICE_MODULE | VARCHAR2 (30) | SERVICE_MODULE | Combination of service and module names in this form: <i>service_name.module_name</i> |
| SERVICE_MODULE_ACTION | VARCHAR2 (30) | SERVICE_MODULE_ACTION | Combination of service name, module name, and action name, in this form: <i>service_name.module_name.action_name</i> |
| SERVICE_NAME | VARCHAR2 (30) | SERVICE_NAME | Service name used by the client to establish a connection |

148.4 Summary of DBMS_RESOURCE_MANAGER Subprograms

This table lists the DBMS_RESOURCE_MANAGER subprograms and briefly describes them.

Table 148-2 DBMS_RESOURCE_MANAGER Package Subprograms

| Subprogram | Description |
|--|---|
| BEGIN_SQL_BLOCK Procedure | Indicates the start of a block of SQL statements to be treated as a group by resource manager |
| CALIBRATE_IO Procedure | Calibrates the I/O capabilities of storage |
| CLEAR_PENDING_AREA Procedure | Clears the work area for the resource manager |
| CREATE_CATEGORY Procedure | Creates a new resource consumer group category |
| CREATE_CDB_PLAN Procedure | Creates entries which define consolidation resource plans. |
| CREATE_CDB_PLAN_DIRECTIVE Procedure | Creates the plan directives of the consolidation resource plan |
| CREATE_CDB_PROFILE_DIRECTIVE Procedure | Creates the performance profile directives of the consolidation resource plan |
| CREATE_CONSUMER_GROUP Procedure | Creates entries which define resource consumer groups |
| CREATE_PENDING_AREA Procedure | Creates a work area for changes to resource manager objects |
| CREATE_PLAN Procedure | Creates entries which define resource plans |
| CREATE_PLAN_DIRECTIVE Procedure | Creates resource plan directives |
| CREATE_SIMPLE_PLAN Procedure | Creates a single-level resource plan containing up to eight consumer groups in one step |
| DELETE_CATEGORY Procedure | Deletes an existing resource consumer group category |
| DELETE_CDB_PLAN Procedure | Deletes the consolidation resource plan |
| DELETE_CDB_PLAN_DIRECTIVE Procedure | Deletes the plan directive of the consolidation resource plan |

Table 148-2 (Cont.) DBMS_RESOURCE_MANAGER Package Subprograms

| Subprogram | Description |
|--|--|
| DELETE_CDB_PROFILE_DIRECTIVE Procedure | Deletes the performance profile directive of the consolidation resource plan |
| DELETE_CONSUMER_GROUP Procedure | Deletes entries which define resource consumer groups |
| DELETE_PLAN Procedure | Deletes the specified plan as well as all the plan directives it refers to |
| DELETE_PLAN_CASCADE Procedure | Deletes the specified plan as well as all its descendants (plan directives, subplans, consumer groups) |
| DELETE_PLAN_DIRECTIVE Procedure | Deletes resource plan directives |
| DEQUEUE_PARALLEL_STATEMENT Procedure | Dequeues a parallel statement from the parallel statement queue |
| END_SQL_BLOCK Procedure | Indicates the end of a block of SQL statements that should be treated as a group by resource manager |
| SET_CONSUMER_GROUP_MAPPING Procedure | Adds, deletes, or modifies entries for the login and run-time attribute mappings |
| SET_CONSUMER_GROUP_MAPPING_PRI Procedure | Creates the session attribute mapping priority list |
| SET_INITIAL_CONSUMER_GROUP Procedure | Assigns the initial resource consumer group for a user (Caution: Deprecated Subprogram) |
| SUBMIT_PENDING_AREA Procedure | Submits pending changes for the resource manager |
| SWITCH_CONSUMER_GROUP_FOR_SESS Procedure | Changes the resource consumer group of a specific session |
| SWITCH_CONSUMER_GROUP_FOR_USER Procedure | Changes the resource consumer group for all sessions with a given user name |
| SWITCH_PLAN Procedure | Sets the current resource manager plan |
| UPDATE_CATEGORY Procedure | Updates an existing resource consumer group category |
| UPDATE_CDB_AUTOTASK_DIRECTIVE Procedure | Updates the plan directives with regard to automated maintenance tasks |
| UPDATE_CDB_DEFAULT_DIRECTIVE Procedure | Updates the default values for a consolidation plan |
| UPDATE_CDB_PLAN Procedure | Updates the consolidation resource plan |
| UPDATE_CDB_PLAN_DIRECTIVE Procedure | Updates the plan directives for a consolidation resource plan |
| UPDATE_CDB_PROFILE_DIRECTIVE Procedure | Updates the performance profile directives of the consolidation resource plan |
| UPDATE_CONSUMER_GROUP Procedure | Updates entries which define resource consumer groups |
| UPDATE_PLAN Procedure | Updates entries which define resource plans |
| UPDATE_PLAN_DIRECTIVE Procedure | Updates resource plan directives |
| VALIDATE_PENDING_AREA Procedure | Validates pending changes for the resource manager |

148.4.1 BEGIN_SQL_BLOCK Procedure

This procedure, to be used with parallel statement queuing, indicates the start of a block of SQL statements that should be treated as a group by resource manager.

Syntax

```
DBMS_RESOURCE_MANAGER.BEGIN_SQL_BLOCK;
```

Usage Notes

For more information, see "Parallel Statement Queuing" and "Managing Parallel Statement Queuing with Resource Manager" in *Oracle Database VLDB and Partitioning Guide*.

148.4.2 CALIBRATE_IO Procedure

This procedure calibrates the I/O capabilities of storage. Calibration status is available from the `V$IO_CALIBRATION_STATUS` view and results for a successful calibration run are located in `DBA_RSRC_IO_CALIBRATE` table.

Syntax

```
DBMS_RESOURCE_MANAGER.CALIBRATE_IO (
  num_physical_disks    IN PLS_INTEGER DEFAULT 1,
  max_latency           IN PLS_INTEGER DEFAULT 20,
  max_iops              OUT PLS_INTEGER,
  max_mbps              OUT PLS_INTEGER,
  actual_latency        OUT PLS_INTEGER);
```

Parameters

Table 148-3 CALIBRATE_IO Procedure Parameters

| Parameter | Description |
|---------------------------------|--|
| <code>num_physical_disks</code> | Approximate number of physical disks in the database storage. This parameter is used to determine the initial I/O load for the calibration run. |
| <code>max_latency</code> | Maximum tolerable latency in milliseconds for database-block-sized IO requests |
| <code>max_iops</code> | Maximum number of I/O requests per second that can be sustained. The I/O requests are randomly-distributed, database-block-sized reads. |
| <code>max_mbps</code> | Maximum throughput of I/O that can be sustained, expressed in megabytes per second. The I/O requests are randomly-distributed, 1 megabyte reads. |
| <code>actual_latency</code> | Average latency of database-block-sized I/O requests at <code>max_iops</code> rate, expressed in milliseconds |

Usage Notes

- Only users with the `SYSDBA` privilege can run this procedure. Qualified users must also turn on `timed_statistics`, and ensure `asynch_io` is enabled for datafiles. This can be

achieved by setting `filesystemio_options` to either `ASYNCH` or `SETALL`. One can also query the `asynch_io` status by means of the following SQL statement:

```
col name format a50
SELECT name, asynch_io FROM v$datafile f,v$iostat_file i
  WHERE f.file#      = i.file_no
  AND  filetype_name = 'Data File'
/
```

- Only one calibration can be run at a time. If another calibration is initiated at the same time, it will fail.
- For an Oracle Real Application Clusters (Oracle RAC) database, the workload is simultaneously generated from all instances.
- In a multitenant container database (CDB), calibration can only be run from the CDB root (`CDB$ROOT`).
- Calibration is extremely disruptive to the database performance. It is strongly recommended to run calibration only when database users can tolerate severe deterioration to database performance.
- For optimal calibration results, no other database workloads should be running.

See Also:

Oracle Database Performance Tuning Guide for more information about calibration

Examples

Example of using I/O Calibration procedure

```
SET SERVEROUTPUT ON
DECLARE
  lat NUMBER;
  iops INTEGER;
  mbps INTEGER;
BEGIN
  -- DBMS_RESOURCE_MANAGER.CALIBRATE_IO (<DISKS>, <MAX_LATENCY>, iops, mbps, lat);
  DBMS_RESOURCE_MANAGER.CALIBRATE_IO (2, 10, iops, mbps, lat);

end;
/
```

View for I/O calibration results

```
SQL> desc v$io_calibration_status
Name                                     Null?    Type
-----
STATUS                                  VARCHA2(13)
CALIBRATION_TIME                        TIMESTAMP(3)

SQL> desc gv$io_calibration_status
Name                                     Null?    Type
-----
INST_ID                                  NUMBER
STATUS                                  VARCHA2(13)
CALIBRATION_TIME                        TIMESTAMP(3)
```

Column explanation:

STATUS:

IN PROGRESS : Calibration in Progress (Results from previous calibration
run displayed, if available)
READY : Results ready and available from earlier run
NOT AVAILABLE : Calibration results not available.

CALIBRATION_TIME: End time of the last calibration run

DBA table that stores I/O Calibration results

SQL> desc DBA_RSRC_IO_CALIBRATE

| Name | Null? | Type |
|--------------------|-------|--------------|
| START_TIME | | TIMESTAMP(6) |
| END_TIME | | TIMESTAMP(6) |
| MAX_IOPS | | NUMBER |
| MAX_MBPS | | NUMBER |
| MAX_PMBPS | | NUMBER |
| LATENCY | | NUMBER |
| NUM_PHYSICAL_DISKS | | NUMBER |

```
comment on table DBA_RSRC_IO_CALIBRATE is
'Results of the most recent I/O calibration'
/
comment on column DBA_RSRC_IO_CALIBRATE.START_TIME is
'start time of the most recent I/O calibration'
/
comment on column DBA_RSRC_IO_CALIBRATE.END_TIME is
'end time of the most recent I/O calibration'
/
comment on column DBA_RSRC_IO_CALIBRATE.MAX_IOPS is
'maximum number of data-block read requests that can be sustained per second'
/
comment on column DBA_RSRC_IO_CALIBRATE.MAX_MBPS is
'maximum megabytes per second of maximum-sized read requests that can be
sustained'
/
comment on column DBA_RSRC_IO_CALIBRATE.MAX_PMBPS is
'maximum megabytes per second of large I/O requests that
can be sustained by a single process'
/
comment on column DBA_RSRC_IO_CALIBRATE.LATENCY is
'latency for data-block read requests'
/
comment on column DBA_RSRC_IO_CALIBRATE.NUM_PHYSICAL_DISKS is
'number of physical disks in the storage subsystem (as specified by user)'
/
```

148.4.3 CLEAR_PENDING_AREA Procedure

This procedure clears pending changes for the resource manager.

Syntax

```
DBMS_RESOURCE_MANAGER.CLEAR_PENDING_AREA;
```

148.4.4 CREATE_CATEGORY Procedure

This procedure creates a new consumer group category. The primary purpose of this attribute is to support Exadata I/O Resource Manager category plans.

The view `DBA_RSRC_CATEGORIES` defines the currently defined categories. The `ADMINISTRATIVE`, `INTERACTIVE`, `BATCH`, `MAINTENANCE`, and `OTHER` categories are available.

Syntax

```
DBMS_RESOURCE_MANAGER.CREATE_CATEGORY (  
    category IN VARCHAR2,  
    comment IN VARCHAR2 DEFAULT NULL);
```

Parameters

Table 148-4 CREATE_CATEGORY Procedure Parameters

| Parameter | Description |
|-----------|---------------------------------|
| category | Name of consumer group category |
| comment | User comment |

148.4.5 CREATE_CDB_PLAN Procedure

Creates entries which define consolidation resource plans.

Syntax

```
DBMS_RESOURCE_MANAGER.CREATE_CDB_PLAN (  
    plan IN VARCHAR2(32),  
    comment IN VARCHAR2(2000) DEFAULT NULL);
```

Parameters

Table 148-5 CREATE_CDB_PLAN Procedure Parameters

| Parameter | Description |
|-----------|--------------------------------|
| plan | Name of the consolidation plan |
| comment | User comment |

Usage Notes

This procedure can be run only from the CDB root (`CDB$ROOT`).

148.4.6 CREATE_CDB_PLAN_DIRECTIVE Procedure

This procedure creates the plan directives of the consolidation resource plan. Plan directives specify the resource allocation policy for pluggable databases (PDBs).

Syntax

```
DBMS_RESOURCE_MANAGER.CREATE_CDB_PLAN_DIRECTIVE (
  plan                IN    VARCHAR2,
  pluggable_database  IN    VARCHAR2,
  comment             IN    VARCHAR2 (2000) DEFAULT '',
  shares              IN    NUMBER           DEFAULT NULL,
  utilization_limit   IN    NUMBER           DEFAULT NULL,
  parallel_server_limit IN  NUMBER           DEFAULT NULL,
  memory_limit        IN    NUMBER           DEFAULT 100,
  memory_min          IN    NUMBER           DEFAULT 0);
```

Parameters

Table 148-6 CREATE_CDB_PLAN_DIRECTIVE Procedure Parameters

| Parameter | Description |
|--------------------|--|
| plan | Name of the consolidation plan |
| pluggable_database | Name of the PDB |
| comment | User comment |
| shares | Specifies the share of resource allocation for the PDB. CPU Resource Manager and Exadata I/O Resource Manager are enabled by specifying shares for each PDB. The <code>shares</code> parameter is also used for Parallel Statement Queuing. If no share is specified, the default is obtained from the default directive, specified through UPDATE_CDB_DEFAULT_DIRECTIVE Procedure . |
| utilization_limit | Specifies the maximum percentage of the CDB's CPU and Exadata I/O resources that the PDB can utilize. CPU Resource Manager and Exadata I/O Resource Manager can also be limited by setting the <code>CPU_COUNT</code> parameter for the PDB. |

Table 148-6 (Cont.) CREATE_CDB_PLAN_DIRECTIVE Procedure Parameters

| Parameter | Description |
|------------------------------------|---|
| <code>parallel_server_limit</code> | <p>Parallel servers that the PDB can use after which parallel statements are queued. Alternatively, you can set the <code>parallel_servers_target</code> at the PDB level.</p> <p>A PDB can set a lower limit for parallel execution servers than the limit specified in the CDB resource plan. When the <code>PARALLEL_SERVERS_TARGET</code> initialization parameter is set in a PDB, and parallel execution server limit is specified for a PDB in the CDB resource plan, then the lower limit is used.</p> <p>For example, assume that the <code>parallel_servers_target</code> initialization parameter is set to 100 in the CDB root and <code>parallel_server_limit</code> is set to 70 for <code>hrpdb</code> in the CDB resource plan. Also, assume that <code>hrpdb</code> has its <code>parallel_servers_target</code> initialization parameter set to 50. In this case, the limit for parallel execution servers for <code>hrpdb</code> is 50, because 50 is lower than the CDB resource plan limit of 70 for <code>hrpdb</code>.</p> |
| <code>memory_limit</code> | <p>This parameter is only applicable to Oracle Exadata storage for configuring the Exadata Smart Flash Cache and Exadata PMEM Cache.</p> |
| <code>memory_min</code> | <p>This parameter is only applicable to Oracle Exadata storage for configuring the Exadata Smart Flash Cache and Exadata PMEM Cache.</p> |

Note:

Oracle recommends, that you use `parallel_servers_target` parameter instead of `parallel_servers_limit` in a CDB resource plan.

Usage Notes

- The default value for `shares`, `utilization_limit`, and `parallel_server_limit` is NULL. When a user specifies NULL, or does not specify a value, this indicates that the default value should be used.
- This procedure can be run only from the CDB root (`CDB$ROOT`).

148.4.7 CREATE_CDB_PROFILE_DIRECTIVE Procedure

This procedure creates the performance profile directives of the consolidation resource plan. The directives specify the resource allocation policy for pluggable databases (PDBs) that use the performance profile.

For a PDB to use the new performance profile, the PDB must have the `DB_PERFORMANCE_PROFILE` initialization parameter set to the profile name.

This procedure provides an easy way to specify the directive for a large number of PDBs with the same resource requirements. Each PDB with a `DB_PERFORMANCE_PROFILE` initialization parameter set to the performance profile name inherits the settings specified by this directive, including the shares, utilization limit, and so on.

Syntax

```
DBMS_RESOURCE_MANAGER.CREATE_CDB_PROFILE_DIRECTIVE (
  plan                IN    VARCHAR2,
  profile             IN    VARCHAR2,
  comment            IN    VARCHAR2 (2000) DEFAULT '',
  shares             IN    NUMBER           DEFAULT NULL,
  utilization_limit  IN    NUMBER           DEFAULT NULL,
  parallel_server_limit IN NUMBER           DEFAULT NULL,
  memory_limit       IN    NUMBER           DEFAULT 100,
  memory_min        IN    NUMBER           DEFAULT 0);
```

Parameters

Table 148-7 CREATE_CDB_PROFILE_DIRECTIVE Procedure Parameters

| Parameter | Description |
|-----------------------|--|
| plan | Name of the consolidation plan |
| profile | Name of the performance profile |
| comment | User comment |
| shares | Specifies the share of resource allocation for PDBs that use the performance profile. CPU Resource Manager and Exadata I/O Resource Manager are enabled by specifying shares for each PDB. The <code>shares</code> parameter is also used for Parallel Statement Queuing. If no share is specified, the default is obtained from the default directive, specified through UPDATE_CDB_DEFAULT_DIRECTIVE Procedure . |
| utilization_limit | Specifies the maximum percentage of CPU Resource Manager and Exadata I/O Resource Manager that PDBs that use the performance profile can utilize. |
| parallel_server_limit | Specifies the maximum percentage of <code>parallel_servers_target</code> parallel servers that PDBs that use the performance profile can use. |
| memory_limit | This parameter is only applicable to Oracle Exadata storage for configuring the Exadata Smart Flash Cache and Exadata PMEM Cache. |
| memory_min | This parameter is only applicable to Oracle Exadata storage for configuring the Exadata Smart Flash Cache and Exadata PMEM Cache. |

148.4.8 CREATE_CONSUMER_GROUP Procedure

This procedure creates entries which define resource consumer groups.

Syntax

```
DBMS_RESOURCE_MANAGER.CREATE_CONSUMER_GROUP (
  consumer_group IN VARCHAR2,
  comment       IN VARCHAR2 DEFAULT NULL,
```

```

cpu_mth          IN VARCHAR2 DEFAULT NULL,
mgmt_mth        IN VARCHAR2 DEFAULT 'ROUND-ROBIN',
category        IN VARCHAR2 DEFAULT 'OTHER');

```

Parameters

Table 148-8 CREATE_CONSUMER_GROUP Procedure Parameters

| Parameter | Description |
|----------------|--|
| consumer_group | Name of the consumer group |
| comment | User comment |
| cpu_mth | Name of CPU resource allocation method (deprecated) |
| mgmt_mth | Name of CPU resource allocation method |
| category | Describes the category of the consumer group. The primary purpose of this attribute is to support Exadata I/O Resource Manager category plans. The view <code>DBA_RSRC_CATEGORIES</code> defines the currently defined categories. Categories can be modified, using the CREATE_CATEGORY Procedure , UPDATE_CATEGORY Procedure , and DELETE_CATEGORY Procedure . |

148.4.9 CREATE_PENDING_AREA Procedure

This procedure makes changes to resource manager objects.

All changes to the plan schema must be done within a pending area. The pending area can be thought of as a "scratch" area for plan schema changes. The administrator creates this pending area, makes changes as necessary, possibly validates these changes, and only when the submit is completed do these changes become active.

Syntax

```
DBMS_RESOURCE_MANAGER.CREATE_PENDING_AREA;
```

Usage Notes

You may, at any time while the pending area is active, view the current plan schema with your changes by selecting from the appropriate user views.

At any time, you may clear the pending area if you want to stop the current changes. You may also call the `VALIDATE` procedure to confirm whether the changes you have made are valid. You do not have to perform your changes in a given order to maintain a consistent group of entries. These checks are also implicitly done when the pending area is submitted.

Note:

Oracle allows "orphan" consumer groups (in other words, consumer groups that have no plan directives that refer to them). This is in anticipation that an administrator may want to create a consumer group that is not currently being used, but will be used in the future.

For resource plans, the following rules must be adhered to, and they are checked whenever the `validate` or `submit` procedures are executed:

- No plan schema may contain any loops.
- All plans and consumer groups referred to by plan directives must exist.
- All plans must have plan directives that refer to either plans or consumer groups.
- All percentages in any given level must not add up to greater than 100 for the emphasis resource allocation method.
- No plan may be deleted that is currently being used as a top plan by an active instance.
- The plan directive parameter, `parallel_degree_limit_p1`, may only appear in plan directives that refer to consumer groups (that is, not at subplans).
- There cannot be more than 28 plan directives coming from any given plan (that is, no plan can have more than 28 children).
- There cannot be more than 28 consumer groups in any active plan schema.
- Plans and consumer groups use the same namespace; therefore, no plan can have the same name as any consumer group.
- There must be a plan directive for `OTHER_GROUPS` somewhere in any active plan schema. This ensures that a session not covered by the currently active plan is allocated resources as specified by the `OTHER_GROUPS` directive.

 **Note:**

These rules are not applicable for CDB resource plans.

If any of the preceding rules are broken when checked by the `VALIDATE` or `SUBMIT` procedures, then an informative error message is returned. You may then make changes to fix one or more problems and reissue the `validate` or `submit` procedures.

148.4.10 CREATE_PLAN Procedure

This procedure creates entries which define resource plans.

Syntax

```
DBMS_RESOURCE_MANAGER.CREATE_PLAN (
  plan                IN  VARCHAR2,
  comment             IN  VARCHAR2 DEFAULT NULL,
  cpu_mth             IN  VARCHAR2 DEFAULT NULL, -- deprecated
  active_sess_pool_mth IN  VARCHAR2 DEFAULT 'ACTIVE_SESS_POOL_ABSOLUTE',
  parallel_degree_limit_mth IN  VARCHAR2 DEFAULT
    'PARALLEL_DEGREE_LIMIT_ABSOLUTE',
  queueing_mth       IN  VARCHAR2 DEFAULT 'FIFO_TIMEOUT',
  mgmt_mth           IN  VARCHAR2 DEFAULT 'EMPHASIS',
  sub_plan           IN  BOOLEAN DEFAULT FALSE,
  max_iops           IN  NUMBER DEFAULT NULL,
  max_mbps           IN  NUMBER DEFAULT NULL);
```

Parameters

Table 148-9 CREATE_PLAN Procedure Parameters

| Parameter | Description |
|---------------------------|--|
| plan | Name of the resource plan |
| comment | User comment |
| cpu_mth | Allocation method for CPU resources (deprecated) |
| active_sess_pool_mth | Active session pool resource allocation method. Limits the number of active sessions. All other sessions are inactive and wait in a queue to be activated. ACTIVE_SESS_POOL_ABSOLUTE is the default and only method available. |
| parallel_degree_limit_mth | Resource allocation method for specifying a limit on the degree of parallelism of any operation. PARALLEL_DEGREE_LIMIT_ABSOLUTE is the default and only method available. |
| queueing_mth | Queueing resource allocation method. Controls order in which queued inactive sessions will execute. FIFO_TIMEOUT is the default and only method available |
| mgmt_mth | Resource allocation method for specifying how much resources (for example, CPU or I/O) each consumer group or sub-plan gets <ul style="list-style-type: none"> EMPHASIS - for multilevel plans that use percentages to specify how I/O resources are distributed among consumer groups RATIO - for single-level plans that use ratios to specify how I/O resources are distributed |
| sub_plan | If TRUE, indicates that this plan is only intended for use as a sub-plan. Sub-plans are not required to have an OTHER_GROUPS directive. Default is FALSE. |
| max_iops | Nonoperative |
| max_mbps | Nonoperative |

Usage Notes

If you want to use any default resource allocation method, then you do not need to specify it when creating or updating a plan.

148.4.11 CREATE_PLAN_DIRECTIVE Procedure

This procedure creates resource plan directives.

Note:

The parameters `max_utilization_limit` and `parallel_target_percentage` are deprecated with Oracle Database 11g Release 1 (11.1.0.1), and are replaced by `utilization_limit` and `parallel_server_limit`.

Syntax

```

DBMS_RESOURCE_MANAGER.CREATE_PLAN_DIRECTIVE (
  plan                IN VARCHAR2,
  group_or_subplan    IN VARCHAR2,
  comment             IN VARCHAR2 DEFAULT NULL,
  cpu_p1              IN NUMBER   DEFAULT NULL, -- deprecated
  cpu_p2              IN NUMBER   DEFAULT NULL, -- deprecated
  cpu_p3              IN NUMBER   DEFAULT NULL, -- deprecated
  cpu_p4              IN NUMBER   DEFAULT NULL, -- deprecated
  cpu_p5              IN NUMBER   DEFAULT NULL, -- deprecated
  cpu_p6              IN NUMBER   DEFAULT NULL, -- deprecated
  cpu_p7              IN NUMBER   DEFAULT NULL, -- deprecated
  cpu_p8              IN NUMBER   DEFAULT NULL, -- deprecated
  active_sess_pool_p1 IN NUMBER   DEFAULT NULL,
  queueing_p1         IN NUMBER   DEFAULT NULL,
  parallel_degree_limit_p1 IN NUMBER DEFAULT NULL,
  switch_group        IN VARCHAR2 DEFAULT NULL,
  switch_time         IN NUMBER   DEFAULT NULL,
  switch_estimate     IN BOOLEAN  DEFAULT FALSE,
  max_est_exec_time   IN NUMBER   DEFAULT NULL,
  undo_pool           IN NUMBER   DEFAULT NULL,
  max_idle_time       IN NUMBER   DEFAULT NULL,
  max_idle_blocker_time IN NUMBER DEFAULT NULL,
  switch_time_in_call IN NUMBER   DEFAULT NULL, -- deprecated
  mgmt_p1             IN NUMBER   DEFAULT NULL,
  mgmt_p2             IN NUMBER   DEFAULT NULL,
  mgmt_p3             IN NUMBER   DEFAULT NULL,
  mgmt_p4             IN NUMBER   DEFAULT NULL,
  mgmt_p5             IN NUMBER   DEFAULT NULL,
  mgmt_p6             IN NUMBER   DEFAULT NULL,
  mgmt_p7             IN NUMBER   DEFAULT NULL,
  mgmt_p8             IN NUMBER   DEFAULT NULL,
  switch_io_megabytes IN NUMBER   DEFAULT NULL,
  switch_io_reqs      IN NUMBER   DEFAULT NULL,
  switch_for_call     IN BOOLEAN  DEFAULT NULL,
  max_utilization_limit IN NUMBER DEFAULT NULL, -- deprecated
  parallel_target_percentage IN NUMBER DEFAULT NULL, -- deprecated
  parallel_server_limit IN NUMBER DEFAULT NULL,
  utilization_limit   IN NUMBER   DEFAULT NULL,
  switch_io_logical   IN NUMBER   DEFAULT NULL,
  switch_elapsed_time IN NUMBER   DEFAULT NULL,
  shares              IN NUMBER   DEFAULT NULL,
  parallel_stmt_critical IN VARCHAR2 DEFAULT NULL,
  session_pga_limit   IN NUMBER   DEFAULT NULL,
  pq_timeout_action   IN NUMBER   DEFAULT NULL,
  parallel_queue_timeout IN NUMBER DEFAULT NULL,);

```

**Note:**

Oracle recommends that you use shares instead of mgmt_p*.

Parameters

Table 148-10 CREATE_PLAN_DIRECTIVE Procedure Parameters

| Parameter | Description |
|--------------------------|--|
| plan | Name of the resource plan |
| group_or_subplan | Name of the consumer group or subplan |
| comment | Comment for the plan directive |
| cpu_p1 | -- deprecated: use mgmt_p1 or, even better, shares instead |
| cpu_p2 | -- deprecated: use mgmt_p2 or, even better, shares instead |
| cpu_p3 | -- deprecated: use mgmt_p3 or, even better, shares instead |
| cpu_p4 | -- deprecated: use mgmt_p4 or, even better, shares instead |
| cpu_p5 | -- deprecated: use mgmt_p5 or, even better, shares instead |
| cpu_p6 | -- deprecated: use mgmt_p6 or, even better, shares instead |
| cpu_p7 | -- deprecated: use mgmt_p7 or, even better, shares instead |
| cpu_p8 | -- deprecated: use mgmt_p8 or, even better, shares instead |
| active_sess_pool_p1 | Specifies maximum number of sessions that can currently have an active call |
| queueing_p1 | Specified time (in seconds) after which a call in the inactive session queue (waiting for execution) will time out. Default is NULL, which means unlimited. |
| parallel_degree_limit_p1 | Specifies a limit on the degree of parallelism for any operation. Default is NULL, which means unlimited. If the value is 0, then all operations will be serial. |
| switch_group | Specifies consumer group to switch to, once a switch condition is met. If the group name is CANCEL_SQL, then the current call is canceled when the switch condition is met. If the group name is KILL_SESSION, then the session is killed when the switch condition is met. If the group name is LOG_ONLY, then no action is taken other than recording this event via SQL monitor. Default is NULL. |
| switch_time | Specifies the time on CPU (not elapsed time) that a session can execute before an action is taken. Default is NULL, which means unlimited. As with other switch directives, if switch_for_call is TRUE, the number of CPUs is accumulated from the start of a call. Otherwise, the number of CPUs is accumulated for the length of the session. |
| switch_estimate | If TRUE, tells Oracle to use its execution time estimate to automatically switch the consumer group of an operation before beginning its execution. This is used in conjunction with the switch_time directive. Default value is FALSE. |
| max_est_exec_time | Specifies the maximum execution time (in CPU seconds) allowed for a session. If the optimizer estimates that an operation will take longer than MAX_EST_EXEC_TIME, the operation is not started and ORA-07455 is issued. If the optimizer does not provide an estimate, this directive has no effect. Default is NULL, which means unlimited. |

Table 148-10 (Cont.) CREATE_PLAN_DIRECTIVE Procedure Parameters

| Parameter | Description |
|-----------------------|---|
| undo_pool | Limits the size in kilobytes of the undo records corresponding to uncommitted transactions by this consumer group |
| max_idle_time | Indicates the maximum session idle time. Default is NULL, which means unlimited. |
| max_idle_blocker_time | Maximum amount of time in seconds that a session can be idle while blocking another session's acquisition of a resource |
| switch_time_in_call | Deprecated. If this parameter is specified, <code>switch_time</code> is set to <code>switch_time_in_call</code> (in seconds) and <code>switch_for_call</code> is effectively set to TRUE. It is better to use <code>switch_time</code> and <code>switch_for_call</code> . |
| mgmt_p1 | Resource allocation value for level 1 (replaces <code>cpu_p1</code>): <ul style="list-style-type: none"> EMPHASIS - specifies the resource percentage at the first level RATIO - specifies the weight of resource usage |
| mgmt_p2 | Resource allocation value for level 2 (replaces <code>cpu_p2</code>): <ul style="list-style-type: none"> EMPHASIS - specifies the resource percentage at the second level RATIO - non-applicable |
| mgmt_p3 | Resource allocation value for level 3 (replaces <code>cpu_p3</code>): <ul style="list-style-type: none"> EMPHASIS - specifies the resource percentage at the third level RATIO - non-applicable |
| mgmt_p4 | Resource allocation value for level 4 (replaces <code>cpu_p4</code>): <ul style="list-style-type: none"> EMPHASIS - specifies the resource percentage at the fourth level RATIO - non-applicable |
| mgmt_p5 | Resource allocation value for level 5 (replaces <code>cpu_p5</code>): <ul style="list-style-type: none"> EMPHASIS - specifies the resource percentage at the fifth level RATIO - non-applicable |
| mgmt_p6 | Resource allocation value for level 6 (replaces <code>cpu_p6</code>): <ul style="list-style-type: none"> EMPHASIS - specifies the resource percentage at the sixth level RATIO - non-applicable |
| mgmt_p7 | Resource allocation value for level 7 (replaces <code>cpu_p7</code>): <ul style="list-style-type: none"> EMPHASIS - specifies the resource percentage at the seventh level RATIO - non-applicable |
| mgmt_p8 | Resource allocation value for level 8 (replaces <code>cpu_p8</code>): <ul style="list-style-type: none"> EMPHASIS - specifies the resource percentage at the eighth level RATIO - non-applicable |

Table 148-10 (Cont.) CREATE_PLAN_DIRECTIVE Procedure Parameters

| Parameter | Description |
|---|--|
| <code>switch_io_megabytes</code> | Specifies the amount of I/O (in MB) that a session can issue before an action is taken. Default is <code>NULL</code> , which means unlimited. As with other switch directives, if <code>switch_for_call</code> is <code>TRUE</code> , the number of CPUs is accumulated from the start of a call. Otherwise, the number of CPUs is accumulated for the length of the session. |
| <code>switch_io_reqs</code> | Specifies the number of I/O requests that a session can issue before an action is taken. Default is <code>NULL</code> , which means unlimited. As with other switch directives, if <code>switch_for_call</code> is <code>TRUE</code> , the number of CPUs is accumulated from the start of a call. Otherwise, the number of CPUs is accumulated for the length of the session. |
| <code>switch_for_call</code> | Specifies that if an action is taken because of the <code>switch_time</code> , <code>switch_io_megabytes</code> , <code>switch_io_reqs</code> , <code>switch_io_logical</code> or <code>switch_elapsed_time</code> parameters, the consumer group is restored to its original consumer group at the end of the top call. Default is <code>NULL</code> , which means that the original consumer group is not restored at the end of the top call. |
| <code>max_utilization_limit</code> | -- deprecated: use <code>utilization_limit</code> instead |
| <code>parallel_target_percentage</code> | -- deprecated: use <code>parallel_sever_limit</code> instead |
| <code>parallel_queue_timeout</code> | Specifies the time (in seconds) that a parallel statement may remain in its Consumer Group's parallel statement queue before it is removed and terminated with an error (ORA- 07454). |

 **Note:**

You can use the `pq_timeout_action` parameter to specify the action to be taken when a parallel statement is removed from the queue.

`parallel_sever_limit` Specifies the maximum percentage of `parallel_servers_target` parallel servers that the Consumer Group can use, after which parallel statements are queued.

`utilization_limit` Resource limit. Currently it includes CPU and I/O for Exadata. For CPU, this limits the CPU utilization for the consumer group. For Exadata I/O, this limits the disk utilization for the consumer group. This does not apply to parallel servers.

`switch_io_logical` Number of logical IOs that will trigger the action specified by `switch_group`. As with other switch directives, if `switch_for_call` is `TRUE`, the number of logical IOs is accumulated from the start of a call. Otherwise, the number of logical IOs is accumulated for the length of the session.

Table 148-10 (Cont.) CREATE_PLAN_DIRECTIVE Procedure Parameters

| Parameter | Description |
|-------------------------------------|--|
| <code>switch_elapsed_time</code> | Elapsed time that will trigger the action specified by <code>switch_group</code> . As with other switch directives, if <code>switch_for_call</code> is <code>TRUE</code> , the elapsed time is accumulated from the start of a call. Otherwise, the elapsed time is accumulated for the length of the session. |
| <code>shares</code> | Specifies the share of resource allocation for the consumer group. CPU Resource Manager and Exadata I/O Resource Manager are enabled by specifying shares for each consumer group. The <code>shares</code> parameter is also used for Parallel Statement Queuing. If CPU Resource Manager and Exadata I/O Resource Manager are enabled, then the default value is 1. |
| <code>parallel_stmt_critical</code> | <p>If set to <code>BYPASS_QUEUE</code>, parallel statements from the Consumer Group are not queued, regardless of the <code>PARALLEL_DEGREE_POLICY</code> parameter value.</p> <p>If set to <code>QUEUE</code>, all the parallel statements from the consumer group, irrespective of the <code>parallel_degree_policy</code> parameter value, are eligible for queuing.</p> <p>Default is <code>FALSE</code>, which means that parallel statements are eligible for queuing, based on the <code>parallel_degree_policy</code> parameter value.</p> |
| <code>session_pga_limit</code> | <p>Maximum amount of untunable PGA (in MB) that a session in this consumer group can allocate before being terminated. <code>NULL</code> (default) indicates no limit.</p> <p>SQL operations that allocate tunable PGA (operations that can opt to use temp space) are not controlled by this limit.</p> |
| <code>pq_timeout_action</code> | <p>Specifies the action to be taken when a parallel statement is removed from the queue due to <code>parallel_queue_timeout</code>.</p> <p>The values are:</p> <ul style="list-style-type: none"> <code>CANCEL</code> — The parallel statement is terminated with error <code>ORA-7454</code> <code>RUN</code> — The SQL statement runs immediately, and might get downgraded if parallel servers are unavailable <p>The default action of this parameter is <code>CANCEL</code>.</p> |

Usage Notes

- All parameters default to `NULL`.
- For `max_idle_time` and `max_idle_blocker_time`, PMON will check these limits once a minute. If it finds a session that has exceeded one of the limits, it will forcibly kill the session and clean up all its state.
- The parameter `switch_for_call` is mostly useful for three-tier applications where the mid-tier server is implementing session pooling. By using `switch_for_call`, the resource usage of one client will not affect a future client that happens to be executed on the same session.
- An error is thrown if `PQ_TIMEOUT_ACTION` is specified, but `PARALLEL_QUEUE_TIMEOUT` is not specified.
- Specifies the action to be taken when a parallel statement is removed from the queue.

148.4.12 CREATE_SIMPLE_PLAN Procedure

This procedure creates a single-level resource plan containing up to eight consumer groups in one step. You do not need to create a pending area manually before creating a resource plan, or use the `CREATE_CONSUMER_GROUP` and `CREATE_RESOURCE_PLAN_DIRECTIVES` procedures separately.

Syntax

```
DBMS_RESOURCE_MANAGER.CREATE_SIMPLE_PLAN (
    simple_plan      IN VARCHAR2 DEFAULT NULL,
    consumer_group1 IN VARCHAR2 DEFAULT NULL,
    group1_cpu      IN NUMBER   DEFAULT NULL,    -- deprecated
    consumer_group2 IN VARCHAR2 DEFAULT NULL,
    group2_cpu      IN NUMBER   DEFAULT NULL,    -- deprecated
    consumer_group3 IN VARCHAR2 DEFAULT NULL,
    group3_cpu      IN NUMBER   DEFAULT NULL,    -- deprecated
    consumer_group4 IN VARCHAR2 DEFAULT NULL,
    group4_cpu      IN NUMBER   DEFAULT NULL,    -- deprecated
    consumer_group5 IN VARCHAR2 DEFAULT NULL,
    group5_cpu      IN NUMBER   DEFAULT NULL,    -- deprecated
    consumer_group6 IN VARCHAR2 DEFAULT NULL,
    group6_cpu      IN NUMBER   DEFAULT NULL,    -- deprecated
    consumer_group7 IN VARCHAR2 DEFAULT NULL,
    group7_cpu      IN NUMBER   DEFAULT NULL,    -- deprecated
    consumer_group8 IN VARCHAR2 DEFAULT NULL,
    group8_cpu      IN NUMBER   DEFAULT NULL,    -- deprecated
    group1_percent  IN NUMBER   DEFAULT NULL,
    group2_percent  IN NUMBER   DEFAULT NULL,
    group3_percent  IN NUMBER   DEFAULT NULL,
    group4_percent  IN NUMBER   DEFAULT NULL,
    group5_percent  IN NUMBER   DEFAULT NULL,
    group6_percent  IN NUMBER   DEFAULT NULL,
    group7_percent  IN NUMBER   DEFAULT NULL,
    group8_percent  IN NUMBER   DEFAULT NULL);
```

Parameters

Table 148-11 CREATE_SIMPLE_PLAN Procedure Parameters

| Parameter | Description |
|------------------------------|-----------------------------------|
| <code>simple_plan</code> | Name of the resource plan |
| <code>consumer_group1</code> | Name of the consumer group |
| <code>group1_cpu</code> | Percentage for group (deprecated) |
| <code>consumer_group2</code> | Name of the consumer group |
| <code>group2_cpu</code> | Percentage for group (deprecated) |
| <code>consumer_group3</code> | Name of the consumer group |
| <code>group3_cpu</code> | Percentage for group (deprecated) |
| <code>consumer_group4</code> | Name of the consumer group |
| <code>group4_cpu</code> | Percentage for group (deprecated) |
| <code>consumer_group5</code> | Name of the consumer group |

Table 148-11 (Cont.) CREATE_SIMPLE_PLAN Procedure Parameters

| Parameter | Description |
|-----------------|---|
| group5_cpu | Percentage for group (deprecated) |
| consumer_group6 | Name of the consumer group |
| group6_cpu | Percentage for group (deprecated) |
| consumer_group7 | Name of the consumer group |
| group7_cpu | Percentage for group (deprecated) |
| consumer_group8 | OTHER_GROUPS - all sessions that aren't mapped to a consumer group. |
| group8_cpu | Percentage for group (deprecated) |
| group1_percent | Percentage of resources allocated for this consumer group |
| group2_percent | Percentage of resources allocated for this consumer group |
| group3_percent | Percentage of resources allocated for this consumer group |
| group4_percent | Percentage of resources allocated for this consumer group |
| group5_percent | Percentage of resources allocated for this consumer group |
| group6_percent | Percentage of resources allocated for this consumer group |
| group7_percent | Percentage of resources allocated for this consumer group |
| group8_percent | Percentage of resources allocated to other groups |

148.4.13 DELETE_CATEGORY Procedure

This procedure deletes an existing resource consumer group category.

Syntax

```
DBMS_RESOURCE_MANAGER.DELETE_CATEGORY (
    category      IN    VARCHAR2);
```

Parameters

Table 148-12 DELETE_CATEGORY Procedure Parameters

| Parameter | Description |
|-----------|---------------------------------|
| category | Name of consumer group category |

148.4.14 DELETE_CDB_PLAN Procedure

This procedure deletes the consolidation resource plan.

Syntax

```
DBMS_RESOURCE_MANAGER.DELETE_CDB_PLAN (
    plan      IN    VARCHAR2(32)  DEFAULT NULL);
```

Parameters

Table 148-13 DELETE_CDB_PLAN Procedure Parameters

| Parameter | Description |
|-----------|--------------------------------|
| plan | Name of the consolidation plan |

Usage Notes

This procedure can be run only from the CDB root (CDB\$ROOT).

148.4.15 DELETE_CDB_PLAN_DIRECTIVE Procedure

This procedure deletes the plan directives of the consolidation resource plan. Once the plan directive is deleted, the pluggable database will get the default resource allocation.

Syntax

```
DBMS_RESOURCE_MANAGER.DELETE_CDB_PLAN_DIRECTIVE (
    plan                IN    VARCHAR2 (32)  DEFAULT NULL,
    pluggable_database  IN    VARCHAR2 (32)  DEFAULT NULL);
```

Parameters

Table 148-14 DELETE_CDB_PLAN_DIRECTIVE Procedure Parameters

| Parameter | Description |
|--------------------|---|
| plan | Name of the consolidation plan |
| pluggable_database | Name of the pluggable database in which the plan directive is to be deleted |

Usage Notes

This procedure can be run only from the CDB root (CDB\$ROOT).

148.4.16 DELETE_CDB_PROFILE_DIRECTIVE Procedure

This procedure deletes the performance profile directive of the consolidation resource plan. Once the directive is deleted, the pluggable databases (PDBs) that use the performance profile use the default resource allocation.

For a PDB to use a performance profile, the PDB must have the DB_PERFORMANCE_PROFILE initialization parameter set to the performance profile name.

Syntax

```
DBMS_RESOURCE_MANAGER.DELETE_CDB_PROFILE_DIRECTIVE (
    plan                IN    VARCHAR2 (32)  DEFAULT NULL,
    profile             IN    VARCHAR2 (32)  DEFAULT NULL);
```

Parameters

Table 148-15 DELETE_CDB_PROFILE_DIRECTIVE Procedure Parameters

| Parameter | Description |
|-----------|---|
| plan | Name of the consolidation plan |
| profile | Name of the performance profile directive to be deleted |

Usage Notes

This procedure can be run only from the CDB root (CDB\$ROOT).

148.4.17 DELETE_CONSUMER_GROUP Procedure

This procedure deletes entries which define resource consumer groups.

Syntax

```
DBMS_RESOURCE_MANAGER.DELETE_CONSUMER_GROUP (
    consumer_group IN VARCHAR2);
```

Parameters

Table 148-16 DELETE_CONSUMER_GROUP Procedure Parameters

| Parameters | Description |
|----------------|--|
| consumer_group | Name of the consumer group to be deleted |

148.4.18 DELETE_PLAN Procedure

This procedure deletes the specified plan as well as all the plan directives to which it refers.

Syntax

```
DBMS_RESOURCE_MANAGER.DELETE_PLAN (
    plan IN VARCHAR2);
```

Parameters

Table 148-17 DELETE_PLAN Procedure Parameters

| Parameter | Description |
|-----------|-------------------------------------|
| plan | Name of the resource plan to delete |

148.4.19 DELETE_PLAN_CASCADE Procedure

This procedure deletes the specified plan and all of its descendants (plan directives, subplans, consumer groups). Mandatory objects and directives are not deleted.

Syntax

```
DBMS_RESOURCE_MANAGER.DELETE_PLAN_CASCADE (
    plan IN VARCHAR2);
```

Parameters

Table 148-18 DELETE_PLAN_CASCADE Procedure Parameters

| Parameters | Description |
|------------|------------------|
| plan | Name of the plan |

Usage Notes

If DELETE_PLAN_CASCADE encounters any error, then it rolls back the operation, and nothing is deleted.

148.4.20 DELETE_PLAN_DIRECTIVE Procedure

This procedure deletes resource plan directives.

Syntax

```
DBMS_RESOURCE_MANAGER.DELETE_PLAN_DIRECTIVE (
    plan          IN VARCHAR2,
    group_or_subplan IN VARCHAR2);
```

Parameters

Table 148-19 DELETE_PLAN_DIRECTIVE Procedure Parameters

| Parameter | Description |
|------------------|------------------------------|
| plan | Name of the resource plan |
| group_or_subplan | Name of the group or subplan |

148.4.21 DEQUEUE_PARALLEL_STATEMENT Procedure

This procedure dequeues a parallel statement from the parallel statement queue.

If the PARALLEL_DEGREE_POLICY initialization parameter is set to AUTO or ADAPTIVE, then parallel statement queuing is enabled. If a parallel statement is in the parallel statement queue, then you can use this procedure to dequeue the parallel statement so that it runs immediately.

Syntax

```
DBMS_RESOURCE_MANAGER.DEQUEUE_PARALLEL_STATEMENT (
    session_id      IN PLS_INTEGER,
    session_serial  IN PLS_INTEGER,
    inst_id         IN PLS_INTEGER DEFAULT NULL,
    sql_id          IN VARCHAR2 DEFAULT NULL);
```

Parameters**Table 148-20 DEQUEUE_PARALLEL_STATEMENT Procedure Parameters**

| Parameter | Description |
|----------------|--|
| session_id | The session id of the session running the parallel statement to be dequeued. |
| session_serial | The serial number of the session. |
| inst_id | Instance ID where the session is running. If NULL, then the current instance is used. |
| sql_id | The SQL ID of the session's statement to dequeue. If the session is running SQL with a different SQL ID, then the statement is not dequeued. |

148.4.22 END_SQL_BLOCK Procedure

This procedure, to be used with parallel statement queuing, indicates the end of a block of SQL statements that should be treated as a group by resource manager.

Syntax

```
DBMS_RESOURCE_MANAGER.END_SQL_BLOCK;
```

Usage Notes

For more information, see "Parallel Statement Queuing" and "Managing Parallel Statement Queuing with Resource Manager" in *Oracle Database VLDB and Partitioning Guide*.

148.4.23 SET_CONSUMER_GROUP_MAPPING Procedure

This procedure adds, deletes, or modifies entries that map sessions to consumer groups, based on the session's login and runtime attributes.

Syntax

```
DBMS_RESOURCE_MANAGER.SET_CONSUMER_GROUP_MAPPING (
    attribute      IN VARCHAR2,
    value         IN VARCHAR2,
    consumer_group IN VARCHAR2 DEFAULT NULL);
```

Parameters

Table 148-21 SET_CONSUMER_GROUP_MAPPING Procedure Parameters

| Parameters | Description |
|----------------|--|
| attribute | Mapping attribute to add or modify. It can be one of the Constants listed. |
| value | Attribute value to match. This includes both absolute mapping and regular expressions. |
| consumer_group | Name of the mapped consumer group, or NULL to delete a mapping |

Usage Notes

- If no mapping exists for the given attribute and value, a mapping to the given consumer group will be created. If a mapping already exists for the given attribute and value, the mapped consumer group will be updated to the one given. If the `consumer_group` argument is NULL, then any mapping from the given attribute and value will be deleted.
- The subprogram supports simple regex expressions for the `value` parameter. It implements the same semantics as the SQL 'LIKE' operator. Specifically, it uses '%' as a multicharacter wildcard and '_' as a single character wildcard. The '\' character can be used to escape the wildcards. Note that wildcards can only be used if the attribute is one of the following:

- CLIENT_OS_USER
- CLIENT_PROGRAM
- CLIENT_MACHINE
- MODULE_NAME
- MODULE_NAME_ACTION
- SERVICE_MODULE
- SERVICE_MODULE_ACTION

- Consumer group mapping comparisons for `DBMS_RESOURCE_MANAGER.CLIENT_PROGRAM` are performed by stripping the @ sign and following characters from `V$SESSION.PROGRAM` before comparing it to the `CLIENT_PROGRAM` value supplied.

148.4.24 SET_CONSUMER_GROUP_MAPPING_PRI Procedure

Multiple attributes of a session can be used to map the session to a consumer group. This procedure prioritizes the attribute mappings.

Syntax

```
DBMS_RESOURCE_MANAGER.SET_CONSUMER_GROUP_MAPPING_PRI (
    explicit          IN NUMBER,
    oracle_user       IN NUMBER,
    service_name      IN NUMBER,
    client_os_user    IN NUMBER,
```

```

client_program      IN NUMBER,
client_machine     IN NUMBER,
module_name        IN NUMBER,
module_name_action IN NUMBER,
service_module     IN NUMBER,
service_module_action IN NUMBER,
client_id          IN NUMBER DEFAULT 11);

```

Parameters

Table 148-22 SET_CONSUMER_GROUP_MAPPING_PRI Procedure Parameters

| Parameters | Description |
|--------------------|---|
| explicit | Priority of the explicit mapping |
| oracle_user | Priority of the Oracle user name mapping |
| service_name | Priority of the client service name mapping |
| client_os_user | Priority of the client operating system user name mapping |
| client_program | Priority of the client program mapping |
| client_machine | Priority of the client machine mapping |
| module_name | Priority of the application module name mapping |
| module_name_action | Priority of the application module name and action mapping |
| service_module | Priority of the service name and application module name mapping |
| module_name_action | Priority of the service name, application module name, and application action mapping |
| client_id | Client identifier |

Usage Notes

- This procedure requires that you include the pseudo-attribute `explicit` as an argument. It must be set to 1. It indicates that explicit consumer group switches have the highest priority. You explicitly switch consumer groups with these package procedures:
 - `DBMS_SESSION.SWITCH_CURRENT_CONSUMER_GROUP`
 - `DBMS_RESOURCE_MANAGER.SWITCH_CONSUMER_GROUP_FOR_SESS`
 - `DBMS_RESOURCE_MANAGER.SWITCH_CONSUMER_GROUP_FOR_USER`
- Each priority value must be a unique integer from 1 to 11. Together, they establish an ordering where 1 is the highest priority and 11 is the lowest.

148.4.25 SET_INITIAL_CONSUMER_GROUP Procedure

This deprecated procedure sets the initial resource consumer group for a user.

The initial consumer group of a user is the consumer group to which any session created by that user initially belongs.

 **Note:**

This procedure is deprecated in Release 11gR1. While the procedure remains available in the package, Initial Consumer Group is set by the session-to-consumer group mapping rules.

Syntax

```
DBMS_RESOURCE_MANAGER.SET_INITIAL_CONSUMER_GROUP (
    user          IN  VARCHAR2,
    consumer_group IN  VARCHAR2);
```

Parameters**Table 148-23 SET_INITIAL_CONSUMER_GROUP Procedure Parameters**

| Parameters | Description |
|----------------|-------------------------------|
| user | Name of the user |
| consumer_group | User's initial consumer group |

Usage Notes

- The ADMINISTER_RESOURCE_MANAGER or the ALTER USER system privilege are required to be able to execute this procedure. The user, or PUBLIC, must be directly granted switch privilege to a consumer group before it can be set to be the user's initial consumer group. Switch privilege for the initial consumer group cannot come from a role granted to that user.

 **Note:**

These semantics are similar to those for ALTER USER DEFAULT ROLE.

- If the initial consumer group for a user has never been set, then the user's initial consumer group is automatically the consumer group: DEFAULT_CONSUMER_GROUP.
- DEFAULT_CONSUMER_GROUP has switch privileges granted to PUBLIC; therefore, all users are automatically granted switch privilege for this consumer group. Upon deletion of a consumer group, all users having the deleted group as their initial consumer group now have DEFAULT_CONSUMER_GROUP as their initial consumer group. All currently active sessions belonging to a deleted consumer group are switched to DEFAULT_CONSUMER_GROUP.

148.4.26 SUBMIT_PENDING_AREA Procedure

This procedure submits pending changes for the resource manager. It clears the pending area after validating and committing the changes (if valid).

Note:

A call to `SUBMIT_PENDING_AREA` may fail even if `VALIDATE_PENDING_AREA` succeeds. This may happen if a plan being deleted is loaded by an instance after a call to `VALIDATE_PENDING_AREA`, but before a call to `SUBMIT_PENDING_AREA`.

Syntax

```
DBMS_RESOURCE_MANAGER.SUBMIT_PENDING_AREA;
```

148.4.27 SWITCH_CONSUMER_GROUP_FOR_SESS Procedure

This procedure changes the resource consumer group of a specific session. It also changes the consumer group of any parallel execution servers that are related to the top user session. This procedure is RAC instance specific. You need to connect to the PDB in same RAC instance where the session to be switched is running, and then run this procedure.

Syntax

```
DBMS_RESOURCE_MANAGER.SWITCH_CONSUMER_GROUP_FOR_SESS (
    session_id      IN NUMBER,
    session_serial  IN NUMBER,
    consumer_group  IN VARCHAR2);
```

Parameters

Table 148-24 SWITCH_CONSUMER_GROUP_FOR_SESS Procedure Parameters

| Parameter | Description |
|-----------------------------|---|
| <code>session_id</code> | SID column from the view <code>V\$SESSION</code> |
| <code>session_serial</code> | <code>SERIAL#</code> column from view <code>V\$SESSION</code> . |
| <code>consumer_group</code> | Name of the consumer group to which to switch |

148.4.28 SWITCH_CONSUMER_GROUP_FOR_USER Procedure

This procedure changes the resource consumer group for all sessions with a given user ID. It also changes the consumer group of any parallel execution servers that are related to the top user session.

Syntax

```
DBMS_RESOURCE_MANAGER.SWITCH_CONSUMER_GROUP_FOR_USER (
    user            IN VARCHAR2,
    consumer_group  IN VARCHAR2);
```

Parameters

Table 148-25 SWITCH_CONSUMER_GROUP_FOR_USER Procedure Parameters

| Parameter | Description |
|----------------|---|
| user | Name of the user |
| consumer_group | Name of the consumer group to which to switch |

Usage Notes

- The [SWITCH_CONSUMER_GROUP_FOR_SESS Procedure](#) and the SWITCH_CONSUMER_GROUP_FOR_USER procedures let you raise or lower the allocation of CPU resources of certain sessions or users. This provides a functionality similar to the nice command on UNIX.
- These procedures cause the session to be moved into the newly specified consumer group immediately.

148.4.29 SWITCH_PLAN Procedure

This procedure sets the current resource manager plan.

Syntax

```
DBMS_RESOURCE_MANAGER.SWITCH_PLAN(
    plan_name          IN    VARCHAR2,
    sid                IN    VARCHAR2 DEFAULT '*',
    allow_scheduler_plan_switches IN BOOLEAN DEFAULT TRUE);
```

Parameters

Table 148-26 SWITCH_PLAN Procedure Parameters

| Parameter | Description |
|-------------------------------|--|
| plan_name | Name of the plan to which to switch. Passing in an empty string ("") for the plan_name, disables the resource manager |
| sid | The sid parameter is relevant only in an Oracle Real Application Clusters environment. This parameter lets you change the plan for a particular instance. Specify the sid of the instance where you want to change the plan. Or specify '*' if you want Oracle to change the plan for all instances. |
| allow_scheduler_plan_switches | FALSE - disables automated plan switches by the job scheduler at window boundaries. To reenale automated plan switches, switch_plan must be called again by the administrator with allow_scheduler_plan_switches set to TRUE. By default automated plan switches by the job scheduler are enabled. |

148.4.30 UPDATE_CATEGORY Procedure

This procedure updates an existing resource consumer group category.

Syntax

```
DBMS_RESOURCE_MANAGER.UPDATE_CATEGORY (
    category      IN    VARCHAR2,
    new_comment   IN    VARCHAR2  DEFAULT NULL);
```

Parameters

Table 148-27 UPDATE_CATEGORY Procedure Parameters

| Parameter | Description |
|-------------|---------------------------------|
| category | Name of consumer group category |
| new_comment | User comment |

Usage Notes

To clear (reset to the directive's default value), use the value -1.

148.4.31 UPDATE_CDB_AUTOTASK_DIRECTIVE Procedure

This procedure updates the plan directives with regard to automated maintenance tasks in the CDB root (CDB\$ROOT).

By default, all maintenance tasks occur directly in the PDBs themselves.

Syntax

```
DBMS_RESOURCE_MANAGER.UPDATE_CDB_AUTOTASK_DIRECTIVE (
    plan                IN    VARCHAR2,
    new_comment         IN    VARCHAR2  DEFAULT NULL,
    new_shares          IN    NUMBER    DEFAULT NULL,
    new_utilization_limit IN    NUMBER    DEFAULT NULL,
    new_parallel_server_limit IN    NUMBER    DEFAULT NULL,
    new_memory_limit    IN    NUMBER    DEFAULT NULL,
    new_memory_min      IN    NUMBER    DEFAULT NULL);
```

Parameters

Table 148-28 UPDATE_CDB_AUTOTASK_DIRECTIVE Procedure Parameters

| Parameter | Description |
|-----------------------|--|
| plan | Name of the consolidation plan |
| new_comment | New user comment |
| new_shares | Specifies the new share of resource allocation for CDB root's automated maintenance tasks |
| new_utilization_limit | Specifies the new maximum percentage of CPU that automated maintenance tasks in the CDB root can utilize |

Table 148-28 (Cont.) UPDATE_CDB_AUTOTASK_DIRECTIVE Procedure Parameters

| Parameter | Description |
|--|---|
| <code>new_parallel_server_limit</code> | Specifies the new maximum percentage of <code>parallel_servers_target</code> parallel servers that automated maintenance tasks in the CDB root are allowed to use |
| <code>new_memory_limit</code> | This parameter is only applicable to Oracle Exadata storage for configuring the Database Smart Flash Cache and PMEM Cache. |
| <code>new_memory_min</code> | This parameter is only applicable to Oracle Exadata storage for configuring the Database Smart Flash Cache and PMEM Cache. |

Usage Notes

- By default for automated maintenance tasks, the values are
 - `shares`: -1
 - `utilization_limit`: 90
 - `parallel_server_limit`: 100
- The `shares = -1` means that the automated maintenance tasks get an allocation of 20% of the system. If the user specifies the `shares`, it behaves the same properties as the other CDB plan directive functions. If the user does not change the `shares` or later changes it back to -1, autotask will get 20% of the system.
- This procedure can be run only from the CDB root.
- To clear (reset to the directive's default value), use the value -1.

148.4.32 UPDATE_CDB_DEFAULT_DIRECTIVE Procedure

This procedure updates the plan directives of the consolidation resource plan.

Syntax

```
DBMS_RESOURCE_MANAGER.UPDATE_CDB_DEFAULT_DIRECTIVE (
    plan                IN    VARCHAR2    DEFAULT NULL,
    new_comment         IN    VARCHAR2    DEFAULT NULL,
    new_shares          IN    NUMBER      DEFAULT NULL,
    new_utilization_limit IN    NUMBER      DEFAULT NULL,
    new_parallel_server_limit IN    NUMBER  DEFAULT NULL,
    new_memory_limit    IN    NUMBER      DEFAULT NULL,
    new_memory_min      IN    NUMBER      DEFAULT NULL);
```

Parameters

Table 148-29 UPDATE_CDB_DEFAULT_DIRECTIVE Procedure Parameters

| Parameter | Description |
|--------------------------|--------------------------------|
| <code>plan</code> | Name of the consolidation plan |
| <code>new_comment</code> | New user comment |

Table 148-29 (Cont.) UPDATE_CDB_DEFAULT_DIRECTIVE Procedure Parameters

| Parameter | Description |
|--|--|
| <code>new_shares</code> | Specifies the share of resource allocation for the pluggable database. CPU Resource Manager and Exadata I/O Resource Manager are enabled by specifying shares for each PDB. The <code>new_shares</code> parameter is also used for Parallel Statement Queuing. |
| <code>new_utilization_limit</code> | Specifies the maximum percentage of CPU that the pluggable database can utilize. |
| <code>new_parallel_server_limit</code> | Specifies the maximum percentage of <code>parallel_servers_target</code> parallel servers that the pluggable database can use. |
| <code>new_memory_limit</code> | This parameter is only applicable to Oracle Exadata storage for configuring the Database Smart Flash Cache and PMEM Cache. |
| <code>new_memory_min</code> | This parameter is only applicable to Oracle Exadata storage for configuring the Database Smart Flash Cache and PMEM Cache. |

Usage Notes

- By default, the default values are
 - `new_shares: 1`
 - `utilization_limit: 100`
 - `parallel_server_limit: 100`
- Note that the default values are `NULL`. This has the same meaning as in [UPDATE_CDB_PLAN_DIRECTIVE Procedure](#). If the user does not specify a value, the value will not be modified.
- This procedure can be run only from the CDB root (`CDB$ROOT`).
- To clear (reset to the directive's default value), use the value `-1`.

148.4.33 UPDATE_CDB_PLAN Procedure

This procedure updates the consolidation resource plan.

Syntax

```
DBMS_RESOURCE_MANAGER.UPDATE_CDB_PLAN (
  plan          IN  VARCHAR2(32),
  new_comment   IN  VARCHAR2(2000) DEFAULT NULL);
```

Parameters

Table 148-30 UPDATE_CDB_PLAN Procedure Parameters

| Parameter | Description |
|-------------|--------------------------------|
| plan | Name of the consolidation plan |
| new_comment | User comment |

Usage Notes

- This procedure can be run only from the CDB root (CDB\$ROOT).
- To clear (reset to the directive's default value), use the value -1.

148.4.34 UPDATE_CDB_PLAN_DIRECTIVE Procedure

Updates the plan directives for a consolidation resource plan. Plan directives specify the resource allocation policy for pluggable databases (PDBs).

Syntax

```
DBMS_RESOURCE_MANAGER.UPDATE_CDB_PLAN_DIRECTIVE (
    plan                IN    VARCHAR2 (30),
    pluggable_database  IN    VARCHAR2 (30)
    new_comment         IN    VARCHAR2 (200) DEFAULT NULL,
    new_shares          IN    NUMBER          DEFAULT NULL,
    new_utilization_limit IN    NUMBER          DEFAULT NULL,
    new_parallel_server_limit IN    NUMBER          DEFAULT NULL,
    new_memory_limit    IN    NUMBER          DEFAULT NULL,
    new_memory_min      IN    NUMBER          DEFAULT NULL);
```

Parameters

Table 148-31 UPDATE_CDB_PLAN_DIRECTIVE Procedure Parameters

| Parameter | Description |
|-----------------------|---|
| plan | Name of the consolidation plan |
| pluggable_database | Name of the pluggable database |
| new_comment | New user comment |
| new_shares | The share of resource allocation for the pluggable database CPU Resource Manager is enabled by specifying shares for each PDB. The <code>shares</code> parameter is also used for Parallel Statement Queuing. If no share is specified, the default is obtained from the default directive, specified through the UPDATE_CDB_DEFAULT_DIRECTIVE Procedure . |
| new_utilization_limit | The new maximum percentage of CPU that the pluggable database can utilize |

Table 148-31 (Cont.) UPDATE_CDB_PLAN_DIRECTIVE Procedure Parameters

| Parameter | Description |
|--|--|
| <code>new_parallel_server_limit</code> | The new maximum percentage of <code>parallel_servers_target</code> parallel servers that the pluggable database can use |
| <code>new_memory_limit</code> | This parameter is only applicable to Oracle Exadata storage for configuring the Database Smart Flash Cache and PMEM Cache. |
| <code>new_memory_min</code> | This parameter is only applicable to Oracle Exadata storage for configuring the Database Smart Flash Cache and PMEM Cache. |

Usage Notes

- The default value for the `new_*` parameters is `NULL` which indicates that the existing value is left unchanged. If the user does not specify one of the arguments when calling this function, the value is not modified.
- This procedure can be run only from the CDB root (`CDB$ROOT`).
- To clear (reset to the directive's default value), use the value `-1`.

148.4.35 UPDATE_CDB_PROFILE_DIRECTIVE Procedure

This procedure updates the performance profile directives of the consolidation resource plan. The directives specify the resource allocation policy for pluggable databases (PDBs) that use the performance profile.

For a PDB to use a performance profile, the PDB must have the `DB_PERFORMANCE_PROFILE` initialization parameter set to the performance profile name.

Syntax

```
DBMS_RESOURCE_MANAGER.UPDATE_CDB_PROFILE_DIRECTIVE (
  plan          IN    VARCHAR2,
  profile       IN    VARCHAR2,
  new_comment   IN    VARCHAR2 (2000) DEFAULT '',
  new_shares    IN    NUMBER          DEFAULT NULL,
  new_utilization_limit IN    NUMBER          DEFAULT NULL,
  new_parallel_server_limit IN    NUMBER          DEFAULT NULL,
  new_memory_limit IN    NUMBER          DEFAULT 100,
  new_memory_min IN    NUMBER          DEFAULT 0);
```

Parameters**Table 148-32 UPDATE_CDB_PROFILE_DIRECTIVE Procedure Parameters**

| Parameter | Description |
|--------------------------|---------------------------------|
| <code>plan</code> | Name of the consolidation plan |
| <code>profile</code> | Name of the performance profile |
| <code>new_comment</code> | New user comment |

Table 148-32 (Cont.) UPDATE_CDB_PROFILE_DIRECTIVE Procedure Parameters

| Parameter | Description |
|--|--|
| <code>new_shares</code> | The share of resource allocation for the PDBs that use the performance profile |
| <code>new_utilization_limit</code> | The new maximum percentage of CPU that PDBs that use the performance profile can use |
| <code>new_parallel_server_limit</code> | The new maximum percentage of <code>parallel_servers_target</code> parallel servers that PDBs that use the performance profile can use |
| <code>new_memory_limit</code> | This parameter is only applicable to Oracle Exadata storage for configuring the Database Smart Flash Cache and PMEM Cache. |
| <code>new_memory_min</code> | This parameter is only applicable to Oracle Exadata storage for configuring the Database Smart Flash Cache and PMEM Cache. |

Usage Notes

- This procedure can be run only from the CDB root (CDB\$ROOT).
- To clear (reset to the directive's default value), use the value `-1`.

148.4.36 UPDATE_CONSUMER_GROUP Procedure

This procedure updates entries which define resource consumer groups.

Syntax

```
DBMS_RESOURCE_MANAGER.UPDATE_CONSUMER_GROUP (
  consumer_group IN VARCHAR2,
  new_comment    IN VARCHAR2 DEFAULT NULL,
  new_cpu_mth    IN VARCHAR2 DEFAULT NULL,
  new_mgmt_mth   IN VARCHAR2 DEFAULT NULL,
  new_category   IN VARCHAR2 DEFAULT NULL);
```

Parameters

Table 148-33 UPDATE_CONSUMER_GROUP Procedure Parameter

| Parameter | Description |
|-----------------------------|---|
| <code>consumer_group</code> | Name of consumer group |
| <code>new_comment</code> | New user comment |
| <code>new_cpu_mth</code> | Name of new method for CPU resource allocation (deprecated) |
| <code>new_mgmt_mth</code> | Name of new method for CPU resource allocation |
| <code>new_category</code> | New consumer group category |

Usage Notes

- If the parameters to the `UPDATE_CONSUMER_GROUP` procedure are not specified, then they remain unchanged in the data dictionary.

- To clear (reset to the directive's default value), use the value -1.

148.4.37 UPDATE_PLAN Procedure

This procedure updates entries which define resource plans.

Syntax

```
DBMS_RESOURCE_MANAGER.UPDATE_PLAN (
    plan                IN VARCHAR2,
    new_comment         IN VARCHAR2 DEFAULT NULL,
    new_cpu_mth         IN VARCHAR2 DEFAULT NULL, -- deprecated
    new_active_sess_pool_mth IN VARCHAR2 DEFAULT NULL,
    new_parallel_degree_limit_mth IN VARCHAR2 DEFAULT NULL,
    new_queueing_mth    IN VARCHAR2 DEFAULT NULL,
    new_mgmt_mth        IN VARCHAR2 DEFAULT NULL,
    new_sub_plan        IN BOOLEAN DEFAULT FALSE,
    new_max_iops        IN NUMBER DEFAULT NULL,
    new_max_mbps        IN NUMBER DEFAULT NULL);
```

Parameters

Table 148-34 UPDATE_PLAN Procedure Parameters

| Parameter | Description |
|-------------------------------|--|
| plan | Name of resource plan |
| new_comment | New user comment |
| new_cpu_mth | Name of new allocation method for CPU resources (deprecated) |
| new_active_sess_pool_mth | Name of new method for maximum active sessions |
| new_parallel_degree_limit_mth | Name of new method for degree of parallelism |
| new_queueing_mth | Specifies type of queuing policy to use with active session pool feature |
| new_mgmt_mth | Resource allocation method for specifying how much resources (for example, CPU or I/O) each consumer group or sub-plan gets <ul style="list-style-type: none"> • EMPHASIS - for multilevel plans that use percentages to specify how I/O resources are distributed among consumer groups. • RATIO - for single-level plans that use ratios to specify how I/O resources are distributed. |
| new_sub_plan | New setting for whether the plan is only intended for use as a sub-plan |
| new_max_iops | Nonoperative |
| new_max_mbps | Nonoperative |

Usage Notes

- If the parameters to [UPDATE_PLAN Procedure](#) are not specified, then they remain unchanged in the data dictionary.
- If you want to use any default resource allocation method, then you do not need to specify it when creating or updating a plan.
- To clear (reset to the directive's default value), use the value -1.

148.4.38 UPDATE_PLAN_DIRECTIVE Procedure

This procedure updates resource plan directives.

Note:

The parameters `new_max_utilization_limit` and `new_parallel_target_percentage` are deprecated with Oracle Database 11g Release 1 (12.1.0.1), and are replaced by `new_utilization_limit` and `new_parallel_server_limit`.

Syntax

```
DBMS_RESOURCE_MANAGER.UPDATE_PLAN_DIRECTIVE (
    plan                               IN VARCHAR2,
    group_or_subplan                   IN VARCHAR2,
    new_comment                         IN VARCHAR2 DEFAULT NULL,
    new_cpu_p1                         IN NUMBER   DEFAULT NULL, -- deprecated
    new_cpu_p2                         IN NUMBER   DEFAULT NULL, -- deprecated
    new_cpu_p3                         IN NUMBER   DEFAULT NULL, -- deprecated
    new_cpu_p4                         IN NUMBER   DEFAULT NULL, -- deprecated
    new_cpu_p5                         IN NUMBER   DEFAULT NULL, -- deprecated
    new_cpu_p6                         IN NUMBER   DEFAULT NULL, -- deprecated
    new_cpu_p7                         IN NUMBER   DEFAULT NULL, -- deprecated
    new_cpu_p8                         IN NUMBER   DEFAULT NULL, -- deprecated
    new_active_sess_pool_p1            IN NUMBER   DEFAULT NULL,
    new_queueing_p1                    IN NUMBER   DEFAULT NULL,
    new_parallel_degree_limit_p1       IN NUMBER   DEFAULT NULL,
    new_switch_group                   IN VARCHAR2 DEFAULT NULL,
    new_switch_time                    IN NUMBER   DEFAULT NULL,
    new_switch_estimate                IN BOOLEAN  DEFAULT FALSE,
    new_max_est_exec_time              IN NUMBER   DEFAULT NULL,
    new_undo_pool                      IN NUMBER   DEFAULT NULL,
    new_max_idle_time                  IN NUMBER   DEFAULT NULL,
    new_max_idle_blocker_time         IN NUMBER   DEFAULT NULL,
    switch_time_in_call                IN NUMBER   DEFAULT NULL, -- deprecated
    new_mgmt_p1                        IN NUMBER   DEFAULT NULL,
    new_mgmt_p2                        IN NUMBER   DEFAULT NULL,
    new_mgmt_p3                        IN NUMBER   DEFAULT NULL,
    new_mgmt_p4                        IN NUMBER   DEFAULT NULL,
    new_mgmt_p5                        IN NUMBER   DEFAULT NULL,
    new_mgmt_p6                        IN NUMBER   DEFAULT NULL,
    new_mgmt_p7                        IN NUMBER   DEFAULT NULL,
    new_mgmt_p8                        IN NUMBER   DEFAULT NULL,
    new_switch_io_megabytes            IN NUMBER   DEFAULT NULL,
    new_switch_io_reqs                 IN NUMBER   DEFAULT NULL,
    new_switch_for_call                IN BOOLEAN  DEFAULT NULL,
    new_max_utilization_limit          IN NUMBER   DEFAULT NULL,
    new_parallel_target_percentage     IN NUMBER   DEFAULT NULL,
    new_parallel_queue_timeout         IN NUMBER   DEFAULT NULL,
    new_parallel_server_limit          IN NUMBER   DEFAULT NULL,
    new_utilization_limit              IN NUMBER   DEFAULT NULL,
    new_switch_io_logical              IN NUMBER   DEFAULT NULL,
    new_switch_elapsed_time            IN NUMBER   DEFAULT NULL,
    new_shares                         IN NUMBER   DEFAULT NULL,
```

```

new_parallel_stmt_critical    IN VARCHAR2 DEFAULT NULL,
new_session_pga_limit        IN NUMBER   DEFAULT NULL,
new_pq_timeout_action        IN NUMBER   DEFAULT NULL);

```

Parameters

Table 148-35 UPDATE_PLAN_DIRECTIVE Procedure Parameters

| Parameter | Description |
|------------------------------|---|
| plan | Name of the resource plan |
| group_or_subplan | Name of the consumer group or subplan |
| new_comment | Comment for the plan directive |
| new_cpu_p1 | Deprecated - use new_mgmt_p1 instead |
| new_cpu_p2 | Deprecated - use new_mgmt_p2 instead |
| new_cpu_p3 | Deprecated - use new_mgmt_p3 instead |
| new_cpu_p4 | Deprecated- use new_mgmt_p4 instead |
| new_cpu_p5 | Deprecated - use new_mgmt_p5 instead |
| new_cpu_p6 | Deprecated- use new_mgmt_p6 instead |
| new_cpu_p7 | Deprecated- use new_mgmt_p7 instead |
| new_cpu_p8 | Deprecated- use new_mgmt_p8 instead |
| new_active_sess_pool_p1 | Specifies maximum number of concurrently active sessions for a consumer group. Default is NULL, which means unlimited. |
| new_queueing_p1 | Specified time (in seconds) after which a job in the inactive session queue (waiting for execution) will time out. Default is NULL, which means unlimited. |
| new_parallel_degree_limit_p1 | Specifies a limit on the degree of parallelism for any operation. Default is NULL, which means unlimited. |
| new_switch_group | Specifies consumer group to which this session is switched if other switch criteria are met. Default is NULL. If the group name is 'CANCEL_SQL', the current call will be canceled when other switch criteria are met. If the group name is 'KILL_SESSION', the session will be killed when other switch criteria are met. |
| new_switch_time | Specifies time (in CPU seconds) that a session can execute before an action is taken. Default is NULL, which means unlimited. |
| new_switch_estimate | If TRUE, tells Oracle to use its execution time estimate to automatically switch the consumer group of an operation before beginning its execution. Default is FALSE. |
| new_max_est_exec_time | Specifies the maximum execution time (in CPU seconds) allowed for a session. If the optimizer estimates that an operation will take longer than MAX_EST_EXEC_TIME, the operation is not started and ORA-07455 is issued. If the optimizer does not provide an estimate, this directive has no effect. Default is NULL, which means unlimited. |
| new_undo_pool | Limits the size in kilobytes of the undo records corresponding to uncommitted transactions by this consumer group |
| new_max_idle_time | Indicates the maximum session idle time. Default is NULL, which means unlimited. |
| new_max_idle_blocker_time | Maximum amount of time in seconds that a session can be idle while blocking another session's acquisition of a resource |

Table 148-35 (Cont.) UPDATE_PLAN_DIRECTIVE Procedure Parameters

| Parameter | Description |
|---|---|
| <code>new_switch_time_in_call</code> | Deprecated. If this parameter is specified, <code>new_switch_time</code> will be effectively set to <code>new_switch_time_in_call</code> and <code>new_switch_for_call</code> will be effectively set to TRUE. |
| <code>new_mgmt_p1</code> | Resource allocation value for level 1 (replaces <code>new_cpu_p1</code>): <ul style="list-style-type: none"> • EMPHASIS - specifies the resource percentage at the first level • RATIO - specifies the weight of resource usage |
| <code>new_mgmt_p2</code> | Resource allocation value for level 2 (replaces <code>new_cpu_p2</code>) <ul style="list-style-type: none"> • EMPHASIS - specifies the resource percentage at the second level • RATIO - non-applicable |
| <code>new_mgmt_p3</code> | Resource allocation value for level 3 (replaces <code>new_cpu_p3</code>) <ul style="list-style-type: none"> • EMPHASIS - specifies the resource percentage at the third level • RATIO - non-applicable |
| <code>new_mgmt_p4</code> | Resource allocation value for level 4 (replaces <code>new_cpu_p4</code>) <ul style="list-style-type: none"> • EMPHASIS - specifies the resource percentage at the fourth level • RATIO - non-applicable |
| <code>new_mgmt_p5</code> | Resource allocation value for level 5 (replaces <code>new_cpu_p5</code>) <ul style="list-style-type: none"> • EMPHASIS - specifies the resource percentage at the fifth level • RATIO - non-applicable |
| <code>new_mgmt_p6</code> | Resource allocation value for level 6 (replaces <code>new_cpu_p6</code>) <ul style="list-style-type: none"> • EMPHASIS - specifies the resource percentage at the sixth level • RATIO - non-applicable |
| <code>new_mgmt_p7</code> | Resource allocation value for level 7 (replaces <code>new_cpu_p7</code>) <ul style="list-style-type: none"> • EMPHASIS - specifies the resource percentage at the seventh level • RATIO - non-applicable |
| <code>new_mgmt_p8</code> | Resource allocation value for level 8 (replaces <code>new_cpu_p8</code>) <ul style="list-style-type: none"> • EMPHASIS - specifies the resource percentage at the eighth level • RATIO - non-applicable |
| <code>new_switch_io_megabytes</code> | Specifies the amount of I/O (in MB) that a session can issue before an action is taken. Default is NULL, which means unlimited. |
| <code>new_switch_io_reqs</code> | Specifies the number of I/O requests that a session can issue before an action is taken. Default is NULL, which means unlimited. |
| <code>new_switch_for_call</code> | Specifies that if an action is taken because of the <code>new_switch_time</code> , <code>new_switch_io_megabytes</code> , or <code>new_switch_io_reqs</code> parameters, the consumer group is restored to its original consumer group at the end of the top call. Default is FALSE, which means that the original consumer group is not restored at the end of the top call. |
| <code>new_max_utilization_limit</code> | Deprecated - use <code>new_utilization_limit</code> instead |
| <code>new_parallel_target_percentage</code> | Deprecated - use <code>new_parallel_server_limit</code> instead |
| <code>new_parallel_server_limit</code> | Parallel server limit. Setting this overwrites the limit for parallel server set by <code>utilization_limit</code> . |

Table 148-35 (Cont.) UPDATE_PLAN_DIRECTIVE Procedure Parameters

| Parameter | Description |
|---|---|
| <code>new_utilization_limit</code> | Resource limit. For CPU, this limits the CPU utilization for the consumer group. For parallel servers, this limits the parallel servers used as a percentage of <code>parallel_servers_target</code> . |
| <code>new_switch_elapsed_time</code> | Elapsed time that will trigger the action specified by <code>switch_group</code> . As with other switch directives, if <code>new_switch_for_call</code> is <code>TRUE</code> , the elapsed time is accumulated from the start of a call. Otherwise, the elapsed time is accumulated for the length of the session. |
| <code>new_shares</code> | Specifies the share of resource allocation for the pluggable database. CPU Resource Manager and Exadata I/O Resource Manager are enabled by specifying shares for each PDB. The <code>shares</code> parameter is also used for Parallel Statement Queuing. If CPU Resource Manager and Exadata I/O Resource Manager are enabled, then the default value is 1. |
| <code>new_parallel_stmt_critical</code> | If set to <code>BYPASS_QUEUE</code> , parallel statements from this consumer group are not queued. If set to <code>QUEUE</code> , all the parallel statements, irrespective of the <code>parallel_degree_policy</code> parameter value, from the consumer group get queued. Default is <code>FALSE</code> , which means that certain parallel statements are eligible for queuing depending upon the <code>parallel_degree_policy</code> parameter value. |
| <code>new_session_pga_limit</code> | Maximum amount of PGA in MB that sessions in this consumer group can allocate before being terminated. <code>NULL</code> (default) indicates no change. |
| <code>new_parallel_queue_timeout</code> | Specifies the time (in seconds) that a parallel statement may remain in its Consumer Group's parallel statement queue before it is removed. The default action of this parameter is <code>ERROR</code> . This action can be altered using the <code>new_pq_timeout_action</code> parameter. |
| <code>new_pq_timeout_action</code> | Specifies the action to be taken when a parallel statement is removed from the queue due to <code>new_parallel_queue_timeout</code> . The values are: <ul style="list-style-type: none"> <code>CANCEL</code> — The SQL statement is terminated with error <code>ORA-7454</code> <code>RUN</code> — The SQL statement runs immediately, and might get downgraded if parallel servers are unavailable |

Usage Notes

- If the parameters for `UPDATE_PLAN_DIRECTIVE` are left unspecified, then they remain unchanged in the data dictionary.
- For `new_max_idle_time` and `new_max_idle_blocker_time`, PMON will check these limits once a minute. If it finds a session that has exceeded one of the limits, it will forcibly kill the session and clean up all its state.
- The parameter `new_switch_time_in_call` is mostly useful for three-tier applications where the mid-tier server is implementing session pooling. By turning on `new_switch_time_in_call`, the resource usage of one client will not affect the consumer group of a future client that happens to be executed on the same session.
- To clear (reset to the directive's default value), use the value `-1`.

148.4.39 VALIDATE_PENDING_AREA Procedure

This procedure validates pending changes for the resource manager.

Syntax

```
DBMS_RESOURCE_MANAGER.VALIDATE_PENDING_AREA;
```

DBMS_RESOURCE_MANAGER_PRIVS

The `DBMS_RESOURCE_MANAGER_PRIVS` package maintains privileges associated with the Resource Manager.

This chapter contains the following topics:

- [Summary of DBMS_RESOURCE_MANAGER_PRIVS Subprograms](#)

See Also:

For more information on using the Database Resource Manager, see *Oracle Database Administrator's Guide*

149.1 Summary of DBMS_RESOURCE_MANAGER_PRIVS Subprograms

This table lists the `DBMS_RESOURCE_MANAGER_PRIVS` subprograms and briefly describes them.

Table 149-1 DBMS_RESOURCE_MANAGER_PRIVS Package Subprograms

| Subprogram | Description |
|--|--|
| GRANT_SWITCH_CONSUMER_GRP OUP Procedure | Grants the privilege to switch to resource consumer groups |
| GRANT_SYSTEM_PRIVILEGE Procedure | Performs a grant of a system privilege |
| REVOKE_SWITCH_CONSUMER_GRP OUP Procedure | Revokes the privilege to switch to resource consumer groups. |
| REVOKE_SYSTEM_PRIVILEGE Procedure | Performs a revoke of a system privilege |

149.1.1 GRANT_SWITCH_CONSUMER_GROUP Procedure

This procedure grants the privilege to switch to a resource consumer group.

Syntax

```
DBMS_RESOURCE_MANAGER_PRIVS.GRANT_SWITCH_CONSUMER_GROUP (
  grantee_name    IN VARCHAR2,
  consumer_group  IN VARCHAR2,
  grant_option    IN BOOLEAN);
```

Parameters

Table 149-2 GRANT_SWITCH_CONSUMER_GROUP Procedure Parameters

| Parameter | Description |
|----------------|---|
| grantee_name | Name of the user or role to whom privilege is to be granted. |
| consumer_group | Name of consumer group. |
| grant_option | TRUE if grantee should be allowed to grant access, FALSE otherwise. |

Usage Notes

If you grant permission to switch to a particular consumer group to a user, then that user can immediately switch their current consumer group to the new consumer group.

If you grant permission to switch to a particular consumer group to a role, then any users who have been granted that role and have enabled that role can immediately switch their current consumer group to the new consumer group.

If you grant permission to switch to a particular consumer group to PUBLIC, then any user can switch to that consumer group.

If the `grant_option` parameter is TRUE, then users granted switch privilege for the consumer group may also grant switch privileges for that consumer group to others.

In order to set the initial consumer group of a user, you must grant the switch privilege for that group to the user.

See Also:

[DBMS_RESOURCE_MANAGER](#)

Examples

```
BEGIN
DBMS_RESOURCE_MANAGER_PRIVS.GRANT_SWITCH_CONSUMER_GROUP (
  'scott', 'mail_maintenance_group', true);
DBMS_RESOURCE_MANAGER.CREATE_PENDING_AREA();
DBMS_RESOURCE_MANAGER.set_consumer_group_mapping(
  dbms_resource_manager.oracle_user, 'scott', 'mail_maintenance_group');
DBMS_RESOURCE_MANAGER.SUBMIT_PENDING_AREA();
END;
/
```

149.1.2 GRANT_SYSTEM_PRIVILEGE Procedure

This procedure performs a grant of a system privilege to a user or role.

Syntax

```
DBMS_RESOURCE_MANAGER_PRIVS.GRANT_SYSTEM_PRIVILEGE (
  grantee_name      IN VARCHAR2,
```

```

privilege_name IN VARCHAR2 DEFAULT 'ADMINISTER_RESOURCE_MANAGER',
admin_option   IN BOOLEAN);

```

Parameters

Table 149-3 GRANT_SYSTEM_PRIVILEGE Procedure Parameters

| Parameter | Description |
|----------------|--|
| grantee_name | Name of the user or role to whom privilege is to be granted. |
| privilege_name | Name of the privilege to be granted. |
| admin_option | TRUE if the grant is with admin_option, FALSE otherwise. |

Usage Notes

Currently, Oracle provides only one system privilege for the Resource Manager: `ADMINISTER_RESOURCE_MANAGER`. Database administrators have this system privilege with the `ADMIN` option. The grantee and the revokee can either be a user or a role. Users that have been granted the system privilege with the `ADMIN` option can also grant this privilege to others.

Examples

The following call grants this privilege to a user called `scott` without the `ADMIN` option:

```

BEGIN
DBMS_RESOURCE_MANAGER_PRIVS.GRANT_SYSTEM_PRIVILEGE (
  grantee_name => 'scott',
  privilege_name => 'ADMINISTER_RESOURCE_MANAGER',
  admin_option => FALSE);
END;
/

```

149.1.3 REVOKE_SWITCH_CONSUMER_GROUP Procedure

This procedure revokes the privilege to switch to a resource consumer group.

Syntax

```

DBMS_RESOURCE_MANAGER_PRIVS.REVOKE_SWITCH_CONSUMER_GROUP (
  revokee_name IN VARCHAR2,
  consumer_group IN VARCHAR2);

```

Parameters

Table 149-4 REVOKE_SWITCH_CONSUMER_GROUP Procedure Parameter

| Parameter | Description |
|----------------|--|
| revokee_name | Name of user/role from which to revoke access. |
| consumer_group | Name of consumer group. |

Usage Notes

If you revoke a user's switch privilege for a particular consumer group, then any subsequent attempts by that user to switch to that consumer group will fail.

If you revoke the initial consumer group from a user, then that user will automatically be part of the `DEFAULT_CONSUMER_GROUP` consumer group when logging in.

If you revoke the switch privilege for a consumer group from a role, then any users who only had switch privilege for the consumer group through that role will not be able to switch to that consumer group.

If you revoke the switch privilege for a consumer group from `PUBLIC`, then any users who could previously only use the consumer group through `PUBLIC` will not be able to switch to that consumer group.

Examples

The following example revokes the privileges to switch to `mail_maintenance_group` from Scott:

```
BEGIN
DBMS_RESOURCE_MANAGER_PRIVS.REVOKE_SWITCH_CONSUMER_GROUP (
  'scott', 'mail_maintenance_group');
END;
/
```

149.1.4 REVOKE_SYSTEM_PRIVILEGE Procedure

This procedure performs a revoke of a system privilege from a user or role.

Syntax

```
DBMS_RESOURCE_MANAGER_PRIVS.REVOKE_SYSTEM_PRIVILEGE (
  revokee_name   IN VARCHAR2,
  privilege_name IN VARCHAR2 DEFAULT 'ADMINISTER_RESOURCE_MANAGER');
```

Parameters

Table 149-5 REVOKE_SYSTEM_PRIVILEGE Procedure Parameters

| Parameter | Description |
|-----------------------------|--|
| <code>revokee_name</code> | Name of the user or role from whom privilege is to be revoked. |
| <code>privilege_name</code> | Name of the privilege to be revoked. |

Examples

The following call revokes the `ADMINISTER_RESOURCE_MANAGER` from user `scott`:

```
BEGIN
DBMS_RESOURCE_MANAGER_PRIVS.REVOKE_SYSTEM_PRIVILEGE ('scott');
END;
/
```

DBMS_RESULT_CACHE

The `DBMS_RESULT_CACHE` package provides an interface to allow the DBA to administer that part of the shared pool that is used by the SQL result cache and the PL/SQL function result cache.

Both these caches use the same infrastructure. Therefore, for example, `DBMS_RESULT_CACHE.BYPASS` determines whether both caches are bypassed or both caches are used, and `DBMS_RESULT_CACHE.FLUSH` flushes both all the cached results for SQL queries and all the cached results for PL/SQL functions.

This chapter contains the following topics:

- [Security Model](#)
- [Constants](#)
- [Summary of DBMS_RESULT_CACHE Subprograms](#)

See Also:

- *Oracle Database Performance Tuning Guide*, for more information about "Result Cache Concepts"
- *Oracle Database PL/SQL Language Reference*, for more information about PL/SQL function Result Cache "Using the Cross-Session PL/SQL Function Result Cache"
- *Database PL/SQL Language Reference*, for more information about Result Cache Management.

150.1 DBMS_RESULT_CACHE Security Model

Only database administrators should be granted the `EXECUTE` privilege for this package.

150.2 DBMS_RESULT_CACHE Constants

The `DBMS_RESULT_CACHE` package defines several constants for specifying parameter values.

The following table describes these constants.

Table 150-1 DBMS_RESULT_CACHE Constants

| Constant | Definition | Description |
|--------------------------|---|---|
| <code>STATUS_BYPS</code> | <code>CONSTANT VARCHAR2(10) := 'BYPASS';</code> | Cache has been made temporarilyunavailable. |

Table 150-1 (Cont.) DBMS_RESULT_CACHE Constants

| Constant | Definition | Description |
|-------------|--------------------------------------|--|
| STATUS_CORR | CONSTANT VARCHAR2(10) := 'CORRUPT'; | The result cache is in an unusable state. |
| STATUS_DISA | CONSTANT VARCHAR2(10) := 'DISABLED'; | Cache is not available. |
| STATUS_ENAB | CONSTANT VARCHAR2(10) := 'ENABLED'; | Cache is available. |
| STATUS_SYNC | CONSTANT VARCHAR2(10) := 'SYNC'; | Cache is available, but synchronizing with Oracle RAC nodes. |

150.3 Summary of DBMS_RESULT_CACHE Subprograms

This table lists the DBMS_RESULT_CACHE subprograms and briefly describes them.

Table 150-2 DBMS_RESULT_CACHE Package Subprograms

| Subprogram | Description |
|--|---|
| BLACK_LIST Function | Returns all the blocklisted cache ids of a local instance. |
| BLACK_LIST_ADD Procedure | Adds a <code>cache_id</code> to the blocklist. |
| BLACK_LIST_CLEAR Procedure | Removes all <code>cache_ids</code> from the blocklist. |
| BLACK_LIST_REMOVE Procedure | Removes the <code>cache_id</code> from the blocklist. |
| BYPASS Procedure | Sets the bypass mode for the result cache. |
| FLUSH Function & Procedure | Attempts to remove all the objects from the result cache, and depending on the arguments retains or releases the memory and retains or clears the statistics. |
| INVALIDATE Functions & Procedures | Invalidates all the result-set objects that are dependent upon the specified dependency object. |
| INVALIDATE_OBJECT Functions & Procedures | Invalidates the specified result-set object(s) |
| MEMORY_REPORT Procedure | Produces the memory usage report for the result cache. |
| OBJECT_BLACK_LIST Function | Returns all the object numbers currently in the blocklist |
| OBJECT_BLACK_LIST_ADD Procedure | Adds objects to the object blocklist |
| OBJECT_BLACK_LIST_CLEAR Procedure | Clears the entire blocklist |
| OBJECT_BLACK_LIST_REMOVE Procedure | Removes objects from the object blocklist. |
| STATUS Function | Checks the status of the result cache. |

150.3.1 BLACK_LIST Function

This table function returns all the blocklisted cache ids of a local instance.

Syntax

```
DBMS_RESULT_CACHE.BLACK_LIST
RETURN BL_TABT;
```

150.3.2 BLACK_LIST_ADD Procedure

This procedure adds a cache_id to the blocklist.

Syntax

```
DBMS_RESULT_CACHE.BLACK_LIST_ADD (
  cache_id  IN VARCHAR2,
  global    IN BOOLEAN DEFAULT FALSE);
```

Parameters

Table 150-3 BLACK_LIST_ADD Procedure Parameters

| Parameter | Description |
|-----------|---|
| cache_id | The cache_id is added to the blocklist. |
| global | TRUE — applies to all caches in a RAC cluster. FALSE (default) — applies only to the local instance cache. |

150.3.3 BLACK_LIST_CLEAR Procedure

This procedure removes all cache_ids from the blocklist.

Syntax

```
DBMS_RESULT_CACHE.BLACK_LIST_CLEAR (
  global  IN BOOLEAN DEFAULT FALSE);
```

Parameters

Table 150-4 BLACK_LIST_CLEAR Procedure Parameters

| Parameter | Description |
|-----------|---|
| global | TRUE — applies to all caches in a RAC cluster. FALSE (default) — applies only to the local instance cache. |

150.3.4 BLACK_LIST_REMOVE Procedure

This procedure removes the cache_id from the blocklist.

Syntax

```
DBMS_RESULT_CACHE.BLACK_LIST_REMOVE (
    cache_id IN VARCHAR2,
    global   IN BOOLEAN DEFAULT FALSE);
```

Parameters

Table 150-5 BLACK_LIST_REMOVE Procedure Parameters

| Parameter | Description |
|-----------|---|
| cache_id | The cache_id is removed from the blocklist. |
| global | TRUE — applies to all caches in a RAC cluster. FALSE (default) — applies only to the local instance cache. |

150.3.5 BYPASS Procedure

This procedure sets the bypass mode for the Result Cache.

It sets one of the following bypass modes:

- When bypass mode is turned on, it implies that cached results are no longer used and that no new results are saved in the cache.
- When bypass mode is turned off, the cache resumes normal operation.

Syntax

```
DBMS_RESULT_CACHE.BYPASS (
    bypass_mode IN BOOLEAN,
    session     IN BOOLEAN);
```

Parameters

Table 150-6 BYPASS Procedure Parameters

| Parameter | Description |
|-------------|--|
| bypass_mode | <ul style="list-style-type: none"> • TRUE => Result Cache usage is bypassed • FALSE => Result Cache usage is turned on |
| session | <ul style="list-style-type: none"> • TRUE => Applies to current session • FALSE (default) => Applies to all sessions |

Usage Notes

This operation is database instance specific.

Examples

This operation can be used when there is a need to hot patch PL/SQL code in a running system. If a code-patch is applied to a PL/SQL module on which a result cached function directly or transitively depends, then the cached results associated

with the result cache function are not automatically flushed (if the instance is not restarted/ bounced). This must be manually achieved.

To ensure correctness during the patching process follow these steps:

1. Place the result cache in bypass mode, and flush existing result.

```
BEGIN
    DBMS_RESULT_CACHE.BYPASS (TRUE);
    DBMS_RESULT_CACHE.FLUSH;
END;
/
```

This step must be performed on each instance if in a Oracle Real Application Clusters environment.

2. Apply the PL/SQL code patches.
3. Resume use of the result cache, by turning off the cache bypass mode.

```
BEGIN
    DBMS_RESULT_CACHE.BYPASS (FALSE);
END;
/
```

This step must be performed on each instance if in a Oracle Real Application Clusters environment.

150.3.6 FLUSH Function & Procedure

This function and procedure attempts to remove all the objects from the Result Cache, and depending on the arguments retains or releases the memory and retains or clears the statistics.

Syntax

```
DBMS_RESULT_CACHE.FLUSH (
    retainMem IN BOOLEAN DEFAULT FALSE,
    retainSta IN BOOLEAN DEFAULT FALSE)
RETURN BOOLEAN;
```

```
DBMS_RESULT_CACHE.FLUSH (
    retainMem IN BOOLEAN DEFAULT FALSE,
    retainSta IN BOOLEAN DEFAULT FALSE);
```

Parameters

Table 150-7 FLUSH Function & Procedure Parameters

| Parameter | Description |
|-----------|---|
| retainMem | <ul style="list-style-type: none"> • TRUE => retains the free memory in the cache • FALSE (default) => releases the free memory to the system |
| retainSta | <ul style="list-style-type: none"> • TRUE => retains the existing cache statistics • FALSE (default) => clears the existing cache statistics |

Return Values

TRUE if successful in removing all the objects.

150.3.7 INVALIDATE Functions & Procedures

This function and procedure invalidates all the result-set objects that dependent upon the specified dependency object.

Syntax

```
DBMS_RESULT_CACHE.INVALIDATE (
  owner      IN VARCHAR2,
  name       IN VARCHAR2)
RETURN NUMBER;
```

```
DBMS_RESULT_CACHE.INVALIDATE (
  owner      IN VARCHAR2,
  name       IN VARCHAR2);
```

```
DBMS_RESULT_CACHE.INVALIDATE (
  object_id  IN BINARY_INTEGER)
RETURN NUMBER;
```

```
DBMS_RESULT_CACHE.INVALIDATE (
  object_id  IN BINARY_INTEGER);
```

Parameters

Table 150-8 INVALIDATE Function & Procedure Parameters

| Parameter | Description |
|-----------|--------------------------|
| owner | Schema name |
| name | Object name |
| object_id | Dictionary object number |

Return Values

The number of objects invalidated.

150.3.8 INVALIDATE_OBJECT Functions & Procedures

This function and procedure invalidates the specified result-set object(s).

Syntax

```
DBMS_RESULT_CACHE.INVALIDATE_OBJECT (
  id         IN BINARY_INTEGER)
RETURN NUMBER;
```

```
DBMS_RESULT_CACHE.INVALIDATE_OBJECT (
  id         IN BINARY_INTEGER);
```

```
DBMS_RESULT_CACHE.INVALIDATE_OBJECT (
  cache_id  IN VARCHAR2)
RETURN NUMBER;
```

```
DBMS_RESULT_CACHE.INVALIDATE_OBJECT (
  cache_id  IN VARCHAR2);
```

Parameters

Table 150-9 INVALIDATE_OBJECT Function & Procedure Parameters

| Parameter | Description |
|-----------|---|
| id | Address of the cache object in the Result Cache |
| cache_id | Result cache identifier of a SQL cursor or PL/SQL function. |

Return Values

The number of objects invalidated.

150.3.9 MEMORY_REPORT Procedure

This procedure produces the memory usage report for the Result Cache.

Syntax

```
DBMS_RESULT_CACHE.MEMORY_REPORT (
    detailed IN BOOLEAN DEFAULT FALSE);
```

Parameters

Table 150-10 MEMORY_REPORT Procedure Parameters

| Parameter | Description |
|-----------|--|
| detailed | <ul style="list-style-type: none"> TRUE => produces a more detailed report FALSE (default) => produces the standard report |

Usage Notes

Invoking this procedure from SQL*Plus requires that the serveroutput be turned on.

Examples

```
SET SERVEROUTPUT ON

EXECUTE DBMS_RESULT_CACHE.MEMORY_REPORT;
```

150.3.10 OBJECT_BLACK_LIST Function

This table function returns all the object numbers currently in the blocklist.

Syntax

```
DBMS_RESULT_CACHE.OBJECT_BLACK_LIST ()
RETURN NATURALN;
```

150.3.11 OBJECT_BLACK_LIST_ADD Procedure

This procedure adds objects to the object blacklist. These procedures only have to be run once in the cluster as they take effect everywhere at once. However, they do not persist between cluster shutdowns and startups.

Syntax

```
DBMS_RESULT_CACHE.OBJECT_BLACK_LIST_ADD (
    objNo          IN BINARY_INTEGER);
```

```
DBMS_RESULT_CACHE.OBJECT_BLACK_LIST_ADD (
    owner          IN VARCHAR2,
    name           IN VARCHAR2);
```

Parameters

Table 150-11 OBJECT_BLACK_LIST_ADD Procedure Parameters

| Parameter | Description |
|-----------|--------------------------|
| objNo | The object number. |
| owner | The owner of the object. |
| name | The name of the table. |

150.3.12 OBJECT_BLACK_LIST_CLEAR Procedure

This procedure clears the entire blacklist.

Syntax

```
DBMS_RESULT_CACHE.OBJECT_BLACK_LIST_CLEAR ();
```

150.3.13 OBJECT_BLACK_LIST_REMOVE Procedure

This procedure removes objects from the object blacklist.

Syntax

```
DBMS_RESULT_CACHE.OBJECT_BLACK_LIST_REMOVE (
    objNo          IN BINARY_INTEGER);
```

```
DBMS_RESULT_CACHE.OBJECT_BLACK_LIST_REMOVE (
    owner          IN VARCHAR2,
    name           IN VARCHAR2);
```

Parameters

Table 150-12 OBJECT_BLACK_LIST_REMOVE Procedure Parameters

| Parameter | Description |
|-----------|--------------------------|
| objNo | The object number. |
| owner | The owner of the object. |

Table 150-12 (Cont.) OBJECT_BLACK_LIST_REMOVE Procedure Parameters

| Parameter | Description |
|-----------|------------------------|
| name | The name of the table. |

150.3.14 STATUS Function

This function checks the status of the Result Cache.

Syntax

```
DBMS_RESULT_CACHE.STATUS  
RETURN VARCHAR2;
```

**Note:**

For more information on the constants, see [DBMS_RESULT_CACHE Constants](#).

DBMS_RESUMABLE

With the `DBMS_RESUMABLE` package, you can suspend large operations that run out of space or reach space limits after executing for a long time, fix the problem, and make the statement resume execution. In this way you can write applications without worrying about running into space-related errors.

This chapter contains the following topics:

- [Operational Notes](#)
- [Summary of DBMS_RESUMABLE Subprograms](#)

151.1 DBMS_RESUMABLE Operational Notes

When you suspend a statement, you should log the suspension in the alert log. You should also register a procedure to be executed when the statement is suspended. Using a view, you can monitor the progress of the statement and indicate whether the statement is currently executing or suspended.

Suspending a statement automatically results in suspending the transaction. Thus all transactional resources are held during a statement suspend and resume. When the error condition disappears, the suspended statement automatically resumes execution. A resumable space allocation can be suspended and resumed multiple times during execution.

A suspension timeout interval is associated with resumable space allocations. A resumable space allocation that is suspended for the timeout interval (the default is two hours) wakes up and returns an exception to the user. A suspended statement may be forced to throw an exception using the `DBMS_RESUMABLE.ABORT()` procedure.

151.2 Summary of DBMS_RESUMABLE Subprograms

This table lists the `DBMS_RESUMABLE` subprograms and briefly describes them.

Table 151-1 *DBMS_RESUMABLE Package Subprograms*

| Subprogram | Description |
|---|---|
| ABORT Procedure | Aborts a suspended resumable space allocation |
| GET_SESSION_TIMEOUT Function | Returns the current timeout value of the resumable space allocations for a session with <code>session_id</code> |
| GET_TIMEOUT Function | Returns the current timeout value of resumable space allocations for the current session |
| SET_SESSION_TIMEOUT Procedure | Sets the timeout of resumable space allocations for a session with <code>session_id</code> |
| SET_TIMEOUT Procedure | Sets the timeout of resumable space allocations for the current session |

Table 151-1 (Cont.) DBMS_RESUMABLE Package Subprograms

| Subprogram | Description |
|---|--|
| SPACE_ERROR_INFO Function | Looks for space-related errors in the error stack, otherwise returning FALSE |

151.2.1 ABORT Procedure

This procedure aborts a suspended resumable space allocation.

The parameter `session_id` is the session ID in which the statement is executed. For a parallel DML/DDI, `session_id` is any session ID that participates in the parallel DML/DDI. This operation is guaranteed to succeed. The procedure can be called either inside or outside of the `AFTER SUSPEND` trigger.

Syntax

```
DBMS_RESUMABLE.ABORT (
    session_id IN NUMBER);
```

Parameters

Table 151-2 ABORT Procedure Parameters

| Parameter | Description |
|-------------------------|---|
| <code>session_id</code> | The session identifier of the resumable space allocation. |

Usage Notes

To call an `ABORT` procedure, you must be the owner of the session with `session_id`, have `ALTER SYSTEM` privileges, or be a DBA.

151.2.2 GET_SESSION_TIMEOUT Function

This function returns the current timeout value of resumable space allocations for a session with `session_id`.

Syntax

```
DBMS_RESUMABLE.GET_SESSION_TIMEOUT (
    session_id IN NUMBER)
RETURN NUMBER;
```

Parameters

Table 151-3 GET_SESSION_TIMEOUT Function Parameters

| Parameter | Description |
|-------------------------|---|
| <code>session_id</code> | The session identifier of the resumable space allocation. |

Return Values

Table 151-4 GET_SESSION_TIMEOUT Function Return Values

| Return Value | Description |
|--------------|---|
| NUMBER | The current timeout value of resumable space allocations for a session with <code>session_id</code> . The timeout is returned in seconds. |

Usage Notes

If `session_id` does not exist, the `GET_SESSION_TIMEOUT` function returns -1.

151.2.3 GET_TIMEOUT Function

This function returns the current timeout value of resumable space allocations for the current session.

Syntax

```
DBMS_RESUMABLE.GET_TIMEOUT  
RETURN NUMBER;
```

Return Values

Table 151-5 GET_TIMEOUT Function Return Values

| Return Value | Description |
|--------------|---|
| NUMBER | The current timeout value of resumable space allocations for the current session. The returned value is in seconds. |

Usage Notes

If the current session is not resumable enabled, the `GET_TIMEOUT` function returns -1.

151.2.4 SET_SESSION_TIMEOUT Procedure

This procedure sets the timeout of resumable space allocations for a session with `session_id`.

The new timeout setting applies to the session immediately. If `session_id` does not exist, no operation occurs.

Syntax

```
DBMS_RESUMABLE.SET_SESSION_TIMEOUT (  
    session_id IN NUMBER,  
    timeout    IN NUMBER);
```

Parameters

Table 151-6 SET_SESSION_TIMEOUT Procedure Parameters

| Parameter | Description |
|------------|---|
| session_id | The session identifier of the resumable space allocation. |
| timeout | The timeout of the resumable space allocation. |

151.2.5 SET_TIMEOUT Procedure

This procedure sets the timeout of resumable space allocations for the current session. The new timeout setting applies to the session immediately.

Syntax

```
DBMS_RESUMABLE.SET_TIMEOUT (
    timeout IN NUMBER);
```

Parameters

Table 151-7 SET_TIMEOUT Procedure Parameters

| Parameter | Description |
|-----------|--|
| timeout | The timeout of the resumable space allocation. |

151.2.6 SPACE_ERROR_INFO Function

This function looks for space-related errors in the error stack.

If it cannot find a space related error, it will return `FALSE`. Otherwise, `TRUE` is returned and information about the particular object that causes the space error is returned.

Syntax

```
DBMS_RESUMABLE.SPACE_ERROR_INFO
    error_type      OUT VARCHAR2,
    object_type     OUT VARCHAR2,
    object_owner    OUT VARCHAR2,
    table_space_name OUT VARCHAR2,
    object_name     OUT VARCHAR2,
    sub_object_name OUT VARCHAR2)
RETURN BOOLEAN;
```

Parameters

Table 151-8 SPACE_ERROR_INFO Function Parameters

| Parameter | Description |
|------------------|--|
| error_type | The space error type. It will be one of the following: <ul style="list-style-type: none"> • NO MORE SPACE • MAX EXTENTS REACHED • SPACE QUOTA EXCEEDED |
| object_type | The object type. It will be one of the following: <ul style="list-style-type: none"> • TABLE • INDEX • CLUSTER • TABLE SPACE • ROLLBACK SEGMENT • UNDO SEGMENT • LOB SEGMENT • TEMP SEGMENT • INDEX PARTITION • TABLE PARTITION • LOB PARTITION • TABLE SUBPARTITION • INDEX SUBPARTITION • LOB SUBPARTITION The type can also be NULL if it does not apply. |
| object_owner | The owner of the object. NULL if it cannot be determined. |
| table_space_name | The table space where the object resides. NULL if it cannot be determined. |
| object_name | The name of rollback segment, temp segment, table, index, or cluster. |
| sub_object_name | The partition name or sub-partition name of LOB, TABLE, or INDEX. NULL if it cannot be determined. |

DBMS_RLS

The `DBMS_RLS` package contains the fine-grained access control administrative interface, which is used to implement Virtual Private Database (VPD).

`DBMS_RLS` is available with the Enterprise Edition only.

See Also:

Oracle Database Security Guide for usage information about `DBMS_RLS`

This chapter contains the following topics:

- [Overview](#)
- [Security Model](#)
- [Constants](#)
- [Operational Notes](#)
- [Rules and Limits](#)
- [Summary of DBMS_RLS Subprograms](#)

152.1 DBMS_RLS Overview

The functionality to support fine-grained access control is based on dynamic predicates, where security rules are not embedded in views, but are acquired at the statement parse time, when the base table or view is referenced in a DML statement.

A dynamic predicate for a table, view, or synonym is generated by a PL/SQL function, which is associated with a security policy through a PL/SQL interface. For example:

```
DBMS_RLS.ADD_POLICY (  
    'hr', 'employees', 'emp_policy', 'hr', 'emp_sec', 'select', 'user_ctx', 'time');
```

Whenever the `EMPLOYEES` table, under the `HR` schema, is referenced in a query or subquery (`SELECT`), the server calls the `EMP_SEC` function (under the `HR` schema). This function returns a predicate specific to the current schema for the `EMP_POLICY` policy. The policy function may generate the predicates based on the session environment variables available during the function call. These variables usually appear in the form of application contexts. The policy can specify any combination of security-relevant columns and of these statement types: `INDEX`, `SELECT`, `INSERT`, `UPDATE`, or `DELETE`.

The server then produces a transient view with the text:

```
SELECT * FROM hr.employees WHERE P1
```

Here, `P1` (for example, where `SAL > 10000`, or even a subquery) is the predicate returned from the `EMP_SEC` function. The server treats the `EMPLOYEES` table as a view and does the view expansion just like the ordinary view, except that the view text is taken from the transient view instead of the data dictionary.

If the predicate contains subqueries, then the owner (definer) of the policy function is used to resolve objects within the subqueries and checks security for those objects. In other words, users who have access privilege to the policy-protected objects do not need to know anything about the policy. They do not need to be granted object privileges for any underlying security policy. Furthermore, the users do not require `EXECUTE` privilege on the policy function, because the server makes the call with the function definer's right.

 **Note:**

The transient view can preserve the updatability of the parent object because it is derived from a single table or view with predicate only; that is, no `JOIN`, `ORDER BY`, `GROUP BY`, and so on.

`DBMS_RLS` also provides the interface to drop or enable security policies. For example, you can drop or enable the `EMP_POLICY` with the following PL/SQL statements:

```
DBMS_RLS.DROP_POLICY('hr', 'employees', 'emp_policy');
DBMS_RLS.ENABLE_POLICY('hr', 'employees', 'emp_policy', TRUE);
```

152.2 DBMS_RLS Security Model

A security check is performed when the transient view is created with a subquery. The schema owning the policy function, which generates the dynamic predicate, is the transient view's definer for security check and object lookup.

152.3 DBMS_RLS Constants

The `DBMS_RLS` package includes constants that can be used for specifying parameter values.

Table 152-1 DBMS_RLS Constants

| Constant | Type | Value | Description |
|--|-----------------------------|-------|--|
| <code>ADD_ATTRIBUTE_ASSOCIATION</code> | <code>BINARY_INTEGER</code> | 1 | Used with <code>DBMS_RLS.ALTER_POLICY</code> and <code>DBMS_RLS.ALTER_GROUPED_POLICY</code> : adds the specified namespace and attribute to the policy or grouped policy |

Table 152-1 (Cont.) DBMS_RLS Constants

| Constant | Type | Value | Description |
|------------------------------|----------------|-------|--|
| REMOVE_ATTRIBUTE_ASSOCIATION | BINARY_INTEGER | 2 | Used with <code>DBMS_RLS.ALTER_POLICY</code> and <code>DBMS_RLS.ALTER_GROUPED_POLICY</code> : removes the specified namespace and attribute to the policy or grouped policy. |

152.4 DBMS_RLS Operational Notes

The `DBMS_RLS` procedures cause current DML transactions, if any, to commit before the operation. However, the procedures do not cause a commit first if they are inside a DDL event trigger. With DDL transactions, the `DBMS_RLS` procedures are part of the DDL transaction.

For example, you may create a trigger for `CREATE TABLE`. Inside the trigger, you may add a column through `ALTER TABLE`, and you can add a policy through `DBMS_RLS`. All these operations are in the same transaction as `CREATE TABLE`, even though each one is a DDL statement. The `CREATE TABLE` succeeds only if the trigger is completed successfully.

Views of current cursors and corresponding predicates are available from `V$VPD_POLICIES`.

A synonym can reference only a view or a table.

152.5 DBMS_RLS Rules and Limits

Using long identifiers is supported for VPD. The maximum length for arguments such as `object_schema`, `object_name`, and `policy_name`, which apply to objects (table names, policy names, and subprogram names) and views is 128 bytes.

152.6 Summary of DBMS_RLS Subprograms

This table lists and briefly describes the subprograms available in `DBMS_RLS`.

Table 152-2 DBMS_RLS Package Subprograms

| Subprogram | Description |
|--|--|
| ADD_GROUPED_POLICY Procedure | Adds a policy associated with a policy group |
| ADD_POLICY Procedure | Adds a fine-grained access control policy to a table, view, or synonym |
| ADD_POLICY_CONTEXT Procedure | Adds the context for the active application |
| ALTER_POLICY Procedure | Associates an application context attribute with VPD policies |
| ALTER_GROUPED_POLICY Procedure | Adds application context related changes |
| CREATE_POLICY_GROUP Procedure | Creates a policy group |
| DELETE_POLICY_GROUP Procedure | Deletes a policy group |

Table 152-2 (Cont.) DBMS_RLS Package Subprograms

| Subprogram | Description |
|--|---|
| DISABLE_GROUPED_POLICY Procedure | Disables a row-level group security policy |
| DROP_GROUPED_POLICY Procedure | Drops a policy associated with a policy group |
| DROP_POLICY Procedure | Drops a fine-grained access control policy from a table, view, or synonym |
| DROP_POLICY_CONTEXT Procedure | Drops a driving context from the object so that it will have one less driving context |
| ENABLE_GROUPED_POLICY Procedure | Enables or disables a row-level group security policy |
| ENABLE_POLICY Procedure | Enables or disables a fine-grained access control policy |
| REFRESH_GROUPED_POLICY Procedure | Reparses the SQL statements associated with a refreshed policy |
| REFRESH_POLICY Procedure | Causes all the cached statements associated with the policy to be reparsed |

152.6.1 ADD_GROUPED_POLICY Procedure

This procedure adds a policy associated with a policy group.

Syntax

```
DBMS_RLS.ADD_GROUPED_POLICY (
  object_schema      IN  VARCHAR2          DEFAULT NULL,
  object_name        IN  VARCHAR2,
  policy_group       IN  VARCHAR2          DEFAULT 'SYS_DEFAULT',
  policy_name        IN  VARCHAR2,
  function_schema    IN  VARCHAR2          DEFAULT NULL,
  policy_function     IN  VARCHAR2,
  statement_types    IN  VARCHAR2          DEFAULT NULL,
  update_check       IN  BOOLEAN           DEFAULT FALSE,
  enable             IN  BOOLEAN           DEFAULT TRUE,
  static_policy      IN  BOOLEAN           DEFAULT FALSE,
  policy_type        IN  BINARY_INTEGER    DEFAULT NULL,
  long_predicate     IN  BOOLEAN           DEFAULT FALSE,
  sec_relevant_cols  IN  VARCHAR2,
  sec_relevant_cols_opt IN BINARY_INTEGER  DEFAULT NULL,
  namespace          IN  VARCHAR2          DEFAULT NULL,
  attribute          IN  VARCHAR2          DEFAULT NULL);
```

Parameters

Table 152-3 ADD_GROUPED_POLICY Procedure Parameters

| Parameter | Description |
|---------------|--|
| object_schema | Schema containing the table, view, or synonym. If no object_schema is specified or is NULL, then the current schema is used. |
| object_name | Name of the table, view, or synonym to which the policy is added |
| policy_group | Name of the policy group to which the policy belongs |
| policy_name | Name of the policy; must be unique for the same table or view |

Table 152-3 (Cont.) ADD_GROUPED_POLICY Procedure Parameters

| Parameter | Description |
|--------------------------------|---|
| <code>function_schema</code> | Schema owning the policy function. If no <code>function_schema</code> is specified or is NULL, then the current schema is used. |
| <code>policy_function</code> | Name of the function that generates a predicate for the policy. If the function is defined within a package, the name of the package must be present. |
| <code>statement_types</code> | Statement types to which the policy applies. It can be any combination of INDEX, SELECT, UPDATE, or DELETE. The default is to apply to all of these types except INSERT and INDEX. |
| <code>update_check</code> | For INSERT and UPDATE statements only, setting <code>update_check</code> to TRUE causes the server to check the policy against the value after INSERT or UPDATE. The check applies only to the security relevant columns that are included in the policy definition. In other words, the INSERT or UPDATE operation will fail only if the security relevant column that is defined in the policy is added or updated in the INSERT or UPDATE statement. |
| <code>enable</code> | Indicates if the policy is enable when it is added. The default is TRUE. |
| <code>static_policy</code> | Default is FALSE. If it is set to TRUE, the server assumes that the policy function for the static policy produces the same predicate string for anyone accessing the object, except for SYS or the privilege user who has the EXEMPT ACCESS POLICY privilege. |
| <code>policy_type</code> | Default is NULL, which means <code>policy_type</code> is decided by the value of <code>static_policy</code> . The available policy types are listed in Table 152-5 . Specifying any of these policy types overrides the value of <code>static_policy</code> . |
| <code>long_predicate</code> | Default is FALSE, which means the policy function can return a predicate with a length of up to 4000 bytes. TRUE means the predicate text string length can be up to 32K bytes. Policies existing prior to the availability of this parameter retain a 32K limit. |
| <code>sec_relevant_cols</code> | Enables column-level Virtual Private Database (VPD), which enforces security policies when a column containing sensitive information is referenced in a query. Applies to tables and views, but not to synonyms. Specify a list of comma- or space-separated valid column names of the policy-protected object. The policy is enforced only if a specified column is referenced (or, for an abstract datatype column, its attributes are referenced) in the user SQL statement or its underlying view definition. Default is all the user-defined columns for the object. |
| <code>namespace</code> | Name which determines the application context namespace |
| <code>attribute</code> | Attribute which determines the application context attribute name |

Usage Notes

- This procedure adds a policy to the specified table, view, or synonym and associates the policy with the specified policy group.
- The policy group must have been created by using the [CREATE_POLICY_GROUP Procedure](#).
- The policy name must be unique within a policy group for a specific object.

- Policies from the default policy group, `SYS_DEFAULT`, are always executed regardless of the active policy group; however, fine-grained access control policies do not apply to users with `EXEMPT ACCESS POLICY` system privilege.

152.6.2 ADD_POLICY Procedure

This procedure adds a fine-grained access control policy to a table, view, or synonym.

The procedure causes the current transaction, if any, to commit before the operation is carried out. However, this does not cause a commit first if it is inside a DDL event trigger.

 **See Also:**
[Operational Notes](#)

A `COMMIT` is also performed at the end of the operation.

Syntax

```
DBMS_RLS.ADD_POLICY (
  object_schema          IN  VARCHAR2          DEFAULT NULL,
  object_name            IN  VARCHAR2,
  policy_name            IN  VARCHAR2,
  function_schema        IN  VARCHAR2          DEFAULT NULL,
  policy_function        IN  VARCHAR2,
  statement_types        IN  VARCHAR2          DEFAULT NULL,
  update_check           IN  BOOLEAN           DEFAULT FALSE,
  enable                 IN  BOOLEAN           DEFAULT TRUE,
  static_policy          IN  BOOLEAN           DEFAULT FALSE,
  policy_type            IN  BINARY_INTEGER    DEFAULT NULL,
  long_predicate         IN  BOOLEAN           DEFAULT FALSE,
  sec_relevant_cols      IN  VARCHAR2          DEFAULT NULL,
  sec_relevant_cols_opt IN  BINARY_INTEGER    DEFAULT NULL,
  namespace              IN  VARCHAR2          DEFAULT NULL,
  attribute              IN  VARCHAR2          DEFAULT NULL);
```

Parameters

Table 152-4 ADD_POLICY Procedure Parameters

| Parameter | Description |
|------------------------------|--|
| <code>object_schema</code> | Schema containing the table, view, or synonym. If no <code>object_schema</code> is specified or is <code>NULL</code> , then the current schema is used. |
| <code>object_name</code> | Name of table, view, or synonym to which the policy is added. |
| <code>policy_name</code> | Name of policy to be added. It must be unique for the same table or view. Do not enter special characters such as spaces or commas. If you want to use special characters for the policy name, then enclose the name in quotation marks. |
| <code>function_schema</code> | Schema owning the policy function. If no <code>function_schema</code> is specified or is <code>NULL</code> , then the current schema is used. |

Table 152-4 (Cont.) ADD_POLICY Procedure Parameters

| Parameter | Description |
|------------------------------------|---|
| <code>policy_function</code> | Name of a function which generates a predicate for the policy. If the function is defined within a package, then the name of the package must be present. |
| <code>statement_types</code> | Statement types to which the policy applies. It can be any combination of <code>INDEX</code> , <code>SELECT</code> , <code>UPDATE</code> , or <code>DELETE</code> . The default is to apply to all of these types except <code>INSERT</code> and <code>INDEX</code> . |
| <code>update_check</code> | Optional argument for the <code>INSERT</code> or <code>UPDATE</code> statement type. The default is <code>FALSE</code> . If you plan to use the <code>INSERT</code> statement type, then you must set <code>update_check</code> to <code>TRUE</code> . Otherwise, an <code>ORA-28104 input value for string is not valid error</code> is generated. The check applies only to the security relevant columns that are included in the policy definition. In other words, the <code>INSERT</code> or <code>UPDATE</code> operation will fail only if the security relevant column that is defined in the policy is added or updated in the <code>INSERT</code> or <code>UPDATE</code> statement. |
| <code>enable</code> | Indicates if the policy is enabled when it is added. The default is <code>TRUE</code> . |
| <code>static_policy</code> | The default is <code>FALSE</code> . If it is set to <code>TRUE</code> , the server assumes that the policy function for the static policy produces the same predicate string for anyone accessing the object, except for <code>SYS</code> or the privileged user who has the <code>EXEMPT ACCESS POLICY</code> privilege. |
| <code>policy_type</code> | Default is <code>NULL</code> , which means <code>policy_type</code> is decided by the value of <code>static_policy</code> . The available policy types are listed in Table 152-5 . Specifying any of these policy types overrides the value of <code>static_policy</code> . |
| <code>long_predicate</code> | Default is <code>FALSE</code> , which means the policy function can return a predicate with a length of up to 4000 bytes. <code>TRUE</code> means the predicate text string length can be up to 32K bytes. Policies existing prior to the availability of this parameter retain a 32K limit. |
| <code>sec_relevant_cols</code> | Enables column-level Virtual Private Database (VPD), which enforces security policies when a column containing sensitive information is referenced in a query. Applies to tables and views, but not to synonyms. Specify a list of comma- or space-separated valid column names of the policy-protected object. The policy is enforced only if a specified column is referenced (or, for an abstract datatype column, its attributes are referenced) in the user SQL statement or its underlying view definition. Default is all the user-defined columns for the object. |
| <code>sec_relevant_cols_opt</code> | Use with <code>sec_relevant_cols</code> to display all rows for column-level VPD filtered queries (<code>SELECT</code> only), but where sensitive columns appear as <code>NULL</code> . Default is set to <code>NULL</code> , which allows the filtering defined with <code>sec_relevant_cols</code> to take effect. Set to <code>dbms_rls.ALL_ROWS</code> to display all rows, but with sensitive column values, which are filtered by <code>sec_relevant_cols</code> , displayed as <code>NULL</code> . See Usage Notes for restrictions and additional information about this option. |
| <code>namespace</code> | Name which determines the application context namespace |
| <code>attribute</code> | Attribute which determines the application context attribute name |

Table 152-5 DBMS_RLS.ADD_POLICY Policy Types

| Policy Type | Description |
|--------------------------|--|
| STATIC | Predicate is assumed to be the same regardless of the runtime environment. Static policy functions are executed once and then cached in SGA. Statements accessing the same object do not reexecute the policy function. However, each execution of the same cursor could produce a different row set even for the same predicate because the predicate may filter the data differently based on attributes such as SYS_CONTEXT or SYSDATE. Applies to only one object. |
| SHARED_STATIC | Same as STATIC except that the server first looks for a cached predicate generated by the same policy function of the same policy type. Shared across multiple objects. |
| CONTEXT_SENSITIVE | Server re-evaluates the policy function at statement execution time if it detects context changes since the last use of the cursor. For session pooling where multiple clients share a database session, the middle tier must reset context during client switches. Note that the server does not cache the value returned by the function for this policy type; it always executes the policy function on statement parsing. Applies to only one object. |
| SHARED_CONTEXT_SENSITIVE | Same as CONTEXT_SENSITIVE except that the server first looks for a cached predicate generated by the same policy function of the same policy type within the same database session. If the predicate is found in the session memory, the policy function is not reexecuted and the cached value is valid until session private application context changes occur. Shared across multiple objects. |
| DYNAMIC | The default policy type. Server assumes the predicate may be affected by any system or session environment at any time, and so always reexecutes the policy function upon each statement parsing and execution. Applies to only one object. |

Usage Notes

- SYS is free of any security policy.
- The policy functions are called by the server. Following is the interface for the function:

```
FUNCTION policy_function (object_schema IN VARCHAR2, object_name VARCHAR2)
    RETURN VARCHAR2
--- object_schema is the schema owning the table or view.
--- object_name is the name of table, view, or synonym to which the policy
applies.
```
- The policy functions must have the purity level of WNDS (write no database state).

See Also:

The *Oracle Database Development Guide* has more details about the RESTRICT_REFERENCES pragma.

- Predicates generated from different VPD policies for the same object have the combined effect of a conjunction (ANDed) of all the predicates.

- The security check and object lookup are performed against the owner of the policy function for objects in the subqueries of the dynamic predicates.
- If the function returns a zero length predicate, then it is interpreted as no restriction being applied to the current user for the policy.
- When a table alias is required (for example, parent object is a type table) in the predicate, the name of the table or view itself must be used as the name of the alias. The server constructs the transient view as something like

```
"select c1, c2, ... from tab tab where <predicate>"
```

- Validity of the function is checked at runtime for ease of installation and other dependency issues during import and export.
- Column-level VPD column masking behavior (specified with `sec_relevant_cols_opt => dbms_ols.ALL_ROWS`) is fundamentally different from all other VPD policies, which return only a subset of rows. Instead the column masking behavior returns all rows specified by the user's query, but the sensitive column values display as `NULL`. The restrictions for this option are as follows:
 - Only applies to `SELECT` statements
 - Unlike regular VPD predicates, the masking condition that is generated by the policy function must be a simple boolean expression.
 - If your application performs calculations, or does not expect `NULL` values, then you should use the default behavior of column-level VPD, which is specified with the `sec_relevant_cols` parameter.
 - If you use `UPDATE AS SELECT` with this option, then only the values in the columns you are allowed to see will be updated.
 - This option may prevent some rows from displaying. For example:

```
SELECT * FROM employees  
WHERE salary = 10
```

This query may not return rows if the `salary` column returns a `NULL` value because the column masking option has been set.

- When you add a VPD policy to a synonym, it causes all the dependent objects of the synonym, including policy functions that reference the synonym, to be marked `INVALID`.
- You cannot associate a global application context with a context sensitive policy or a context shared sensitive policy.
- The maximum number of policies that can be created for a single object is 255.

Examples

As the first of two examples, the following creates a policy that applies to the `hr.employee` table. This is a column-level VPD policy that will be enforced only if a `SELECT` or an `INDEX` statement refers to the `salary`, `birthdate`, or `SSN` columns of the table explicitly, or implicitly through a view. It is also a `CONTEXT_SENSITIVE` policy, so the server will invoke the policy function `hr.hrfun` at parse time. The namespace and attribute application context parameters restrict the policy evaluation only when the application context values change. During execution, it will only invoke the function if there has been any session private context change since the last use of the statement cursor. The predicate generated by the policy function must not exceed 4000 bytes, the default length limit, since the `long_predicate` parameter is omitted from the call.

```

BEGIN
  DBMS_RLS.ADD_POLICY(
    object_schema => 'hr',
    object_name   => 'employee',
    policy_name   => 'hr_policy',
    function_schema => 'hr',
    policy_function => 'hrfun',
    statement_types => 'select,index',
    policy_type    => DBMS_RLS.CONTEXT_SENSITIVE,
    sec_relevant_cols => 'salary,birthdate,ssn',
    namespace     => 'empno_ctx',
    attribute     => 'emp_id');
END;

```

As the second example, the following command creates another policy that applies to the same object for hosting, so users can access only data based on their subscriber ID. Since it is defined as a `SHARED_STATIC` policy type, the server will first try to find the predicate in the SGA cache. The server will only invoke the policy function, `subfun`, if that search fails.

```

BEGIN
  DBMS_RLS.ADD_POLICY(
    object_schema => 'hr',
    object_name   => 'employee',
    policy_name   => 'hosting_policy',
    function_schema => 'hr',
    policy_function => 'subfun',
    policy_type    => dbms_ols.SHARED_STATIC);
END;

```

152.6.3 ADD_POLICY_CONTEXT Procedure

This procedure adds the context for the active application.

Syntax

```

DBMS_RLS.ADD_POLICY_CONTEXT (
  object_schema IN VARCHAR2 NULL,
  object_name   IN VARCHAR2,
  namespace     IN VARCHAR2,
  attribute     IN VARCHAR2);

```

Parameters

Table 152-6 ADD_POLICY_CONTEXT Procedure Parameters

| Parameter | Description |
|----------------------------|---|
| <code>object_schema</code> | Schema containing the table, view, or synonym. If no <code>object_schema</code> is specified or is <code>NULL</code> , then the current schema is used. |
| <code>object_name</code> | Name of the table, view, or synonym to which the policy is added. |
| <code>namespace</code> | Name which determines the application context namespace |
| <code>attribute</code> | Attribute which determines the application context attribute name |

Usage Notes

Note the following:

- This procedure indicates the application context that drives the enforcement of policies; this is the context that determines which application is running.
- The driving context can be session or global.
- At execution time, the server retrieves the name of the active policy group from the value of this context.
- There must be at least one driving context defined for each object that has fine-grained access control policies; otherwise, all policies for the object will be executed.
- Adding multiple context to the same object will cause policies from multiple policy groups to be enforced.
- If the driving context is `NULL`, policies from all policy groups are used.
- If the driving context is a policy group with policies, all enabled policies from that policy group will be applied, along with all policies from the `SYS_DEFAULT` policy group.
- To add a policy to table `HR.EMPLOYEES` in group `access_control_group`, the following command is issued:

```
DBMS_RLS.ADD_GROUPED_POLICY('hr','employees','access_control_group','policy1','SYS',
 'HR.ACCESS');
```

152.6.4 ALTER_POLICY Procedure

This procedure associates an application context attribute with VPD policies.

Syntax

```
DBMS_RLS.ALTER_POLICY (
  object_schema  IN VARCHAR2 DEFAULT NULL,
  object_name    IN VARCHAR2,
  policy_name    IN VARCHAR2,
  alter_option   IN NUMBER,
  namespace     IN VARCHAR2 DEFAULT NULL,
  attribute      IN VARCHAR2 DEFAULT NULL);
```

Parameters

Table 152-7 ALTER_POLICY Procedure Parameters

| Parameter | Description |
|----------------------------|---|
| <code>object_schema</code> | Schema containing the table, view, or synonym. If no <code>object_schema</code> is specified or is <code>NULL</code> , then the current schema is used. |
| <code>object_name</code> | Name of the table, view, or synonym to which the policy is added |
| <code>policy_name</code> | Name of the policy, unique for the same table or view |
| <code>alter_option</code> | Used to determine whether the application context is being added or removed from an Oracle Virtual Private Database policy |
| <code>namespace</code> | Name which determines the application context namespace |
| <code>attribute</code> | Attribute which determines the application context attribute name |

Usage Notes

Note the following:

- This procedure associates an application context namespace and application context attribute to context sensitive and shared context sensitive policies only. Specifying application context namespace and application context attribute for DYNAMIC, STATIC or SHARED_STATIC policies will result in an error. If namespace is specified, attribute should also be specified for the procedure call.
- You cannot associate a global application context with a context sensitive policy or a context shared sensitive policy.
- Invocations of ALTER_POLICY which modify a shared context sensitive VPD policy have an effect on all shared context sensitive VPD policies that have the same VPD policy function.
- The driving context can be session or global.
- At execution time, the server retrieves the name of the active policy group from the value of this context.
- There must be at least one driving context defined for each object that has fine-grained access control policies; otherwise, all policies for the object will be executed.
- Adding multiple context to the same object will cause policies from multiple policy groups to be enforced.
- If the driving context is NULL, policies from all policy groups are used.
- If the driving context is a policy group with policies, all enabled policies from that policy group will be applied, along with all policies from the SYS_DEFAULT policy group.
- To add a policy to table hr.employees in group access_control_group, the following command is issued:

```
DBMS_RLS.ADD_GROUPED_POLICY(
    'hr','employees','access_control_group','policy1','SYS','HR.ACCESS');
```

152.6.5 ALTER_GROUPED_POLICY Procedure

This procedure adds application context related changes.

Syntax

```
DBMS_RLS.ALTER_GROUPED_POLICY (
    object_schema    IN VARCHAR2 DEFAULT NULL,
    object_name      IN VARCHAR2,
    policy_group     IN VARCHAR2 DEFAULT SYS_DEFAULT,
    policy_name      IN VARCHAR2,
    alter_option     IN NUMBER,
    namespace        IN VARCHAR2 DEFAULT NULL,
    attribute        IN VARCHAR2 DEFAULT NULL);
```

Parameters

Table 152-8 ALTER_GROUPED_POLICY Procedure Parameters

| Parameter | Description |
|---------------|--|
| object_schema | Schema containing the table, view, or synonym. If no object_schema is specified or is NULL, then the current schema is used. |

Table 152-8 (Cont.) ALTER_GROUPED_POLICY Procedure Parameters

| Parameter | Description |
|--------------|---|
| object_name | Name of the table, view, or synonym to which the policy is added |
| policy_group | Name of the policy group to which this policy belongs; must be unique for the same table or view |
| policy_name | Name of the policy, unique for the same table or view |
| alter_option | Used to determine whether the application context is being added or removed from the Oracle Virtual Private Database policy |
| namespace | Name that determines the application context namespace |
| attribute | Attribute determines the application context attribute name |

Usage Notes

Note the following:

- This procedure will associate an application context namespace and application context attribute to context sensitive and shared context sensitive policies only. Specifying application context namespace and application context attribute for DYNAMIC, STATIC or SHARED_STATIC policies will result in an error. If namespace is specified, attribute should also be specified for the procedure call.
- You cannot associate a global application context with a context sensitive policy or a context shared sensitive policy.
- Invocations of ALTER_GROUPED_POLICY which modify a shared context sensitive VPD policy have an effect on all shared context sensitive VPD policies that have the same VPD policy function.
- The driving context can be session or global.
- At execution time, the server retrieves the name of the active policy group from the value of this context.
- There must be at least one driving context defined for each object that has fine-grained access control policies; otherwise, all policies for the object will be executed.
- Adding multiple context to the same object will cause policies from multiple policy groups to be enforced.
- If the driving context is NULL, policies from all policy groups are used.
- If the driving context is a policy group with policies, all enabled policies from that policy group will be applied, along with all policies from the SYS_DEFAULT policy group.
- To add a policy to table hr.employees in group access_control_group, the following command is issued:

```
DBMS_RLS.ADD_GROUPED_POLICY (
    'hr', 'employees', 'access_control_group', 'policy1', 'SYS', 'HR.ACCESS');
```

152.6.6 CREATE_POLICY_GROUP Procedure

This procedure creates a policy group.

Syntax

```
DBMS_RLS.CREATE_POLICY_GROUP (
  object_schema  IN VARCHAR2 NULL,
  object_name    IN VARCHAR2,
  policy_group   IN VARCHAR2);
```

Parameters

Table 152-9 CREATE_POLICY_GROUP Procedure Parameters

| Parameter | Description |
|---------------|--|
| object_schema | Schema containing the table, view, or synonym. If no object_schema is specified or is NULL, then the current schema is used. |
| object_name | Name of the table, view, or synonym to which the policy is added |
| policy_group | Name of the policy group that the policy belongs to |

Usage Notes

The group must be unique for each table or view.

152.6.7 DELETE_POLICY_GROUP Procedure

This procedure deletes a policy group.

Syntax

```
DBMS_RLS.DELETE_POLICY_GROUP (
  object_schema  IN VARCHAR2 NULL,
  object_name    IN VARCHAR2,
  policy_group   IN VARCHAR2);
```

Parameters

Table 152-10 DELETE_POLICY_GROUP Procedure Parameters

| Parameter | Description |
|---------------|--|
| object_schema | Schema containing the table, view, or synonym. If no object_schema is specified or is NULL, then the current schema is used. |
| object_name | Name of the table, view, or synonym to which the policy is added |
| policy_group | Name of the policy group that the policy belongs to |

Usage Notes

Note the following:

- This procedure deletes a policy group for the specified table, view, or synonym.
- No policy can be in the policy group.

152.6.8 DISABLE_GROUPED_POLICY Procedure

This procedure disables a row-level group security policy.

Syntax

```
DBMS_RLS.DISABLE_GROUPED_POLICY (  
    object_schema IN VARCHAR2 NULL,  
    object_name   IN VARCHAR2,  
    group_name    IN VARCHAR2,  
    policy_name   IN VARCHAR2);
```

Parameters

Table 152-11 DISABLE_GROUPED_POLICY Procedure Parameters

| Parameter | Description |
|---------------|---|
| object_schema | Schema containing the table, view, or synonym |
| object_name | Name of the table, view, or synonym with which the policy is associated |
| group_name | Name of the group of the policy |
| policy_name | Name of the policy to be enabled or disabled |

Usage Notes

- The procedure causes the current transaction, if any, to commit before the operation is carried out.
- A commit is performed at the end of the operation.
- A policy is disabled when this procedure is executed or when the ENABLE_GROUPED_POLICY procedure is executed with "enable" set to FALSE.

152.6.9 DROP_GROUPED_POLICY Procedure

This procedure drops a policy associated with a policy group.

Syntax

```
DBMS_RLS.DROP_GROUPED_POLICY (  
    object_schema IN VARCHAR2 NULL,  
    object_name   IN VARCHAR2,  
    policy_group  IN VARCHAR2 'SYS_DEFAULT',  
    policy_name   IN VARCHAR2);
```

Parameters

Table 152-12 DROP_GROUPED_POLICY Procedure Parameters

| Parameter | Description |
|---------------|--|
| object_schema | Schema containing the table, view, or synonym. If no object_schema is specified or is NULL, then the current schema is used. |
| object_name | Name of the table, view, or synonym to which the policy is dropped |
| policy_group | Name of the policy group to which the policy belongs |
| policy_name | Name of the policy |

152.6.10 DROP_POLICY Procedure

This procedure drops a fine-grained access control policy from a table, view, or synonym.

The procedure causes the current transaction, if any, to commit before the operation is carried out. However, this does not cause a commit first if it is inside a DDL event trigger.

 **See Also:**
[Operational Notes](#)

A COMMIT is also performed at the end of the operation.

Syntax

```
DBMS_RLS.DROP_POLICY (
    object_schema  IN VARCHAR2 NULL,
    object_name    IN VARCHAR2,
    policy_name    IN VARCHAR2);
```

Parameters

Table 152-13 DROP_POLICY Procedure Parameters

| Parameter | Description |
|---------------|---|
| object_schema | Schema containing the table, view or synonym. If no object_schema is specified, or NULL is provided, then the current user's schema is assumed. |
| object_name | Name of the table, view, or synonym for which the policy is dropped |
| policy_name | Name of policy to be dropped from table, view, or synonym |

Usage Notes

- When you drop a VPD policy from a synonym, it causes all the dependent objects of the synonym, including policy functions that reference the synonym, to be marked `INVALID`.

152.6.11 DROP_POLICY_CONTEXT Procedure

This procedure drops a driving context from the object so that it will have one less driving context.

Syntax

```
DBMS_RLS.DROP_POLICY_CONTEXT (
  object_schema  IN VARCHAR2 NULL,
  object_name    IN VARCHAR2,
  namespace     IN VARCHAR2,
  attribute      IN VARCHAR2);
```

Parameters**Table 152-14** DROP_POLICY_CONTEXT Procedure Parameters

| Parameter | Description |
|---------------|--|
| object_schema | Schema containing the table, view, or synonym. If no object_schema is specified or is NULL, then the current schema is used. |
| object_name | Name of the table, view, or synonym to which the policy is dropped |
| namespace | Namespace of the driving context |
| attribute | Attribute of the driving context |

152.6.12 ENABLE_GROUPED_POLICY Procedure

This procedure enables or disables a row-level group security policy.

Syntax

```
DBMS_RLS.ENABLE_GROUPED_POLICY (
  object_schema  IN VARCHAR2 NULL,
  object_name    IN VARCHAR2,
  group_name     IN VARCHAR2,
  policy_name    IN VARCHAR2,
  enable        IN BOOLEAN TRUE);
```

Parameters**Table 152-15** ENABLE_GROUPED_POLICY Procedure Parameters

| Parameter | Description |
|---------------|--|
| object_schema | Schema containing the table, view, or synonym. If no object_schema is specified or is NULL, then the current schema is used. |
| object_name | Name of the table, view, or synonym with which the policy is associated |
| group_name | Name of the group of the policy |

Table 152-15 (Cont.) ENABLE_GROUPED_POLICY Procedure Parameters

| Parameter | Description |
|-------------|--|
| policy_name | Name of the policy to be enabled or disabled |
| enable | TRUE enables the policy; FALSE disables the policy |

Usage Notes

- The procedure causes the current transaction, if any, to commit before the operation is carried out.
- A commit is performed at the end of the operation.
- A policy is enabled when it is created.

152.6.13 ENABLE_POLICY Procedure

This procedure enables or disables a fine-grained access control policy. A policy is enabled when it is created.

The procedure causes the current transaction, if any, to commit before the operation is carried out. However, this does not cause a commit first if it is inside a DDL event trigger.

 **See Also:**
[Operational Notes](#)

A COMMIT is also performed at the end of the operation.

Syntax

```
DBMS_RLS.ENABLE_POLICY (
  object_schema IN VARCHAR2 NULL,
  object_name   IN VARCHAR2,
  policy_name   IN VARCHAR2,
  enable        IN BOOLEAN TRUE);
```

Parameters**Table 152-16 ENABLE_POLICY Procedure Parameters**

| Parameter | Description |
|---------------|--|
| object_schema | Schema containing the table, view, or synonym. If no object_schema is specified or is NULL, then the current schema is used. |
| object_name | Name of table, view, or synonym with which the policy is associated |
| policy_name | Name of policy to be enabled or disabled |
| enable | TRUE to enable the policy, FALSE to disable the policy |

152.6.14 REFRESH_GROUPED_POLICY Procedure

This procedure reparses the SQL statements associated with a refreshed policy.

Syntax

```
DBMS_RLS.REFRESH_GROUPED_POLICY (  
    object_schema IN VARCHAR2 NULL,  
    object_name   IN VARCHAR2 NULL,  
    group_name    IN VARCHAR2 NULL,  
    policy_name   IN VARCHAR2 NULL);
```

Parameters

Table 152-17 REFRESH_GROUPED_POLICY Procedure Parameters

| Parameter | Description |
|---------------|---|
| object_schema | Schema containing the table, view, or synonym. If no <code>object_schema</code> is specified or is <code>NULL</code> , then the current schema is used. |
| object_name | Name of the table, view, or synonym with which the policy is associated |
| group_name | Name of the group of the policy |
| policy_name | Name of the policy |

Usage Notes

- This procedure causes all the cached statements associated with the policy to be reparsed. This guarantees that the latest change to the policy has immediate effect after the procedure is executed.
- The procedure causes the current transaction, if any, to commit before the operation is carried out.
- A commit is performed at the end of the operation.
- The procedure returns an error if it tries to refresh a disabled policy.
- The procedure removes the cached results of context and shared sensitive VPD policies.

152.6.15 REFRESH_POLICY Procedure

This procedure causes all the cached statements associated with the policy to be reparsed. This guarantees that the latest change to this policy will have immediate effect after the procedure is executed.

The procedure causes the current transaction, if any, to commit before the operation is carried out. However, this does not cause a commit first if it is inside a DDL event trigger.

See Also:

[Operational Notes](#)

A COMMIT is also performed at the end of the operation.

Syntax

```
DBMS_RLS.REFRESH_POLICY (  
    object_schema IN VARCHAR2 NULL,  
    object_name   IN VARCHAR2 NULL,  
    policy_name   IN VARCHAR2 NULL);
```

Parameters

Table 152-18 REFRESH_POLICY Procedure Parameters

| Parameter | Description |
|---------------|--|
| object_schema | Schema containing the table, view, or synonym. If no object_schema is specified or is NULL, then the current schema is used. |
| object_name | Name of table, view, or synonym with which the policy is associated |
| policy_name | Name of policy to be refreshed |

Usage Notes

- The procedure returns an error if it tries to refresh a disabled policy.
- The procedure removes the cached results of context and shared sensitive VPD policies.

DBMS_ROLLING

The `DBMS_ROLLING` PL/SQL package is used to implement the Rolling Upgrade Using Active Data Guard feature, which streamlines the process of upgrading Oracle Database software in a Data Guard configuration in a rolling fashion. The Rolling Upgrade Using Active Data Guard feature requires a license for the Oracle Active Data Guard option, and can be used for database version upgrades starting with the first patchset of Oracle Database 12c.

Additionally, you can use this feature immediately for other database maintenance tasks. The database where maintenance is performed must be operating at a minimum of Oracle Database 12c Release 1 (12.1). Such maintenance tasks include:

- Adding partitioning to non-partitioned tables
- Changing BasicFiles LOBs to SecureFiles LOBs
- Changing `XMLType` stored as `CLOB` to `XMLtype` stored as binary XML
- Altering tables to be OLTP-compressed

This chapter contains the following topics:

- [Overview](#)
- [Security Model](#)
- [Summary of DBMS_ROLLING Subprograms](#)

See Also:

- *Oracle Data Guard Concepts and Administration* for information about using `DBMS_ROLLING` to perform a rolling upgrade

153.1 DBMS_ROLLING Overview

The `DBMS_ROLLING` PL/SQL package provides procedures that you can use to perform any change throughout a Data Guard configuration in a rolling fashion, including a rolling upgrade of the Oracle Database software. Although the focus of this document is rolling upgrade operations, the content is applicable to the deployment of any rolling changes.

All the procedures are executed at the current primary database, which eliminates the potential confusion of moving between remote databases to perform various operations related to the rolling upgrade. If necessary, all the procedures can be called again to resume the rolling upgrade after an error or interruption. (The upgrade script must still be run at the standby.)

The package also provides a procedure that allows you to return a Data Guard configuration back to its original, pre-upgrade state in the event users wish to abandon the rolling upgrade.

The actual execution of a rolling upgrade has been reduced to three steps (excluding the upgrade of the Oracle Database software itself and the on-disk setup of the new Oracle Database software). The number of steps remains the same regardless of the size of the Data Guard configuration.

Conceptually, for the purposes of the `DBMS_ROLLING` package, you divide your Data Guard configuration into two groups: the leading group and the trailing group. The databases in the leading group undergo the upgrade operation (or any other change that you are deploying) first. The databases in the trailing group undergo the upgrade of the Oracle Database software (or any other change that you are deploying) only after the switchover operation. This insulates them from the upgrade and gives you time to evaluate the effect of the change in the leading group databases.

Each group has a master database: the future primary database as specified in the `DBMS_ROLLING.INIT_PLAN` procedure is the master of the leading group, called Leading Group Master (LGM), while the original primary database is the master of the trailing group called Trailing Group Master (TGM). You can configure databases to protect the LGM and the TGM. Standbys designated to protect the LGM are referred to as Leading Group Standbys (LGS). Standbys designated to protect the TGM are referred to as Trailing Group Standbys (TGS). These terms are used throughout this documentation.

153.2 DBMS_ROLLING Security Model

The `DBMS_ROLLING` package is available to users who have been granted the DBA role.

153.3 Summary of DBMS_ROLLING Subprograms

This table lists and briefly describes the `DBMS_ROLLING` package subprograms.

Table 153-1 DBMS_ROLLING Package Subprograms

| Subprogram | Description |
|---|--|
| INIT_PLAN Procedure | Initializes a rolling operation plan with system-generated default values. |
| DESTROY_PLAN Procedure | Destroys any existing rolling operation plan, its parameters, and all resources associated with the rolling operation. |
| BUILD_PLAN Procedure | Validates plan parameters and creates or modifies a rolling operation plan. |
| SET_PARAMETER Procedure | Modifies a rolling operation parameter. |
| START_PLAN Procedure | Starts the rolling operation. |
| SWITCHOVER Procedure | Performs a switchover between the current primary database and the transient logical standby database. |
| FINISH_PLAN Procedure | Finalizes the rolling operation. |
| ROLLBACK_PLAN Procedure | Completely rolls back the rolling operation. |

153.3.1 INIT_PLAN Procedure

This procedure initializes a rolling operation plan with system-generated default values.

Syntax

```
DBMS_ROLLING.INIT_PLAN (  
    future_primary IN VARCHAR2);
```

Parameters

Table 153-2 *INIT_PLAN Procedure Parameters*

| Parameter | Description |
|----------------|---|
| future_primary | DB_UNIQUE_NAME of the future primary (also known as the Leading Group Master (LGM)) |

Exceptions

- ORA-45400: operation not permitted on current database
- ORA-45401: upgrade plan is already active
- ORA-45402: LOG_ARCHIVE_CONFIG must contain the DG_CONFIG attribute
- ORA-45403: database %s must be specified in DG_CONFIG
- ORA-45411: operation requires additional arguments
- ORA-65040: operation not allowed from within a pluggable database

Usage Notes

- This procedure communicates with all databases defined in the log_archive_config init.ora parameter and validates that each database is a valid participant in the rolling upgrade. Valid participants other than the primary database must have a database role of either physical standby, DG, or logical standby.
- The designated future primary must be a physical standby or ADG.

153.3.2 DESTROY_PLAN Procedure

This procedure destroys any existing upgrade plan, its parameters, and all resources associated with a rolling operation.

Syntax

```
DBMS_ROLLING.DESTROY_PLAN ();
```

Parameters

This procedure has no parameters.

Exceptions

- ORA-45422: operation requires existing plan

- ORA-65040: operation not allowed from within a pluggable database

Usage Notes

- When a rolling operation is complete, this procedure can be called to completely purge all states related to a rolling operation.
- This procedure must also be called after a `ROLLBACK_PLAN` to purge the metadata.

153.3.3 BUILD_PLAN Procedure

This procedure validates plan parameters and creates or modifies a rolling operation plan.

A successfully constructed plan is required in order to perform a rolling operation. This procedure must return successfully before the `START_PLAN` procedure can be called to start the rolling operation. Parameter changes made after a plan has been created may require calling the `BUILD_PLAN` procedure to modify the existing plan. The `DBA_ROLLING_EVENTS` view will indicate if any invocation of the `SET_PARAMETER` procedure requires a plan rebuild. Failure to rebuild the plan will result in an ORA-45416 error when attempting to resume the rolling operation.

Syntax

```
DBMS_ROLLING.BUILD_PLAN ();
```

Parameters

This procedure has no parameters.

Exceptions

- ORA-45400: operation not permitted on current database
- ORA-45403: database %s must be specified in the DG_CONFIG
- ORA-45414: could not connect to a remote database
- ORA-45419: DB_UNIQUE_NAME parameter must be specified
- ORA-45433: failover was detected on an unsupported database
- ORA-45434: multiple failovers of the same type detected
- ORA-65040: operation not allowed from within a pluggable database

Usage Notes

- This procedure connects to databases specified as plan parameters. These instances must be mounted or open, and must be reachable via the network.

153.3.4 SET_PARAMETER Procedure

This procedure modifies a rolling operation parameter.

Starting with Oracle Database 20c, a new parameter called `BLOCK_UNSUPPORTED` is added to the `DBMS_ROLLING.SET_PARAMETER` procedure. By default, `BLOCK_UNSUPPORTED` is set to 1, indicating that operations performed on tables that are unsupported by Transient Logical Standby will be blocked on the primary database. If set to 0, then the

DBMS_ROLLING package does not block operations on unsupported tables. Those tables will not be maintained by Transient Logical Standby, and will diverge from the primary database.

Syntax

```
DBMS_ROLLING.SET_PARAMETER (  
    scope          IN VARCHAR2 DEFAULT NULL,  
    name           IN NUMBER,  
    value          IN VARCHAR2);
```

Parameters

Table 153-3 *SET_PARAMETER Procedure Parameters*

| Parameter | Description |
|-----------|--|
| scope | Parameter scope. It can either be NULL for global parameters, or the DB_UNIQUE_NAME of a specific database for local parameters. |
| name | The DBMS_ROLLING constant for a given parameter. |
| value | New value for the parameter or NULL to revert to a default value. |

Exceptions

- ORA-45400: operation not permitted on current database
- ORA-45408: parameter name is unknown
- ORA-45409: parameter value is invalid or out of bounds
- ORA-45410: parameter may not be modified
- ORA-45411: operation requires additional arguments
- ORA-45412: parameter scope argument is unknown
- ORA-45413: parameter has no default value
- ORA-45414: could not connect to a remote database
- ORA-65040: operation not allowed from within a pluggable database

Usage Notes

- Changes to a parameter value may require a call to the DBMS_ROLLING.BUILD_PLAN procedure to modify the existing plan. Users should check the DBA_ROLLING_EVENTS view after setting a parameter to determine if a rebuild is necessary.
- [Table 153-4](#) lists all the available parameters and their descriptions. The parameter names and values described in the table are all of type VARCHAR2.
- The MINVAL and MAXVAL columns in the DBA_ROLLING_PARAMETERS view identify the valid range of values for a parameter. The view does not contain any parameters until the DBMS_ROLLING.INIT_PLAN procedure has been successfully invoked.

Table 153-4 Valid Values for DBMS_ROLLING.SET_PARAMETER Procedure

| Parameter Name | Global? | Description | Default |
|------------------------------|---------|--|--------------------------------------|
| ACTIVE_SESSIONS_TIMEOUT | Yes | The maximum amount of time in seconds to enforce ACTIVE_SESSIONS_WAIT before halting the rolling upgrade. This parameter is only valid if ACTIVE_SESSIONS_WAIT is set to 1. | 3600 |
| ACTIVE_SESSIONS_WAIT | Yes | Whether the switchover operation will wait for active sessions to finish. If set to 1, the SWITCHOVER procedure waits for active sessions to complete. If set to 0, the SWITCHOVER procedure kills active sessions to expedite the switchover. | 0 |
| BACKUP_CONTROLFILE | Yes | File name of the backup control file that is created during a rolling upgrade. | rolling_change_backup.f |
| BLOCK_UNSUPPORTED | Yes | This parameter can be set for Rolling Upgrade to Block Unsupported Operations on the source database. Possible values are 0 and 1. <ul style="list-style-type: none"> 1: Turns blocking on. This is the default value. 0: Turns blocking off. Scope is not considered for this parameter. | 1 |
| DGBROKER | Yes | Use Data Guard broker for managing apply, recovery, and log archive destinations. | 1 if broker is enabled, 0 otherwise. |
| DICTIONARY_LOAD_TIMEOUT | Yes | The maximum amount of time in seconds to enforce DICTIONARY_LOAD_WAIT before halting the rolling upgrade. This parameter is only valid if DICTIONARY_LOAD_WAIT is set to 1. | 3600 |
| DICTIONARY_LOAD_WAIT | Yes | Whether the instantiation of the transient logical standby will include a wait for the complete loading of the data dictionary snapshot in redo. If set to 1, then the START_PLAN procedure will not return until the dictionary has been completely loaded. If set to 0, then the START_PLAN procedure will only verify that the loading of the dictionary has started. | 0 |
| DICTIONARY_PLS_WAIT_INTERVAL | Yes | The time in seconds to wait in between attempts to quiesce PL/SQL activity in order to write the data dictionary to redo. | 300 |
| DICTIONARY_PLS_WAIT_TIMEOUT | Yes | The maximum amount of time in seconds to attempt to quiesce PL/SQL activity in order to write the data dictionary to redo. | 3600 |
| EVENT_RECORDS | Yes | The maximum number of records to permit in DBA_ROLLING_EVENTS | 10000 |
| FAILOVER | Yes | Automatically attempt to adjust the upgrade plan as a result of a failover event. This parameter resets its value to 0 upon completion of a subsequent call to BUILD_PLAN. | 0 |
| GRP_PREFIX | Yes | Execution of procedures in DBMS_ROLLING results in a number of Guaranteed Restore Points (GRP) taken in various databases participating in the Data Guard configuration. All such GRPs have the same prefix in their names. You can use this parameter to override the default prefix. | DBMSRU |

Table 153-4 (Cont.) Valid Values for DBMS_ROLLING.SET_PARAMETER Procedure

| Parameter Name | Global? | Description | Default |
|------------------------|---------|--|---------|
| IGNORE_BUILD_WARNINGS | Yes | Ignore warnings which would otherwise raise exceptions during execution of the BUILD_PLAN procedure. | 1 |
| IGNORE_LAST_ERROR | Yes | Ignore last encountered error upon startup of next rolling operation. This parameter resets its value to 0 upon invocation of a procedure call which resumes the rolling upgrade. | 0 |
| LAD_ENABLED_TIMEOUT | Yes | The maximum time in seconds to wait for a recently enabled log archive destination to reach a VALID state. | 600 |
| LOG_LEVEL | Yes | Logging level for the DBS_ROLLING PL/SQL package. A value of INFO results in the logging of errors and relevant non-fatal warnings. A value of FULL results in the logging of all events. | INFO |
| MEMBER | No | The upgrade group in which the specified database is a member. A value of LEADING indicates that the standby is a member of the leading upgrade group. As such, it is a standby of the Leading Group Master (LGM). The LGM is the database which is converted into the transient logical standby, and which becomes the new primary after the switchover. A value of TRAILING indicates that the standby is a member of the trailing upgrade group. As such, it is a standby of the Trailing Group Master (TGM). The TGM is the original primary database. | LEADING |
| READY_LGM_LAG_TIME | Yes | The apply lag time in seconds associated with the READY_LGM_LAG_WAIT parameter. | 600 |
| READY_LGM_LAG_TIMEOUT | Yes | The maximum amount of time in seconds to enforce READY_LGM_LAG_WAIT before halting the rolling upgrade. This parameter is only valid if READY_LGM_LAG_WAIT is set to 1. | 60 |
| READY_LGM_LAG_WAIT | Yes | Whether the START_PLAN procedure will wait for the apply lag on the leading group master to fall below READY_LGM_LAG_TIME seconds before returning control back to the user. If set to 1, the wait is performed. If set to 0, the wait is not performed. | 0 |
| SWITCH_LGM_LAG_TIME | Yes | The apply lag time in seconds associated with the SWITCH_LGM_LAG_WAIT parameter. | 600 |
| SWITCH_LGM_LAG_TIMEOUT | Yes | The maximum amount of time in seconds to enforce SWITCH_LGM_LAG_WAIT before halting the rolling upgrade. This parameter is only valid if SWITCH_LGM_LAG_WAIT is set to 1. | 60 |
| SWITCH_LGM_LAG_WAIT | Yes | Whether the SWITCHOVER procedure will wait for the apply lag on the leading group master to fall below SWITCH_LGM_LAG_TIME seconds before initiating the switchover. If set to 1, the wait is performed. If set to 0, the wait is not performed. | 1 |
| SWITCH_LGS_LAG_TIME | Yes | The apply lag time in seconds associated with the SWITCH_LGS_LAG_WAIT parameter. | 60 |

Table 153-4 (Cont.) Valid Values for DBMS_ROLLING.SET_PARAMETER Procedure

| Parameter Name | Global? | Description | Default |
|----------------------------|---------|--|---------|
| SWITCH_LGS_LAG_TIMEOU T | Yes | The maximum amount of time in seconds to enforce SWITCH_LGS_LAG_WAIT before halting the rolling upgrade. This parameter is only valid if SWITCH_LGS_LAG_WAIT is set to 1. | 60 |
| SWITCH_LGS_LAG_WAIT | Yes | Whether the SWITCHOVER procedure will wait for the apply lag on the leading group standbys to fall below SWITCH_LGS_LAG_TIME seconds before initiating the switchover. If set to 1, the wait is performed. If set to 0, the wait is not performed. | 0 |
| UPDATED_LGS_TIMEOUT | Yes | The maximum amount of time in seconds to enforce UPDATED_LGS_WAIT before halting the rolling upgrade. This parameter is only valid if UPDATED_LGS_WAIT is set to 1. | 10800 |
| UPDATED_LGS_WAIT | Yes | Whether the SWITCHOVER procedure will wait for the leading group standbys to complete recovery of all upgrade redo before initiating the switchover. If set to 1, the wait is performed. If set to 0, the wait is not performed | 1 |
| UPDATED_TGS_TIMEOUT | Yes | The maximum amount of time in seconds to enforce UPDATED_TGS_WAIT before halting the rolling upgrade. This parameter is only valid if UPDATED_TGS_WAIT is set to 1. | 10800 |
| UPDATED_TGS_WAIT | Yes | Whether the FINISH_PLAN procedure will wait for the trailing group standbys to complete recovery of all upgrade redo before returning control to the user. If set to 1, the wait is performed. If set to 0, the wait is not performed. | 1 |

153.3.5 START_PLAN Procedure

This procedure starts the rolling operation. This procedure must be executed on the primary database to formally start the rolling operation.

When the START_PLAN procedure is complete, the `future_primary` parameter in the INIT_PLAN procedure will be converted into a fully configured transient logical standby database.

Syntax

```
DBMS_ROLLING.START_PLAN ();
```

Parameters

This procedure has no parameters.

Exceptions

- ORA-45400: operation not permitted on current database
- ORA-45414: could not connect to a remote database
- ORA-45415: instruction execution failure
- ORA-45416: operation cannot start until plan rebuild

- ORA-45417: operation not permitted since current phase was not %s
- ORA-45422: operation requires existing plan
- ORA-45426: managed recovery process was not running
- ORA-45427: logical standby Redo Apply process was not running
- ORA-45428: database was not in expected database role
- ORA-45435: managed recovery process was running
- ORA-45436: logical standby Redo Apply process was running
- ORA-45438: database is not in mounted mode
- ORA-45439: database is not in open read/write mode
- ORA-45486: database update progress is inconsistent
- ORA-65040: operation not allowed from within a pluggable database

Usage Notes

- A rolling operation plan must have previously been generated through the `BUILD_PLAN` procedure.

153.3.6 SWITCHOVER Procedure

This procedure performs a switchover between the current primary database and the transient logical standby database.

At the successful completion of the procedure, the LGM assumes the primary role for the Data Guard configuration.

Syntax

```
DBMS_ROLLING.SWITCHOVER ();
```

Parameters

This procedure has no parameters.

Exceptions

- ORA-45400: operation not permitted on current database
- ORA-45414: could not connect to a remote database
- ORA-45415: instruction execution failure
- ORA-45416: operation cannot start until plan rebuild
- ORA-45417: operation not permitted since current phase was not %s
- ORA-45422: operation requires existing plan
- ORA-45426: managed recovery process was not running
- ORA-45427: logical standby Redo Apply process was not running
- ORA-45428: database was not in expected database role
- ORA-45435: managed recovery process was running

- ORA-45436: logical standby Redo Apply process was running
- ORA-45438: database is not in mounted mode
- ORA-45439: database is not in open read/write mode
- ORA-45486: database update progress is inconsistent
- ORA-65040: operation not allowed from within a pluggable database

Usage Notes

- This procedure can only be called after you have manually upgraded the transient logical standby and opened it on the higher Oracle Database version.
- Once the future primary has been upgraded, logical apply should be restarted and allowed to catch up with the primary since the primary will have been open for business and generating redo which the standby must now apply. Failing to do so will cause the switchover to take a long time since it will have to apply all of that redo.

153.3.7 FINISH_PLAN Procedure

This procedure finalizes the rolling operation.

It configures the former primary as a physical standby of the new primary by flashing it back to an earlier taken GRP (guaranteed restore point), converting its role to physical standby, and then starting managed recovery which will recover all redo generated by the new primary including upgrade redo and any other redo generated before or after the upgrade.

Syntax

```
DBMS_ROLLING.FINISH_PLAN ();
```

Parameters

This procedure has no parameters.

Exceptions

- ORA-45400: operation not permitted on current database
- ORA-45414: could not connect to a remote database
- ORA-45415: instruction execution failure
- ORA-45416: operation cannot start until plan rebuild
- ORA-45417: operation not permitted since current phase was not %s
- ORA-45422: operation requires existing plan
- ORA-45426: managed recovery process was not running
- ORA-45427: logical standby Redo Apply process was not running
- ORA-45428: database was not in expected database role
- ORA-45435: managed recovery process was running
- ORA-45436: logical standby Redo Apply process was running

- ORA-45438: database is not in mounted mode
- ORA-45439: database is not in open read/write mode
- ORA-45486: database update progress is inconsistent
- ORA-65040: operation not allowed from within a pluggable database

Usage Notes

- This procedure can only be called after you have remounted the former primary and remaining physical standbys on the higher Oracle Database version.

153.3.8 ROLLBACK_PLAN Procedure

This procedure rolls back the configuration-wide rolling operation.

Once completed, all of the databases in the leading group become physical standbys of the original primary database. This procedure can only be called if the configuration has not yet gone through a switchover operation since the `START_PLAN` procedure was invoked.

Syntax

```
DBMS_ROLLING.ROLLBACK_PLAN;
```

Parameters

This procedure has no parameters.

Exceptions

- ORA-45400: operation not permitted on current database
- ORA-45414: could not connect to a remote database
- ORA-45415: instruction execution failure
- ORA-45441: no databases eligible for rollback
- ORA-45442: rollback is not permitted after a role change
- ORA-65040: operation not allowed from within a pluggable database

Usage Notes

- You must manually restart media recovery on the lower Oracle Database version if the upgrade of the transient logical standby has already been performed.

DBMS_ROWID

The `DBMS_ROWID` package lets you create `ROWIDs` and obtain information about `ROWIDs` from PL/SQL programs and SQL statements. You can find the data block number, the object number, and other `ROWID` components without writing code to interpret the base-64 character external `ROWID`. `DBMS_ROWID` is intended for upgrading from Oracle database version 7 to Oracle database version 8.X.

**Note:**

`DBMS_ROWID` is not to be used with universal `ROWIDs` (`UROWIDs`).

This chapter contains the following topics:

- [Security Model](#)
- [Types](#)
- [Exceptions](#)
- [Operational Notes](#)
- [Examples](#)
- [Summary of DBMS_ROWID Subprograms](#)

154.1 DBMS_ROWID Security Model

This package runs with the privileges of calling user, rather than the package owner `SYS`.

154.2 DBMS_ROWID Types

There are four `DBMS_ROWID` types.

These are:

- Extension and restriction types
- Verification types
- Object types
- Conversion types

Extension and Restriction Type

The types are as follows:

- `RESTRICTED`—restricted `ROWID`
- `EXTENDED`—extended `ROWID`

For example:

```
rowid_type_restricted constant integer := 0;
rowid_type_extended   constant integer := 1;
```

Note:

Extended ROWIDs are only used in Oracle database version 8.Xi and higher.

Verification Types

Table 154-1 Verification Types

| Result | Description |
|---------|---------------|
| VALID | Valid ROWID |
| INVALID | Invalid ROWID |

For example:

```
rowid_is_valid   constant integer := 0;
rowid_is_invalid constant integer := 1;
```

Object Types

Table 154-2 Object Types

| Result | Description |
|-----------|---|
| UNDEFINED | Object Number not defined (for restricted ROWIDs) |

For example:

```
rowid_object_undefined constant integer := 0;
```

Conversion Types

Table 154-3 Conversion Types

| Result | Description |
|----------|--------------------------------------|
| INTERNAL | Convert to/from column of ROWID type |
| EXTERNAL | Convert to/from string format |

For example:

```
rowid_convert_internal constant integer := 0;
rowid_convert_external constant integer := 1;
```

154.3 DBMS_ROWID Exceptions

This table describes the Exceptions raised by DBMS_ROWID subprograms.

Table 154-4 Exceptions

| Exception | Description |
|-----------------|-----------------------------|
| ROWID_INVALID | Invalid rowid format |
| ROWID_BAD_BLOCK | Block is beyond end of file |

For example:

```
ROWID_INVALID exception;
pragma exception_init(ROWID_INVALID, -1410);

ROWID_BAD_BLOCK exception;
pragma exception_init(ROWID_BAD_BLOCK, -28516);
```

154.4 DBMS_ROWID Operational Notes

These operation notes apply to DBMS_ROWID.

- Some of the functions in this package take a single parameter, such as a ROWID. This can be a character or a PL/SQL ROWID, either restricted or extended, as required.
- You can call the DBMS_ROWID functions and procedures from PL/SQL code, and you can also use the functions in SQL statements.

Note:

ROWID_INFO is a procedure. It can only be used in PL/SQL code.

- You can use functions from the DBMS_ROWID package just like built-in SQL functions; in other words, you can use them wherever you can use an expression. In this example, the ROWID_BLOCK_NUMBER function is used to return just the block number of a single row in the EMP table:

```
SELECT DBMS_ROWID.ROWID_BLOCK_NUMBER(rowid)
FROM emp
WHERE ename = 'KING';
```

- If Oracle returns the error "ORA:452, 0, 'Subprogram '%s' violates its associated pragma' for pragma restrict_references, it could mean the violation is due to:
 - A problem with the current procedure or function
 - Calling a procedure or function without a pragma or due to calling one with a less restrictive pragma
 - Calling a package procedure or function that touches the initialization code in a package or that sets the default values

154.5 DBMS_ROWID Examples

This example returns the ROWID for a row in the EMP table, extracts the data object number from the ROWID, using the ROWID_OBJECT function in the DBMS_ROWID package, then displays the object number:

```
DECLARE
  object_no  INTEGER;
  row_id     ROWID;
  ...
BEGIN
  SELECT ROWID INTO row_id FROM emp
     WHERE empno = 7499;
  object_no := DBMS_ROWID.ROWID_OBJECT(row_id);
  DBMS_OUTPUT.PUT_LINE('The obj. # is '|| object_no);
  ...

```

154.6 Summary of DBMS_ROWID Subprograms

This table lists the DBMS_ROWID subprograms and briefly describes them.

Table 154-5 DBMS_ROWID Package Subprograms

| Subprogram | Description |
|--|--|
| ROWID_BLOCK_NUMBER Function | Returns the block number of a ROWID |
| ROWID_CREATE Function | Creates a ROWID, for testing only |
| ROWID_INFO Procedure | Returns the type and components of a ROWID |
| ROWID_OBJECT Function | Returns the object number of the extended ROWID |
| ROWID_RELATIVE_FNO Function | Returns the file number of a ROWID |
| ROWID_ROW_NUMBER Function | Returns the row number |
| ROWID_TO_ABSOLUTE_FNO Function | Returns the absolute file number associated with the ROWID for a row in a specific table |
| ROWID_TO_EXTENDED Function | Converts a ROWID from restricted format to extended |
| ROWID_TO_RESTRICTED Function | Converts an extended ROWID to restricted format |
| ROWID_TYPE Function | Returns the ROWID type: 0 is restricted, 1 is extended |
| ROWID_VERIFY Function | Checks if a ROWID can be correctly extended by the ROWID_TO_EXTENDED function |

154.6.1 ROWID_BLOCK_NUMBER Function

This function returns the database block number for the input ROWID.

Syntax

```
DBMS_ROWID.ROWID_BLOCK_NUMBER (  
    row_id      IN  ROWID,  
    ts_type_in  IN  VARCHAR2 DEFAULT 'SMALLFILE')  
RETURN NUMBER;
```

Pragmas

```
pragma RESTRICT_REFERENCES(rowid_block_number,WNDS,RNDS,WNPS,RNPS);
```

Parameters

Table 154-6 ROWID_BLOCK_NUMBER Function Parameters

| Parameter | Description |
|------------|---|
| row_id | ROWID to be interpreted |
| ts_type_in | The type of the tablespace (bigfile/smallfile) to which the row belongs |

Examples

The example SQL statement selects the block number from a ROWID and inserts it into another table:

```
INSERT INTO T2 (SELECT dbms_rowid.rowid_block_number(ROWID, 'BIGFILE')  
FROM some_table  
WHERE key_value = 42);
```

154.6.2 ROWID_CREATE Function

This function lets you create a ROWID, given the component parts as parameters.

This is useful for testing ROWID operations, because only the Oracle Server can create a valid ROWID that points to data in a database.

Syntax

```
DBMS_ROWID.ROWID_CREATE (  
    rowid_type  IN NUMBER,  
    object_number IN NUMBER,  
    relative_fno IN NUMBER,  
    block_number IN NUMBER,  
    row_number  IN NUMBER)  
RETURN ROWID;
```

Pragmas

```
pragma RESTRICT_REFERENCES(rowid_create,WNDS,RNDS,WNPS,RNPS);
```

Parameters

Table 154-7 ROWID_CREATE Function Parameters

| Parameter | Description |
|---------------|---|
| rowid_type | Type (restricted or extended) Set the rowid_type parameter to 0 for a restricted ROWID. Set it to 1 to create an extended ROWID. If you specify rowid_type as 0, then the required object_number parameter is ignored, and ROWID_CREATE returns a restricted ROWID. |
| object_number | Data object number (rowid_object_undefined for restricted) |
| relative_fno | Relative file number |
| block_number | Block number in this file |
| row_number | Returns row number in this block |

Examples

Create a dummy extended ROWID:

```
my_rowid := DBMS_ROWID.ROWID_CREATE(1, 9999, 12, 1000, 13);
```

Find out what the rowid_object function returns:

```
obj_number := DBMS_ROWID.ROWID_OBJECT(my_rowid);
```

The variable obj_number now contains 9999.

154.6.3 ROWID_INFO Procedure

This procedure returns information about a ROWID, including its type (restricted or extended), and the components of the ROWID.

This is a procedure, and it cannot be used in a SQL statement.

Syntax

```
DBMS_ROWID.ROWID_INFO (
  rowid_in      IN  ROWID,
  rowid_type    OUT NUMBER,
  object_number OUT NUMBER,
  relative_fno  OUT NUMBER,
  block_number  OUT NUMBER,
  row_number    OUT NUMBER);
```

Pragmas

```
pragma RESTRICT_REFERENCES(rowid_info,WNDS,RNDS,WNPS,RNPS);
```

Parameters

Table 154-8 ROWID_INFO Procedure Parameters

| Parameter | Description |
|---------------|--|
| rowid_in | ROWID to be interpreted. This determines if the ROWID is a restricted (0) or extended (1) ROWID. |
| rowid_type | Returns type (restricted/extended) |
| object_number | Returns data object number (rowid_object_undefined for restricted) |
| relative_fno | Returns relative file number |
| block_number | Returns block number in this file |
| row_number | Returns row number in this block |

See Also:

"ROWID_TYPE Function"

Examples

This example reads back the values for the ROWID that you created in the ROWID_CREATE:

```
DBMS_ROWID.ROWID_INFO (
  my_rowid, rid_type, obj_num, file_num, block_num, row_num, 'BIGFILE');
```

154.6.4 ROWID_OBJECT Function

This function returns the data object number for an extended ROWID.

The function returns zero if the input ROWID is a restricted ROWID.

Syntax

```
DBMS_ROWID.ROWID_OBJECT (
  rowid_id IN ROWID)
RETURN NUMBER;
```

Pragmas

```
pragma RESTRICT_REFERENCES(rowid_object,WNDS,RNDS,WNPS,RNPS);
```

Parameters

Table 154-9 ROWID_OBJECT Function Parameters

| Parameter | Description |
|-----------|-------------------------|
| row_id | ROWID to be interpreted |

**Note:**

The ROWID_OBJECT_UNDEFINED constant is returned for restricted ROWIDs.

Examples

```
SELECT dbms_rowid.rowid_object (ROWID)
FROM emp
WHERE empno = 7499;
```

154.6.5 ROWID_RELATIVE_FNO Function

This function returns the relative file number of the ROWID specified as the IN parameter. (The file number is relative to the tablespace.)

Syntax

```
DBMS_ROWID.ROWID_RELATIVE_FNO (
    rowid_id      IN   ROWID,
    ts_type_in    IN   VARCHAR2 DEFAULT 'SMALLFILE')
RETURN NUMBER;
```

Pragmas

```
pragma RESTRICT_REFERENCES(rowid_relative_fno,WNDS,RNDS,WNPS,RNPS);
```

Parameters**Table 154-10 ROWID_RELATIVE_FNO Function Parameters**

| Parameter | Description |
|------------|---|
| row_id | ROWID to be interpreted |
| ts_type_in | Type of the tablespace (bigfile/smallfile) to which the row belongs |

Examples

The example PL/SQL code fragment returns the relative file number:

```
DECLARE
    file_number    INTEGER;
    rowid_val      ROWID;
BEGIN
    SELECT ROWID INTO rowid_val
    FROM dept
    WHERE loc = 'Boston';
    file_number :=
        dbms_rowid.rowid_relative_fno(rowid_val, 'SMALLFILE');
    ...
```

154.6.6 ROWID_ROW_NUMBER Function

This function extracts the row number from the ROWID IN parameter.

Syntax

```
DBMS_ROWID.ROWID_ROW_NUMBER (  
    row_id IN ROWID)  
    RETURN NUMBER;
```

Pragmas

```
PRAGMA RESTRICT_REFERENCES(rowid_row_number,WNDS,RNDS,WNPS,RNPS);
```

Parameters

Table 154-11 ROWID_ROW_NUMBER Function Parameters

| Parameter | Description |
|-----------|--------------------------|
| row_id | ROWID to be interpreted. |

Examples

Select a row number:

```
SELECT dbms_rowid.rowid_row_number(ROWID)  
FROM emp  
WHERE ename = 'ALLEN';
```

154.6.7 ROWID_TO_ABSOLUTE_FNO Function

This function extracts the absolute file number from a ROWID, where the file number is absolute for a row in a given schema and table.

The schema name and the name of the schema object (such as a table name) are provided as IN parameters for this function.

Syntax

```
DBMS_ROWID.ROWID_TO_ABSOLUTE_FNO (  
    row_id      IN ROWID,  
    schema_name IN VARCHAR2,  
    object_name IN VARCHAR2)  
    RETURN NUMBER;
```

Pragmas

```
pragma RESTRICT_REFERENCES(rowid_to_absolute_fno,WNDS,WNPS,RNPS);
```

Parameters

Table 154-12 ROWID_TO_ABSOLUTE_FNO Function Parameters

| Parameter | Description |
|-------------|---|
| row_id | ROWID to be interpreted |
| schema_name | Name of the schema which contains the table |
| object_name | Table name |

Examples

```

DECLARE
  abs_fno      INTEGER;
  rowid_val    CHAR(18);
  object_name  VARCHAR2(20) := 'EMP';
BEGIN
  SELECT ROWID INTO rowid_val
  FROM emp
  WHERE empno = 9999;
  abs_fno := dbms_rowid.rowid_to_absolute_fno(
    rowid_val, 'SCOTT', object_name);

```

Note:

For partitioned objects, the name must be a table name, not a partition or a sub/partition name.

154.6.8 ROWID_TO_EXTENDED Function

This function translates a restricted ROWID that addresses a row in a schema and table that you specify to the extended ROWID format.

Later, it may be removed from this package into a different place.

Syntax

```

DBMS_ROWID.ROWID_TO_EXTENDED (
  old_rowid      IN ROWID,
  schema_name    IN VARCHAR2,
  object_name    IN VARCHAR2,
  conversion_type IN INTEGER)
RETURN ROWID;

```

Pragmas

```
pragma RESTRICT_REFERENCES(rowid_to_extended,WNDS,WNPS,RNPS);
```

Parameters

Table 154-13 ROWID_TO_EXTENDED Function Parameters

| Parameter | Description |
|-----------------|--|
| old_rowid | ROWID to be converted |
| schema_name | Name of the schema which contains the table (optional) |
| object_name | Table name (optional). |
| conversion_type | The following constants are defined: ROWID_CONVERT_INTERNAL (:=0) ROWID_CONVERT_EXTERNAL (:=1) |

Return Values

ROWID_TO_EXTENDED returns the ROWID in the extended character format. If the input ROWID is NULL, then the function returns NULL. If a zero-valued ROWID is supplied (00000000.0000.0000), then a zero-valued restricted ROWID is returned.

Examples

Assume that there is a table called RIDS in the schema SCOTT, and that the table contains a column ROWID_COL that holds ROWIDs (restricted), and a column TABLE_COL that point to other tables in the SCOTT schema. You can convert the ROWIDs to extended format with the statement:

```
UPDATE SCOTT.RIDS
   SET rowid_col =
      dbms_rowid.rowid_to_extended (
         rowid_col, 'SCOTT', TABLE_COL, 0);
```

Usage Notes

- If the schema and object names are provided as IN parameters, then this function verifies SELECT authority on the table named, and converts the restricted ROWID provided to an extended ROWID, using the data object number of the table. That ROWID_TO_EXTENDED returns a value, however, does not guarantee that the converted ROWID actually references a valid row in the table, either at the time that the function is called, or when the extended ROWID is actually used.
- If the schema and object name are not provided (are passed as NULL), then this function attempts to fetch the page specified by the restricted ROWID provided. It treats the file number stored in this ROWID as the absolute file number. This can cause problems if the file has been dropped, and its number has been reused prior to the migration. If the fetched page belongs to a valid table, then the data object number of this table is used in converting to an extended ROWID value. This is very inefficient, and Oracle recommends doing this only as a last resort, when the target table is not known. The user must still know the correct table name at the time of using the converted value.
- If an extended ROWID value is supplied, the data object number in the input extended ROWID is verified against the data object number computed from the table name parameter. If the two numbers do not match, the INVALID_ROWID exception is raised. If they do match, the input ROWID is returned.

- ROWID_TO_EXTENDED cannot be used with partition tables.

See Also:

The [ROWID_VERIFY Function](#) has a method to determine if a given ROWID can be converted to the extended format.

154.6.9 ROWID_TO_RESTRICTED Function

This function converts an extended ROWID into restricted ROWID format.

Syntax

```
DBMS_ROWID.ROWID_TO_RESTRICTED (
    old_rowid      IN ROWID,
    conversion_type IN INTEGER)
RETURN ROWID;
```

Pragmas

```
pragma RESTRICT_REFERENCES(rowid_to_restricted,WNDS,RNDS,WNPS,RNPS);
```

Parameters

Table 154-14 ROWID_TO_RESTRICTED Function Parameters

| Parameter | Description |
|-----------------|--|
| old_rowid | ROWID to be converted |
| conversion_type | The following constants are defined: ROWID_CONVERT_INTERNAL (:=0) ROWID_CONVERT_EXTERNAL (:=1) |

154.6.10 ROWID_TYPE Function

This function returns 0 if the ROWID is a restricted ROWID, and 1 if it is extended.

Syntax

```
DBMS_ROWID.ROWID_TYPE (
    rowid_id IN ROWID)
RETURN NUMBER;
```

Pragmas

```
pragma RESTRICT_REFERENCES(rowid_type,WNDS,RNDS,WNPS,RNPS);
```

Parameters

Table 154-15 ROWID_TYPE Function Parameters

| Parameter | Description |
|-----------|-------------------------|
| row_id | ROWID to be interpreted |

Examples

```
IF DBMS_ROWID.ROWID_TYPE(my_rowid) = 1 THEN
    my_obj_num := DBMS_ROWID.ROWID_OBJECT(my_rowid);
```

154.6.11 ROWID_VERIFY Function

This function verifies the ROWID.

It returns 0 if the input restricted ROWID can be converted to extended format, given the input schema name and table name, and it returns 1 if the conversion is not possible.

**Note:**

You can use this function in a WHERE clause of a SQL statement, as shown in the example.

Syntax

```
DBMS_ROWID.ROWID_VERIFY (
    rowid_in      IN ROWID,
    schema_name   IN VARCHAR2,
    object_name   IN VARCHAR2,
    conversion_type IN INTEGER
) RETURN NUMBER;
```

Pragmas

```
pragma RESTRICT_REFERENCES(rowid_verify,WNDS,WNPS,RNPS);
```

Parameters

Table 154-16 ROWID_VERIFY Function Parameters

| Parameter | Description |
|-----------------|--|
| rowid_in | ROWID to be verified |
| schema_name | Name of the schema which contains the table |
| object_name | Table name |
| conversion_type | The following constants are defined: ROWID_CONVERT_INTERNAL (:=0) ROWID_CONVERT_EXTERNAL (:=1) |

Examples

Considering the schema in the example for the `ROWID_TO_EXTENDED` function, you can use the following statement to find bad ROWIDs prior to conversion. This enables you to fix them beforehand.

```
SELECT ROWID, rowid_col
FROM SCOTT.RIDS
WHERE dbms_rowid.rowid_verify(rowid_col, NULL, NULL, 0) =1;
```

DBMS_RULE

The `DBMS_RULE` package contains subprograms that enable the evaluation of a rule set for a specified event.

This chapter contains the following topics:

- [Overview](#)
- [Security Model](#)
- [Summary of DBMS_RULE Subprograms](#)

155.1 DBMS_RULE Overview

This package contains subprograms that enable the evaluation of a rule set for a specified event.

See Also:

- [Rule TYPES](#) for more information about the types used with the `DBMS_RULE` package
- [DBMS_RULE_ADM](#)

155.2 DBMS_RULE Security Model

`PUBLIC` is granted `EXECUTE` privilege on this package.

See Also:

Oracle Database Security Guide for more information about user group `PUBLIC`

155.3 Summary of DBMS_RULE Subprograms

This table lists the `DBMS_RULE` subprograms and briefly describes them.

Table 155-1 `DBMS_RULE` Package Subprograms

| Subprogram | Description |
|--|-------------------------|
| CLOSE_ITERATOR Procedure | Closes an open iterator |

Table 155-1 (Cont.) DBMS_RULE Package Subprograms

| Subprogram | Description |
|--|--|
| EVALUATE Procedure | Evaluates the rules in the specified rule set that use the evaluation context specified |
| EVALUATE_EXPRESSION Procedure | Evaluates an expression under the logged in user in a session |
| EVALUATE_EXPRESSION_ITERATOR Procedure | Finds the relevant datapoints and pass re\$value_list into evaluation interface |
| EVALUATE_RULE Procedure | Evaluates the condition defined in the Rule |
| EVALUATE_RULE_ITERATOR Procedure | Finds the relevant datapoints and pass re\$value_list into evaluation interface |
| GET_NEXT_HIT Function | Returns the next rule that evaluated to TRUE from a true rules iterator, or returns the next rule that evaluated to MAYBE from a maybe rules iterator; returns NULL if there are no more rules that evaluated to TRUE or MAYBE. |
| IS_FAST Procedure | Returns TRUE if the expression can be evaluated fast. An expression can be evaluated fast if the engine does not need to run any internal SQL and does not need to go to PL/SQL layer in case there are any PL/SQL functions referred. |
| GET_NEXT_RESULT Function | Iterates over result from the expression given result_val_iterator. |

155.3.1 CLOSE_ITERATOR Procedure

This procedure closes an open iterator.

Syntax

```
DBMS_RULE.CLOSE_ITERATOR(
    iterator IN BINARY_INTEGER);
```

Parameter

Table 155-2 CLOSE_ITERATOR Procedure Parameter

| Parameter | Description |
|-----------|-----------------------|
| iterator | Iterator to be closed |

Usage Notes

This procedure requires an open iterator that was returned by an earlier call to `DBMS_RULE.EVALUATE` in the same session. The user who runs this procedure does not require any privileges on the rule set being evaluated.

Closing an iterator frees resources, such as memory, associated with the iterator. Therefore, Oracle recommends that you close an iterator when it is no longer needed.

See Also:

[EVALUATE Procedure](#)

155.3.2 EVALUATE Procedure

This procedure evaluates the rules in the specified rule set that use the evaluation context specified for a specified event.

This procedure is overloaded. The `true_rules` and `maybe_rules` parameters are mutually exclusive with the `true_rules_iterator` and `maybe_rules_iterator` parameters. In addition, the procedure with the `true_rules` and `maybe_rules` parameters includes the `stop_on_first_hit` parameter, but the other procedure does not.

Syntax

```

DBMS_RULE.EVALUATE (
    rule_set_name          IN      VARCHAR2,
    evaluation_context     IN      VARCHAR2,
    event_context         IN      SYS.RE$NV_LIST          DEFAULT NULL,
    table_values          IN      SYS.RE$TABLE_VALUE_LIST DEFAULT NULL,
    column_values        IN      SYS.RE$COLUMN_VALUE_LIST DEFAULT NULL,
    variable_values      IN      SYS.RE$VARIABLE_VALUE_LIST DEFAULT NULL,
    attribute_values     IN      SYS.RE$ATTRIBUTE_VALUE_LIST DEFAULT NULL,

    skip_rules           IN      SYS.RE$RULE_NAME_LIST    DEFAULT NULL,

    dop                  IN      NUMBER,

    result_cache         IN      BOOLEAN                 DEFAULT FALSE,
    stop_on_first_hit   IN      BOOLEAN                 DEFAULT FALSE,
    simple_rules_only    IN      BOOLEAN                 DEFAULT FALSE,
    true_rules           OUT     SYS.RE$RULE_HIT_LIST,
    maybe_rules         OUT     SYS.RE$RULE_HIT_LIST);

DBMS_RULE.EVALUATE (
    rule_set_name          IN      VARCHAR2,
    evaluation_context     IN      VARCHAR2,
    event_context         IN      SYS.RE$NV_LIST          DEFAULT NULL,
    table_values          IN      SYS.RE$TABLE_VALUE_LIST DEFAULT NULL,
    column_values        IN      SYS.RE$COLUMN_VALUE_LIST DEFAULT NULL,
    variable_values      IN      SYS.RE$VARIABLE_VALUE_LIST DEFAULT NULL,
    attribute_values     IN      SYS.RE$ATTRIBUTE_VALUE_LIST DEFAULT NULL,

    skip_rules           IN      SYS.RE$RULE_NAME_LIST    DEFAULT NULL,

    dop                  IN      NUMBER,

    simple_rules_only    IN      BOOLEAN                 DEFAULT FALSE,
    true_rules_iterator  OUT     BINARY_INTEGER,
    maybe_rules_iterator OUT     BINARY_INTEGER);

```

Parameters

Table 155-3 EVALUATE Procedure Parameters

| Parameter | Description |
|---------------------------------|--|
| <code>rule_set_name</code> | Name of the rule set in the form <code>[schema_name.]rule_set_name</code> . For example, to evaluate all of the rules in a rule set named <code>hr_rules</code> in the <code>hr</code> schema, enter <code>hr.hr_rules</code> for this parameter. If the schema is not specified, then the schema of the current user is used. |
| <code>evaluation_context</code> | An evaluation context name in the form <code>[schema_name.]evaluation_context_name</code> . If the schema is not specified, then the name of the current user is used. Only rules that use the specified evaluation context are evaluated. |
| <code>event_context</code> | A list of name-value pairs that identify events that cause evaluation |
| <code>table_values</code> | Contains the data for table rows using the table aliases specified when the evaluation context was created. Each table alias in the list must be unique. |
| <code>column_values</code> | Contains the partial data for table rows. It must not contain column values for tables, whose values are already specified in <code>table_values</code> . |
| <code>variable_values</code> | A list containing the data for variables. The only way for an explicit variable value to be known is to specify its value in this list. If an implicit variable value is not specified in the list, then the function used to obtain the value of the implicit variable is invoked. If an implicit variable value is specified in the list, then this value is used and the function is not invoked. |
| <code>attribute_values</code> | Contains the partial data for variables. It must not contain attribute values for variables whose values are already specified in <code>variable_values</code> . |
| <code>stop_on_first_hit</code> | If <code>TRUE</code> , then the rules engine stops evaluation as soon as it finds a <code>TRUE</code> rule. If <code>TRUE</code> and there are no <code>TRUE</code> rules, then the rules engine stops evaluation as soon as it finds a rule that may evaluate to <code>TRUE</code> given more data. If <code>FALSE</code> , then the rules engine continues to evaluate rules even after it finds a <code>TRUE</code> rule. |
| <code>simple_rules_only</code> | If <code>TRUE</code> , then only those rules that are simple enough to be evaluated fast (without issuing SQL) are considered for evaluation. If <code>FALSE</code> , then evaluates all rules. |

Table 155-3 (Cont.) EVALUATE Procedure Parameters

| Parameter | Description |
|-----------------------------------|--|
| <code>true_rules</code> | <p>Receives the output of the <code>EVALUATE</code> procedure into a varray of <code>RE\$RULE_HIT_LIST</code> type.</p> <p>If no rules evaluate to <code>TRUE</code>, then <code>true_rules</code> is empty.</p> <p>If at least one rule evaluates to <code>TRUE</code> and <code>stop_on_first_hit</code> is <code>TRUE</code>, then <code>true_rules</code> contains one rule that evaluates to <code>TRUE</code>.</p> <p>If <code>stop_on_first_hit</code> is <code>FALSE</code>, then <code>true_rules</code> contains all rules that evaluate to <code>TRUE</code>.</p> |
| <code>maybe_rules</code> | <p>If all rules can be evaluated completely, without requiring any additional data, then <code>maybe_rules</code> is empty.</p> <p>If <code>stop_on_first_hit</code> is <code>TRUE</code>, then if there is at least one rule that may evaluate to <code>TRUE</code> given more data, and no rules evaluate to <code>TRUE</code>, then <code>maybe_rules</code> contains one rule that may evaluate to <code>TRUE</code>.</p> <p>If <code>stop_on_first_hit</code> is <code>FALSE</code>, then <code>maybe_rules</code> contains all rules that may evaluate to <code>TRUE</code> given more data.</p> |
| <code>true_rules_iterator</code> | Contains the iterator for accessing rules that are <code>TRUE</code> |
| <code>maybe_rules_iterator</code> | Contains the iterator for accessing rules that may be <code>TRUE</code> given additional data or the ability to issue SQL |
| <code>skip_rules</code> | List of rules to skip within this evaluation. |
| <code>dop</code> | Degree of parallelism |
| <code>result_cache</code> | If <code>TRUE</code> , Result Cache will be created. If evaluate procedure is called with either <code>true_rules_iterator</code> or <code>maybe_rules_iterator</code> , then <code>result_cache</code> is not enabled. |

Usage Notes

Note:

Rules in the rule set that use an evaluation context different from the one specified are not considered for evaluation.

The rules in the rule set are evaluated using the data specified for `table_values`, `column_values`, `variable_values`, and `attribute_values`. These values must refer to tables and variables in the specified evaluation context. Otherwise, an error is raised.

The caller may specify, using `stop_on_first_hit`, if evaluation must stop as soon as the first `TRUE` rule or the first `MAYBE` rule (if there are no `TRUE` rules) is found.

The caller may also specify, using `simple_rules_only`, if only rules that are simple enough to be evaluated fast (which means without SQL) should be considered for evaluation. This makes evaluation faster, but causes rules that cannot be evaluated without SQL to be returned as `MAYBE` rules.

Partial evaluation is supported. The `EVALUATE` procedure can be called with data for only some of the tables, columns, variables, or attributes. In such a case, rules that cannot be evaluated because of a lack of data are returned as `MAYBE` rules, unless they can be determined to be `TRUE` or `FALSE` based on the values of one or more simple expressions within the rule. For example, given a value of 1 for attribute "a.b" of variable "x", a rule with the following rule condition can be returned as `TRUE`, without a value for table "tab":

```
(:x.a.b = 1) or (tab.c > 10)
```

The results of an evaluation are the following:

- `TRUE` rules, which is the list of rules that evaluate to `TRUE` based on the given data. These rules are returned either in the `OUT` parameter `true_rules`, which returns all of the rules that evaluate to `TRUE`, or in the `OUT` parameter `true_rules_iterator`, which returns each rule that evaluates to `TRUE` one at a time.
- `MAYBE` rules, which is the list of rules that could not be evaluated for one of the following reasons:
 - The rule refers to data that was unavailable. For example, a variable attribute "x.a.b" is specified, but no value is specified for the variable "x", the attribute "a", or the attribute "a.b".
 - The rule is not simple enough to be evaluated fast (without SQL) and `simple_rules_only` is specified as `TRUE`, or partial data is available.

Maybe rules are returned either in the `OUT` parameter `maybe_rules`, which returns all of the rules that evaluate to `MAYBE`, or in the `OUT` parameter `maybe_rules_iterator`, which returns each rule that evaluates to `MAYBE` one at a time.

The caller may specify whether the procedure returns all of the rules that evaluate to `TRUE` and `MAYBE` for the event or an iterator for rules that evaluate to `TRUE` and `MAYBE`. A true rules iterator enables the client to fetch each rule that evaluates to `TRUE` one at a time, and a maybe rules iterator enables the client to fetch each rule that evaluates to `MAYBE` one at a time.

If you use an iterator, then you use the `GET_NEXT_HIT` function in the `DBMS_RULE` package to retrieve the next rule that evaluates to `TRUE` or `MAYBE` from an iterator. Oracle recommends that you close an iterator if it is no longer needed to free resources, such as memory, used by the iterator. An iterator can be closed in the following ways:

- The `CLOSE_ITERATOR` procedure in the `DBMS_RULE` package is run with the iterator specified.
- The iterator returns `NULL` because no more rules evaluate to `TRUE` or `MAYBE`.
- The session in which the iterator is running ends.

To run the `DBMS_RULE.EVALUATE` procedure, a user must meet at least one of the following requirements:

- Have `EXECUTE_ON_RULE_SET` privilege on the rule set
- Have `EXECUTE_ANY_RULE_SET` system privilege
- Be the rule set owner

 **Note:**

The rules engine does not invoke any actions. An action context can be returned with each returned rule, but the client of the rules engine must invoke any necessary actions.

 **See Also:**

- [Rule TYPES](#) for more information about the types used with the DBMS_RULE package
- [GET_NEXT_HIT](#) Function
- [CLOSE_ITERATOR](#) Procedure

155.3.3 EVALUATE_EXPRESSION Procedure

This procedure allows user to evaluate an expression under the logged in user in a session.

Any re-execute of the same expression with same table alias and variable type will result in reusing the same compiled context. With fixed compile cache size, its possible of aging....

Syntax

```
DBMS_RULE.EVALUATE_EXPRESSION(
  rule_expression      IN      VARCHAR2,
  table_aliases        IN      SYS.RE$TABLE_ALIAS_LIST:= NULL,
  variable_types       IN      SYS.RE$VARIABLE_TYPE_LIST:= NULL,
  table_values         IN      SYS.RE$TABLE_VALUE_LIST:= NULL,
  column_values        IN      SYS.RE$COLUMN_VALUE_LIST:=NULL,
  variable_values      IN      SYS.RE$VARIABLE_VALUE_LIST:=NULL,
  attribute_values     IN      SYS.RE$ATTRIBUTE_VALUE_LIST:=NULL,
  cache                IN      BOOLEAN DEFAULT FALSE,
  result_val           OUT     BOOLEAN);
```

Parameters

Table 155-4 EVALUATE_EXPRESSION Procedure Parameters

| Parameter | Description |
|------------------|---|
| rule_expression | Contains an expression string. |
| table_alias | Contains alias of tables referred in the expression string. |
| variable_types | Contains type definitions of variables used in expression. |
| table_values | Contains ROWID of table row for expression evaluation. |
| column_values | Contains values of columns referred in the expression. |
| variable_values | Contains values of variables referred in the expression. |
| attribute_values | Contains values of attributes referred in the expression. |
| cache | If TRUE, Result Cache will be created. |

Table 155-4 (Cont.) EVALUATE_EXPRESSION Procedure Parameters

| Parameter | Description |
|------------|---------------------------|
| result_val | Result of the evaluation. |

155.3.4 EVALUATE_EXPRESSION_ITERATOR Procedure

This is a user visible interface. Because PL/SQL based callbacks can be expensive, we provide an array based approach. The client program is assumed to find the relevant datapoints and pass `re$value_list` into evaluation interface. The expression evaluation engine is expected to walk through this list and evaluate expression for each datapoint (`re$value_list`) element.

Syntax

```
DBMS_RULE.EVALUATE_EXPRESSION_ITERATOR(
    rule_expression      IN          varchar2,
    table_aliases        IN          sys.re$table_alias_list:= NULL,
    variable_types      IN          sys.re$variable_type_list:= NULL,
    values               IN          sys.re$value_list,
    cache                IN          boolean DEFAULT FALSE,
    result_val_iter_id  OUT          BINARY_INTEGER)
```

Parameters

Table 155-5 EVALUATE_EXPRESSION_ITERATOR Procedure Parameter

| Parameter | Description |
|--------------------|---|
| rule_expression | Contains an expression string. |
| table_alias | Alias of tables referred in the above expression string. |
| variable_types | Type definitions of variables used in expression. |
| values | List of datapoint values for evaluation. |
| cache | If TRUE, Result Cache will be created. |
| result_val_iter_id | Contains iterator for result of array of values sent using value. |

155.3.5 EVALUATE_RULE Procedure

The Rule Evaluation API expects that `CREATE_RULE` procedure has been called with an legitimate `EVALUATION_CONTEXT` prior. This API will evaluate the condition defined in the Rule.

Syntax

```
DBMS_RULE.EVALUATE_RULE(
    rule_name           IN          VARCHAR2,
    event_context      IN          SYS.RE$NV_LIST           DEFAULT NULL,
    table_values       IN          SYS.RE$table_value_list  DEFAULT NULL,
    column_values      IN          SYS.RE$column_value_list DEFAULT NULL,
    variable_values    IN          SYS.RE$variable_value_list DEFAULT NULL,
    attribute_values   IN          SYS.RE$attribute_value_list DEFAULT NULL,
```

```

cache          IN  BOOLEAN DEFAULT FALSE,
result_val     OUT BOOLEAN);

```

Parameters

Table 155-6 EVALUATE_RULE Procedure Parameter

| Parameter | Description |
|------------------|--|
| rule_name | Name of the rule previously create using CREATE_RULE procedure. |
| event_context | A list of name-value pairs that identify events that cause evaluation. |
| table_values | ROWID of table row for expression evaluation. |
| column_values | Values of columns referred in the expression |
| variable_values | Values of variables referred in expression |
| attribute_values | Values of attributes referred in expression |
| cache | If TRUE, Result Cache will be created. |
| result_val | Result of the evaluation |

155.3.6 EVALUATE_RULE_ITERATOR Procedure

This is an iterative interface. The client program is assumed to find the relevant datapoints and pass re\$value_list into evaluation interface.

Evaluation engine is expected to walk through this list and evaluate expression for each datapoint (re\$value_list) element. User can use DBMS_RULE.GET_NEXT_RESULT procedure to iterate through the result list.

Syntax

```

DBMS_RULE.EVALUATE_RULE_ITERATOR(
rule_name      IN      VARCHAR2,
event_context  IN      SYS.RE$NV_LIST DEFAULT NULL,
values         IN      SYS.RE$VALUE_LIST,
cache         IN      BOOLEAN DEFAULT FALSE,
result_val_iter_id OUT  BINARY_INTEGER);

```

Parameters

Table 155-7 EVALUATE_RULE_ITERATOR Procedure Parameter

| Parameter | Description |
|--------------------|---|
| rule_name | Name of the rule previously create using CREATE_RULE procedure. |
| event_context | A list of name-value pairs that identify events that cause evaluation |
| values | List of datapoint values for evaluation. |
| cache | If TRUE, Result Cache will be created. |
| result_val_iter_id | Contains iterator for result of array of values sent using values |

155.3.7 GET_NEXT_HIT Function

This function returns the next rule that evaluated to `TRUE` from a true rules iterator, or returns the next rule that evaluated to `MAYBE` from a maybe rules iterator. The function returns `NULL` if there are no more rules that evaluated to `TRUE` or `MAYBE`.

Syntax

```
DBMS_RULE.GET_NEXT_HIT(  
    iterator IN BINARY_INTEGER)  
RETURN SYS.RE$RULE_HIT;
```

Parameter

Table 155-8 GET_NEXT_HIT Function Parameter

| Parameter | Description |
|-----------------------|---|
| <code>iterator</code> | The iterator from which the rule that evaluated to <code>TRUE</code> or <code>MAYBE</code> is retrieved |

Usage Notes

This procedure requires an open iterator that was returned by an earlier call to `DBMS_RULE.EVALUATE` in the same session. The user who runs this procedure does not require any privileges on the rule set being evaluated.

When an iterator returns `NULL`, it is closed automatically. If an open iterator is no longer needed, then use the `CLOSE_ITERATOR` procedure in the `DBMS_RULE` package to close it.

Note:

This function raises an error if the rule set being evaluated was modified after the call to the `DBMS_RULE.EVALUATE` procedure that returned the iterator. Modifications to a rule set include added rules to the rule set, changing existing rules in the rule set, dropping rules from the rule set, and dropping the rule set.

See Also:

- [Rule TYPES](#) for more information about the types used with the `DBMS_RULE` package
- [EVALUATE Procedure](#)
- [CLOSE_ITERATOR Procedure](#)

155.3.8 GET_NEXT_RESULT Function

This function iterates over result from the expression given in RESULT_VAL_ITERATOR. It returns the expression at iterator evaluated to TRUE or FALSE.

Syntax

```
DBMS_RULE.GET_NEXT_RESULT (
  result_val_iterator_id  IN  BINARY_INTEGER)
RETURN  BOOLEAN;
```

Parameter

Table 155-9 GET_NEXT_RESULT Function Parameter

| Parameter | Description |
|------------------------|---|
| result_val_iterator_id | Iterator returned from EVALUATE_EXPRESSION_ITERATOR |

155.3.9 IS_FAST Procedure

Given an expression, of either rule or Independent Expression, this procedure will return TRUE if the expression can be evaluated as fast. An expression can be evaluated as fast if the engine does not need to run any internal SQL and does not need to go to PL/SQL layer in case there are any PL/SQL functions referred.

Syntax

```
DBMS_RULE.IS_FAST(
  expression          IN          VARCHAR2,
  table_aliases       IN          SYS.RE$TABLE_ALIAS_LIST:= NULL,
  variable_types      IN          SYS.RE$VARIABLE_TYPE_LIST:= NULL,
  result_val          OUT         BOOLEAN);
```

Parameter

Table 155-10 IS_FAST Procedure Parameter

| Parameter | Description |
|----------------|---|
| expression | Expression to check |
| table_aliases | Alias of tables referred in the above expression string |
| variable_types | Type definitions of variables used in expression |
| result_val | If the expression can be evaluated as fast |

DBMS_RULE_ADM

The `DBMS_RULE_ADM` package provides the subprograms for creating and managing rules, rule sets, and rule evaluation contexts.

This chapter contains the following topics:

- [Overview](#)
- [Security Model](#)
- [Summary of DBMS_RULE_ADM Subprograms](#)

156.1 DBMS_RULE_ADM Overview

This package provides the subprograms for creating and managing rules, rule sets, and rule evaluation contexts.

See Also:

- [Rule TYPES](#) for more information about the types used with the `DBMS_RULE_ADM` package
- [DBMS_RULE](#)

156.2 DBMS_RULE_ADM Security Model

`PUBLIC` is granted `EXECUTE` privilege on this package.

See Also:

Oracle Database Security Guide for more information about user group `PUBLIC`

156.3 Summary of DBMS_RULE_ADM Subprograms

This table lists the `DBMS_RULE_ADM` subprograms and briefly describes them.

Table 156-1 `DBMS_RULE_ADM` Package Subprograms

| Subprogram | Description |
|------------------------------------|---|
| ADD_RULE Procedure | Adds the specified rule to the specified rule set |

Table 156-1 (Cont.) DBMS_RULE_ADM Package Subprograms

| Subprogram | Description |
|---|--|
| ALTER_EVALUATION_CONTEXT Procedure | Alters a rule evaluation context |
| ALTER_RULE Procedure | Changes one or more aspects of the specified rule |
| CREATE_EVALUATION_CONTEXT Procedure | Creates a rule evaluation context |
| CREATE_RULE Procedure | Creates a rule with the specified name |
| CREATE_RULE_SET Procedure | Creates a rule set with the specified name |
| DROP_EVALUATION_CONTEXT Procedure | Drops the rule evaluation context with the specified name |
| DROP_RULE Procedure | Drops the rule with the specified name |
| DROP_RULE_SET Procedure | Drops the rule set with the specified name |
| GRANT_OBJECT_PRIVILEGE Procedure | Grants the specified object privilege on the specified object to the specified user or role |
| GRANT_SYSTEM_PRIVILEGE Procedure | Grants the specified system privilege to the specified user or role |
| REMOVE_RULE Procedure | Removes the specified rule from the specified rule set |
| REVOKE_OBJECT_PRIVILEGE Procedure | Revokes the specified object privilege on the specified object from the specified user or role |
| REVOKE_SYSTEM_PRIVILEGE Procedure | Revokes the specified system privilege from the specified user or role |

**Note:**

All subprograms commit unless specified otherwise.

156.3.1 ADD_RULE Procedure

This procedure adds the specified rule to the specified rule set.

Syntax

```
DBMS_RULE_ADM.ADD_RULE(
  rule_name          IN  VARCHAR2,
  rule_set_name      IN  VARCHAR2,
  evaluation_context IN  VARCHAR2  DEFAULT NULL,
  rule_comment       IN  VARCHAR2  DEFAULT NULL);
```

Parameters

Table 156-2 ADD_RULE Procedure Parameters

| Parameter | Description |
|---------------------------------|---|
| <code>rule_name</code> | The name of the rule you are adding to the rule set, specified as <code>[schema_name.]rule_name</code> . For example, to add a rule named <code>all_a</code> in the <code>hr</code> schema, enter <code>hr.all_a</code> for this parameter. If the schema is not specified, then the current user is the default. |
| <code>rule_set_name</code> | The name of the rule set to which you are adding the rule, specified as <code>[schema_name.]rule_set_name</code> . For example, to add the rule to a rule set named <code>apply_rules</code> in the <code>hr</code> schema, enter <code>hr.apply_rules</code> for this parameter. If the schema is not specified, then the current user is the default. |
| <code>evaluation_context</code> | An evaluation context name in the form <code>[schema_name.]evaluation_context_name</code> . If the schema is not specified, then the current user is the default. Only specify an evaluation context if the rule itself does not have an evaluation context and you do not want to use the rule set's evaluation context for the rule. |
| <code>rule_comment</code> | Optional description, which can contain the reason for adding the rule to the rule set |

Usage Notes

To run this procedure, a user must meet at least one of the following requirements:

- Have `ALTER_ON_RULE_SET` privilege on the rule set
- Have `ALTER_ANY_RULE_SET` system privilege
- Be the owner of the rule set

Also, the rule set owner must meet at least one of the following requirements:

- Have `EXECUTE_ON_RULE` privilege on the rule
- Have `EXECUTE_ANY_RULE` system privilege
- Be the rule owner

If the rule has no evaluation context and no evaluation context is specified when you run this procedure, then the rule uses the evaluation context associated with the rule set. In such a case, the rule owner must have the necessary privileges on all the base objects accessed by the rule using the evaluation context.

If an evaluation context is specified, then the rule set owner must meet at least one of the following requirements:

- Have `EXECUTE_ON_EVALUATION_CONTEXT` privilege on the evaluation context
- Have `EXECUTE_ANY_EVALUATION_CONTEXT` system privilege, and the owner of the evaluation context must not be `SYS`
- Be the evaluation context owner

Also, the rule owner must have the necessary privileges on all the base objects accessed by the rule using the evaluation context.

156.3.2 ALTER_EVALUATION_CONTEXT Procedure

This procedure alters a rule evaluation context. A rule evaluation context defines external data that can be referenced in rule conditions. The external data can either exist as variables or as table data.

Syntax

```
DBMS_RULE_ADM.ALTER_EVALUATION_CONTEXT(
  evaluation_context_name      IN  VARCHAR2,
  table_aliases                IN  SYS.RE$TABLE_ALIAS_LIST   DEFAULT NULL,
  remove_table_aliases        IN  BOOLEAN                   DEFAULT FALSE,
  variable_types              IN  SYS.RE$VARIABLE_TYPE_LIST  DEFAULT NULL,
  remove_variable_types       IN  BOOLEAN                   DEFAULT FALSE,
  evaluation_function          IN  VARCHAR2                  DEFAULT NULL,
  remove_evaluation_function   IN  BOOLEAN                   DEFAULT FALSE,
  evaluation_context_comment   IN  VARCHAR2                  DEFAULT NULL,
  remove_eval_context_comment IN  BOOLEAN                   DEFAULT FALSE);
```

Parameters

Table 156-3 ALTER_EVALUATION_CONTEXT Procedure Parameters

| Parameter | Description |
|-------------------------|---|
| evaluation_context_name | The name of the evaluation context you are altering, specified as <code>[schema_name.]evaluation_context_name</code> . For example, to alter an evaluation context named <code>dept_eval_context</code> in the <code>hr</code> schema, enter <code>hr.dept_eval_context</code> for this parameter. If the schema is not specified, then the current user is the default. |
| table_aliases | If <code>NULL</code> and <code>remove_table_aliases</code> is <code>FALSE</code> , then the procedure retains the existing table aliases. If <code>NULL</code> and <code>remove_table_aliases</code> is <code>TRUE</code> , then the procedure removes the existing table aliases. If non- <code>NULL</code> , then the procedure replaces the existing table aliases for the evaluation context with the specified table aliases. Table aliases specify the tables in an evaluation context. The table aliases can be used to reference tables in rule conditions. |
| remove_table_aliases | If <code>TRUE</code> and <code>table_aliases</code> is <code>NULL</code> , then the procedure removes the existing table aliases for the evaluation context. If <code>TRUE</code> and <code>table_aliases</code> is non- <code>NULL</code> , then the procedure raises an error. If <code>FALSE</code> , then the procedure does not remove table aliases. |

Table 156-3 (Cont.) ALTER_EVALUATION_CONTEXT Procedure Parameters

| Parameter | Description |
|---|---|
| <code>variable_types</code> | <p>If NULL and <code>remove_variable_types</code> is FALSE, then the procedure retains the variable types. If NULL and <code>remove_variable_types</code> is TRUE, then the procedure removes the existing variable types.</p> <p>If non-NULL, then the procedure replaces the existing variable types for the evaluation context with the specified variable types.</p> |
| <code>remove_variable_types</code> | <p>If TRUE and <code>variable_types</code> is NULL, then the procedure removes the existing variable types for the evaluation context. If TRUE and <code>variable_types</code> is non-NULL, then the procedure raises an error.</p> <p>If FALSE, then the procedure does not remove the variable types.</p> |
| <code>evaluation_function</code> | <p>If NULL and <code>remove_evaluation_function</code> is FALSE, then the procedure retains the existing evaluation function. If NULL and <code>remove_evaluation_function</code> is TRUE, then the procedure removes the existing evaluation function.</p> <p>If non-NULL, then the procedure replaces the existing evaluation function for the evaluation context with the specified evaluation function.</p> <p>An evaluation function is an optional function that will be called to evaluate rules that use the evaluation context. It must have the same form as the <code>DBMS_RULE.EVALUATE</code> procedure. If the schema is not specified, then the current user is the default.</p> <p>See CREATE_EVALUATION_CONTEXT Procedure for more information about evaluation functions.</p> |
| <code>remove_evaluation_function</code> | <p>If TRUE and <code>evaluation_function</code> is NULL, then the procedure removes the existing evaluation function for the evaluation context. If TRUE and <code>evaluation_function</code> is non-NULL, then the procedure raises an error.</p> <p>If FALSE, then the procedure does not remove the evaluation function.</p> |
| <code>evaluation_context_comment</code> | <p>If NULL and <code>remove_eval_context_comment</code> is FALSE, then the procedure retains the existing evaluation context comment. If NULL and <code>remove_evaluation_function</code> is TRUE, then the procedure removes the existing evaluation context comment.</p> <p>If non-NULL, then the procedure replaces the existing comment for the evaluation context with the specified comment.</p> <p>An evaluation context comment is an optional description of the rule evaluation context.</p> |

Table 156-3 (Cont.) ALTER_EVALUATION_CONTEXT Procedure Parameters

| Parameter | Description |
|-----------------------------|---|
| remove_eval_context_comment | If TRUE and evaluation_context_comment is NULL, then the procedure removes the existing comment for the evaluation context. If TRUE and evaluation_context_comment is non-NULL, then the procedure raises an error. If FALSE, then the procedure does not remove the evaluation context comment. |

Usage Notes

To run this procedure, a user must meet at least one of the following requirements:

- Be the owner of the evaluation context being altered
- Have ALL_ON_EVALUATION_CONTEXT or ALTER_ON_EVALUATION_CONTEXT object privilege on an evaluation context owned by another user
- Have ALTER_ANY_EVALUATION_CONTEXT system privilege

See Also:

[Rule TYPES](#) for more information about the types used with the DBMS_RULE_ADM package

156.3.3 ALTER_RULE Procedure

This procedure changes one or more aspects of the specified rule.

Syntax

```
DBMS_RULE_ADM.ALTER_RULE(
    rule_name           IN  VARCHAR2,
    condition           IN  VARCHAR2           DEFAULT NULL,
    evaluation_context  IN  VARCHAR2           DEFAULT NULL,
    remove_evaluation_context IN  BOOLEAN       DEFAULT FALSE,
    action_context      IN  SYS.RE$NV_LIST     DEFAULT NULL,
    remove_action_context IN  BOOLEAN       DEFAULT FALSE,
    rule_comment        IN  VARCHAR2           DEFAULT NULL,
    remove_rule_comment IN  BOOLEAN       DEFAULT FALSE);
```

Parameters

Table 156-4 ALTER_RULE Procedure Parameters

| Parameter | Description |
|--|---|
| <code>rule_name</code> | The name of the rule you are altering, specified as <code>[schema_name.]rule_name</code> . For example, to alter a rule named <code>all_a</code> in the <code>hr</code> schema, enter <code>hr.all_a</code> for this parameter. If the schema is not specified, then the current user is the default. |
| <code>condition</code> | The condition to be associated with the rule. If non-NULL, then the procedure replaces the existing condition of the rule with the specified condition. |
| <code>evaluation_context</code> | An evaluation context name in the form <code>[schema_name.]evaluation_context_name</code> . If the schema is not specified, then the current user is the default. If non-NULL, then the procedure replaces the existing evaluation context of the rule with the specified evaluation context. |
| <code>remove_evaluation_context</code> | If TRUE, then the procedure sets the evaluation context for the rule to NULL, which effectively removes the evaluation context from the rule. If FALSE, then the procedure retains any evaluation context for the specified rule. If the <code>evaluation_context</code> parameter is non-NULL, then this parameter should be set to FALSE. |
| <code>action_context</code> | If non-NULL, then the procedure changes the action context associated with the rule. A rule action context is information associated with a rule that is interpreted by the client of the rules engine when the rule is evaluated. |
| <code>remove_action_context</code> | If TRUE, then the procedure sets the action context for the rule to NULL, which effectively removes the action context from the rule. If FALSE, then the procedure retains any action context for the specified rule. If the <code>action_context</code> parameter is non-NULL, then this parameter should be set to FALSE. |
| <code>rule_comment</code> | If non-NULL, then the existing comment of the rule is replaced by the specified comment. |
| <code>remove_rule_comment</code> | If TRUE, then the procedure sets the comment for the rule to NULL, which effectively removes the comment from the rule. If FALSE, then the procedure retains any comment for the specified rule. If the <code>rule_comment</code> parameter is non-NULL, then this parameter should be set to FALSE. |

Usage Notes

To run this procedure, a user must meet at least one of the following requirements:

- Have `ALTER_ON_RULE` privilege on the rule

- Have ALTER_ANY_RULE system privilege
- Be the owner of the rule being altered

If an evaluation context is specified, then the rule owner must meet at least one of the following requirements:

- Have EXECUTE_ON_EVALUATION_CONTEXT privilege on the evaluation context
- Have EXECUTE_ANY_EVALUATION_CONTEXT system privilege, and the owner of the evaluation context must not be SYS
- Be the evaluation context owner

Also, the rule owner must have the necessary privileges on all the base objects accessed by the rule using the evaluation context.

See Also:

[Rule TYPES](#) for more information about the types used with the DBMS_RULE_ADM package

156.3.4 CREATE_EVALUATION_CONTEXT Procedure

This procedure creates a rule evaluation context. A rule evaluation context defines external data that can be referenced in rule conditions. The external data can either exist as variables or as table data.

Syntax

```
DBMS_RULE_ADM.CREATE_EVALUATION_CONTEXT (
  evaluation_context_name      IN  VARCHAR2,
  table_aliases                IN  SYS.RE$TABLE_ALIAS_LIST   DEFAULT NULL,
  variable_types               IN  SYS.RE$VARIABLE_TYPE_LIST  DEFAULT NULL,
  evaluation_function          IN  VARCHAR2                  DEFAULT NULL,
  evaluation_context_comment   IN  VARCHAR2                  DEFAULT NULL);
```

Parameters

Table 156-5 CREATE_EVALUATION_CONTEXT Procedure Parameters

| Parameter | Description |
|-------------------------|---|
| evaluation_context_name | The name of the evaluation context you are creating, specified as <i>[schema_name.]evaluation_context_name</i> . For example, to create an evaluation context named dept_eval_context in the hr schema, enter hr.dept_eval_context for this parameter. If the schema is not specified, then the current user is the default. |
| table_aliases | Table aliases that specify the tables in an evaluation context. The table aliases can be used to reference tables in rule conditions. |
| variable_types | A list of variables for the evaluation context |

Table 156-5 (Cont.) CREATE_EVALUATION_CONTEXT Procedure Parameters

| Parameter | Description |
|---|--|
| <code>evaluation_function</code> | An optional function that will be called to evaluate rules using the evaluation context. It must have the same form as the <code>DBMS_RULE.EVALUATE</code> procedure. If the schema is not specified, then the current user is the default. See " Usage Notes " for more information about the evaluation function. |
| <code>evaluation_context_comment</code> | An optional description of the rule evaluation context. |

Usage Notes

To run this procedure, a user must meet at least one of the following requirements:

- Be the owner of the evaluation context being created and have `CREATE_EVALUATION_CONTEXT_OBJ` system privilege
- Have `CREATE_ANY_EVALUATION_CONTEXT` system privilege

See Also:

[Rule TYPEs](#) for more information about the types used with the `DBMS_RULE_ADM` package

The evaluation function must have the following signature:

```
FUNCTION evaluation_function_name(
  rule_set_name      IN  VARCHAR2,
  evaluation_context IN  VARCHAR2,
  event_context     IN  SYS.RE$NV_LIST          DEFAULT NULL,
  table_values      IN  SYS.RE$TABLE_VALUE_LIST DEFAULT NULL,
  column_values     IN  SYS.RE$COLUMN_VALUE_LIST DEFAULT NULL,
  variable_values   IN  SYS.RE$VARIABLE_VALUE_LIST DEFAULT NULL,
  attribute_values  IN  SYS.RE$ATTRIBUTE_VALUE_LIST DEFAULT NULL,
  stop_on_first_hit IN  BOOLEAN                DEFAULT FALSE,
  simple_rules_only IN  BOOLEAN                DEFAULT FALSE,
  true_rules        OUT SYS.RE$RULE_HIT_LIST,
  maybe_rules       OUT SYS.RE$RULE_HIT_LIST);
RETURN BINARY_INTEGER;
```

Note:

Each parameter is required and must have the specified datatype. However, you can change the names of the parameters.

The return value of the function must be one of the following:

- `DBMS_RULE_ADM.EVALUATION_SUCCESS`: The user specified evaluation function completed the rule set evaluation successfully. The rules engine returns the results of the evaluation

obtained by the evaluation function to the rules engine client using the `DBMS_RULE.EVALUATE` procedure.

- `DBMS_RULE_ADM.EVALUATION_CONTINUE`: The rules engine evaluates the rule set as if there were no evaluation function. The evaluation function is not used, and any results returned by the evaluation function are ignored.
- `DBMS_RULE_ADM.EVALUATION_FAILURE`: The user specified evaluation function failed. Rule set evaluation stops, and an error is raised.

156.3.5 CREATE_RULE Procedure

This procedure creates a rule.

Syntax

```
DBMS_RULE_ADM.CREATE_RULE (
  rule_name          IN  VARCHAR2,
  condition          IN  VARCHAR2,
  evaluation_context IN  VARCHAR2          DEFAULT NULL,
  action_context     IN  SYS.RE$NV_LIST   DEFAULT NULL,
  rule_comment       IN  VARCHAR2          DEFAULT NULL);
```

Parameters

Table 156-6 CREATE_RULE Procedure Parameters

| Parameter | Description |
|---------------------------------|---|
| <code>rule_name</code> | The name of the rule you are creating, specified as <code>[schema_name.]rule_name</code> . For example, to create a rule named <code>all_a</code> in the <code>hr</code> schema, enter <code>hr.all_a</code> for this parameter. If the schema is not specified, then the current user is the default. |
| <code>condition</code> | The condition to be associated with the rule. A condition evaluates to <code>TRUE</code> or <code>FALSE</code> and can be any condition allowed in the <code>WHERE</code> clause of a <code>SELECT</code> statement. For example, the following is a valid rule condition: <code>department_id = 30</code> Ensure that the proper case is used for text in rule conditions. Note: Do not include the word "WHERE" in the condition. |
| <code>evaluation_context</code> | An optional evaluation context name in the form <code>[schema_name.]evaluation_context_name</code> , which is associated with the rule. If the schema is not specified, then the current user is the default. If <code>evaluation_context</code> is not specified, then the rule inherits the evaluation context from its rule set. |
| <code>action_context</code> | The action context associated with the rule. A rule action context is information associated with a rule that is interpreted by the client of the rules engine when the rule is evaluated. |
| <code>rule_comment</code> | An optional description of the rule |

Usage Notes

To run this procedure, a user must meet at least one of the following requirements:

- Be the owner of the rule being created and have the `CREATE_RULE_OBJ` system privilege
- Have `CREATE_ANY_RULE` system privilege

If an evaluation context is specified, then the rule owner must meet at least one of the following requirements:

- Have `EXECUTE_ON_EVALUATION_CONTEXT` privilege on the evaluation context
- Have `EXECUTE_ANY_EVALUATION_CONTEXT` system privilege, and the owner of the evaluation context must not be `SYS`.
- Be the evaluation context owner

Also, the rule owner must have the necessary privileges on all the base objects accessed by the rule using the evaluation context.

See Also:

[Rule TYPES](#) for more information about the types used with the `DBMS_RULE_ADM` package

156.3.6 CREATE_RULE_SET Procedure

This procedure creates a rule set.

Syntax

```
DBMS_RULE_ADM.CREATE_RULE_SET(
    rule_set_name      IN  VARCHAR2,
    evaluation_context IN  VARCHAR2 DEFAULT NULL,
    rule_set_comment  IN  VARCHAR2 DEFAULT NULL);
```

Parameters

Table 156-7 CREATE_RULE_SET Procedure Parameters

| Parameter | Description |
|---------------------------------|--|
| <code>rule_set_name</code> | The name of the rule set you are creating, specified as <code>[schema_name.]rule_set_name</code> . For example, to create a rule set named <code>apply_rules</code> in the <code>hr</code> schema, enter <code>hr.apply_rules</code> for this parameter. If the schema is not specified, then the current user is the default. |
| <code>evaluation_context</code> | An optional evaluation context name in the form <code>[schema_name.]evaluation_context_name</code> , which applies to all rules in the rule set that are not associated with an evaluation context explicitly. If the schema is not specified, then the current user is the default. |
| <code>rule_set_comment</code> | An optional description of the rule set |

Usage Notes

To run this procedure, a user must meet at least one of the following requirements:

- Be the owner of the rule set being created and have `CREATE_RULE_SET_OBJ` system privilege
- Have `CREATE_ANY_RULE_SET` system privilege

If an evaluation context is specified, then the rule set owner must meet at least one of the following requirements:

- Have `EXECUTE_ON_EVALUATION_CONTEXT` privilege on the evaluation context
- Have `EXECUTE_ANY_EVALUATION_CONTEXT` system privilege, and the owner of the evaluation context must not be `SYS`
- Be the evaluation context owner

156.3.7 DROP_EVALUATION_CONTEXT Procedure

This procedure drops a rule evaluation context.

Syntax

```
DBMS_RULE_ADM.DROP_EVALUATION_CONTEXT (
    evaluation_context_name IN VARCHAR2,
    force                   IN BOOLEAN  DEFAULT FALSE);
```

Parameters

Table 156-8 DROP_EVALUATION_CONTEXT Procedure Parameters

| Parameter | Description |
|--------------------------------------|--|
| <code>evaluation_context_name</code> | The name of the evaluation context you are dropping, specified as <code>[schema_name.]evaluation_context_name</code> . For example, to drop an evaluation context named <code>dept_eval_context</code> in the <code>hr</code> schema, enter <code>hr.dept_eval_context</code> for this parameter. If the schema is not specified, then the current user is the default. |
| <code>force</code> | If <code>TRUE</code> , then the procedure removes the rule evaluation context from all rules and rule sets that use it. If <code>FALSE</code> and no rules or rule sets use the rule evaluation context, then the procedure drops the rule evaluation context. If <code>FALSE</code> and one or more rules or rule sets use the rule evaluation context, then the procedure raises an exception. Caution: Setting <code>force</code> to <code>TRUE</code> can result in rules and rule sets that do not have an evaluation context. If neither a rule nor the rule set it is in has an evaluation context, and no evaluation context was specified for the rule by the <code>ADD_RULE</code> procedure, then the rule cannot be evaluated. |

Usage Notes

To run this procedure, a user must meet at least one of the following requirements:

- Be the owner of the evaluation context
- Have `DROP_ANY_EVALUATION_CONTEXT` system privilege

156.3.8 DROP_RULE Procedure

This procedure drops a rule.

Syntax

```
DBMS_RULE_ADM.DROP_RULE (
    rule_name IN VARCHAR2,
    force     IN BOOLEAN  DEFAULT FALSE);
```

Parameters

Table 156-9 DROP_RULE Procedure Parameters

| Parameter | Description |
|------------------------|--|
| <code>rule_name</code> | The name of the rule you are dropping, specified as <code>[schema_name.]rule_name</code> . For example, to drop a rule named <code>all_a</code> in the <code>hr</code> schema, enter <code>hr.all_a</code> for this parameter. If the schema is not specified, then the current user is the default. |
| <code>force</code> | <p>If <code>TRUE</code>, then the procedure removes the rule from all rule sets that contain it.</p> <p>If <code>FALSE</code> and no rule sets contain the rule, then the procedure drops the rule.</p> <p>If <code>FALSE</code> and one or more rule sets contain the rule, then the procedure raises an exception.</p> |

Usage Notes

To run this procedure, a user must meet at least one of the following requirements:

- Be the owner of the rule
- Have `DROP_ANY_RULE` system privilege

Note:

- To remove a rule from a rule set without dropping the rule from the database, use the `REMOVE_RULE` procedure.
- The rule evaluation context associated with the rule, if any, is not dropped when you run this procedure.

156.3.9 DROP_RULE_SET Procedure

This procedure drops a rule set.

Syntax

```
DBMS_RULE_ADM.DROP_RULE_SET(
  rule_set_name IN VARCHAR2,
  delete_rules  IN BOOLEAN  DEFAULT FALSE);
```

Parameters

Table 156-10 DROP_RULE_SET Procedure Parameters

| Parameter | Description |
|---------------|--|
| rule_set_name | The name of the rule set you are dropping, specified as [<i>schema_name</i> .] <i>rule_set_name</i> . For example, to drop a rule set named <i>apply_rules</i> in the <i>hr</i> schema, enter <i>hr.apply_rules</i> for this parameter. If the schema is not specified, then the current user is the default. |
| delete_rules | If TRUE , then the procedure drops any rules that are in the rule set. If any of the rules in the rule set are also in another rule set, then these rules are not dropped. If FALSE , then the procedure does not drop the rules in the rule set. |

Usage Notes

To run this procedure, a user must meet at least one of the following requirements:

- Have **DROP_ANY_RULE_SET** system privilege
- Be the owner of the rule set

Note:

The rule evaluation context associated with the rule set, if any, is not dropped when you run this procedure.

156.3.10 GRANT_OBJECT_PRIVILEGE Procedure

This procedure grants the specified object privilege on the specified object to the specified user or role. If a user owns the object, then the user automatically is granted all privileges on the object, with grant option.

Syntax

```
DBMS_RULE_ADM.GRANT_OBJECT_PRIVILEGE(
  privilege      IN BINARY_INTEGER,
  object_name    IN VARCHAR2,
  grantee       IN VARCHAR2,
  grant_option   IN BOOLEAN  DEFAULT FALSE);
```

Parameters

Table 156-11 GRANT_OBJECT_PRIVILEGE Procedure Parameters

| Parameter | Description |
|--------------|---|
| privilege | The name of the object privilege to grant to the grantee on the object. See " Usage Notes " for the available object privileges. |
| object_name | The name of the object for which you are granting the privilege to the grantee, specified as [<i>schema_name</i> .] <i>object_name</i> . For example, to grant the privilege on a rule set named <i>apply_rules</i> in the <i>hr</i> schema, enter <i>hr.apply_rules</i> for this parameter. If the schema is not specified, then the current user is the default. The object must be an existing rule, rule set, or evaluation context. |
| grantee | The name of the user or role for which the privilege is granted. The specified user cannot be the owner of the object. |
| grant_option | If TRUE, then the specified user or users granted the specified privilege can grant this privilege to others. If FALSE, then the specified user or users granted the specified privilege cannot grant this privilege to others. |

Usage Notes

To run this procedure, a user must meet at least one of the following requirements:

- Be the owner of the object on which the privilege is granted
- Have the same privilege as the privilege being granted with the grant option

In addition, if the object is a rule set, then the user must have EXECUTE privilege on all the rules in the rule set with grant option or must own the rules in the rule set.

[Table 156-12](#) lists the object privileges.

Table 156-12 Object Privileges for Evaluation Contexts, Rules, and Rule Sets

| Privilege | Description |
|---|--|
| SYS.DBMS_RULE_ADM.ALL_ON_EVALUATION_CONTEXT | Alter and execute a particular evaluation context in another user's schema |
| SYS.DBMS_RULE_ADM.ALL_ON_RULE | Alter and execute a particular rule in another user's schema |
| SYS.DBMS_RULE_ADM.ALL_ON_RULE_SET | Alter and execute a particular rule set in another user's schema |
| SYS.DBMS_RULE_ADM.ALTER_ON_EVALUATION_CONTEXT | Alter a particular evaluation context in another user's schema |
| SYS.DBMS_RULE_ADM.ALTER_ON_RULE | Alter a particular rule in another user's schema |
| SYS.DBMS_RULE_ADM.ALTER_ON_RULE_SET | Alter a particular rule set in another user's schema |
| SYS.DBMS_RULE_ADM.EXECUTE_ON_EVALUATION_CONTEXT | Execute a particular evaluation context in another user's schema |
| SYS.DBMS_RULE_ADM.EXECUTE_ON_RULE | Execute a particular rule in another user's schema |

Table 156-12 (Cont.) Object Privileges for Evaluation Contexts, Rules, and Rule Sets

| Privilege | Description |
|---------------------------------------|--|
| SYS.DBMS_RULE_ADM.EXECUTE_ON_RULE_SET | Execute a particular rule set in another user's schema |

Examples

For example, to grant the HR user the privilege to alter a rule named hr_dml in the strmadmin schema, enter the following:

```
BEGIN
  DBMS_RULE_ADM.GRANT_OBJECT_PRIVILEGE(
    privilege   => SYS.DBMS_RULE_ADM.ALTER_ON_RULE,
    object_name => 'strmadmin.hr_dml',
    grantee     => 'hr',
    grant_option => FALSE);
END;
/
```

156.3.11 GRANT_SYSTEM_PRIVILEGE Procedure

This procedure grant the specified system privilege to the specified user or role.

Syntax

```
DBMS_RULE_ADM.GRANT_SYSTEM_PRIVILEGE(
  privilege   IN  BINARY_INTEGER,
  grantee     IN  VARCHAR2,
  grant_option IN  BOOLEAN   DEFAULT FALSE);
```

Parameters

Table 156-13 GRANT_SYSTEM_PRIVILEGE Procedure Parameters

| Parameter | Description |
|--------------|--|
| privilege | The name of the system privilege to grant to the grantee. |
| grantee | The name of the user or role for which the privilege is granted |
| grant_option | If TRUE, then the specified user or users granted the specified privilege can grant the system privilege to others. If FALSE, then the specified user or users granted the specified privilege cannot grant the system privilege to others. |

Usage Notes

[Table 156-14](#) lists the system privileges.

Table 156-14 System Privileges for Evaluation Contexts, Rules, and Rule Sets

| Privilege | Description |
|--|--|
| SYS.DBMS_RULE_ADM.ALTER_ANY_EVALUATION_CONTEXT | Alter any evaluation context owned by any user |

Table 156-14 (Cont.) System Privileges for Evaluation Contexts, Rules, and Rule Sets

| Privilege | Description |
|--|---|
| SYS.DBMS_RULE_ADM.ALTER_ANY_RULE | Alter any rule owned by any user |
| SYS.DBMS_RULE_ADM.ALTER_ANY_RULE_SET | Alter any rule set owned by any user |
| SYS.DBMS_RULE_ADM.CREATE_ANY_EVALUATION_CONTEXT | Create a new evaluation context in any schema |
| SYS.DBMS_RULE_ADM.CREATE_EVALUATION_CONTEXT_OBJ | Create a new evaluation context in the grantee's schema |
| SYS.DBMS_RULE_ADM.CREATE_ANY_RULE | Create a new rule in any schema |
| SYS.DBMS_RULE_ADM.CREATE_RULE_OBJ | Create a new rule in the grantee's schema |
| SYS.DBMS_RULE_ADM.CREATE_ANY_RULE_SET | Create a new rule set in any schema |
| SYS.DBMS_RULE_ADM.CREATE_RULE_SET_OBJ | Create a new rule set in the grantee's schema |
| SYS.DBMS_RULE_ADM.DROP_ANY_EVALUATION_CONTEXT | Drop any evaluation context in any schema |
| SYS.DBMS_RULE_ADM.DROP_ANY_RULE | Drop any rule in any schema |
| SYS.DBMS_RULE_ADM.DROP_ANY_RULE_SET | Drop any rule set in any schema |
| SYS.DBMS_RULE_ADM.EXECUTE_ANY_EVALUATION_CONTEXT | Execute any evaluation context owned by any user |
| SYS.DBMS_RULE_ADM.EXECUTE_ANY_RULE | Execute any rule owned by any user |
| SYS.DBMS_RULE_ADM.EXECUTE_ANY_RULE_SET | Execute any rule set owned by any user |

For example, to grant the `strmadmin` user the privilege to create a rule set in any schema, enter the following:

```
BEGIN
  DBMS_RULE_ADM.GRANT_SYSTEM_PRIVILEGE(
    privilege => SYS.DBMS_RULE_ADM.CREATE_ANY_RULE_SET,
    grantee   => 'strmadmin',
    grant_option => FALSE);
END;
/
```

156.3.12 REMOVE_RULE Procedure

This procedure removes the specified rule from the specified rule set.

Syntax

```
DBMS_RULE_ADM.REMOVE_RULE(
  rule_name           IN  VARCHAR2,
  rule_set_name       IN  VARCHAR2,
  evaluation_context  IN  VARCHAR2  DEFAULT NULL,
  all_evaluation_contexts IN  BOOLEAN  DEFAULT FALSE);
```

Parameters

Table 156-15 REMOVE_RULE Procedure Parameters

| Parameter | Description |
|--------------------------------------|---|
| <code>rule_name</code> | The name of the rule you are removing from the rule set, specified as <code>[schema_name.]rule_name</code> . For example, to remove a rule named <code>all_a</code> in the <code>hr</code> schema, enter <code>hr.all_a</code> for this parameter. If the schema is not specified, then the current user is the default. |
| <code>rule_set_name</code> | The name of the rule set from which you are removing the rule, specified as <code>[schema_name.]rule_set_name</code> . For example, to remove the rule from a rule set named <code>apply_rules</code> in the <code>hr</code> schema, enter <code>hr.apply_rules</code> for this parameter. If the schema is not specified, then the current user is the default. |
| <code>evaluation_context_name</code> | <p>The name of the evaluation context associated with the rule you are removing, specified as <code>[schema_name.]evaluation_context_name</code>. For example, to specify an evaluation context named <code>dept_eval_context</code> in the <code>hr</code> schema, enter <code>hr.dept_eval_context</code> for this parameter. If the schema is not specified, then the current user is the default.</p> <p>If an evaluation context was specified for the rule you are removing when you added the rule to the rule set using the <code>ADD_RULE</code> procedure, then specify the same evaluation context. If you added the same rule more than once with different evaluation contexts, then specify the rule with the evaluation context you want to remove. If you specify an evaluation context that is not associated with the rule, then the procedure raises an error.</p> <p>Specify <code>NULL</code> if you did not specify an evaluation context when you added the rule to the rule set. If you specify <code>NULL</code> and there are one or more evaluation contexts associated with the rule, then the procedure raises an error.</p> |
| <code>all_evaluation_contexts</code> | <p>If <code>TRUE</code>, then the procedure removes the rule from the rule set with all of its associated evaluation contexts.</p> <p>If <code>FALSE</code>, then the procedure only removes the rule with the specified evaluation context.</p> <p>This parameter is relevant only if the same rule is added more than once to the rule set with different evaluation contexts.</p> |

Usage Notes

To run this procedure, a user must meet at least one of the following requirements:

- Have `ALTER_ON_RULE_SET` privilege on the rule set
- Have `ALTER_ANY_RULE_SET` system privilege
- Be the owner of the rule set

 **Note:**

This procedure does not drop a rule from the database. To drop a rule from the database, use the `DROP_RULE` procedure.

156.3.13 REVOKE_OBJECT_PRIVILEGE Procedure

This procedure revokes the specified object privilege on the specified object from the specified user or role.

Syntax

```
DBMS_RULE_ADM.REVOKE_OBJECT_PRIVILEGE (
  privilege   IN  BINARY_INTEGER,
  object_name IN  VARCHAR2,
  revokee     IN  VARCHAR2);
```

Parameters

Table 156-16 REVOKE_OBJECT_PRIVILEGE Procedure Parameters

| Parameter | Description |
|-------------|--|
| privilege | The name of the object privilege on the object to revoke from the revokee. See GRANT_OBJECT_PRIVILEGE Procedure for a list of the object privileges. |
| object_name | The name of the object for which you are revoking the privilege from the revokee, specified as <code>[schema_name.]object_name</code> . For example, to revoke an object privilege on a rule set named <code>apply_rules</code> in the <code>hr</code> schema, enter <code>hr.apply_rules</code> for this parameter. If the schema is not specified, then the current user is the default. The object must be an existing rule, rule set, or evaluation context. |
| revokee | The name of the user or role from which the privilege is revoked. The user who owns the object cannot be specified. |

156.3.14 REVOKE_SYSTEM_PRIVILEGE Procedure

This procedure revokes the specified system privilege from the specified user or role.

Syntax

```
DBMS_RULE_ADM.REVOKE_SYSTEM_PRIVILEGE (
  privilege IN  BINARY_INTEGER,
  revokee   IN  VARCHAR2);
```

Parameters

Table 156-17 REVOKE_SYSTEM_PRIVILEGE Procedure Parameters

| Parameter | Description |
|-----------|--|
| privilege | The name of the system privilege to revoke from the revokee. See GRANT_SYSTEM_PRIVILEGE Procedure for a list of the system privileges. |
| revokee | The name of the user or role from which the privilege is revoked |

DBMS_SCHEDULER

The `DBMS_SCHEDULER` package provides a collection of scheduling functions and procedures that can be called from any PL/SQL program.

This chapter contains the following topics:

- [Deprecated Subprograms](#)
- [Security Model](#)
- [Rules and Limits](#)
- [Operational Notes](#)
- [Data Structures](#)
- [Summary of DBMS_SCHEDULER Subprograms](#)

See Also:

Oracle Database Administrator's Guide for more information regarding how to use `DBMS_SCHEDULER`

157.1 DBMS_SCHEDULER Deprecated Subprograms

Oracle recommends that you do not use deprecated subprograms in new applications. Support for deprecated features is for backward compatibility only.

The following subprograms are deprecated with Oracle Database 12c Release 1 (12.1):

- [CREATE_CREDENTIAL Procedure](#)
- [DROP_CREDENTIAL Procedure](#)

157.2 DBMS_SCHEDULER Security Model

The `DBMS_SCHEDULER` package ignores privileges granted on scheduler objects, such as jobs or chains, through roles. Object privileges must be granted directly to the user.

157.3 DBMS_SCHEDULER Rules and Limits

These rules apply when using the `DBMS_SCHEDULER` package.

- Only `SYS` can perform actions on objects in the `SYS` schema.
- Several of the procedures accept comma-delimited lists of object names. If you provide a list of names, then the Scheduler stops executing the list at the first object that returns an

error. Therefore, the Scheduler does not perform the tasks needed for the remaining objects on the list.

For example, consider the statement `DBMS_SCHEDULER.STOP_JOB ('job1, job2, job3, sys.jobclass1, sys.jobclass2, sys.jobclass3');`

If `job3` cannot be stopped, then the jobs that follow it, `jobclass1`, `jobclass2`, and `jobclass3` cannot be stopped. The jobs that preceded `job3`, `job1` and `job2`, are stopped.

- Performing an action on an object that does not exist returns a PL/SQL exception stating that the object does not exist.

157.4 DBMS_SCHEDULER Operational Notes

The Scheduler uses a rich **calendar**ing syntax to enable you to define repeating schedules, such as "every Tuesday and Friday at 4:00 p.m." or "the second Wednesday of every month." This calendaring syntax is used in calendaring expressions in the `repeat_interval` argument of a number of package subprograms. Evaluating a calendaring expression results in a set of discrete timestamps.

See *Oracle Database Administrator's Guide* for examples of the calendaring syntax.

Calendaring Syntax

This section starts with the calendaring syntax. It is followed by descriptions of various parts of the syntax.

In the calendaring syntax, * means 0 or more.

```
repeat_interval = regular_schedule | combined_schedule
```

```
regular_schedule = frequency_clause
[";" interval_clause] [";" bymonth_clause] [";" byweekno_clause]

Table 157-1 Values for repeat_interval

| Name | Description |
|-----------|--|
| FREQ | This specifies the type of recurrence. It must be specified. The possible predefined frequency values are YEARLY, MONTHLY, WEEKLY, DAILY, HOURLY, MINUTELY, and SECONDLY. Alternatively, specifies an existing schedule to use as a user-defined frequency. |
| INTERVAL | This specifies a positive integer representing how often the recurrence repeats. The default is 1, which means every second for secondly, every day for daily, and so on. The maximum value is 99. |
| BYMONTH | This specifies which month or months you want the job to execute in. You can use numbers such as 1 for January and 3 for March, as well as three-letter abbreviations such as FEB for February and JUL for July. |
| BYWEEKNO | <p>This specifies the week of the year as a number. It follows ISO-8601, which defines the week as starting with Monday and ending with Sunday; and the first week of a year as the first week, which is mostly within the Gregorian year. The first week is equivalent to the following two variants: the week that contains the first Thursday of the Gregorian year; and the week containing January 4th.</p> <p>The ISO-8601 week numbers are integers from 1 to 52 or 53; parts of week 1 may be in the previous calendar year; parts of week 52 may be in the following calendar year; and if a year has a week 53, parts of it must be in the following calendar year.</p> <p>As an example, in the year 1998, the ISO week 1 began on Monday December 29th, 1997; and the last ISO week (week 53) ended on Sunday January 3rd, 1999. So December 29th, 1997, is in the ISO week 1998-01, and January 1st, 1999, is in the ISO week 1998-53.</p> <p>byweekno is only valid for YEARLY.</p> <p>Examples of invalid specifications are "FREQ=YEARLY; BYWEEKNO=1; BYMONTH=12" and "FREQ=YEARLY; BYWEEKNO=53; BYMONTH=1".</p> |
| BYYEARDAY | This specifies the day of the year as a number. Valid values are 1 to 366. An example is 69, which is March 10 (31 for January, 28 for February, and 10 for March). 69 evaluates to March 10 for non-leap years and March 9 in leap years. -2 will always evaluate to December 30th independent of whether it is a leap year. |
| BYDATE | <p>This specifies a list of dates, where each date is of the form [YYYY]MMDD. A list of consecutive dates can be generated by using the SPAN modifier, and a date can be adjusted with the OFFSET modifier. An example of a simple BYDATE clause follows:</p> <pre>BYDATE=0115,0315,0615,0915,1215,20060115</pre> <p>The following SPAN example is equivalent to BYDATE=0110,0111,0112,0113,0114, which is a span of 5 days starting at 1/10:</p> <pre>BYDATE=0110+SPAN:5D</pre> <p>The plus sign in front of the SPAN keyword indicates a span starting at the supplied date. The minus sign indicates a span ending at the supplied date, and the "^" sign indicates a span of <i>n</i> days or weeks centered around the supplied date. If <i>n</i> is an even number, it is adjusted up to the next odd number.</p> <p>Offsets adjust the supplied date by adding or subtracting <i>n</i> days or weeks. BYDATE=0205-OFFSET:2W is equivalent to BYDATE=0205-14D (the OFFSET: keyword is optional), which is also equivalent to BYDATE=0122.</p> |

Table 157-1 (Cont.) Values for repeat_interval

| Name | Description |
|------------|--|
| BYMONTHDAY | This specifies the day of the month as a number. Valid values are 1 to 31. An example is 10, which means the 10th day of the selected month. You can use the minus sign (-) to count backward from the last day, so, for example, BYMONTHDAY=-1 means the last day of the month and BYMONTHDAY=-2 means the next to last day of the month. |
| BYDAY | This specifies the day of the week from Monday to Sunday in the form MON, TUE, and so on. Using numbers, you can specify the 26th Friday of the year, if using a YEARLY frequency, or the 4th THU of the month, using a MONTHLY frequency. Using the minus sign, you can say the second to last Friday of the month. For example, -1 FRI is the last Friday of the month. |
| BYHOUR | This specifies the hour on which the job is to run. Valid values are 0 to 23. As an example, 10 means 10 a.m. |
| BYMINUTE | This specifies the minute on which the job is to run. Valid values are 0 to 59. As an example, 45 means 45 minutes past the chosen hour. |
| BYSECOND | This specifies the second on which the job is to run. Valid values are 0 to 59. As an example, 30 means 30 seconds past the chosen minute. |
| BYSETPOS | <p>This selects one or more items, by position, in the list of timestamps that result after the whole calendaring expression is evaluated. It is useful for requirements such as running a job on the last workday of the month. Rather than attempting to express this with the other BY clauses, you can code the calendaring expression to evaluate to a list of every workday of the month, and then add the BYSETPOS clause to select only the last item of that list. Assuming that workdays are Monday through Friday, the syntax would then be:</p> <pre>FREQ=MONTHLY; BYDAY=MON,TUE,WED,THU,FRI; BYSETPOS=-1</pre> <p>Valid values are 1 through 9999. A negative number selects an item from the end of the list (-1 is the last item, -2 is the next to last item, and so on) and a positive number selects from the front of the list. The BYSETPOS clause is always evaluated last. BYSETPOS is only supported with the MONTHLY and YEARLY frequencies.</p> <p>The BYSETPOS clause is applied to the list of timestamps once per frequency period. For example, when the frequency is defined as MONTHLY, the Scheduler determines all valid timestamps for the month, orders that list, and then applies the BYSETPOS clause. The Scheduler then moves on to the next month and repeats the procedure. Assuming a start date of Jun 10, 2004, the example evaluates to: Jun 30, Jul 30, Aug 31, Sep 30, Oct 29, and so on.</p> |
| INCLUDE | <p>This includes one or more named schedules in the calendaring expression. That is, the set of timestamps defined by each included named schedule is added to the results of the calendaring expression. If an identical timestamp is contributed by both an included schedule and the calendaring expression, it is included in the resulting set of timestamps only once. The named schedules must have been defined with the CREATE_SCHEDULE procedure.</p> <p>This clause only works on a full day and therefore cannot be used with BYHOUR, BYMIN, and BYSECOND.</p> |

Table 157-1 (Cont.) Values for repeat_interval

| Name | Description |
|-----------|---|
| EXCLUDE | <p>This excludes one or more named schedules from the calendaring expression. That is, the set of timestamps defined by each excluded named schedule is removed from the results of the calendaring expression. The named schedules must have been defined with the <code>CREATE_SCHEDULE</code> procedure.</p> <p>This clause only works on a full day and therefore cannot be used with <code>BYHOUR</code>, <code>BYMIN</code>, and <code>BYSECOND</code>.</p> |
| INTERSECT | <p>This specifies an intersection between the calendaring expression results and the set of timestamps defined by one or more named schedules. Only the timestamps that appear both in the calendaring expression and in one of the named schedules are included in the resulting set of timestamps.</p> <p>For example, assume that the named schedule <code>last_sat</code> indicates the last Saturday in every month, and that for the year 2005, the only months where the last day of the month is also a Saturday are April and December. Assume also that the named schedule <code>end_qtr</code> indicates the last day of each quarter in 2005:</p> <pre>3/31/2005, 6/30/2005, 9/30/2005, 12/31/2005</pre> <p>These calendaring expressions result in the dates that follow:</p> <pre>3/31/2005, 4/30/2005, 6/30/2005, 9/30/2005, 12/31/2005</pre> <pre>FREQ=MONTHLY; BYMONTHDAY=-1; INTERSECT=last_sat,end_qtr</pre> <p>In this example, the terms <code>FREQ=MONTHLY; BYMONTHDAY=-1</code> indicate the last day of each month.</p> <p>This clause only works on a full day and therefore cannot be used with <code>BYHOUR</code>, <code>BYMIN</code>, and <code>BYSECOND</code>.</p> |
| PERIODS | <p>This identifies the number of periods that together form one cycle of a user-defined frequency. It is used in the <code>repeat_interval</code> expression of the schedule that defines the user-defined frequency. It is mandatory when the <code>repeat_interval</code> expression in the main schedule contains a <code>BYPERIOD</code> clause. The following example defines the quarters of a fiscal year.</p> <pre>FREQ=YEARLY;BYDATE=0301,0601,0901,1201;PERIODS=4</pre> |
| BYPERIOD | <p>This selects periods from a user-defined frequency. For example, if a main schedule names a user-defined frequency schedule that defines the fiscal quarters shown in the previous example, the clause <code>BYPERIOD=2,4</code> in the main schedule selects the 2nd and 4th fiscal quarters.</p> |

Combining Schedules

There are two ways to combine schedules:

- Using a combined schedule expression, which is a list of individual schedules
 For example, to create a schedule for all company holidays, you provide a list of individual schedules, where each schedule in the list defines a single holiday. The Scheduler evaluates each individual schedule, and then returns a union of the timestamps returned by each individual schedule.

- Embedding other schedules into the main schedule using `include`, `exclude`, and `intersect` clauses

With this method, the embedded schedules inherit certain attributes from the main schedule.

- Timestamps generated by the `INCLUDE` clause that fall into periods that are skipped by the main schedule are ignored. This is the case when the main schedule skips periods due to the `INTERVAL` clause, the `BYPERIOD` clause, or the `BYMONTH` clause for `freq=monthly`.
- Days that are added by the `INCLUDE` clause follow the hourly/minutes/seconds execution pattern of the main schedule.
- When the `INCLUDE` clause is present, no date-specific defaults are retrieved from the start date (but time-specific defaults can be). (See ["Start Dates and Repeat Intervals"](#), later in this section.) For example, a `repeat_interval` of `FREQ=MONTHLY;INCLUDE=HOLIDAY` executes only on holidays and not on the month/day defaults retrieved from the start date.

The following is an example:

```
BEGIN
dbms_scheduler.create_schedule('embed_sched', repeat_interval =>
  'FREQ=YEARLY;BYDATE=0130,0220,0725');
dbms_scheduler.create_schedule('main_sched', repeat_interval =>
  'FREQ=MONTHLY;INTERVAL=2;BYMONTHDAY=15;BYHOUR=9,17;INCLUDE=embed_sched');
END;
/
```

In this example, the dates 1/30, 2/20, and 7/25 are added to the main schedule. However, the Scheduler does not include dates that fall in months that are skipped by the `INTERVAL` clause. If the start date of the main schedule is 1/1/2005, then 2/20 is not added. On the dates that are added, the embedded schedule follows the execution pattern of the main schedule: jobs are executed at 9:00 a.m. and 5:00 p.m. on 1/30 and 7/25. If the embedded schedule does not itself have a start date, it inherits the start date from the main schedule.

User-Defined Frequencies

Instead of using predefined frequencies like `DAILY`, `WEEKLY`, `MONTHLY`, and so on, you can create your own frequencies by creating a schedule that returns the start date of each period. For example, the following `repeat_interval` expression is used in a schedule named `fiscal_year` that defines the start of each quarter in a fiscal year:

```
FREQ=YEARLY;BYDATE=0301,0601,0901,1201;PERIODS=4
```

To return the last Wednesday of every quarter, you create a schedule (the "main schedule") that uses the `fiscal_year` schedule as a user-defined frequency:

```
FREQ=fiscal_year;BYDAY=-1WED
```

Periods in a user-defined frequency do not have to be equal in length. In the main schedule, the `BYSETPOS` clause and numbered weekdays are recalculated based on the size of each period. To select dates in specific periods, you must use the `BYPERIOD` clause in the main schedule. To enable this, the schedule that is used as the user-defined frequency must include a `PERIODS` clause, and it must set its start date appropriately. The first date returned by this schedule is used as the starting point of period 1.

As another example, assuming work days are Monday through Friday, to get the last work day of the 2nd and 4th quarters of the fiscal year, the `repeat_interval` clause in the main schedule is the following:

```
FREQ=fiscal_year;BYDAY=MON,TUE,WED,THU,FRI;BYPERIOD=2,4;BYSETPOS=-1
```

Start Dates and Repeat Intervals

The Scheduler retrieves the date and time from the job or schedule start date and incorporates them as defaults into the `repeat_interval`. For example, if the specified frequency is yearly and there is no `BYMONTH` or `BYMONTHDAY` clause in the repeat interval, then the month and day that the job runs on are retrieved from the start date. Similarly, if frequency is monthly but there is no `BYMONTHDAY` clause in the repeat interval, then the day of the month that the job runs on is retrieved from the start date. If present, `BYHOUR`, `BYMINUTE`, and `BYSECOND` defaults are also retrieved from the start date, and used if those clauses are not specified. Note that if the `INCLUDE`, `EXCLUDE`, or `INTERSECT` clauses are present, no date-related defaults are retrieved from the start date, but time-related defaults are. The following are some examples:

```
start_date:      4/15/05 9:00:00
repeat_interval: freq=yearly
```

is expanded internally to:

```
freq=yearly;bymonth=4;bymonthday=15;byhour=9;byminute=0;bysecond=0
```

The preceding schedule executes on 04/15/05 9:00:00, 04/15/06 9:00:00, 04/15/07 9:00:00, and so on.

For the next example, assume that schedule S1 has a `repeat_interval` of `FREQ=YEARLY;BYDATE=0701`.

```
start_date:      01/20/05 9:00:00
repeat_interval: freq=yearly;include=S1
```

is expanded internally to:

```
freq=yearly;byhour=9;byminute=0;bysecond=0;include=S1
```

Because an `INCLUDE` clause is present, date-related information is not retrieved from the start date. However, time-specific information is, so the preceding schedule executes on 07/01/05 9:00:00, 07/01/06 9:00:00, 07/01/08 9:00:00, and so on.

General Rules

When using a calendaring expression, consider the following rules:

- For a regular schedule (as opposed to a combined schedule), the calendar string must start with the frequency clause. All other clauses are optional and can be put in any order.
- All clauses are separated by a semicolon, and each clause can be present at most once, with the exception of the `include`, `exclude`, and `intersect` clauses.
- Spaces are allowed between syntax elements and the strings are case-insensitive.
- The list of values for a specific `BY` clause do not need to be ordered.

- When not enough `BY` clauses are present to determine what the next date is, this information is retrieved from the start date. For example, "`FREQ=YEARLY`" with a start date of `02/15/2003` becomes "`FREQ=YEARLY;BYMONTH=FEB;BYMONTHDAY=15`", which means every year on the 15th of February.

"`FREQ=YEARLY;BYMONTH=JAN,JUL`" with start date `01/21/2003` becomes "`FREQ=YEARLY;BYMONTH=JAN,JUL;BYMONTHDAY=21`", which means every year on January 21 and July 21.

- The `byweekno` clause is only allowed if the frequency is `YEARLY`. It cannot be used with other frequencies. When it is present, it will return all days in that week number. If you want to limit it to specific days within the week, you have to add a `BYDAY` clause. For example, "`FREQ=YEARLY;BYWEEKNO=2`" with a start date of `01/01/2003` will return:

```
01/06/2003, 01/07/2003, 01/08/2003, 01/09/2003, 01/10/2003, 01/11/2003,
01/12/2003, 01/05/2004, 01/06/2004, 01/07/2004, .... and so on.
```

Note that when the `byweekno` clause is used, it is possible that the dates returned are from a year other than the current year. For example, if returning dates for the year 2004 and the calendar string is "`FREQ=YEARLY;BYWEEKNO=1,53`" for the specified week numbers in 2004, it will return the dates:

```
12/29/03, 12/30/03, 12/31/03, 01/01/04, 01/02/04, 01/03/04, 01/04/04, 12/27/04,
12/28/04, 12/29/04, 12/30/04, 12/31/04, 01/01/05, 01/02/05
```

- For those `BY` clauses that do not have a consistent range of values, you can count backward by putting a "-" in front of the numeric value. For example, specifying `BYMONTHDAY=31` will not give you the last day of every month, because not every month has 31 days. Instead, `BYMONTHDAY=-1` will give you the last day of the month.

This is not supported for `BY` clauses that are fixed in size. In other words, `BYMONTH`, `BYHOUR`, `BYMINUTE`, and `BYSECOND` are not supported.

- The basic values for the `BYDAY` clause are the days of the week. When the frequency is `YEARLY`, or `MONTHLY`, you are allowed to specify a positive or negative number in front of each day of the week. In the case of `YEARLY`, `BYDAY=40MON`, indicates the 40th Monday of the year. In the case of `MONTHLY`, `BYDAY=-2SAT`, indicates the second to last Saturday of the month.

Note that positive or negative numbers in front of the weekdays are not supported for other frequencies and that in the case of yearly, the number ranges from -53 ... -1, 1 ... 53, whereas for the monthly frequency it is limited to -5 ... -1, 1... 5.

If no number is present in front of the weekday it specifies, every occurrence of that weekday in the specified frequency.

- The first day of the week is Monday.
- Repeating jobs with frequencies smaller than daily follow their frequencies exactly across daylight savings adjustments. For example, suppose that a job is scheduled to repeat every 3 hours, the clock is moved forward from 1:00 a.m. to 2:00 a.m., and the last time the job ran was midnight. Its next scheduled time will be 4:00 a.m. Thus, the 3 hour period between subsequent job runs is retained. The same applies when the clock is moved back. This behavior is not the case for repeating jobs that have frequencies of daily or larger. For example, if a repeating job is supposed to be executed on a daily basis at midnight, it will continue to run at midnight if the clock is moved forward or backward. When the execution time of such a daily (or larger frequency) job happens to fall inside a window where the clock is moved forward, the job executes at the end of the window.

- The calendaring syntax does not allow you to specify a time zone. Instead the Scheduler retrieves the time zone from the `start_date` argument. If jobs must follow daylight savings adjustments, then you must specify a region name for the time zone of the `start_date`. For example specifying the `start_date` time zone as 'US/Eastern' in New York ensures that daylight saving adjustments are automatically applied. If instead, the time zone of the `start_date` is set to an absolute offset, such as '-5:00', then daylight savings adjustments are not followed and your job execution is off by an hour for half the year.
- When `start_date` is NULL, the Scheduler determines the time zone for the repeat interval as follows:
 1. It checks whether or not the session time zone is a region name. The session time zone can be set by either:
 - Issuing an ALTER SESSION statement, for example:

```
SQL> ALTER SESSION SET time_zone = 'Asia/Shanghai';
```
 - Setting the ORA_SDTZ environment variable.
 2. If the session time zone is an absolute offset instead of a region name, the Scheduler uses the value of the DEFAULT_TIMEZONE Scheduler attribute. For more information, see the [SET_SCHEDULER_ATTRIBUTE Procedure](#).
 3. If the DEFAULT_TIMEZONE attribute is NULL, the Scheduler uses the time zone of `systimestamp` when the job or window is enabled.

BYSETPOS Clause Rules

The following are rules for the BYSETPOS clause.

- The BYSETPOS clause is the last clause to be evaluated. It is processed after all other BY clauses and the INCLUDE, EXCLUDE and INTERSECT clauses have been evaluated.
- The INTERVAL clause does not change the size of the period to which the BYSETPOS clause is applied. For example, when the frequency is set to monthly and interval is set to 3, the list of timestamps to which BYSETPOS is applied is generated from a month, not a quarter. The only impact of the INTERVAL clause is to cause months to be skipped. However, you can still select the second to last workday of the quarter like this:

```
FREQ=MONTHLY; INTERVAL=3; BYDAY=MON, TUE, WED, THU, FRI; BYSETPOS=-2
```

provided that you set the start date in the right month. This example returns the next to last workday of a month, and repeats once a quarter.

- To get consistent results, the set to which BYSETPOS is applied is determined from the beginning of the frequency period independently of when the evaluation occurs. Whether the Scheduler evaluates

```
FREQ=MONTHLY; BYDAY=MON, TUE, FRI; BYSETPOS=1, 3
```

on 01/01/2004 or 01/15/2004, in both cases the expression evaluates to Friday 01/02/2004, and Tuesday 01/06/2004. The only difference is that when the expression is evaluated on 01/15/2004, the Scheduler determines that there are no matches in January because the timestamps found are in the past, and it moves on to the matches in the next month, February.

BYDATE Clause Rules

The following are rules for the `BYDATE` clause.

- If dates in the `BYDATE` clause do not have their optional year component, the job runs on those dates every year.
- The job execution times on the included dates are derived from the `BY` clauses in the calendaring expression. For example, if `repeat_interval` is defined as

```
freq=daily;byhour=8,13,18;byminute=0;bysecond=0;bydate=0502,0922
```

then the execution times on 05/02 and 09/22 are 8:00 a.m., 1:00 p.m., and 6:00 p.m.

EXCLUDE Clause Rules

Excluded dates without a time component are 24 hour periods. All timestamps that fall on an excluded date are removed. In the following example, `jan_fifteen` is a named schedule that resolves to the single date of 01/15:

```
freq=monthly;bymonthday=15,30;byhour=8,13,18;byminute=0;bysecond=0;
  exclude=jan_fifteenth
```

In this case, all three instances of the job are removed for 01/15.

OFFSET Rules

You can adjust the dates of individual named schedules by adding positive offsets to them. For example, to execute `JOB2` exactly 15 days after every occurrence of `JOB1`, add `+OFFSET:15D` to the schedule of `JOB1`, as follows:

```
BEGIN
dbms_scheduler.create_schedule('job2_schedule', repeat_interval =>
  'job1_schedule+OFFSET:15D');
END;
/
```

Note that negative offsets to named schedules are not supported.

Example 157-1 Putting It All Together

This example demonstrates the use of user-defined frequencies, spans, offsets, and the `BYSETPOS` and `INCLUDE` clauses. (Note that the `OFFSET:` keyword is optional in an offset clause.)

Many companies in the retail industry share the same fiscal year. The fiscal year starts on the Sunday closest to February 1st, and subsequent quarters start exactly 13 weeks later. The fiscal year schedule for the retail industry can be defined as the following:

```
begin
  dbms_scheduler.create_schedule('year_start', repeat_interval=>
    'FREQ=YEARLY;BYDATE=0201^SPAN:1W;BYDAY=SUN');
  dbms_scheduler.create_schedule('retail_fiscal_year',
    to_timestamp_tz('15-JAN-2005 12:00:00','DD-MON-YYYY HH24:MI:SS'),
    'year_start,year_start+13w,year_start+26w,year_start+39w;periods=4');
end;
/
```

The following schedule can be used to execute a job on the 5th day off in the 2nd and the 4th quarters of the retail industry. This assumes that Saturday and Sunday are off days as well as the days in the existing `holiday` schedule.

```
begin
  dbms_scheduler.create_schedule('fifth_day_off', repeat_interval=>
```

```
'FREQ=retail_fiscal_year;BYDAY=SAT,SUN;INCLUDE=holiday;
  BYPERIOD=2,4;BYSETPOS=5');
end;
/
```

157.5 DBMS_SCHEDULER Data Structures

The `DBMS_SCHEDULER` package defines `OBJECT` types and `TABLE` types.

OBJECT Types

- `JOBARG` Object Type
- `JOB_DEFINITION` Object Type
- `JOBATTR` Object Type
- `SCHEDULER$_STEP_TYPE` Object Type
- `SCHEDULER$_EVENT_INFO` Object Type
- `SCHEDULER_FILEWATCHER_RESULT` Object Type
- `SCHEDULER_FILEWATCHER_REQUEST` Object Type

TABLE Types

- `JOBARG_ARRAY` Table Type
- `JOB_DEFINITION_ARRAY` Table Type
- `JOBATTR_ARRAY` Table Type
- `SCHEDULER$_STEP_TYPE_LIST` Table Type

157.5.1 DBMS_SCHEDULER JOBARG Object Type

This type is used by the `JOB` and `JOBATTR` object types. It represents a job argument in a batch of job arguments.

Syntax

```
TYPE jobarg IS OBJECT (
  arg_position          NUMBER,
  arg_text_value       VARCHAR2(4000),
  arg_anydata_value    ANYDATA,
  arg_operation        VARCHAR2(5));
```

Attributes

Table 157-2 JOBARG Object Type Attributes

| Attribute | Description |
|--------------------------------|--|
| <code>arg_position</code> | Position of the argument |
| <code>arg_text_value</code> | Value of the argument if the type is <code>VARCHAR2</code> |
| <code>arg_anydata_value</code> | Value of the argument if the type is <code>AnyData</code> |

Table 157-2 (Cont.) JOBARG Object Type Attributes

| Attribute | Description |
|---------------|---|
| arg_operation | Type of the operation: <ul style="list-style-type: none"> • SET • RESET |

JOBARG Constructor Function

This constructor function constructs a job argument. It is overloaded to construct job arguments with different types of values.

Syntax

Constructs a job argument with a text value.

```
constructor function jobarg (
  arg_position      IN POSITIVEN,
  arg_value         IN VARCHAR2)
RETURN SELF AS RESULT;
```

Constructs a job argument with an AnyData value.

```
constructor function jobarg (
  arg_position      IN POSITIVEN,
  arg_value         IN ANYDATA)
RETURN SELF AS RESULT;
```

Constructs a job argument with a NULL value.

```
constructor function jobarg (
  arg_position      IN POSITIVEN,
  arg_reset        IN BOOLEAN DEFAULT FALSE)
RETURN SELF AS RESULT;
```

Parameters**Table 157-3 JOBARG Constructor Function Parameters**

| Parameter | Description |
|--------------|--|
| arg_position | Position of the argument |
| arg_value | Value of the argument |
| arg_reset | If arg_reset is TRUE, then the argument at that position is reset. Setting arg_reset to FALSE (which is the default) will create an argument with a NULL value. |

JOBARG_ARRAY Table Type**Syntax**

```
TYPE jobarg_array IS TABLE OF jobarg;
```

157.5.2 JOBARG_ARRAY Table Type

The `jobarg_array` type is a table of `jobarg`.

Syntax

```
TYPE jobarg_array IS TABLE OF jobarg;
```

157.5.3 DBMS_SCHEDULER JOB_DEFINITION Object Type

This type is used by the `CREATE_JOBS` procedure and represents a job in a batch of jobs.

Syntax

```
TYPE job_definition IS OBJECT (
  job_name                VARCHAR2(100),
  job_class                VARCHAR2(32),
  job_style                VARCHAR2(11),
  program_name            VARCHAR2(100),
  job_action               VARCHAR2(4000),
  job_type                 VARCHAR2(20),
  schedule_name           VARCHAR2(65),
  repeat_interval         VARCHAR2(4000),
  schedule_limit          INTERVAL DAY TO SECOND,
  start_date               TIMESTAMP WITH TIME ZONE,
  end_date                 TIMESTAMP WITH TIME ZONE,
  event_condition         VARCHAR2(4000),
  queue_spec               VARCHAR2(100),
  number_of_arguments     NUMBER,
  arguments                SYS.JOBARG_ARRAY,
  job_priority             NUMBER,
  job_weight               NUMBER,
  max_run_duration        INTERVAL DAY TO SECOND,
  max_runs                 NUMBER,
  max_failures             NUMBER,
  logging_level            NUMBER,
  restartable              VARCHAR2(5),
  stop_on_window_close    VARCHAR2(5),
  raise_events             NUMBER,
  comments                 VARCHAR2(240),
  auto_drop                VARCHAR2(5),
  enabled                  VARCHAR2(5),
  follow_default_timezone VARCHAR2(5),
  parallel_instances      VARCHAR2(5),
  aq_job                   VARCHAR2(5),
  instance_id              NUMBER,
  credential_name          VARCHAR2(65),
  destination              VARCHAR2(4000),
  database_role            VARCHAR2(20),
  allow_runs_in_restricted_mode VARCHAR2(5);
  restart_on_recovery      BOOLEAN;
  restart_on_failure       BOOLEAN;)
```

Object Attributes

Table 157-4 provides brief descriptions of the attributes of the `JOB_DEFINITION` object type. For more complete information about these attributes, see the "[CREATE_JOB Procedure](#)" and the "[SET_ATTRIBUTE Procedure](#)".

Table 157-4 JOB_DEFINITION Object Types

| Attribute | Description |
|----------------------------------|---|
| <code>job_name</code> | Name of the job |
| <code>job_class</code> | Name of the job class |
| <code>job_style</code> | Style of the job: <ul style="list-style-type: none"> REGULAR LIGHTWEIGHT IN_MEMORY_RUNTIME IN_MEMORY_FULL |
| <code>program_name</code> | Name of the program that the job runs |
| <code>job_action</code> | Inline action of the job. This is either the code for an anonymous PL/SQL block or the name of a stored procedure, external executable, or chain. |
| <code>job_type</code> | Job action type ('PLSQL_BLOCK', 'STORED_PROCEDURE', 'EXECUTABLE', 'CHAIN', 'EXTERNAL_SCRIPT', 'SQL_SCRIPT', and 'BACKUP_SCRIPT') |
| <code>schedule_name</code> | Name of the schedule that specifies when the job has to execute |
| <code>repeat_interval</code> | Inline time-based schedule |
| <code>schedule_limit</code> | Maximum delay time between scheduled and actual job start before a job run is canceled |
| <code>start_date</code> | Start date and time of the job |
| <code>end_date</code> | End date and time of the job |
| <code>event_condition</code> | Event condition for event-based jobs |
| <code>queue_spec</code> | File watcher name or queue specification for event-based jobs |
| <code>number_of_arguments</code> | Number of job arguments |
| <code>arguments</code> | Array of job arguments |
| <code>job_priority</code> | Job priority |
| <code>job_weight</code> | *** Deprecated in Oracle Database 11gR2. Do not change the value of this attribute from the default, which is 1. Weight of the job for parallel execution. |
| <code>max_run_duration</code> | Maximum run duration of the job |
| <code>max_runs</code> | Maximum number of runs before the job is marked as completed |
| <code>max_failures</code> | Maximum number of failures tolerated before the job is marked as broken |
| <code>logging_level</code> | Job logging level |
| <code>restartable</code> | Indicates whether the job is restartable (TRUE) or not (FALSE) |

Table 157-4 (Cont.) JOB_DEFINITION Object Types

| Attribute | Description |
|-------------------------------|--|
| stop_on_window_close | Indicates whether the job is stopped when the window that it runs in ends (TRUE) or not (FALSE). Equivalent to the stop_on_window_close job attribute described in the SET_ATTRIBUTE Procedure . |
| raise_events | State changes that raise events |
| comments | Comments on the job |
| auto_drop | If TRUE (the default), indicates that the job should be dropped once completed |
| enabled | Indicates whether the job should be enabled immediately after creating it (TRUE) or not (FALSE) |
| follow_default_timezone | If TRUE and if the job start_date is null, then when the default_timezone scheduler attribute is changed, the Scheduler recomputes the next run date and time for this job so that it is in accordance with the new time zone. |
| parallel_instances | For event-based jobs only. If TRUE, on the arrival of the specified event, the Scheduler creates a new lightweight job to handle that event, so multiple instances of the same event-based job can run in parallel. If FALSE, then an event is discarded if it is raised while the job that handles it is already running, |
| aq_job | For internal use only |
| instance_id | The instance ID of the instance that the job must run on For in-memory full jobs, the instance_id value determines in which instance to stop the job; if left NULL, the job is stopped in all instances. |
| credential_name | The credential to use for a single destination or the default credential for a group of destinations |
| destination | The name of a single external destination or database destination, or a group name of type external destination or database destination |
| database_role | In an Oracle Data Guard environment, the database role ('PRIMARY' or 'LOGICAL STANDBY') for which the job runs |
| allow_runs_in_restricted_mode | If TRUE, the job is permitted to run when the database is in restricted mode, provided that the job owner is permitted to log in during this mode |
| restart_on_recovery | If set to TRUE for a job and the job is stopped by a database shutdown, then the job is restarted when the database is recovered. If set to FALSE, and the job is stopped by a database shutdown, then the job is marked as stopped when the database is recovered. |
| restart_on_failure | If set to TRUE for a job and the job fails due to an application error, then the job is retried using the normal Scheduler retry mechanism (after 1 second, after 10 seconds, after 100 seconds, and so on, up to a maximum of 6 times). If all 6 retries fail (after about 30 hours), then the job is marked FAILED. If set to FALSE (the default), a failed job is immediately marked FAILED. |

JOB_DEFINITION Constructor Function

This constructor function constructs a `job_definition` object.

Syntax

```

constructor function job_definition (
    job_name          IN      VARCHAR2,
    job_style         IN      VARCHAR2 DEFAULT 'REGULAR',
    program_name     IN      VARCHAR2 DEFAULT NULL,
    job_action       IN      VARCHAR2 DEFAULT NULL,
    job_type         IN      VARCHAR2 DEFAULT NULL,
    schedule_name    IN      VARCHAR2 DEFAULT NULL,
    repeat_interval  IN      VARCHAR2 DEFAULT NULL,
    event_condition  IN      VARCHAR2 DEFAULT NULL,
    queue_spec       IN      VARCHAR2 DEFAULT NULL,
    start_date       IN      TIMESTAMP WITH TIME ZONE DEFAULT NULL,
    end_date         IN      TIMESTAMP WITH TIME ZONE DEFAULT NULL,
    number_of_arguments IN  NATURAL DEFAULT NULL,
    arguments        IN      SYS.JOBARG_ARRAY DEFAULT NULL,
    job_class        IN      VARCHAR2 DEFAULT 'DEFAULT_JOB_CLASS',
    schedule_limit   IN      INTERVAL DAY TO SECOND DEFAULT NULL,
    job_priority     IN      NATURAL DEFAULT NULL,
    job_weight       IN      NATURAL DEFAULT NULL,
    max_run_duration IN      INTERVAL DAY TO SECOND DEFAULT NULL,
    max_runs         IN      NATURAL DEFAULT NULL,
    max_failures     IN      NATURAL DEFAULT NULL,
    logging_level    IN      NATURALN DEFAULT 64,
    restartable      IN      BOOLEAN DEFAULT FALSE,
    stop_on_window_close IN  BOOLEAN DEFAULT FALSE,
    raise_events     IN      NATURAL DEFAULT NULL,
    comments        IN      VARCHAR2 DEFAULT NULL,
    auto_drop        IN      BOOLEAN DEFAULT TRUE,
    enabled          IN      BOOLEAN DEFAULT FALSE,
    follow_default_timezone IN  BOOLEAN DEFAULT FALSE,
    parallel_instances IN  BOOLEAN DEFAULT FALSE,
    aq_job           IN      BOOLEAN DEFAULT FALSE,
    instance_id      IN      NATURAL DEFAULT NULL,
    credential_name  IN      VARCHAR2 DEFAULT NULL,
    destination      IN      VARCHAR2 DEFAULT NULL,
    database_role    IN      VARCHAR2 DEFAULT NULL,
    allow_runs_in_restricted_mode IN  BOOLEAN DEFAULT FALSE)
RETURN SELF AS RESULT;

```

JOB_DEFINITION_ARRAY Table Type

Syntax

```
TYPE job_definition_array IS TABLE OF job_definition;
```

157.5.4 JOB_DEFINITION_ARRAY Table Type

The type `job_definition_array` is a table of `job_definition`.

Syntax

```
TYPE job_definition_array IS TABLE OF job_definition;
```

157.5.5 JOBATTR Object Type

This type is used by the `SET_JOB_ATTRIBUTES` procedure and represents a job attribute in a batch of job attributes.

Syntax

```
TYPE jobattr IS OBJECT (
  job_name          VARCHAR2(100),
  attr_name         VARCHAR2(30),
  char_value        VARCHAR2(4000),
  char_value2       VARCHAR2(4000),
  args_value        JOBARG_ARRAY,
  num_value         NUMBER,
  timestamp_value   TIMESTAMP(6) WITH TIME ZONE,
  interval_value    INTERVAL DAY(2) TO SECOND(6));
```

Attributes

Table 157-5 JOBATTR Object Type Attributes

| Attribute | Description |
|-----------------|---|
| job_name | Name of the job |
| attr_name | Name of the attribute |
| char_value | Value of the argument if the type is VARCHAR2 |
| char_value2 | Second VARCHAR2 attribute value |
| args_value | Value of the argument if the type is a JOBARG array |
| num_value | Value of the argument if the type is NUMBER |
| timestamp_value | Value of the argument if the type is TIMESTAMP WITH TIME ZONE |
| interval_value | Value of the argument if the type is INTERVAL DAY TO SECOND |

JOBATTR Constructor Function

This constructor function constructs a job attribute. It is overloaded to create attribute values of the following types: VARCHAR2, NUMBER, TIMESTAMP WITH TIME ZONE, INTERVAL DAY TO SECOND, and an array of JOBARG types.

Syntax

```
constructor function jobattr (
  job_name          IN VARCHAR2,
  attr_name         IN VARCHAR2,
  attr_value        IN VARCHAR2,
  attr_value2       IN VARCHAR2 DEFAULT NULL)
  RETURN SELF AS RESULT;

constructor function jobattr (
  job_name          IN VARCHAR2,
  attr_name         IN VARCHAR2,
  attr_value        IN [NUMBER, BOOLEAN,
                       TIMESTAMP WITH TIME ZONE,
```

```

                                INTERVAL DAY TO SECOND, JOBARG_ARRAY))
RETURN SELF AS RESULT;

constructor function jobattr (
    job_name          IN VARCHAR2,
    attr_name         IN VARCHAR2)
RETURN SELF AS RESULT;

```

Parameters

Table 157-6 JOBATTR Constructor Function Parameters

| Parameter | Description |
|-------------|--|
| job_name | Name of the job |
| attr_name | Name of the argument |
| attr_value | Value of the argument |
| attr_value2 | Most attributes have only one value associated with them, but some can have two. The attr_value2 argument is for this optional second value. |

JOBATTR Table Type

Syntax

```
TYPE jobattr_array IS TABLE OF jobattr;
```

157.5.6 JOBATTR_ARRAY Table Type

The type jobattr_array is a table of jobattr.

Syntax

```
TYPE jobattr_array IS TABLE OF jobattr;
```

157.5.7 SCHEDULER\$_STEP_TYPE Object Type

This type is used by RUN_CHAIN to return a list of chain steps with an initial state.

Syntax

```
TYPE scheduler$_step_type IS OBJECT (
    step_name  VARCHAR2(32),
    step_type  VARCHAR2(32));
```

Attributes

Table 157-7 SCHEDULER\$_STEP_TYPE Object Type Attributes

| Attribute | Description |
|-----------|-------------------|
| step_name | Name of the step |
| step_type | State of the step |

157.5.8 SCHEDULER\$_STEP_TYPE_LIST Table Type

This type is a table of scheduler\$_step_type.

Syntax

```
TYPE scheduler$_step_type_list IS TABLE OF scheduler$_step_type;
```

157.5.9 SCHEDULER\$_EVENT_INFO Object Type

This is the datatype of the Scheduler event queue SYS.SCHEDULER\$_EVENT_QUEUE, from which your application consumes job state events raised by the Scheduler.

It is a secure queue owned by SYS.

Syntax

```
TYPE SCHEDULER$_EVENT_INFO IS OBJECT (
  event_type          VARCHAR2(4000),
  object_owner       VARCHAR2(4000),
  object_name        VARCHAR2(4000),
  event_timestamp    TIMESTAMP WITH TIME ZONE,
  error_code         NUMBER,
  error_msg          VARCHAR2(4000),
  event_status       NUMBER,
  log_id            NUMBER,
  run_count          NUMBER,
  failure_count      NUMBER,
  retry_count        NUMBER,
  spare1            NUMBER,
  spare2            NUMBER,
  spare3            VARCHAR2(4000),
  spare4            VARCHAR2(4000),
  spare5            TIMESTAMP WITH TIME ZONE,
  spare6            TIMESTAMP WITH TIME ZONE,
  spare7            RAW(2000),
  spare8            RAW(2000));
```

Attributes

Table 157-8 SCHEDULER_EVENT_INFO Object Type Attributes

| Attribute | Description |
|-----------------|---|
| event_type | One of "JOB_STARTED", "JOB_SUCCEEDED", "JOB_FAILED", "JOB_BROKEN", "JOB_COMPLETED", "JOB_STOPPED", "JOB_SCH_LIM_REACHED", "JOB_DISABLED", "JOB_CHAIN_STALLED", "JOB_OVER_MAX_DUR". For descriptions of these event types, see Table 157-84 . |
| object_owner | Owner of the job that raised the event |
| object_name | Name of the job that raised the event |
| event_timestamp | Time at which the event occurred |
| error_code | Applicable only when an error is thrown during job execution. Contains the top-level error code. |

Table 157-8 (Cont.) SCHEDULER_EVENT_INFO Object Type Attributes

| Attribute | Description |
|-----------------|--|
| error_msg | Applicable only when an error is thrown during job execution. Contains the entire error stack. |
| event_status | Adds further qualification to the event type. If event_type is "JOB_STARTED," status 1 indicates that it is a normal start, and status 2 indicates that it is a retry. If event_type is "JOB_FAILED," status 4 indicates that it was a failure due to an error that was thrown during job execution, and status 8 indicates that it was an abnormal termination of some kind. If event_type is "JOB_STOPPED," status 16 indicates that it was a normal stop, and status 32 indicates that it was a stop with the FORCE option set to TRUE. |
| log_id | Points to the ID in the scheduler job log from which additional information can be obtained. Note that there need not always be a log entry corresponding to an event. In such cases, log_id is NULL. |
| run_count | Run count for the job when the event was raised. |
| failure_count | Failure count for the job when the event was raised. |
| retry_count | Retry count for the job when the event was raised. |
| spare1 – spare8 | Not currently in use. |

157.5.10 SCHEDULER_FILEWATCHER_RESULT Object Type

This is the datatype of a file arrival event message.

You access the event message as a parameter of an event-based job (or a parameter of a program referenced by an event-based job). The message contains information needed to locate and process a file that arrived on a local or remote system.

Syntax

```
TYPE scheduler_filewatcher_result IS OBJECT (
  destination          VARCHAR2(4000),
  directory_path       VARCHAR2(4000),
  actual_file_name     VARCHAR2(4000),
  file_size            NUMBER,
  file_timestamp       TIMESTAMP WITH TIME ZONE,
  ts_ms_from_epoch     NUMBER,
  matching_requests    SYS.SCHEDULER_FILEWATCHER_REQ_LIST);
```

Attributes

Table 157-9 SCHEDULER_FILEWATCHER_RESULT Object Type Attributes

| Attribute | Description |
|----------------|--|
| destination | Destination at which the file was found, expressed as a host name or IP address. |
| directory_path | Absolute path of directory in which the file was found. |

Table 157-9 (Cont.) SCHEDULER_FILEWATCHER_RESULT Object Type Attributes

| Attribute | Description |
|-------------------|--|
| actual_file_name | Actual name of the file that was found. If the file name specified in the file watcher did not contain wildcards, then this is the same as the name specified in the file watcher. |
| file_size | Size of the file that was found, in bytes. |
| file_timestamp | Timestamp assigned to the file when the file watcher considered the file found, based on the minimum file size and steady state duration attributes. |
| ts_ms_from_epoch | For internal use only. |
| matching_requests | List of matching requests. This is a TABLE of type objects SCHEDULER_FILEWATCHER_REQUEST. Each matching request corresponds to a file watcher whose destination, directory_path, and file_name attributes matched the arrived file. See " SCHEDULER_FILEWATCHER_REQUEST Object Type ". |

157.5.11 SCHEDULER_FILEWATCHER_REQUEST Object Type

This type is returned in the `matching_requests` attribute of the `SCHEDULER_FILEWATCHER_RESULT` Object Type. Its attributes are similar to the attributes of a file watcher.

Syntax

```
TYPE scheduler_filewatcher_request IS OBJECT (
  owner          VARCHAR2(4000),
  name           VARCHAR2(4000),
  requested_path_name VARCHAR2(4000),
  requested_file_name VARCHAR2(4000),
  credential_owner VARCHAR2(4000),
  credential_name VARCHAR2(4000),
  min_file_size  NUMBER,
  steady_state_dur NUMBER);
```

Attributes

Table 157-10 SCHEDULER_FILEWATCHER_REQUEST Object Type Attributes

| Attribute | Description |
|---------------------|---|
| owner | Owner of the matched file watcher. |
| name | Name of the matched file watcher. |
| requested_path_name | Value of the <code>directory_path</code> attribute of the matched file watcher. |
| requested_file_name | Value of the <code>file_name</code> attribute of the matched file watcher. |
| credential_owner | Owner of the credential referenced by the matched file watcher. |
| credential_name | Name of the credential referenced by the matched file watcher. |
| min_file_size | Value of the <code>min_file_size</code> attribute of the matched file watcher. |

Table 157-10 (Cont.) SCHEDULER_FILEWATCHER_REQUEST Object Type Attributes

| Attribute | Description |
|------------------|---|
| steady_state_dur | Value of the steady_state_duration attribute of the matched file watcher. |

Related Topics

- [SCHEDULER_FILEWATCHER_RESULT Object Type](#)
This is the datatype of a file arrival event message.

157.6 Summary of DBMS_SCHEDULER Subprograms

This table lists the DBMS_SCHEDULER subprograms and briefly describes them.

Table 157-11 DBMS_SCHEDULER Package Subprograms

| Subprogram | Description |
|---|---|
| ADD_EVENT_QUEUE_SUBSCRIBER Procedure | Adds a user as a subscriber to the Scheduler event queue SYS.SCHEDULER\$_EVENT_QUEUE |
| ADD_GROUP_MEMBER Procedure | Adds one or more members to an existing group |
| ADD_JOB_EMAIL_NOTIFICATION Procedure | Adds e-mail notifications for a job for a list of recipients and a list of job state events |
| ADD_TO_INCOMPATIBILITY Procedure | Adds jobs or programs to an existing incompatibility definition |
| ALTER_CHAIN Procedure | Alters specified steps of a chain |
| ALTER_RUNNING_CHAIN Procedure | Alters specified steps of a running chain |
| CLOSE_WINDOW Procedure | Closes an open window prematurely |
| COPY_JOB Procedure | Copies an existing job |
| CREATE_CHAIN Procedure | Creates a chain, which is a named series of programs that are linked together for a combined objective |
| CREATE_CREDENTIAL Procedure | Creates a credential |
| CREATE_DATABASE_DESTINATION Procedure | Creates a database destination for use with remote database jobs |
| CREATE_EVENT_SCHEDULE Procedure | Creates an event schedule, which is a schedule that starts a job based on the detection of an event |
| CREATE_FILE_WATCHER Procedure | Creates a file watcher, which is a Scheduler object that defines the location, name, and other properties of a file whose arrival on a system causes the Scheduler to start a job |
| CREATE_GROUP Procedure | Creates a group |

Table 157-11 (Cont.) DBMS_SCHEDULER Package Subprograms

| Subprogram | Description |
|--|--|
| CREATE_INCOMPATIBILITY Procedure | Creates an incompatibility definition |
| CREATE_JOB Procedure | Creates a single job |
| CREATE_JOB_CLASS Procedure | Creates a job class, which provides a way to group jobs for resource allocation and prioritization |
| CREATE_JOBS Procedure | Creates multiple jobs |
| CREATE_PROGRAM Procedure | Creates a program |
| CREATE_RESOURCE Procedure | Specifies resources used by jobs or creates a new resource |
| CREATE_SCHEDULE Procedure | Creates a schedule |
| CREATE_WINDOW Procedure | Creates a window, which provides a way to automatically activate different resource plans at different times |
| DEFINE_ANYDATA_ARGUMENT Procedure | Defines a program argument whose value is of a complex type and must be passed encapsulated in an AnyData object |
| DEFINE_CHAIN_EVENT_STEP Procedure | Adds or replaces a chain step and associates it with an event schedule or inline event. See also: DEFINE_CHAIN_STEP . |
| DEFINE_CHAIN_RULE Procedure | Adds a rule to an existing chain |
| DEFINE_CHAIN_STEP Procedure | Defines a chain step, which can be a program or another (nested) chain. See also: DEFINE_CHAIN_EVENT_STEP . |
| DEFINE_METADATA_ARGUMENT Procedure | Defines a special metadata argument for the program. You can retrieve specific metadata through this argument. |
| DEFINE_PROGRAM_ARGUMENT Procedure | Defines a program argument whose value can be passed as a string literal to the program |
| DISABLE Procedure | Disables a program, job, chain, window, database destination, external destination, file watcher, group, or incompatibility |
| DROP_AGENT_DESTINATION Procedure | Drops one or more external destinations. Use only when the preferred method of dropping external destinations—unregistering the Scheduler agent with the database—fails. |
| DROP_CHAIN Procedure | Drops an existing chain |
| DROP_CHAIN_RULE Procedure | Removes a rule from an existing chain |
| DROP_CHAIN_STEP Procedure | Drops a chain step |

Table 157-11 (Cont.) DBMS_SCHEDULER Package Subprograms

| Subprogram | Description |
|---|---|
| DROP_CREDENTIAL Procedure | Drops a credential |
| DROP_DATABASE_DESTINATION Procedure | Drops one or more database destinations |
| DROP_FILE_WATCHER Procedure | Drops one or more file watchers |
| DROP_GROUP Procedure | Drops one or more groups |
| DROP_INCOMPATIBILITY Procedure | Drops an existing incompatibility definition |
| DROP_JOB Procedure | Drops a job or all jobs in a job class |
| DROP_JOB_CLASS Procedure | Drops a job class |
| DROP_PROGRAM Procedure | Drops a program |
| DROP_PROGRAM_ARGUMENT Procedure | Drops a program argument |
| DROP_SCHEDULE Procedure | Drops a schedule |
| DROP_WINDOW Procedure | Drops a window |
| ENABLE Procedure | Enables a program, job, chain, window, database destination, external destination, file watcher, or group |
| END_DETACHED_JOB_RUN Procedure | Ends a running detached job |
| EVALUATE_CALENDAR_STRING Procedure | Evaluates the calendar string and tells you what the next execution date of a job or window will be |
| EVALUATE_RUNNING_CHAIN Procedure | Forces reevaluation of the rules of a running chain to trigger any rules for conditions that have been satisfied |
| GENERATE_JOB_NAME Function | Generates a unique name for a job. This enables you to identify jobs by adding a prefix, so, for example, Sally's jobs would be named <code>sally1</code> , <code>sally2</code> , and so on |
| GET_AGENT_INFO Function | Returns job information specific to an agent, such as how many are running and so on, depending on the attribute selected |
| GET_AGENT_VERSION Function | Returns the version string of a Scheduler agent that is registered with the database and is currently running |
| GET_ATTRIBUTE Procedure | Retrieves the value of an attribute of an object |
| GET_FILE Procedure | Retrieves a file from a host |
| GET_SCHEDULER_ATTRIBUTE Procedure | Retrieves the value of a Scheduler attribute |
| OPEN_WINDOW Procedure | Opens a window prematurely. The window is opened immediately for the duration |
| PURGE_LOG Procedure | Purges specific rows from the job and window logs |

Table 157-11 (Cont.) DBMS_SCHEDULER Package Subprograms

| Subprogram | Description |
|---|--|
| PUT_FILE Procedure | Saves a file to one or more hosts |
| REMOVE_EVENT_QUEUE_SUBSCRIBER Procedure | Unsubscribes a user from the Scheduler event queue <code>SYS.SCHEDULER\$_EVENT_QUEUE</code> |
| REMOVE_FROM_INCOMPATIBILITY Procedure | Removes jobs or programs from an incompatibility definition |
| REMOVE_GROUP_MEMBER Procedure | Removes one or more members from a group |
| REMOVE_JOB_EMAIL_NOTIFICATION Procedure | Removes e-mail notifications for a job |
| RESET_JOB_ARGUMENT_VALUE Procedure | Resets the current value assigned to an argument defined with the associated program |
| RUN_CHAIN Procedure | Immediately runs a chain by creating a run-once job |
| RUN_JOB Procedure | Runs a job immediately |
| SET_AGENT_REGISTRATION_PASS Procedure | Sets the agent registration password for a database |
| SET_ATTRIBUTE Procedure | Changes an attribute of a job, schedule, or other Scheduler object |
| SET_ATTRIBUTE_NULL Procedure | Changes an attribute of an object to NULL |
| SET_JOB_ANYDATA_VALUE Procedure | Sets the value of a job argument encapsulated in an <code>AnyData</code> object |
| SET_JOB_ARGUMENT_VALUE Procedure | Sets the value of a job argument |
| SET_JOB_ATTRIBUTES Procedure | Sets the value of a job attribute |
| SET_RESOURCE_CONSTRAINT Procedure | Specifies the resources used by jobs |
| SET_SCHEDULER_ATTRIBUTE Procedure | Sets the value of a Scheduler attribute |
| STOP_JOB Procedure | Stops a currently running job or all jobs in a job class |

157.6.1 ADD_EVENT_QUEUE_SUBSCRIBER Procedure

This procedure adds a user as a subscriber to the Scheduler event queue `SYS.SCHEDULER$_EVENT_QUEUE`, and grants the user permission to dequeue from this queue using the designated agent.

Syntax

```
DBMS_SCHEDULER.ADD_EVENT_QUEUE_SUBSCRIBER (
    subscriber_name          IN VARCHAR2 DEFAULT NULL);
```

Parameters

Table 157-12 ADD_EVENT_QUEUE_SUBSCRIBER Procedure Parameters

| Parameter | Description |
|------------------------------|---|
| <code>subscriber_name</code> | Name of the Oracle Advanced Queuing (AQ) agent to be used to subscribe to the Scheduler event queue. If <code>NULL</code> , an agent is created and assigned the user name of the calling user. |

Usage Notes

The subscription is rule-based. The rule permits the user to see only events raised by jobs that the user owns, and filters out all other messages. If an AQ agent with the same name already exists, an error is raised.

157.6.2 ADD_GROUP_MEMBER Procedure

This procedure adds one or more members to an existing group.

Syntax

```
DBMS_SCHEDULER.ADD_GROUP_MEMBER (
    group_name          IN VARCHAR2,
    member              IN VARCHAR2);
```

Parameters

Table 157-13 ADD_GROUP_MEMBER Procedure Parameters

| Parameter | Description |
|-------------------------|---|
| <code>group_name</code> | The name of the group. |
| <code>member</code> | <p>A comma-separated list of members to add to the group. Members must match the group type. A group of the same type can be a member. The Scheduler immediately expands the included group name into its list of members.</p> <p>An error is returned if any of the members do not exist. A member that is already in the group is skipped, and no error is generated.</p> <p>The keyword <code>LOCAL</code> can be included as a member for database destination or external destination groups. See the "CREATE_GROUP Procedure" for information about this keyword.</p> |

Usage Notes

The following users may add members to a group:

- The group owner
- A user that has been granted the `ALTER` object privilege on the group
- A user with the `CREATE ANY JOB` system privilege

You must have the `MANAGE SCHEDULER` privilege to add a member to a group of type `WINDOW`.

See Also:

"CREATE_GROUP Procedure"

157.6.3 ADD_JOB_EMAIL_NOTIFICATION Procedure

This procedure adds e-mail notifications for a job. E-mails are then sent to the specified list of recipients whenever any of the specified job state events is raised.

Syntax

```
DBMS_SCHEDULER.ADD_JOB_EMAIL_NOTIFICATION (
  job_name          IN VARCHAR2,
  recipients        IN VARCHAR2,
  sender            IN VARCHAR2 DEFAULT NULL,
  subject           IN VARCHAR2 DEFAULT DBMS_SCHEDULER.DEFAULT_NOTIFICATION_SUBJECT,
  body             IN VARCHAR2 DEFAULT DBMS_SCHEDULER.DEFAULT_NOTIFICATION_BODY,
  events            IN VARCHAR2 DEFAULT 'JOB_FAILED, JOB_BROKEN, JOB_SCH_LIM_REACHED,
                                     JOB_CHAIN_STALLED, JOB_OVER_MAX_DUR',
  filter_condition IN VARCHAR2 DEFAULT NULL);
```

Parameters

Table 157-14 ADD_JOB_EMAIL_NOTIFICATION Procedure Parameters

| Parameter | Description |
|------------|--|
| job_name | Name of the job that e-mail notifications are added for. Cannot be NULL. |
| recipients | Comma-separated list of e-mail addresses to send notifications to. E-mail notifications for all listed events are sent to all recipients. Cannot be NULL. |
| sender | e-mail address to use as the sender address (the From: address) in the e-mail header. If NULL or omitted, the e-mail address specified in the Scheduler attribute <code>email_sender</code> is used. See <i>Oracle Database Administrator's Guide</i> for more information on this Scheduler attribute. |
| subject | The subject to use in the e-mail header. Table 157-15 describes the variables that you can include within this parameter. The Scheduler assigns values to these variables before sending the notification. If <code>subject</code> is omitted, the default subject is used. The default subject is the following text, where text enclosed in the '%' character represents a variable: 'Oracle Scheduler Job Notification - %job_owner%.%job_name%.%job_subname% %event_type%' |

Table 157-14 (Cont.) ADD_JOB_EMAIL_NOTIFICATION Procedure Parameters

| Parameter | Description |
|------------------|--|
| body | <p>The body of the e-mail message. Table 157-15 describes the variables that you can include within this parameter. The Scheduler assigns values to these variables before sending the notification. If <code>body</code> is omitted, the default body is used. The default body is the following text, where text enclosed in the '%' character represents a variable:</p> <pre>'Job: %job_owner%.%job_name%.%job_subname% Event: %event_type% Date: %event_timestamp% Log id: %log_id% Job class: %job_class_name% Run count: %run_count% Failure count: %failure_count% Retry count: %retry_count% Error code: %error_code% Error message: %error_message%'</pre> |
| events | <p>Comma-separate list of job state events to send e-mail notifications for. Cannot be NULL. A notification is sent to all recipients if any of the listed events is raised. Table 157-84 lists the valid events for this parameter. If <code>events</code> is omitted, notifications are sent for the following default events:</p> <pre>JOB_FAILED, JOB_BROKEN, JOB_SCH_LIM_REACHED, JOB_CHAIN_STALLED, JOB_OVER_MAX_DUR</pre> |
| filter_condition | <p>Used to filter events to send e-mail notifications for. If NULL, all occurrences of the specified events cause e-mail notifications to be sent. <code>filter_condition</code> must be a boolean SQL WHERE clause that may refer to the <code>:event</code> bind variable. This bind variable is automatically bound to an object of type <code>SCHEDULER\$_EVENT_INFO</code> that represents the raised event.</p> <p>For example, to send an e-mail notification only when the error number in an event is 600 or 700, use the following <code>filter_condition</code>:</p> <pre>:event.error_code=600 or :event.error_code=700</pre> <p>See "SCHEDULER\$_EVENT_INFO Object Type".</p> |

[Table 157-15](#) lists the variables that you can use in the subject and body arguments.

Table 157-15 Variables Used in the SUBJECT and BODY Parameters

| Variable | Comment |
|--------------------------------|---|
| <code>%job_owner%</code> | Schema in which job was created |
| <code>%job_name%</code> | Name of the job that e-mail notifications are added for |
| <code>%job_subname%</code> | Present for event-based jobs with the <code>parallel_instances</code> attribute set and for chain steps |
| <code>%event_type%</code> | Valid values are listed in Table 157-84 |
| <code>%event_timestamp%</code> | Time at which the event occurred |

Table 157-15 (Cont.) Variables Used in the SUBJECT and BODY Parameters

| Variable | Comment |
|-----------------|--|
| %log_id% | Refers to the LOG_ID column in views *_SCHEDULER_JOB_LOG and *_SCHEDULER_JOB_RUN_DETAILS |
| %error_code% | Number of the error code. |
| %error_message% | The text of the error message |
| %run_count% | Run count for the job when the event was raised |
| %failure_count% | Failure count for the job when the event was raised |
| %retry_count% | Retry count for the job when the event was raised |

Usage Notes

You can call `ADD_JOB_EMAIL_NOTIFICATION` once for each different set of notifications that you want to configure for a particular job. For example, you may want to send notifications for the `JOB_FAILED`, `JOB_BROKEN`, `JOB_SCH_LIM_REACHED`, and `JOB_CHAIN_STALLED` events to the principle DBA and all senior DBAs, but send a notification for the `JOB_OVER_MAX_DUR` event only to the principle DBA.

This procedure succeeds only if the Scheduler attribute `email_server` is set to a valid SMTP server. See *Oracle Database Administrator's Guide* for more information.

To call this procedure, you must be the job owner or have the `CREATE ANY JOB` system privilege or have the `ALTER` object privilege on the job.

157.6.4 ADD_TO_INCOMPATIBILITY Procedure

This procedure adds jobs or programs to an existing incompatibility definition.

Syntax

```
DBMS_SCHEDULER.ADD_TO_INCOMPATIBILITY (
    incompatibility_name    IN VARCHAR2,
    object_name             IN VARCHAR2);
```

Parameters

Table 157-16 ADD_TO_INCOMPATIBILITY Procedure Parameters

| Parameter | Description |
|-----------------------------------|--|
| <code>incompatibility_name</code> | The name of the incompatibility definition. |
| <code>object_name</code> | One or more (comma-separated) programs or jobs |

Usage Notes

This procedure does not raise an error if any specified objects already exist in the incompatibility definition.

**See Also:**Using Incompatibility Definitions in *Oracle Database Administrator's Guide*

157.6.5 ALTER_CHAIN Procedure

This procedure alters an attribute of the specified steps of a chain. This affects all future runs of the specified steps, both in the currently running chain job and in future runs of the same chain job or other chain jobs that point to the chain.

Syntax

Alters the value of a boolean attribute of one or more steps:

```
DBMS_SCHEDULER.ALTER_CHAIN (
  chain_name      IN VARCHAR2,
  step_name       IN VARCHAR2,
  attribute       IN VARCHAR2,
  value           IN BOOLEAN);
```

Alters the value of a character attribute of one or more steps:

```
DBMS_SCHEDULER.ALTER_CHAIN (
  chain_name      IN VARCHAR2,
  step_name       IN VARCHAR2,
  attribute       IN VARCHAR2,
  char_value      IN VARCHAR2);
```

Parameters

Table 157-17 ALTER_CHAIN Procedure Parameters

| Parameter | Description |
|------------|--|
| chain_name | The name of the chain to alter |
| step_name | The name of the step or a comma-separated list of steps to alter. This cannot be NULL. |

Table 157-17 (Cont.) ALTER_CHAIN Procedure Parameters

| Parameter | Description |
|-----------|--|
| attribute | <p>The attribute of the steps to change. Must be one of the following:</p> <ul style="list-style-type: none"> • 'PAUSE' <p>If set to TRUE for a step, after the step has run, its state changes to PAUSED (and the completed attribute remains FALSE).</p> <p>If PAUSE is reset to FALSE for a paused chain step (using ALTER_RUNNING_CHAIN), the state is set to its completion state (SUCCEEDED, FAILED, or STOPPED) and the completed attribute is set to TRUE.</p> <p>Setting PAUSE has no effect on steps that have already run. This allows execution of a chain to be suspended after the execution of certain steps.</p> • 'PAUSED_BEFORE' <p>If set to TRUE for a step and if any of the rule conditions that start the step are true, then its state changes to PAUSED and the step does not run.</p> <p>If PAUSED_BEFORE is reset to FALSE for a chain step that has paused before starting (using ALTER_RUNNING_CHAIN), then the step starts running if any of the rule conditions that start the step are true.</p> <p>Setting PAUSED_BEFORE has no effect on steps that are running or have already run. This allows execution of a chain to be suspended before the execution of certain steps.</p> • 'SKIP' <p>If set to TRUE for a step, when the step condition is met, instead of being run, the step is treated as if it has immediately succeeded. Setting SKIP to TRUE has no effect for a step that is running, scheduled to run after a delay, or has already run. If SKIP is set TRUE for a step that PAUSE is also set for, when the step condition is met, the step immediately changes to state PAUSED.</p> • 'RESTART_ON_FAILURE' <p>If set to TRUE for a step and the step fails due to an application error, then the step is retried using the normal Scheduler retry mechanism (after 1 second, after 10 seconds, after 100 seconds, and so on, up to a maximum of 6 times). If all 6 retries fail (after about 30 hours), then the chain step is marked FAILED.</p> <p>If set to FALSE (the default), a failed chain step is immediately marked FAILED.</p> • 'RESTART_ON_RECOVERY' <p>If set to TRUE for a step and the step is stopped by a database shutdown, then the step is restarted when the database is recovered.</p> <p>If set to FALSE, and the step is stopped by a database shutdown, then the step is marked as stopped when the database is recovered and the chain continues.</p> • 'DESTINATION_NAME' <p>The name of an existing database destination or external destination. You can view external destination names in the view ALL_SCHEDULER_EXTERNAL_DESTS, and database destination names in the views *_SCHEDULER_DB_DESTS. You cannot specify a destination group for this attribute. This parameter is NULL by default.</p> • 'CREDENTIAL_NAME' <p>The credential to use when running this step. NULL by default.</p> |

Table 157-17 (Cont.) ALTER_CHAIN Procedure Parameters

| Parameter | Description |
|------------|---|
| value | The value to set for the attribute (for a boolean attribute). |
| char_value | The value to set for the attribute (for a character attribute). |

Usage Notes

Altering a chain requires `ALTER` privileges on the chain either by being the owner of the chain, or by having the `ALTER` object privilege on the chain or by having the `CREATE ANY JOB` system privilege.

157.6.6 ALTER_RUNNING_CHAIN Procedure

This procedure alters an attribute of the specified steps of a chain. This affects only steps of the instance of the chain for the specified running chain job.

Syntax

```
DBMS_SCHEDULER.ALTER_RUNNING_CHAIN (
  job_name          IN VARCHAR2,
  step_name         IN VARCHAR2,
  attribute         IN VARCHAR2,
  value             IN {BOOLEAN|VARCHAR2});
```

Parameters

Table 157-18 ALTER_RUNNING_CHAIN Procedure Parameters

| Parameter | Description |
|-----------|---|
| job_name | The name of the job that is running the chain |
| step_name | The name of the step or a comma-separated list of steps to alter. If this is set to <code>NULL</code> and attribute is <code>PAUSE</code> or <code>SKIP</code> , then all steps of the running chain are altered. |

Table 157-18 (Cont.) ALTER_RUNNING_CHAIN Procedure Parameters

| Parameter | Description |
|-----------|--|
| attribute | <p>The attribute of the steps to change. Valid values are:</p> <ul style="list-style-type: none"> <li data-bbox="602 375 1458 663"> <p>• 'PAUSE'</p> <p>If the PAUSE attribute is set TRUE for a step, then after the step runs, its state changes to PAUSED (and the completed attribute remains false).</p> <p>If PAUSE is reset to FALSE for a paused chain step (using ALTER_RUNNING_CHAIN), the state is set to completion (SUCCEEDED, FAILED, or STOPPED) and the completed attribute is set to TRUE. Setting PAUSE has no effect on steps that have already run. This allows execution of a chain to be suspended after the execution of certain steps. If step_name is set to NULL, PAUSE is set to TRUE for all steps of this running chain.</p> <li data-bbox="602 674 1458 1058"> <p>• 'PAUSE_BEFORE'</p> <p>If set to TRUE for a step that has not yet run and if any of the rule conditions that start the step are true, then its state changes to PAUSED and the step does not run.</p> <p>If PAUSE_BEFORE is reset to FALSE for a chain step that has paused before starting, then the step starts running if any of the rule conditions that start the step are true.</p> <p>Setting PAUSE_BEFORE has no effect on steps that are running or have already run. This allows execution of a chain to be suspended before the execution of certain steps.</p> <p>If step_name is set to NULL, then PAUSE_BEFORE is set to the specified value for all steps of this running chain.</p> |

Table 157-18 (Cont.) ALTER_RUNNING_CHAIN Procedure Parameters

| Parameter | Description |
|------------------------|---|
| attribute CONTINUED | <ul style="list-style-type: none"> 'SKIP' If the SKIP attribute is set to TRUE for a step, when the step condition is met, instead of being run, the step is treated as if it has immediately succeeded. Setting SKIP to TRUE has no effect for a step that is running, scheduled to run after a delay, or has already run. If step_name is set to NULL, SKIP is set TRUE for all steps of this running chain. If SKIP is set TRUE for a step that PAUSE is also set for, when the step condition is met the step immediately changes to state PAUSED. 'RESTART_ON_FAILURE' If set to TRUE for a step and the step fails due to an application error, then the step is retried using the normal Scheduler retry mechanism (after 1 second, after 10 seconds, after 100 seconds, and so on, up to a maximum of 6 times). If all 6 retries fail (after about 30 hours), then the chain step is marked FAILED. If set to FALSE (the default), a failed chain step is immediately marked FAILED. 'RESTART_ON_RECOVERY' If the RESTART_ON_RECOVERY attribute is set to TRUE for a step, then if the step is stopped by a database shutdown, it is restarted when the database is recovered. If set to FALSE, then if the step is stopped by a database shutdown, the step is marked as stopped when the database is recovered and the chain continues. 'STATE' This changes the state of the steps. The state can only be changed if the step is not running. The state can only be changed to one of the following: 'NOT_STARTED', 'SUCCEEDED', 'FAILED error_code' If the state is being changed to FAILED, an error code must be included (this must be a positive integer). |
| value | The value to set for the attribute. Valid values are: TRUE, FALSE, 'NOT_STARTED', 'SUCCEEDED', or 'FAILED error_code' |

Usage Notes

Altering a running chain requires you to have alter privileges on the job that is running (either as the owner, or as a user with ALTER privileges on the job or the CREATE ANY JOB system privilege).

When trying to update a step defined with a nested chain, it is necessary to specify the job_name as <SCHEMA>.<JOB_NAME>.<STEP_NAME_IN_TOP_LEVEL_CHAIN> to be able to make reference to the steps inside the subchain.

157.6.7 CLOSE_WINDOW Procedure

This procedure closes an open window prematurely. A closed window means that it is no longer in effect. When a window is closed, the Scheduler switches the resource plan to the

one that is in effect outside the window, or in the case of overlapping windows, to another window.

Syntax

```
DBMS_SCHEDULER.CLOSE_WINDOW (
    window_name          IN VARCHAR2);
```

Parameters

Table 157-19 CLOSE_WINDOW Procedure Parameters

| Parameter | Description |
|-------------|------------------------|
| window_name | The name of the window |

Usage Notes

If you try to close a window that does not exist or is not open, an error is generated.

A job that is running does not stop when the window it is running in closes, unless the attribute `stop_on_window_close` is set to `TRUE` for the job. However, the resources allocated to the job can change if the resource plan changes.

When a running job has a group of type `WINDOW` as its schedule, the job is not stopped when its window is closed if another window in the same window group becomes active. This is the case even if the job has the attribute `stop_on_window_close` set to `TRUE`.

Closing a window requires the `MANAGE SCHEDULER` privilege.

157.6.8 COPY_JOB Procedure

This procedure copies all attributes of an existing job to a new job. The new job is created disabled, while the state of the existing job is unaltered.

Syntax

```
DBMS_SCHEDULER.COPY_JOB (
    old_job              IN VARCHAR2,
    new_job              IN VARCHAR2);
```

Parameters

Table 157-20 COPY_JOB Procedure Parameters

| Parameter | Description |
|-----------|------------------------------|
| old_job | The name of the existing job |
| new_job | The name of the new job |

Usage Notes

To copy a job, you must have privileges to create a job in the schema of the new job (the `CREATE JOB` system privilege if it is in your own schema, otherwise, the `CREATE ANY`

JOB system privilege). If the old job is not in the your own schema, then you must also have ALTER privileges on the old job or the CREATE ANY JOB system privilege.

157.6.9 CREATE_CHAIN Procedure

This procedure creates a new chain. The chain name can be optionally qualified with a schema name (for example, myschema.myname).

A chain is always created as disabled and must be enabled with the [ENABLE Procedure](#) before it can be used.

Syntax

```
DBMS_SCHEDULER.CREATE_CHAIN (
    chain_name          IN VARCHAR2,
    rule_set_name       IN VARCHAR2 DEFAULT NULL,
    evaluation_interval IN INTERVAL DAY TO SECOND DEFAULT NULL,
    comments            IN VARCHAR2 DEFAULT NULL);
```

Parameters

Table 157-21 CREATE_CHAIN Procedure Parameters

| Parameter | Description |
|---------------------|---|
| chain_name | The name to assign to the new chain, which can optionally be qualified with a schema. This must be unique in the SQL namespace, therefore, there cannot already be a table or other object with this name and schema. |
| rule_set_name | In the normal case, no rule set should be passed in. The Scheduler automatically creates a rule set and associated empty evaluation context. You then use DEFINE_CHAIN_RULE to add rules and DROP_CHAIN_RULE to remove them. Advanced users can create a rule set that describes their chain dependencies and pass it in here. This allows greater flexibility in defining rules. For example, conditions can refer to external variables, and tables can be exposed through the evaluation context. If you pass in a rule set, you must ensure that it is in the format of a chain rule set. (For example, all steps must be listed as variables in the evaluation context). If no rule set is passed in, the rule set created is of the form SCHED_RULESET{N} and the evaluation context created is of the form SCHED_EVCTX{N} |
| evaluation_interval | If this is NULL, reevaluation of the rules of a running chain are performed only when the job starts and when a step completes. A non-NULL value causes rule evaluations to also occur periodically at the specified interval. Because evaluation may be CPU-intensive, this should be conservatively set to the highest possible value or left at NULL if possible. evaluation_interval cannot be less than a minute or greater than a day. |
| comments | An optional comment describing the purpose of the chain |

Usage Notes

To create a chain in your own schema, you must have the CREATE JOB system privilege. To create a chain in a different schema you must have the CREATE ANY JOB system privilege. If you do not provide a rule_set_name, a rule set and evaluation context is created in the schema that the chain is being created in, so you must have the privileges required to create

these objects. See the `DBMS_RULE_ADM.CREATE_RULE_SET` and `DBMS_RULE_ADM.CREATE_EVALUATION_CONTEXT` procedures for more information.

157.6.10 CREATE_CREDENTIAL Procedure

This deprecated procedure creates a stored username/password pair. Credentials are assigned to jobs so that they can authenticate with a local or remote host operating system or a remote Oracle database.

Note:

This procedure is deprecated with Oracle Database 12c Release 1 (12.1). While the procedure remains available in this package, for reasons of backward compatibility, Oracle recommends using the alternative enhanced functionality provided in the `DBMS_CREDENTIAL` package, specifically the `CREATE_CREDENTIAL Procedure`.

Syntax

```
DBMS_SCHEDULER.CREATE_CREDENTIAL (
  credential_name      IN VARCHAR2,
  username             IN VARCHAR2,
  password             IN VARCHAR2,
  database_role        IN VARCHAR2 DEFAULT NULL,
  windows_domain       IN VARCHAR2 DEFAULT NULL,
  comments             IN VARCHAR2 DEFAULT NULL);
```

Parameters

Table 157-22 CREATE_CREDENTIAL Procedure Parameters

| Parameter | Description |
|------------------------------|--|
| <code>credential_name</code> | The name to assign to the credential. It can optionally be prefixed with a schema name. It cannot be set to <code>NULL</code> . It is converted to uppercase unless enclosed in double quotation marks. |
| <code>username</code> | The user name for logging into to the host operating system or remote Oracle database. This cannot be set to <code>NULL</code> and is case-sensitive. It cannot contain double quotes or spaces. Maximum length is 64. |
| <code>password</code> | The password for the user name. This cannot be set to <code>NULL</code> and is case sensitive. The password is stored obfuscated and is not displayed in the Scheduler dictionary views. Maximum length is 128. |
| <code>database_role</code> | The value of the <code>database_role</code> attribute is used as the system privilege for logging into a remote database to run a remote database job. Valid values are: <code>SYSDBA</code> and <code>SYSOPER</code> |
| <code>windows_domain</code> | For a Windows remote executable target, this is the domain that the specified user belongs to. The domain is converted to uppercase automatically. Maximum length is 64. |
| <code>comments</code> | A text string that can be used to describe the credential. Scheduler does not use this parameter. Maximum length is 240. |

Usage Notes

Credentials reside in a particular schema and can be created by any user with the `CREATE JOB` system privilege. To create a credential in a schema other than your own, you must have the `CREATE ANY JOB` privilege.

157.6.11 CREATE_DATABASE_DESTINATION Procedure

This procedure creates a database destination. A database destination represents an Oracle database on which remote database jobs run.

The host that the remote database resides on must have a running Scheduler agent that is registered with the database that this procedure is called from.

Syntax

```
DBMS_SCHEDULER.CREATE_DATABASE_DESTINATION (
    destination_name      IN VARCHAR2,
    agent                 IN VARCHAR2,
    tns_name              IN VARCHAR2,
    comments              IN VARCHAR2 DEFAULT NULL);
```

Parameters

Table 157-23 CREATE_DATABASE_DESTINATION Procedure Parameters

| Parameter | Description |
|-------------------------------|---|
| <code>destination_name</code> | The name to assign to the database destination. It can optionally be prefixed with a schema name. Cannot be <code>NULL</code> . It is converted to uppercase unless enclosed in double quotation marks. |
| <code>agent</code> | The external destination name of the Scheduler agent to connect. Equivalent to an agent name. The external destination must already exist. The external destination representing an agent is created automatically on a database instance when the agent registers with that instance. An agent's name is specified in its agent configuration file. If it is not specified, it defaults to the first part (before the first period) of the name of the host it resides on. |
| <code>tns_name</code> | An Oracle Net connect identifier that is resolved to the Oracle database instance being connected to. The exact syntax depends on the Oracle Net configuration. The connect identifier can be a complete Oracle Net connect descriptor (network address and database service name) or a <i>net service name</i> , which is an alias for a connect descriptor. The alias must be resolved in the <code>tnsnames.ora</code> file on the local computer. The maximum size for <code>tns_name</code> is 2000 characters. If <code>tns_name</code> is <code>NULL</code> , the agent connects to the default Oracle database on its host. You specify the default database by assigning values to the <code>ORACLE_HOME</code> and <code>ORACLE_SID</code> parameters in the agent configuration file, <code>schagent.conf</code> , located in the agent home directory. See <i>Oracle Database Net Services Administrator's Guide</i> for more information on connect identifiers. |
| <code>comments</code> | A text string that describes the database destination. Scheduler does not use this argument. |

Usage Notes

Database destinations reside in a particular schema and can be created by any user with the `CREATE JOB` system privilege. To create a database destination in a schema other than your own, you must have the `CREATE ANY JOB` privilege.

157.6.12 CREATE_EVENT_SCHEDULE Procedure

This procedure creates an event schedule, which is used to start a job when a particular event is raised.

Syntax

```
DBMS_SCHEDULER.CREATE_EVENT_SCHEDULE (
    schedule_name      IN VARCHAR2,
    start_date         IN TIMESTAMP WITH TIME ZONE DEFAULT NULL,
    event_condition    IN VARCHAR2 DEFAULT NULL,
    queue_spec         IN VARCHAR2,
    end_date           IN TIMESTAMP WITH TIME ZONE DEFAULT NULL,
    comments           IN VARCHAR2 DEFAULT NULL);
```

Parameters

Table 157-24 CREATE_EVENT_SCHEDULE Parameters

| Parameter | Description |
|------------------------------|---|
| <code>schedule_name</code> | The name to assign to the schedule. The name must be unique in the SQL namespace. For example, a schedule cannot have the same name as a table in a schema. If no name is specified, then an error occurs. |
| <code>start_date</code> | This attribute specifies the date and time that this schedule becomes valid. Occurrences of the event before this date and time are ignored in the context of this schedule. |
| <code>event_condition</code> | This is a conditional expression based on the columns of the event source queue table. The expression must have the syntax of an Advanced Queuing rule. Accordingly, you can include user data properties in the expression, provided that the message payload is an object type, and that you prefix object attributes in the expression with <code>tab.user_data</code> . For more information on rules, see the <code>DBMS_AQADM.ADD_SUBSCRIBER</code> procedure. |
| <code>queue_spec</code> | This argument specifies either a file watcher name or the queue into which events that start this particular job are enqueued (the source queue). If the source queue is a secure queue, the <code>queue_spec</code> argument is a string containing a pair of values of the form <i>queue_name, agent name</i> . For non-secure queues, only the queue name need be provided. If a fully qualified queue name is not provided, the queue is assumed to be in the job owner's schema. In the case of secure queues, the agent name provided should belong to a valid agent that is currently subscribed to the queue. |
| <code>end_date</code> | The date and time after which jobs do not run and windows do not open. An event schedule that has no <code>end_date</code> is valid forever. <code>end_date</code> must be after the <code>start_date</code> . If it is not, then an error is generated when the schedule is created. |

Table 157-24 (Cont.) CREATE_EVENT_SCHEDULE Parameters

| Parameter | Description |
|-----------|--|
| comments | This attribute specifies an optional comment about the schedule. By default, this attribute is NULL. |

Usage Notes

You must have the `CREATE JOB` privilege to create a schedule in your own schema or the `CREATE ANY JOB` privilege to create a schedule in someone else's schema by specifying `schema.schedule_name`. Once a schedule has been created, it can be used by other users. The schedule is created with access to `PUBLIC`. Therefore, there is no need to explicitly grant access to the schedule.

**See Also:**

["CREATE_FILE_WATCHER Procedure"](#)

157.6.13 CREATE_FILE_WATCHER Procedure

This procedure creates a file watcher, which is a Scheduler object that defines the location, name, and other properties of a file whose arrival on a system causes the Scheduler to start a job. After you create a file watcher, you reference it in an event-based job or event schedule.

Syntax

```
DBMS_SCHEDULER.CREATE_FILE_WATCHER (
  file_watcher_name      IN VARCHAR2,
  directory_path         IN VARCHAR2,
  file_name              IN VARCHAR2,
  credential_name        IN VARCHAR2,
  destination            IN VARCHAR2 DEFAULT NULL,
  min_file_size          IN PLS_INTEGER DEFAULT 0,
  steady_state_duration IN INTERVAL DAY TO SECOND DEFAULT NULL,
  comments               IN VARCHAR2 DEFAULT NULL,
  enabled                IN BOOLEAN DEFAULT TRUE);
```

Parameters**Table 157-25 CREATE_FILE_WATCHER Parameters**

| Parameter | Description |
|-------------------|---|
| file_watcher_name | The name to assign to the file watcher. The name must be unique in the SQL namespace. For example, a file watcher cannot have the same name as a table in a schema. This can optionally be prefixed with a schema name. Cannot be NULL. |

Table 157-25 (Cont.) CREATE_FILE_WATCHER Parameters

| Parameter | Description |
|-----------------------|---|
| directory_path | Directory in which the file is expected to arrive. The single wildcard '?' at the beginning of the path denotes the Oracle home path. For example, '?/rdbms/log' denotes the rdbms/log subdirectory of the Oracle home directory. |
| file_name | Name of the file to look for. Two wildcards are permitted anywhere in the file name: '?' denotes any single character, and '*' denotes zero or more characters. This attribute cannot be NULL. |
| credential_name | Name of a valid credential object. The file watcher uses the credential to authenticate itself with the host operating system to access the watched-for file. The file watcher owner must have EXECUTE privileges on the credential. Cannot be NULL. |
| destination | Name of an external destination. You create an external destination by registering a remote Scheduler agent with the database. See the view ALL_SCHEDULER_EXTERNAL_DESTS for valid external destination names. If this parameter is NULL, the file watcher is created on the local host. |
| min_file_size | Minimum size in bytes that the file must be before the file watcher considers the file found. Default is 0. |
| steady_state_duration | Minimum time interval that the file must remain unchanged before the file watcher considers the file found. Cannot exceed one hour. If NULL, an internal value is used. The minimum value is 10 seconds. Oracle recommends similar steady_state_duration values for all file watchers for efficient file watcher job operation. Also, the repeat interval of the file watcher schedule must be equal or greater than the steady_state_duration value. |
| comments | Optional comment. |
| enabled | If TRUE (the default), the file watcher is enabled. |

Usage Notes

You must have the CREATE JOB system privilege to create a file watcher in your own schema. You require the CREATE ANY JOB system privilege to create a file watcher in a schema different from your own (except the SYS schema, which is disallowed).

157.6.14 CREATE_GROUP Procedure

This procedure creates a group. Groups contain members, which you can specify when you create the group or at a later time. There are three types of groups: window groups, database destination groups, and external destination groups.

You can use a group name in other DBMS_SCHEDULER package procedures to specify a list of objects. For example, to specify multiple destinations for a remote database job, you provide a group name for the DESTINATION_NAME parameter of the job.

Syntax

```
DBMS_SCHEDULER.CREATE_GROUP (
    group_name          IN VARCHAR2,
    group_type         IN VARCHAR2,
```

```
member          IN VARCHAR2 DEFAULT NULL,
comments       IN VARCHAR2 DEFAULT NULL);
```

Parameters

Table 157-26 CREATE_GROUP Procedure Parameters

| Parameter | Description |
|------------|--|
| group_name | The name to assign to the group. It can optionally be prefixed with a schema name. It cannot be NULL. It is converted to uppercase unless enclosed in double quotation marks. |
| group_type | <p>The type of members in the group. All members must be of the same type. Possible types are:</p> <ul style="list-style-type: none"> 'DB_DEST' Database destination: Members are database destinations, for running remote database jobs. 'EXTERNAL_DEST' External destination: Members are external destinations, for running remote external jobs. 'WINDOW' Members are Scheduler windows. You must have the <code>MANAGE SCHEDULER</code> privilege to create a group of this type. <p>Members in database destination and external destination groups have the following format:</p> <pre>[[schema.]credential@[schema.]destination</pre> <p>where:</p> <ul style="list-style-type: none"> <i>credential</i> is the name of an existing credential. <i>destination</i> is the name of an existing database destination or external destination. <p>The credential portion of a destination member is optional. If omitted, the job using this destination member uses its default credential.</p> <p>Members in window groups are window names. Because all Scheduler windows reside in the <code>SYS</code> schema, you do not specify a schema name for windows.</p> |
| member | <p>Optional comma-separated list of group members. The default is NULL. If NULL, use the <code>ADD_GROUP_MEMBER</code> procedure to add members. You can also use <code>ADD_GROUP_MEMBER</code> to add additional members at a later time.</p> <p>The keyword <code>LOCAL</code> can be used as a member in database destination groups and external destination groups.</p> <ul style="list-style-type: none"> In database destination groups, <code>LOCAL</code> represents the source database on which the job is created. It cannot be preceded with a credential. In external destination groups, <code>LOCAL</code> represents the host on which the source database resides. It can be optionally preceded with a credential name. If no credential is provided, jobs that use this group as their destination must have a default credential. |
| comments | A text string that describes the group. Scheduler does not use this argument. |

Usage Notes

Groups reside in a particular schema and can be created by any user with the `CREATE JOB` system privilege. To create a group in a schema other than your own, you must have the `CREATE ANY JOB` privilege. The group name must be unique among all Scheduler objects.

You can grant the `SELECT` or `READ` privilege on a group so that other users can reference the group when creating jobs or schedules. To enable other users to modify a group, you can grant the `ALTER` privilege on the group.

Each group member must be unique within the group. For destination groups, the credential/destination name pairs must be unique within the group. An error is generated if any of the group members do not exist. For destination groups, both the credential and destination portions of a member must exist.

Another group of the same type can be a group member. The Scheduler immediately expands the included group name into its list of members.

Groups are created enabled, but you can disable them.

Example

The following PL/SQL block creates a group named `production_dest1`, whose members are database destinations for a collection of production databases.

```
BEGIN
  DBMS_SCHEDULER.CREATE_GROUP(
    GROUP_NAME => 'production_dest1',
    GROUP_TYPE => 'DB_DEST',
    MEMBER     => 'LOCAL, oracle_cred@prodhost1, prodhost2',
    COMMENTS  => 'All sector1 production machines');
END;
```

157.6.15 CREATE_INCOMPATIBILITY Procedure

This procedure creates an incompatibility definition.

Syntax

```
DBMS_SCHEDULER.CREATE_INCOMPATIBILITY (
  incompatibility_name  IN VARCHAR2,
  object_name          IN VARCHAR2,
  constraint_level     IN VARCHAR2 DEFAULT 'JOB_LEVEL',
  enabled              IN BOOLEAN DEFAULT TRUE,
  comments             IN VARCHAR2 DEFAULT NULL);
```

Parameters

Table 157-27 CREATE_INCOMPATIBILITY Procedure Parameters

| Parameter | Description |
|-----------------------------------|---|
| <code>incompatibility_name</code> | The name of the incompatibility definition. |
| <code>object_name</code> | One or more (comma-separated) programs or jobs. |

Table 157-27 (Cont.) CREATE_INCOMPATIBILITY Procedure Parameters

| Parameter | Description |
|-------------------------------|--|
| <code>constraint_level</code> | One or more (comma-separated) programs or jobs. |
| <code>enabled</code> | Specifies whether the constraint is initially enabled (<code>true</code>) or not enabled (<code>false</code>). |
| <code>comments</code> | Optional descriptive comment. |

Usage Notes

If `object_name` contains multiple (comma-separated) values, they must be either all programs or all jobs that are incompatible with each other (that is, they cannot be run at the same time). For jobs, the list must consist of two or more jobs, and `constraint_level` must be 'JOB_LEVEL'. For programs, `constraint_level` can be either 'JOB_LEVEL' or 'PROGRAM_LEVEL'. When set to the default value 'JOB_LEVEL', only a single job that is based on the program (or programs) mentioned in `object_name` can run at the same time. When `constraint_level` is set to 'PROGRAM_LEVEL', the programs are incompatible, but the jobs based on the same program are not incompatible.

For example, if the value of `object_name` is 'P1,P2,P3' and `constraint_level` is 'PROGRAM_LEVEL', many jobs based on P1 can be running at the same time, but if any P1 based job is running, none based on P2 or P3 can be running. Or, similarly, many jobs based on P3 can be running at the same time, but none based on P1 or P2. If `constraint_level` is set to 'JOB_LEVEL', then only a single job out of all the jobs based on programs P1, P2 and P3 can be running at a time.

See Also:

Using Incompatibility Definitions in *Oracle Database Administrator's Guide*

157.6.16 CREATE_JOB Procedure

This procedure creates a single job.

If you create the job as enabled by setting the `enabled` attribute to `TRUE`, the Scheduler automatically runs the job according to its schedule. If you create the job disabled, the job does not run until you enable it with the [SET_ATTRIBUTE Procedure](#).

The procedure is overloaded. The different functionality of each form of syntax is presented along with the syntax declaration.

Syntax

Creates a job in a single call without using an existing program or schedule:

```
DBMS_SCHEDULER.CREATE_JOB (
  job_name          IN VARCHAR2,
  job_type          IN VARCHAR2,
  job_action        IN VARCHAR2,
  number_of_arguments IN PLS_INTEGER          DEFAULT 0,
  start_date        IN TIMESTAMP WITH TIME ZONE DEFAULT NULL,
```

```

repeat_interval      IN VARCHAR2                                DEFAULT NULL,
end_date            IN TIMESTAMP WITH TIME ZONE DEFAULT NULL,
job_class           IN VARCHAR2                                DEFAULT 'DEFAULT_JOB_CLASS',
enabled             IN BOOLEAN                               DEFAULT FALSE,
auto_drop           IN BOOLEAN                               DEFAULT TRUE,
comments           IN VARCHAR2                                DEFAULT NULL,
credential_name     IN VARCHAR2                                DEFAULT NULL,
destination_name    IN VARCHAR2                                DEFAULT NULL);

```

Creates a job using a named schedule object and a named program object:

```

DBMS_SCHEDULER.CREATE_JOB (
  job_name           IN VARCHAR2,
  program_name       IN VARCHAR2,
  schedule_name      IN VARCHAR2,
  job_class          IN VARCHAR2                                DEFAULT 'DEFAULT_JOB_CLASS',
  enabled            IN BOOLEAN                               DEFAULT FALSE,
  auto_drop          IN BOOLEAN                               DEFAULT TRUE,
  comments           IN VARCHAR2                                DEFAULT NULL,
  job_style          IN VARCHAR2                                DEFAULT 'REGULAR',
  credential_name    IN VARCHAR2                                DEFAULT NULL,
  destination_name   IN VARCHAR2                                DEFAULT NULL);

```

Creates a job using a named program object and an inlined schedule:

```

DBMS_SCHEDULER.CREATE_JOB (
  job_name           IN VARCHAR2,
  program_name       IN VARCHAR2,
  start_date         IN TIMESTAMP WITH TIME ZONE DEFAULT NULL,
  repeat_interval    IN VARCHAR2                                DEFAULT NULL,
  end_date           IN TIMESTAMP WITH TIME ZONE DEFAULT NULL,
  job_class          IN VARCHAR2                                DEFAULT 'DEFAULT_JOB_CLASS',
  enabled            IN BOOLEAN                               DEFAULT FALSE,
  auto_drop          IN BOOLEAN                               DEFAULT TRUE,
  comments           IN VARCHAR2                                DEFAULT NULL,
  job_style          IN VARCHAR2                                DEFAULT 'REGULAR',
  credential_name    IN VARCHAR2                                DEFAULT NULL,
  destination_name   IN VARCHAR2                                DEFAULT NULL);

```

Creates a job using a named schedule object and an inlined program:

```

DBMS_SCHEDULER.CREATE_JOB (
  job_name           IN VARCHAR2,
  schedule_name      IN VARCHAR2,
  job_type           IN VARCHAR2,
  job_action         IN VARCHAR2,
  number_of_arguments IN PLS_INTEGER                        DEFAULT 0,
  job_class          IN VARCHAR2                                DEFAULT 'DEFAULT_JOB_CLASS',
  enabled            IN BOOLEAN                               DEFAULT FALSE,
  auto_drop          IN BOOLEAN                               DEFAULT TRUE,
  comments           IN VARCHAR2                                DEFAULT NULL,
  credential_name    IN VARCHAR2                                DEFAULT NULL,
  destination_name   IN VARCHAR2                                DEFAULT NULL);

```

Creates a job using an inlined program and an event:

```

DBMS_SCHEDULER.CREATE_JOB (
  job_name           IN VARCHAR2,
  job_type           IN VARCHAR2,
  job_action         IN VARCHAR2,
  number_of_arguments IN PLS_INTEGER                        DEFAULT 0,
  start_date         IN TIMESTAMP WITH TIME ZONE DEFAULT NULL,

```

```

event_condition      IN VARCHAR2          DEFAULT NULL,
queue_spec           IN VARCHAR2,
end_date             IN TIMESTAMP WITH TIME ZONE DEFAULT NULL,
job_class            IN VARCHAR2          DEFAULT 'DEFAULT_JOB_CLASS',
enabled              IN BOOLEAN          DEFAULT FALSE,
auto_drop            IN BOOLEAN          DEFAULT TRUE,
comments            IN VARCHAR2          DEFAULT NULL,
credential_name      IN VARCHAR2          DEFAULT NULL,
destination_name     IN VARCHAR2          DEFAULT NULL);

```

Creates a job using a named program object and an event:

```

DBMS_SCHEDULER.CREATE_JOB (
  job_name            IN VARCHAR2,
  program_name        IN VARCHAR2,
  start_date          IN TIMESTAMP WITH TIME ZONE,
  event_condition     IN VARCHAR2,
  queue_spec          IN VARCHAR2,
  end_date            IN TIMESTAMP WITH TIME ZONE,
  job_class           IN VARCHAR2          DEFAULT 'DEFAULT_JOB_CLASS',
  enabled             IN BOOLEAN          DEFAULT FALSE,
  auto_drop           IN BOOLEAN          DEFAULT TRUE,
  comments            IN VARCHAR2          DEFAULT NULL,
  job_style           IN VARCHAR2          DEFAULT 'REGULAR',
  credential_name     IN VARCHAR2          DEFAULT NULL,
  destination_name    IN VARCHAR2          DEFAULT NULL);

```

Parameters

Table 157-28 *CREATE_JOB Procedure Parameters*

| Parameter | Description |
|-----------|--|
| job_name | <p>The name to assign to the job. The name must be unique in the SQL namespace. For example, a job cannot have the same name as a table in a schema. If the job being created will reside in another schema, it must be qualified with the schema name.</p> <p>If <code>job_name</code> is not specified, an error is generated. If you want to have a name generated by the Scheduler, you can use the <code>GENERATE_JOB_NAME</code> procedure to generate a name and then use the output in the <code>CREATE_JOB</code> procedure. The <code>GENERATE_JOB_NAME</code> procedure generates a number from a sequence, which is the job name. You can prefix the number with a string. The job name will then be the string with the number from the sequence appended to it. See "GENERATE_JOB_NAME Function" for more information.</p> |

Table 157-28 (Cont.) CREATE_JOB Procedure Parameters

| Parameter | Description |
|-----------|--|
| job_type | <p>This attribute specifies the type of job that you are creating. If it is not specified, an error is generated. See <code>job_action</code> in the next row for related information.</p> <p>The supported values are:</p> <ul style="list-style-type: none"> 'PLSQL_BLOCK' This specifies that the job is an anonymous PL/SQL block. Job or program arguments are not supported when the job or program type is <code>PLSQL_BLOCK</code>. In this case, the number of arguments must be 0. 'STORED_PROCEDURE' This specifies that the job is a PL/SQL or Java stored procedure, or an external C subprogram. Only procedures, not functions with return values, are supported. 'EXECUTABLE' This specifies that the job is going to be run outside the database using an external executable. External jobs are anything that can be executed from the command line of the operating system. <code>Anydata</code> arguments are not supported with a job or program type of <code>EXECUTABLE</code>. The job owner must have the <code>CREATE EXTERNAL JOB</code> system privilege before the job can be enabled or run. 'CHAIN' This specifies that the job is a chain. Arguments are not supported for a chain, so <code>number_of_arguments</code> must be 0. 'EXTERNAL_SCRIPT' This specifies that the job is an external script that uses the command shell of the computer running the job. For Windows this is <code>cmd.exe</code> and for UNIX based systems the <code>sh</code> shell, unless a different interpreter is specified by prefixing the first line of the script with <code>#!</code>. 'SQL_SCRIPT' This specifies that the job is a SQL*Plus script. The job must point to a credential that contains a valid operating system username and password. The SQL*Plus script is run by the SQL*Plus executable. The job may point to a connect credential that contains a database credential. If so, this credential is used to connect to the database before running the SQL*Plus script. Note that if you choose to use connect credential, you must use <code>set_attribute</code> to specify the <code>Connect_Credential_Name</code> attribute. If you do not have connect credential, you must include an explicit SQL*Plus connect statement providing a valid database userid / password. The job owner must have the <code>CREATE EXTERNAL JOB</code> system privilege. 'BACKUP_SCRIPT' This specifies that the job is an RMAN backup script. The script runs a connect statement that uses either a password or OS authentication before it executes any target commands. The job points to a credential that contains a valid operating system username and password. The RMAN session runs under this operating system user. The Scheduler uses the RMAN executable from the current Oracle home to run the script and throws an error if this is missing. The job owner must have the <code>CREATE EXTERNAL JOB</code> system privilege. |

Table 157-28 (Cont.) CREATE_JOB Procedure Parameters

| Parameter | Description |
|------------|---|
| job_action | <p>This attribute specifies the action of the job. If <code>job_action</code> is not specified for an inline program, then an error is generated when creating the job.</p> <p>The job action is executed inside an autonomous transaction, and all autonomous transaction guidelines and restrictions apply. For example, online DDL operations are not allowed inside an autonomous transaction, and therefore cannot be used in the job action.</p> <p>The following actions are possible:</p> <ul style="list-style-type: none"> • For a PL/SQL block: <p>The action is to execute PL/SQL code. These blocks must end with a semicolon. For example, <code>my_proc();</code> or <code>BEGIN my_proc(); END;</code> or <code>DECLARE arg pls_integer:= 10; BEGIN my_proc2(arg); END;</code></p> <p>Note that the Scheduler wraps <code>job_action</code> in its own block and passes the following to PL/SQL for execution: <code>DECLARE ... BEGIN job_action END;</code> This is done to declare some internal Scheduler variables. You can include any Scheduler metadata attribute except <code>event_message</code> in your PL/SQL code. You use the attribute name as you use any other PL/SQL identifier, and the Scheduler assigns it a value.</p> <p>See Table 157-40 for details on available metadata attributes.</p> • For a stored procedure: <p>The action is the name of the stored procedure. You have to specify the schema if the procedure resides in another schema than the job. If case sensitivity is needed, enclose the schema name and the store procedure name in double quotes. For example, <code>job_action_action=>'Schema"."Procedure"</code>.</p> <p>PL/SQL procedures with <code>INOUT</code> or <code>OUT</code> arguments are not supported as <code>job_action</code> when the job or program type is <code>STORED_PROCEDURE</code>.</p> • For an executable: <p>The action is the name of the external executable, including the full path name, but excluding any command-line arguments. If the action starts with a single question mark ('?'), the question mark is replaced by the path to the Oracle home directory for a local job or to the Scheduler agent home for a remote job. If the action contains an at-sign ('@') and the job is local, the at-sign is replaced with the SID of the current Oracle instance.</p> <p>NOTE: Shell script syntax is not supported, only syntax for the name of and path to an executable is supported.</p> • For a chain: <p>The action is the name of a Scheduler chain object. You must specify the schema of the chain if it resides in a different schema than the job.</p> • For an external script: <p>The <code>job_action</code> must be either the path to an operating system script or an inline operating system script. If the <code>job_action</code> is a path to a script, then the script must reside on every computer that the job runs on. The <code>job_action</code> may contain calls to SQL*Plus or RMAN executables directly, without having to specify its full path, given that they are stored on their default location for every computer that runs the job.</p> <p>The job can only have arguments that are strings or that can be cast to strings. These arguments are passed positionally when the script is called. The job must point to a credential that contains a valid operating system username and password.</p> • For a SQL script: |

Table 157-28 (Cont.) CREATE_JOB Procedure Parameters

| Parameter | Description |
|----------------------------------|--|
| | <p>The <code>job_action</code> must be either the path to a SQL*Plus script or an inline SQL*Plus script. If the <code>job_action</code> is a path to a script, then the script must reside on every computer that the job runs on.</p> <p>The job can only have arguments that are strings or that can be cast to strings. These arguments are passed positionally when the script is called. If the arguments are named, they are also bound to named variables in the SQL*Plus session.</p> <ul style="list-style-type: none"> For a backup script: <p>The <code>job_action</code> is either the path to a RMAN script or an inline RMAN script. If the <code>program_action</code> is a path to a script, then the script must reside on every computer that the program runs on.</p> <p>The job can only have arguments that are strings or that can be cast to strings. These arguments are passed positionally when the script is called.</p> |
| <code>number_of_arguments</code> | This attribute specifies the number of arguments that the job expects. The range is 0-255, with the default being 0. |
| <code>program_name</code> | The name of the program associated with this job. If the program is of type EXECUTABLE, the job owner must have the CREATE EXTERNAL JOB system privilege before the job can be enabled or run. |
| <code>start_date</code> | <p>This attribute specifies the first date and time on which this job is scheduled to start. If <code>start_date</code> and <code>repeat_interval</code> are left null, then the job is scheduled to run as soon as the job is enabled.</p> <p>For repeating jobs that use a calendaring expression to specify the repeat interval, <code>start_date</code> is used as a reference date. The first time the job runs is the first match of the calendaring expression that is on or after the current date and time.</p> <p>The Scheduler cannot guarantee that a job executes on an exact time because the system may be overloaded and thus resources unavailable.</p> |
| <code>event_condition</code> | This is a conditional expression based on the columns of the event source queue table. The expression must have the syntax of an Advanced Queuing rule. Accordingly, you can include user data properties in the expression provided that the message payload is an object type, and that you prefix object attributes in the expression with <code>tab.user_data</code> . For more information on rules, see the DBMS_AQADM.ADD_SUBSCRIBER procedure. |
| <code>queue_spec</code> | <p>This argument specifies either of the following:</p> <ul style="list-style-type: none"> The source queue where events that start this particular job are enqueued. If it is secure, then the <code>queue_spec</code> argument is a pair of values of the form <code>queue_name, agent name</code>. If it is not secure, then only the queue name need be provided. If a fully qualified queue name is not provided, the queue is assumed to be in the job owner's schema. In the case of secure queues, the agent name provided should belong to a valid agent that is currently subscribed to the queue. A file watcher name. For more information on this option, see <i>Oracle Database Administrator's Guide</i>. |
| <code>repeat_interval</code> | <p>This attribute specifies how often the job repeats. You can specify the repeat interval by using calendaring or PL/SQL expressions.</p> <p>The expression specified is evaluated to determine the next time the job should run. If <code>repeat_interval</code> is not specified, the job runs only once at the specified start date. See "Calendaring Syntax" for further information.</p> |
| <code>schedule_name</code> | The name of the schedule, window, or window group associated with this job. |

Table 157-28 (Cont.) CREATE_JOB Procedure Parameters

| Parameter | Description |
|-----------------|--|
| job_class | The class this job is associated with. |
| end_date | <p>This attribute specifies the date and time after which the job expires and is no longer run. After the end_date, if auto_drop is TRUE, the job is dropped. If auto_drop is FALSE, the job is disabled and the STATE of the job is set to COMPLETED.</p> <p>If no value for end_date is specified, the job repeats forever unless max_runs or max_failures is set, in which case the job stops when either value is reached.</p> <p>The value for end_date must be after the value for start_date. If end_date is less than start_date, then an error will be generated. If end_date is the same as start_date, then the job will not execute and no error will be generated.</p> |
| comments | This attribute specifies a comment about the job. By default, this attribute is NULL. |
| job_style | <p>Style of the job being created. This argument can have one of the following values:</p> <ul style="list-style-type: none"> 'REGULAR' creates a regular job. This is the default. 'LIGHTWEIGHT' creates a lightweight job. This value is permitted only when the job references a program object. Use lightweight jobs when you have many short-duration jobs that run frequently. Under certain circumstances, using lightweight jobs can deliver a small performance gain. 'IN_MEMORY_RUNTIME' creates an in-memory runtime job. These jobs are based on lightweight job structures, so the same rules and restrictions apply; however, they further boost performance by keeping an in-memory cache, so they minimize disk access for pre-run and post-run actions. 'IN_MEMORY_FULL' creates an in-memory full job. In-memory full jobs require a program and cannot have a schedule or repeat interval. They run automatically when the job is enabled, and after running they are discarded. They keep all the job information in memory and are not backed up on disk, meaning that they are lost when the instance is rebooted. They are designed to run actions that must be performed immediately with the least amount of overhead possible. |
| credential_name | <p>The default credential to use with the job. Applicable only to remote database jobs, remote external jobs, local external jobs, script jobs, and event-based jobs that process file arrival events. The credential must exist.</p> <p>For local database jobs, it must be NULL.</p> <p>For local external jobs only, if this attribute is NULL (the default), then a preferred (default) credential is selected. See <i>Oracle Database Administrator's Guide</i> for information about preferred credentials for local external jobs.</p> <p>See also: "CREATE_CREDENTIAL Procedure"</p> |

Table 157-28 (Cont.) CREATE_JOB Procedure Parameters

| Parameter | Description |
|------------------|--|
| destination_name | <p>The database destination or external destination for the job. Use for remote database jobs and remote external jobs only. Must be NULL for jobs running on the local database or for local external jobs (executables).</p> <p>This attribute can be a single destination name or the name of a group of type 'EXTERNAL_DEST' or 'DB_DEST'. The single destination or group must already exist.</p> <p>The following applies to this attribute:</p> <ul style="list-style-type: none"> • If it is a database destination, it must have been created by the CREATE_DATABASE_DESTINATION Procedure. • If it is an external destination, it must have been implicitly created by registering a remote Scheduler agent with the local database. • If it is a group, each member of the group must exist, and the job must run on all destinations named in the group. See "CREATE_GROUP Procedure". <p>destination_name cannot reference a destination group when:</p> <ul style="list-style-type: none"> • The job type is 'CHAIN' • The job style is 'LIGHTWEIGHT', 'IN_MEMORY_RUNTIME', or 'IN_MEMORY_FULL' <p>If the credential_name argument of CREATE_JOB is NULL, each destination must be preceded by a credential, in the following format:</p> <pre>credential.destination</pre> <p>The credential must already exist. If the credential_name argument is provided, then it serves as the default credential for every destination that is not preceded by a credential.</p> <p>You can query the views *_SCHEDULER_DB_DESTS and ALL_SCHEDULER_EXTERNAL_DESTS for existing destinations and *_SCHEDULER_GROUP_MEMBERS for existing groups and their members.</p> <p>*** destination job attribute is deprecated in Oracle Database 11gR2 and superseded by destination_name.</p> |
| enabled | <p>This attribute specifies whether the job is created enabled or not. The possible settings are TRUE or FALSE. By default, this attribute is set to FALSE and, therefore, the job is created as disabled. A disabled job means that the metadata about the job has been captured, and the job exists as a database object. However, the Scheduler ignores the job and the job coordinator does not pick it for processing. In order for the job coordinator to process the job, the job must be enabled. You can enable a job by setting this argument to TRUE or by using the ENABLE procedure.</p> |
| auto_drop | <p>This flag, if TRUE, causes a job to be automatically dropped after it has completed or has been automatically disabled. A job is considered completed if:</p> <ul style="list-style-type: none"> • Its end date (or the end date of the job schedule) has passed. Note that a job with a Window schedule will not be auto-dropped when the window closes, because this is not considered to be the end of the Window. • It has run max_runs number of times. max_runs must be set with SET_ATTRIBUTE. • It is not a repeating job and has run once. <p>A job is disabled when it has failed max_failures times. max_failures is also set with SET_ATTRIBUTE.</p> <p>If this flag is set to FALSE, the jobs are not dropped and their metadata is kept until the job is explicitly dropped with the DROP_JOB procedure.</p> <p>By default, jobs are created with auto_drop set to TRUE.</p> |

Usage Notes

Jobs are created as disabled by default. You must explicitly enable them so that they will become active and scheduled. Before enabling a job, ensure that all program arguments, if any, are defined, either by defining default values in the program object or by supplying values with the job.

The `JOB_QUEUE_PROCESSES` initialization parameter specifies the maximum number of processes that can be created for the execution of jobs. Beginning with Oracle Database 11g Release 2, `JOB_QUEUE_PROCESSES` applies to `DBMS_SCHEDULER` jobs. Setting this parameter to 0 disables `DBMS_SCHEDULER` jobs.

To create a job in your own schema, you need to have the `CREATE JOB` privilege. A user with the `CREATE ANY JOB` privilege can create a job in any schema. If the job being created will reside in another schema, the job name must be qualified with the schema name. For a job of type `EXECUTABLE` (or for a job that points to a program of type `EXECUTABLE`), the job owner must have the `CREATE EXTERNAL JOB` system privilege before the job can be enabled or run.

Associating a job with a particular class or program requires `EXECUTE` privileges for that class or program.

Not all possible job attributes can be set with `CREATE_JOB`. Some must be set after the job is created. For example, job arguments must be set with the [SET_JOB_ARGUMENT_VALUE Procedure](#) or the [SET_JOB_ANYDATA_VALUE Procedure](#). Other job attributes, such as `job_priority` and `max_runs`, are set with the [SET_ATTRIBUTE Procedure](#).

To create multiple jobs efficiently, use the `CREATE_JOBS` procedure.

Note:

The Scheduler runs event-based jobs for each occurrence of an event that matches the event condition of the job. However, events that occur while the job is already running are ignored; the event gets consumed, but does not trigger another run of the job.

157.6.17 CREATE_JOB_CLASS Procedure

This procedure creates a job class. Job classes are created in the `SYS` schema.

Syntax

```
DBMS_SCHEDULER.CREATE_JOB_CLASS (
  job_class_name          IN VARCHAR2,
  resource_consumer_group IN VARCHAR2 DEFAULT NULL,
  service                IN VARCHAR2 DEFAULT NULL,
  logging_level          IN PLS_INTEGER
                        DEFAULT DBMS_SCHEDULER.LOGGING_RUNS,
  log_history            IN PLS_INTEGER DEFAULT NULL,
  comments              IN VARCHAR2 DEFAULT NULL);
```

Parameters

Table 157-29 CREATE_JOB_CLASS Procedure Parameters

| Parameter | Description |
|-------------------------|--|
| job_class_name | <p>The name to assign to the job class. Job classes can only be created in the SYS schema.</p> <p>This attribute specifies the name of the job class and uniquely identifies the job class. The name must be unique in the SQL namespace. For example, a job class cannot have the same name as a table in a schema.</p> |
| resource_consumer_group | <p>This attribute specifies the resource consumer group that this class is associated with. A resource consumer group is a set of synchronous or asynchronous sessions that are grouped together based on their processing needs. A job class has a many-to-one relationship with a resource consumer group. The resource consumer group that the job class associates with determines the resources that are allocated to the job class.</p> <p>If a resource consumer group is dropped, job classes associated with it are then associated with the default resource consumer group.</p> <p>If no resource consumer group is specified, job classes are associated with the default resource consumer group.</p> <p>If the specified resource consumer group does not exist when creating the job class, an error occurs.</p> |
| service | <p>This attribute specifies the database service that the jobs in this class have affinity to. In an Oracle RAC environment, this means that the jobs in this class only run on those database instances that are assigned to the specific service.</p> <p>Note that a service can be mapped to a resource consumer group, so you can also control resources allocated to jobs by specifying a service. See DBMS_RESOURCE_MANAGER.SET_CONSUMER_GROUP_MAPPING for details. If both the resource_consumer_group and service attributes are specified, and if the service is mapped to a resource consumer group, the resource_consumer_group attribute takes precedence.</p> <p>If no service is specified, the job class belongs to the default service, which means it has no service affinity and any one of the database instances within the cluster might run the job. If the service that a job class belongs to is dropped, the job class will then belong to the default service.</p> <p>If the specified service does not exist when creating the job class, then an error occurs.</p> |
| logging_level | <p>This attribute specifies how much information is logged. The possible options are:</p> <ul style="list-style-type: none"> • DBMS_SCHEDULER.LOGGING_OFF No logging is performed for any jobs in this class. • DBMS_SCHEDULER.LOGGING_RUNS The Scheduler writes detailed information to the job log for all runs of each job in this class. This is the default. • DBMS_SCHEDULER.LOGGING_FAILED_RUNS The Scheduler logs only jobs that failed in this class. • DBMS_SCHEDULER.LOGGING_FULL In addition to recording every run of a job, the Scheduler records all operations performed on all jobs in this class. Every time a job is created, enabled, disabled, altered (with SET_ATTRIBUTE), stopped, and so, an entry is recorded in the log. |

Table 157-29 (Cont.) CREATE_JOB_CLASS Procedure Parameters

| Parameter | Description |
|-------------|--|
| log_history | This attribute controls the number of days that job log entries for jobs in this class are retained. It helps prevent the job log from growing indiscriminately. The range of valid values is 0 through 1000000. If set to 0, no history is kept. If NULL (the default), retention days are set by the log_history Scheduler attribute (set with SET_SCHEDULER_ATTRIBUTE). |
| comments | This attribute is for an optional comment about the job class. By default, this attribute is NULL. |

Usage Notes

For users to create jobs that belong to a job class, the job owner must have EXECUTE privileges on the job class. Therefore, after the job class has been created, EXECUTE privileges must be granted on the job class so that users create jobs belonging to that class. You can also grant the EXECUTE privilege to a role.

Creating a job class requires the MANAGE_SCHEDULER system privilege.

157.6.18 CREATE_JOBS Procedure

This procedure creates multiple jobs and sets the values of their arguments in a single call.

Syntax

```
DBMS_SCHEDULER.CREATE_JOBS (
    jobdef_array      IN SYS.JOB_DEFINITION_ARRAY,
    commit_semantics  IN VARCHAR2 DEFAULT 'STOP_ON_FIRST_ERROR');
```

Parameters**Table 157-30 CREATE_JOBS Procedure Parameters**

| Parameter | Description |
|------------------|---|
| jobdef_array | The array of job definitions. See " Data Structures " for a description of the JOB_DEFINITION_ARRAY and JOB_DEFINITION datatypes. |
| commit_semantics | The commit semantics. The following types are supported: <ul style="list-style-type: none"> STOP_ON_FIRST_ERROR returns on the first error. Previous successfully created jobs are committed to disk. This is the default. TRANSACTIONAL returns on the first error and everything that happened before that error is rolled back. ABSORB_ERRORS tries to absorb any errors and attempts to create the rest of the jobs on the list. It commits all successfully created jobs. If errors occur, you can query the view SCHEDULER_BATCH_ERRORS for details. |

Usage Notes

This procedure creates many jobs in the context of a single transaction. To realize the desired performance gains, the jobs being created must be grouped in batches of sufficient size.

Calling `CREATE_JOBS` with a small array size may not be much faster than calling `CREATE_JOB` once for each job.

You cannot use this procedure to create multiple-destination jobs. That is, the `destination` attribute of the `job_definition` object cannot reference a destination group.

Examples

See *Oracle Database Administrator's Guide*.

157.6.19 CREATE_PROGRAM Procedure

This procedure creates a program.

Syntax

```
DBMS_SCHEDULER.CREATE_PROGRAM (  
    program_name          IN VARCHAR2,  
    program_type          IN VARCHAR2,  
    program_action        IN VARCHAR2,  
    number_of_arguments  IN PLS_INTEGER DEFAULT 0,  
    enabled                IN BOOLEAN DEFAULT FALSE,  
    comments               IN VARCHAR2 DEFAULT NULL);
```

Parameters

Table 157-31 CREATE_PROGRAM Procedure Parameters

| Parameter | Description |
|---------------------------|--|
| <code>program_name</code> | The name to assign to the program. The name must be unique in the SQL namespace. For example, a program cannot have the same name as a table in a schema. If no name is specified, then an error occurs. |

Table 157-31 (Cont.) CREATE_PROGRAM Procedure Parameters

| Parameter | Description |
|---------------------------|---|
| <code>program_type</code> | <p>This attribute specifies the type of program you are creating. If it is not specified then you get an error. These are the supported values for <code>program_type</code>:</p> <ul style="list-style-type: none"> <p><code>'PLSQL_BLOCK'</code></p> <p>This specifies that the program is a PL/SQL block. Job or program arguments are not supported when the job or program type is <code>PLSQL_BLOCK</code>. In this case, the number of arguments must be 0.</p> <p><code>'STORED_PROCEDURE'</code></p> <p>This specifies that the program is a PL/SQL or Java stored procedure, or an external C subprogram. Only procedures, not functions with return values, are supported. PL/SQL procedures with <code>INOUT</code> or <code>OUT</code> arguments are not supported.</p> <p><code>'EXECUTABLE'</code></p> <p>This specifies that the job is going to be run outside the database using an external executable. External programs imply anything that can be executed from the operating system command line. <code>AnyData</code> arguments are not supported with job or program type <code>EXECUTABLE</code>.</p> <p><code>'EXTERNAL_SCRIPT'</code></p> <p>project 25230, this bullet and next two</p> <p>This specifies that the job is an external script that uses the command shell of the computer running the job. For Windows this is <code>cmd.exe</code> and for UNIX based systems the <code>sh</code> shell, unless a different interpreter is specified by prefixing the first line of the script with <code>#!</code>.</p> <p><code>'SQL_SCRIPT'</code></p> <p>This specifies that the program is a SQL*Plus script. A job using this program must point to a credential that contains a valid operating system username and password. The SQL*Plus script is run by SQL*Plus executable. The job using this program may point to a connect credential that contains a database credential. If so, this credential is used to connect to the database before running the SQL*Plus script. Note that if you choose to use connect credential, you must use <code>set_attribute</code> to specify the <code>Connect_Credential_Name</code> attribute. If you do not have connect credential, you must include an explicit SQL*Plus connect statement providing a valid database userid / password.</p> <p><code>'BACKUP_SCRIPT'</code></p> <p>This specifies that the program is an RMAN backup script. The script runs a connect statement that uses either a password or OS authentication before it executes any target commands. The Scheduler uses the RMAN executable from the current Oracle home to run the script and throws an error if this is missing.</p> |

Table 157-31 (Cont.) CREATE_PROGRAM Procedure Parameters

| Parameter | Description |
|----------------|--|
| program_action | <p>This attribute specifies the action of the program. If program_action is not specified, an error is generated.</p> <p>project 25230 last 3 bullets</p> <p>The following actions are possible:</p> <ul style="list-style-type: none"> For a PL/SQL block, the action is to execute PL/SQL code. These blocks must end with a semicolon. For example, <code>my_proc();</code> or <code>BEGIN my_proc(); END;</code> or <code>DECLARE arg pls_integer:= 10; BEGIN my_proc2(arg); END;</code>. <p>Note that the Scheduler wraps job_action in its own block and passes the following to PL/SQL for execution: <code>DECLARE ... BEGIN job_action END;</code> This is done to declare some internal Scheduler variables. You can include any Scheduler metadata attribute except event_message in your PL/SQL code. You use the attribute name as you use any other PL/SQL identifier, and the Scheduler assigns it a value. See Table 157-40 for details on available metadata attributes.</p> <p>If it is an anonymous block, special Scheduler metadata may be accessed using the following variable names: job_name, job_owner, job_start, window_start, window_end. For more information, see the "DEFINE_METADATA_ARGUMENT Procedure".</p> <ul style="list-style-type: none"> For a stored procedure, the action is the name of the stored procedure. You have to specify the schema if the procedure resides in a schema other than the job. If case sensitivity is needed, enclose the schema name and the store procedure name in double quotes. For example, <code>program_action=>'Schema"."Procedure"'</code>. For an executable, the action is the name of the external executable, including the full path name, but excluding any command-line arguments. If the action starts with a single question mark ('?'), the question mark is replaced by the path to the Oracle home directory for a local job or to the Scheduler agent home for a remote job. If the action contains an at sign('@') and the job is local, the at sign is replaced with the SID of the current Oracle instance. For an external script, the action must be either the path to an operating system script or an inline operating system script. If the program_action is a path to a script, then the script must reside on every computer that the program runs on. The program_action may contain calls to SQL*Plus or RMAN executables directly, without having to specify its full path, given that they are stored on their default location for every computer that runs the job. <p>The job can only have arguments that are strings or that can be cast to strings. These arguments are passed positionally when the script is called. The program points</p> |

Table 157-31 (Cont.) CREATE_PROGRAM Procedure Parameters

| Parameter | Description |
|----------------------------------|--|
| | <p>to a credential that contains a valid operating system username and password.</p> <ul style="list-style-type: none"> For a SQL script, the action must be either the path to a SQL*Plus script or an inline SQL*Plus script. If the <code>program_action</code> is a path to a script, then the script must reside on every computer that the program runs on. The job can only have arguments that are strings or that can be cast to strings. These arguments are passed positionally when the script is called. If the arguments are named, they are also bound to named variables in the SQL*Plus session. For a backup script, the action must be either the path to a RMAN script or an inline RMAN script. If the <code>program_action</code> is a path to a script, then the script must reside on every computer that the program runs on. The job can only have arguments that are strings or that can be cast to strings. These arguments are passed positionally when the script is called. |
| <code>number_of_arguments</code> | <p>This attribute specifies the number of arguments the program takes. If this parameter is not specified, then the default is 0. A program can have a maximum of 255 arguments.</p> <p>If the <code>program_type</code> is <code>PLSQL_BLOCK</code>, then this parameter is ignored.</p> |
| <code>enabled</code> | <p>This flag specifies whether the program should be created as enabled or not. If the flag is set to <code>TRUE</code>, then validity checks are made and the program is created as <code>ENABLED</code> if all the checks be successful. By default, this flag is set to <code>FALSE</code>, meaning not created enabled. You can also call the <code>ENABLE</code> procedure to enable the program before it can be used.</p> |
| <code>comments</code> | <p>A comment about the program. By default, this attribute is <code>NULL</code>.</p> |

Usage Notes

To create a program in their own schema, users need the `CREATE JOB` privilege. A user with the `CREATE ANY JOB` privilege can create a program in any schema. A program is created in a disabled state by default (unless the `enabled` parameter is set to `TRUE`). It cannot be executed by a job until it is enabled.

To use your programs, other users must have `EXECUTE` privileges, therefore once a program has been created, you have to grant `EXECUTE` privileges on it.

See Also:

"[DEFINE_PROGRAM_ARGUMENT Procedure](#)"

157.6.20 CREATE_RESOURCE Procedure

This procedure allows users to specify the resources used by jobs or to create a new resource.

Syntax

```
DBMS_SCHEDULER.CREATE_RESOURCE (
  resource_name  IN VARCHAR2,
  units          IN PLS_INTEGER,
  status         IN VARCHAR2 DEFAULT 'ENFORCE_CONSTRAINTS',
  constraint_level IN VARCHAR2 DEFAULT 'JOB_LEVEL',
  comments       IN VARCHAR2 DEFAULT NULL);
```

Parameters

Table 157-32 CREATE_RESOURCE Procedure Parameters

| Parameter | Description |
|------------------|--|
| resource_name | The name of the resource. |
| units | The number of units of this resource that the job or program uses. |
| status | The status of the resource. <ul style="list-style-type: none"> 'ENFORCE_CONSTRAINTS'. This is the default value, and when set, will force the scheduler to enforce resource limits. When the maximum number of units of this resource has been reached no additional jobs using this resource will get started. 'IGNORE_CONSTRAINTS'. When set, the scheduler will ignore any constraints on this resource. 'BLOCKED_ALL_JOBS'. No jobs having a constraint on this resource will be allowed to run. The resource is considered to be permanently blocking until switched to one of the other two states. |
| constraint_level | Level of the constraint: <code>JOB_LEVEL</code> or <code>PROGRAM_LEVEL</code> . For incompatibilities, for <code>JOB_LEVEL</code> , the incompatibility members must be jobs; for <code>PROGRAM_LEVEL</code> the incompatibility members must be programs. |
| comments | Descriptive comment about the resource. |

Usage Notes

The following example creates a new resource.

```
BEGIN
  DBMS_SCHEDULER.CREATE_RESOURCE(
    resource_name => 'my_resource',
    units => 3,
    state => 'ENFORCE_CONSTRAINTS',
    comments => 'Resource1'
  )
END;
/
```

 **See Also:**

- Creating or Dropping a Resource in *Oracle Database Administrator's Guide*
- [SET_RESOURCE_CONSTRAINT Procedure](#)

157.6.21 CREATE_SCHEDULE Procedure

This procedure creates a schedule.

Syntax

```
DBMS_SCHEDULER.CREATE_SCHEDULE (
    schedule_name      IN VARCHAR2,
    start_date         IN TIMESTAMP WITH TIMEZONE DEFAULT NULL,
    repeat_interval    IN VARCHAR2,
    end_date           IN TIMESTAMP WITH TIMEZONE DEFAULT NULL,
    comments           IN VARCHAR2 DEFAULT NULL);
```

Parameters

Table 157-33 CREATE_SCHEDULE Procedure Parameters

| Parameter | Description |
|-----------------|---|
| schedule_name | The name to assign to the schedule. The name must be unique in the SQL namespace. For example, a schedule cannot have the same name as a table in a schema. If no name is specified, then an error occurs. |
| start_date | This attribute specifies the first date and time on which this schedule becomes valid. For a repeating schedule, the value for start_date is a reference date. In this case, the start of the schedule is not the start_date; it depends on the repeat interval specified. start_date is used to determine the first instance of the schedule. If start_date is specified in the past and no value for repeat_interval is specified, the schedule is invalid. For a repeating job or window, start_date can be derived from the repeat_interval if it is not specified. If start_date is null, then the date that the job or window is enabled is used. start_date and repeat_interval cannot both be null. |
| repeat_interval | This attribute specifies how often the schedule repeats. It is expressed using calendaring syntax. See " Calendaring Syntax " for further information. PL/SQL expressions are not allowed as repeat intervals for named schedules. |
| end_date | The date and time after which jobs will not run and windows will not open. A non-repeating schedule that has no end_date is valid forever. end_date has to be after the start_date. If this is not the case, then an error is generated when the schedule is created. |
| comments | This attribute specifies an optional comment about the schedule. By default, this attribute is NULL. |

Usage Notes

This procedure requires the `CREATE JOB` privilege to create a schedule in your own schema or the `CREATE ANY JOB` privilege to create a schedule in someone else's schema by specifying `schema.schedule_name`. Once a schedule has been created, it can be used by other users. The schedule is created with access to `PUBLIC`. Therefore, there is no need to explicitly grant access to the schedule.

157.6.22 CREATE_WINDOW Procedure

This procedure creates a recurring time window and associates it with a resource plan. You can then use the window to schedule jobs that run under the associated resource plan. Windows are created in the `SYS` schema.

The procedure is overloaded.

Syntax

Creates a window using a named schedule object:

```
DBMS_SCHEDULER.CREATE_WINDOW (
  window_name          IN VARCHAR2,
  resource_plan        IN VARCHAR2,
  schedule_name        IN VARCHAR2,
  duration              IN INTERVAL DAY TO SECOND,
  window_priority      IN VARCHAR2 DEFAULT 'LOW',
  comments              IN VARCHAR2 DEFAULT NULL);
```

Creates a window using an inlined schedule:

```
DBMS_SCHEDULER.CREATE_WINDOW (
  window_name          IN VARCHAR2,
  resource_plan        IN VARCHAR2,
  start_date           IN TIMESTAMP WITH TIME ZONE DEFAULT NULL,
  repeat_interval      IN VARCHAR2,
  end_date             IN TIMESTAMP WITH TIME ZONE DEFAULT NULL,
  duration              IN INTERVAL DAY TO SECOND,
  window_priority      IN VARCHAR2 DEFAULT 'LOW',
  comments              IN VARCHAR2 DEFAULT NULL);
```

Parameters

Table 157-34 CREATE_WINDOW Procedure Parameters

| Parameter | Description |
|--------------------------|---|
| <code>window_name</code> | The name to assign to the window. The name must be unique in the SQL namespace. All windows are in the <code>SYS</code> schema, so the preface 'SYS' is optional. |

Table 157-34 (Cont.) CREATE_WINDOW Procedure Parameters

| Parameter | Description |
|-----------------|---|
| resource_plan | <p>This attribute specifies the resource plan that automatically activates when the window opens. When the window closes, the system switches to the appropriate resource plan, which is usually the plan that was in effect before the window opened, but can also be the plan of a different window.</p> <p>Only one resource plan can be associated with a window. It may be NULL or the empty string (""). When it is NULL, the resource plan in effect when the window opens stays in effect for the duration of the window. When it is the empty string, the resource manager is disabled for the duration of the window.</p> <p>If the window is open and the resource plan is dropped, then the resource allocation for the duration of the window is not affected.</p> |
| start_date | <p>This attribute specifies the first date and time on which this window is scheduled to open. If the value for start_date specified is in the past or is not specified, the window opens as soon as it is created.</p> <p>For repeating windows that use a calendaring expression to specify the repeat interval, the value for start_date is a reference date. The first time the window opens depends on the repeat interval specified and the value for start_date.</p> |
| duration | <p>This attribute specifies how long the window stays open. For example, 'interval '5' hour' for five hours. There is no default value for this attribute. Therefore, if no value is specified when the window is created, an error occurs. The duration is of type interval day to seconds and ranges from one minute to 99 days.</p> |
| schedule_name | <p>This attribute specifies the name of the schedule associated with the window.</p> |
| repeat_interval | <p>This attribute specifies how often the window repeats. It is expressed using the Scheduler calendaring syntax. See "Calendaring Syntax" for more information.</p> <p>A PL/SQL expression cannot be used to specify the repeat interval for a window.</p> <p>The expression specified is evaluated to determine the next time the window opens. If no repeat_interval is specified, the window opens only once at the specified start date.</p> |
| end_date | <p>This attribute specifies the date and time after which the window no longer opens. When the value for end_date is reached, the window is disabled. In the *_SCHEDULER_WINDOWS views, the enabled flag of the window is set to FALSE.</p> <p>A non-repeating window that has no value for end_date opens only once for the duration of the window. For a repeating window, if no end_date is specified, then the window keeps repeating forever.</p> <p>The end_date must be after the start_date. If it is not, then an error is generated when the window is created.</p> |

Table 157-34 (Cont.) CREATE_WINDOW Procedure Parameters

| Parameter | Description |
|-----------------|--|
| window_priority | This attribute is only relevant when two windows overlap. Because only one window can be in effect at one time, the window priority determines which window opens. The two possible values for this attribute are 'HIGH' and 'LOW'. A high priority window has precedence over a low priority window, therefore, the low priority window does not open if it overlaps a high priority window. By default, windows are created with priority 'LOW'. |
| comments | This attribute specifies an optional comment about the window. By default, this attribute is NULL. |

Usage Notes

Creating a window requires the `MANAGE SCHEDULER` privilege.

Scheduler windows are the principal mechanism used to automatically switch resource plans according to a schedule. You can also manually activate a resource plan by using the `ALTER SYSTEM SET RESOURCE_MANAGER_PLAN` statement or the `DBMS_RESOURCE_MANAGER.SWITCH_PLAN` package procedure. Note that either of these manual methods can also disable resource plan switching by Scheduler windows. For more information, see *Oracle Database Administrator's Guide* and "[SWITCH_PLAN Procedure](#)".

157.6.23 DEFINE_ANYDATA_ARGUMENT Procedure

This procedure defines a name or default value for a program argument that is of a complex type and must be encapsulated within an `ANYDATA` object. A job that references the program can override the default value.

Syntax

```
DBMS_SCHEDULER.DEFINE_ANYDATA_ARGUMENT (
    program_name          IN VARCHAR2,
    argument_position     IN PLS_INTEGER,
    argument_name         IN VARCHAR2 DEFAULT NULL,
    argument_type         IN VARCHAR2,
    default_value         IN SYS.ANYDATA,
    out_argument          IN BOOLEAN DEFAULT FALSE);
```

Parameters

Table 157-35 DEFINE_ANYDATA_ARGUMENT Procedure Parameters

| Parameter | Description |
|-------------------|---|
| program_name | The name of the program to be altered. A program with this name must exist. |
| argument_position | The position of the argument as it is passed to the executable. Argument numbers go from one to the <code>number_of_arguments</code> specified for the program. This must be unique, so it can replace any argument already defined at this position. |

Table 157-35 (Cont.) DEFINE_ANYDATA_ARGUMENT Procedure Parameters

| Parameter | Description |
|---------------|---|
| argument_name | The name to assign to the argument. It is optional, but must be unique for the program if it is specified. If you assign a name, the name can then be used by other package procedures, including the SET_JOB_ANYDATA_VALUE Procedure . |
| argument_type | The datatype of the argument being defined. This is not verified or used by the Scheduler. It is only used by the user of the program when deciding what value to assign to the argument. |
| default_value | The default value to be assigned to the argument encapsulated within an AnyData object. This is optional. |
| out_argument | This parameter is reserved for future use. It must be set to FALSE. |

Usage Notes

All program arguments from one to the `number_of_arguments` value must be defined before a program can be enabled. If a default value for an argument is not defined with this procedure, a value must be defined in the job.

Defining a program argument requires that you be the owner of the program or have ALTER privileges on that program. You can also define a program argument if you have the CREATE ANY JOB privilege.

See Also:

- ["DEFINE_PROGRAM_ARGUMENT Procedure"](#)
- ["SET_JOB_ANYDATA_VALUE Procedure"](#)

157.6.24 DEFINE_CHAIN_EVENT_STEP Procedure

This procedure adds or replaces a chain step and associates it with an event schedule or an inline event.

Once started in a running chain, this step does not complete until the specified event has occurred. Every step in a chain must be defined before the chain can be enabled and used. Defining a step gives it a name and specifies what happens during the step. If a step already exists with this name, the new step replaces the old one.

Syntax

```
DBMS_SCHEDULER.DEFINE_CHAIN_EVENT_STEP (
    chain_name          IN VARCHAR2,
    step_name           IN VARCHAR2,
    event_schedule_name IN VARCHAR2,
    timeout             IN INTERVAL DAY TO SECOND DEFAULT NULL);
```

```
DBMS_SCHEDULER.DEFINE_CHAIN_EVENT_STEP (
    chain_name          IN VARCHAR2,
```

```

step_name          IN VARCHAR2,
event_condition    IN VARCHAR2,
queue_spec         IN VARCHAR2,
timeout            IN INTERVAL DAY TO SECOND DEFAULT NULL);

```

Parameters

Table 157-36 DEFINE_CHAIN_EVENT_STEP Procedure Parameters

| Parameter | Description |
|---------------------|---|
| chain_name | The name of the chain that the step is in |
| step_name | The name of the step |
| event_schedule_name | The name of the event schedule that the step waits for |
| timeout | This parameter is reserved for future use |
| event_condition | See the CREATE_EVENT_SCHEDULE Procedure |
| queue_spec | See the CREATE_EVENT_SCHEDULE Procedure |

Usage Notes

Defining a chain step requires ALTER privileges on the chain either as the owner of the chain, or as a user with the ALTER object privilege on the chain or the CREATE ANY JOB system privilege.

You can base a chain step on a file watcher as well. To do this, provide the file watcher name directly in the queue_spec parameter, or use a file watcher schedule for the event_schedule_name parameter.

See Also:

"[DEFINE_CHAIN_STEP Procedure](#)"

157.6.25 DEFINE_CHAIN_RULE Procedure

This procedure adds a new rule to an existing chain, specified as a condition-action pair. The condition is expressed using either SQL or the Scheduler chain condition syntax and indicates the prerequisites for the action to occur. The action is a result of the condition being met.

An actual rule object is created to store the rule in the schema where the chain resides. If a rule name is given, this name is used for the rule object. If an existing rule name in the schema of the chain is given, the existing rule is altered. (A schema different than the schema of the chain cannot be specified). If no rule name is given, one is generated in the form SCHED_RULE\${N}.

Syntax

```

DBMS_SCHEDULER.DEFINE_CHAIN_RULE (
  chain_name      IN VARCHAR2,
  condition       IN VARCHAR2,
  action          IN VARCHAR2,

```

```
rule_name          IN VARCHAR2 DEFAULT NULL,
comments          IN VARCHAR2 DEFAULT NULL);
```

Parameters

Table 157-37 DEFINE_CHAIN_RULE Procedure Parameters

| Parameter | Description |
|------------|--|
| chain_name | The name of the chain to alter |
| condition | <p>A boolean expression which must evaluate to <code>TRUE</code> for the action to be performed. Every chain must have a rule that evaluates to <code>TRUE</code> to start the chain. For this purpose, you can use a rule that has 'TRUE' as its condition if you are using Scheduler chain condition syntax, or '1=1' as its condition if you are using SQL syntax.</p> <ul style="list-style-type: none"> Scheduler Chain Condition Syntax See "Scheduler Chain Condition Syntax" and <i>Oracle Database Administrator's Guide</i> for details SQL WHERE Clause Syntax Conditions expressed with SQL must use the syntax of a SELECT statement WHERE clause. You can refer to chain step attributes by using the chain step name as a bind variable. The bind variable syntax is <code>:step_name.attribute</code>. (<i>step_name</i> refers to a typed object.) Possible attributes are: <code>completed</code>, <code>state</code>, <code>start_date</code>, <code>end_date</code>, <code>error_code</code>, and <code>duration</code>. Possible values for the state attribute include: 'NOT_STARTED', 'SCHEDULED', 'RUNNING', 'PAUSED', 'STALLED', 'SUCCEEDED', 'FAILED', and 'STOPPED'. If a step is in the state 'SUCCEEDED', 'FAILED', or 'STOPPED', its completed attribute is set to 'TRUE', otherwise completed is 'FALSE'. |
| action | <p>The action to be performed when the rule evaluates to <code>TRUE</code>. The action must consist of at least one keyword with an optional value and an optional delay clause.</p> <p>Possible actions include:</p> <ul style="list-style-type: none"> <code>[AFTER delay_interval] START step_1[,step_2 ...]</code> <code>STOP step_1[,step_2 ...]</code> <code>END [{end_value step_name.error_code}]</code> <p>At the beginning of the START action, a delay clause can specify a delay interval before performing the action. <i>delay_interval</i> is a formatted datetime interval of the form <code>HH:MM:SS</code>.</p> <p>The END action ends the chain with an error code equal to either the supplied <i>end_value</i> or the error code that <i>step_name</i> completes with. The default error code is 0, indicating a successful chain run.</p> |
| rule_name | The name of the rule being created. If no <i>rule_name</i> is given, one is generated in the form <code>SCHED_RULE\$_{N}</code> . |
| comments | An optional comment describing the rule. This is stored in the rule object created. |

Scheduler Chain Condition Syntax

The Scheduler chain condition syntax provides an easy way to construct a condition using the states and error codes of steps in the current chain.

Chain Condition Syntax

The following are the available constructs for Scheduler chain condition syntax, which are all boolean expressions:

```

TRUE
FALSE
stepname [NOT] SUCCEEDED
stepname [NOT] FAILED
stepname [NOT] STOPPED
stepname [NOT] COMPLETED
stepname ERROR_CODE IN (integer, integer, integer ...)
stepname ERROR_CODE NOT IN (integer, integer, integer ...)
stepname ERROR_CODE = integer
stepname ERROR_CODE != integer
stepname ERROR_CODE <> integer
stepname ERROR_CODE > integer
stepname ERROR_CODE >= integer
stepname ERROR_CODE < integer
stepname ERROR_CODE <= integer

```

These boolean operators are available to create more complex conditions:

```

expression AND expression
expression OR expression
NOT (expression)

```

integer can be positive or negative. Parentheses may be used for clarity or to enforce ordering. You must use parentheses with the `NOT` operator.

PL/SQL code that runs as part of a step can set the value of `ERROR_CODE` for that step with the `RAISE_APPLICATION_ERROR` statement.

Usage Notes

Defining a chain rule requires `ALTER` privileges on the chain (either as the owner, or as a user with `ALTER` privileges on the chain or the `CREATE ANY JOB` system privilege).

You must define at least one rule that starts the chain and at least one that ends it. See the section "Adding Rules to a Chain" in *Oracle Database Administrator's Guide* for more information.

Examples

The following are examples of using rule conditions and rule actions.

Rule Conditions Using Scheduler Chain Condition Syntax

```

'step1 completed'
-- satisfied when step step1 has completed. (step1 completed is also TRUE when
any
-- of the following are TRUE: step1 succeeded, step1 failed, step1 stopped.)

'step1 succeeded and step2 succeeded'
-- satisfied when steps step1 and step2 have both succeeded

'step1 error_code > 100'
-- satisfied when step step1 has failed with an error_code greater than 100

'step1 error_code IN (1, 3, 5, 7)'
-- satisfied when step step1 has failed with an error_code of 1, 3, 5, or 7

```

Rule Conditions Using SQL Syntax

```
':step1.completed = 'TRUE' AND :step1.end_date >SYSDATE-1/24'
--satisfied when step step1 completed less than an hour ago

':step1.duration > interval '5' minute'
-- satisfied when step step1 has completed and took longer than 5 minutes to complete
```

Rule Actions

```
'AFTER 01:00:00 START step1, step2'
--After an hour start steps step1 and step2

'STOP step1'
--Stop step step1

END step4.error_code'
--End the chain with the error code that step step4 finished with. If step4 has not
completed, the chain will be ended unsuccessfully with error code 27435.

'END' or 'END 0'
--End the chain successfully (with error_code 0)

'END 100'
--End the chain unsuccessfully with error code 100.
```

157.6.26 DEFINE_CHAIN_STEP Procedure

This procedure adds or replaces a chain step and associates it with a program or a nested chain. When the chain step is started, the specified program or chain is run. If a step already exists with the name supplied in the `chain_name` argument, the new step replaces the old one.

The chain owner must have `EXECUTE` privileges on the program or chain associated with the step. Only one program or chain can run during a step.

You cannot set all possible step attributes with this procedure. Use the `ALTER_CHAIN` procedure to set additional chain step attributes, such as `credential_name` and `destination_name`.

Syntax

```
DBMS_SCHEDULER.DEFINE_CHAIN_STEP (
    chain_name          IN VARCHAR2,
    step_name           IN VARCHAR2,
    program_name        IN VARCHAR2);
```

Parameters

Table 157-38 DEFINE_CHAIN_STEP Procedure Parameters

| Parameter | Description |
|-------------------------|---|
| <code>chain_name</code> | The name of the chain to alter. |
| <code>step_name</code> | The name of the step being defined. If a step already exists with this name, the new step replaces the old one. |

Table 157-38 (Cont.) DEFINE_CHAIN_STEP Procedure Parameters

| Parameter | Description |
|--------------|--|
| program_name | The name of a program or chain to run during this step. The chain owner must have EXECUTE privileges on this program or chain. |

Usage Notes

Defining a chain step requires ALTER privileges on the chain (either as the owner, or a user with ALTER privileges on the chain or the CREATE ANY JOB system privilege).

See Also:

- ["ALTER_CHAIN Procedure"](#)
- ["DEFINE_CHAIN_EVENT_STEP Procedure"](#)

157.6.27 DEFINE_METADATA_ARGUMENT Procedure

This procedure defines a special metadata argument for the program. The Scheduler can pass Scheduler metadata through this argument to your stored procedure or other executable. You cannot set values for jobs using this argument.

Syntax

```
DBMS_SCHEDULER.DEFINE_METADATA_ARGUMENT (
  program_name          IN VARCHAR2,
  metadata_attribute    IN VARCHAR2,
  argument_position     IN PLS_INTEGER,
  argument_name         IN VARCHAR2 DEFAULT NULL);
```

Parameters

Table 157-39 DEFINE_METADATA_ARGUMENT Procedure Parameters

| Parameter | Description |
|--------------------|---|
| program_name | The name of the program to be altered |
| metadata_attribute | The metadata to be passed. Valid metadata attributes are: 'job_name', 'job_subname', 'job_owner', 'job_start', 'window_start', 'window_end', and 'event_message'. Table 157-40 describes these attributes in detail. |
| argument_position | The position of the argument as it is passed to the executable. The position cannot be greater than the number_of_arguments specified for the program. It must be unique, so it replaces any argument already defined at this position. |
| argument_name | The name to assign to the argument. It is optional, but must be unique for the program if it is specified. If you assign a name, the name can then be used by other package procedures. |

Table 157-40 Metadata Attributes

| Metadata Attribute | Datatype | Description |
|---------------------|--------------------------|---|
| job_name | VARCHAR2 | Name of the currently running job |
| job_subname | VARCHAR2 | Subname of the currently running job. The name + subname form a unique identifier for a job that is running a chain step. NULL if the job is not part of a chain. |
| job_owner | VARCHAR2 | Owner of the currently running job |
| job_scheduled_start | TIMESTAMP WITH TIME ZONE | When the currently running job was scheduled to start |
| job_start | TIMESTAMP WITH TIME ZONE | When the currently running job started |
| window_start | TIMESTAMP WITH TIME ZONE | If the job was started by a window, the time that the window opened |
| window_end | TIMESTAMP WITH TIME ZONE | If the job was started by a window, the time that the window is scheduled to close |
| event_message | (See Description) | For an event-based job, the message content of the event that started the job. The datatype of this attribute depends on the queue used for the event. It has the same type as the USER_DATA column of the queue table. In the case of a file arrival event, event_message is of type SYS.SCHEDULER_FILEWATCHER_RESULT. See "SCHEDULER_FILEWATCHER_RESULT Object Type". |

Usage Notes

Defining a program argument requires that you be the owner of the program or have ALTER privileges on that program. You can also define a program argument if you have the CREATE ANY JOB privilege.

All metadata attributes except event_message can be used in PL/SQL blocks that you enter into the job_action or program_action attributes of jobs or programs, respectively. You use the attribute name as you use any other PL/SQL identifier, and the Scheduler assigns it a value.

157.6.28 DEFINE_PROGRAM_ARGUMENT Procedure

This procedure defines a name or default value for a program argument. If no default value is defined for a program argument, the job that references the program must supply an argument value. (The job can also override a default value.)

This procedure is overloaded.

Syntax

Defines a program argument without a default value:

```
PROCEDURE define_program_argument(
    program_name          IN VARCHAR2,
    argument_position     IN PLS_INTEGER,
    argument_name         IN VARCHAR2 DEFAULT NULL,
    argument_type         IN VARCHAR2,
    out_argument          IN BOOLEAN DEFAULT FALSE);
```

Defines a program argument with a default value:

```
PROCEDURE define_program_argument(
    program_name          IN VARCHAR2,
    argument_position     IN PLS_INTEGER,
    argument_name         IN VARCHAR2 DEFAULT NULL,
    argument_type         IN VARCHAR2,
    default_value         IN VARCHAR2,
    out_argument          IN BOOLEAN DEFAULT FALSE);
```

Parameters

Table 157-41 DEFINE_PROGRAM_ARGUMENT Procedure Parameters

| Parameter | Description |
|-------------------|--|
| program_name | The name of the program to be altered. A program with this name must exist. |
| argument_position | The position of the argument as it is passed to the executable. Argument numbers go from one to the <code>number_of_arguments</code> specified for the program. This must be unique so it replaces any argument already defined at this position. |
| argument_name | The name to assign to the argument. It is optional, but must be unique for the program if specified. If you assign a name, the name can then be used by other package procedures, including the SET_JOB_ARGUMENT_VALUE Procedure . |
| argument_type | The datatype of the argument being defined. This is not verified or used by the Scheduler. The program user uses <code>argument_type</code> when deciding what value to assign to the argument. Any valid SQL datatype is allowed. |
| default_value | The default value to be assigned to the argument if none is specified by the job. |
| out_argument | This parameter is reserved for future use. It must be set to <code>FALSE</code> . |

Usage Notes

All program arguments from 1 to the `number_of_arguments` value must be defined before a program can be enabled. If a default value for an argument is not defined with this procedure, a value must be defined in the job.

Defining a program argument requires that you be the owner of the program or have `ALTER` privileges on that program. You can also define a program argument if you have the `CREATE ANY JOB` privilege.

`DEFINE_PROGRAM_ARGUMENT` only supports arguments of SQL type. Therefore, argument values that are not of SQL type, such as booleans, are not supported as program or job arguments.

See Also:

- ["DEFINE_ANYDATA_ARGUMENT Procedure"](#)
- ["SET_JOB_ARGUMENT_VALUE Procedure"](#)

157.6.29 DISABLE Procedure

This procedure disables a program, job, chain, window, database destination, external destination, file watcher, or group. When an object is disabled, its `enabled` attribute is set to `FALSE`.

Syntax

```
DBMS_SCHEDULER.DISABLE (
    name          IN VARCHAR2,
    force         IN BOOLEAN DEFAULT FALSE,
    commit_semantics IN VARCHAR2 DEFAULT 'STOP_ON_FIRST_ERROR');
```

Parameters

Table 157-42 DISABLE Procedure Parameters

| Parameter | Description |
|-------------------------------|---|
| <code>name</code> | The name of the object being disabled. Can be a comma-delimited list. If a job class name is specified, then all the jobs in the job class are disabled. The job class is not disabled. If a group name is specified, then the group is disabled, but the enabled state of the group members is unaffected. |
| <code>force</code> | If <code>TRUE</code> , objects are disabled even if other objects depend on them. See the usage notes for more information. |
| <code>commit_semantics</code> | The commit semantics. The following types are supported: <ul style="list-style-type: none"> <code>STOP_ON_FIRST_ERROR</code>: The procedure returns on the first error and the previous disable operations that were successful are committed to disk. This is the default. <code>TRANSACTIONAL</code>: The procedure returns on the first error and everything that happened before that error is rolled back. This type is only supported when disabling a job or a list of jobs. In addition, this type is not supported when <code>force</code> is set to <code>TRUE</code>. <code>ABSORB_ERRORS</code>: The procedure tries to absorb any errors and disable the rest of the jobs and commits all the disable operations that were successful. If errors occur, you can query the view <code>SCHEDULER_BATCH_ERRORS</code> for details. This type is only supported when disabling a job or a list of jobs. |

Usage Notes

Windows must be preceded by `SYS`.

Disabling an object that is already disabled does not generate an error.

The purpose of the `force` option is to point out dependencies. No dependent objects are altered.

To run `DISABLE` for a window or a group of type `WINDOW`, you must have the `MANAGE SCHEDULER` privilege.

You can use `DISABLE` with any schema except the `SYS` schema.

Jobs

Disabling a job means that, although the metadata of the job is there, it should not run and the job coordinator will not pick up these jobs for processing. When a job is disabled, its `state` in the job queue is changed to `disabled`.

If `force` is set to `FALSE` and the job is currently running, an error is returned.

If `force` is set to `TRUE`, the job is disabled, but the currently running instance is allowed to finish.

For jobs with multiple destinations, you cannot disable a child job at a specific destination. Instead, you can disable the destination.

Programs

When a program is disabled, the status is changed to `disabled`. A disabled program implies that, although the metadata is still there, jobs that point to this program cannot run.

If `force` is set to `FALSE`, the program must not be referenced by any job, otherwise an error will occur.

If `force` is set to `TRUE`, those jobs that point to the program will not be disabled, however, they will fail at runtime because their program will not be valid.

Running jobs that point to the program are not affected by the `DISABLE` call and are allowed to continue.

No arguments that pertain to the program are affected when the program is disabled.

File Watchers

If `force` is set to `FALSE`, the file watcher must not be referenced by any job, otherwise an error will occur. If you force disabling a file watcher, jobs that depend on it become disabled.

Windows

This means that the window will not open, however, the metadata of the window is still there, so it can be reenabled.

If `force` is set to `FALSE`, the window must not be open or referenced by any job otherwise an error occurs.

If `force` is set to `TRUE`, disabling a window that is open will succeed but the window will not be closed. It will prevent the window from opening in the future until it is reenabled.

When the window is disabled, those jobs that have the window as their schedule will not be disabled.

Window Groups

When a group of type `WINDOW` is disabled, jobs (other than a running job) that have the window group as their schedule will not run when the member windows open. However, a job that has one of the window group members as its schedule still runs.

The metadata of the window group is still there, so it can be reenabled. Note that the members of the window group will still open.

If `force` is set to `FALSE`, the window group must not have any members that are open or referenced by any job, otherwise an error will occur.

If `force` is set to `TRUE`:

- The window group is disabled and the open window will be not closed or disabled. It will be allowed to continue to its end.
- The window group is disabled but those jobs that have the window group as their schedule will not be disabled.

Job Chains

When a chain is disabled, the metadata for the chain is still there, but jobs that point to it will not be able to be run. This allows changes to the chain to be made safely without the risk of having an incompletely specified chain run. If `force` is set to `FALSE`, the chain must not be referenced by any job, otherwise an error will occur. If `force` is set to `TRUE`, those jobs that point to the chain will not be disabled, however, they will fail at runtime. Running jobs that point to this chain are not affected by the `DISABLE` call and are allowed to complete.

Database Destinations

When you disable a database destination:

- The destination is skipped when a multiple destination job runs.
- If all destinations are disabled for a job, the Scheduler generates an error when it attempts to run the job.
- The `REFS_ENABLED` column in `*_SCHEDULER_JOB_DESTS` is set to `FALSE` for all jobs that reference the database destination.

External Destinations

When you disable an external destination:

- Dependent database destinations remain enabled, but the Scheduler generates an error when it attempts to run a job with a database destination that depends on the external destination.
- The `REFS_ENABLED` column in `*_SCHEDULER_JOB_DESTS` is set to `FALSE` for all external jobs that reference the external destination and for all database jobs with a database destination that depends on the external destination.

Groups

If you disable an external destination group or database destination group, the Scheduler generates an error when it attempts to run a job that names the group as its destination.

157.6.30 DROP_AGENT_DESTINATION Procedure

This procedure drops one or more external destinations, also known as agent destinations. It should be used only when the preferred method of dropping an external destination, using the `schagent` utility to unregister a Scheduler agent with a database, is unavailable due to failures.

This procedure can be called only by the `SYS` user or a user with the `MANAGE SCHEDULER` privilege.

**Note:**

External destinations are created on a source database only implicitly by registering an agent with the database. There is no user-callable `CREATE_AGENT_DESTINATION` procedure.

Syntax

```
DBMS_SCHEDULER.DROP_AGENT_DESTINATION (
    destination_name      IN VARCHAR2);
```

Parameters**Table 157-43 DROP_AGENT_DESTINATION Procedure Parameters**

| Parameter | Description |
|-------------------------------|--|
| <code>destination_name</code> | <p>A comma-separated list of external destinations to drop. Because user <code>SYS</code> owns all external destinations, do not prefix them with a schema name.</p> <p>The procedure stops processing if it encounters an external destination that does not exist. All external destinations processed before the error are dropped.</p> <p>Cannot be <code>NULL</code>.</p> |

Usage Notes

When an external destination is dropped:

- All database destinations that refer to the external destination are disabled and their `agent` attribute is set to `NULL`.
- Members of external destination groups that refer to the destination are removed from the group.
- All job instances in the `*_SCHEDULER_JOB_DESTS` views that refer to the external destination are also dropped.
- Jobs running against the destination are stopped.

157.6.31 DROP_CHAIN Procedure

This procedure drops an existing chain.

Syntax

```
DBMS_SCHEDULER.DROP_CHAIN (
    chain_name      IN VARCHAR2,
    force           IN BOOLEAN DEFAULT FALSE);
```

Parameters

Table 157-44 DROP_CHAIN Procedure Parameters

| Parameter | Description |
|------------|---|
| chain_name | The name of the chain to drop. Can also be a comma-delimited list of chains. |
| force | If <code>force</code> is set to <code>FALSE</code> , the chain must not be referenced by any job, otherwise an error will occur. If <code>force</code> is set to <code>TRUE</code> , all jobs pointing to the chain are disabled before the chain is dropped. Running jobs that point to this chain are stopped before the chain is dropped. |

Usage Notes

Dropping a chain requires alter privileges on the chain (either as the owner, or a user with `ALTER` privileges on the chain or the `CREATE ANY JOB` system privilege).

All steps associated with the chain are dropped. If no rule set was specified when the chain was created, then the automatically created rule set and evaluation context associated with the chain are also dropped, so the user must have the privileges required to do this. See the `DBMS_RULE_ADM.DROP_RULE_SET` and `DBMS_RULE_ADM.DROP_EVALUATION_CONTEXT` procedures for more information.

If `force` is `FALSE`, no jobs may be using this chain. If `force` is `TRUE`, any jobs that use this chain are disabled before the chain is dropped (and any of these jobs that are running will be stopped).

157.6.32 DROP_CHAIN_RULE Procedure

This procedure removes a rule from an existing chain. The rule object corresponding to this rule will also be dropped. The chain will not be disabled. If dropping this rule makes the chain invalid, the user should first disable the chain to ensure that it does not run.

Syntax

```
DBMS_SCHEDULER.DROP_CHAIN_RULE (
    chain_name      IN VARCHAR2,
    rule_name       IN VARCHAR2,
    force           IN BOOLEAN DEFAULT FALSE);
```

Parameters

Table 157-45 DROP_CHAIN_RULE Procedure Parameters

| Parameter | Description |
|------------|--|
| chain_name | The name of the chain to alter |
| rule_name | The name of the rule to drop |
| force | If <code>force</code> is set to <code>TRUE</code> , the drop operation proceeds even if the chain is currently running. The running chain is not stopped or interrupted. If <code>force</code> is set to <code>FALSE</code> and the chain is running, an error is generated. |

Usage Notes

Dropping a chain rule requires alter privileges on the chain (either as the owner or as a user with ALTER privileges on the chain or the CREATE ANY JOB system privilege).

Dropping a chain rule also drops the underlying rule database object so you must have the privileges to drop this rule object. See the DBMS_RULE_ADM.DROP_RULE procedure for more information.

157.6.33 DROP_CHAIN_STEP Procedure

This procedure drops a chain step. If this chain step is still used in the chain rules, the chain will be disabled.

Syntax

```
DBMS_SCHEDULER.DROP_CHAIN_STEP (
  chain_name          IN VARCHAR2,
  step_name           IN VARCHAR2,
  force               IN BOOLEAN DEFAULT FALSE);
```

Parameters

Table 157-46 DROP_CHAIN_STEP Procedure Parameters

| Parameter | Description |
|------------|---|
| chain_name | The name of the chain to alter |
| step_name | The name of the step being dropped. Can be a comma-separated list. |
| force | If force is set to TRUE, this succeeds even if this chain is currently running. The running chain will not be stopped or interrupted. If force is set to FALSE and this chain is currently running, an error is thrown. |

Usage Notes

Dropping a chain step requires ALTER privileges on the chain (either as the owner or as a user with ALTER privileges on the chain or the CREATE ANY JOB system privilege).

157.6.34 DROP_CREDENTIAL Procedure

This deprecated procedure drops a credential.

Note:

This procedure is deprecated with Oracle Database 12c Release 1 (12.1). While the procedure remains available in this package, for reasons of backward compatibility, Oracle recommends using the alternative enhanced functionality provided in the DBMS_CREDENTIAL package, specifically the DROP_CREDENTIAL Procedure.

Syntax

```
DBMS_SCHEDULER.DROP_CREDENTIAL (
    credential_name      IN VARCHAR2,
    force                IN BOOLEAN DEFAULT FALSE);
```

Parameters

Table 157-47 DROP_CREDENTIAL Procedure Parameters

| Parameter | Description |
|-----------------|---|
| credential_name | The name of the credential being dropped. This can optionally be prefixed with a schema name. This cannot be set to NULL. |
| force | If set to FALSE, the credential must not be referenced by any job, or an error will occur. If set to TRUE, the credential is dropped whether or not there are jobs referencing it. Jobs that reference the credential will continue to point to a nonexistent credential and throw an error at runtime. |

Usage Notes

Only the owner of a credential or a user with the CREATE ANY JOB system privilege may drop the credential.

Running jobs that point to the credential are not affected by this procedure and are allowed to continue.

157.6.35 DROP_DATABASE_DESTINATION Procedure

This procedure drops one or more database destinations.

Syntax

```
DBMS_SCHEDULER.DROP_DATABASE_DESTINATION (
    destination_name    IN VARCHAR2);
```

Parameters

Table 157-48 DROP_DATABASE_DESTINATION Procedure Parameters

| Parameter | Description |
|------------------|---|
| destination_name | The name of the destination to drop. Can be a comma-separated list of database destinations to drop. Each database destination can optionally be prefixed with a schema name. The procedure stops processing if it encounters a database destination that does not exist. All database destinations processed before the error are dropped. Cannot be NULL. |

Usage Notes

Only the owner or a user with the CREATE ANY JOB system privilege may drop the database destination.

When a database destination is dropped:

- All job instances that refer to the destination in the *_SCHEDULER_JOB_DESTS views are also dropped.
- Jobs running against the destination are stopped.
- Members of database destination groups that refer to the destination are removed from the group.

See Also:

[CREATE_DATABASE_DESTINATION Procedure](#)

157.6.36 DROP_FILE_WATCHER Procedure

This procedure drops one or more file watchers.

Syntax

```
DBMS_SCHEDULER.DROP_FILE_WATCHER (
  file_watcher_name      IN VARCHAR2,
  force                  IN BOOLEAN DEFAULT FALSE);
```

Parameters

Table 157-49 DROP_FILE_WATCHER Procedure Parameters

| Parameter | Description |
|-------------------|---|
| file_watcher_name | The file watcher to drop. Can be a comma-separated list of file watchers. Each file watcher name can optionally be prefixed with a schema name. Cannot be NULL. |
| force | If set to FALSE, the file watcher must not be referenced by any job, or an error occurs. If set to TRUE, the file watcher is dropped whether or not there are jobs referencing it. In this case, jobs that reference the dropped file watcher are disabled. |

Usage Notes

Only the owner of a file watcher or a user with the CREATE ANY JOB system privilege may drop the file watcher.

Running jobs that point to the file watcher are not affected by this procedure and are allowed to continue.

See Also:

["CREATE_FILE_WATCHER Procedure"](#)

157.6.37 DROP_GROUP Procedure

This procedure drops one or more groups.

Syntax

```
DBMS_SCHEDULER.DROP_GROUP (  
    group_name      IN VARCHAR2,  
    force           IN BOOLEAN DEFAULT FALSE);
```

Parameters

Table 157-50 DROP_GROUP Procedure Parameters

| Parameter | Description |
|------------|--|
| group_name | A group to drop. Can be a comma-separated list of group names. Each group name can optionally be prefixed with a schema name. The procedure stops processing if it encounters a group that does not exist. All groups processed before the error are dropped. Cannot be NULL. |
| force | If FALSE, the group must not be referenced by any job, otherwise an error occurs. If TRUE, the group is dropped whether or not there are jobs referencing it. In this case, all jobs referencing the group are disabled and all job instances that reference the group are removed from the *_SCHEDULER_JOB_DESTS views. |

Usage Notes

Only the owner or a user with the CREATE ANY JOB system privilege may drop a group. You must have the MANAGE SCHEDULER privilege to drop a group of type WINDOW.

See Also:

["CREATE_FILE_WATCHER Procedure"](#)

157.6.38 DROP_INCOMPATIBILITY Procedure

This procedure drops an existing incompatibility definition.

Syntax

```
DBMS_SCHEDULER.DROP_INCOMPATIBILITY (  
    incompatibility_name  IN VARCHAR2);
```

Parameters

Table 157-51 DROP_INCOMPATIBILITY Procedure Parameters

| Parameter | Description |
|-----------------------------------|---|
| <code>incompatibility_name</code> | The name of the incompatibility definition. |

Usage Notes

See Also:

Using Incompatibility Definitions in *Oracle Database Administrator's Guide*

157.6.39 DROP_JOB Procedure

This procedure drops one or more jobs or all jobs in one or more job classes. Dropping a job also drops all argument values set for that job.

Syntax

```
DBMS_SCHEDULER.DROP_JOB (
    job_name          IN VARCHAR2,
    force             IN BOOLEAN DEFAULT FALSE,
    defer             IN BOOLEAN DEFAULT FALSE,
    commit_semantics IN VARCHAR2 DEFAULT 'STOP_ON_FIRST_ERROR');
```

Parameters

Table 157-52 DROP_JOB Procedure Parameters

| Parameter | Description |
|-----------------------|---|
| <code>job_name</code> | The name of a job or job class. Can be a comma-delimited list. For a job class, the <code>SYS</code> schema should be specified. If the name of a job class is specified, the jobs that belong to that job class are dropped, but the job class itself is not dropped. |
| <code>force</code> | If <code>force</code> is set to <code>TRUE</code> , the Scheduler first attempts to stop the running job instances (by issuing the <code>STOP_JOB</code> call with the <code>force</code> flag set to <code>false</code>), and then drops the jobs. |
| <code>defer</code> | If <code>defer</code> is set to <code>TRUE</code> , the Scheduler allows the running jobs to complete and then drops the jobs. |

Table 157-52 (Cont.) DROP_JOB Procedure Parameters

| Parameter | Description |
|-------------------------------|--|
| <code>commit_semantics</code> | <p>The commit semantics. The following types are supported:</p> <ul style="list-style-type: none"> • <code>STOP_ON_FIRST_ERROR</code> returns on the first error and previous successful drop operations are committed to disk. This is the default. • <code>TRANSACTIONAL</code> returns on the first error. Everything that happened before that error is rolled back. This type is not supported when <code>force</code> is set to <code>TRUE</code>. • <code>ABSORB_ERRORS</code> tries to absorb any errors and drop the rest of the jobs, and commits all the successful drops. If errors occur, you can query the view <code>SCHEDULER_BATCH_ERRORS</code> for details. <p>Only <code>STOP_ON_FIRST_ERROR</code> is permitted when job classes are included in the <code>job_name</code> list.</p> |

Usage Notes

If both `force` and `defer` are set to `FALSE` and a job is running at the time of the call, the attempt to drop that job fails. The entire call to `DROP_JOB` may then fail, depending on the setting of `commit_semantics`.

Setting both `force` and `defer` to `TRUE` results in an error.

Dropping a job requires `ALTER` privileges on the job either as the owner of the job or as a user with the `ALTER` object privilege on the job or the `CREATE ANY JOB` system privilege.

157.6.40 DROP_JOB_CLASS Procedure

This procedure drops a job class. Dropping a job class means that all the metadata about the job class is removed from the database.

Syntax

```
DBMS_SCHEDULER.DROP_JOB_CLASS (
    job_class_name      IN VARCHAR2,
    force               IN BOOLEAN DEFAULT FALSE);
```

Parameters

Table 157-53 DROP_JOB_CLASS Procedure Parameters

| Parameter | Description |
|-----------------------------|---|
| <code>job_class_name</code> | The name of the job class. Can be a comma-delimited list. |
| <code>force</code> | <p>If <code>force</code> is set to <code>FALSE</code>, a class being dropped must not be referenced by any jobs, otherwise an error occurs.</p> <p>If <code>force</code> is set to <code>TRUE</code>, jobs belonging to the class are disabled and their class is set to the default class. Only if this is successful is the class dropped.</p> <p>Running jobs that belong to the job class are not affected.</p> |

Usage Notes

Dropping a job class requires the `MANAGE SCHEDULER` system privilege.

157.6.41 DROP_PROGRAM Procedure

This procedure drops a program. Any arguments that pertain to the program are also dropped when the program is dropped.

Syntax

```
DBMS_SCHEDULER.DROP_PROGRAM (
  program_name      IN VARCHAR2,
  force             IN BOOLEAN DEFAULT FALSE);
```

Parameters

Table 157-54 DROP_PROGRAM Procedure Parameters

| Parameter | Description |
|---------------------------|--|
| <code>program_name</code> | The name of the program to be dropped. Can be a comma-delimited list. |
| <code>force</code> | If <code>force</code> is set to <code>FALSE</code> , the program must not be referenced by any job, otherwise an error occurs. If <code>force</code> is set to <code>TRUE</code> , all jobs referencing the program are disabled before the program is dropped. Running jobs that point to the program are not affected by the <code>DROP_PROGRAM</code> call and are allowed to continue. |

Usage Notes

Dropping a program requires that you be the owner of the program or have `ALTER` privileges on that program. You can also drop a program if you have the `CREATE ANY JOB` privilege.

157.6.42 DROP_PROGRAM_ARGUMENT Procedure

This procedure drops a program argument. An argument can be specified by either name (if one has been given) or position.

The procedure is overloaded.

Syntax

Drops a program argument by position:

```
DBMS_SCHEDULER.DROP_PROGRAM_ARGUMENT (
  program_name      IN VARCHAR2,
  argument_position IN PLS_INTEGER);
```

Drops a program argument by name:

```
DBMS_SCHEDULER.DROP_PROGRAM_ARGUMENT (
  program_name      IN VARCHAR2,
  argument_name     IN VARCHAR2);
```

Parameters

Table 157-55 DROP_PROGRAM_ARGUMENT Procedure Parameters

| Parameter | Description |
|--------------------------------|---|
| <code>program_name</code> | The name of the program to be altered. A program with this name must exist. |
| <code>argument_name</code> | The name of the argument being dropped |
| <code>argument_position</code> | The position of the argument to be dropped |

Usage Notes

Dropping a program argument requires that you be the owner of the program or have `ALTER` privileges on that program. You can also drop a program argument if you have the `CREATE ANY JOB` privilege.

157.6.43 DROP_RESOURCE Procedure

This procedure drops a resource.

Syntax

```
DBMS_SCHEDULER.DROP_RESOURCE (
    resource_name IN VARCHAR2,
    force         IN BOOLEAN DEFAULT FALSE);
```

Parameters

Table 157-56 DROP_RESOURCE Procedure Parameters

| Parameter | Description |
|----------------------------|---|
| <code>resource_name</code> | The name of the resource to be dropped. Can be a comma-delimited list. |
| <code>force</code> | If <code>force</code> is set to <code>FALSE</code> , the resource must not have any existing constraints, otherwise an error occurs. If <code>force</code> is set to <code>TRUE</code> , the resource will be dropped and any constraints defined on this resource will also be dropped. |

Usage Notes

Only the owner or a user with the `CREATE ANY JOB` system privilege may drop the resource.

See Also:

Creating or Dropping a Resource in *Oracle Database Administrator's Guide*

157.6.44 DROP_SCHEDULE Procedure

This procedure drops a schedule.

Syntax

```
DBMS_SCHEDULER.DROP_SCHEDULE (
    schedule_name    IN VARCHAR2,
    force            IN BOOLEAN DEFAULT FALSE);
```

Parameters

Table 157-57 DROP_SCHEDULE Procedure Parameters

| Parameter | Description |
|---------------|---|
| schedule_name | The name of the schedule. Can be a comma-delimited list. |
| force | If <code>force</code> is set to <code>FALSE</code> , the schedule must not be referenced by any job or window, otherwise an error will occur. If <code>force</code> is set to <code>TRUE</code> , any jobs or windows that use this schedule are disabled before the schedule is dropped Running jobs and open windows that point to the schedule are not affected. |

Usage Notes

You must be the owner of the schedule being dropped or have `ALTER` privileges for the schedule or the `CREATE ANY JOB` privilege.

157.6.45 DROP_WINDOW Procedure

This procedure drops a window. All metadata about the window is removed from the database. The window is removed from any groups that reference it.

Syntax

```
DBMS_SCHEDULER.DROP_WINDOW (
    window_name      IN VARCHAR2,
    force            IN BOOLEAN DEFAULT FALSE);
```

Parameters

Table 157-58 DROP_WINDOW Procedure Parameters

| Parameter | Description |
|-------------|--|
| window_name | The name of the window. Can be a comma-delimited list. |

Table 157-58 (Cont.) DROP_WINDOW Procedure Parameters

| Parameter | Description |
|--------------------|---|
| <code>force</code> | <p>If <code>force</code> is set to <code>FALSE</code>, the window must be not be open or referenced by any job, otherwise an error occurs.</p> <p>If <code>force</code> is set to <code>TRUE</code>, the window is dropped and those jobs that have the window as their schedule are disabled. However, jobs that have a window group, of which the dropped window is a member, as their schedule, are not disabled. If the window is open then, the Scheduler attempts to first close the window and then drop it. When the window is closed, normal close window rules apply.</p> <p>Running jobs that have the window as their schedule is allowed to continue, unless the <code>stop_on_window_close</code> flag is set to <code>TRUE</code> for the job. If this is the case, the job is stopped when the window is dropped.</p> |

Usage Notes

Dropping a window requires the `MANAGE SCHEDULER` privilege.

157.6.46 ENABLE Procedure

This procedure enables a program, job, chain, window, database destination, external destination, file watcher, or group.

When an object is enabled, its `enabled` attribute is set to `TRUE`. By default, jobs, chains, and programs are created disabled and database destinations, external destinations, file watchers, windows, and groups are created enabled.

If a job was disabled and you enable it, the Scheduler begins to automatically run the job according to its schedule. Enabling a disabled job also resets the job `RUN_COUNT`, `FAILURE_COUNT` and `RETRY_COUNT` columns in the `*_SCHEDULER_JOBS` data dictionary views.

Validity checks are performed before enabling an object. If the check fails, the object is not enabled, and an appropriate error is returned. This procedure does not return an error if the object was already enabled.

Syntax

```
DBMS_SCHEDULER.ENABLE (
    name           IN VARCHAR2,
    commit_semantics IN VARCHAR2 DEFAULT 'STOP_ON_FIRST_ERROR');
```

Parameters

Table 157-59 ENABLE Procedure Parameters

| Parameter | Description |
|------------------|--|
| name | The name of the Scheduler object being enabled. Can be a comma-delimited list of names. If a job class name is specified, then all the jobs in the job class are enabled. If a group name is specified, then the group is enabled, but the enabled state of the group members is unaffected. |
| commit_semantics | The commit semantics. The following types are supported: <ul style="list-style-type: none"> • <code>STOP_ON_FIRST_ERROR</code> - The procedure returns on the first error and previous successful enable operations are committed to disk. This is the default. • <code>TRANSACTIONAL</code> - The procedure returns on the first error and everything that happened before that error is rolled back. This type is only supported when enabling a job or a list of jobs. • <code>ABSORB_ERRORS</code> - The procedure tries to absorb any errors and enable the rest of the jobs. It commits all the enable operations that were successful. If errors occur, you can query the view <code>SCHEDULER_BATCH_ERRORS</code> for details. This type is only supported when enabling a job or a list of jobs. |

Usage Notes

Window names must be preceded by `SYS`.

To run `ENABLE` for a window or group of type `WINDOW`, you must have the `MANAGE SCHEDULER` privilege. For a job of type `EXECUTABLE` (or for a job that points to a program of type `EXECUTABLE`), the job owner must have the `CREATE EXTERNAL JOB` system privilege before the job can be enabled or run.

To enable a file watcher, the file watcher owner must have the `EXECUTE` privilege on the designated credential.

You can use `ENABLE` with any schema except the `SYS` schema.

157.6.47 END_DETACHED_JOB_RUN Procedure

This procedure ends a detached job run. A detached job points to a detached program, which is a program with the `detached` attribute set to `TRUE`.

A detached job run does not end until this procedure or the [STOP_JOB Procedure](#) is called.

Syntax

```
DBMS_SCHEDULER.END_DETACHED_JOB_RUN (
  job_name          IN VARCHAR2,
  error_number      IN PLS_INTEGER DEFAULT 0,
  additional_info   IN VARCHAR2 DEFAULT NULL);
```

Parameters

Table 157-60 END_DETACHED_JOB_RUN Procedure Parameters

| Parameter | Description |
|-----------------|--|
| job_name | The name of the job to end. Must be a detached job that is running. |
| error_number | If zero, then the job run is logged as succeeded. If -1013, then the job run is logged as stopped. If any other number, then the job run is logged as failed with that error number. |
| additional_info | This text is stored in the additional_info column of the *_scheduler_job_run_details views for this job run. |

Usage Notes

This procedure requires that you either own the job or have ALTER privileges on it. You can also end any detached job run if you have the CREATE ANY JOB privilege.

See Also:

Oracle Database Administrator's Guide for information about detached jobs.

157.6.48 EVALUATE_CALENDAR_STRING Procedure

You can define repeat intervals of jobs, windows or schedules using the Scheduler calendaring syntax. This procedure evaluates the calendar expression and tells you the next execution date and time of a job or window. This is very useful for testing the correct definition of the calendar string without actually scheduling the job or window.

This procedure can also get multiple steps of the repeat interval by passing the next_run_date returned by one invocation as the return_date_after argument of the next invocation.

See the calendaring syntax described in "[Operational Notes](#)".

Syntax

```
DBMS_SCHEDULER.EVALUATE_CALENDAR_STRING (
    calendar_string    IN  VARCHAR2,
    start_date         IN  TIMESTAMP WITH TIME ZONE,
    return_date_after  IN  TIMESTAMP WITH TIME ZONE,
    next_run_date      OUT TIMESTAMP WITH TIME ZONE);
```

Parameters

Table 157-61 EVALUATE_CALENDAR_STRING Procedure Parameters

| Parameter | Description |
|-----------------|---|
| calendar_string | The calendar expression to be evaluated. The string must be in the calendaring syntax described in " Operational Notes ". |

Table 157-61 (Cont.) EVALUATE_CALENDAR_STRING Procedure Parameters

| Parameter | Description |
|-------------------|---|
| start_date | The date and time after which the repeat interval becomes valid. It can also be used to fill in specific items that are missing from the calendar string. Can optionally be NULL. |
| return_date_after | The return_date_after argument helps the Scheduler determine which one of all possible matches (all valid execution dates) to return from those determined by the start_date and the calendar string. When a NULL value is passed for this argument, the Scheduler automatically fills in systimestamp as its value. |
| next_run_date | The first timestamp that matches the calendar string and start date that occur after the value passed in for the return_date_after argument. |

Examples

The following code fragment can be used to determine the next five dates a job will run given a specific calendar string.

```
SET SERVEROUTPUT ON;
ALTER SESSION set NLS_DATE_FORMAT = 'DD-MON-YYYY HH24:MI:SS';
Session altered.

DECLARE
start_date          TIMESTAMP;
return_date_after  TIMESTAMP;
next_run_date      TIMESTAMP;
BEGIN
start_date :=
to_timestamp_tz('01-JAN-2003 10:00:00','DD-MON-YYYY HH24:MI:SS');
return_date_after := start_date;
FOR i IN 1..5 LOOP
    DBMS_SCHEDULER.EVALUATE_CALENDAR_STRING(
        'FREQ=DAILY;BYHOUR=9;BYMINUTE=30;BYDAY=MON,TUE,WED,THU,FRI',
        start_date, return_date_after, next_run_date);
    DBMS_OUTPUT.PUT_LINE('next_run_date: ' || next_run_date);
    return_date_after := next_run_date;
END LOOP;
END;
/

next_run_date: 02-JAN-03 09.30.00.000000 AM
next_run_date: 03-JAN-03 09.30.00.000000 AM
next_run_date: 06-JAN-03 09.30.00.000000 AM
next_run_date: 07-JAN-03 09.30.00.000000 AM
next_run_date: 08-JAN-03 09.30.00.000000 AM
```

PL/SQL procedure successfully completed.

Usage Notes

No specific Scheduler privileges are required.

157.6.49 EVALUATE_RUNNING_CHAIN Procedure

This procedure forces reevaluation of the rules of a running chain to trigger any rules for which the conditions have been satisfied. The job passed as an argument must point to a chain and must be running. If the job is not running, an error is thrown. (`RUN_JOB` can be used to start the job.)

If any of the steps of the chain are themselves running chains, another `EVALUATE_RUNNING_CHAIN` is performed on each of the nested running chains.

Syntax

```
DBMS_SCHEDULER.EVALUATE_RUNNING_CHAIN (
    job_name          IN VARCHAR2);
```

Parameters

Table 157-62 EVALUATE_RUNNING_CHAIN Procedure Parameter

| Parameter | Description |
|-----------|---|
| job_name | The name of the running job (pointing to a chain) to reevaluate the rules for |

Usage Notes

Running `EVALUATE_RUNNING_CHAIN` on a job requires alter privileges on the job (either as the owner, or as a user with `ALTER` privileges on the job or the `CREATE ANY JOB` system privilege).

Note:

The Scheduler automatically evaluates a chain:

- At the start of the chain job
- When a chain step completes
- When an event occurs that is associated with an event step in the chain

For most chains, this is sufficient. `EVALUATE_RUNNING_CHAIN` should be used only under the following circumstances:

- After manual intervention of a running chain with the `ALTER_RUNNING_CHAIN` procedure
- When chain rules use SQL syntax and the rule conditions contain elements that are not under the control of the Scheduler.

In these cases, `EVALUATE_RUNNING_CHAIN` may not be needed if you set the `evaluation_interval` attribute when you created the chain.

157.6.50 GENERATE_JOB_NAME Function

This function returns a unique name for a job.

The name will be of the form {prefix}N where N is a number from a sequence. If no prefix is specified, the generated name will, by default, be JOB\$_1, JOB\$_2, JOB\$_3, and so on. If 'SCOTT' is specified as the prefix, the name will be SCOTT1, SCOTT2, and so on.

Syntax

```
DBMS_SCHEDULER.GENERATE_JOB_NAME (
    prefix          IN VARCHAR2 DEFAULT 'JOB$_') RETURN VARCHAR2;
```

Parameters

Table 157-63 GENERATE_JOB_NAME Function Parameter

| Parameter | Description |
|-----------|--|
| prefix | The prefix to use when generating the job name |

Usage Notes

If the prefix is explicitly set to NULL, the name is just the sequence number. In order to successfully use such numeric names, they must be surrounded by double quotes throughout the DBMS_SCHEDULER calls. A prefix cannot be longer than 18 characters and cannot end with a digit.

Note that, even though the GENERATE_JOB_NAME function never returns the same job name twice, there is a small chance that the returned name matches an already existing database object.

No specific Scheduler privileges are required to use this function.

157.6.51 GET_AGENT_INFO Function

This function can return job information specific to an agent, such as how many are running and so on, depending on the attribute selected.

Syntax

```
DBMS_SCHEDULER.GET_AGENT_INFO (
    agent_name      IN VARCHAR2,
    attribute       IN VARCHAR2) RETURN VARCHAR2;
```

Parameters

Table 157-64 GET_AGENT_INFO Function Parameter

| Parameter | Description |
|------------|--|
| agent_name | The name of an external destination where the agent is running |

Table 157-64 (Cont.) GET_AGENT_INFO Function Parameter

| Parameter | Description |
|-----------|---|
| attribute | <p>Possible Attributes values</p> <ul style="list-style-type: none"> • VERSION: Returns the agent version number. Requires the <code>CREATE JOB</code> system privilege. • UPTIME: Returns the time the agent has been up and running. Requires the <code>CREATE JOB</code> system privilege. • NUMBER_OF_RUNNING_JOBS: Returns the number of jobs that the agent is currently running. Requires the <code>CREATE JOB</code> system privilege. • TOTAL_JOBS_RUN: Returns the number of jobs run by the agent since it was started. Requires the <code>CREATE JOB</code> system privilege. • RUNNING_JOBS: Returns a comma-separated list of the names of the jobs running currently. Requires the <code>MANAGE SCHEDULER</code> system privilege. • ALL: Returns all the information the previous options return. It requires the <code>MANAGE SCHEDULER</code> system privilege. |

Usage Notes

This function returns the same information as the `schagent` utility status option. See *Oracle Database Administrator's Guide*.

157.6.52 GET_AGENT_VERSION Function

This function returns the version string of a Scheduler agent that is registered with the database and is currently running. `GET_AGENT_VERSION` throws an error if the agent is not registered with the database or if the agent is not currently running.

Syntax

```
DBMS_SCHEDULER.GET_AGENT_VERSION (
    agent_host          IN VARCHAR2) RETURN VARCHAR2;
```

Parameters

Table 157-65 GET_AGENT_VERSION Function Parameter

| Parameter | Description |
|------------|---|
| agent_host | <p>Either the hostname and port on which the agent is running in the form <code>hostname:port</code> or the name of the agent as shown in the <code>destination_name</code> column of the <code>ALL_SCHEDULER_EXTERNAL_DESTS</code> view which lists all Scheduler agents registered with the database.</p> |

Usage Notes

This function requires the `CREATE EXTERNAL JOB` system privilege.

157.6.53 GET_ATTRIBUTE Procedure

This procedure retrieves the value of an attribute of a Scheduler object. It is overloaded to retrieve values of various types.

Syntax

```
DBMS_SCHEDULER.GET_ATTRIBUTE (
    name          IN VARCHAR2,
    attribute     IN VARCHAR2,
    value        OUT {VARCHAR2|PLS_INTEGER|BOOLEAN|DATE|TIMESTAMP|
                    TIMESTAMP WITH TIME ZONE|TIMESTAMP WITH LOCAL TIME ZONE|
                    INTERVAL DAY TO SECOND});
```

```
DBMS_SCHEDULER.GET_ATTRIBUTE (
    name          IN VARCHAR2,
    attribute     IN VARCHAR2,
    value        OUT VARCHAR2,
    value2       OUT VARCHAR2);
```

Parameters

Table 157-66 GET_ATTRIBUTE Procedure Parameters

| Parameter | Description |
|-----------|--|
| name | The name of the object |
| attribute | The attribute being retrieved. See the SET_ATTRIBUTE Procedure for tables of attribute values. |
| value | The existing value of the attribute |
| value2 | The value2 argument is for an optional second value. Most attributes have only one value associated with them, but some can have two. |

Usage Notes

To run `GET_ATTRIBUTE` for a job class, you must have the `MANAGE_SCHEDULER` privilege or have `EXECUTE` privileges on the class. For a schedule, window, or group, no privileges are necessary. Otherwise, you must be the owner of the object or have `ALTER` or `EXECUTE` privileges on that object or have the `CREATE ANY JOB` privilege.

See the [SET_ATTRIBUTE Procedure](#) for tables of attribute values that you can retrieve for the various Scheduler object types.

157.6.54 GET_FILE Procedure

This procedure retrieves a file from the operating system file system of a specified host. The file is copied to a destination, or its contents are returned in a procedure output parameter.

You can also use this procedure to retrieve the standard output or error text for a run of an external job that has an associated credential.

This procedure differs from the equivalent `UTL_FILE` procedure in that it uses a credential and can retrieve files from remote hosts that have only a Scheduler agent (and not an Oracle database) installed.

Syntax

```
DBMS_SCHEDULER.GET_FILE (
    source_file           IN VARCHAR2,
    source_host          IN VARCHAR2,
    credential_name      IN VARCHAR2,
    file_contents        IN OUT NOCOPY {BLOB|CLOB});
```

```
DBMS_SCHEDULER.GET_FILE (
    source_file           IN VARCHAR2,
    source_host          IN VARCHAR2,
    credential_name      IN VARCHAR2,
    destination_file_name IN VARCHAR2,
    destination_directory_object IN VARCHAR2,
    destination_permissions IN VARCHAR2 DEFAULT NULL);
```

Parameters

Table 157-67 GET_FILE Procedure Parameters

| Parameter | Description |
|------------------------------|---|
| <code>source_file</code> | <p>Fully qualified path name of the file to retrieve from the operating system. The file name is case-sensitive and is not converted to uppercase. If the file name starts with a question mark ('?'), the question mark is replaced by the path to the Oracle home if getting a file from the local host, or to the Scheduler agent home if getting a file from a remote host.</p> <p>If the format of this parameter is <code>external_log_id_stdout</code>, then the stdout from the designated external job run is returned.</p> <p>If the format of this parameter is <code>external_log_id_stderr</code>, the error text from the designated external job run is returned.</p> <p>You obtain the value of <code>external_log_id</code> from the <code>ADDITIONAL_INFO</code> column of the <code>*_SCHEDULER_JOB_RUN_DETAILS</code> views. This column contains a set of name/value pairs in an indeterminate order, so you must parse this column for the <code>external_log_id</code> name/value pair, and then append either <code> "_stdout"</code> or <code> "_stderr"</code> to its value.</p> <p>The external job must have an associated credential. The <code>credential_name</code> parameter of <code>GET_FILE</code> must name the same credential that is used by the job, and the <code>source_host</code> parameter must be the same as the <code>destination</code> attribute of the job.</p> |
| <code>source_host</code> | <p>If the file is to be retrieved from a remote host, then this parameter must be a valid external destination name. (An external destination is created when you register a remote Scheduler agent with the database. You can view external destination names in the views <code>*_SCHEDULER_EXTERNAL_DESTS</code>.)</p> <p>If <code>source_host</code> is <code>NULL</code> or set to <code>'localhost'</code>, then the file is retrieved from the file system of the local host. To determine the port number of a Scheduler agent, view the <code>schagent.conf</code> file, which is located in the Scheduler agent home directory on the remote host.</p> |
| <code>credential_name</code> | The name of the credential to use for accessing the file system. |
| <code>file_contents</code> | The variable into which the file contents is read. |

Table 157-67 (Cont.) GET_FILE Procedure Parameters

| Parameter | Description |
|------------------------------|--|
| destination_file_name | The file to which the file contents is written. |
| destination_directory_object | The directory object that specifies the path to the destination file, when destination_file_name is used. The caller must have the necessary privileges on the directory object. |
| destination_permissions | Reserved for future use |

Usage Notes

The caller must have the CREATE EXTERNAL JOB system privilege and have EXECUTE privileges on the credential.

157.6.55 GET_SCHEDULER_ATTRIBUTE Procedure

This procedure retrieves the value of a Scheduler attribute.

Syntax

```
DBMS_SCHEDULER.GET_SCHEDULER_ATTRIBUTE (
    attribute    IN VARCHAR2,
    value        OUT VARCHAR2);
```

Parameters

Table 157-68 GET_SCHEDULER_ATTRIBUTE Procedure Parameters

| Parameter | Description |
|-----------|-------------------------------------|
| attribute | The name of the attribute |
| value | The existing value of the attribute |

Usage Notes

To run GET_SCHEDULER_ATTRIBUTE, you must have the MANAGE_SCHEDULER privilege.

[Table 157-69](#) lists the Scheduler attributes that you can retrieve. For more detail on these attributes, see [Table 157-101](#) and the section "Configuring the Scheduler" in *Oracle Database Administrator's Guide*.

Table 157-69 Scheduler Attributes Retrievable with GET_SCHEDULER_ATTRIBUTE

| Scheduler Attribute | Description |
|---------------------|--|
| current_open_window | Name of the currently open window |
| default_timezone | Default time zone used by the Scheduler for repeat intervals and windows |

Table 157-69 (Cont.) Scheduler Attributes Retrievable with GET_SCHEDULER_ATTRIBUTE

| Scheduler Attribute | Description |
|-------------------------|---|
| email_sender | The default e-mail address of the sender for job state e-mail notifications |
| email_server | The SMTP server address that the Scheduler uses to send e-mail notifications for job state events. E-mail notifications cannot be sent if this attribute is NULL. |
| event_expiry_time | Time in seconds before an event generated by the Scheduler and enqueued onto the Scheduler event queue expires. May be NULL. |
| log_history | Retention period in days for job and window logs. The range of valid values is 0 through 1000000. |
| max_job_slave_processes | This Scheduler attribute is not used. |

157.6.56 OPEN_WINDOW Procedure

This procedure manually opens a window, unrelated to its schedule.

The window opens and the resource plan associated with it takes effect immediately, for the duration specified or for the normal duration of the window, if no duration is given. Only an enabled window can be manually opened.

Syntax

```
DBMS_SCHEDULER.OPEN_WINDOW (
    window_name      IN VARCHAR2,
    duration          IN INTERVAL DAY TO SECOND,
    force             IN BOOLEAN DEFAULT FALSE);
```

Parameters

Table 157-70 OPEN_WINDOW Procedure Parameters

| Parameter | Description |
|-------------|--|
| window_name | The name of the window |
| duration | The duration of the window. It is of type interval day to second. If it is NULL, then the window opens for the regular duration as specified in the window metadata. |

Table 157-70 (Cont.) OPEN_WINDOW Procedure Parameters

| Parameter | Description |
|--------------------|---|
| <code>force</code> | <p>If <code>force</code> is set to <code>FALSE</code>, then opening an already open window generates an error.</p> <p>If <code>force</code> is set to <code>TRUE</code>:</p> <p>You can open a window that is already open. The window stays open for the duration specified in the call, from the time the <code>OPEN_WINDOW</code> command was issued.</p> <p>For example: <code>window1</code> was created with a duration of four hours. It has now been open for two hours. If, at this point, you reopen <code>window1</code> using the <code>OPEN_WINDOW</code> call and do not specify a duration, then <code>window1</code> stays open for four hours because it was created with that duration. If you specified a duration of 30 minutes, the window will close in 30 minutes.</p> <p>The Scheduler automatically closes any window that is open at that time, even if it has a higher priority. For the duration of this manually opened window, the Scheduler does not open any other scheduled windows even if they have a higher priority.</p> |

Usage Notes

Opening a window manually has no impact on regular scheduled runs of the window. The next open time of the window is not updated and is determined by the regular scheduled opening.

When a window that was manually opened closes, the rules about overlapping windows are applied to determine which other window should be opened at that time if any at all.

If there are jobs running when the window opens, the resources allocated to them might change if there is a switch in resource plan.

If a window fails to switch resource plans because the designated resource plan no longer exists or because resource plan switching by windows is disabled (for example, by using the `ALTER SYSTEM` statement with the `force` option), the failure to switch resource plans is recorded in the window log.

Opening a window requires the `MANAGE SCHEDULER` privilege.

157.6.57 PURGE_LOG Procedure

The `PURGE_LOG` procedure purges rows from the job and window log that were not purged automatically by the scheduler.

By default, the Scheduler automatically purges all rows in the job log and window log that are older than 30 days. The `PURGE_LOG` procedure can be used to purge additional rows from the job and window log.

Rows in the job log table pertaining to the steps of a chain are purged only when the entry for the main chain job is purged (either manually or automatically).

Syntax

```
DBMS_SCHEDULER.PURGE_LOG (
    log_history          IN PLS_INTEGER DEFAULT 0,
```

```

which_log          IN VARCHAR2          DEFAULT 'JOB_AND_WINDOW_LOG',
job_name           IN VARCHAR2          DEFAULT NULL);

```

Parameters

Table 157-71 PURGE_LOG Procedure Parameters

| Parameter | Description |
|-------------|--|
| log_history | This specifies how much history (in days) to keep. The valid range is 0 - 1000000. If set to 0, no history is kept. |
| which_log | This specifies the log type. Valid values are: job_log, window_log, and job_and_window_log. |
| job_name | This specifies which job-specific entries must be purged from the jog log. This can be a comma-delimited list of job names and job classes. Whenever job_name has a value other than NULL, the which_log argument implicitly includes the job log. |

Usage Notes

This procedure requires the `MANAGE SCHEDULER` privilege.

Examples

The following completely purges all rows from both the job log and the window log:

```
DBMS_SCHEDULER.PURGE_LOG();
```

The following purges all rows from the window log that are older than 5 days:

```
DBMS_SCHEDULER.PURGE_LOG(5, 'window_log');
```

The following purges all rows from the window log that are older than 1 day and all rows from the job log that are related to jobs in jobclass1 and older than 1 day:

```
DBMS_SCHEDULER.PURGE_LOG(1, 'job_and_window_log', 'sys.jobclass1');
```

157.6.58 PUT_FILE Procedure

This procedure saves a file to the operating system file system of a specified remote host or of the local computer.

It differs from the equivalent `UTL_FILE` procedure in that it uses a credential and can save files to a remote host that has only a Scheduler agent (and not an Oracle Database) installed.

Syntax

```

DBMS_SCHEDULER.PUT_FILE (
  destination_file      IN VARCHAR2,
  destination_host      IN VARCHAR2,
  credential_name       IN VARCHAR2,
  file_contents         IN {BLOB|CLOB},
  destination_permissions IN VARCHAR2 DEFAULT NULL);

```

```

DBMS_SCHEDULER.PUT_FILE (
  destination_file      IN VARCHAR2,
  destination_host      IN VARCHAR2,
  credential_name       IN VARCHAR2,

```

```
source_file_name          IN VARCHAR2,
source_directory_object  IN VARCHAR2,
destination_permissions  IN VARCHAR2 DEFAULT NULL);
```

Parameters

Table 157-72 PUT_FILE Procedure Parameters

| Parameter | Description |
|-------------------------|---|
| destination_file | Fully qualified path name of the file to save to the operating system file system. The file name is case-sensitive. If the file name starts with a question mark ('?'), the question mark is replaced by the path to the Oracle home if saving to the local host, or to the Scheduler agent home if saving to a remote host. |
| destination_host | If NULL or set to 'localhost', the file is saved to the file system of the local computer. To save to a remote host, this parameter must be a valid external destination name. (An external destination is created when you register a remote Scheduler agent with the database. You can view external destination names in the views *_SCHEDULER_EXTERNAL_DESTS.) |
| credential_name | The name of the credential to use for accessing the destination file system. |
| file_contents | The variable from which the file contents is read. |
| source_file_name | The file from which the file contents is written |
| source_directory_object | The directory object that specifies the path to the source file, when source_file_name is used. The caller must have the necessary privileges on the directory object. |
| destination_permissions | Reserved for future use |

Usage Notes

The caller must have the CREATE EXTERNAL JOB system privilege and have EXECUTE privileges on the credential.

157.6.59 REMOVE_EVENT_QUEUE_SUBSCRIBER Procedure

This procedure unsubscribes a user from the Scheduler event queue SYS.SCHEDULER\$_EVENT_QUEUE.

Syntax

```
DBMS_SCHEDULER.REMOVE_EVENT_QUEUE_SUBSCRIBER (
    subscriber_name          IN VARCHAR2 DEFAULT NULL);
```

Parameters

Table 157-73 REMOVE_EVENT_QUEUE_SUBSCRIBER Procedure Parameters

| Parameter | Description |
|-----------------|---|
| subscriber_name | Name of the Oracle Advanced Queuing (AQ) agent to remove the subscription from. If NULL, the user name of the calling user is used. |

Usage Notes

After the agent is unsubscribed, it is deleted. If the agent does not exist or is not currently subscribed to the Scheduler event queue, an error is raised.

157.6.60 REMOVE_FROM_INCOMPATIBILITY Procedure

This procedure removes jobs or programs from an existing incompatibility definition.

Syntax

```
DBMS_SCHEDULER.REMOVE_FROM_INCOMPATIBILITY (
    incompatibility_name    IN VARCHAR2,
    object_name             IN VARCHAR2);
```

Parameters

Table 157-74 REMOVE_FROM_INCOMPATIBILITY Procedure Parameters

| Parameter | Description |
|----------------------|--|
| incompatibility_name | The name of the incompatibility definition. |
| object_name | One or more (comma-separated) programs or jobs |

Usage Notes

This procedure does not raise an error if any specified objects do not already exist in the incompatibility definition.

See Also:

Using Incompatibility Definitions in *Oracle Database Administrator's Guide*

157.6.61 REMOVE_GROUP_MEMBER Procedure

This procedure removes one or more members from an existing group.

Syntax

```
DBMS_SCHEDULER.REMOVE_GROUP_MEMBER (
    group_name              IN VARCHAR2,
    member                  IN VARCHAR2);
```

Parameters

Table 157-75 REMOVE_GROUP_MEMBER Procedure Parameters

| Parameter | Description |
|-------------|--|
| group_name | The name of the group. |
| member_name | The name of the member to remove from group. Comma-separated list of members to remove. An error is returned if any of the members is not part of the group. A group of the same type can be named as a member. The Scheduler immediately expands the included group name into its list of members. If the member is a destination, any job instances that run on this destination are removed from the *_SCHEDULER_JOB_DESTS views. |

Usage Notes

The following users may remove members from a group:

- The group owner
- A user that has been granted the ALTER object privilege on the group
- A user with the CREATE ANY JOB system privilege

You must have the MANAGE SCHEDULER privilege to remove a member from a group of type WINDOW.

See Also:

["CREATE_GROUP Procedure"](#)

157.6.62 REMOVE_JOB_EMAIL_NOTIFICATION Procedure

This procedure removes e-mail notifications for a job. You can remove all e-mail notifications or remove notifications only for specified recipients or specified events.

Syntax

```
DBMS_SCHEDULER.REMOVE_JOB_EMAIL_NOTIFICATION (
    job_name          IN VARCHAR2,
    recipients        IN VARCHAR2 DEFAULT NULL,
    events            IN VARCHAR2 DEFAULT NULL);
```

Parameters

Table 157-76 ADD_JOB_EMAIL_NOTIFICATION Procedure Parameters

| Parameter | Description |
|-----------|---|
| job_name | Name of the job to remove e-mail notifications for. Cannot be NULL. |

Table 157-76 (Cont.) ADD_JOB_EMAIL_NOTIFICATION Procedure Parameters

| Parameter | Description |
|------------|--|
| recipients | E-mail address to remove e-mail notification for. Comma-separated list of e-mail addresses. |
| events | Job state event to remove e-mail notification for. Comma-separated list of job state events. |

Usage Notes

When you specify multiple recipients and multiple events, the notification for each specified event is removed for each specified recipient. The procedure ignores any recipients or events that are specified but that were not previously added.

If `recipients` is `NULL`, e-mail notifications for the specified events are removed for all existing recipients. If `events` is `NULL`, notifications for all events are removed for the specified recipients. If both `recipients` and `events` are `NULL`, all e-mail notifications are removed for the job.

For example, if `recipients` is `'jsmith@example.com,rjones@example.com'` and `events` is `'JOB_FAILED,JOB_BROKEN'`, then notifications for both the `JOB_FAILED` and `JOB_BROKEN` events are removed for both `jsmith` and `rjones`. If `recipients` is `NULL`, then notifications for both the `JOB_FAILED` and `JOB_BROKEN` events are removed for `jsmith`, `rjones`, and any other previously defined recipients for these events.

To call this procedure, you must be the job owner or a user with the `CREATE ANY JOB` system privilege or `ALTER` object privilege on the job.

**See Also:**

["ADD_JOB_EMAIL_NOTIFICATION Procedure"](#)

157.6.63 RESET_JOB_ARGUMENT_VALUE Procedure

This procedure resets (clears) the value previously set to an argument for a job.

`RESET_JOB_ARGUMENT_VALUE` is overloaded.

Syntax

Clears a previously set job argument value by argument position:

```
DBMS_SCHEDULER.RESET_JOB_ARGUMENT_VALUE (
  job_name           IN VARCHAR2,
  argument_position  IN PLS_INTEGER);
```

Clears a previously set job argument value by argument name:

```
DBMS_SCHEDULER.RESET_JOB_ARGUMENT_VALUE (
  job_name           IN VARCHAR2,
  argument_name      IN VARCHAR2);
```

Parameters

Table 157-77 RESET_JOB_ARGUMENT_VALUE Procedure Parameters

| Parameter | Description |
|--------------------------------|--|
| <code>job_name</code> | The name of the job being altered |
| <code>argument_position</code> | The position of the program argument being reset |
| <code>argument_name</code> | The name of the program argument being reset |

Usage Notes

If the corresponding program argument has no default value, the job is disabled. Resetting a program argument of a job belonging to another user requires `ALTER` privileges on that job. Arguments can be specified by position or by name.

`RESET_JOB_ARGUMENT_VALUE` requires that you be the owner of the job or have `ALTER` privileges on that job. You can also reset a job argument value if you have the `CREATE ANY JOB` privilege.

`RESET_JOB_ARGUMENT_VALUE` only supports arguments of SQL type. Therefore, argument values that are not of SQL type, such as booleans, are not supported as program or job arguments.

157.6.64 RUN_CHAIN Procedure

This procedure immediately runs a chain or part of a chain by creating a run-once job with the job name given.

If no `job_name` is given, one is generated of the form `RUN_CHAIN$_chainnameN`, where `chainname` is the first 8 characters of the chain name and `N` is an integer.

If a list of start steps is given, only those steps are started when the chain begins running. Steps not in the list that would normally have started are skipped and paused (so that they or the steps after them do not run).

If `start_steps` is `NULL`, then the chain starts normally—that is, it performs an initial evaluation to see which steps to start running).

If a list of initial step states is given, the newly created chain job sets every listed step to the state specified for that step before evaluating the chain rules to see which steps to start. (Steps in the list are not started.)

Syntax

Runs a chain, with a list of start steps.

```
DBMS_SCHEDULER.RUN_CHAIN (
    chain_name          IN VARCHAR2,
    start_steps         IN VARCHAR2,
    job_name            IN VARCHAR2 DEFAULT NULL);
```

Runs a chain, with a list of initial step states.

```
DBMS_SCHEDULER.RUN_CHAIN (
    chain_name          IN VARCHAR2,
```

```

step_state_list      IN SYS.SCHEDULER$_STEP_TYPE_LIST,
job_name             IN VARCHAR2 DEFAULT NULL);

```

Parameters

Table 157-78 RUN_CHAIN Procedure Parameters

| Parameter | Description |
|-----------------|---|
| chain_name | The name of the chain to run |
| job_name | The name of the job to create to run the chain |
| start_steps | Comma-separated list of the steps to start when the chain starts running |
| step_state_list | List of chain steps with an initial state (SUCCEEDED or FAILED) to set for each. Set the attributes of <code>sys.scheduler\$_step_type</code> as follows: step_name The name of the step step_type 'SUCCEEDED' or 'FAILED' error_number where <i>error_number</i> is a positive or negative integer. |

Usage Notes

Running a chain requires `CREATE JOB` if the job is being created in the user's schema, or `CREATE ANY JOB` otherwise. In addition, the owner of the job being created needs execute privileges on the chain (as the owner of the chain, or as a user with the `EXECUTE` privilege on the chain or the `EXECUTE ANY PROGRAM` system privilege).

Examples

The following example illustrates how to start a chain in the middle by providing the initial state of some chain steps.

```

declare
  initial_step_states sys.scheduler$_step_type_list;
begin
  initial_step_states := sys.scheduler$_step_type_list(
    sys.scheduler$_step_type('step1', 'SUCCEEDED'),
    sys.scheduler$_step_type('step2', 'FAILED 27486'),
    sys.scheduler$_step_type('step3', 'SUCCEEDED'),
    sys.scheduler$_step_type('step5', 'SUCCEEDED'));
  dbms_scheduler.run_chain('my_chain', initial_step_states);
end;
/

```

157.6.65 RUN_JOB Procedure

This procedure runs a job immediately.

If a job is enabled, the Scheduler runs it automatically. It is not necessary to call `RUN_JOB` to run a job according to its schedule. Use `RUN_JOB` to run a job outside of its normal schedule.

Syntax

```

DBMS_SCHEDULER.RUN_JOB (
  job_name             IN VARCHAR2,
  use_current_session  IN BOOLEAN DEFAULT TRUE);

```

Parameters

Table 157-79 RUN_JOB Procedure Parameters

| Parameter | Description |
|---------------------|--|
| job_name | <p>A job name or a comma-separated list of entries, where each is the name of an existing job, optionally preceded by a schema name and dot separator.</p> <p>If you specify a multiple-destination job, the job runs on all destinations. In this case, the use_current_session argument must be FALSE.</p> |
| use_current_session | <p>This specifies whether or not the job run should occur in the same session that the procedure was invoked from. The job always runs as the job owner, in the job owner's schema, unless it has credential specified, then the job runs using the user named in the credential.</p> <p>When use_current_session is set to TRUE:</p> <ul style="list-style-type: none"> You can test a job and see any possible errors on the command line. state, run_count, last_start_date, last_run_duration, and failure_count of *_scheduler_jobs are not updated. RUN_JOB can be run in parallel with a regularly scheduled job run. <p>When use_current_session is set to FALSE:</p> <ul style="list-style-type: none"> You need to check the job log to find error information. All relevant fields in *_scheduler_jobs are updated. RUN_JOB fails if a regularly scheduled job is running. <p>For jobs that have a specified destination or destination group, or point to chains or programs with the detached attribute set to TRUE, use_current_session must be FALSE.</p> |

Usage Notes

Jobs do not have to be enabled. If a job is disabled, the following validity checks are performed before running it:

- The job points to a valid job class.
- The job owner has EXECUTE privileges on the job class.
- If a program or chain is referenced, the program/chain exists.
- If a program or chain is referenced, the job owner has privileges to execute the program/chain.
- All argument values have been set (or have defaults).
- The job owner has the CREATE EXTERNAL JOB privilege if this is an external job.

A TRUE value for use_current_session is not permitted for the following types of jobs:

- Jobs that specify a destination or destination group in the destination_name attribute
- Jobs that point to chains (chain jobs)
- Jobs that make use of detached programs (detached jobs).

above bug fix 1261887 6.12.11

When `use_current_session` is `TRUE`, the call to `RUN_JOB` blocks until the job completes. Any errors that occur during the execution of the job are returned as errors to the `RUN_JOB` procedure.

Using `RUN_JOB` with `use_current_session=TRUE` does not update the job state and the job will not appear in `*_SCHEDULER_RUNNING_JOBS` views.

above bug fix 19185117 9.15.14

When `use_current_session` is `FALSE`, `RUN_JOB` returns immediately and the job is picked up by the job coordinator and passed on to a job slave for execution. The Scheduler views and logs must be queried for the outcome of the job.

Multiple user sessions can use `RUN_JOB` in their sessions simultaneously when `use_current_session` is set to `TRUE`.

`RUN_JOB` requires that you own the job or have `ALTER` privileges on that job. You can also run a job if you have the `CREATE ANY JOB` privilege.

Example

The following is an example of using `RUN_JOB`.

```
BEGIN
  DBMS_SCHEDULER.RUN_JOB (
    JOB_NAME      => 'EODJOB, DSS.ETLJOB',
    USE_CURRENT_SESSION => FALSE);
END;
```

157.6.66 SET_AGENT_REGISTRATION_PASS Procedure

This procedure sets the agent registration password for a database.

A Scheduler agent must register with the database before the database can submit jobs to the agent. The agent must provide this password when registering.

Syntax

```
DBMS_SCHEDULER.SET_AGENT_REGISTRATION_PASS (
  registration_password IN VARCHAR2,
  expiration_date       IN TIMESTAMP WITH TIME ZONE DEFAULT NULL,
  max_uses              IN NUMBER DEFAULT NULL);
```

Parameters

Table 157-80 SET_AGENT_REGISTRATION_PASS Procedure Parameters

| Parameter | Description |
|------------------------------------|--|
| <code>registration_password</code> | This is the password that remote agents must specify in order to successfully register with the database. If this is <code>NULL</code> , then no agents will be able to register with the database. |
| <code>expiration_date</code> | If this is set to a non- <code>NULL</code> value, then the <code>registration_password</code> is not valid after this date. After this date, no agents can register with the database. This cannot be set to a date in the past. |

Table 157-80 (Cont.) SET_AGENT_REGISTRATION_PASS Procedure Parameters

| Parameter | Description |
|-----------|---|
| max_uses | This is the maximum number of successful registrations that can be performed with this password. After the number of successful registrations has been performed with this password, then no agents can register with the database. This cannot be set to 0 or a negative value. If this is set to NULL, then there will be no limit on the number of successful registrations. |

Usage Notes

To prevent abuse, this password can be set to expire after a given date or a maximum number of successful registrations. This procedure will overwrite any password already set. This requires the `MANAGE_SCHEDULER` system privilege.

By default, `max_uses` is set to `NULL`, which means that there is no limit to the number of successful registrations.

Oracle recommends that an agent registration password be reset after every agent registration or every known set of agent registrations. Furthermore, Oracle recommends that this password be set to `NULL` if no new agents are being registered.

157.6.67 SET_ATTRIBUTE Procedure

This procedure modifies an attribute of a Scheduler object. It is overloaded to accept values of various types.

To set an attribute to `NULL`, use the `SET_ATTRIBUTE_NULL` procedure. The attributes that can be set depend on the object being altered. All object attributes can be changed, except the object name.

Syntax

```
DBMS_SCHEDULER.SET_ATTRIBUTE (
    name          IN VARCHAR2,
    attribute     IN VARCHAR2,
    value         IN {BOOLEAN|DATE|TIMESTAMP|
                    TIMESTAMP WITH TIME ZONE|TIMESTAMP WITH LOCAL TIME ZONE|
                    INTERVAL DAY TO SECOND});
```

```
DBMS_SCHEDULER.SET_ATTRIBUTE (
    name          IN VARCHAR2,
    attribute     IN VARCHAR2,
    value         IN VARCHAR2,
    value2       IN VARCHAR2 DEFAULT NULL);
```

Parameters

Table 157-81 SET_ATTRIBUTE Procedure Parameters

| Parameter | Description |
|-----------|---|
| name | The name of the object. |
| attribute | See Table 157-83 through Table 157-93 . |

Table 157-81 (Cont.) SET_ATTRIBUTE Procedure Parameters

| Parameter | Description |
|-----------|--|
| value | The new value being set for the attribute. This cannot be NULL. To set an attribute value to NULL, use the SET_ATTRIBUTE_NULL procedure. |
| value2 | The value2 argument is for an optional second value. Most attributes have only one value associated with them, but some can have two. |

[Table 157-82](#) is a directory of Scheduler object types and tables of attributes for the object types.

These object types can be viewed with Scheduler Data Dictionary Views, listed in *Oracle Database Administrator's Guide*.

Table 157-82 Attribute Tables for Scheduler Object Types

| Scheduler Object Type | Table of Attributes |
|-----------------------|------------------------------|
| Job | Table 157-83 |
| Program | Table 157-85 |
| Schedule | Table 157-86 |
| File Watcher | Table 157-87 |
| Job Class | Table 157-88 |
| Window | Table 157-89 |
| Chain | Table 157-90 |
| Database Destination | Table 157-91 |
| External Destination | Table 157-92 |
| Group | Table 157-93 |
| Credential | Table 157-94 |
| Resource | Table 157-95 |

Usage Notes

If an object is altered and it was in the enabled state, the Scheduler first disables it, then makes the change and reenables it. If any errors are encountered during the enable process, the object is not reenabled and an error is generated.

If an object is altered and it was in the disabled state, it remains disabled after it is altered.

To run SET_ATTRIBUTE for a window, a group of type WINDOW, or job class, you must have the MANAGE_SCHEDULER privilege. Otherwise, you must be the owner of the object being altered or have ALTER privileges on that object or have the CREATE ANY JOB privilege.

Job

If there is a running instance of the job when the SET_ATTRIBUTE call is made, it is not affected by the call. The change is only affects future runs of the job.

If any of the schedule attributes of a job are altered while the job is running, the time of the next job run is scheduled using the new schedule attributes. Schedule attributes of a job include `schedule_name`, `start_date`, `end_date`, and `repeat_interval`.

If any of the program attributes of a job are altered while the job is running, the new program attributes take effect the next time the job runs. Program attributes of a job include `program_name`, `job_action`, `job_type`, and `number_of_arguments`.

If any job argument values are altered while the job is running, the new values take effect the next time the job runs.

Granting the `ALTER` privilege on a job lets a user alter all attributes of that job except its program attributes (`program_name`, `job_type`, `job_action`, `program_action`, and `number_of_arguments`) and does not allow a user to use a PL/SQL expression to specify the schedule for a job.

Oracle recommends that you not alter a job that was automatically created for you by the database. Jobs that were created by the database have the column `SYSTEM` set to `TRUE` in job views.

Program

If any currently running jobs use the program that was altered, they continue to run with the program definition prior to the alter. The job runs with the new program definition the next time the job executes.

Schedule

If a schedule is altered, the change does not affect running jobs and open windows that use this schedule. The change only goes into effect the next time the jobs runs or the window opens.

File Watcher

If a file watcher is altered, any currently running event-based jobs started by the file arrival event are not affected. On the local system, the new file watcher attributes take effect the next time that the file watcher checks for the arrival of the file (every ten minutes by default). On remote systems, there may be an additional delay before the new file watcher attributes take effect.

Job Class

With the exception of the default job class, all job classes can be altered. To alter a job class, you must have the `MANAGE_SCHEDULER` privilege.

When a job class is altered, running jobs that belong to the class are not affected. The change only takes effect for jobs that have not started running yet. Job Class names must be preceded by `SYS`.

Window

When a window is altered, it does not affect an active window. The changes only take effect the next time the window opens.

If there is no current resource plan, when a window with a designated resource plan opens, the Resource Manager activates with that plan. Window names must be preceded by `SYS`.

Job Attribute Values

Table 157-83 lists attribute values for jobs.

Note:

See the `CREATE_JOB` procedure and the `CREATE_JOBS` procedure for more complete descriptions of the attributes in this table.

Table 157-83 Job Attribute Values

| Name | Description |
|--|---|
| <code>allow_runs_in_restricted_mode</code> | If TRUE, the job is permitted to run when the database is in restricted mode, provided that the job owner is permitted to log in during this mode. FALSE by default. |
| <code>auto_drop</code> | This attribute, if TRUE, causes a job to be automatically dropped after it completes or is automatically disabled. A job is considered completed if: <ul style="list-style-type: none"> • Its end date (or the end date of the schedule) has passed. • It has run <code>max_runs</code> number of times. <code>max_runs</code> must be set with <code>SET_ATTRIBUTE</code>. • It is not a repeating job and has run once. A job is automatically disabled when it has failed <code>max_failures</code> times. <code>max_failures</code> is also set with <code>SET_ATTRIBUTE</code> . If this attribute is set to FALSE, the jobs are not dropped and their metadata is kept until the job is explicitly dropped with the <code>DROP_JOB</code> procedure. By default, jobs are created with <code>auto_drop</code> set to TRUE. |
| <code>comments</code> | An optional comment. |
| <code>connect_credential_name</code> | feature 25230 This attribute may be set to point to a database credential. For a SQL*Plus or backup script job, the credential connects to the database before running the script. For other job types, it is ignored. The job owner must have execute privileges on the credential, otherwise the job fails. Using a <code>connect_credential_name</code> is recommended since it allows the password to be stored securely in a credential in the database rather than in plain view in the job, program action, or script. |
| <code>credential_name</code> | This attribute specifies the name of the credential object (credential) to use for a remote database job, a remote external job, a local external job, or an event-based job that processes a file arrival event. For local external jobs only, if this attribute is NULL (the default), then a preferred (default) credential is selected. See <i>Oracle Database Administrator's Guide</i> for information about preferred credentials for local external jobs. |
| <code>database_role</code> | This attribute applies when the database participates in an Oracle Data Guard environment. If this attribute is set to 'PRIMARY', the job runs only when the database is in the role of the primary database. If set to 'LOGICAL STANDBY', the job runs only when the database is in the role of a logical standby. The default is 'PRIMARY' when the database is the primary database, and 'LOGICAL STANDBY' when the database is a logical standby. Note: If you want a job to run for all database roles on a particular host, you must create two copies of the job on that host: one with a <code>database_role</code> of 'PRIMARY', and the other with a <code>database_role</code> of 'LOGICAL STANDBY'. |

Table 157-83 (Cont.) Job Attribute Values

| Name | Description |
|-------------------------|---|
| destination | <p>*** Deprecated in Oracle Database 11g Release 2. Use <code>destination_name</code> instead.</p> <p>This attribute specifies a host on which to run a remote external job. It must be set to the host name or IP address of the destination host. It can optionally be followed by a port number, in the following format:</p> <p><i>hostname:port</i></p> <p>This attribute is set to NULL by default.</p> |
| destination_name | <p>The database destination or external destination for the job. Use for remote database jobs and remote external jobs only. For jobs running on the local database or for local external jobs (executables), must be NULL.</p> <p>See Table 157-28 for details about this attribute.</p> |
| end_date | <p>Specifies the date and time after which the job expires and is no longer run. After the <code>end_date</code>, if is TRUE, the job is dropped. If <code>auto_drop</code> is FALSE, the job is disabled and the STATE of the job is set to COMPLETED.</p> <p>If no value for <code>end_date</code> is specified, the job repeats forever unless <code>max_runs</code> or <code>max_failures</code> is set, in which case the job stops when either value is reached.</p> <p>The value for <code>end_date</code> must be after the value for <code>start_date</code>. If <code>end_date</code> is less than <code>start_date</code>, then an error will be generated. If <code>end_date</code> is the same as <code>start_date</code>, then the job will not execute and no error will be generated.</p> |
| event_spec | <p>This attribute takes two values: the <code>value</code> argument specifies the event condition and the <code>value2</code> argument specifies the queue specification. For more details, see the descriptions for the <code>event_condition</code> and <code>queue_spec</code> arguments in the "CREATE_JOB Procedure".</p> |
| follow_default_timezone | <p>If TRUE and if the job <code>start_date</code> is null, then when the <code>default_timezone</code> scheduler attribute is changed, the Scheduler recomputes the next run date and time for this job so that it is in accordance with the new time zone.</p> <p>For example, if the job was set to run at 02:00 in the previous time zone, it will run at 02:00 in the new time zone.</p> <p>If the job <code>start_date</code> is not null, then the time zone for the run date and time for the job is always specified by the time zone of the <code>start_date</code>.</p> <p>If FALSE, the next start date and time for the job is not recomputed when the <code>default_timezone</code> scheduler attribute is changed. In this case, if the old time zone is three hours earlier than the new time zone, then a job scheduled to run at 02:00 in the old time zone runs at 05:00 in the new time zone.</p> <p>Summer and winter transitions do not change the default time zone name.</p> |
| instance_id | <p>Valid only in an Oracle Real Application Clusters environment. Indicates the instance on which the job is to be run.</p> |

Table 157-83 (Cont.) Job Attribute Values

| Name | Description |
|---------------------|--|
| instance_stickiness | <p>This attribute should only be used for a database running in an Oracle Real Application Clusters (Oracle RAC) environment. By default, it is set to <code>TRUE</code>. If you set <code>instance_stickiness</code> to <code>TRUE</code>, jobs start running on the instance with the lightest load and the Scheduler thereafter attempts to run on the instance that it last ran on. If that instance is either down or so overloaded that it does not start new jobs for a significant period of time, another instance runs the job. If the interval between runs is large, <code>instance_stickiness</code> is ignored and the job is handled as if it were a non-sticky job.</p> <p>If <code>instance_stickiness</code> is set to <code>FALSE</code>, each instance of the job runs on the first instance available.</p> <p>For environments other than Oracle RAC, this attribute is not useful because there is only one instance.</p> |
| job_action | <p>The action that the job performs, depending on the <code>job_type</code> attribute. For example, if <code>job_type</code> is <code>'STORED_PROCEDURE'</code>, <code>job_action</code> contains the name of the stored procedure.</p> |
| job_class | <p>The class this job is associated with.</p> |
| job_priority | <p>This attribute specifies the priority of this job relative to other jobs in the same class as this job. If multiple jobs within a class are scheduled to be executed at the same time, the job priority determines the order in which jobs from that class are picked up for execution by the job coordinator. It can be a value from 1 through 5, with 1 being the first to be picked up for job execution.</p> <p>If no job priority is specified when creating a job, the default priority of 3 is assigned to it.</p> |
| job_type | <p>The type of this job. Valid values are: <code>'PLSQL_BLOCK'</code>, <code>'STORED_PROCEDURE'</code>, <code>'EXECUTABLE'</code>, <code>CHAIN</code>, <code>'EXTERNAL_SCRIPT'</code>, <code>'SQL_SCRIPT'</code>, and <code>'BACKUP_SCRIPT'</code>.</p> <p>If this is set, <code>program_name</code> must be <code>NULL</code>.</p> |
| job_weight | <p>*** Deprecated in Oracle Database 11gR2. Do not change the value of this attribute from the default, which is 1.</p> <p>Weight of the job for parallel execution.</p> |
| logging_level | <p>This attribute specifies how much information is logged. The possible options are:</p> <p><code>DBMS_SCHEDULER.LOGGING_OFF</code></p> <p>(The default) No logging is performed for this job. However, the logging level of the job class takes precedence and job logging may occur.</p> <p><code>DBMS_SCHEDULER.LOGGING_FAILED_RUNS</code></p> <p>The Scheduler logs only jobs that failed, with the reason for failure. If the job class has a higher logging level, then the higher logging level takes precedence.</p> <p><code>DBMS_SCHEDULER.LOGGING_RUNS</code></p> <p>The Scheduler writes detailed information to the job log for all runs of each job in this class. If the job class has a higher logging level, then the higher logging level takes precedence.</p> <p><code>DBMS_SCHEDULER.LOGGING_FULL</code></p> <p>In addition to recording every run of a job, the Scheduler records all operations performed on the job, including create, enable, disable, alter (with <code>SET_ATTRIBUTE</code>), stop, and so on.</p> |

Table 157-83 (Cont.) Job Attribute Values

| Name | Description |
|---------------------|--|
| max_failures | <p>This attribute specifies the number of times a job can fail on consecutive scheduled runs before it is automatically disabled. Once a job is disabled, it is no longer executed and its <code>STATE</code> is set to <code>BROKEN</code> in the <code>*_SCHEDULER_JOB</code> views.</p> <p><code>max_failures</code> can be an integer between 1 to 1,000,000. By default, it is set to <code>NULL</code>, which indicates that new instances of the job are started regardless of how many previous instances have failed.</p> |
| max_run_duration | <p>This attribute specifies the maximum amount of time that the job should be allowed to run. Its datatype is <code>INTERVAL DAY TO SECOND</code>. If this attribute is set to a non-zero and non-<code>NULL</code> value, and job duration exceeds this value, the Scheduler raises an event of type <code>JOB_OVER_MAX_DUR</code>. It is then up to your event handler to decide whether or not to allow the job to continue.</p> |
| max_runs | <p>This attribute specifies the maximum number of consecutive scheduled runs of the job. Once <code>max_runs</code> is reached, the job is disabled and its state is changed to <code>COMPLETED</code>.</p> <p><code>max_runs</code> can be an integer between 1 and 1,000,000. By default, it is set to <code>NULL</code>, which means that it repeats forever or until <code>end_date</code> or <code>max_failures</code> is reached.</p> |
| number_of_arguments | <p>The number of arguments if the program is inlined. If this is set, <code>program_name</code> should be <code>NULL</code>.</p> |
| parallel_instances | <p>This is a boolean attribute that can be set only for event-based jobs.</p> <p>If <code>FALSE</code> (the default), then if an event is raised and the event-based job that processes that event is already running, the new event is ignored.</p> <p>If <code>TRUE</code>, then an instance of the job is started for every instance of the event, and each job instance is a lightweight job so multiple instances of the same event-based job can run in parallel. Each lightweight job takes its attributes (such as action, maximum run duration, and so on) from the definition of the event-based job (its <i>parent job</i>). After the lightweight job completes, it is dropped. There is no explicit limit to the number of lightweight jobs that can run simultaneously to process multiple instances of the event. However, limitations may be imposed by available system resources.</p> <p>The lightweight jobs are not visible in any of the <code>*_SCHEDULER_JOBS</code> views. However, they are visible in the <code>*_SCHEDULER_RUNNING_JOBS</code> views. The name of each lightweight job is the same as that of the parent job, and a subname is automatically generated to distinguish each lightweight job from its parent and from its siblings.</p> |
| program_name | <p>The name of a program object to use with this job. If this is set, <code>job_action</code>, <code>job_type</code> and <code>number_of_arguments</code> should be <code>NULL</code>.</p> |

Table 157-83 (Cont.) Job Attribute Values

| Name | Description |
|-----------------|--|
| raise_events | <p>This attribute tells the Scheduler at what stages of the job execution to raise events. It is a bit vector in which zero or more of the following bits can be set. Each bit has a package constant corresponding to it.</p> <ul style="list-style-type: none"> • job_started CONSTANT PLS_INTEGER := 1 • job_succeeded CONSTANT PLS_INTEGER := 2 • job_failed CONSTANT PLS_INTEGER :=4 • job_broken CONSTANT PLS_INTEGER :=8 • job_completed CONSTANT PLS_INTEGER :=16 • job_stopped CONSTANT PLS_INTEGER :=32 • job_sch_lim_reached CONSTANT PLS_INTEGER :=64 • job_disabled CONSTANT PLS_INTEGER :=128 • job_chain_stalled CONSTANT PLS_INTEGER :=256 • job_all_events CONSTANT PLS_INTEGER := 511 • job_run_completed CONSTANT PLS_INTEGER := job_succeeded + job_failed + job_stopped <p>Table 157-84 describes these event types in detail.</p> |
| repeat_interval | <p>Either a PL/SQL function returning the next date and time on which to run, or calendaring syntax expression. If this is set, schedule_name should be NULL. See "Calendaring Syntax" for more information.</p> |
| restartable | <p>This attribute specifies whether or not a job can be restarted in case of failure. By default, jobs are not restartable and this attribute is set to FALSE. Setting this to TRUE means that if a job fails while running, it is restarted from the beginning point of the job.</p> <p>In the case of a chain job, if this attribute is TRUE, the chain is restarted from the beginning after an application failure. If this attribute is FALSE, or if there has been a database failure, the chain is restarted at the last running step. The restart_on_recovery attribute of that step then determines if the step is restarted or marked as stopped. (If marked as stopped, the chain evaluates rules and continues.)</p> <p>Note that setting this attribute to TRUE might lead to data inconsistencies in some situations, for example, if data is committed within a job.</p> <p>Retries on errors are not counted as regular runs. The run count or failure count is not incremented until the job succeeds or has failed all its six retries.</p> <p>The restartable attribute is used by the Scheduler to determine whether to retry the job not only on regular application errors, but after a database malfunction as well. The Scheduler retries the job a maximum of six times. The first time, it waits for one second and multiplies this wait time with a factor of 10 each time thereafter.</p> <p>Both the run count and failure count are incremented by 1 if the job has failed all its six retries. If the job immediately succeeds, or it succeeds on one of its retries, run count is incremented by 1.</p> <p>The Scheduler stops retrying a job when:</p> <ul style="list-style-type: none"> • One of the retries succeeds. • All of its six retries have failed. • The next retry would occur after the next regularly scheduled run of the job. <p>The Scheduler no longer retries the job if the next scheduled retry is past the next regularly scheduled run for repeating jobs.</p> |

Table 157-83 (Cont.) Job Attribute Values

| Name | Description |
|-----------------------------------|--|
| <code>schedule_limit</code> | <p>In heavily loaded systems, jobs are not always started at their scheduled time. This attribute enables you to have the Scheduler not start a job at all if the delay in starting the job is larger than the interval specified. It can be a value of 1 minute to 99 days. For example, if a job was supposed to start at noon and the schedule limit is set to 60 minutes, the job will not be run if it has not started to run by 1:00 p.m.</p> <p>If <code>schedule_limit</code> is not specified, the job is executed at some later date as soon as there are resources available to run it. By default, this attribute is set to null, which indicates that the job can be run at any time after its scheduled time. A scheduled job run that is skipped because of this attribute does not count against the number of runs and failures of the job. An entry in the job log reflects the skipped run.</p> |
| <code>schedule_name</code> | <p>The name of a schedule, window, or group of type <code>WINDOW</code> to use as the schedule for this job. If this is set, <code>end_date</code>, <code>start_date</code> and <code>repeat_interval</code> should all be <code>NULL</code>.</p> |
| <code>start_date</code> | <p>The original date and time on which this job started or is scheduled to start. If this is set, <code>schedule_name</code> should be <code>NULL</code>.</p> |
| <code>stop_on_window_close</code> | <p>This attribute only applies if the schedule of a job is a window or a window group. Setting this attribute to <code>TRUE</code> implies that the job should stop once the associated window is closed. The job is stopped using the <code>stop_job</code> procedure with <code>force</code> set to <code>FALSE</code>.</p> <p>By default, <code>stop_on_window_close</code> is set to <code>FALSE</code>. Therefore, if you do not set this attribute, the job continues after the window closes.</p> <p>Note that, although the job is allowed to continue, its resource allocation will probably change because closing a window generally also implies a change in resource plans.</p> |
| <code>store_output</code> | <p>This is a boolean attribute. If set to <code>TRUE</code>, then for job runs that are logged, all job output and error messages are stored in the <code>*_JOB_RUN_DETAILS</code> views. If set to <code>FALSE</code>, then the output and messages are not stored. For new jobs, this is set, by default, to <code>TRUE</code>.</p> |

The following event types are valid values for the `raise_events` attribute in [Table 157-83](#).

Table 157-84 Event Types Raised by the Scheduler

| Event Type | Description |
|--------------------------------|--|
| <code>job_all_events</code> | <p>Not an event, but a constant that provides an easy way for you to enable all events</p> |
| <code>job_broken</code> | <p>The job has been disabled and has changed to the <code>BROKEN</code> state because it exceeded the number of failures defined by the <code>max_failures</code> job attribute</p> |
| <code>job_chain_stalled</code> | <p>A job running a chain is in the <code>CHAIN_STALLED</code> state. A running chain becomes stalled if there are no steps running or scheduled to run and the chain <code>evaluation_interval</code> is set to <code>NULL</code>. No progress is made in the chain unless there is manual intervention.</p> |
| <code>job_completed</code> | <p>The job completed because it reached its <code>max_runs</code> or <code>end_date</code></p> |

Table 157-84 (Cont.) Event Types Raised by the Scheduler

| Event Type | Description |
|---------------------|--|
| job_disabled | The job was disabled by the Scheduler or by a call to SET_ATTRIBUTE |
| job_failed | The job failed, either due to an error or an abnormal termination. |
| job_over_max_dur | The job exceeded the maximum run duration specified by its max_run_duration attribute. (Note: you do not need to enable this event with the raise_events job attribute; it is always enabled.) |
| job_run_completed | A job run either failed, succeeded, or was stopped |
| job_sch_lim_reached | The schedule limit of the job was reached. The job was not started because the delay in starting the job exceeded the value of the schedule_limit job attribute. |
| job_started | The job started |
| job_stopped | The job was stopped by a call to STOP_JOB |
| job_succeeded | The job completed successfully |

Program Attribute Values

Table 157-85 lists program attribute values.

Note:

See the "[CREATE_PROGRAM Procedure](#)" for more complete descriptions of the attributes in this table.

Table 157-85 Program Attribute Values

| Name | Description |
|---------------------|--|
| comments | An optional comment. This can describe what the program does or give usage details. |
| detached | If TRUE, the program is a detached program. See <i>Oracle Database Administrator's Guide</i> for information about detached jobs and detached programs. |
| number_of_arguments | The number of arguments required by the stored procedure or other executable that the program invokes |
| program_action | The action that the program performs, indicated by the program_type attribute. For example, if program_type is 'STORED_PROCEDURE', program_action contains the name of the stored procedure. |
| program_type | The type of program. This must be one of these supported program types: 'PLSQL_BLOCK', 'STORED_PROCEDURE', and 'EXECUTABLE'. |

Schedule Attribute Values

Table 157-86 lists schedule attribute values.

Note:

See "[CREATE_SCHEDULE Procedure](#)" for more complete descriptions of the attributes in this table.

Table 157-86 Schedule Attribute Values

| Name | Description |
|-----------------|---|
| comments | An optional comment. |
| end_date | The cutoff date and time after which the schedule does not specify any dates. |
| event_spec | This attribute takes two values: the <code>value</code> argument should contain the event condition and the <code>value2</code> argument should contain the queue specification. For more details, see the descriptions for the <code>event_condition</code> and <code>queue_spec</code> arguments to the " CREATE_JOB Procedure ". |
| repeat_interval | An attribute specifying how often the schedule should repeat, using the calendaring syntax. See " Calendaring Syntax " for more information. |
| start_date | The start or reference date and time used by the calendaring syntax. |

File Watcher Attribute Values

[Table 157-87](#) lists file watcher attribute values.

Table 157-87 File Watcher Attribute Values

| Parameter | Description |
|-----------------------|--|
| destination | Remote host name or IP address where the file is expected to arrive. If <code>NULL</code> , destination is the local host. |
| directory_path | Directory in which the file is expected to arrive. The single wildcard '?' at the beginning of the path denotes the Oracle home path. For example, '?/rdbms/log' denotes the rdbms/log subdirectory of the Oracle home directory. |
| file_name | Name of the file being looked for. Two wildcards are permitted anywhere in the file name: '?' denotes any single character, and '*' denotes zero or more characters. This attribute cannot be <code>NULL</code> . |
| credential_name | Name of a valid credential object. The file watcher uses the credential to authenticate itself with the host operating system to access the watched-for file. The file watcher owner must have the <code>EXECUTE</code> privilege on the credential. Cannot be <code>NULL</code> . |
| min_file_size | Minimum file size in bytes before the file watcher considers the file found. Default is 0. |
| steady_state_duration | Minimum time interval that the file must remain unchanged before the file watcher considers the file found. If <code>NULL</code> , an internal value is used. The lower limit for this attribute is 10 seconds. |
| comments | Optional comment. |

Job Class Attribute Values

Table 157-88 lists job class attribute values.

Note:

See the "[CREATE_JOB_CLASS Procedure](#)" for more complete descriptions of the attributes in this table.

Table 157-88 Job Class Attribute Values

| Name | Description |
|-------------------------|---|
| comments | An optional comment about the class. |
| log_history | This attribute controls the number of days that job log entries for jobs in this class are retained. It helps prevent the job log from growing indiscriminately. The range of valid values is 0 through 1000000. If set to 0, no history is kept. If NULL, retention days are set by the log_history Scheduler attribute (set with SET_SCHEDULER_ATTRIBUTE). |
| logging_level | This attribute specifies how much information is logged. The valid values are: <ul style="list-style-type: none"> DBMS_SCHEDULER.LOGGING_OFF No logging is performed for any jobs in this class. DBMS_SCHEDULER.LOGGING_FAILED_RUNS The Scheduler logs only jobs in the class that failed, with the reason for failure. DBMS_SCHEDULER.LOGGING_RUNS The Scheduler writes detailed information to the job log for all runs of each job in this class. This is the default. DBMS_SCHEDULER.LOGGING_FULL The Scheduler records all operations performed on all jobs in this class, in addition to recording every run of a job. Every time a job is created, enabled, disabled, altered (with SET_ATTRIBUTE), stopped, and so on, an entry is recorded in the log. |
| resource_consumer_group | The resource consumer group that a class is associated with. All jobs in the class run under this resource consumer group. See <i>Oracle Database Administrator's Guide</i> for a description of resource consumer groups and the Database Resource Manager. |
| service | The database service that the jobs in the job class have affinity to. If both the resource_consumer_group and service attributes are set for a job class, and if the service is mapped to a resource consumer group, the resource_consumer_group attribute takes precedence. |

Window Attribute Values

Table 157-89 lists window attribute values.

Note:

See the "[CREATE_WINDOW Procedure](#)" for more complete descriptions of the attributes in this table.

Table 157-89 Window Attribute Values

| Name | Description |
|-----------------|---|
| comments | An optional comment about the window. |
| duration | The duration of the window. |
| end_date | The date after which the window no longer opens. If this is set, schedule_name must be NULL. |
| repeat_interval | An attribute specifying how often the schedule should repeat, using the calendaring syntax. PL/SQL date functions are not allowed. If this is set, schedule_name must be NULL. See " Calendaring Syntax " for more information. |
| resource_plan | The resource plan to be associated with a window. When the window opens, the system switches to this resource plan. When the window closes, the original resource plan is restored. If a resource plan has been made active with the force option, no resource plan switch occurs. Only one resource plan can be associated with a window. It may be NULL or the empty string (""). When it is NULL, the resource plan that is in effect when the window opens stays in effect for the duration of the window. When it is the empty string, the resource manager is disabled for the duration of the window. |
| schedule_name | The name of a schedule to use with this window. If this is set, start_date, end_date, and repeat_interval must all be NULL. |
| start_date | The next date and time on which this window is scheduled to open. If this is set, schedule_name must be NULL. |
| window_priority | The priority of the window. Must be either 'LOW' (default) or 'HIGH'. |

Chain Attribute Values

[Table 157-90](#) lists chain attribute values.

Note:

See the "[CREATE_CHAIN Procedure](#)" for more complete descriptions of the attributes in this table.

Table 157-90 Chain Attribute Values

| Name | Description |
|---------------------|---|
| comments | An optional comment describing the purpose of the chain. |
| evaluation_interval | If not NULL, provides an additional evaluation of the chain at this interval, as well as at normal evaluation times (when the job starts, when a step completes, or when an event that is associated with an event step arrives) This attribute should only to be used when chain rules use SQL syntax and the rule conditions contain elements that are not under the control of the Scheduler, because the extra interval is CPU intensive. For most chains, the normal evaluation times are sufficient. |

Table 157-90 (Cont.) Chain Attribute Values

| Name | Description |
|---------------|--|
| rule_set_name | <p>In the normal case, no rule set should be passed in. The Scheduler automatically creates a rule set and associated empty evaluation context. You then use <code>DEFINE_CHAIN_RULE</code> to add rules and <code>DROP_CHAIN_RULE</code> to remove them.</p> <p>Advanced users can create a rule set that describes their chain dependencies and pass it in here. This allows greater flexibility in defining rules. For example, conditions can refer to external variables, and tables can be exposed through the evaluation context. If you pass in a rule set, you must ensure that it is in the format of a chain rule set. (For example, all steps must be listed as variables in the evaluation context). If no rule set is passed in, the rule set created is of the form <code>SCHED_RULESET\${N}</code> and the evaluation context created is of the form <code>SCHED_EVCTX\${N}</code></p> |

Database Destination Attribute Values

Table 157-91 lists database destination attribute values.

Note:

See the "[CREATE_DATABASE_DESTINATION Procedure](#)" for more complete descriptions of the attributes in this table.

Table 157-91 Database Destination Attribute Values

| Name | Description |
|--------------|--|
| agent | <p>The name of the external destination (also known as agent destination) that is used to connect to the remote database.</p> <p>You can obtain valid external destination names from the view <code>ALL_SCHEDULER_EXTERNAL_DESTS</code>.</p> |
| connect_info | <p>The TNS connect descriptor that identifies the remote database to connect to, or the net service name (alias) in <code>tnsnames.ora</code> that resolves to the connect descriptor.</p> <p>Note: This corresponds to the <code>tns_name</code> argument of <code>CREATE_DATABASE_DESTINATION</code>.</p> |
| enabled | If <code>TRUE</code> , the database destination is enabled. |
| comments | An optional comment about the database destination. |

External Destination Attribute Values

Table 157-92 lists external destination attribute values.

Note:

External destinations are created only implicitly by registering a remote Scheduler agent with the local database.

Table 157-92 External Destination Attribute Values

| Name | Description |
|------------|---|
| hostname | (GET_ATTRIBUTE only) The fully qualified host name (including domain) or IP address of the computer on which the Scheduler agent resides. |
| port | (GET_ATTRIBUTE only) The TCP port number on which the agent listens. |
| ip_address | (GET_ATTRIBUTE only) The IP address of the host on which the agent resides. |
| enabled | If TRUE, the external destination is enabled. |
| comments | An optional comment about the external destination. |

Group Attribute Values

[Table 157-93](#) lists group attribute values.

Note:

See the "[CREATE_GROUP Procedure](#)" for more complete descriptions of the attributes in this table.

Table 157-93 Group Attribute Values

| Name | Description |
|-------------------|--|
| group_type | (GET_ATTRIBUTE only) The group type (either WINDOW, DB_DEST, or EXTERNAL_DEST). |
| member_name | Comma-separated list of members. Replaces the existing list of members. To add one or more members to the existing list, use ADD_GROUP_MEMBER. Note: this attribute corresponds to the member argument of CREATE_GROUP. |
| enabled | If TRUE, the group is enabled. |
| comments | An optional comment about the group. |
| number_of_members | (GET_ATTRIBUTE only) The number of members in the group. |

Credential Attribute Values

[Table 157-94](#) lists credential attribute values.

 **Note:**

Credential attribute values for the `SET_ATTRIBUTE` and `GET_ATTRIBUTE` procedures are deprecated with Oracle Database Release 12c Release 1 (12.1). While these attribute values remain available in this package, for reasons of backward compatibility, Oracle recommends using the alternative enhanced functionality provided in the `DBMS_CREDENTIAL` package, specifically the attribute parameter in the `UPDATE_CREDENTIAL` Procedure.

Table 157-94 Credential Attribute Values

| Name | Description |
|-----------------------------|--|
| <code>username</code> | The user name for logging into to the host operating system or remote Oracle database. Maximum length is 64. |
| <code>password</code> | The password for the user name. Maximum length is 128. |
| <code>comments</code> | A description of the credential. Maximum length is 240. |
| <code>windows_domain</code> | For a Windows remote executable target, this is the domain that the specified user belongs to. Maximum length is 64. |
| <code>database_role</code> | The value of the <code>database_role</code> attribute is used as the system privilege for logging into a remote database to run a remote database job. Valid values are: <code>SYSDBA</code> and <code>SYSOPER</code> . |

Resource Attribute Values

[Table 157-95](#) lists resource attribute values.

Table 157-95 Resource Attribute Values

| Name | Description |
|-------------------------------|--|
| <code>resource_name</code> | The name of the resource |
| <code>units</code> | The number of units of this resource that the job or program uses. |
| <code>status</code> | The status of the resource. <code>ENFORCE_CONSTRAINTS</code> . This is the default value, and when set, will force the scheduler to enforce resource limits. When the maximum number of units of this resource has been reached, no additional jobs using this resource will get started. <code>IGNORE_CONSTRAINTS</code> . When set, the scheduler will ignore any constraints on this resource. <code>BLOCKED_ALL_JOBS</code> . No jobs having a constraint on this resource will be allowed to run. The resource is considered to be permanently blocking until switched to one of the other two states. |
| <code>constraint_level</code> | Level of the constraint: <code>JOB_LEVEL</code> or <code>PROGRAM_LEVEL</code> For incompatibilities, for <code>JOB_LEVEL</code> , the incompatibility members must be jobs; for <code>PROGRAM_LEVEL</code> the incompatibility members must be programs. |
| <code>comments</code> | Descriptive comment about the resource. |

157.6.68 SET_ATTRIBUTE_NULL Procedure

This procedure sets an attribute of an object to `NULL`.

The attributes that can be set depend on the object being altered. If the object is enabled, it is disabled before being altered and reenabled afterward. If the object cannot be reenabled, an error is generated and the object is left in a disabled state.

Syntax

```
DBMS_SCHEDULER.SET_ATTRIBUTE_NULL (
    name          IN VARCHAR2,
    attribute     IN VARCHAR2);
```

Parameters

Table 157-96 SET_ATTRIBUTE_NULL Procedure Parameters

| Parameter | Description |
|-----------|-----------------------------|
| name | The name of the object |
| attribute | The attribute being changed |

Usage Notes

To run `SET_ATTRIBUTE_NULL` for a window, group of type `WINDOW`, or job class, you must have the `MANAGE_SCHEDULER` privilege. Otherwise, you must be the owner of the object being altered or have `ALTER` privileges on that object or have the `CREATE ANY JOB` privilege.

157.6.69 SET_JOB_ANYDATA_VALUE Procedure

This procedure sets the value for an argument of the associated program for a job, encapsulated in an `AnyData` object.

It overrides any default value set for the program argument. `NULL` is a valid assignment for a program argument.

The argument can be specified by position or by name. You can specify by name only when:

- The job points to a saved program object
- The argument was assigned a name with the [DEFINE_ANYDATA_ARGUMENT Procedure](#)

Scheduler does no type checking of the argument at any time.

`SET_JOB_ANYDATA_VALUE` is overloaded.

Syntax

Sets a program argument by its position.

```
DBMS_SCHEDULER.SET_JOB_ANYDATA_VALUE (
    job_name          IN VARCHAR2,
```

```
argument_position    IN PLS_INTEGER,
argument_value      IN SYS.ANYDATA);
```

Sets a program argument by its name.

```
DBMS_SCHEDULER.SET_JOB_ANYDATA_VALUE (
  job_name           IN VARCHAR2,
  argument_name      IN VARCHAR2,
  argument_value     IN SYS.ANYDATA);
```

Parameters

Table 157-97 SET_JOB_ANYDATA_VALUE Procedure Parameters

| Parameter | Description |
|-------------------|---|
| job_name | The name of the job to be altered |
| argument_name | The name of the program argument being set |
| argument_position | The position of the program argument being set |
| argument_value | The new value to be assigned to the program argument, encapsulated in an AnyData object |

Usage Notes

SET_JOB_ANYDATA_VALUE requires that you own the job or have ALTER privileges on that job. You can also set a job argument value if you have the CREATE ANY JOB privilege.

SET_JOB_ANYDATA_VALUE does not apply to lightweight jobs because lightweight jobs cannot take AnyData arguments.

See Also:

- "[SET_JOB_ARGUMENT_VALUE Procedure](#)"
- "[DEFINE_ANYDATA_ARGUMENT Procedure](#)"

157.6.70 SET_JOB_ARGUMENT_VALUE Procedure

This procedure sets the value of an argument for a job.

It overrides any default value set for the corresponding program or stored procedure argument. The argument can be specified by position or by name. You can specify by name only when:

- The job points to a saved program object
- The argument was assigned a name with the [DEFINE_PROGRAM_ARGUMENT Procedure](#) or the [DEFINE_METADATA_ARGUMENT Procedure](#)

Scheduler does no type checking of the argument at any time.

SET_JOB_ARGUMENT_VALUE is overloaded.

Syntax

Sets an argument value by position:

```
DBMS_SCHEDULER.SET_JOB_ARGUMENT_VALUE (
  job_name          IN VARCHAR2,
  argument_position IN PLS_INTEGER,
  argument_value    IN VARCHAR2);
```

Sets an argument value by name:

```
DBMS_SCHEDULER.SET_JOB_ARGUMENT_VALUE (
  job_name          IN VARCHAR2,
  argument_name     IN VARCHAR2,
  argument_value    IN VARCHAR2);
```

Parameters

Table 157-98 SET_JOB_ARGUMENT_VALUE Procedure Parameters

| Parameter | Description |
|-------------------|--|
| job_name | The name of the job to be altered |
| argument_name | The name of the program argument being set |
| argument_position | The position of the program argument being set |
| argument_value | The new value to be set for the program argument. To set a non-VARCHAR value, use the SET_JOB_ANYDATA_VALUE procedure. |

Usage Notes

SET_JOB_ARGUMENT_VALUE requires that you be the owner of the job or have ALTER privileges on that job. You can also set a job argument value if you have the CREATE ANY JOB privilege.

SET_JOB_ARGUMENT_VALUE only supports arguments of SQL type. Therefore, argument values that are not of SQL type, such as booleans, are not supported as program or job arguments.

SET_JOB_ARGUMENT_VALUE can be used to set arguments of lightweight jobs but only if the argument is of type VARCHAR2.

See Also:

- ["SET_JOB_ANYDATA_VALUE Procedure"](#)
- ["DEFINE_PROGRAM_ARGUMENT Procedure"](#)

157.6.71 SET_JOB_ATTRIBUTES Procedure

This procedure changes an attribute of a job.

Syntax

```
DBMS_SCHEDULER.SET_JOB_ATTRIBUTES (
    jobattr_array    IN JOBATTR_ARRAY,
    commit_semantics IN VARCHAR2 DEFAULT 'STOP_ON_FIRST_ERROR');
```

Parameters

Table 157-99 SET_JOB_ATTRIBUTES Procedure Parameters

| Parameter | Description |
|------------------|---|
| jobattr_array | The array of job attribute changes. |
| commit_semantics | The commit semantics. The following types are supported: <ul style="list-style-type: none"> STOP_ON_FIRST_ERROR returns on the first error and commits previous successful attribute changes to disk. This is the default. TRANSACTIONAL returns on the first error and rolls back everything that happened before that error. ABSORB_ERRORS tries to absorb any errors and complete the rest of the job attribute changes on the list. It commits all the successful changes. If errors occur, you can query the view SCHEDULER_BATCH_ERRORS for details. |

Usage Notes

Calling SET_ATTRIBUTE on an enabled job disables the job, changes the attribute value, and reenables the job. SET_JOB_ATTRIBUTES changes the attribute values in the context of a single transaction.

157.6.72 SET_RESOURCE_CONSTRAINT Procedure

This procedure allows users to specify the resources used by jobs.

Syntax

```
DBMS_SCHEDULER.SET_RESOURCE_CONSTRAINT (
    object_name    IN VARCHAR2,
    resource_name  IN VARCHAR2,
    units          IN NUMBER DEFAULT 1);
```

Parameters

Table 157-100 SET_RESOURCE_CONSTRAINT Procedure Parameters

| Parameter | Description |
|---------------|---|
| object_name | The name of a program or a job, or a comma separated list of these objects. |
| resource_name | The name of the resource. |

Table 157-100 (Cont.) SET_RESOURCE_CONSTRAINT Procedure Parameters

| Parameter | Description |
|--------------------|--|
| <code>units</code> | The number of units of this resource that the job or program uses. |

Usages Notes

`object_name` can be the name or comma-separated list of names of either programs or jobs. This creates a constraint on the named resource for these programs or jobs.

`units` specifies the number of units of the resource that the program or job can use. If `units` is set to 0, then the program or job does not use this resource anymore, and the resulting constraint is deleted. Setting `units` to 0 on a resource with no previous constraint results in an error.

When multiple constraints are defined on the same resource, the object types must match. When one or more existing constraints for a resource are based on jobs and a new constraint is added for the same resource that is based on a program (or vice versa) an error will be raised.

157.6.73 SET_SCHEDULER_ATTRIBUTE Procedure

This procedure sets the value of a Scheduler attribute. This takes effect immediately but the resulting changes may not be seen immediately, depending on the attribute affected.

[Table 157-101](#) provides short attribute descriptions for the `SET_SCHEDULER_ATTRIBUTE` procedure. For complete descriptions, see section "Setting Scheduler Preferences" in *Oracle Database Administrator's Guide*.

Syntax

```
DBMS_SCHEDULER.SET_SCHEDULER_ATTRIBUTE (  
    attribute    IN VARCHAR2,  
    value        IN VARCHAR2);
```

Parameters

Table 157-101 SET_SCHEDULER_ATTRIBUTE Procedure Parameters

| Parameter | Description |
|-----------|--|
| attribute | <p>The name of the Scheduler attribute. Possible values are:</p> <ul style="list-style-type: none"> • 'default_timezone': Repeating jobs and windows that use the calendaring syntax retrieve the time zone from this attribute when start_date is not specified. See "Calendaring Syntax" for more information. • 'email_server': The SMTP server address that the Scheduler uses to send e-mail notifications for job state events. E-mail notifications cannot be sent if this attribute is NULL. • 'email_sender': The default e-mail address of the sender of job state e-mail notifications. • 'email_server_credential': The schema and name of an existing credential object that SYS has execute object privileges on. Default is NULL. The username and password stored in this credential are used to authenticate with the e-mail server when sending e-mail notifications. • 'email_server_encryption': This attribute indicates whether or not encryption is enabled for this email server connection, and if so, at what point encryption starts, and with which protocol. Values are: <ul style="list-style-type: none"> – NONE: the default, indicating no encryption used – SSL_TLS: indicating that either SSL or TLS are used, from the beginning of the connection – STARTTLS: indicating that the connection starts unencrypted, but the command STARTTLS is sent to the e-mail server and starts encryption • 'event_expiry_time': The time, in seconds, before a job state event generated by the Scheduler expires from the Scheduler event queue. If NULL, job state events expire after 24 hours. • 'log_history': The number of days that log entries for both the job log and the window log are retained. Default is 30 and the range of valid values is 0 through 1000000. • 'max_job_slave_processes': This Scheduler attribute is not used. |
| value | The new value of the attribute |

Usage Notes

To run SET_SCHEDULER_ATTRIBUTE, you must have the `MANAGE SCHEDULER` privilege.

See Also:

Oracle Database Administrator's Guide for more detailed descriptions of Scheduler attributes

157.6.74 STOP_JOB Procedure

This procedure stops currently running jobs or all jobs in a job class.

After stopping the job, the state of a one-time job is set to `STOPPED`, whereas the state of a repeating job is set to `SCHEDULED` or `COMPLETED`, depending on whether the next run of the job is scheduled.

If a job pointing to a chain is stopped, all running steps of the running chain are stopped.

If a job has multiple destinations, the database attempts to stop the job at all destinations.

For external jobs, `STOP_JOB` stops only the external process that was directly started by the job action. It does not stop child processes of external jobs.

For in-memory full jobs in an Oracle Real Application Clusters environment, `STOP_JOB` uses the `instance_id` attribute of the job definition to determine in which instance (or all of them if the attribute is left null) to stop the in-memory full job. (In-memory full jobs are kept cached in memory, and as such are limited to the instance currently caching them. Because of this, the same `job_name` can in some conditions be used for different jobs on different instances.)

Syntax

```
DBMS_SCHEDULER.STOP_JOB (
  job_name          IN VARCHAR2
  force             IN BOOLEAN DEFAULT FALSE
  commit_semantics IN VARCHAR2 DEFAULT 'STOP_ON_FIRST_ERROR');
```

Parameters

Table 157-102 STOP_JOB Procedure Parameters

| Parameter | Description |
|-----------------------|---|
| <code>job_name</code> | <p>Name of a job to stop. Can be a comma-separated list of jobs, where each entry can be one of the following:</p> <ul style="list-style-type: none"> Job name: the name of an existing job, optionally preceded by a schema name and dot separator. Job destination ID: a number, obtained from the <code>JOB_DEST_ID</code> column of the <code>*_SCHEDULER_JOB_DESTS</code> views, that represents the unique combination of a job, a credential, and a destination. Job class: the name of a job class. Must be preceded by the <code>SYS</code> schema name and a dot separator. <p>If you specify a job class, all jobs that belong to that job class are stopped. If you specify a job that was created with a destination group as its <code>destination_name</code> attribute, all job instances on all destinations are stopped.</p> |

Table 157-102 (Cont.) STOP_JOB Procedure Parameters

| Parameter | Description |
|-------------------------------|---|
| <code>force</code> | <p>If <code>force</code> is set to <code>FALSE</code>, the Scheduler tries to gracefully stop the job using an interrupt mechanism. This method gives control back to the slave process, which can update the status of the job in the job queue to stopped. If this fails, an error is returned.</p> <p>If <code>force</code> is set to <code>TRUE</code>, the Scheduler immediately terminates the job slave. Oracle recommends that <code>STOP_JOB</code> with <code>force</code> set to <code>TRUE</code> be used only after a <code>STOP_JOB</code> with <code>force</code> set to <code>FALSE</code> has failed.</p> <p>Use of the <code>force</code> option requires the <code>MANAGE SCHEDULER</code> system privilege.</p> |
| <code>commit_semantics</code> | <p>The commit semantics. The following two types are supported:</p> <ul style="list-style-type: none"> <code>STOP_ON_FIRST_ERROR</code>: The procedure returns on the first error and commits previous successful stop operations to disk. This is the default. <code>ABSORB_ERRORS</code>: The procedure tries to absorb any errors, stops the rest of the jobs, and commits all the successful stop operations. This type is available only if no job classes are specified in the <code>job_name</code> list. If errors occur, you can query the view <code>SCHEDULER_BATCH_ERRORS</code> for details. |

Usage Notes

`STOP_JOB` without the `force` option requires that you be the owner of the job or have `ALTER` privileges on that job. You can also stop a job if you have the `CREATE ANY JOB` or `MANAGE SCHEDULER` privilege.

`STOP_JOB` with the `force` option requires that you have the `MANAGE SCHEDULER` privilege.

Example

The following is an example of using `STOP_JOB`.

```
BEGIN
  DBMS_SCHEDULER.STOP_JOB('DSS.ETLJOB', 984, 1223, SYS.ETL_JOBCLASS');
END;
```

DBMS_SERVER_ALERT

The `DBMS_SERVER_ALERT` package enables you to configure the Oracle Database server to issue an alert when a threshold for a specified server metric has been violated. You can configure both warning and critical thresholds for a large number of predefined metrics.

If a warning threshold is reached, the server generates a severity level 5 alert. If a critical threshold is reached, the server generates a severity level 1 alert.

The chapter contains the following topics:

- [Security Model](#)
- [Object Types](#)
- [Relational Operators](#)
- [Supported Metrics](#)
- [Summary of DBMS_SERVER_ALERT Subprograms](#)

158.1 DBMS_SERVER_ALERT Security Model

The user needs `DBA` or `IMP_FULL_DATABASE` roles to use the `DBMS_SERVER_ALERT` package.

158.2 DBMS_SERVER_ALERT Object Types

You qualify the metric by an individual object for the listed object types.

Table 158-1 Object Types Defined as Constants

| Constant | Description |
|--------------------------------------|--|
| <code>OBJECT_TYPE_SYSTEM</code> | Metrics collected on the system level for each instance. |
| <code>OBJECT_TYPE_FILE</code> | Metrics collected on the file level. These are used for <code>AVG_FILE_READ_TIME</code> and <code>AVG_FILE_WRITE_TIME</code> metrics. |
| <code>OBJECT_TYPE_SERVICE</code> | Metrics collected on the service level. Currently <code>ELAPSED_TIME_PER_CALL</code> and <code>CPU_TIME_PER_CALL</code> are collected. |
| <code>OBJECT_TYPE_TABLESPACE</code> | Metrics collected on the tablespace level. Note: Dictionary managed tablespaces are not supported. |
| <code>OBJECT_TYPE_EVENT_CLASS</code> | Metrics collected on wait event class level. Currently supported metrics are <code>AVG_USERS_WAITING</code> and <code>DB_TIME_WAITING</code> . |
| <code>OBJECT_TYPE_SESSION</code> | Metrics collected on the session level. Currently only <code>BLOCKED_USERS</code> is collected. The threshold can only be set at the instance level, which means that no object name should be specified when setting the threshold for this type of metric. |
| <code>OBJECT_TYPE_WRCCLIENT</code> | Refers to a group of metrics (<code>WCR_...</code>) used during replay to monitor the replay clients' performance |

158.3 DBMS_SERVER_ALERT Relational Operators

You can specify a relational comparison operator to determine whether or not a given metric's value violates the threshold setting. The server supports the following operators.

Table 158-2 Relational Operators Defined as Constants

| Constant | Description |
|-----------------------|---|
| OPERATOR_CONTAINS | A metric value matching an entry in a list of threshold values is considered a violation. |
| OPERATOR_DO_NOT_CHECK | The metric value is not compared to the threshold value, and no alerts are generated. Use this operator to disable alerts for a metric. |
| OPERATOR_EQ | A metric value equal to the threshold value is considered a violation. |
| OPERATOR_GE | A metric value greater than or equal to the threshold value is considered a violation. |
| OPERATOR_GT | A metric value greater than the threshold value is considered a violation. |
| OPERATOR_LE | A metric value less than or equal to the threshold value is considered a violation. |
| OPERATOR_LT | A metric value less than the threshold value is considered a violation. |
| OPERATOR_NE | A metric value not equal to the threshold value is considered a violation. |

158.4 DBMS_SERVER_ALERT Supported Metrics

These metrics are supported. All internal metric names are supplied as package constants.

Table 158-3 List of Supported Metrics

| Metric Name (Internal) | Metric Name (External) | Units |
|------------------------|---|-----------------------------|
| AVG_FILE_READ_TIME | Average File Read Time | Microseconds |
| AVG_FILE_WRITE_TIME | Average File Write Time | Microseconds |
| AVG_USERS_WAITING | Average Number of Users Waiting on a Class of Wait Events | Count of sessions |
| BLOCKED_USERS | Number of Users blocked by some Session | Number of Users |
| BRANCH_NODE_SPLITS_SEC | Branch Node Splits (for each second) | Splits for each Second |
| BRANCH_NODE_SPLITS_TXN | Branch Node Splits (for each transaction) | Splits for each Transaction |
| BUFFER_CACHE_HIT | Buffer Cache Hit (%) | % of cache accesses |

Table 158-3 (Cont.) List of Supported Metrics

| Metric Name (Internal) | Metric Name (External) | Units |
|-------------------------------|--|--------------------------------|
| CONSISTENT_CHANGES_SEC | Consistent Changes (for each second) | Changes for each Second |
| CONSISTENT_CHANGES_TXN | Consistent Changes (for each transaction) | Changes for each Transaction |
| CONSISTENT_GETS_SEC | Consistent Gets (for each second) | Gets for each Second |
| CONSISTENT_GETS_TXN | Consistent Gets (for each transaction) | Gets for each Transaction |
| CR_BLOCKS_CREATED_SEC | CR Blocks Created (for each second) | Blocks for each Second |
| CR_BLOCKS_CREATED_TXN | CR Blocks Created (for each transaction) | Blocks for each Transaction |
| CR_RECORDS_APPLIED_SEC | CR Undo Records Applied (for each second) | Records for each Second |
| CR_RECORDS_APPLIED_TXN | CR Undo Records Applied (for each transaction) | Records for each Transaction |
| CURSOR_CACHE_HIT | Cursor Cache Hit (%) | % of soft parses |
| DATABASE_WAIT_TIME | Database Wait Time (%) | % of all database time |
| DATABASE_CPU_TIME | Database CPU Time (%) | % of all database time |
| DB_BLKGETS_SEC | DB Block Gets (for each second) | Gets for each Second |
| DB_BLKGETS_TXN | DB Block Gets (for each transaction) | Gets for each Transaction |
| DB_TIME_WAITING | Percent of Database Time Spent Waiting on a Class of Wait Events | % of Database Time |
| DBWR_CKPT_SEC | DBWR Checkpoints (for each second) | Checkpoints for each Second |
| DISK_SORT_SEC | Sorts to Disk (for each second) | Sorts for each Second |
| DISK_SORT_TXN | Sorts to Disk (for each transaction) | Sorts for each Transaction |
| ELAPSED_TIME_PER_CALL | Elapsed time for each user call for each service | Microseconds for each call |
| ENQUEUE_DEADLOCKS_SEC | Enqueue Deadlocks (for each second) | Deadlocks for each Second |
| ENQUEUE_DEADLOCKS_TXN | Enqueue Deadlocks (for each transaction) | Deadlocks for each Transaction |
| ENQUEUE_REQUESTS_SEC | Enqueue Requests (for each second) | Requests for each Second |
| ENQUEUE_REQUESTS_TXN | Enqueue Requests (for each transaction) | Requests for each Transaction |
| ENQUEUE_TIMEOUTS_SEC | Enqueue Timeouts (for each second) | Timeouts for each Second |
| ENQUEUE_TIMEOUTS_TXN | Enqueue Timeouts (for each transaction) | Timeouts for each Transaction |
| ENQUEUE_WAITS_SEC | Enqueue Waits (for each second) | Waits for each Second |
| ENQUEUE_WAITS_TXN | Enqueue Waits (for each transaction) | Waits for each Transaction |
| EXECUTE_WITHOUT_PARSE | Executes Performed Without Parsing | % of all executes |
| FULL_INDEX_SCANS_SEC | Fast Full Index Scans (for each second) | Scans for each Second |

Table 158-3 (Cont.) List of Supported Metrics

| Metric Name (Internal) | Metric Name (External) | Units |
|-------------------------------|--|------------------------------|
| FULL_INDEX_SCANS_TXN | Fast Full Index Scans (for each transaction) | Scans for each Transaction |
| GC_AVG_CR_GET_TIME | Global Cache CR Request | Milliseconds |
| GC_AVG_CUR_GET_TIME | Global Cache Current Request | Milliseconds |
| GC_BLOCKS_CORRUPT | Global Cache Blocks Corrupt | Blocks |
| GC_BLOCKS_LOST | Global Cache Blocks Lost | Blocks |
| HARD_PARSSES_SEC | Hard Parses (for each second) | Parses for each Second |
| HARD_PARSSES_TXN | Hard Parses (for each transaction) | Parses for each Transaction |
| LEAF_NODE_SPLITS_SEC | Leaf Node Splits (for each second) | Splits for each Second |
| LEAF_NODE_SPLITS_TXN | Leaf Node Splits (for each transaction) | Splits for each Transaction |
| LIBRARY_CACHE_HIT | Library Cache Hit (%) | % of cache accesses |
| LIBRARY_CACHE_MISS | Library Cache Miss (%) | % of cache accesses |
| LOGONS_CURRENT | Current Number of Logons | Number of Logons |
| LOGONS_SEC | Cumulative Logons (for each second) | Logons for each Second |
| LOGONS_TXN | Cumulative Logons (for each transaction) | Logons for each Transaction |
| LONG_TABLE_SCANS_SEC | Scans on Long Tables (for each second) | Scans for each Second |
| LONG_TABLE_SCANS_TXN | Scans on Long Tables (for each transaction) | Scans for each Transaction |
| OPEN_CURSORS_SEC | Cumulative Open Cursors (for each second) | Cursors for each Second |
| MEMORY_SORTS_PCT | Sorts in Memory (%) | % of sorts |
| NETWORK_BYTES_SEC | Network Bytes, for each second | Bytes for each Second |
| OPEN_CURSORS_CURRENT | Current Number of Cursors | Number of Cursors |
| OPEN_CURSORS_TXN | Cumulative Open Cursors (for each transaction) | Cursors for each Transaction |
| OS_SCHED_CPU_WAIT_TIME | Operating System Scheduler CPU Wait (by time) | Microseconds |
| PARSE_FAILURES_SEC | Parse Failures (for each second) | Parses for each Second |
| PARSE_FAILURES_TXN | Parse Failures (for each transaction) | Parses for each Transaction |
| PGA_CACHE_HIT | PGA Cache Hit (%) | % bytes processed in PGA |
| PHYS_DESGN_WAIT_SCT | Physical Design Wait (by session count) | Count of sessions |
| PHYSICAL_READS_SEC | Physical Reads (for each second) | Reads for each Second |
| PHYSICAL_READS_TXN | Physical Reads (for each transaction) | Reads for each Transaction |
| PHYSICAL_WRITES_SEC | Physical Writes (for each second) | Writes for each Second |
| PHYSICAL_WRITES_TXN | Physical Writes (for each transaction) | Writes for each Transaction |

Table 158-3 (Cont.) List of Supported Metrics

| Metric Name (Internal) | Metric Name (External) | Units |
|-------------------------------|--|---------------------------------|
| PHYSICAL_READS_DIR_SEC | Direct Physical Reads (for each second) | Reads for each Second |
| PHYSICAL_READS_DIR_TXN | Direct Physical Reads (for each transaction) | Reads for each Transaction |
| PHYSICAL_WRITES_DIR_SEC | Direct Physical Writes (for each second) | Writes for each Second |
| PHYSICAL_WRITES_DIR_TXN | Direct Physical Writes (for each transaction) | Writes for each Transaction |
| PHYSICAL_READS_LOB_SEC | Direct LOB Physical Reads (for each second) | Reads for each Second |
| PHYSICAL_READS_LOB_TXN | Direct LOB Physical Reads (for each transaction) | Reads for each Transaction |
| PHYSICAL_WRITES_LOB_SEC | Direct LOB Physical Writes (for each second) | Writes for each Second |
| PHYSICAL_WRITES_LOB_TXN | Direct LOB Physical Writes (for each transaction) | Writes for each Transaction |
| PROCESS_LIMIT_PCT | Process Limit Usage (%) | % of maximum value |
| PX_DOWNGRADED_SEC | Downgraded Parallel Operations (for each second) | Operations for each Second |
| PX_DOWNGRADED_25_SEC | Downgraded to 25% and more (for each second) | Operations for each Second |
| PX_DOWNGRADED_50_SEC | Downgraded to 50% and more (for each second) | Operations for each Second |
| PX_DOWNGRADED_75_SEC | Downgraded to 75% and more (for each second) | Operations for each Second |
| PX_DOWNGRADED_SER_SEC | Downgraded to serial (for each second) | Operations for each Second |
| RB_RECORDS_APPLIED_SEC | Rollback Undo Records Applied (for each second) | Records for each Second |
| RB_RECORDS_APPLIED_TXN | Rollback Undo Records Applied (for each transaction) | Records for each Transaction |
| REDO_ALLOCATION_HIT | Redo Log Allocation Hit | % of redo allocations |
| REDO_GENERATED_SEC | Redo Generated (for each second) | Redo Bytes for each Second |
| REDO_GENERATED_TXN | Redo Generated (for each transaction) | Redo Bytes for each Transaction |
| REDO_WRITES_SEC | Redo Writes (for each second) | Writes for each Second |
| REDO_WRITES_TXN | Redo Writes (for each transaction) | Writes for each Transaction |
| RECURSIVE_CALLS_SEC | Recursive Calls (for each second) | Calls for each Second |
| RECURSIVE_CALLS_TXN | Recursive Calls (for each transaction) | Calls for each Transaction |
| RESPONSE_TXN | Response (for each transaction) | Seconds for each Transaction |
| ROWS_PER_SORT | Rows Processed for each Sort | Rows for each Sort |

Table 158-3 (Cont.) List of Supported Metrics

| Metric Name (Internal) | Metric Name (External) | Units |
|-------------------------------|---|-----------------------------------|
| SESS_LOGICAL_READS_SEC | Session Logical Reads (for each second) | Reads for each Second |
| SESS_LOGICAL_READS_TXN | Session Logical Reads (for each transaction) | Reads for each Transaction |
| SESSION_CPU_SEC | Database CPU (for each second) | Microseconds for each Second |
| SESSION_CPU_TXN | Database CPU (for each transaction) | Microseconds for each Transaction |
| SESSION_LIMIT_PCT | Session Limit Usage (%) | % of maximum value |
| SHARED_POOL_FREE_PCT | Shared Pool Free(%) | % of shared pool |
| SOFT_PARSE_PCT | Soft Parse (%) | % of all parses |
| SQL_SRV_RESPONSE_TIME | Service Response (for each execution) | Seconds |
| TABLESPACE_PCT_FULL | Tablespace space usage | % full |
| TABLESPACE_BYT_FREE | Tablespace bytes space usage | Kilobytes free |
| TOTAL_TABLE_SCANS_SEC | Total Table Scans (for each second) | Scans for each Second |
| TOTAL_TABLE_SCANS_TXN | Total Table Scans (for each transaction) | Scans for each Transaction |
| TOTAL_INDEX_SCANS_SEC | Total Index Scans (for each second) | Scans for each Second |
| TOTAL_INDEX_SCANS_TXN | Total Index Scans (for each transaction) | Scans for each Transaction |
| TOTAL_PARSSES_SEC | Total Parses (for each second) | Parses for each Second |
| TOTAL_PARSSES_TXN | Total Parses (for each transaction) | Parses for each Transaction |
| USER_COMMITS_SEC | User Commits (for each second) | Commits for each Second |
| USER_COMMITS_TXN | User Commits (for each transaction) | Commits for each Transaction |
| USER_ROLLBACKS_SEC | User Rollbacks (for each second) | Rollbacks for each Second |
| USER_ROLLBACKS_TXN | User Rollbacks (for each transaction) | Rollbacks for each Transaction |
| USER_CALLS_SEC | User Calls (for each second) | Calls for each Second |
| USER_CALLS_TXN | User Calls (for each transaction) | Calls for each Transaction |
| USER_CALLS_PCT | User Calls (%) | % of all calls |
| USER_LIMIT_PCT | User Limit Usage (%) | % of maximum value |
| WCR_AVG_IO_LAT | Average IO response time (for a WRC client) | Milliseconds |
| WCR_PCPU | Percentage of replay threads on CPU (for a WRC client) | % of total replay threads |
| WCR_PIO | Percentage of replay threads doing IOs (for a WRC client) | % of total replay threads |

158.5 Summary of DBMS_SERVER_ALERT Subprograms

This table lists the DBMS_SERVER_ALERT subprograms and briefly describes them.

Table 158-4 DBMS_SERVER_ALERT Package Subprograms

| Subprogram | Description |
|---|---|
| EXPAND_MESSAGE Function | Expands alert messages |
| GET_THRESHOLD Procedure | Gets the current threshold settings for a specified metric |
| SET_THRESHOLD Procedure | Sets the warning and critical thresholds for a specified metric |

158.5.1 EXPAND_MESSAGE Function

This function expands alert messages.

Syntax

```
DBMS_SERVER_ALERT.EXPAND_MESSAGE (
    user_language      IN   VARCHAR2,
    message_id         IN   NUMBER,
    argument_1         IN   VARCHAR2,
    argument_2         IN   VARCHAR2,
    argument_3         IN   VARCHAR2,
    argument_4         IN   VARCHAR2,
    argument_5         IN   VARCHAR2)
RETURN VARCHAR2;
```

Parameters

Table 158-5 EXPAND_MESSAGE Function Parameters

| Parameter | Description |
|---------------|---|
| user_language | The language of the current session. |
| message_id | Id of the alert message |
| argument_1 | The first argument in the alert message. |
| argument_2 | The second argument in the alert message. |
| argument_3 | The third argument in the alert message. |
| argument_4 | The fourth argument in the alert message. |
| argument_5 | The fifth argument in the alert message. |

158.5.2 GET_THRESHOLD Procedure

This procedure gets the current threshold settings for the specified metric.

Syntax

```
DBMS_SERVER_ALERT.GET_THRESHOLD (
    metrics_id          IN   BINARY_INTEGER,
    warning_operator    OUT  BINARY_INTEGER,
    warning_value       OUT  VARCHAR2,
    critical_operator    OUT  BINARY_INTEGER,
    critical_value      OUT  VARCHAR2,
    observation_period  OUT  BINARY_INTEGER,
    consecutive_occurrences OUT BINARY_INTEGER,
```

```

instance_name      IN  VARCHAR2,
object_type        IN  BINARY_INTEGER,
object_name        IN  VARCHAR2);

```

Parameters

Table 158-6 GET_THRESHOLD Procedure Parameters

| Parameter | Description |
|-------------------------|---|
| metrics_id | The internal name of the metric. See " Supported Metrics ". |
| warning_operator | The operator for the comparing the actual value with the warning threshold. |
| warning_value | The warning threshold value. |
| critical_operator | The operator for the comparing the actual value with the critical threshold. |
| critical_value | The critical threshold value. |
| observation_period | The period at which the metric values are computed and verified against the threshold setting. |
| consecutive_occurrences | The number of observation periods the metric value should violate the threshold value before the alert is issued. |
| instance_name | The name of the instance for which the threshold is set. This is NULL for database-wide alerts. In cases in which this parameter is not NULL, this should be set to one of the INSTANCE_NAME values found in the GV\$INSTANCE View. |
| object_type | Either OBJECT_TYPE_SYSTEM or OBJECT_TYPE_SERVICE. |
| object_name | The name of the object. |

Usage Notes

Note that this subprogram does not check if the value of the `instance_name` parameter is meaningful or valid.

158.5.3 SET_THRESHOLD Procedure

This procedure sets the warning and critical thresholds for a specified metric.

Syntax

```

DBMS_SERVER_ALERT.SET_THRESHOLD(
  metrics_id          IN  BINARY_INTEGER,
  warning_operator    IN  BINARY_INTEGER,
  warning_value       IN  VARCHAR2,
  critical_operator   IN  BINARY_INTEGER,
  critical_value      IN  VARCHAR2,
  observation_period  IN  BINARY_INTEGER,
  consecutive_occurrences IN BINARY_INTEGER,
  instance_name       IN  VARCHAR2,
  object_type         IN  BINARY_INTEGER,
  object_name         IN  VARCHAR2);

```

Parameters

Table 158-7 SET_THRESHOLD Procedure Parameters

| Parameter | Description |
|--------------------------------------|---|
| <code>metrics_id</code> | The internal name of the metric. See " Supported Metrics ". |
| <code>warning_operator</code> | The operator for the comparing the actual value with the warning threshold (such as <code>OPERATOR_GE</code>). See " Relational Operators ". |
| <code>warning_value</code> | The warning threshold value. This is <code>NULL</code> if no warning threshold is set. A list of values may be specified for <code>OPERATOR_CONTAINS</code> . |
| <code>critical_operator</code> | The operator for the comparing the actual value with the critical threshold. See " Relational Operators ". |
| <code>critical_value</code> | The critical threshold value. This is <code>NULL</code> if not set. A list of values may be specified for <code>OPERATOR_CONTAINS</code> . |
| <code>observation_period</code> | The period at which the metric values are computed and verified against the threshold setting. The valid range is 1 to 60 minutes. |
| <code>consecutive_occurrences</code> | The number of observation periods the metric value should violate the threshold value before the alert is issued. |
| <code>instance_name</code> | The name of the instance for which the threshold is set. This is <code>NULL</code> for database-wide alerts. |
| <code>object_type</code> | See " Object Types ". |
| <code>object_name</code> | The name of the object. This is <code>NULL</code> for <code>SYSTEM</code> . |

Usage Notes

Note that this subprogram does not check if the value of the `instance_name` parameter is meaningful or valid. Passing a name that does not identify a valid instance will result in a threshold that is not used by any by any instance although the threshold setting will be visible in the `DBA_THRESHOLDS` view. The exception is the lower-case string 'database_wide' which is semantically equivalent to passing `NULL` for the instance name, the latter being the preferred usage.

DBMS_SERVICE

The `DBMS_SERVICE` package lets you create, delete, activate, and deactivate services for a single instance.

The chapter contains the following topics:

- [Overview](#)
- [Security Model](#)
- [Constants](#)
- [Operating Procedures](#)
- [Exceptions](#)
- [Summary of DBMS_SERVICE Subprograms](#)

 **See Also:**

Oracle Real Application Clusters Administration and Deployment Guide for administering services in Oracle Real Application Clusters.

159.1 DBMS_SERVICE Overview

`DBMS_SERVICE` supports the workload management of high availability, quality of service, job scheduling, and other planned operations in the RDBMS for the purposes of workload measurement, management, prioritization, and XA and distributed transaction management.

Oracle Real Application Clusters (RAC) can manage service names across instances as administered through `SRVCTL`. The `DBMS_SERVICE` package allows the creation, deletion, starting, and stopping of services in a single instance. Additionally, it provides the ability to disconnect all sessions that connect to an instance with a service name.

 **See Also:**

For more information about Oracle Real Application Clusters, *Oracle Real Application Clusters Administration and Deployment Guide*.

159.2 DBMS_SERVICE Security Model

The `DBMS_SERVICE` package has certain security requirements.

Privileges

The client using this package must have the `ALTER SYSTEM` execution privilege and the `V$SESSION` table read privilege.

Schemas

This package must be installed under `SYS` schema.

Roles

The `EXECUTE` privilege of the package is granted to the `DBA` role only.

159.3 DBMS_SERVICE Constants

The `DBMS_SERVICE` package provides constants that can be used for specifying parameter values.

- Constants used in calling arguments are described in [Table 159-1](#)
- Constants used in connection balancing goal arguments are described in [Table 159-2](#)
- Constants used in TAF failover attribute arguments are described in [Table 159-3](#)

Table 159-1 Constants Used in Calling Arguments

| Name | Type | Value | Description |
|--------------------------------|--------|-------|--|
| <code>GOAL_NONE</code> | NUMBER | 0 | Disables Load Balancing Advisory |
| <code>GOAL_SERVICE_TIME</code> | NUMBER | 1 | Load Balancing Advisory is based on elapsed time for work done in the service plus available bandwidth to the service |
| <code>GOAL_THROUGHPUT</code> | NUMBER | 2 | Load Balancing Advisory is based on the rate that work is completed in the service plus available bandwidth to the service |

Table 159-2 Constants Used in Connection Balancing Goal Arguments

| Name | Type | Value | Description |
|-----------------------------|--------|-------|---|
| <code>CLB_GOAL_SHORT</code> | NUMBER | 1 | Connection load balancing uses Load Balancing Advisory, when Load Balancing Advisory is enabled (either <code>goal_service_time</code> or <code>goal_throughput</code>). When <code>GOAL=NONE</code> (no load balancing advisory), connection load balancing uses an abridged advice based on CPU utilization. |

Table 159-2 (Cont.) Constants Used in Connection Balancing Goal Arguments

| Name | Type | Value | Description |
|---------------|--------|-------|---|
| CLB_GOAL_LONG | NUMBER | 2 | Balances the number of connections for each instance using session count for each service. This setting is recommended for applications with long connections such as forms. This setting can be used with Load Balancing Advisory when the connection pool is sized to accommodate gravitation within the pool itself (without adding or removing connections). The latter is the most efficient design. |

Table 159-3 Constants Used in High Availability Attribute Arguments for FAN, Application Continuity, Transaction Guard and TAF

| Name | Type | Value | Description |
|------------------------|----------------------|--------|--|
| FAILOVER_METHOD_NONE | VARCHAR2 | 0 | Server side TAF is not enabled for this service |
| FAILOVER_METHOD_BASIC | VARCHAR2 | 1 | Server side TAF method is BASIC. BASIC is the only value currently supported. This means that a new connection is established at failure time. |
| FAILOVER_TYPE_NONE | VARCHAR | | Server side TAF type is NONE |
| FAILOVER_TYPE_SESSION | VARCHAR | | Server side TAF failover type is SESSION. At failure time, if the failover type is SESSION, TAF reconnects to a surviving node and re-establish a vanilla database session. Customizations (for example, ALTER SESSION) must be re-executed in a failover callback. |
| FAILOVER_TYPE_SELECT | VARCHAR | | Server side TAF failover type is SELECT |
| FAILOVER_RETRIES | NUMBER | | Number of connection attempts when failover occurs. Specifies the number of times for Application Continuity and TAF to attempt the reconnect and re-authenticate pair. The value must be an integer greater than 0. The default in Oracle Database 12c Release 1 (12.1) for Application Continuity is 30. |
| FAILOVER_RESTORE_NONE | CONSTANT VARCHAR2 | NONE | The initial state is not restored before replaying for Application Continuity and TAF. This is recommended for OCI applications that use Application Continuity and build their own state in the request. For example, SQLPLUS. |
| FAILOVER_RESTORE_BASIC | VARCHAR2 | LEVEL1 | This is the recommended value for Java and ODP.NET applications using Application Continuity. The initial states that the user knows are restored automatically before replaying. If the user needs additional states, a callback must be registered. |

Table 159-3 (Cont.) Constants Used in High Availability Attribute Arguments for FAN, Application Continuity, Transaction Guard and TAF

| Name | Type | Value | Description |
|---------------------------|---------|-------|--|
| FAILOVER_DELAY | NUMBER | | Number of seconds delay between each connection attempt. This is the delay that Application Continuity and TAF waits if a reconnect and re-authentication fails. The value must be an integer greater than 0. The default in Oracle Database 12c Release 1 (12.1) is 10s when using Application Continuity. Using FAILOVER_DELAY the failover can be delayed until the service is next available. This can work well in conjunction with a planned outage that may make a service temporarily unavailable (such as for several minutes). |
| STOP_OPTION_NONE | VARCHAR | | Sessions are not disconnected. |
| STOP_OPTION_IMMEDIATE | VARCHAR | | Sessions are disconnected immediately after the drain_timeout expires. |
| STOP_OPTION_TRANSACTIONAL | VARCHAR | | Sessions are disconnected after the transactions during the drain_timeout. The sessions disconnect immediately when drain_timeout expires. |
| DYNAMIC | NUMBER | | For Application Continuity, this parameter specifies whether the session state that is not transactional is changed by the application during request execution. A value of DYNAMIC is recommended for all applications. If you are in any doubt, or the application can be customized, you must use DYNAMIC. |

Usage Notes

- If a TAF callback has been registered, then the failover retries and failover delay are ignored. If an error occurs, TAF continues to re-attempt the connect and authentication as long as the callback returns a value of OCI_FO_RETRY. Any delay must be coded into the callback logic
- Server side TAF settings override client-side counterparts that might be configured in TNS connect descriptors. If TAF is not configured on the client side, then at a minimum, the failover type must be set to enable TAF. If the failover type is set on the server side, then the failover method defaults to BASIC. Delay and retries are optional and may be specified independently.

159.4 DBMS_SERVICE Operating Procedures

You cannot use the following procedures with Oracle Real Applications Clusterware, Oracle Restart, and Oracle Global Data Services.

- – [CREATE_SERVICE Procedure](#)
- [DELETE_SERVICE Procedure](#)
- [MODIFY_SERVICE Procedure](#)

- [START_SERVICE Procedure](#)
- [STOP_SERVICE Procedure](#)
- With Oracle Database 12c release 1, you are advised to use the parameter interface in all service-related subprograms.
- If you wish to use `DBMS_SERVICE` on a pluggable database (PDB) in a single instance, you must connect to that PDB first.

159.5 DBMS_SERVICE Exceptions

This table lists the exceptions raised by the `DBMS_SERVICE` package.

Table 159-4 DBMS_SERVICE Exceptions

| Exception | Error Code | Description |
|--------------------------------------|------------|---|
| <code>NULL_SERVICE_NAME</code> | 44301 | Service name argument was found to be NULL |
| <code>NULL_NETWORK_NAME</code> | 44302 | Network name argument was found to be NULL |
| <code>SERVICE_EXISTS</code> | 44303 | Service name already exists |
| <code>SERVICE_DOES_NOT_EXIST</code> | 44304 | Specified service does not exist |
| <code>SERVICE_IN_USE</code> | 44305 | Specified service was running |
| <code>SERVICE_NAME_TOO_LONG</code> | 44306 | Service name was too long |
| <code>NETWORK_PREFIX_TOO_LONG</code> | 44307 | Network name, excluding the domain, was too long |
| <code>NOT_INITIALIZED</code> | 44308 | Services layer was not yet initialized |
| <code>GENERAL_FAILURE</code> | 44309 | An unknown failure |
| <code>MAX_SERVICES_EXCEEDED</code> | 44310 | Maximum number of services has been reached |
| <code>SERVICE_NOT_RUNNING</code> | 44311 | Specified service was not running |
| <code>DATABASE_CLOSED</code> | 44312 | Database was closed |
| <code>INVALID_INSTANCE</code> | 44313 | Instance name argument was not valid |
| <code>NETWORK_EXISTS</code> | 44314 | Network name already exists |
| <code>NULL_ATTRIBUTES</code> | 44315 | All attributes specified were NULL |
| <code>INVALID_ARGUMENT</code> | 44316 | Invalid argument supplied |
| <code>DATABASE_READONLY</code> | 44317 | Database is open read-only |
| <code>MAX_SN_LENGTH</code> | 44318 | Total length of all running service network names exceeded the maximum allowable length |
| <code>ERR_AQ_SERVICE</code> | 44319 | Cannot delete AQ service |
| <code>ERR_GLB_SERVICE</code> | 44320 | Cannot delete global service |
| <code>ERR_INVALID_PDB_NAME</code> | 44771 | Invalid name for a pluggable database |

Table 159-4 (Cont.) DBMS_SERVICE Exceptions

| Exception | Error Code | Description |
|-----------------|------------|--|
| ERR_CRS_API | 44772 | Cluster ready services (CRS) operation failed |
| ERR_PDB_CLOSED | 44773 | Cannot perform requested service operation |
| ERR_PDB_INVALID | 44774 | Pluggable database attribute cannot be changed |
| ERR_PDB_NAME | 44775 | Pluggable database service cannot be created |
| ERR_PDB_EXP | 44776 | Pluggable database service cannot be deleted |
| ERR_PDB_FAIL | 44777 | Pluggable database service cannot be started |

159.6 Summary of DBMS_SERVICE Subprograms

This table lists the DBMS_SERVICE subprograms and briefly describes them.

Table 159-5 DBMS_SERVICE Package Subprograms

| Subprogram | Description |
|--|---|
| CREATE_SERVICE Procedure | Creates service |
| DELETE_SERVICE Procedure | Deletes service |
| DISCONNECT_SESSION Procedure | Disconnects sessions running under this service |
| MODIFY_SERVICE Procedure | Modifies service |
| START_SERVICE Procedure | Activates service |
| STOP_SERVICE Procedure | Stops service |

159.6.1 CREATE_SERVICE Procedure

This procedure creates a service name in the data dictionary. Services are also created in the data dictionary implicitly when you set the service in the `service_name` parameter or by means of the `ALTER SYSTEM SET SERVICE_NAMES` command.

Note:

Starting with Oracle Database 21c, the combination of session attribute values `FAILOVER_TYPE = TRANSACTION` with `SESSION_STATE_CONSISTENCY = STATIC` is deprecated.

Starting with Oracle Database 19c, customer use of the `SERVICE_NAME` parameter is deprecated. It can be desupported in a future release. It must not be used for high availability (HA) deployments. It is not supported to use service name parameter for any HA operations. This restriction includes FAN, load balancing, `FAILOVER_TYPE`, `FAILOVER_RESTORE`, `SESSION_STATE_CONSISTENCY`, and any other uses.

You cannot use the second version of subprogram if your services are managed by Oracle Clusterware, Oracle Restart or Oracle Global Data Services. The version with the parameter array interface applies to databases that are not managed by Oracle Clusterware, Oracle Restart or Oracle Global Data Services. New attributes are only available using the parameter interface.

Syntax

```
DBMS_SERVICE.CREATE_SERVICE(
  service_name          IN VARCHAR2,
  network_name         IN VARCHAR2,
  parameter_array      IN TABLE OF VARCHAR2(100));
```

This overload is maintained for backward compatibility:

```
DBMS_SERVICE.CREATE_SERVICE(
  service_name          IN VARCHAR2,
  network_name         IN VARCHAR2,
  goal                 IN NUMBER DEFAULT NULL,
  dtp                 IN BOOLEAN DEFAULT NULL,
  aq_ha_notifications IN BOOLEAN DEFAULT NULL,
  failover_method     IN VARCHAR2 DEFAULT NULL,
  failover_type       IN VARCHAR2 DEFAULT NULL,
  failover_retries    IN NUMBER DEFAULT NULL,
  failover_delay      IN NUMBER DEFAULT NULL,
  clb_goal            IN NUMBER DEFAULT NULL,
  edition             IN VARCHAR2 DEFAULT NULL);
```

Parameters

Table 159-6 CREATE_SERVICE Procedure Parameters

| Parameter | Description |
|---------------------------|--|
| <code>service_name</code> | Name of the service, limited to 64 characters in the Data Dictionary |

Table 159-6 (Cont.) CREATE_SERVICE Procedure Parameters

| Parameter | Description |
|---------------------|--|
| network_name | Network name of the service as used in SQLNet connect descriptors for client connections. This is limited to the NET service_names character set (see <i>Oracle Database Net Services Reference</i>). |
| parameter_array | Associative array with name-value pairs of the service attributes. Supported names: <ul style="list-style-type: none"> • goal • dtp • aq_ha_notifications • failover_method • failover_type • failover_retries • failover_restore • failover_delay • clb_goal • edition • commit_outcome • reset_state • retention_timeout • replay_initiation_timeout • session_state_consistency • sql_translation_profile • drain_timeout • stop_option • placement_policy |
| goal | Workload management goal directive for the service. Valid values: <ul style="list-style-type: none"> • DBMS_SERVICE.GOAL_SERVICE_TIME • DBMS_SERVICE.GOAL_THROUGHPUT • DBMS_SERVICE.GOAL_NONE |
| dtp | Declares the service to be for X/Open Distributed Transaction Processing (DTP) or any distributed transaction (especially XA) |
| aq_ha_notifications | Determines whether Fast Application Notification (FAN) is enabled for OCI/OCCI/ODP. In Oracle Database12c, FAN uses Oracle Notification Services (ONS). This parameter is still used to enable FAN. FAN is recommended for all High Availability systems, and is on by default for Application Continuity |
| failover_method | Failover TYPE for the service for Application Continuity and TAF. If the failover_type is set to TRANSACTION on the service, this automatically sets COMMIT_OUTCOME to TRUE. JDBC Replay Driver uses the FAILOVER_TYPE service attribute setting of TRANSACTION for TRANSACTION failover. OCI uses the older settings of SELECT and SESSION. The server only accepts FAILOVER_METHOD = BASIC with the TRANSACTION setting. |
| failover_type | TRANSACTION for Application Continuity. SELECT or BASIC for TAF. |

Table 159-6 (Cont.) CREATE_SERVICE Procedure Parameters

| Parameter | Description |
|-------------------------------|--|
| <code>failover_retries</code> | Number of connection retries for Application Continuity and TAF. Using the <code>failover_retries</code> and <code>failover_delay</code> parameters, the failover can be delayed until the service is next available. This parameter is for connecting. It does not control the number of failovers, which is 3 for each incident for Application Continuity. |
| <code>failover_delay</code> | Delay in seconds between connection retries for Application Continuity and TAF. The default is 10 seconds for Application Continuity. Do not use a 0-second delay if the service needs time to failover and register. Long delays are good for planned outages and to failover to Data Guard. Short delays work well with RAC when the service is already available. |
| <code>edition</code> | <p>If this argument has a non-NULL value, this provides the initial session edition for subsequent database connections using this service that do not specify an edition. If no value is specified, this argument has no effect.</p> <p>During service creation or modification, no validation is performed on this parameter.</p> <p>At connection time, if the connecting user does not have <code>USE</code> privilege on the edition, or the edition does not exist, this raises the error <code>ORA-38802</code> (edition does not exist).</p> |
| <code>drain_timeout</code> | If this parameter is defined, all sessions connected to that service are drained by the client drivers and pools using Fast Connection Failover (FCF). The <code>drain_timeout</code> can be set on the service, so stopping and relocating drains for this time by default. |
| <code>stop_option</code> | <p>Provides options to terminate a session. The supported values are:</p> <ul style="list-style-type: none"> • <code>TRANSACTIONAL</code> <code>drain_timeout</code> applies to the transactions. After the <code>drain_timeout</code> expire, the sessions are immediately killed. • <code>IMMEDIATE</code> The sessions are killed after <code>drain_timeout</code> expires. • <code>NONE</code> Sessions are not terminated. <p>However, these parameter values can be overridden using the command line.</p> |
| <code>commit_outcome</code> | <p>Determines whether transaction <code>COMMIT</code> outcome is accessible after the <code>COMMIT</code> has executed. While the database guarantees that <code>COMMIT</code> is durable, this ensures that the outcome of the <code>COMMIT</code> is durable. Applications use the feature to probe the status of the commit last executed after an outage, and is available to applications to determine an outcome. Note:</p> <ul style="list-style-type: none"> • Invoking the GET_LTXID_OUTCOME Procedure of the <code>DBMS_APP_CONT</code> package requires that the <code>commit_outcome</code> attribute be set. • <code>commit_outcome</code> has no effect on active Data Guard and read-only databases. • <code>commit_outcome</code> is only allowed on the database service and on user-defined database services |

Table 159-6 (Cont.) CREATE_SERVICE Procedure Parameters

| Parameter | Description |
|---------------------------|---|
| reset_state | Clears the session state usage between requests, so that each new request starts clean (usage web and stateless applications). |
| retention_timeout | Used in conjunction with <code>commit_outcome</code> , it determines the amount of time (in seconds) that the <code>COMMIT_OUTCOME</code> is retained. Default is 24 hours (86400). Maximum value is 30 days (2592000). |
| replay_initiation_timeout | For Application Continuity, <code>replay_initiation_timeout</code> is the difference between the time of original execution of first operation of a request, and the time that the replay is ready to start after a successful reconnect. Replay initiation time is measured from the time that the request was originally submitted until the time that replay has connected and is ready to replay. When replay is expected, keep this value high. Default is 900 seconds. |
| session_state_consistency | Describes how nontransactional is changed during a request (values are <code>DYNAMIC</code> or <code>STATIC</code>). This parameter is considered only if <code>failover_type</code> is set to <code>TRANSACTION</code> for Application Continuity. Examples of session state are NLS settings, optimizer preferences, event settings, PL/SQL global variables, temporary tables, advanced queues, LOBs, and result cache. If these values change after the request starts, set to <code>DYNAMIC</code> (default). Almost all applications should use <code>DYNAMIC</code> mode. If you are unsure, use <code>DYNAMIC</code> mode. |
| sql_translation_profile | Name of SQL translation profile. |
| clb_goal | Method used for Connection Load Balancing (see Table 159-2) |
| placement_policy | NUMBER Placement policy for the service. Possible values: <ul style="list-style-type: none"> • 0: PDB-NONE • 1: PDB-SINGLETON • 2: PDB-UNIFORM |

 **Note:**

Values other than 0 are applicable only in the ATP-Dedicated Cloud in an Oracle RAC environment.

Examples

```
DBMS_SERVICE.CREATE_SERVICE('ernie.example.com','ernie.example.com');
```

```
DECLARE
  params dbms_service.svc_parameter_array;
BEGIN
  params('FAILOVER_TYPE')           := 'TRANSACTION';
  params('REPLAY_INITIATION_TIMEOUT') := 1800;
  params('RETENTION_TIMEOUT')       := 86400;
  params('FAILOVER_DELAY')           := 10;
  params('FAILOVER_RETRIES')         := 30;
  params('DRAIN_TIMEOUT')            := 60;
```

```

params('STOP_OPTION')           := 'DBMS_SERVICE.STOP_OPTION_IMMEDIATE';
params('FAILOVER_RESTORE')      := 'DBMS_SERVICE.FAILOVER_RESTORE_BASIC';
params('commit_outcome')       := 'true';
params('aq_ha_notifications')  := 'true';
DBMS_SERVICE.MODIFY_SERVICE('GOLD',params);
END;
```

159.6.2 DELETE_SERVICE Procedure

This procedure deletes a service from the data dictionary.

Note:

Starting with Oracle Database 19c, customer use of the `SERVICE_NAME` parameter is deprecated. It can be desupported in a future release. It must not be used for high availability (HA) deployments. It is not supported to use service name parameter for any HA operations. This restriction includes FAN, load balancing, `FAILOVER_TYPE`, `FAILOVER_RESTORE`, `SESSION_STATE_CONSISTENCY`, and any other uses.

You cannot use this subprogram if your services are managed by Oracle Clusterware, Oracle Restart, or Oracle Global Data Services.

Syntax

```
DBMS_SERVICE.DELETE_SERVICE(
    service_name  IN VARCHAR2);
```

Parameters

Table 159-7 DELETE_SERVICE Procedure Parameters

| Parameter | Description |
|---------------------------|--|
| <code>service_name</code> | Name of the service, limited to 64 characters in the Data Dictionary |

Examples

```
DBMS_SERVICE.DELETE_SERVICE('ernie.example.com');
```

159.6.3 DISCONNECT_SESSION Procedure

This procedure disconnects sessions with the named service at the current instance.

Syntax

```
DBMS_SERVICE.DISCONNECT_SESSION(
    service_name      IN VARCHAR2,
    disconnect_option IN NUMBER DEFAULT POST_TRANSACTION);
```

Parameters

Table 159-8 DISCONNECT_SESSION Procedure Parameters

| Parameter | Description |
|--------------------------------|---|
| <code>service_name</code> | Name of the service, limited to 64 characters in the Data Dictionary |
| <code>disconnect_option</code> | The options, package constants, are expressed as NUMBER: <ul style="list-style-type: none">• <code>POST_TRANSACTION = 0</code>: session disconnects after the current transaction commits or rolls back• <code>IMMEDIATE = 1</code>: session disconnects immediately• <code>NOREPLAY = 2</code>: session disconnects immediately and be flagged to not be replayed by application continuity, that is <code>IMMEDIATE</code> and <code>NOREPLAY</code> together Note: <code>IMMEDIATE</code> or <code>POST_TRANSACTION</code> and <code>NOREPLAY</code> is automatically translated as 1 or 0 or 2 respectively. However, passing a string literal (quoted using either the ' or " characters, such as "IMMEDIATE" or 'POST_TRANSACTION' or 'NOREPLAY') raises an error. |

Usage Notes

- This procedure can be used in the context of a single instance as well as with Oracle Real Application Clusters.
- This subprogram does not return until all corresponding sessions are disconnected. Therefore, use the `DBMS_JOB` package or put the SQL session in background if the caller does not want to wait for all corresponding sessions to be disconnected.

Examples

This disconnects sessions with `service_name` 'ernie.example.com'.

```
DBMS_SERVICE.DISCONNECT_SESSION('ernie.example.com');
```

If a service is using application continuity, and you do not want the sessions replayed but simply terminated, use the following:

```
EXECUTE DBMS_SERVICE.DISCONNECT_SESSION('service name', DBMS_SERVICE.NOREPLAY);
```

159.6.4 MODIFY_SERVICE Procedure

This procedure modifies an existing service.

Note:

You cannot use the second version of subprogram if your services are managed by Oracle Clusterware, Oracle Restart, or Oracle Global Data Services. The version with the parameter array interface applies to databases that are not managed by Oracle Clusterware, Oracle Restart or Oracle Global Data Services. New attributes are only available using the parameter interface.

Syntax

```
DBMS_SERVICE.MODIFY_SERVICE(  
    service_name          IN VARCHAR2,  
    parameter_array      IN svc_parameter_array);
```

This overload is maintained for backward compatibility:

```
DBMS_SERVICE.MODIFY_SERVICE(  
    service_name          IN VARCHAR2,  
    goal                  IN NUMBER DEFAULT NULL,  
    dtp                   IN BOOLEAN DEFAULT NULL,  
    aq_ha_notifications  IN BOOLEAN DEFAULT NULL,  
    failover_method       IN VARCHAR2 DEFAULT NULL,  
    failover_type         IN VARCHAR2 DEFAULT NULL,  
    failover_retries      IN NUMBER DEFAULT NULL,  
    failover_delay        IN NUMBER DEFAULT NULL,  
    clb_goal              IN NUMBER DEFAULT NULL,  
    edition               IN VARCHAR2 DEFAULT NULL,  
    modify_edition        IN BOOLEAN DEFAULT FALSE;
```

Parameters

Table 159-9 MODIFY_SERVICE Procedure Parameters

| Parameter | Description |
|--------------|--|
| service_name | Name of the service, limited to 64 characters in the Data Dictionary |

Table 159-9 (Cont.) MODIFY_SERVICE Procedure Parameters

| Parameter | Description |
|---------------------|--|
| parameter_array | <p>Associative array with name/value pairs of the service attributes. Supported names:</p> <ul style="list-style-type: none"> • goal • dtp • aq_ha_notifications • failover_method • failover_type • failover_restore • failover_retries • failover_delay • drain_timeout • stop_option • edition • commit_outcome • retention_timeout • replay_initiation_timeout • session_state_consistency • sql_translation_profile • placement_policy |
| goal | <p>Workload management goal directive for the service. Valid values:</p> <ul style="list-style-type: none"> • DBMS_SERVICE.GOAL_SERVICE_TIME • DBMS_SERVICE.GOAL_THROUGHPUT • DBMS_SERVICE.GOAL_NONE |
| dtp | <p>Declares the service to be for X/Open Distributed Transaction Processing (DTP) or any distributed transaction (especially XA)</p> |
| aq_ha_notifications | <p>Determines whether Fast Application Notification (FAN) is enabled for OCI/OCCI/ODP. In Oracle Database12c, FAN uses Oracle Notification Services (ONS). This parameter is still used to enable FAN. FAN is recommended for all High Availability systems, and is on by default for Application Continuity</p> |
| failover_method | <p>Failover TYPE for the service for Application Continuity and TAF. If the failover_type is set to TRANSACTION on the service, this automatically sets COMMIT_OUTCOME to TRUE. JDBC Replay Driver uses the FAILOVER_TYPE service attribute setting of TRANSACTION for TRANSACTION failover. OCI uses the older settings of SELECT and SESSION. The server only accepts FAILOVER_METHOD = BASIC with the TRANSACTION setting.</p> |
| failover_type | <p>Failover TYPE for the service for Application Continuity and TAF.</p> |
| failover_restore | <p>For Application Continuity, when the failover_restore parameter is set, the session states are restored before replaying for ODP.NET and Java. Use LEVEL1 for ODP.NET and Java with Application Continuity to restore the initial state.</p> <p>For AC OCI, use NONE for applications that are not STATIC.</p> |

Table 159-9 (Cont.) MODIFY_SERVICE Procedure Parameters

| Parameter | Description |
|--|--|
| <code>failover_retries</code> | Number of connection retries for Application Continuity and TAF. Using the <code>failover_retries</code> and <code>failover_delay</code> parameters, the failover can be delayed until the service is next available. This parameter is for connecting. It does not control the number of failovers, which is 3 for each incident for Application Continuity. |
| <code>failover_delay</code> | Delay in seconds between connection retries for Application Continuity and TAF. The default is 10 seconds for Application Continuity. Do not use a 0-second delay if the service needs time to failover and register. Long delays are good for planned outages and to failover to Data Guard. Short delays work well with Oracle RAC when the service is already available. |
| <code>drain_timeout</code> | When this parameter is set, all sessions connected to that service are drained by the client drivers and pools using Fast Connection Failover (FCF). The <code>drain_timeout</code> can be set on the service, to stop and relocate drains for this time by default. |
| <code>edition</code> | <p>If this argument has a non-NULL value, this provides the initial session edition for subsequent database connections using this service that do not specify an edition. If no value is specified, this argument has no effect.</p> <p>During service creation or modification, no validation is performed on this parameter.</p> <p>At connection time, if the connecting user does not have <code>USE</code> privilege on the edition, or the edition does not exist, this raises the error <code>ORA-38802</code> (edition does not exist).</p> |
| <code>commit_outcome</code> | <p>Determines whether transaction <code>COMMIT</code> outcome is accessible after the <code>COMMIT</code> has executed. While the database guarantees that <code>COMMIT</code> is durable, this ensures that the outcome of the <code>COMMIT</code> is durable. Applications use the feature to probe the status of the commit last executed after an outage, and is available to applications to determine an outcome. Note:</p> <ul style="list-style-type: none"> Invoking the GET_LTXID_OUTCOME Procedure of the <code>DBMS_APP_CONT</code> package requires that the <code>commit_outcome</code> attribute be set. <code>commit_outcome</code> has no effect on active Data Guard and read-only databases. <code>commit_outcome</code> is allowed only on user-defined database services |
| <code>retention_timeout</code> | Used in conjunction with <code>commit_outcome</code> , it determines the amount of time (in seconds) that the <code>COMMIT_OUTCOME</code> is retained. Default is 24 hours (86400). Maximum value is 30 days (2592000). |
| <code>replay_initiation_timeout</code> | For Application Continuity, <code>replay_initiation_timeout</code> is the difference between the time of original execution of first operation of a request, and the time that the replay is ready to start after a successful reconnect. Replay initiation time is measured from the time that the request was originally submitted until the time that replay has connected and is ready to replay. When replay is expected, keep this value high. Default is 900 seconds. |

Table 159-9 (Cont.) MODIFY_SERVICE Procedure Parameters

| Parameter | Description |
|---------------------------|---|
| session_state_consistency | Describes how nontransactional is changed during a request (values are DYNAMIC or STATIC). This parameter is considered only if failover_type is set to TRANSACTION for Application Continuity. Examples of session state are NLS settings, optimizer preferences, event settings, PL/SQL global variables, temporary tables, advanced queues, LOBs, and result cache. If these values change after the request starts, set to DYNAMIC (default). Almost all applications should use DYNAMIC mode. If you are unsure, use DYNAMIC mode. |
| sql_translation_profile | Name of SQL translation profile. |
| modify_edition | If TRUE, the edition service attribute is updated to use the edition argument value. If FALSE or NULL, the edition attribute is not updated. |
| clb_goal | Method used for Connection Load Balancing (see Table 159-2) |
| placement_policy | NUMBER Placement policy for the service. Possible values: <ul style="list-style-type: none"> • 0: PDB-NONE • 1: PDB-SINGLETON • 2: PDB-UNIFORM |

 **Note:**

Values other than 0 are applicable only in the ATP-Dedicated Cloud in an Oracle RAC environment.

Usage Notes

- If you are using Clustered Managed Services with Oracle Clusterware, or using Oracle Restart with your single instance database, you must modify services using the `srvctl` command rather than `DBMS_SERVICE`. When the service is started by Oracle Clusterware or Oracle Restart, the service is modified in the database to match the resource defined to either Oracle Clusterware or Oracle Restart. Any changes made with `DBMS_SERVICE` are lost unless they are also made with the corresponding `srvctl` command. Starting with 11.2.0.2, service attribute modifications take effect immediately when the service is started or modified by `srvctl`.
- Although users can modify the edition attribute while the service is up and running, it may not be safe to do so. Users must proceed with caution because this causes new connections to be connected at the new edition, while the existing connection is not affected. This can cause mid-tier operations to connect to the wrong edition.

159.6.5 START_SERVICE Procedure

This procedure starts a service. In Oracle RAC, implementing this option acts on the instance specified.

Note:

You cannot use this subprogram if your services are managed by Oracle Clusterware, Oracle Restart or Oracle Global Data Services.

Syntax

```
DBMS_SERVICE.START_SERVICE(  
    service_name IN VARCHAR2,  
    instance_name IN VARCHAR2);
```

Parameters

Table 159-10 START_SERVICE Procedure Parameters

| Parameter | Description |
|---------------|---|
| service_name | Name of the service limited to 64 characters in the Data Dictionary |
| instance_name | Name of the instance where the service must be activated (optional). NULL results in starting of the service on the local instance. In single instance, this can only be the current instance or NULL. Specify DBMS_SERVICE.ALL_INSTANCES to start the service on all configured instances. |

Examples

```
DBMS_SERVICE.START_SERVICE('ernie.example.com');
```

159.6.6 STOP_SERVICE Procedure

This procedure stops a service.

Note:

You cannot use this subprogram if your services are managed by Oracle Clusterware, Oracle Restart or Oracle Global Data Services.

Syntax

```
DBMS_SERVICE.STOP_SERVICE(  
    service_name IN VARCHAR2,  
    instance_name IN VARCHAR2 DEFAULT NULL,  
    stop_option IN VARCHAR2 DEFAULT NULL,
```

```

drain_timeout IN NUMBER    DEFAULT NULL,
replay       IN BOOLEAN   DEFAULT TRUE);

```

Parameters

Table 159-11 STOP_SERVICE Procedure Parameters

| Parameter | Description |
|---------------|--|
| service_name | Name of the service limited to 64 characters in the Data Dictionary |
| instance_name | Name of the instance where the service must be stopped (optional). NULL results in stopping of the service locally. In single instance, this can only be the current instance or NULL. The default in Oracle RAC and exclusive case is NULL. Specify DBMS_SERVICE.ALL_INSTANCES to stop the service on all configured instances. |
| stop_option | To specify how sessions are stopped with draining. The possible values are as follows: <ul style="list-style-type: none"> IMMEDIATE: sessions are aborted immediately after the time specified in drain_timeout. TRANASCTIONAL: applies for transactions. After the transaction expires, the sessions are immediately terminated. NONE: sessions are not terminated. These values can be overridden on the command line using SRVCTL. |
| drain_timeout | The time in seconds for the session to drain. |
| replay | Enable application continuity replay. |

Examples

```
DBMS_SERVICE.STOP_SERVICE('ernie.example.com');
```

160

DBMS_SESSION

This package provides access to `SQL ALTER SESSION` and `SET ROLE` statements, and other session information, from PL/SQL. You can use `DBMS_SESSION` to set preferences and security levels.

This chapter contains the following topics:

- [Security Model](#)
- [Operational Notes](#)
- [Data Structures](#)
- [Summary of DBMS_SESSION Subprograms](#)

160.1 DBMS_SESSION Security Model

This package runs with the privileges of the calling user, rather than the package owner `SYS`.

160.2 DBMS_SESSION Operational Notes

You should not attempt to turn `close_cached_open_cursors` on or off.

160.3 DBMS_SESSION Data Structures

The `DBMS_SESSION` package defines `TABLE` types.

Table Types

- [INTEGER_ARRAY Table Type](#)
- [LNAME_ARRAY Table Type](#)

160.3.1 DBMS_SERVICE INTEGER_ARRAY Table Type

`INTEGER_ARRAY` is a table type of `BINARY_INTEGER`.

Syntax

```
TYPE integer_array IS TABLE OF BINARY_INTEGER INDEX BY BINARY_INTEGER;
```

160.3.2 DBMS_SERVICE LNAME_ARRAY Table Type

`LNAME_ARRAY` is a table type of `VARCHAR2`.

Syntax

```
TYPE lname_array IS TABLE OF VARCHAR2(4000) INDEX BY BINARY_INTEGER;
```

160.4 Summary of DBMS_SESSION Subprograms

This table lists the DBMS_SESSION subprograms in alphabetical order and briefly describes them.

Table 160-1 DBMS_SESSION Package Subprograms

| Subprogram | Description |
|--|--|
| CLEAR_ALL_CONTEXT Procedure | Clears all context information |
| CLEAR_CONTEXT Procedure | Clears the context |
| CLEAR_IDENTIFIER Procedure | Clears the identifier |
| CLOSE_DATABASE_LINK Procedure | Closes database link |
| CURRENT_IS_ROLE_ENABLED Function | Determines if the named role is currently enabled. |
| FREE_UNUSED_USER_MEMORY Procedure | Lets you reclaim unused memory after performing operations requiring large amounts of memory |
| GET_PACKAGE_MEMORY_UTILIZATION Procedure | Describes static package memory usage |
| IS_ROLE_ENABLED Function | Determines if the named role is enabled for the session. |
| IS_SESSION_ALIVE Function | Determines if the specified session is active |
| LIST_CONTEXT Procedures | Returns a list of active namespace and context for the current session |
| MODIFY_PACKAGE_STATE Procedure | Used to perform various actions (as specified by the <code>action_flags</code> parameter) on the session state of all PL/SQL program units active in the session |
| RESET_PACKAGE Procedure | De-instantiates all packages in the session |
| SESSION_IS_ROLE_ENABLED Function | Determines if the named role is enabled at the session level. |
| SESSION_TRACE_DISABLE Procedure | Resets the session-level SQL trace for the session from which it was called. |
| SESSION_TRACE_ENABLE Procedure | Enables session-level SQL trace for the invoking session |
| SET_CONTEXT Procedure | Sets or resets the value of a context attribute |
| SET_EDITION_DEFERRED Procedure | Requests a switch to the specified edition |
| SET_IDENTIFIER Procedure | Sets the identifier |
| SET-NLS Procedure | Sets Globalization Support (NLS) |
| SET_ROLE Procedure | Sets role |
| SET_SQL_TRACE Procedure | Turns tracing on or off |
| SLEEP Procedure | Suspends the session for a specified period of time. |
| SWITCH_CURRENT_CONSUMER_GROUP Procedure | Facilitates changing the current resource consumer group of a user's current session |
| UNIQUE_SESSION_ID Function | Returns an identifier that is unique for all sessions currently connected to this database |

160.4.1 CLEAR_ALL_CONTEXT Procedure

This procedure clears application context information in the specified namespace.

Syntax

```
DBMS_SESSION.CLEAR_ALL_CONTEXT
(namespace          VARCHAR2);
```

Parameters

Table 160-2 CLEAR_ALL_CONTEXT Procedure Parameters

| Parameter | Description |
|-----------|---|
| namespace | The namespace where the application context information is to be cleared. Required. |

Usage Notes

- This procedure must be invoked directly or indirectly by the trusted package.
- Any changes in context value are reflected immediately and subsequent calls to access the value through SYS_CONTEXT return the most recent value.

160.4.2 CLEAR_CONTEXT Procedure

This procedure clears application context in the specified namespace.

Syntax

```
DBMS_SESSION.CLEAR_CONTEXT
(namespace          VARCHAR2,
client_identifier  VARCHAR2
attribute          VARCHAR2);
```

Parameters

Table 160-3 CLEAR_CONTEXT Procedure Parameters

| Parameter | Description |
|-------------------|---|
| namespace | Namespace in which the application context is to be cleared. Required. For a session-local context, namespace must be specified. If namespace is defined as Session Local Context, then client_identifier is optional since it is only associated with a globally accessed context. For a globally accessed context, namespace must be specified. NULL is a valid value for client_identifier because a session with no identifier set can see a context that looks like the (namespace, attribute, value, username, null) set using SET_CONTEXT. |
| client_identifier | Applies to a global context and is optional for other types of contexts; 64-byte maximum |

Table 160-3 (Cont.) CLEAR_CONTEXT Procedure Parameters

| Parameter | Description |
|-----------|--|
| attribute | Specific attribute in the namespace to be cleared. Optional. the default is NULL. If you specify attribute as NULL, then (namespace, attribute, value) for that namespace are cleared from the session. If attribute is not specified, then all context information that has the namespace and client_identifier arguments is cleared. |

Usage Notes

- This procedure must be invoked directly or indirectly by the trusted package.
- Any changes in context value are reflected immediately and subsequent calls to access the value through SYS_CONTEXT return the most recent value.

160.4.3 CLEAR_IDENTIFIER Procedure

This procedure removes the `set_client_id` in the session.

Syntax

```
DBMS_SESSION.CLEAR_IDENTIFIER;
```

Usage Notes

This procedure is executable by public.

160.4.4 CLOSE_DATABASE_LINK Procedure

This procedure closes an open database link. It is equivalent to the following SQL statement: `ALTER SESSION CLOSE DATABASE LINK <name>`

Syntax

```
DBMS_SESSION.CLOSE_DATABASE_LINK (
    dblink VARCHAR2);
```

Parameters**Table 160-4 CLOSE_DATABASE_LINK Procedure Parameters**

| Parameter | Description |
|-----------|------------------------------------|
| dblink | Name of the database link to close |

160.4.5 CURRENT_IS_ROLE_ENABLED Function

This function determines if the named role is currently enabled.

Syntax

```
DBMS_SESSION.CURRENT_IS_ROLE_ENABLED (  
    rolename    VARCHAR2)  
    RETURN BOOLEAN;
```

Parameters

Table 160-5 CURRENT_IS_ROLE_ENABLED Function Parameters

| Parameter | Description |
|-----------|-------------------|
| rolename | Name of the role. |

Return Values

- TRUE-if the role is enabled.
- FALSE-if the role is not enabled.

160.4.6 FREE_UNUSED_USER_MEMORY Procedure

This procedure reclaims unused memory after performing operations requiring large amounts of memory (more than 100K).

Examples of operations that use large amounts of memory include:

- Large sorting where entire `sort_area_size` is used and `sort_area_size` is hundreds of KB.
- Compiling large PL/SQL packages, procedures, or functions.
- Storing hundreds of KB of data within PL/SQL indexed tables.

You can monitor user memory by tracking the statistics "session UGA memory" and "session PGA memory" in the `v$sesstat` or `v$statname` fixed views. Monitoring these statistics also shows how much memory this procedure has freed.

Note:

This procedure should only be used in cases where memory is at a premium. It should be used infrequently and judiciously.

Syntax

```
DBMS_SESSION.FREE_UNUSED_USER_MEMORY;
```

Return Values

The behavior of this procedure depends upon the configuration of the server operating on behalf of the client:

- **Dedicated server:** This returns unused PGA memory and session memory to the operating system. Session memory is allocated from the PGA in this configuration.
- **Shared server:** This returns unused session memory to the `shared_pool`. Session memory is allocated from the `shared_pool` in this configuration.

Usage Notes

In order to free memory using this procedure, the memory must not be in use.

After an operation allocates memory, only the same type of operation can reuse the allocated memory. For example, after memory is allocated for sort, even if the sort is complete and the memory is no longer in use, only another sort can reuse the sort-allocated memory. For both sort and compilation, after the operation is complete, the memory is no longer in use, and the user can call this procedure to free the unused memory.

An indexed table implicitly allocates memory to store values assigned to the indexed table's elements. Thus, the more elements in an indexed table, the more memory the RDBMS allocates to the indexed table. As long as there are elements within the indexed table, the memory associated with an indexed table is in use.

The scope of indexed tables determines how long their memory is in use. Indexed tables declared globally are indexed tables declared in packages or package bodies. They allocate memory from session memory. For an indexed table declared globally, the memory remains in use for the lifetime of a user's login (lifetime of a user's session), and is freed after the user disconnects from ORACLE.

Indexed tables declared locally are indexed tables declared within functions, procedures, or anonymous blocks. These indexed tables allocate memory from PGA memory. For an indexed table declared locally, the memory remains in use for as long as the user is still running the procedure, function, or anonymous block in which the indexed table is declared. After the procedure, function, or anonymous block is finished running, the memory is then available for other locally declared indexed tables to use (in other words, the memory is no longer in use).

Assigning an uninitialized, "empty" indexed table to an existing index table is a method to explicitly re-initialize the indexed table and the memory associated with the indexed table. After this operation, the memory associated with the indexed table is no longer in use, making it available to be freed by calling this procedure. This method is particularly useful on indexed tables declared globally which can grow during the lifetime of a user's session, as long as the user no longer needs the contents of the indexed table.

The memory rules associated with an indexed table's scope still apply; this method and this procedure, however, allow users to intervene and to explicitly free the memory associated with an indexed table.

Examples

The following PL/SQL illustrates the method and the use of procedure `FREE_UNUSED_USER_MEMORY`.

```

CREATE PACKAGE foobar
  type number_idx_tbl is table of number indexed by binary_integer;

  store1_table number_idx_tbl;    -- PL/SQL indexed table
  store2_table number_idx_tbl;    -- PL/SQL indexed table
  store3_table number_idx_tbl;    -- PL/SQL indexed table
  ...
END;                                -- end of foobar

DECLARE
  ...
  empty_table number_idx_tbl;     -- uninitialized ("empty") version
BEGIN
  FOR i in 1..1000000 loop
    store1_table(i) := i;         -- load data
  END LOOP;
  ...
  store1_table := empty_table;    -- "truncate" the indexed table
  ...
  -
  dbms_session.free_unused_user_memory; -- give memory back to system

  store1_table(1) := 100;         -- index tables still declared;
  store2_table(2) := 200;         -- but truncated.
  ...
END;

```

160.4.7 GET_PACKAGE_MEMORY_UTILIZATION Procedure

This procedure describes static package memory usage.

The output collections describe memory usage in each instantiated package. Each package is described by its owner name, package name, used memory amount, and unused allocated memory amount. The amount of unused memory is greater than zero because of memory fragmentation and also because once used free memory chunks initially go to a free list owned by the package memory heap. They are released back to the parent heap only when the [FREE_UNUSED_USER_MEMORY Procedure](#) is invoked.

Syntax

```

DBMS_SESSION.GET_PACKAGE_MEMORY_UTILIZATION (
  owner_names      OUT NOCOPY LNAME_ARRAY,
  unit_names       OUT NOCOPY LNAME_ARRAY,
  unit_types       OUT NOCOPY INTEGER_ARRAY,
  used_amounts     OUT NOCOPY INTEGER_ARRAY,
  free_amounts     OUT NOCOPY INTEGER_ARRAY);

```

Parameters

Table 160-6 GET_PACKAGE_MEMORY_UTILIZATION Function Parameters

| Parameter | Description |
|--------------|--|
| owner_name | Owner of package |
| unit_name | Name of package |
| unit_types | Value of the type# columns of the dictionary table obj\$ |
| used_amounts | Amount of allocated memory specified in bytes |

Table 160-6 (Cont.) GET_PACKAGE_MEMORY_UTILIZATION Function Parameters

| Parameter | Description |
|---------------------------|---|
| <code>free_amounts</code> | Amount of available memory specified in bytes |

160.4.8 IS_ROLE_ENABLED Function

This function determines if the named role is enabled for this session.

Note:

This function is deprecated starting in Oracle Database 19c. Use `DBMS_SESSION.CURRENT_IS_ROLE_ENABLED` or `DBMS_SESSION.SESSION_IS_ROLE_ENABLED` instead.

Syntax

```
DBMS_SESSION.IS_ROLE_ENABLED (
    rolename    VARCHAR2)
RETURN BOOLEAN;
```

Parameters

Table 160-7 IS_ROLE_ENABLED Function Parameters

| Parameter | Description |
|-----------------------|--------------------|
| <code>rolename</code> | Name of the role.\ |

Return Values

Table 160-8 IS_ROLE_ENABLED Function Return Values

| Return | Description |
|------------------------------|---|
| <code>is_role_enabled</code> | TRUE or FALSE, depending on whether the role is enabled |

160.4.9 IS_SESSION_ALIVE Function

This function determines if the specified session is active.

Syntax

```
DBMS_SESSION.IS_SESSION_ALIVE (
    uniqueid VARCHAR2)
RETURN BOOLEAN;
```

Parameters

Table 160-9 IS_SESSION_ALIVE Function Parameters

| Parameter | Description |
|-----------|--|
| uniqueid | Unique ID of the session: This is the same one as returned by UNIQUE_SESSION_ID. |

Return Values

Table 160-10 IS_SESSION_ALIVE Function Return Values

| Return | Description |
|------------------|---|
| is_session_alive | TRUE or FALSE, depending on whether the session is active |

160.4.10 LIST_CONTEXT Procedures

This procedure returns a list of active namespaces and contexts for the current session.

Syntax

```
TYPE AppCtxRecTyp IS RECORD (
    namespace VARCHAR2(30),
    attribute VARCHAR2(30),
    value      VARCHAR2(256));

TYPE AppCtxTabTyp IS TABLE OF AppCtxRecTyp INDEX BY BINARY_INTEGER;

DBMS_SESSION.LIST_CONTEXT (
    list OUT AppCtxTabTyp,
    size OUT NUMBER);
```

Parameters

Table 160-11 LIST_CONTEXT Procedure Parameters

| Parameter | Description |
|-----------|--|
| list | Buffer to store a list of application context set in the current session |

Return Values

Table 160-12 LIST_CONTEXT Procedure Return Values

| Return | Description |
|--------|---|
| list | A list of (namespace, attribute, values) set in current session |
| size | Returns the number of entries in the buffer returned |

Usage Notes

The context information in the list appears as a series of <namespace> <attribute> <value>. Because `list` is a table type variable, its size is dynamically adjusted to the size of returned list.

160.4.11 MODIFY_PACKAGE_STATE Procedure

This procedure is used to perform various actions (as specified by the `action_flags` parameter) on the session state of all PL/SQL program units active in the session. This takes effect after the PL/SQL call that made the current invocation finishes running.

The procedure uses the `DBMS_SESSION` constants listed in [Table 160-14](#).

Syntax

```
DBMS_SESSION.MODIFY_PACKAGE_STATE(  
    action_flags IN PLS_INTEGER);
```

Parameters

Table 160-13 MODIFY_PACKAGE_STATE Procedure Parameters

| Parameter | Description |
|---------------------------|---|
| <code>action_flags</code> | <p>Bit flags that determine the action taken on PL/SQL program units:</p> <p><code>DBMS_SESSION.FREE_ALL_RESOURCES</code> (or 1)—frees all memory associated with each of the previously run PL/SQL programs from the session. Clears the current values of any package globals and closes cached cursors. On subsequent use, the PL/SQL program units are reinstantiated and package globals are reinitialized. Invoking <code>MODIFY_PACKAGE_STATE</code> with the <code>DBMS_SESSION.FREE_ALL_RESOURCES</code> parameter provides functionality identical to the <code>DBMS_SESSION.RESET_PACKAGE()</code> interface.</p> <p><code>DBMS_SESSION.REINITIALIZE</code> (or 2)—reinitializes packages without actually being freed and recreated from scratch. Instead the package memory is reused. In terms of program semantics, the <code>DBMS_SESSION.REINITIALIZE</code> flag is similar to the <code>DBMS_SESSION.FREE_ALL_RESOURCES</code> flag in that both have the effect of reinitializing all packages.</p> <p>However, <code>DBMS_SESSION.REINITIALIZE</code> should exhibit better performance than the <code>DBMS_SESSION.FREE_ALL_RESOURCES</code> option because:</p> <ul style="list-style-type: none"> • Packages are reinitialized without actually being freed and recreated from scratch. Instead the package memory gets reused. • Any open cursors are closed, semantically speaking. However, the cursor resource is not actually freed. It is simply returned to the PL/SQL cursor cache. The cursor cache is not flushed. Hence, cursors corresponding to frequently accessed static SQL in PL/SQL remains cached in the PL/SQL cursor cache and the application does not incur the overhead of opening, parsing, and closing a new cursor for those statements on subsequent use. • The session memory for PL/SQL modules without global state (such as types, stored-procedures) are not freed and recreated. |

Usage Notes

See the parameter descriptions in [Table 160-16](#) for the differences between the flags and why `DBMS_SESSION.REINITIALIZE` exhibits better performance than `DBMS_SESSION.FREE_ALL_RESOURCES`.

Table 160-14 Action_flags Constants for MODIFY_PACKAGE_STATE

| Constant | Description |
|---------------------------------|------------------------------|
| <code>FREE_ALL_RESOURCES</code> | <code>PLS_INTEGER:= 1</code> |
| <code>REINITIALIZE</code> | <code>PLS_INTEGER:= 2</code> |

- Reinitialization refers to the process of resetting all package variables to their initial values and running the initialization block (if any) in the package bodies. Consider the package:

```
package P is
  n number;
  m number := P2.foo;
  d date := SYSDATE;
  cursor c is select * from emp;
  procedure bar;
end P;
/
package body P is
  v varchar2(20) := 'hello';
  procedure bar is
  begin
    ...
  end;
  procedure init_pkg is
  begin
    ....
  end;
begin
  -- initialization block
  init_pkg;
  ...
  ...
end P;
/
```

For the package P, reinitialization involves:

- Setting P.n to NULL
- Invoking function P2.foo and setting P.m to the value returned from P2.foo
- Setting P.d to the return value of SYSDATE built-in
- Closing cursor P.c if it was previously opened
- Setting P.v to 'hello'
- Running the initialization block in the package body
- The reinitialization for a package is done only if the package is actually referenced subsequently. Furthermore, the packages are reinitialized in the order in which they are referenced subsequently.
- When using FREE_ALL_RESOURCES or REINITIALIZE, make sure that resetting package variable values does not affect the application.
- Because DBMS_SESSION.REINITIALIZE does not actually cause all the package state to be freed, in some situations, the application could use significantly more session memory than if the FREE_ALL_RESOURCES flag or the RESET_PACKAGE procedure had been used. For instance, after performing DBMS_SESSION.MODIFY_PACKAGE_STATE(DBMS_SESSION.REINITIALIZE), if the application does not refer to many of the packages that were previously referenced, then the session memory for those packages remains until the end of the session (or until DBMS_SESSION.RESET_PACKAGE is called).
- Because the client-side PL/SQL code cannot reference remote package variables or constants, you must explicitly use the values of the constants. For example, DBMS_SESSION.MODIFY_PACKAGE_STATE(DBMS_SESSION.REINITIALIZE) does not compile on the client because it uses the constant DBMS_SESSION.REINITIALIZE.

Instead, use `DBMS_SESSION.MODIFY_PACKAGE_STATE(2)` on the client, because the argument is explicitly provided.

Examples

This example illustrates the use of `DBMS_SESSION.MODIFY_PACKAGE_STATE`. Consider a package `P` with some global state (a cursor `c` and a number `cnt`). When the package is first initialized, the package variable `cnt` is 0 and the cursor `c` is `CLOSED`. Then, in the session, change the value of `cnt` to 111 and also execute an `OPEN` operation on the cursor. If you call `print_status` to display the state of the package, you see that `cnt` is 111 and that the cursor is `OPEN`. Next, call `DBMS_SESSION.MODIFY_PACKAGE_STATE`. If you print the status of the package `P` again using `print_status`, you see that `cnt` is 0 again and the cursor is `CLOSED`. If the call to `DBMS_SESSION.MODIFY_PACKAGE_STATE` had not been made, then the second `print_status` would have printed 111 and `OPEN`.

```
create or replace package P is
  cnt    number := 0;
  cursor c is select * from emp;
  procedure print_status;
end P;
/
show errors;

create or replace package body P is
  procedure print_status is
  begin
    dbms_output.put_line('P.cnt = ' || cnt);
    if c%ISOPEN then
      dbms_output.put_line('P.c is OPEN');
    else
      dbms_output.put_line('P.c is CLOSED');
    end if;
  end;
end P;
/
show errors;

SQL> set serveroutput on;
SQL> begin
  2  P.cnt := 111;
  3  open p.c;
  4  P.print_status;
  5  end;
  6  /
P.cnt = 111
P.c is OPEN

PL/SQL procedure successfully completed.

SQL> begin
  2  dbms_session.modify_package_state(dbms_session.reinitialize);
  3  end;
  4  /

PL/SQL procedure successfully completed.

SQL> set serveroutput on;
SQL>
SQL> begin
  2  P.print_status;
```

```
3 end;  
4 /  
P.cnt = 0  
P.c is CLOSED
```

PL/SQL procedure successfully completed.

160.4.12 RESET_PACKAGE Procedure

This procedure de-instantiates all packages in this session. It frees the package state.

Note:

See "[SESSION_TRACE_ENABLE Procedure](#)". The `MODIFY_PACKAGE_STATE` interface, introduced in Oracle9i, provides an equivalent of the `RESET_PACKAGE` capability. It is an efficient, lighter-weight variant for reinitializing the state of all PL/SQL packages in the session.

Memory used for caching the execution state is associated with all PL/SQL functions, procedures, and packages that were run in a session.

For packages, this collection of memory holds the current values of package variables and controls the cache of cursors opened by the respective PL/SQL programs. A call to `RESET_PACKAGE` frees the memory associated with each of the previously run PL/SQL programs from the session, and, consequently, clears the current values of any package globals and closes any cached cursors.

`RESET_PACKAGE` can also be used to reliably restart a failed program in a session. If a program containing package variables fails, then it is hard to determine which variables need to be reinitialized. `RESET_PACKAGE` guarantees that all package variables are reset to their initial values.

Syntax

```
DBMS_SESSION.RESET_PACKAGE;
```

Usage Notes

Because the amount of memory consumed by all executed PL/SQL can become large, you might use `RESET_PACKAGE` to trim down the session memory footprint at certain points in your database application. However, make sure that resetting package variable values does not affect the application. Also, remember that later execution of programs that have lost their cached memory and cursors will perform slower, because they need to re-create the freed memory and cursors.

`RESET_PACKAGE` does not free the memory, cursors, and package variables immediately when called.

Note:

RESET_PACKAGE only frees the memory, cursors, and package variables after the PL/SQL call that made the invocation finishes running.

For example, PL/SQL procedure P1 calls PL/SQL procedure P2, and P2 calls RESET_PACKAGE. The RESET_PACKAGE effects do not occur until procedure P1 finishes execution (the PL/SQL call ends).

Examples

This SQL*Plus script runs a large program with many PL/SQL program units that may or may not use global variables, but it doesn't need them beyond this execution:

```
EXECUTE large_plsql_program1;
```

To free up PL/SQL cached session memory:

```
EXECUTE DBMS_SESSION.RESET_PACKAGE;
```

To run another large program:

```
EXECUTE large_plsql_program2;
```

160.4.13 SESSION_IS_ROLE_ENABLED Function

This function determines if the named role is enabled for the login user session.

Syntax

```
DBMS_SESSION.SESSION_IS_ROLE_ENABLED (
    rolename    VARCHAR2)
    RETURN BOOLEAN;
```

Parameters

Table 160-15 SESSION_IS_ROLE_ENABLED Function Parameters

| Parameter | Description |
|-----------|-------------------|
| rolename | Name of the role. |

Return Values

- TRUE-if the role is enabled.
- FALSE-if the role is not enabled.

160.4.14 SESSION_TRACE_DISABLE Procedure

This procedure resets the session-level SQL trace for the session from which it was called. Client ID and service/module/action traces are not affected.

Syntax

```
DBMS_SESSION.SESSION_TRACE_DISABLE;
```

160.4.15 SESSION_TRACE_ENABLE Procedure

This procedure enables session-level SQL trace for the invoking session. Invoking this procedure results in SQL tracing of every SQL statement issued by the session.

Syntax

```
DBMS_SESSION.SESSION_TRACE_ENABLE(  
    waits      IN   BOOLEAN DEFAULT TRUE,  
    binds      IN   BOOLEAN DEFAULT FALSE,  
    plan_stat  IN   VARCHAR2 DEFAULT NULL);
```

Parameters

Table 160-16 SESSION_TRACE_ENABLE Procedure Parameters

| Parameter | Description |
|-----------|--|
| waits | Specifies if wait information is to be traced |
| binds | Specifies if bind information is to be traced |
| plan_stat | Frequency at which we dump row source statistics. Value should be 'NEVER', 'FIRST_EXECUTION' (equivalent to NULL) or 'ALL_EXECUTIONS'. |

160.4.16 SET_CONTEXT Procedure

This procedure sets the context, of which there are four types: session local, globally initialized, externally initialized, and globally accessed.

Of its five parameters, only the first three are required; the final two parameters are optional, used only in globally accessed contexts. Further parameter information appears in the parameter table and the usage notes.

Syntax

```
DBMS_SESSION.SET_CONTEXT (  
    namespace VARCHAR2,  
    attribute  VARCHAR2,  
    value      VARCHAR2,  
    username   VARCHAR2,  
    client_id  VARCHAR2 );
```

Parameters

Table 160-17 SET_CONTEXT Procedure Parameters

| Parameter | Description |
|-----------|---|
| namespace | Namespace of the application context to be set, limited to 30 bytes |
| attribute | Attribute of the application context to be set, limited to 30 bytes |
| value | Value of the application context to be set, limited to 4 kilobytes. |
| username | Database username attribute of the application context. Default: NULL |
| client_id | Application-specific client_id attribute of the application context (64-byte maximum). Default: NULL |

Usage Notes

- The first three parameters are required for all types of context.
- The `username` parameter must be a valid SQL identifier.
- The `client_id` parameter must be a string of at most 64 bytes. It is case-sensitive and must match the argument provided for `set_identifier`.
- If the `namespace` parameter is a global context namespace, then the `username` parameter is matched against the current database user name in the session, and the `client_id` parameter is matched against the current `client_id` in the session. If these parameters are not set, NULL is assumed, enabling any user to see the context values.
- This procedure must be invoked directly or indirectly by the trusted package.
- The caller of SET_CONTEXT must be in the calling stack of a procedure that has been associated to the context namespace through a CREATE CONTEXT statement. The checking of the calling stack does not cross a DBMS boundary.
- No limit applies to the number of attributes that can be set in a namespace. An attribute retains its value during the user's session unless it is reset by the user.
- If the value of the parameter in the namespace has been set, SET_CONTEXT overwrites this value.
- Any changes in context value are reflected immediately and subsequent calls to access the value through SYS_CONTEXT return the most recent value.

See Also:

Oracle Database Security Guide for more information about

- "Setting the username and client ID"
- "Example: Creating a Global Application Context that Uses a Client Session ID"

160.4.17 SET_EDITION_DEFERRED Procedure

This procedure requests a switch to the specified edition. The switch takes effect at the end of the current client call.

Syntax

```
DBMS_SESSION.SET_EDITION_DEFERRED (  
    edition    IN    VARCHAR2);
```

Parameters

Table 160-18 SET_EDITION_DEFERRED Procedure Parameters

| Parameter | Description |
|-----------|--|
| edition | Name of the edition to which to switch. The contents of the string are processed as a SQL identifier; double quotation marks must surround the remainder of the string if special characters or lower case characters are present in the edition's actual name and, if double quotation marks are not used, the contents are set in uppercase. The caller must have <code>USE</code> privilege on the named edition. |

160.4.18 SET_IDENTIFIER Procedure

This procedure sets the client ID in the session.

Syntax

```
DBMS_SESSION.SET_IDENTIFIER (  
    client_id  VARCHAR2);
```

Parameters

Table 160-19 SET_IDENTIFIER Procedure Parameters

| Parameter | Description |
|-----------|--|
| client_id | Case-sensitive application-specific identifier of the current database session. The maximum number of bytes for this parameter is 64 bytes. If the input exceeds 64 bytes, then <code>ORA-28264</code> is raised. |

Usage Notes

- `SET_IDENTIFIER` sets the session's client id to the given value. This value can be used to identify sessions in `v$session` by means of `v$session.client_identifier`. It can also be used to identify sessions by means of `sys_context('USERENV', 'CLIENT_IDENTIFIER')`.
- This procedure is executable by `PUBLIC`.

160.4.19 SET_NLS Procedure

This procedure sets up your Globalization Support (NLS). It is equivalent to the SQL statement: `ALTER SESSION SET <nls_parameter> = <value>`.

Syntax

```
DBMS_SESSION.SET_NLS (  
    param VARCHAR2,  
    value VARCHAR2);
```

Parameters

Table 160-20 SET_NLS Procedure Parameters

| Parameter | Description |
|-----------|---|
| param | Globalization Support parameter. The parameter name must begin with 'NLS'. |
| value | Parameter value. If the parameter is a text literal, then it needs embedded single-quotes. For example, "set_nls ('nls_date_format','DD-MON-YY')". |

160.4.20 SET_ROLE Procedure

This procedure enables and disables roles. It is equivalent to the `SET ROLE SQL` statement.

Syntax

```
DBMS_SESSION.SET_ROLE (  
    role_cmd VARCHAR2);
```

Parameters

Table 160-21 SET_ROLE Procedure Parameters

| Parameter | Description |
|-----------|--|
| role_cmd | Text is appended to "set role" and then run as SQL |

Usage Notes

Note that the procedure creates a new transaction if it is not invoked from within an existing transaction.

160.4.21 SET_SQL_TRACE Procedure

This procedure turns tracing on or off. It is equivalent to the SQL statement `ALTER SESSION SET SQL_TRACE`

Syntax

```
DBMS_SESSION.SET_SQL_TRACE (  
    sql_trace boolean);
```

Parameters**Table 160-22 SET_SQL_TRACE Procedure Parameters**

| Parameter | Description |
|-----------|--|
| sql_trace | TRUE turns tracing on, FALSE turns tracing off |

160.4.22 SLEEP Procedure

This procedure suspends the session for a specified period of time.

Syntax

```
DBMS_SESSION.SLEEP (
    seconds IN NUMBER);
```

Parameters**Table 160-23 SLEEP Procedure Parameters**

| Parameter | Description |
|-----------|--|
| seconds | Amount of time, in seconds, to suspend the session. The smallest increment can be entered in hundredths of a second; for example, 1.95 is a legal time value. |

160.4.23 SWITCH_CURRENT_CONSUMER_GROUP Procedure

This procedure changes the current resource consumer group of a user's current session.

This lets you switch to a consumer group if you have the switch privilege for that particular group. If the caller is another procedure, then this enables the user to switch to a consumer group for which the owner of that procedure has switch privilege.

Syntax

```
DBMS_SESSION.switch_current_consumer_group (
    new_consumer_group    IN VARCHAR2,
    old_consumer_group    OUT VARCHAR2,
    initial_group_on_error IN BOOLEAN);
```

Parameters**Table 160-24 SWITCH_CURRENT_CONSUMER_GROUP Procedure Parameters**

| Parameter | Description |
|--------------------|---|
| new_consumer_group | Name of consumer group to which you want to switch |
| old_consumer_group | Name of the consumer group from which you just switched out |

Table 160-24 (Cont.) SWITCH_CURRENT_CONSUMER_GROUP Procedure Parameters

| Parameter | Description |
|-------------------------------------|--|
| <code>initial_group_on_error</code> | If TRUE, then sets the current consumer group of the caller to his/her initial consumer group in the event of an error |

Return Values

This procedure outputs the old consumer group of the user in the parameter `old_consumer_group`.

 **Note:**

- The `old_consumer_group` parameter returns the name of old consumer group only if it were set explicitly. That is, you might get NULL if the old consumer group was set by some mapping rules.
- You can switch back to the old consumer group later using the value returned in `old_consumer_group`.

Exceptions**Table 160-25 SWITCH_CURRENT_CONSUMER_GROUP Procedure Exceptions**

| Exception | Description |
|-----------|--|
| 29368 | Non-existent consumer group |
| 1031 | Insufficient privileges |
| 29396 | Cannot switch to OTHER_GROUPS consumer group |

Usage Notes

The owner of a procedure must have privileges on the group from which a user was switched (`old_consumer_group`) in order to switch them back. There is one exception: The procedure can always switch the user back to his/her initial consumer group (skipping the privilege check).

By setting `initial_group_on_error` to TRUE, `SWITCH_CURRENT_CONSUMER_GROUP` puts the current session into the default group, if it can't put it into the group designated by `new_consumer_group`. The error associated with the attempt to move a session into `new_consumer_group` is raised, even though the current consumer group has been changed to the initial consumer group.

Examples

```
CREATE OR REPLACE PROCEDURE high_priority_task is
    old_group varchar2(30);
    prev_group varchar2(30);
    curr_user varchar2(30);
BEGIN
```

```

-- switch invoker to privileged consumer group. If we fail to do so, an
-- error is thrown, but the consumer group does not change
-- because 'initial_group_on_error' is set to FALSE

dbms_session.switch_current_consumer_group('tkrogrp1', old_group, FALSE);
-- set up exception handler (in the event of an error, we do not want to
-- return to caller while leaving the session still in the privileged
-- group)

BEGIN
  -- perform some operations while under privileged group

EXCEPTION
  WHEN OTHERS THEN
    -- It is possible that the procedure owner does not have privileges
    -- on old_group. 'initial_group_on_error' is set to TRUE to make sure
    -- that the user is moved out of the privileged group in such a
    -- situation

    dbms_session.switch_current_consumer_group(old_group,prev_group,TRUE);
    RAISE;
  END;

-- we've succeeded. Now switch to old_group, or if cannot do so, switch
-- to caller's initial consumer group

  dbms_session.switch_current_consumer_group(old_group,prev_group,TRUE);
END high_priority_task;
/

```

160.4.24 UNIQUE_SESSION_ID Function

This function returns an identifier that is unique for all sessions currently connected to this database. Multiple calls to this function during the same session always return the same result.

Syntax

```

DBMS_SESSION.UNIQUE_SESSION_ID
  RETURN VARCHAR2;

```

Pragmas

```

pragma restrict_references(unique_session_id,WNDS,RNDS,WNPS);

```

Return Values

Table 160-26 UNIQUE_SESSION_ID Function Return Values

| Return | Description |
|-------------------|------------------------|
| unique_session_id | Returns up to 24 bytes |

160.4.25 USE_DEFAULT_EDITION_ALWAYS procedure

This procedure turns a mode 'on' or 'off' that disassociates the session from an edition at the end of each and every client call.

Following each call and before the next top level call, no edition will be in use by the session. The session will use the reigning database default edition on its next operation.

Syntax

```
DBMS_SESSION.USE_DEFAULT_EDITION_ALWAYS (
    mode_on IN BOOLEAN DEFAULT TRUE);
```

Parameters

Table 160-27 USE_DEFAULT_EDITION_ALWAYS Procedure Parameters

| Parameter | Description |
|-----------|---|
| mode_on | TRUE to turn on this mode, FALSE to turn off this mode. |

Usage Notes

- A choice of session edition that might otherwise occur due to use of ALTER SESSION SET EDITION, SET_EDITION_DEFERRED, USE_DEFAULT_EDITION_DEFERRED, or the edition-choosing aspect of ALTER SESSION SET CONTAINER will be overridden by this mode.
- Turn this mode off before invoking the above mechanisms to avoid the overriding effect.

160.4.26 USE_DEFAULT_EDITION_DEFERRED procedure

This procedure disassociates the session from an edition.

The reset takes effect at the end of the current client call. Following this call, and before the next top level call, no edition will be in use by the session. The session will use the reigning database default edition on its next operation.

Syntax

```
DBMS_SESSION.USE_DEFAULT_EDITION_DEFERRED
```

161

DBMS_SFW_ACL_ADMIN

The DBMS_SFW_ACL_ADMIN package provides interfaces for administering and managing access control policies for the "database service firewall" feature. Each policy is represented by an access control list (ACL) containing hosts that are allowed access to a specific database service. Local listeners and server processes validate all inbound client connections against the ACL.

This chapter contains the following topics:

- [DBMS_SFW_ACL_ADMIN Security Model](#)
- [DBMS_SFW_ACL_ADMIN Operational Notes](#)
- [DBMS_SFW_ACL_ADMIN Examples](#)
- [Summary of DBMS_SFW_ACL_ADMIN Subprograms](#)

161.1 DBMS_SFW_ACL_ADMIN Security Model

This package is owned by the DBSFUSER schema. The procedures in this package can be run only by the DBSFUSER user.

161.2 DBMS_SFW_ACL_ADMIN Operational Notes

These operation notes apply to DBMS_SFW_ACL_ADMIN.

- An ACL contains entries, which are called "ace", for "access control entries".
- You add entries to an ACL using the [IP_ADD_ACE Procedure](#) and [IP_ADD_PDB_ACE Procedure](#). After calling these procedures, you call the [COMMIT_ACL Procedure](#) to send the updated ACL to the listeners. Similarly, if you remove entries from an ACL using the [IP_REMOVE_ACE Procedure](#), [IP_REMOVE_ACL Procedure](#), [IP_REMOVE_PDB_ACE Procedure](#), or [IP_REMOVE_PDB_ACL Procedure](#), you need to call the [COMMIT_ACL Procedure](#) to update the ACL on the listeners.
- Access control must be enabled using the new FIREWALL endpoint attribute and the new LOCAL_REGISTRATION_ADDRESS_listenerName parameter. The configuration can be done manually in listener.ora or through the Server Control Utility (SRVCTL). Refer to the *Oracle Database Net Services Reference* and the *Oracle Real Application Clusters Administration and Deployment Guide* for configuration instructions.
- You can query the IP_ACL table to show the committed ACLs. But to see the ACLs that have been sent to the local listeners, you have to query the V\$IP_ACL or GV\$IP_ACL view. The IP_ACL table can contain ACLs that are not in [G]V\$IP_ACL because the database services for those ACLs were not running at the time of the commit. When the services are running, you can call the COMMIT_ACL procedure again to send the committed ACLs in the IP_ACL table to the local listeners.

In an Oracle RAC environment, GV\$IP_ACL can be used to query ACLs across the database cluster, and V\$IP_ACL to query ACLs in the connected instance.

161.3 DBMS_SFW_ACL_ADMIN Examples

These three examples show how DBMS_SFW_ACL_ADMIN can be used to administer and manage access control policies.

The following example adds three access control entries to the ACL and commits them.

```
## Connect to DBSFUSER
SQL> connect dbsfuser/<password>
Connected.

## Create an ACL for database service SVC1
SQL> exec dbms_sfw_acl_admin.ip_add_ace('svc1','192.168.12.1');
PL/SQL procedure successfully completed.

SQL> exec dbms_sfw_acl_admin.ip_add_ace('svc1','192.168.12.2');
PL/SQL procedure successfully completed.

SQL> exec dbms_sfw_acl_admin.ip_add_ace('svc1','test02.example.com');
PL/SQL procedure successfully completed.

## Commit the ACLs to the DB ACL table.
## This sends the ACLs for running services to ALL local Listeners
SQL> exec dbms_sfw_acl_admin.commit_acl;
PL/SQL procedure successfully completed.
```

The following example retrieves the ACLs committed from the previous example.

```
SQL> select * from ip_acl;
SERVICE_NAME          HOST
-----
"SVC1.EXAMPLE.COM"    192.168.12.1
"SVC1.EXAMPLE.COM"    192.168.12.2
"SVC1.EXAMPLE.COM"    TEST02.EXAMPLE.COM

## View ACLs sent to the local Listeners
## NOTE: ACLs are sent ONLY to running services
SQL> select * from v$ip_acl;
SERVICE_NAME          HOST          CON_ID
-----
SVC1.EXAMPLE.COM      192.168.12.1      1
SVC1.EXAMPLE.COM      192.168.12.2      1
SVC1.EXAMPLE.COM      TEST02.EXAMPLE.COM 1
```

The following example adds access control entries for pluggable database "PDB1" using various host formats.

```
SQL> exec dbms_sfw_acl_admin.ip_add_pdb_ace('pdb1','192.168.12.3');
PL/SQL procedure successfully completed.

SQL> exec dbms_sfw_acl_admin.ip_add_pdb_ace('pdb1','192.168.12.0/23');
PL/SQL procedure successfully completed.

SQL> exec dbms_sfw_acl_admin.ip_add_pdb_ace('pdb1','192.168.12.*');
PL/SQL procedure successfully completed.

SQL> exec dbms_sfw_acl_admin.commit_acl;
PL/SQL procedure successfully completed.
```

161.4 Summary of DBMS_SFW_ACL_ADMIN Subprograms

This table lists the DBMS_SFW_ACL_ADMIN subprograms and briefly describes them.

Table 161-1 DBMS_SFW_ACL_ADMIN Package Subprograms

| Subprogram | Description |
|---|--|
| COMMIT_ACL Procedure | Commits changes to the ACL tables, and propagates the changes to the local listeners for database instances. |
| IP_ADD_ACE Procedure | Adds an access control entry to the ACL for a database service. |
| IP_ADD_PDB_ACE Procedure | Adds an access control entry to the ACL for all the database services in a pluggable database (PDB). |
| IP_REMOVE_ACE Procedure | Removes an entry from the ACL for a database service. |
| IP_REMOVE_ACL Procedure | Removes all entries from the ACL for a database service. |
| IP_REMOVE_PDB_ACE Procedure | Removes an access control entry from the ACL for all the database services in a pluggable database (PDB). |
| IP_REMOVE_PDB_ACL Procedure | Removes all entries from the ACL for all the database services in a pluggable database (PDB). |

161.4.1 COMMIT_ACL Procedure

This procedure commits changes to the ACL tables. It also propagates the changes to the local listeners for database instances.

If you have changed access entries for database services, but the database services were not running at the time when you called the COMMIT_ACL procedure, then those changes will be committed to the ACL tables, but they will not be sent to the local listener. To send the entries to the listener, start up the database services, and call the COMMIT_ACL procedure again.

This procedure returns when the operation has completed successfully.

Syntax

```
DBMS_SFW_ACL_ADMIN.COMMIT_ACL;
```

Parameters

None

161.4.2 IP_ADD_ACE Procedure

This procedure adds an access control entry to the ACL for a database service.

Syntax

```
DBMS_SFW_ACL_ADMIN.IP_ADD_ACE (
  p_service_name IN VARCHAR2,
  p_host         IN VARCHAR2);
```

Parameters

Table 161-2 IP_ADD_ACE Procedure Parameters

| Parameter | Description |
|----------------|---|
| p_service_name | The name of the database service for which you want to add an access control entry. |
| p_host | The host of the client that is allowed access to the service. This value can be a host name, an IPv4 address, or an IPv6 address. Wildcard "*" for IPv4 and CIDR format are also allowed. |

161.4.3 IP_ADD_PDB_ACE Procedure

This procedure adds an access control entry to the ACL for all the database services in a pluggable database (PDB).

Syntax

```
DBMS_SFW_ACL_ADMIN.IP_ADD_PDB_ACE (
  p_pdb_name IN VARCHAR2,
  p_host     IN VARCHAR2);
```

Parameters

Table 161-3 IP_ADD_PDB_ACE Procedure Parameters

| Parameter | Description |
|------------|--|
| p_pdb_name | The name of the PDB. |
| p_host | The host of the client that is allowed access to the database services in the PDB. This value can be a host name, an IPv4 address, or an IPv6 address. Wildcard "*" for IPv4 and CIDR format are also allowed. |

161.4.4 IP_REMOVE_ACE Procedure

This procedure removes an entry from the ACL for a database service.

Syntax

```
DBMS_SFW_ACL_ADMIN.IP_REMOVE_ACE (
  p_service_name IN VARCHAR2,
  p_host         IN VARCHAR2);
```

Parameters

Table 161-4 IP_REMOVE_ACE Procedure Parameters

| Parameter | Description |
|----------------|---|
| p_service_name | The name of the database service from which you want to remove an access control entry. |

Table 161-4 (Cont.) IP_REMOVE_ACE Procedure Parameters

| Parameter | Description |
|-----------|---|
| p_host | The host that you want to remove from the ACL. This value can be a host name, an IPv4 address, or an IPv6 address. Wildcard "*" for IPv4 and CIDR format are also allowed. This has to match the existing value exactly. You can query the IP_ACL table to get the list of entries for a database service. |

161.4.5 IP_REMOVE_ACL Procedure

This procedure removes all entries from the ACL for a database service.

Syntax

```
DBMS_SFW_ACL_ADMIN.IP_REMOVE_ACL (
  p_service_name IN VARCHAR2);
```

Parameters

Table 161-5 IP_REMOVE_ACL Procedure Parameters

| Parameter | Description |
|----------------|---|
| p_service_name | The name of the database service whose ACL you want to clear. |

161.4.6 IP_REMOVE_PDB_ACE Procedure

This procedure removes an access control entry from the ACL for all the database services in the specified pluggable database (PDB).

Syntax

```
DBMS_SFW_ACL_ADMIN.IP_REMOVE_PDB_ACE (
  p_pdb_name IN VARCHAR2,
  p_host     IN VARCHAR2);
```

Parameters

Table 161-6 IP_REMOVE_PDB_ACE Procedure Parameters

| Parameter | Description |
|------------|---|
| p_pdb_name | The name of the PDB. |
| p_host | The host that you want to remove from the ACL. This value can be a host name, an IPv4 address, or an IPv6 address. Wildcard "*" for IPv4 and CIDR format are also allowed. This has to match the existing value exactly. You can query the IP_ACL table to get the list of entries for a database service. |

161.4.7 IP_REMOVE_PDB_ACL Procedure

This procedure removes all entries from the ACL for all the database services in the specified pluggable database (PDB).

Syntax

```
DBMS_SFW_ACL_ADMIN.IP_REMOVE_PDB_ACL (  
    p_pdb_name IN VARCHAR2);
```

Parameters

Table 161-7 IP_REMOVE_PDB_ACL Procedure Parameters

| Parameter | Description |
|------------|----------------------|
| p_pdb_name | The name of the PDB. |

DBMS_SODA

The `DBMS_SODA` package is a `PL/SQL` package implementing Simple Oracle Document Access (`SODA`). `SODA` allows you to use the Oracle Database as a NoSQL document store. The core abstraction provided by `SODA` is that of document collections. The `DBMS_SODA` package allows you to create, list, and delete document collections from `PL/SQL`, and to perform `CRUD` (create, replace, update, delete) operations on documents. All `DDL` functions are encapsulated within this package.

This chapter contains the following topics:

- [DBMS_SODA Security Model](#)
- [Summary of DBMS_SODA Subprograms](#)
- [Summary of SODA Online Redefinition Subprograms](#)

See Also:

- [Oracle Database SODA for PL/SQL Developer's Guide](#)
- [SODA Types](#)

162.1 DBMS_SODA Security Model

This package is available to users with the `SODA_APP` role.

All `SODA` types (packages and types) are `SYS` types. `PUBLIC` is granted `EXECUTE` privilege on the `DBMS_SODA` described in this chapter.

162.2 Summary of DBMS_SODA Subprograms

This table lists the `DBMS_SODA` subprograms in alphabetical order and briefly describes them.

Table 162-1 DBMS_SODA Package Subprograms

| Subprogram | Purpose |
|--|---|
| CREATE_COLLECTION Function | Creates a collection using the collection name and metadata. |
| DROP_COLLECTION Function | Drops an existing collection from the user's schema. This also removes all the documents in the collection. |
| GET_AS_OF_SCN Function | This function returns the current database SCN number. |

Table 162-1 (Cont.) DBMS_SODA Package Subprograms

| Subprogram | Purpose |
|---|--|
| GET_AS_OF_TIMESTAMP Function | This function returns the current database timestamp value. |
| GET_DEFAULT_METADATA_AS_CLOB Function | This function returns the default metadata. |
| GET_DEFAULT_METADATA_AS_VARCHAR2 Function | This function returns the default metadata. |
| LIST_COLLECTION_NAMES Function | Lists the collection names in the user's schema as a table of NVARCHAR2. |
| OPEN_COLLECTION Function | Opens an existing collection. |

162.2.1 CREATE_COLLECTION Function

Creates a collection using the collection name and metadata. Uses the settings specified in the metadata and auto-assigns the ones that are not, and returns the collection object. If the metadata argument is omitted or set to `NULL`, a collection is created with default metadata. The returned collection is open for `read` and/or `write` operations. If a collection already exists, the function just opens and returns the collection object.

Syntax

```
DBMS_SODA.CREATE_COLLECTION (
    collection_Name      IN NVARCHAR2,
    metadata             IN VARCHAR2 DEFAULT NULL,
    create_Mode         IN PLS_INTEGER DEFAULT CREATE_MODE_DDL)
RETURN SODA_Collection_T;
```

Parameters

Table 162-2 CREATE_COLLECTION Parameters

| Parameter | Description |
|------------------------------|---|
| <code>collection_Name</code> | The name of the collection. The value of <code>collection_Name</code> is case-sensitive. |
| <code>metadata</code> | The metadata of the collection in <code>VARCHAR2</code> format. |

Table 162-2 (Cont.) CREATE_COLLECTION Parameters

| Parameter | Description |
|-------------|---|
| create_Mode | <p>Valid values are:</p> <ul style="list-style-type: none"> DBMS_SODA.CREATE_MODE_DDL (default). First attempts to create a new table for the collection. If table exists already, tries to map that existing table to the collection. Minimal checking is performed to ensure the table shape matches supplied collection metadata (if not, then an error is returned). DBMS_SODA.CREATE_MODE_MAP. Tries to map an existing table to the collection. Minimal checking is performed to ensure the table shape matches supplied collection metadata (if not, then an error is returned). |

Return Values

The function returns a `Soda_Collection_T` object representing the collection.

Exceptions

- Descriptor Error—if the input descriptor is invalid
- Error—if an error occurs while creating the collection

**See Also:**

Oracle Database SODA for PL/SQL Developer's Guide

162.2.2 DROP_COLLECTION Function

Drops an existing collection from the user's schema. This also removes all the documents in the collection.

Syntax

```
DBMS_SODA.DROP_COLLECTION (
    collection_Name    IN NVARCHAR2,
    purge              IN BOOLEAN DEFAULT FALSE,
    drop_Mapped_Table IN BOOLEAN DEFAULT FALSE)
RETURN NUMBER;
```

Parameters

Table 162-3 DROP_COLLECTION Parameters

| Parameter | Description |
|-------------------|--|
| collection_Name | The name of the collection. The value of collection_Name is case-sensitive. |
| purge | The default value is FALSE. |
| drop_Mapped_Table | The default value is FALSE. |

Return values

This function returns the following values:

- 1—if the collection was dropped successfully
- 0—if the collection does not exist

Exceptions

If an error occurs while dropping the collection, for example, due to uncommitted writes to the collection or privilege issues.

**See Also:**

Oracle Database SODA for PL/SQL Developer's Guide

162.2.3 GET_AS_OF_SCN Function

This function returns the current database SCN number.

Syntax

```
DBMS_SODA.GET_AS_OF_SCN ( )
RETURN NUMBER;
```

Return values

This function returns the current database SCN number.

162.2.4 GET_AS_OF_TIMESTAMP Function

This function returns the current database timestamp value.

Syntax

```
DBMS_SODA.GET_AS_OF_TIMESTAMP ( )
RETURN NUMBER;
```

Return values

This function returns the current database timestamp value.

162.2.5 GET_DEFAULT_METADATA_AS_CLOB Function

This function returns the default metadata.

Syntax

```
DBMS_SODA.GET_DEFAULT_METADATA_AS_CLOB ( )  
RETURN CLOB;
```

Return Values

This function returns the default metadata using the `CLOB` datatype.

162.2.6 GET_DEFAULT_METADATA_AS_VARCHAR2 Function

This function returns the default metadata.

Syntax

```
DBMS_SODA.GET_DEFAULT_METADATA_AS_VARCHAR2 ( )  
RETURN VARCHAR2;
```

Return Values

This function returns the default metadata using the `VARCHAR2` datatype.

162.2.7 LIST_COLLECTION_NAMES Function

This function returns a list of collection names in the user's schema as a table of `NVARCHAR2`.

Syntax

```
DBMS_SODA.LIST_COLLECTION_NAMES ( )  
RETURN SODA_CollName_List_T;
```

Return Values

This function returns a list of collection names as a table of `NVARCHAR2(255)`. The collection list is empty if there are no collections in the schema.

Exceptions

`Error`—if an error occurs while listing the collection names.

**See Also:**

Oracle Database SODA for PL/SQL Developer's Guide

162.2.8 OPEN_COLLECTION Function

Opens an existing collection for `read` and/or `write` operations.

Syntax

```
DBMS_SODA.OPEN_COLLECTION (  
    collection_Name      IN NVARCHAR2)  
    RETURN SODA_Collection_T;
```

Parameters

Table 162-4 OPEN_COLLECTION Parameters

| Parameter | Description |
|------------------------------|---|
| <code>collection_Name</code> | The name of the collection. The value of <code>collection_Name</code> is case-sensitive. |

Return Values

This function returns the following values:

- a collection object which is open
- `NULL`, if the collection does not exist

Exceptions

`Error`—if an error occurs while creating the collection

See Also:

- [Opening an Existing Document Collection with SODA for PL/SQL](#)
- [Checking Whether a Given Collection Exists with SODA for PL/SQL](#)

162.3 Summary of SODA Online Redefinition Subprograms

This table lists the SODA Online Redefinition subprograms in alphabetical order and briefly describes them.

Table 162-5 SODA Online Redefinition Subprograms

| Subprogram | Purpose |
|--|---|
| ABORT_REDEF_COLLECTION Procedure | This procedure reverts the changes made to a collection if there are any errors in <code>CREATE_INTERIM_COLLECTION</code> , <code>START_REDEF_COLLECTION</code> , <code>COPY_COLLECTION_DEPENDENTS</code> , <code>SYNC_INTERIM_COLLECTION</code> , or due to any other reasons. |
| CAN_REDEF_COLLECTION Procedure | This procedure checks if the data table can be redefined. If the data table cannot be redefined, errors are raised. |
| COPY_COLLECTION_DEPENDENTS Procedure | This procedure copies all the dependents that are defined on the original table to the interim table. However, if the interim table is JSON type, constraints like <code>IS JSON NOT NULL</code> will not be copied because those are extraneous. |
| CREATE_INTERIM_COLLECTION Procedure | This procedure creates an interim SODA collection. The <code>interim_metadata</code> specifies the changes the user needs to make. For example, a delta applied as a patch to the original metadata. |
| FINISH_REDEF_COLLECTION Procedure | This procedure performs the following tasks in one atomic transaction. It introduces a downtime. This can only be called after every dependent required for a SODA data table is present on the interim collection, otherwise an error is raised. |
| START_REDEF_COLLECTION Procedure | This procedure starts the redefinition process. Copies the existing data from the original table to the interim table and performs the required transformations on the redefined columns. |
| SYNC_INTERIM_COLLECTION Procedure | This procedure synchronizes the changes to the interim table if the original data table was changed. This procedure can only be called after every dependent required for the SODA data table is present on the interim collection, otherwise, an error is raised. |
| TO_UUID Function | This function is used to remap the version column of the collection table during Data Pump Import to UUID values. This function is only for use with the <code>REMAP_DATA</code> feature of Data Pump. |

162.3.1 ABORT_REDEF_COLLECTION Procedure

This procedure reverts the changes made to a collection if there are any errors in CREATE_INTERIM_COLLECTION, START_REDEF_COLLECTION, COPY_COLLECTION_DEPENDENTS, SYNC_INTERIM_COLLECTION, or due to any other reasons.

Syntax

```
DBMS_SODA.ABORT_REDEF_COLLECTION (
    collection_name      IN  NVARCHAR2,
    interim_collection_name IN NVARCHAR2);
```

Parameters

Table 162-6 ABORT_REDEF_COLLECTION Procedure Parameters

| Parameter | Description |
|-------------------------|---|
| collection_name | The name of the collection to be redefined. |
| interim_collection_name | The name used for the interim collection. |

162.3.2 CAN_REDEF_COLLECTION Procedure

This procedure checks if the data table can be redefined. If the data table cannot be redefined, errors are raised.

Syntax

```
DBMS_SODA.CAN_REDEF_COLLECTION (
    collection_name IN NVARCHAR2);
```

Parameters

Table 162-7 CAN_REDEF_COLLECTION Procedure Parameters

| Parameter | Description |
|-----------------|---|
| collection_name | The name of the collection to be redefined. |

162.3.3 COPY_COLLECTION_DEPENDENTS Procedure

This procedure copies all the dependents that are defined on the original table to the interim table.

Syntax

```
DBMS_SODA.COPY_COLLECTION_DEPENDENTS (
    collection_name      IN  NVARCHAR,
    interim_collection_name IN NVARCHAR2,
    ignore_error         IN  BOOLEAN DEFAULT NULL,
    num_errors           OUT PLS_INTEGER);
```

Parameters

Table 162-8 COPY_COLLECTION_DEPENDENTS Procedure Parameters

| Parameter | Description |
|--------------------------------------|---|
| <code>collection_name</code> | The name of the collection to be redefined. |
| <code>interim_collection_name</code> | The name used for the interim collection. |
| <code>ignore_error</code> | Ignore the errors encountered in the process and proceed. |
| <code>num_errors</code> | The number of errors encountered in the process. |

162.3.4 CREATE_INTERIM_COLLECTION Procedure

This procedure creates an interim SODA collection. The `interim_metadata` specifies the changes the user needs to make. For example, a delta applied as a patch to the original metadata.

Syntax

```
DBMS_SODA.CREATE_INTERIM_COLLECTION (
  collection_name      IN  NVARCHAR2,
  interim_collection_name  IN  NVARCHAR2,
  interim_metadata     IN  VARCHAR2);
```

Parameters

Table 162-9 CREATE_INTERIM_COLLECTION Procedure Parameters

| Parameter | Description |
|--------------------------------------|--|
| <code>collection_name</code> | The name of the collection to be redefined. |
| <code>interim_collection_name</code> | The name used for the interim collection. |
| <code>interim_metadata</code> | The metadata snippet specifying the columns that need to be redefined and how they need to be redefined. |

Usage Notes

The `interim_metadata` parameter can contain the following fields. An error is raised if other fields are present and if the fields are not the same as those in the metadata for the original collection.

- Set `contentColumn.sqlType` to `JSON` in order to redefine the `CONTENT` column to `JSON` type, automatically generating the `VERSION` column if needed.
- Set `versionColumn.method` to `UUID` to redefine the `VERSION` column to use `UUID`.
- Set `tableName` to specify a name for the data table of this interim collection. If this field is not present, a default data table name will be generated according to the rules of table name defaulting outlined in Default Naming of a Collection Table. However, if the table already exists, the collection is created using the `MAP` mode. In this scenario, make sure that the mapped table does not have any constraints defined.
- The user can combine the above fields in the supplied `interim_metadata` snippet. For example, the most common use case is to both redefine the content column to `JSON` type

and redefine the version column to UUID, which can be achieved by setting the interim_metadata parameter to {"contentColumn" : {"sqlType": "JSON"}, "versionColumn" : {"method": "UUID"}}.

162.3.5 FINISH_REDEF_COLLECTION Procedure

This procedure performs the following tasks in one atomic transaction. It introduces a downtime. This can only be called after every dependent required for a SODA data table is present on the interim collection, otherwise an error is raised.

Syntax

```
DBMS_SODA.FINISH_REDEF_COLLECTION (
    collection_name          IN  NVARCHAR,
    interim_collection_name IN  NVARCHAR2,
    dml_lock_timeout        IN  PLS_INTEGER DEFAULT NULL);
```

Parameters

Table 162-10 FINISH_REDEF_COLLECTION Procedure Parameters

| Parameter | Description |
|-------------------------|---|
| collection_name | The name of the collection to be redefined. |
| interim_collection_name | The name used for the interim collection. |
| dml_lock_timeout | The wait period in seconds. If the lock is not acquired within this wait period, an error occurs. |

Usage Notes

This action cannot be undone. After this procedure is executed, you cannot perform ROLLBACK procedure provided by the DBMS_REDEFINITION package.

Caution:

Before calling FINISH_REDEF_COLLECTION Procedure, the interim collection should be tried out to make sure it can be accessed and is working as expected. In case of any issues, use [ABORT_REDEF_COLLECTION Procedure](#).

It is very important to do this before calling FINISH_REDEF_COLLECTION because the latter cannot be reversed.

162.3.6 START_REDEF_COLLECTION Procedure

This procedure starts the redefinition process. Copies the existing data from the original table to the interim table and performs the required transformations on the redefined columns.

Syntax

```
DBMS_SODA.START_REDEF_COLLECTION (
  collection_name          IN  NVARCHAR,
  interim_collection_name IN  NVARCHAR2,
  copy_vpd_opt            IN  DEFAULT NULL,
  refresh_dep_mviews     IN  DEFAULT NULL);
```

Parameters

Table 162-11 START_REDEF_COLLECTION Procedure Parameters

| Parameter | Description |
|-------------------------|---|
| collection_name | The name of the collection to be redefined. |
| interim_collection_name | The name used for the interim collection. |
| copy_vpd_opt | Can be either DBMS_REDEFINITION.CONST_VPD_MANUAL or DBMS_REDEFINITION.CONST_VPD_NONE. DBMS_REDEFINITION.CONST_VPD_MANUAL is used to indicate to copy VPD policies manually. DBMS_REDEFINITION.CONST_VPD_NONE is used to indicate that there are no VPD policies on the original table. If NULL, DBMS_REDEFINITION.CONST_VPD_NONE is used. |
| refresh_dep_mviews | Can be N or Y. When set to N, fast refresh of dependent materialized views is performed when the START_REDEF_TABLE procedure is run, each time the SYNC_INTERIM_TABLE procedure is run, and when the FINISH_REDEF_TABLE procedure is run. If NULL, N is used. |

162.3.7 SYNC_INTERIM_COLLECTION Procedure

This procedure synchronizes the changes to the interim table if the original data table was changed. This procedure can only be called after every dependent required for the SODA data table is present on the interim collection, otherwise, an error is raised.

Syntax

```
DBMS_SODA.SYNC_INTERIM_COLLECTION (
  collection_name          IN  NVARCHAR,
  interim_collection_name IN  NVARCHAR2);
```

Parameters

Table 162-12 SYNC_INTERIM_COLLECTION Procedure Parameters

| Parameter | Description |
|-------------------------|---|
| collection_name | The name of the collection to be redefined. |
| interim_collection_name | The name used for the interim collection. |

162.3.8 TO_UUID Function

This function is used to remap the version column of the collection table during Data Pump Import to UUID values. This function is only for use with the `REMAP_DATA` feature of Data Pump.

Syntax

```
DBMS_SODA.TO_UUID (  
    placeholder      IN    NVARCHAR2)  
RETURN VARCHAR2;
```

Parameters

Table 162-13 TO_UUID Parameters

| Parameter | Description |
|-------------|--|
| placeholder | This parameter is not used and can be ignored. It is used due to the syntactic constraints for the Data Pump <code>REMAP_DATA</code> function. |

Return values

This function returns a hexadecimal string that can be used as a `UUID` value.

See Also:

`REMAP_DATA` in the *Oracle® Database Utilities Guide*.

DBMS_SHARED_POOL

The `DBMS_SHARED_POOL` package provides access to the shared pool, which is the shared memory area where cursors and PL/SQL objects are stored. `DBMS_SHARED_POOL` enables you to display the sizes of objects in the shared pool, and mark them for keeping or not-keeping in order to reduce memory fragmentation.

This chapter contains the following topics:

- [Overview](#)
- [Operational Notes](#)
- [Summary of DBMS_SHARED_POOL Subprograms](#)

163.1 DBMS_SHARED_POOL Overview

The procedures provided here may be useful when loading large PL/SQL objects. When large PL/SQL objects are loaded, users response time is affected because of the large number of smaller objects that need to be aged out from the shared pool to make room (due to memory fragmentation). In some cases, there may be insufficient memory to load the large objects.

`DBMS_SHARED_POOL` is also useful for frequently executed triggers. You may want to keep compiled triggers on frequently used tables in the shared pool.

Additionally, `DBMS_SHARED_POOL` supports sequences. Sequence numbers are lost when a sequence is aged out of the shared pool. `DBMS_SHARED_POOL` is useful for keeping sequences in the shared pool and thus preventing the loss of sequence numbers.

163.2 DBMS_SHARED_POOL Operational Notes

To create `DBMS_SHARED_POOL`, run the `DBMSPOOL.SQL` script. The `PRVTPPOOL.PLB` script is automatically executed after `DBMSPOOL.SQL` runs. These scripts are *not* run by as part of standard database creation.

163.3 Summary of DBMS_SHARED_POOL Subprograms

This table lists the `DBMS_SHARED_POOL` subprograms and briefly describes them.

Table 163-1 *DBMS_SHARED_POOL Package Subprograms*

| Subprogram | Description |
|---|--|
| ABORTED_REQUEST_THRESHOLD Procedure | Sets the aborted request threshold for the shared pool |
| KEEP Procedure | Keeps an object in the shared pool |
| MARKHOT Procedure | Marks a library cache object as a hot object |

Table 163-1 (Cont.) DBMS_SHARED_POOL Package Subprograms

| Subprogram | Description |
|-------------------------------------|--|
| PURGE Procedure | Purges the named object or specified heap(s) of the object |
| SIZES Procedure | Shows objects in the shared pool that are larger than the specified size |
| UNKEEP Procedure | Unkeeps the named object |
| UNMARKHOT Procedure | Unmarks a library cache object as a hot object |

163.3.1 ABORTED_REQUEST_THRESHOLD Procedure

This procedure sets the aborted request threshold for the shared pool.

Syntax

```
DBMS_SHARED_POOL.ABORTED_REQUEST_THRESHOLD (
    threshold_size NUMBER);
```

Parameters

Table 163-2 ABORTED_REQUEST_THRESHOLD Procedure Parameters

| Parameter | Description |
|----------------|---|
| threshold_size | Size, in bytes, of a request which does not try to free unpinned (not "unkeep-ed") memory within the shared pool. The range of threshold_size is 5000 to ~2 GB inclusive. |

Exceptions

An exception is raised if the threshold is not in the valid range.

Usage Notes

Usually, if a request cannot be satisfied on the free list, then the RDBMS tries to reclaim memory by freeing objects from the LRU list and checking periodically to see if the request can be fulfilled. After finishing this step, the RDBMS has performed a near equivalent of an 'ALTER SYSTEM FLUSH SHARED_POOL'.

Because this impacts all users on the system, this procedure "localizes" the impact to the process failing to find a piece of shared pool memory of size greater than thresh_hold size. This user gets the 'out of memory' error without attempting to search the LRU list.

163.3.2 KEEP Procedure

This procedure keeps an object in the shared pool. Once an object has been kept in the shared pool, it is not subject to aging out of the pool. This may be useful for

frequently used large objects. When large objects are brought into the shared pool, several objects may need to be aged out to create a contiguous area large enough.

Syntax

```
DBMS_SHARED_POOL.KEEP (
    name          VARCHAR2,
    flag          CHAR DEFAULT 'P');

DBMS_SHARED_POOL.KEEP (
    schema        VARCHAR2,
    objname       VARCHAR2,
    namespace     NUMBER,
    heaps         NUMBER,
    edition_name  VARCHAR2 DEFAULT NULL);

DBMS_SHARED_POOL.KEEP (
    hash          VARCHAR2,
    namespace     NUMBER,
    heaps         NUMBER);
```

Parameters

Table 163-3 KEEP Procedure Parameters

| Parameter | Description |
|--------------|--|
| name | The name of the object to keep. |
| flag | A character string indicating the kind of object to keep in the shared pool. The string is not case sensitive. This parameter is optional. If the parameter is not specified, the package assumes that the first parameter is the name of a package/procedure/function and will resolve the name. <ul style="list-style-type: none"> • Set to 'P' or 'p' to fully specify that the input is the name of a package/procedure/function. • Set to 'Q' or 'q' to specify that the input is the name of a sequence. • Set to 'R' or 'r' to specify that the input is the name of a trigger. • Set to 'T' or 't' to specify that the input is the name of a type. • Set to 'JS' or 'js' to specify that the input is the name of a java source. • Set to 'JC' or 'jc' to specify that the input is the name of a java class. • Set to 'JD' or 'jd' to specify that the input is the name of a java shared data. • Set to 'JR' or 'jr' to specify that the input is the name of a java resource. • Set to 'C' or 'c' to specify that the input is the name of a cursor. |
| schema | The user name or the schema to which the object belongs to. |
| objname | The name of the object to keep. |
| namespace | A number indicating the library cache namespace in which the object has to be searched for. |
| heaps | The heaps to keep. For example, if heap 0 and heap 6 are to be kept. |
| edition_name | The name of the edition that the target object resides in. This parameter is optional. |
| hash | A 16-byte hash value for the object. |

Exceptions

An exception is raised if the named object is not found.

Usage Notes

There are two kinds of objects:

- PL/SQL objects, triggers, sequences, types, and Java objects, which are specified by name.
- SQL cursor objects which are specified by a two-part number (indicating a location in the shared pool).

For example:

```
DBMS_SHARED_POOL.KEEP('scott.hispackage')
```

This keeps package `HISPACKAGE`, owned by `SCOTT`. The names for PL/SQL objects follow SQL rules for naming objects (for example, delimited identifiers and multibyte names are allowed). A cursor can be kept by `DBMS_SHARED_POOL.KEEP('0034CFFF, 20348871', 'C')`, `0034CFFF` being the `ADDRESS` and `20348871` the `HASH_VALUE`. Note that the complete hexadecimal address must be in the first 8 characters.

163.3.3 MARKHOT Procedure

This procedure marks a library cache object as a hot object.

Syntax

```
DBMS_SHARED_POOL.MARKHOT (
  schema          VARCHAR2,
  objname         VARCHAR2,
  namespace       NUMBER DEFAULT 1,
  global          BOOLEAN DEFAULT TRUE,
  edition_name    VARCHAR2 DEFAULT NULL);
```

```
DBMS_SHARED_POOL.MARKHOT (
  hash           VARCHAR2,
  namespace      NUMBER DEFAULT 1,
  global         BOOLEAN DEFAULT TRUE);
```

Parameters

Table 163-4 MARKHOT Procedure Parameters

| Parameter | Description |
|-----------|--|
| schema | User name or the schema to which the object belongs |
| objname | Name of the object |
| namespace | Number indicating the library cache namespace in which the object is to be searched. Views, such as <code>USER_OBJECTS</code> and <code>DBA_OBJECTS</code> , reflect the namespace as a number column, as do most dictionary tables such as <code>OBJ\$</code> . |
| global | If <code>TRUE</code> (default), mark the object hot on all Oracle RAC instances |
| hash | 16-byte hash value for the object |

Table 163-4 (Cont.) MARKHOT Procedure Parameters

| Parameter | Description |
|---------------------------|--|
| <code>edition_name</code> | Denotes the name of the edition that the target object resides in. This parameter is optional. |

Exceptions

ORA-06502: An exception is raised if the named object cannot be found due to incorrect input

ORA-04043: An exception is raised if the named object cannot be found (bad namespace, or hash input)

Usage Notes

If a package or type's specification is marked hot or unhot, then the corresponding package or type body will be implicitly marked as hot or unhot.

Users can examine column, `V$DB_OBJECT_CACHE.PROPERTY`, to see whether or not the object has been marked hot. The values for `PROPERTY` are:

- `HOTCOPYnnn`- An object that is a hot copy with integer identifier of 'nnn'. For example, `HOTCOPY5`, `HOTCOPY94`, and `HOTCOPY125`.
- `HOTCOPY-As` above but the identifier is unknown
- `HOT`-The "root" kgl object that has been marked as hot
- `NULL`-A normal object

163.3.4 PURGE Procedure

This procedure purges the named object or specified heaps of the object.

Syntax

```
DBMS_SHARED_POOL.PURGE (
    name          VARCHAR2,
    flag          CHAR DEFAULT 'P',
    heaps        NUMBER DEFAULT 1);
```

```
DBMS_SHARED_POOL.PURGE (
    schema        VARCHAR2,
    objname       VARCHAR2,
    namespace    NUMBER,
    heaps        NUMBER,
    edition_name VARCHAR2 DEFAULT NULL);
```

```
DBMS_SHARED_POOL.PURGE (
    hash         VARCHAR2,
    namespace    NUMBER,
    heaps        NUMBER);
```

Parameters

Table 163-5 PURGE Procedure Parameters

| Parameter | Description |
|--------------|---|
| name | Name of the object to purge. The value for this identifier is the concatenation of the address and hash_value columns from the v\$sqlarea view. This is displayed by the SIZES procedure. Currently, TABLE and VIEW objects may not be purged. |
| flag | A character string indicating the kind of object to purge from the shared pool. The string is not case sensitive. This parameter is optional. If the parameter is not specified, the package assumes that the first parameter is the name of a package/procedure/function and will resolve the name. <ul style="list-style-type: none"> Set to 'P' or 'p' to fully specify that the input is the name of a package/procedure/function. Set to 'Q' or 'q' to specify that the input is the name of a sequence. Set to 'R' or 'r' to specify that the input is the name of a trigger. Set to 'T' or 't' to specify that the input is the name of a type. Set to 'JS' or 'js' to specify that the input is the name of a java source. Set to 'JC' or 'jc' to specify that the input is the name of a java class. Set to 'JD' or 'jd' to specify that the input is the name of a java shared data. Set to 'JR' or 'jr' to specify that the input is the name of a java resource. Set to 'C' or 'c' to specify that the input is the name of a cursor. |
| heaps | Heaps to be purged. For example, if heap 0 and heap 6 are to be purged: 1<<0 1<<6 => hex 0x41 => decimal 65, so specify heaps =>65. Default value is 1, that is, heap 0 which means the whole object would be purged |
| schema | User name or the schema to which the object belongs |
| objname | Name of the object to purge |
| namespace | Parameter is a number indicating the library cache namespace in which the object is to be searched |
| hash | 16-byte hash value for the object |
| edition_name | The name of the edition that the target object resides in. This parameter is optional. |

Exceptions

ORA-6570: An exception is raised if the named object cannot be found

ORA-6570: An object cannot be purged it marked as permanently kept

Usage Notes

All objects supported by the [KEEP Procedure](#) are supported for PURGE.

163.3.5 SIZES Procedure

This procedure shows objects in the `shared_pool` that are larger than the specified size. The name of the object is also given, which can be used as an argument to either the `KEEP` or `UNKEEP` calls.

Syntax

```
DBMS_SHARED_POOL.SIZES (
    minsize NUMBER);
```

Parameters

Table 163-6 SIZES Procedure Parameters

| Parameter | Description |
|----------------------|---|
| <code>minsize</code> | Size, in kilobytes, over which an object must be occupying in the shared pool, in order for it to be displayed. |

Usage Notes

Issue the `SQLDBA` or `SQLPLUS` `'SET SERVEROUTPUT ON SIZE XXXXX'` command prior to using this procedure so that the results are displayed.

163.3.6 UNKEEP Procedure

This procedure unkeeps the named object.

Syntax

```
DBMS_SHARED_POOL.UNKEEP (
    name          VARCHAR2,
    flag          CHAR DEFAULT 'P');

DBMS_SHARED_POOL.UNKEEP (
    schema        VARCHAR2,
    objname       VARCHAR2,
    namespace     NUMBER,
    edition_name  VARCHAR2 DEFAULT NULL);

DBMS_SHARED_POOL.UNKEEP (
    hash          VARCHAR2,
    namespace     NUMBER);
```

WARNING:

This procedure may not be supported in the future if automatic mechanisms are implemented to make this unnecessary.

Parameters

Table 163-7 UNKEEP Procedure Parameters

| Parameter | Description |
|--------------|---|
| name | The name of the object to unkeep. |
| flag | A character string indicating what kind of object to keep the name identifies. The string is not case sensitive. This parameter is optional. If the parameter is not specified, the package assumes that the first parameter is the name of a package/procedure/function and will resolve the name. |
| schema | The user name or the schema to which the object belongs to. |
| objname | The name of the object to unkeep. |
| namespace | A number that indicates the library cache namespace in which the object has to be searched for. |
| edition_name | The name of the edition that the target object resides in. This parameter is optional. |
| hash | A 16-byte hash value for the object. |

Exceptions

ORA-06502: An exception is raised if the named object cannot be found

163.3.7 UNMARKHOT Procedure

This procedure unmarks a library cache object as a hot object.

Syntax

```
DBMS_SHARED_POOL.UNMARKHOT (
  schema          VARCHAR2,
  objname         VARCHAR2,
  namespace       NUMBER DEFAULT 1,
  global          BOOLEAN DEFAULT TRUE,
  edition_name    VARCHAR2 DEFAULT NULL);
```

```
DBMS_SHARED_POOL.UNMARKHOT (
  hash            VARCHAR2,
  namespace       NUMBER DEFAULT 1,
  global          BOOLEAN DEFAULT TRUE);
```

Parameters

Table 163-8 UNMARKHOT Procedure Parameters

| Parameter | Description |
|-----------|---|
| schema | User name or the schema to which the object belongs |
| objname | Name of the object |

Table 163-8 (Cont.) UNMARKHOT Procedure Parameters

| Parameter | Description |
|---------------------------|---|
| <code>namespace</code> | Number indicating the library cache namespace in which the object is to be searched |
| <code>global</code> | If <code>TRUE</code> , unmark the object hot on all Oracle RAC instances. The default value of this parameter is <code>TRUE</code> . |
| <code>hash</code> | A 16-byte hash value for the object |
| <code>edition_name</code> | Denotes the name of the edition that the target object resides in. This parameter is optional. |

Exceptions

ORA-06502: An exception is raised if the named object cannot be found due to incorrect input

ORA-04043: An exception is raised if the named object cannot be found (bad namespace, or hash input, or non-existent object)

Usage Notes

If a package or type's specification is marked hot or unhot, then the corresponding package or type body will be implicitly marked as hot or unhot.

164

DBMS_SPACE

The `DBMS_SPACE` package enables you to analyze segment growth and space requirements.

This chapter contains the following topics:

- [Security Model](#)
- [Data Structures](#)
- [Summary of DBMS_SPACE Subprograms](#)

164.1 DBMS_SPACE Security Model

This package runs with `SYS` privileges. The execution privilege is granted to `PUBLIC`. Subprograms in this package run under the caller security. The user must have `ANALYZE` privilege on the object.

164.2 DBMS_SPACE Data Structures

The `DBMS_SPACE` package defines an `OBJECT` type, a `RECORD` type, and a `TABLE` type.

OBJECT Types

[CREATE_TABLE_COST_COLINFO](#) Object Type

RECORD Types

[ASA_RECO_ROW](#) Record Type

TABLE Types

[ASA_RECO_ROW_TB](#) Table Type

164.2.1 DBMS_SPACE CREATE_TABLE_COST_COLINFO Object Type

This type describes the datatype and size of a column in the table.

Syntax

```
TYPE create_table_cost_colinfo IS OBJECT(  
    col_type    VARCHAR(200),  
    col_size    NUMBER)
```

Attributes**Table 164-1 CREATE_TABLE_COST_COLINFO Object Type**

| Attribute | Description |
|-----------|-------------|
| col_type | Column type |
| col_size | Column size |

164.2.2 DBMS_SPACE ASA_RECO_ROW Record Type

This type contains the column type of individual columns returned by the ASA_RECOMMENDATIONS Function.

Syntax

```

TYPE asa_reco_row IS RECORD (
  tablespace_name    VARCHAR2(30),
  segment_owner     VARCHAR2(30),
  segment_name      VARCHAR2(30),  segment_type      VARCHAR2(18),
  partition_name    VARCHAR2(30),
  allocated_space   NUMBER,
  used_space        NUMBER,
  reclaimable_space NUMBER,
  chain_rowexcess   NUMBER,
  recommendations   VARCHAR2(1000),
  c1                VARCHAR2(1000),
  c2                VARCHAR2(1000),
  c3                VARCHAR2(1000),
  task_id           NUMBER,
  mesg_id           NUMBER);

```

Attributes**Table 164-2 ASA_RECO_ROW Attributes**

| Field | Description |
|-------------------|--|
| tablespace_name | Name of the tablespace containing the object |
| segment_owner | Name of the schema |
| segment_name | Name of the object |
| segment_type | Type of the segment 'TABLE','INDEX' and so on |
| partition_name | Name of the partition |
| allocated_space | Space allocated to the segment |
| used_space | Space actually used by the segment |
| reclaimable_space | Reclaimable free space in the segment |
| chain_rowexcess | Percentage of excess chain row pieces that can be eliminated |
| recommendations | Recommendation or finding for this segment |
| c1 | Command associated with the recommendation |
| c2 | Command associated with the recommendation |

Table 164-2 (Cont.) ASA_RECO_ROW Attributes

| Field | Description |
|---------|--|
| c3 | Command associated with the recommendation |
| task_id | Advisor Task that processed this segment |
| mesg_id | Message ID corresponding to the recommendation |

Related Topics

- [DBMS_SPACE ASA_RECOMMENDATIONS Function](#)
This function returns recommendations using the stored results of the auto segment advisor. This function returns results from the latest run on any given object.

164.2.3 DBMS_SPACE ASA_RECO_ROW_TB Table Type

The type `asa_reco_row_tb` is a table of `asa_reco_row`.

Syntax

```
TYPE asa_reco_row_tb IS TABLE OF asa_reco_row;
```

164.3 Summary of DBMS_SPACE Subprograms

This table lists the `DBMS_SPACE` subprograms and briefly describes them.

Table 164-3 DBMS_SPACE Package Subprograms

| Subprogram | Description |
|--|---|
| ASA_RECOMMENDATIONS Function | Returns recommendations/findings of segment advisor run automatically by the system or manually invoked by the user |
| CREATE_INDEX_COST Procedure | Determines the cost of creating an index on an existing table |
| CREATE_TABLE_COST Procedures | Determines the size of the table given various attributes |
| FREE_BLOCKS Procedure | Returns information about free blocks in an object (table, index, or cluster) |
| ISDATAFILEDROPPABLE_NAME Procedure | Checks whether a datafile is droppable |
| OBJECT_DEPENDENT_SEGMENTS Function | Returns the list of segments that are associated with the object |
| OBJECT_GROWTH_TREND Function | A table function where each row describes the space usage of the object at a specific point in time |
| SPACE_USAGE Procedures | Returns information about free blocks in an auto segment space managed segment |
| UNUSED_SPACE Procedure | Returns information about unused space in an object (table, index, or cluster) |

164.3.1 DBMS_SPACE ASA_RECOMMENDATIONS Function

This function returns recommendations using the stored results of the auto segment advisor. This function returns results from the latest run on any given object.

Syntax

```
DBMS_SPACE.ASA_RECOMMENDATIONS (
    all_runs          IN    VARCHAR2 DEFAULT := TRUE,
    show_manual       IN    VARCHAR2 DEFAULT := TRUE,
    show_findings     IN    VARCHAR2 DEFAULT := FALSE)
RETURN ASA_RECO_ROW_TB PIPELINED;
```

Parameters

Table 164-4 ASA_RECOMMENDATIONS Procedure Parameters

| Parameter | Description |
|---------------|---|
| all_runs | Returns the results of all the auto advisor runs or only the results of the latest run. The valid values are TRUE and FALSE. The default value is TRUE. If TRUE, returns recommendations/findings for all runs of auto segment advisor. If FALSE, returns the results of the LATEST run only. LATEST does not make sense for manual invocation of segment advisor. This is applicable only for auto advisor. |
| show_manual | This parameter is used to indicate if the results of manual jobs should be included. If TRUE, results of manual tasks are shown. If FALSE, results of manual tasks are not shown. Specifying manual=true does not negate the specification of auto advisor tasks. However, the all_runs settings may override manual. If all_runs is FALSE, implying we only want to see the latest of auto advisor job, then manual may not be specified as TRUE. The valid values are TRUE and FALSE. The default value is TRUE. |
| show_findings | Shows only the findings instead of the recommendations. The valid values are TRUE and FALSE. The default value is FALSE. |

Table 164-5 Parameter Usage

| all_runs | show_manual | show_findings | Outcome |
|----------|-------------|---------------|---|
| TRUE | TRUE | TRUE | All findings from auto advisor and manual tasks. |
| TRUE | TRUE | FALSE | All recommendations from auto advisor and manual tasks. |
| TRUE | FALSE | TRUE | All findings from auto advisor tasks. |
| TRUE | FALSE | FALSE | All recommendations from all auto advisor tasks. |

Table 164-5 (Cont.) Parameter Usage

| all_runs | show_manual | show_findings | Outcome |
|-----------------|--------------------|----------------------|--|
| FALSE | TRUE | TRUE | N/A |
| FALSE | TRUE | FALSE | N/A |
| FALSE | FALSE | TRUE | Findings for the latest auto advisor task. |
| FALSE | FALSE | FALSE | Recommendations from the latest auto advisor task. |

164.3.2 CREATE_INDEX_COST Procedure

This procedure determines the cost of creating an index on an existing table. The input is the DDL statement that will be used to create the index. The procedure will output the storage required to create the index.

Syntax

```
DBMS_SPACE.CREATE_INDEX_COST (
    ddl          IN   VARCHAR2,
    used_bytes   OUT  NUMBER,
    alloc_bytes  OUT  NUMBER,
    plan_table   IN   VARCHAR2 DEFAULT NULL);
```

Pragmas

```
pragma restrict_references (create_index_cost,WNDS);
```

Parameters

Table 164-6 CREATE_INDEX_COST Procedure Parameters

| Parameter | Description |
|------------------|--|
| ddl | The create index DDL statement |
| used_bytes | The number of bytes representing the actual index data |
| alloc_bytes | Size of the index when created in the tablespace |
| plan_table | Which plan table to use, default NULL |

Usage Notes

- The table on which the index is created must already exist.
- The computation of the index size depends on statistics gathered on the segment.
- It is imperative that the table must have been analyzed recently.
- In the absence of correct statistics, the results may be inaccurate, although the procedure will not raise any errors.

164.3.3 CREATE_TABLE_COST Procedures

This procedure is used in capacity planning to determine the size of the table given various attributes. The size of the object can vary widely based on the tablespace storage attributes, tablespace block size, and so on. There are two overloads of this procedure.

- The first version takes the column information of the table as argument and outputs the table size.
- The second version takes the average row size of the table as argument and outputs the table size.

This procedure can be used on tablespace of dictionary managed and locally managed extent management as well as manual and auto segment space management.

Syntax

```
DBMS_SPACE.CREATE_TABLE_COST (
    tablespace_name    IN VARCHAR2,
    avg_row_size       IN NUMBER,
    row_count          IN NUMBER,
    pct_free           IN NUMBER,
    used_bytes         OUT NUMBER,
    alloc_bytes        OUT NUMBER);
```

```
DBMS_SPACE.CREATE_TABLE_COST (
    tablespace_name    IN VARCHAR2,
    colinfos           IN CREATE_TABLE_COST_COLUMNS,
    row_count          IN NUMBER,
    pct_free           IN NUMBER,
    used_bytes         OUT NUMBER,
    alloc_bytes        OUT NUMBER);
```

```
CREATE TYPE create_table_cost_colinfo IS OBJECT (
    COL_TYPE    VARCHAR(200),
    COL_SIZE    NUMBER);
```

Parameters

Table 164-7 CREATE_TABLE_COST Procedure Parameters

| Parameter | Description |
|-----------------|---|
| tablespace_name | The tablespace in which the object will be created. The default is SYSTEM tablespace. |
| avg_row_size | The anticipated average row size in the table |
| colinfos | The description of the columns |
| row_count | The anticipated number of rows in the table |
| pct_free | The percentage of free space in each block for future expansion of existing rows due to updates |
| used_bytes | The space used by user data |
| alloc_bytes | The size of the object taking into account the tablespace extent characteristics |

Usage Notes

- The `used_bytes` represent the actual bytes used by the data. This includes the overhead due to the block metadata, `pctfree` etc.
- The `alloc_bytes` represent the size of the table when it is created in the tablespace. This takes into account, the size of the extents in the tablespace and tablespace extent management properties.

Examples

```
-- review the parameters
SELECT argument_name, data_type, type_owner, type_name
FROM all_arguments
WHERE object_name = 'CREATE_TABLE_COST'
AND overload = 2

-- examine the input parameter type
SELECT text
FROM dba_source
WHERE name = 'CREATE_TABLE_COST_COLUMNS';

-- drill down further into the input parameter type
SELECT text
FROM dba_source
WHERE name = 'create_table_cost_colinfo';

set serveroutput on

DECLARE
  ub NUMBER;
  ab NUMBER;
  c1 sys.create_table_cost_columns;
BEGIN
  c1 := sys.create_table_cost_columns( sys.create_table_cost_colinfo('NUMBER',10),
    sys.create_table_cost_colinfo('VARCHAR2',30),
    sys.create_table_cost_colinfo('VARCHAR2',30),
    sys.create_table_cost_colinfo('DATE',NULL));

  DBMS_SPACE.CREATE_TABLE_COST('SYSTEM',c1,100000,0,ub,ab);

  DBMS_OUTPUT.PUT_LINE('Used Bytes: ' || TO_CHAR(ub));
  DBMS_OUTPUT.PUT_LINE('Alloc Bytes: ' || TO_CHAR(ab));
END;
/
```

164.3.4 FREE_BLOCKS Procedure

This procedure returns information about free blocks in an object (table, index, or cluster).

See [SPACE_USAGE Procedures](#) for returning free block information in an auto segment space managed segment.

Syntax

```
DBMS_SPACE.FREE_BLOCKS (
  segment_owner  IN  VARCHAR2,
  segment_name   IN  VARCHAR2,
  segment_type   IN  VARCHAR2,
```

```
freelist_group_id IN NUMBER,
free_blks          OUT NUMBER,
scan_limit         IN NUMBER DEFAULT NULL,
partition_name    IN VARCHAR2 DEFAULT NULL);
```

Pragmas

```
pragma restrict_references(free_blocks,WNDS);
```

Parameters

Table 164-8 FREE_BLOCKS Procedure Parameters

| Parameter | Description |
|-------------------|--|
| segment_owner | Schema name of the segment to be analyzed |
| segment_name | Segment name of the segment to be analyzed |
| segment_type | Type of the segment to be analyzed (TABLE, INDEX, or CLUSTER): <ul style="list-style-type: none"> • TABLE • TABLE PARTITION • TABLE SUBPARTITION • INDEX • INDEX PARTITION • INDEX SUBPARTITION • CLUSTER • LOB • LOB PARTITION • LOB SUBPARTITION |
| freelist_group_id | Freelist group (instance) whose free list size is to be computed |
| free_blks | Returns count of free blocks for the specified group |
| scan_limit | Maximum number of free list blocks to read (optional). Use a scan limit of X you are interested only in the question, "Do I have X blocks on the free list?" |
| partition_name | Partition name of the segment to be analyzed. This is only used for partitioned tables. The name of subpartition should be used when partitioning is composite. |

Examples

The following uses the CLUS cluster in SCOTT schema with 4 freelist groups. It returns the number of blocks in freelist group 3 in CLUS.

```
DBMS_SPACE.FREE_BLOCKS('SCOTT', 'CLUS', 'CLUSTER', 3, :free_blocks);
```

Note:

An error is raised if `scan_limit` is not a positive number.

164.3.5 ISDATAFILEDROPPABLE_NAME Procedure

This procedure checks whether a datafile is droppable. This procedure may be called before actually dropping the file.

Syntax

```
DBMS_SPACE.ISDATAFILEDROPPABLE_NAME (
    filename    IN    VARCHAR2,
    value       OUT   NUMBER);
```

Pragmas

```
pragma restrict_references (free_blocks, WNDS);
```

Parameters

Table 164-9 ISDATAFILEDROPPABLE_NAME Procedure Parameters

| Parameter | Description |
|-----------|---|
| filename | Name of the file |
| value | Values: 0 if the file is not droppable, 1 if the file is droppable. |

Examples

```
DECLARE fname    VARCHAR2(100);  retval    NUMBER;
BEGIN  SELECT file_name INTO
fname FROM dba_data_files WHERE file_name like
'%empty%';
DBMS_SPACE.ISDATAFILEDROPPABLE_NAME (fname,
retval);
DBMS_OUTPUT.PUT_LINE (retval);
END;
```

164.3.6 OBJECT_DEPENDENT_SEGMENTS Function

This table function, given an object, returns the list of segments that are associated with the object.

Syntax

```
DBMS_SPACE.OBJECT_DEPENDENT_SEGMENTS (
    objowner    IN    VARCHAR2,
    objname     IN    VARCHAR2,
    partname    IN    VARCHAR2,
    objtype     IN    NUMBER)
RETURN dependent_segments_table PIPELINED;
```

Parameters

Table 164-10 OBJECT_DEPENDENT_SEGMENTS Function Parameters

| Parameter | Description |
|-----------|----------------------------------|
| objowner | The schema containing the object |
| objname | The name of the object |
| partname | The name of the partition |

Table 164-10 (Cont.) OBJECT_DEPENDENT_SEGMENTS Function Parameters

| Parameter | Description |
|-----------|---|
| objtype | Type of the object: <ul style="list-style-type: none"> • OBJECT_TYPE_TABLE constant positive := 1; • OBJECT_TYPE_NESTED_TABLE constant positive := 2; • OBJECT_TYPE_INDEX constant positive := 3; • OBJECT_TYPE_CLUSTER constant positive := 4; • OBJECT_TYPE_TABLE_PARTITION constant positive := 7; • OBJECT_TYPE_INDEX_PARTITION constant positive := 8; • OBJECT_TYPE_TABLE_SUBPARTITION constant positive := 9; • OBJECT_TYPE_INDEX_SUBPARTITION constant positive := 10; • OBJECT_TYPE_MV constant positive := 13; • OBJECT_TYPE_MVLOG constant positive := 14; |

Return Values

The content of one row of a dependent_segments_table:

```
TYPE object_dependent_segment IS RECORD (
  segment_owner      VARCHAR2(100),
  segment_name       VARCHAR2(100),
  segment_type        VARCHAR2(100),
  tablespace_name    VARCHAR2(100),
  partition_name      VARCHAR2(100),
  lob_column_name     VARCHAR2(100));
```

Table 164-11 OBJECT_DEPENDENT_SEGMENT Type Parameters

| Parameter | Description |
|-----------------|--|
| segment_owner | The schema containing the segment |
| segment_name | The name of the segment |
| segment_type | The type of the segment, such as table, index or LOB |
| tablespace_name | The name of the tablespace |
| partition_name | The name of the partition, if any |
| lob_column_name | The name of the LOB column, if any |

164.3.7 OBJECT_GROWTH_TREND Function

This is a table function. The output is one or more rows where each row describes the space usage of the object at a specific point in time.

Either the space usage totals will be retrieved from Automatic Workload Repository Facilities (AWRF), or the current space usage will be computed and combined with space usage deltas retrieved from AWRF.

Syntax

```
DBMS_SPACE.OBJECT_GROWTH_TREND (
    object_owner      IN   VARCHAR2,
    object_name       IN   VARCHAR2,
    object_type       IN   VARCHAR2,
    partition_name    IN   VARCHAR2 DEFAULT NULL,
    start_time        IN   TIMESTAMP DEFAULT NULL,
    end_time          IN   TIMESTAMP DEFAULT NULL,
    interval          IN   DSINTERVAL_UNCONSTRAINED DEFAULT NULL,
    skip_interpolated IN   VARCHAR2 DEFAULT 'FALSE',
    timeout_seconds   IN   NUMBER DEFAULT NULL,
    single_datapoint_flag IN VARCHAR2 DEFAULT 'TRUE')
RETURN object_growth_trend_table PIPELINED;
```

Parameters

Table 164-12 OBJECT_GROWTH_TREND Function Parameters

| Parameter | Description |
|------------------------|--|
| object_owner | The schema containing the object |
| object_name | The name of the object |
| object_type | The type of the object |
| partition_name | The name of the partition |
| start_time | Statistics generated after this time will be used in generating the growth trend |
| end_time | Statistics generated until this time will be used in generating the growth trend |
| interval | The interval at which to sample |
| skip_interpolated | Whether interpolation of missing values should be skipped |
| timeout_seconds | The time-out value for the function in seconds |
| single_data_point_flag | Whether in the absence of statistics the segment should be sampled |

Return Values

The `object_growth_trend_row` and `object_growth_trend_table` are used by the `OBJECT_GROWTH_TREND` table function to describe its output.

```
TYPE object_growth_trend_row IS RECORD(
    timepoint      TIMESTAMP,
    space_usage    NUMBER,
    space_alloc    NUMBER,
    quality        VARCHAR(20));
```

Table 164-13 OBJECT_GROWTH_TREND_ROW Type Parameters

| Parameter | Description |
|-------------|---|
| timepoint | The time at which the statistic was recorded |
| space_usage | The space used by data |
| space_alloc | The size of the segment including overhead and unused space |

Table 164-13 (Cont.) OBJECT_GROWTH_TREND_ROW Type Parameters

| Parameter | Description |
|-----------|---|
| quality | The quality of result: "GOOD", "INTERPOLATED", "PROJECTION" |

```
TYPE object_growth_trend_table IS TABLE OF object_growth_trend_row;
```

164.3.8 SPACE_USAGE Procedures

This procedure has two variations to show space usage.

The first form of the procedure shows the space usage of data blocks under the segment High Water Mark. You can calculate usage for LOBS, LOB PARTITIONS and LOB SUBPARTITIONS. This procedure can only be used on tablespaces that are created with auto segment space management. The bitmap blocks, segment header, and extent map blocks are not accounted for by this procedure. Note that this overload cannot be used on SECUREFILE LOBS.

Note:

For LOB segments, the number of blocks that is returned from `full_blocks` and `unformatted_blocks` is actually the number of chunks for the LOB segment.

The second form of the procedure returns information about SECUREFILE LOB space usage. It will return the amount of space in blocks being used by all the SECUREFILE LOBS in the LOB segment. The procedure displays the space actively used by the LOB column, freed space that has retention expired, and freed space that has retention unexpired. Note that this overload can be used only on SECUREFILE LOBS.

Syntax

```
DBMS_SPACE.SPACE_USAGE (
    segment_owner      IN  VARCHAR2,
    segment_name       IN  VARCHAR2,
    segment_type       IN  VARCHAR2,
    unformatted_blocks OUT NUMBER,
    unformatted_bytes  OUT NUMBER,
    fs1_blocks         OUT NUMBER,
    fs1_bytes          OUT NUMBER,
    fs2_blocks         OUT NUMBER,
    fs2_bytes          OUT NUMBER,
    fs3_blocks         OUT NUMBER,
    fs3_bytes          OUT NUMBER,
    fs4_blocks         OUT NUMBER,
    fs4_bytes          OUT NUMBER,
    full_blocks        OUT NUMBER,
    full_bytes         OUT NUMBER,
    partition_name     IN  VARCHAR2 DEFAULT NULL);
```

```
DBMS_SPACE.SPACE_USAGE (
    segment_owner      IN  VARCHAR2,
```

```

segment_name      IN   VARCHAR2,
segment_type      IN   VARCHAR2,
segment_size_blocks OUT  NUMBER,
segment_size_bytes OUT  NUMBER,
used_blocks       OUT  NUMBER,
used_bytes        OUT  NUMBER,
expired_blocks    OUT  NUMBER,
expired_bytes     OUT  NUMBER,
unexpired_blocks  OUT  NUMBER,
unexpired_bytes   OUT  NUMBER,
partition_name    IN   VARCHAR2 DEFAULT NULL);

```

Parameters

Table 164-14 SPACE_USAGE Procedure Parameters

| Parameter | Description |
|---------------------|--|
| segment_owner | Schema name of the segment to be analyzed |
| segment_name | Name of the segment to be analyzed |
| partition_name | Partition name of the segment to be analyzed |
| segment_type | Type of the segment to be analyzed (TABLE, INDEX, or CLUSTER): <ul style="list-style-type: none"> • TABLE • TABLE PARTITION • TABLE SUBPARTITION • INDEX • INDEX PARTITION • INDEX SUBPARTITION • CLUSTER • LOB • LOB PARTITION • LOB SUBPARTITION |
| unformatted_blocks | For LOB segments, the number of blocks that is returned from unformatted_blocks is actually the number of chunks for the LOB segment. |
| unformatted bytes | Total number of bytes unformatted |
| fs1_blocks | Number of blocks having at least 0 to 25% free space |
| fs1_bytes | Number of bytes having at least 0 to 25% free space |
| fs2_blocks | Number of blocks having at least 25 to 50% free space |
| fs2_bytes | Number of bytes having at least 25 to 50% free space |
| fs3_blocks | Number of blocks having at least 50 to 75% free space |
| fs3_bytes | Number of bytes having at least 50 to 75% free space |
| fs4_blocks | Number of blocks having at least 75 to 100% free space |
| fs4_bytes | Number of bytes having at least 75 to 100% free space |
| full_blocks | The number of blocks that is returned from full_blocks is actually the number of chunks for the LOB segment |
| full_bytes | Total number of bytes full in the segment |
| segment_size_blocks | Number of blocks allocated to the segment |
| segment_size_bytes | Number of bytes allocated to the segment |

Table 164-14 (Cont.) SPACE_USAGE Procedure Parameters

| Parameter | Description |
|------------------|---|
| used_blocks | Number blocks allocated to the LOB that contains active data |
| used_bytes | Number bytes allocated to the LOB that contains active data |
| expired_blocks | Number of expired blocks used by the LOB to keep version data |
| expired_bytes | Number of expired bytes used by the LOB to keep version data |
| unexpired_blocks | Number of unexpired blocks used by the LOB to keep version data |
| unexpired_bytes | Number of unexpired bytes used by the LOB to keep version data |
| partition_name | Name of the partition (NULL if not a partition) |

Examples

```
variable unf number;
variable unfb number;
variable fs1 number;
variable fs1b number;
variable fs2 number;
variable fs2b number;
variable fs3 number;
variable fs3b number;
variable fs4 number;
variable fs4b number;
variable full number;
variable fullb number;

begin
dbms_space.space_usage('U1','T',
                      'TABLE',
                      :unf, :unfb,
                      :fs1, :fs1b,
                      :fs2, :fs2b,
                      :fs3, :fs3b,
                      :fs4, :fs4b,
                      :full, :fullb);

end;
/
print unf ;
print unfb ;
print fs4 ;
print fs4b;
print fs3 ;
print fs3b;
print fs2 ;
print fs2b;
print fs1 ;
print fs1b;
print full;
print fullb;
```

164.3.9 UNUSED_SPACE Procedure

This procedure returns information about unused space in an object (table, index, or cluster).

Syntax

```
DBMS_SPACE.UNUSED_SPACE (
    segment_owner      IN VARCHAR2,
    segment_name       IN VARCHAR2,
    segment_type       IN VARCHAR2,
    total_blocks       OUT NUMBER,
    total_bytes        OUT NUMBER,
    unused_blocks      OUT NUMBER,
    unused_bytes       OUT NUMBER,
    last_used_extent_file_id OUT NUMBER,
    last_used_extent_block_id OUT NUMBER,
    last_used_block    OUT NUMBER,
    partition_name     IN VARCHAR2 DEFAULT NULL);
```

Parameters

Table 164-15 UNUSED_SPACE Procedure Parameters

| Parameter | Description |
|---------------------------|--|
| segment_owner | Schema name of the segment to be analyzed |
| segment_name | Segment name of the segment to be analyzed |
| segment_type | Type of the segment to be analyzed (TABLE, INDEX, or CLUSTER): <ul style="list-style-type: none"> • TABLE • TABLE PARTITION • TABLE SUBPARTITION • INDEX • INDEX PARTITION • INDEX SUBPARTITION • CLUSTER • LOB • LOB PARTITION • LOB SUBPARTITION |
| total_blocks | Returns total number of blocks in the segment |
| total_bytes | Returns total number of blocks in the segment, in bytes |
| unused_blocks | Returns number of blocks which are not used |
| unused_bytes | Returns, in bytes, number of blocks which are not used |
| last_used_extent_file_id | Returns the file ID of the last extent which contains data |
| last_used_extent_block_id | Returns the starting block ID of the last extent which contains data |
| last_used_block | Returns the last block within this extent which contains data |
| partition_name | Partition name of the segment to be analyzed. This is only used for partitioned tables; the name of subpartition should be used when partitioning is compose. |

Examples

The following declares the necessary bind variables and executes.

```
DBMS_SPACE.UNUSED_SPACE('SCOTT', 'EMP', 'TABLE', :total_blocks,  
    :total_bytes, :unused_blocks, :unused_bytes, :lastextf,  
    :last_extb, :lastusedblock);
```

DBMS_SPACE_ADMIN

The `DBMS_SPACE_ADMIN` package provides functionality for locally managed tablespaces.

This chapter contains the following topics:

- [Security Model](#)
- [Constants](#)
- [Operational Notes](#)
- [Summary of DBMS_SPACE_ADMIN Subprograms](#)

See Also:

Oracle Database Administrator's Guide for an example and description of using `DBMS_SPACE_ADMIN`.

165.1 DBMS_SPACE_ADMIN Security Model

This package runs with `SYS` privileges; therefore, any user who has privilege to execute the package can manipulate the bitmaps.

165.2 DBMS_SPACE_ADMIN Constants

The `DBMS_SPACE_ADMIN` package provides constants that can be used for specifying parameter values.

Table 165-1 DBMS_SPACE_ADMIN Constants

| Constant | Type | Value | Description |
|--|----------|-------|---|
| <code>SEGMENT_VERIFY_EXTENTS</code> | POSITIVE | 1 | Verifies that the space owned by segment is appropriately reflected in the bitmap as used |
| <code>SEGMENT_VERIFY_EXTENTS_GLOBAL</code> | POSITIVE | 2 | Verifies that the space owned by segment is appropriately reflected in the bitmap as used and that no other segment claims any of this space to be used by it |
| <code>SEGMENT_MARK_CORRUPT</code> | POSITIVE | 3 | Marks a temporary segment as corrupt whereby facilitating its elimination from the dictionary (without space reclamation) |

Table 165-1 (Cont.) DBMS_SPACE_ADMIN Constants

| Constant | Type | Value | Description |
|-----------------------------|----------|-------|--|
| SEGMENT_MARK_VALID | POSITIVE | 4 | Marks a corrupt temporary segment as valid. It is useful when the corruption in the segment extent map or elsewhere has been resolved and the segment can be dropped normally. |
| SEGMENT_DUMP_EXTENT_MAP | POSITIVE | 5 | Dumps the extent map for a given segment |
| TABLESPACE_VERIFY_BITMAP | POSITIVE | 6 | Verifies the bitmap of the tablespace with extent maps of the segments in that tablespace to make sure everything is consistent |
| TABLESPACE_EXTENT_MAKE_FREE | POSITIVE | 7 | Marks the block range (extent) as free in the bitmaps |
| TABLESPACE_EXTENT_MAKE_USED | POSITIVE | 8 | Marks the block range (extent) as used in the bitmaps |
| SEGMENT_VERIFY_BASIC | POSITIVE | 9 | Performs the basic metadata checks |
| SEGMENT_VERIFY_DEEP | POSITIVE | 10 | Performs deep verification |
| SEGMENT_VERIFY_SPECIFIC | POSITIVE | 11 | Performs a specific check for the segment |
| HWM_CHECK | POSITIVE | 12 | Checks high water mark (HWM) |
| BMB_CHECK | POSITIVE | 13 | Checks integrity among L1, L2 and L3 BMBs (Bit Map Blocks) |
| SEG_DICT_CHECK | POSITIVE | 14 | Checks consistency of segment header with corresponding SEG entry |
| EXTENT_TS_BITMAP_CHECK | POSITIVE | 15 | Checks whether the tablespace bitmaps corresponding to the extent map are marked used |
| DB_BACKPOINTER_CHECK | POSITIVE | 16 | Checks whether the L1 BMBs, L2 BMBs, L3 BMBs and data blocks point to the same parent segment |
| EXTENT_SEGMENT_BITMAP_CHECK | POSITIVE | 17 | Checks whether the bitmap blocks are consistent with the extent map |
| BITMAPS_CHECK | POSITIVE | 18 | Checks from the datablocks that the bitmap states representing the blocks are consistent |
| TS_VERIFY_BITMAPS | POSITIVE | 19 | Checks whether the tablespace bitmaps are consistent with the extents belonging to that tablespace |
| TS_VERIFY_DEEP | POSITIVE | 20 | Performs TS_VERIFY_BITMAPS and TS_VERIFY_SEGMENTS with DEEP option |
| TS_VERIFY_SEGMENTS | POSITIVE | 21 | Performs ASSM_SEGMENT_VERIFY on all segments in the tablespace, taking either the BASIC or the DEEP option |

Table 165-1 (Cont.) DBMS_SPACE_ADMIN Constants

| Constant | Type | Value | Description |
|------------------------------|----------|-------|-----------------------------------|
| SEGMENTS_DUMP_BITMAP_SUMMARY | POSITIVE | 27 | Dumps only bitmap block summaries |

165.3 DBMS_SPACE_ADMIN Operational Notes

Before migrating the `SYSTEM` tablespace, certain conditions must be met. These conditions are enforced by the `TABLESPACE_MIGRATE_TO_LOCAL` procedure, except for the cold backup.

- The database must have a default temporary tablespace that is not `SYSTEM`.
- Dictionary-managed tablespaces cannot have any rollback segments.
- A locally managed tablespace must have at least one online rollback segment. If you are using automatic undo management, then an undo tablespace must be online.
- All tablespaces—except the tablespace containing the rollback segment or the undo tablespace—must be read-only.
- You must have a cold backup of the database.
- The system must be in restricted mode.

165.4 Summary of DBMS_SPACE_ADMIN Subprograms

This table lists the `DBMS_SPACE_ADMIN` subprograms and briefly describes them.

Table 165-2 DBMS_SPACE_ADMIN Package Subprograms

| Subprogram | Description |
|--|---|
| ASSM_SEGMENT_VERIFY Procedure | Verifies segments created in ASSM (Automatic Segment-Space Management) tablespaces |
| ASSM_TABLESPACE_VERIFY Procedure | Verifies ASSM tablespaces |
| DROP_EMPTY_SEGMENTS Procedure | Drops segments from empty tables or table fragments and dependent objects |
| GET_SEGADV_ATTRIB Procedure | returns the values of attributes of <code>DBSM_SPACE_ADMIN</code> package |
| MATERIALIZER_DEFERRED_SEGMENTS Procedure | Materializes segments for tables and table fragments with deferred segment creation and their dependent objects |
| SEGMENT_CORRUPT Procedure | Marks the segment corrupt or valid so that appropriate error recovery can be done |
| SEGMENT_DROP_CORRUPT Procedure | Drops a segment currently marked corrupt (without reclaiming space) |
| SEGMENT_DUMP Procedure | Dumps the segment header and extent maps of a given segment |
| SEGMENT_VERIFY Procedure | Verifies the consistency of the extent map of the segment |

Table 165-2 (Cont.) DBMS_SPACE_ADMIN Package Subprograms

| Subprogram | Description |
|--|---|
| SET_SEGADV_ATTRIB Procedure | Sets/changes the values of attributes of DBSM_SPACE_ADMIN package |
| TABLESPACE_FIX_BITMAPS Procedure | Marks the appropriate block range (extent) as free or used in bitmap |
| TABLESPACE_FIX_SEGMENT_STAT ES Procedure | Fixes the state of the segments in a tablespace in which migration was aborted |
| TABLESPACE_MIGRATE_FROM_LOCAL Procedure | Migrates a locally managed tablespace to dictionary-managed tablespace |
| TABLESPACE_MIGRATE_TO_LOCAL Procedure | Migrates a tablespace from dictionary-managed format to locally managed format |
| TABLESPACE_REBUILD_BITMAPS Procedure | Rebuilds the appropriate bitmaps |
| TABLESPACE_REBUILD_QUOTAS Procedure | Rebuilds quotas for given tablespace |
| TABLESPACE_RELOCATE_BITMAPS Procedure | Relocates the bitmaps to the destination specified |
| TABLESPACE_VERIFY Procedure | Verifies that the bitmaps and extent maps for the segments in the tablespace are synchronized |

165.4.1 ASSM_SEGMENT_VERIFY Procedure

Given a segment definition, the procedure verifies the basic consistency of the space metadata blocks as well as consistency between space metadata and segment data blocks. This procedure verifies segments created in Automatic Segment Space Management (ASSM) tablespaces.

There is however a difference between basic verification and deep verification:

- Basic verification involves consistency checks of space metadata, such as integrity among level 1, level 2, level 3 bitmap blocks, consistency of segment extent map and level 1 bitmap ranges.
- Deep verification involves consistency checks between datablocks and space metadata blocks such as whether the datablocks point correctly to the parent level 1 bitmap blocks, and whether the freeness states in the datablocks are consistent with the freeness states of bits in level 1 bitmap blocks corresponding to the datablocks.

Syntax

```
DBMS_SPACE_ADMIN.ASSM_SEGMENT_VERIFY (
  segment_owner  IN VARCHAR2,
  segment_name   IN VARCHAR2,
  segment_type   IN VARCHAR2,
  partition_name IN VARCHAR2,
  verify_option  IN POSITIVE DEFAULT SEGMENT_VERIFY_BASIC,
  attrib         IN POSITIVE DEFAULT NULL);
```

Parameters

Table 165-3 ASSM_SEGMENT_VERIFY Procedure Parameters

| Parameter | Description |
|----------------|--|
| segment_owner | Schema that owns the segment |
| segment_name | Name of the segment to be verified |
| segment_type | Segment namespace is one of TABLE, TABLE PARTITION, TABLE SUBPARTITION, INDEX, INDEX PARTITION, INDEX SUBPARTITION, LOB, LOB PARTITION, LOB SUBPARTITION, CLUSTER |
| partition_name | Name of the partition or subpartition |
| verify_option | One of the following options: <ul style="list-style-type: none"> SEGMENT_VERIFY_BASIC := 9. Performs the basic metadata checks (Default) SEGMENT_VERIFY_DEEP := 10. Performs deep verification SEGMENT_VERIFY_SPECIFIC := 11. Performs a specific check for the segment |
| attrib | When option SEGMENT_VERIFY_SPECIFIC is specified as option, attrib can be one of the following: <ul style="list-style-type: none"> HWM_CHECK := 12. Checks whether high water mark information is accurate BMB_CHECK := 13. Checks whether space bitmap blocks have correct backpointers to the segment header SEG_DICT_CHECK := 14. Checks whether dictionary information for segment is accurate EXTENT_TS_BITMAP_CHECK := 15. Checks whether extent maps are consistent with file level bitmaps DB_BACKPOINTER_CHECK := 16. Checks whether datablocks have correct backpointers to the space metadata blocks EXTENT_SEGMENT_BITMAP_CHECK := 17. Checks whether extent map in the segment matches the bitmaps in the segment BITMAPS_CHECK := 18. Checks whether space bitmap blocks are accurate |

Usage Notes

- Using this procedure requires SYSDBA privileges.
- You can determine the relative file # and header block # (header_relative_file and header_block parameters) by querying DBA_SEGMENTS.
- This procedure outputs a dump file named sid_ora_process_ID.trc to the location specified in the USER_DUMP_DEST initialization parameter.

165.4.2 ASSM_TABLESPACE_VERIFY Procedure

This procedure verifies all the segments created in an ASSM tablespace. The verification for each segment performs basic consistency checks of the space metadata blocks as well as consistency checks between space metadata and segment data blocks.

Syntax

```
DBMS_SPACE_ADMIN.ASSM_TABLESPACE_VERIFY (
    tablespace_name  IN VARCHAR2,
    ts_option        IN POSITIVE,
    segment_option   IN POSITIVE DEFAULT NULL);
```

Parameters

Table 165-4 ASSM_TABLESPACE_VERIFY Procedure Parameters

| Parameter | Description |
|-----------------|---|
| tablespace_name | Name of the tablespace to verify. The tablespace must be an ASSM tablespace. |
| ts_option | <ul style="list-style-type: none"> TS_VERIFY_BITMAPS := 19. The bitmaps are verified against the extents. This detects bits that are marked used or free wrongly and detects multiple allocation of extents. The file metadata is validated against file\$ and control file. TS_VERIFY_DEEP := 20. This option is used to verify the file bitmaps as well perform checks on all the segments. TS_VERIFY_SEGMENTS := 21. This option is used to invoke SEGMENT_VERIFY on all the segments in the tablespace. Optionally you can write a script that queries all the segments in the tablespace and invoke SEGMENT_VERIFY. |
| segment_option | <p>When TS_VERIFY_SEGMENTS is specified, segment_option can be one of the following:</p> <ul style="list-style-type: none"> SEGMENT_VERIFY_BASIC := 9 SEGMENT_VERIFY_DEEP := 10 <p>The value of segment_option is NULL when TS_VERIFY_DEEP or TS_VERIFY_BITMAPS is specified.</p> |

Usage Notes

- Using this procedure requires SYSDBA privileges.
- This procedure outputs a dump file named `sid_ora_process_ID.trc` to the location specified in the `USER_DUMP_DEST` initialization parameter.

165.4.3 DROP_EMPTY_SEGMENTS Procedure

This procedure drops segments from empty tables or table fragments and dependent objects.

Syntax

```
DBMS_SPACE_ADMIN.DROP_EMPTY_SEGMENTS (  
  schema_name      IN      VARCHAR2  DEFAULT NULL,  
  table_name       IN      VARCHAR2  DEFAULT NULL,  
  partition_name   IN      VARCHAR2  DEFAULT NULL);
```

Parameters

Table 165-5 DROP_EMPTY_SEGMENTS Procedure Parameters

| Parameter | Description |
|----------------|-------------------|
| schema_name | Name of schema |
| table_name | Name of table |
| partition_name | Name of partition |

Usage Notes

Given a schema name, this procedure scans all tables in the schema. For each table, if the table or any of its fragments are found to be empty, and the table satisfies certain criteria (restrictions being the same as those described in "Restrictions on Deferred Segment Creation"), then the empty table fragment and associated index segments are dropped along with the corresponding LOB data and index segments. A subsequent insert creates segments with the same properties.

Optionally:

- No `schema_name` is specified, in which case tables belonging to all schemas are scanned
- Both `schema_name` and `table_name` are specified to perform the operation on a specified table
- All three arguments are supplied, restricting the operation to the partition and its dependent objects

165.4.4 GET_SEGADV_ATTRIB Procedure

This procedure returns the values of attributes of `DBMS_SPACE_ADMIN` package.

Syntax

```
DBMS_SPACE_ADMIN.GET_SEGADV_ATTRIB(  
  attribute IN NUMBER,  
  value     OUT NUMBER);
```

Parameters

Table 165-6 GET_SEGADV_ATTRIB Procedure Parameters

| Parameter | Description |
|-----------|---|
| attribute | Supported attributes: <ul style="list-style-type: none"> COMP_ADVISOR — Provides an option to enable or disable Compression Advisor for Automatic Segment Advisor. By default Compression Advisor is enabled for Automatic Segment Advisor. COMP_LOB — Provides an option to enable or disable Compression Advisor for the tables with LOB columns while Automatic Segment Advisor is running. By default Compression Advisor is enabled for tables with LOB columns. |
| value | Supported values: <ul style="list-style-type: none"> ATTR_ENABLE : 1 ATTR_DISABLE : 0 |

165.4.5 MATERIALIZE_DEFERRED_SEGMENTS Procedure

This procedure materializes segments for tables and table fragments with deferred segment creation and their dependent objects.

Syntax

```
DBMS_SPACE_ADMIN.MATERIALIZE_DEFERRED_SEGMENTS (
  schema_name      IN      VARCHAR2  DEFAULT NULL,
  table_name       IN      VARCHAR2  DEFAULT NULL,
  partition_name   IN      VARCHAR2  DEFAULT NULL);
```

Parameters

Table 165-7 MATERIALIZE_DEFERRED_SEGMENTS Procedure Parameters

| Parameter | Description |
|----------------|-------------------|
| schema_name | Name of schema |
| table_name | Name of table |
| partition_name | Name of partition |

Usage Notes

Given a schema name, this procedure scans all tables in the schema. For each table, if the deferred or delayed segment property is set for the table or any of its fragments, then a new segment is created for those fragments and their dependent objects.

Optionally:

- No `schema_name` is specified, in which case tables belonging to all schemas are scanned

- Both `schema_name` and `table_name` are specified to perform the operation on a specified table
- All three arguments are supplied, restricting the operation to the partition and its dependent objects

165.4.6 SEGMENT_CORRUPT Procedure

This procedure marks the segment corrupt or valid so that appropriate error recovery can be performed.

It cannot be used on the `SYSTEM` tablespace.

Syntax

```
DBMS_SPACE_ADMIN.SEGMENT_CORRUPT (
    tablespace_name      IN    VARCHAR2,
    header_relative_file IN    POSITIVE,
    header_block         IN    NUMBER,
    corrupt_option       IN    POSITIVE DEFAULT SEGMENT_MARK_CORRUPT);
```

Parameters

Table 165-8 SEGMENT_CORRUPT Procedure Parameters

| Parameter | Description |
|-----------------------------------|--|
| <code>tablespace_name</code> | Name of tablespace in which segment resides |
| <code>header_relative_file</code> | Relative file number of segment header |
| <code>header_block</code> | Block number of segment header |
| <code>corrupt_option</code> | <code>SEGMENT_MARK_CORRUPT</code> (default) or <code>SEGMENT_MARK_VALID</code> |

Usage Notes

You can determine the relative file number and block number (`header_relative_file` and `header_block` parameter) of the segment header block by querying `DBA_SEGMENTS`.

Examples

The following example marks the segment as corrupt:

```
EXECUTE DBMS_SPACE_ADMIN.SEGMENT_CORRUPT('USERS', 4, 33,
DBMS_SPACE_ADMIN.SEGMENT_MARK_CORRUPT);
```

Alternately, the next example marks a corrupt segment valid:

```
EXECUTE DBMS_SPACE_ADMIN.SEGMENT_CORRUPT('USERS', 4, 33,
DBMS_SPACE_ADMIN.SEGMENT_MARK_VALID);
```

165.4.7 SEGMENT_DROP_CORRUPT Procedure

This procedure drops a segment currently marked corrupt (without reclaiming space).

For this to work, the segment must be marked *temporary*. To mark a corrupt segment as temporary, issue a `DROP` command on the segment.

Syntax

```
DBMS_SPACE_ADMIN.SEGMENT_DROP_CORRUPT (
    tablespace_name      IN    VARCHAR2,
    header_relative_file IN    POSITIVE,
    header_block         IN    NUMBER);
```

Parameters

Table 165-9 SEGMENT_DROP_CORRUPT Procedure Parameters

| Parameter | Description |
|----------------------|---|
| tablespace_name | Name of tablespace in which segment resides |
| header_relative_file | Relative file number of segment header |
| header_block | Block number of segment header |

Usage Notes

- The space for the segment is not released, and it must be fixed by using the [TABLESPACE_FIX_BITMAPS Procedure](#) or the [TABLESPACE_REBUILD_BITMAPS Procedure](#).
- The procedure cannot be used on the SYSTEM tablespace.
- You can determine the relative file number and block number (header_relative_file and header_block parameter) of the segment header block by querying DBA_SEGMENTS.

Examples

```
EXECUTE DBMS_SPACE_ADMIN.SEGMENT_DROP_CORRUPT('USERS', 4, 33);
```

165.4.8 SEGMENT_DUMP Procedure

This procedure dumps the segment header and bitmap blocks of a specific segment to the location specified in the USER_DUMP_DEST initialization parameter.

Syntax

```
DBMS_SPACE_ADMIN.SEGMENT_DUMP (
    tablespace_name      IN    VARCHAR2,
    header_relative_file IN    POSITIVE,
    header_block         IN    NUMBER,
    dump_option          IN    POSITIVE DEFAULT SEGMENT_DUMP_EXTENT_MAP);
```

Parameters

Table 165-10 SEGMENT_DUMP Procedure Parameters

| Parameter | Description |
|----------------------|---|
| tablespace_name | Name of tablespace in which segment resides |
| header_relative_file | Relative file number of segment header |
| header_block | Block number of segment header |

Table 165-10 (Cont.) SEGMENT_DUMP Procedure Parameters

| Parameter | Description |
|-------------|--|
| dump_option | One of the following options: <ul style="list-style-type: none"> SEGMENT_DUMP_EXTENT_MAP SEGMENT_DUMP_BITMAP_SUMMARY |

Usage Notes

- You can produce a slightly abbreviated dump, which includes the segment header and bitmap block summaries, without percent-free states of each block if you pass SEGMENT_DUMP_BITMAP_SUMMARY as the dump_option parameter.
- You can determine the relative file number and block number (header_relative_file and header_block parameter) of the segment header block by querying DBA_SEGMENTS.HEADER_FILE. If HEADER_FILE is greater than 1023 then use DBA_DATA_FILES.RELATIVE_FNO.

Examples

```
EXECUTE DBMS_SPACE_ADMIN.SEGMENT_DUMP('USERS', 4, 33);
```

165.4.9 SEGMENT_VERIFY Procedure

This procedure checks the consistency of the segment extent map with the tablespace file bitmaps.

Syntax

```
DBMS_SPACE_ADMIN.SEGMENT_VERIFY (
    tablespace_name      IN    VARCHAR2,
    header_relative_file IN    POSITIVE,
    header_block         IN    NUMBER,
    verify_option        IN    POSITIVE DEFAULT SEGMENT_VERIFY_EXTENTS);
```

Parameters

Table 165-11 SEGMENT_VERIFY Procedure Parameters

| Parameters | Description |
|----------------------|---|
| tablespace_name | Name of tablespace in which segment resides |
| header_relative_file | Relative file number of segment header |
| header_block | Block number of segment header |
| verify_option | What kind of check to do: SEGMENT_VERIFY_EXTENTS or SEGMENT_VERIFY_EXTENTS_GLOBAL |

Usage Notes

- Anomalies are output as block range, bitmap-block, bitmap-block-range, anomaly-information, in the trace file for all block ranges found to have incorrect space representation. The kinds of problems which would be reported are free space not

considered free, used space considered free, and the same space considered used by multiple segments.

- You can determine the relative file number and block number (header_relative_file and header_block parameter) of the segment header block by querying DBA_SEGMENTS.

Examples

The following example verifies that the segment with segment header at relative file number 4, block number 33, has its extent maps and bitmaps synchronized.

```
EXECUTE DBMS_SPACE_ADMIN.SEGMENT_VERIFY('USERS', 4, 33,
DBMS_SPACE_ADMIN.SEGMENT_VERIFY_EXTENTS);
```

165.4.10 SET_SEGADV_ATTRIB Procedure

This procedure sets the values of attributes of DBMS_SPACE_ADMIN package.

Syntax

```
DBMS_SPACE_ADMIN.SET_SEGADV_ATTRIB (
    attribute IN NUMBER,
    value     IN NUMBER);
```

Parameters

Table 165-12 SET_SEGADV_ATTRIB Procedure Parameters

| Parameter | Description |
|-----------|---|
| attribute | Supported attributes: <ul style="list-style-type: none"> • COMP_ADVISOR — Provides an option to enable or disable Compression Advisor for Automatic Segment Advisor. By default Compression Advisor is enabled for Automatic Segment Advisor. • COMP_LOB — Provides an option to enable or disable Compression Advisor for the tables with LOB columns while Automatic Segment Advisor is running. By default Compression Advisor is enabled for tables with LOB columns. |
| value | Supported values: <ul style="list-style-type: none"> • ATTR_ENABLE : 1 • ATTR_DISABLE : 0 |

165.4.11 TABLESPACE_FIX_BITMAPS Procedure

This procedure marks the appropriate block range (extent) as free or used in bitmap. It cannot be used on the SYSTEM tablespace.

Syntax

```
DBMS_SPACE_ADMIN.TABLESPACE_FIX_BITMAPS (
    tablespace_name IN VARCHAR2,
    dbarange_relative_file IN POSITIVE,
    dbarange_begin_block IN POSITIVE,
```

```
dbarange_end_block    IN    POSITIVE,
fix_option            IN    POSITIVE);
```

Parameters

Table 165-13 TABLESPACE_FIX_BITMAPS Procedure Parameters

| Parameter | Description |
|------------------------|--|
| tablespace_name | Name of tablespace |
| dbarange_relative_file | Relative file number of block range (extent) |
| dbarange_begin_block | Block number of beginning of extent |
| dbarange_end_block | Block number (inclusive) of end of extent |
| fix_option | One of the following options: <ul style="list-style-type: none"> TABLESPACE_EXTENT_MAKE_FREE TABLESPACE_EXTENT_MAKE_USED |

Examples

The following example marks bits for 51 blocks for relative file number 4, beginning at block number 33 and ending at 83, as `USED` in bitmaps.

```
EXECUTE DBMS_SPACE_ADMIN.TABLESPACE_FIX_BITMAPS('USERS', 4, 33, 83,
DBMS_SPACE_ADMIN.EXTENT_MAKE_USED);
```

Alternatively, specifying an option of `TABLESPACE_EXTENT_MAKE_FREE` marks the bits free in bitmaps. The `BEGIN` and `END` blocks must be in extent boundary and be extent multiple; otherwise, an error is raised.

165.4.12 TABLESPACE_FIX_SEGMENT_STATES Procedure

This procedure fixes the state of the segments in a tablespace in which migration was aborted.

During tablespace migration to or from local, the segments are put in a transient state. If migration is aborted, then the segment states are corrected by `SMON` when event 10906 is set. A database with segments in such a transient state cannot be downgraded. The procedure can be used to fix the state of such segments.

Syntax

```
DBMS_SPACE_ADMIN.TABLESPACE_FIX_SEGMENT_STATES (
    tablespace_name    IN    VARCHAR);
```

Parameters

Table 165-14 TABLESPACE_FIX_SEGMENT_STATES Procedure Parameters

| Parameter Name | Description |
|-----------------|---|
| tablespace_name | Name of the tablespace whose segments must be fixed |

Usage Notes

The tablespace must be kept online and read/write when this procedure is called.

Examples

```
EXECUTE DBMS_SPACE_ADMIN.TABLESPACE_FIX_SEGMENT_STATES('TS1')
```

165.4.13 TABLESPACE_MIGRATE_FROM_LOCAL Procedure

This procedure migrates a locally managed tablespace to a dictionary-managed tablespace.

Syntax

```
DBMS_SPACE_ADMIN.TABLESPACE_MIGRATE_FROM_LOCAL (
    tablespace_name      IN      VARCHAR2);
```

Parameter

Table 165-15 TABLESPACE_MIGRATE_FROM_LOCAL Procedure Parameter

| Parameter | Description |
|-----------------|--------------------|
| tablespace_name | Name of tablespace |

Usage Notes

The tablespace must be kept online and read/write during migration. Migration of temporary tablespaces and migration of SYSTEM tablespaces are not supported.

Examples

```
EXECUTE DBMS_SPACE_ADMIN.TABLESPACE_MIGRATE_FROM_LOCAL('USERS');
```

165.4.14 TABLESPACE_MIGRATE_TO_LOCAL Procedure

This procedure migrates the tablespace from a dictionary-managed format to a locally managed format. Tablespaces migrated to locally managed format are user managed.

Syntax

```
DBMS_SPACE_ADMIN.TABLESPACE_MIGRATE_TO_LOCAL (
    tablespace_name      IN      VARCHAR2,
    unit_size            IN      POSITIVE DEFAULT NULL,
    rfno                 IN      POSITIVE DEFAULT NULL);
```

Parameters

Table 165-16 TABLESPACE_MIGRATE_TO_LOCAL Procedure Parameters

| Parameter Name | Description |
|-----------------|---------------------------------------|
| tablespace_name | Name of the tablespace to be migrated |

Table 165-16 (Cont.) TABLESPACE_MIGRATE_TO_LOCAL Procedure Parameters

| Parameter Name | Description |
|----------------|--|
| unit_size | Bitmap unit size (which is the size of the smallest possible chunk of space that can be allocated) in the tablespace specified in number of blocks |
| rfno | Relative File Number of the file where the bitmap blocks are placed |

Usage Notes

- Before you migrate the SYSTEM tablespace, migrate any dictionary-managed tablespaces that you want to use in read/write mode to locally managed. After the SYSTEM tablespace is migrated, you cannot change dictionary-managed tablespaces to read/write.

 **See Also:**
Oracle Database Administrator's Guide

- The tablespace must be kept online and read/write during migration. Note that temporary tablespaces cannot be migrated.
- Allocation Unit may be specified optionally. The default is calculated by the system based on the highest common divisor of all extents (used or free) for the tablespace. This number is further trimmed based on the MINIMUM EXTENT for the tablespace (5 if MINIMUM EXTENT is not specified). Thus, the calculated value will not be larger than the MINIMUM EXTENT for the tablespace. The last free extent in every file is ignored for GCD calculation. If you specify the unit size, then it must be a factor of the unit_size calculated by the system; otherwise an error message is returned.
- The Relative File Number parameter is used to place the bitmaps in a desired file. If space is not found in the file, then an error is issued. The data file specified must be part of the tablespace being migrated. If the dataflow is not specified, then the system chooses a dataflow in which to place the initial bitmap blocks. If space is not found for the initial bitmaps, then an error is raised.

Examples

To migrate a tablespace 'TS1' in 2KB blocksize with minimum extent size 1MB:

```
EXECUTE DBMS_SPACE_ADMIN.TABLESPACE_MIGRATE_TO_LOCAL('TS1', 512, 2);
```

The bitmaps are placed in file with relative file number 2.

165.4.15 TABLESPACE_REBUILD_BITMAPS Procedure

This procedure rebuilds the appropriate bitmaps. If no bitmap block is specified, then it rebuilds all bitmaps for the given tablespace.

The procedure cannot be used on the SYSTEM tablespace.

Syntax

```
DBMS_SPACE_ADMIN.TABLESPACE_REBUILD_BITMAPS (
    tablespace_name      IN    VARCHAR2,
    bitmap_relative_file IN    POSITIVE  DEFAULT NULL,
    bitmap_block         IN    POSITIVE  DEFAULT NULL);
```

Parameters

Table 165-17 TABLESPACE_REBUILD_BITMAPS Procedure Parameters

| Parameter | Description |
|----------------------|---|
| tablespace_name | Name of tablespace |
| bitmap_relative_file | Relative file number of bitmap block to rebuild |
| bitmap_block | Block number of bitmap block to rebuild |

Usage Notes

Only full rebuild is supported.

Examples

The following example rebuilds bitmaps for all the files in the `USERS` tablespace.

```
EXECUTE DBMS_SPACE_ADMIN.TABLESPACE_REBUILD_BITMAPS('USERS');
```

165.4.16 TABLESPACE_REBUILD_QUOTAS Procedure

This procedure rebuilds quotas for the given tablespace.

Syntax

```
DBMS_SPACE_ADMIN.TABLESPACE_REBUILD_QUOTAS (
    tablespace_name      IN    VARCHAR2);
```

Parameters

Table 165-18 TABLESPACE_REBUILD_QUOTAS Procedure Parameters

| Parameter | Description |
|-----------------|--------------------|
| tablespace_name | Name of tablespace |

Examples

```
EXECUTE DBMS_SPACE_ADMIN.TABLESPACE_REBUILD_QUOTAS('USERS');
```

165.4.17 TABLESPACE_RELOCATE_BITMAPS Procedure

This procedure relocates the bitmaps to the destination specified.

Syntax

```
DBMS_SPACE_ADMIN.TABLESPACE_RELOCATE_BITMAPS (  
    tablespace_name    IN    VARCHAR2,  
    filno              IN    POSITIVE,  
    blkno              IN    POSITIVE);
```

Parameters

Table 165-19 TABLESPACE_RELOCATE_BITMAPS Procedure Parameters

| Parameter Name | Description |
|-----------------|--|
| tablespace_name | Name of tablespace |
| filno | Relative File Number of the destination file |
| blkno | Block Number of the destination range |

Usage Notes

- Migration of a tablespace from dictionary-managed to locally managed format could result in the creation of `SPACE HEADER` segment that contains the bitmap blocks. The `SPACE HEADER` segment is treated as user data. If you explicitly resize a file at or below the space header segment, then an error is issued. Use the `TABLESPACE_RELOCATE_BITMAPS` command to move the control information to a different destination and then resize the file.
- This procedure cannot be used on the `SYSTEM` tablespace.
- The tablespace must be kept online and read/write during relocation of bitmaps. This can be done only on migrated locally managed tablespaces.

Examples

```
EXECUTE DBMS_SPACE_ADMIN.TABLESPACE_RELOCATE_BITMAPS('TS1', 3, 4);
```

Moves the bitmaps to file 3, block 4.

Note:

The source and the destination addresses must not overlap. The destination block number is rounded down to the unit boundary. If there is user data in that location, then an error is raised.

165.4.18 TABLESPACE_VERIFY Procedure

This procedure verifies that the bitmaps and extent maps for the segments in the tablespace are synchronized.

Syntax

```
DBMS_SPACE_ADMIN.TABLESPACE_VERIFY (  
    tablespace_name      IN    VARCHAR2,  
    verify_option        IN    POSITIVE DEFAULT TABLESPACE_VERIFY_BITMAP);
```

Parameters

Table 165-20 TABLESPACE_VERIFY Procedure Parameters

| Parameter | Description |
|-----------------|---|
| tablespace_name | Name of tablespace |
| verify_option | One option is supported: TABLESPACE_VERIFY_BITMAP |

Examples

```
EXECUTE DBMS_SPACE_ADMIN.TABLESPACE_VERIFY('USERS');
```

DBMS_SPD

The `DBMS_SPD` package provides subprograms for managing SQL plan directives (SPD).

This chapter contains the following topics:

- [Overview](#)
- [Security Model](#)
- [Views](#)
- [Summary of DBMS_SPD Subprograms](#)

See Also:

- [DBMS_STATS](#)
- *Oracle Database SQL Tuning Guide* regarding SQL plan directives

166.1 DBMS_SPD Overview

This package provides subprograms for managing SQL plan directives (SPD).

SPD are objects generated automatically by Oracle. For example, if Oracle detects that the single table cardinality estimated made by the optimizer is different from the actual number of rows returned when accessing the table, it will automatically create a directive to perform dynamic statistics for the table. When any SQL statement referencing the table is compiled, the optimizer will perform dynamic statistics for the table to get a more accurate estimate.

166.2 DBMS_SPD Security Model

`DBMS_SPD` is an invoker-rights package. The invoker requires `ADMINISTER SQL MANAGEMENT OBJECT` privilege for executing most of the subprograms in this package. Also, the subprograms commit the current transaction (if any), perform the operation, and then commit it again.

166.3 DBMS_SPD Views

The DBA view `DBA_SQL_PLAN_DIRECTIVES` shows all the directives created in the system and the view `DBA_SQL_PLAN_DIR_OBJECTS` displays the objects that are included in the directives.

166.4 Summary of DBMS_SPD Subprograms

This table lists and briefly describes the `DBMS_SPD` package subprograms.

Table 166-1 DBMS_SPD Package Subprograms

| Subprogram | Description |
|--|---|
| ALTER_SQL_PLAN_DIRECTIVE Procedure | Changes different attributes of a SQL plan directive |
| CREATE_STGTAB_DIRECTIVE Procedure | Creates a staging table into which to pack (export) SQL plan directives. |
| DROP_SQL_PLAN_DIRECTIVE Procedure | Drops a SQL plan directive |
| FLUSH_SQL_PLAN_DIRECTIVE Procedure | Allows for manual flushing of the SQL plan directives that are automatically recorded in SGA memory while executing SQL statements. |
| GET_PREFS Function | Gets the values for preferences for SQL plan directives |
| PACK_STGTAB_DIRECTIVE Function | Packs (exports) SQL plan directives into a staging table. |
| SET_PREFS Procedure | Allows the setting of different preferences for SQL plan directives |
| UNPACK_STGTAB_DIRECTIVE Function | Unpacks (imports) SQL plan directives from a staging table. |

166.4.1 ALTER_SQL_PLAN_DIRECTIVE Procedure

This procedure changes different attributes of a SQL plan directive.

Syntax

```
DBMS_SPD.ALTER_SQL_PLAN_DIRECTIVE (
    directive_id      IN      NUMBER,
    attribute_name    IN      VARCHAR2,
    attribute_value   IN      VARCHAR2);
```

Parameters

Table 166-2 ALTER_SQL_PLAN_DIRECTIVE Procedure Parameters

| Parameter | Description |
|-----------------|--|
| directive_id | SQL plan directive ID |
| attribute_name | <ul style="list-style-type: none"> ENABLED AUTO_DROP |
| attribute_value | <p>Possible values:</p> <ul style="list-style-type: none"> ENABLED: <ul style="list-style-type: none"> - If YES directive is enabled and may be used - If NO directive is not enabled and will not be used AUTO_DROP: <ul style="list-style-type: none"> - If YES directive will be dropped automatically if not used for SPD_RETENTION_WEEKS. This is the default behavior. - If NO directive will not be dropped automatically |

Exceptions

- ORA-38171 `INSUFFICIENT_PRIVILEGE`: The user does not have proper privilege to perform the operation.
- ORA-28104 `INVALID_INPUT`: The input value is not valid.
- ORA-13158 `OBJECT_DOES_NOT_EXIST`: The specified object does not exist.

Usage Notes

The `ADMINISTER SQL MANAGEMENT OBJECT` privilege is required to execute this procedure.

Examples

```
BEGIN
  DBMS_SPD.ALTER_SQL_PLAN_DIRECTIVE (12345, 'STATE', 'PERMANENT');
END;
```

166.4.2 CREATE_STGTAB_DIRECTIVE Procedure

This procedure creates a staging table into which to pack (export) SQL plan directives.

Syntax

```
DBMS_SPD.CREATE_STGTAB_DIRECTIVE (
  table_name          IN VARCHAR2,
  table_owner         IN VARCHAR2 := USER,
  tablespace_name     IN VARCHAR2 := NULL);
```

Parameters

Table 166-3 *CREATE_STGTAB_DIRECTIVE Procedure Parameters*

| Parameter | Description |
|------------------------------|---|
| <code>table_name</code> | Name of staging table |
| <code>table_owner</code> | Name of schema owner of staging table. Default is current schema. |
| <code>tablespace_name</code> | Name of tablespace. Default <code>NULL</code> means create staging table in the default tablespace: |

Exceptions

- ORA-38171 `INSUFFICIENT_PRIVILEGE`: The user does not have proper privilege to perform the operation.
- ORA-28104 `INVALID_INPUT`: The input value is not valid.
- ORA-44001 `INVALID_SCHEMA`: The input schema does not exist.
- ORA-13159 `TABLE_ALREADY_EXISTS`: The specified table already exists.
- ORA-29304 `TABLESPACE_MISSING`: The specified tablespace does not exist.

Usage Notes

The `ADMINISTER SQL MANAGEMENT OBJECT` privilege is required to execute this procedure.

166.4.3 DROP_SQL_PLAN_DIRECTIVE Procedure

This procedure drops a SQL plan directive.

Syntax

```
DBMS_SPD.DROP_SQL_PLAN_DIRECTIVE (  
    directive_id      IN      NUMBER);
```

Parameters

Table 166-4 *DROP_SQL_PLAN_DIRECTIVE Procedure Parameters*

| Parameter | Description |
|--------------|-----------------------|
| directive_id | SQL plan directive ID |

Exceptions

- ORA-38171 `INSUFFICIENT_PRIVILEGE`: The user does not have proper privilege to perform the operation.
- ORA-28104 `INVALID_INPUT`: The input value is not valid.
- ORA-13158 `OBJECT_DOES_NOT_EXIST`: The specified object does not exist.

Usage Notes

The `ADMINISTER SQL MANAGEMENT OBJECT` privilege is required to execute this procedure.

Examples

```
BEGIN  
    DBMS_SPD.DROP_SQL_PLAN_DIRECTIVE (12345);  
END;
```

166.4.4 FLUSH_SQL_PLAN_DIRECTIVE Procedure

This procedure allows for manual flushing of the SQL plan directives that are automatically recorded in SGA memory while executing SQL statements.

The information recorded in the SGA is periodically flushed by an Oracle background process. This procedure provides a way to flush the information manually.

Syntax

```
DBMS_SPD.FLUSH_SQL_PLAN_DIRECTIVE;
```

Exceptions

ORA-38171 `INSUFFICIENT_PRIVILEGE`: The user does not have proper privilege to perform the operation.

Usage Notes

The `ADMINISTER SQL MANAGEMENT OBJECT` privilege is required to execute this procedure.

Examples

```
BEGIN
  DBMS_SPD.FLUSH_SQL_PLAN_DIRECTIVE;
END;
```

166.4.5 GET_PREFS Function

This function returns the value for the specified preferences for SQL plan directives.

Syntax

```
DBMS_SPD.GET_PREFS (
  pname      IN  VARCHAR2)
RETURN VARCHAR2;
```

Parameters

Table 166-5 *GET_PREFS Function Parameters*

| Parameter | Description |
|-----------|---|
| pname | Preference name. The procedure supports the preference <code>SPD_RETENTION_WEEKS</code> . |

Return Values

Preference value

Exceptions

- ORA-38171 `INSUFFICIENT_PRIVILEGE`: The user does not have proper privilege to perform the operation.
- ORA-28104 `INVALID_INPUT`: The input value is not valid.

Usage Notes

- The `ADMINISTER SQL MANAGEMENT OBJECT` privilege is required to execute this procedure.
- `SPD_RETENTION_WEEKS` - SQL plan directives are purged if not used for more than the value set for this preference.

Examples

```
SELECT DBMS_SPD.GET_PREFS('SPD_RETENTION_WEEKS') FROM DUAL;
```

166.4.6 PACK_STGTAB_DIRECTIVE Function

This function packs (exports) SQL plan directives into a staging table.

Syntax

```
DBMS_SPD.PACK_STGTAB_DIRECTIVE (
    table_name      IN VARCHAR2,
    table_owner     IN VARCHAR2 := USER,
    directive_id    IN NUMBER    := NULL,
    obj_list        IN OBJECTTAB := NULL)
RETURN NUMBER
```

Parameters

Table 166-6 *PACK_STGTAB_DIRECTIVE* Function Parameters

| Parameter | Description |
|--------------|--|
| table_name | Name of staging table |
| table_owner | Name of schema owner of staging table. Default is current schema. |
| directive_id | SQL plan directive ID. Default NULL means all directives in the system. |
| obj_list | Used to filter the directives to be packed based on the objects used in directives. If obj_list is not NULL, a directive is packed only if all the objects in the directive exist in obj_list. |

Return Values

Number of SQL plan directives packed.

Exceptions

- ORA-38171 INSUFFICIENT_PRIVILEGE: The user does not have proper privilege to perform the operation.
- ORA-28104 INVALID_INPUT: The input value is not valid.
- ORA-44001 INVALID_SCHEMA: The input schema does not exist.
- ORA-29304 INVALID_STGTAB: The specified staging table is invalid or does not exist.
- ORA-13158 OBJECT_DOES_NOT_EXIST: The specified object does not exist.

Usage Notes

The ADMINISTER SQL MANAGEMENT OBJECT privilege is required to execute this procedure.

Examples

```
-- Pack all directives in the system
SELECT DBMS_SPD.PACK_STGTAB_DIRECTIVE('mydirtab') FROM DUAL;

SET SERVEROUTPUT ON;
```

```

-- Pack directives relevant to objects in SH schema
DECLARE
  my_list  DBMS_SPD.OBJECTTAB := DBMS_SPD.ObjectTab();
  dir_cnt  NUMBER;
BEGIN
  my_list.extend(1);
  my_list(1).owner := 'SH';           -- schema name
  my_list(1).object_name := NULL;     -- all tables in SH
  my_list(1).object_type := 'TABLE';  -- type of object

  dir_cnt :=
    DBMS_SPD.PACK_STGTAB_DIRECTIVE('mydirtab', obj_list => my_list);
  DBMS_OUTPUT.PUT_LINE('dir_cnt = ' || dir_cnt);
END;

-- Pack directives relevant to tables SALES and CUSTOMERS in SH schema
DECLARE
  my_list  DBMS_SPD.OBJECTTAB := DBMS_SPD.ObjectTab();
  dir_cnt  NUMBER;
BEGIN
  my_list.extend(2);

  -- SALES table
  my_list(1).owner := 'SH';
  my_list(1).object_name := 'SALES';
  my_list(1).object_type := 'TABLE';

  -- CUSTOMERS table
  my_list(2).owner := 'SH';
  my_list(2).object_name := 'CUSTOMERS';
  my_list(2).object_type := 'TABLE';

  dir_cnt :=
    DBMS_SPD.PACK_STGTAB_DIRECTIVE('mydirtab', obj_list => my_list);
  DBMS_OUTPUT.PUT_LINE('dir_cnt = ' || dir_cnt);
END;

```

166.4.7 SET_PREFS Procedure

This procedure allows the setting of different preferences for SQL plan directives.

Syntax

```

DBMS_SPD.SET_PREFS (
  pname      IN   VARCHAR2,
  pvalue     IN   VARCHAR2);

```

Parameters

Table 166-7 *SET_PREFS Procedure Parameters*

| Parameter | Description |
|-----------|---|
| pname | Preference name. The procedure supports the preference SPD_RETENTION_WEEKS. |

Table 166-7 (Cont.) SET_PREFS Procedure Parameters

| Parameter | Description |
|-----------|--|
| pvalue | <p>Preference value.</p> <ul style="list-style-type: none"> SPD_RETENTION_WEEKS: SQL plan directives are purged if not used for more than the value set for this preference. Default is 53 (SPD_RETENTION_WEEKS_DEFAULT) weeks, which means a directive is purged if it has been left unused for little over a year. It can be set to any value greater than or equal to 0. Also value NULL can be passed to set the preference to default. |

Exceptions

- ORA-38171 INSUFFICIENT_PRIVILEGE: The user does not have proper privilege to perform the operation.
- ORA-28104 INVALID_INPUT: The input value is not valid.

Usage Notes

- The ADMINISTER SQL MANAGEMENT OBJECT privilege is required to execute this procedure.
- SPD_RETENTION_WEEKS - SQL plan directives are purged if not used for more than the value set for this preference.

Examples

```
BEGIN
  DBMS_SPD.SET_PREFS('SPD_RETENTION_WEEKS', '4');
END;
```

166.4.8 UNPACK_STGTAB_DIRECTIVE Function

This procedure unpacks (imports) SQL plan directives from a staging table.

Syntax

```
DBMS_SPD.UNPACK_STGTAB_DIRECTIVE (
  table_name      IN VARCHAR2,
  table_owner     IN VARCHAR2 := USER,
  directive_id    IN NUMBER    := NULL,
  obj_list        IN OBJECTTAB := NULL)
RETURN NUMBER
```

Parameters

Table 166-8 UNPACK_STGTAB_DIRECTIVE Function Parameters

| Parameter | Description |
|-------------|---|
| table_name | Name of staging table |
| table_owner | Name of schema owner of staging table. Default is current schema. |

Table 166-8 (Cont.) UNPACK_STGTAB_DIRECTIVE Function Parameters

| Parameter | Description |
|--------------|--|
| directive_id | SQL plan directive ID. Default NULL means all directives in the system. |
| obj_list | Used to filter the directives to be unpacked based on the objects used in directives. If obj_list is not NULL, a directive is unpacked only if all the objects in the directive exist in obj_list. |

Return Values

Number of SQL plan directives unpacked.

Exceptions

- ORA-38171 INSUFFICIENT_PRIVILEGE: The user does not have proper privilege to perform the operation.
- ORA-28104 INVALID_INPUT: The input value is not valid.
- ORA-44001 INVALID_SCHEMA: The input schema does not exist.
- ORA-29304 INVALID_STGTAB: The specified staging table is invalid or does not exist.
- ORA-13158 OBJECT_DOES_NOT_EXIST: The specified object does not exist.

Usage Notes

The ADMINISTER SQL MANAGEMENT OBJECT privilege is required to execute this procedure.

Examples

```
-- Unack all directives in the staging table
SELECT DBMS_SPD.UNPACK_STGTAB_DIRECTIVE('mydirtab') FROM DUAL;

SET SERVEROUTPUT ON;
-- Unpack directives relevant to objects in SH schema
DECLARE
  my_list DBMS_SPD.OBJECTTAB := DBMS_SPD.ObjectTab();
  dir_cnt number;
BEGIN
  my_list.extend(1);
  my_list(1).owner := 'SH';           -- schema name
  my_list(1).object_name := null;     -- all tables in SH
  my_list(1).object_type := 'TABLE';  -- type of object

  dir_cnt :=
    DBMS_SPD.UNPACK_STGTAB_DIRECTIVE('mydirtab', obj_list => my_list);
  DBMS_OUTPUT.PUT_LINE('dir_cnt = ' || dir_cnt);
END;

-- Unpack directives relevant to tables SALES and CUSTOMERS in SH schema
DECLARE
  my_list DBMS_SPD.OBJECTTAB := DBMS_SPD.ObjectTab();
  dir_cnt NUMBER;
begin
  my_list.extend(2);
```

```
-- SALES table
my_list(1).owner := 'SH';
my_list(1).object_name := 'SALES';
my_list(1).object_type := 'TABLE';

-- CUSTOMERS table
my_list(2).owner := 'SH';
my_list(2).object_name := 'CUSTOMERS';
my_list(2).object_type := 'TABLE';

dir_cnt :=
  DBMS_SPD.UNPACK_STGTAB_DIRECTIVE('mydirtab', obj_list => my_list);
  DBMS_OUTPUT.PUT_LINE('dir_cnt = ' || dir_cnt);
END;
```

DBMS_SPM

The `DBMS_SPM` package supports the SQL plan management feature by providing an interface for the DBA or other user to perform controlled manipulation of plan history and SQL plan baselines maintained for various SQL statements.

This chapter contains the following topics:

- [Overview](#)
- [Security Model](#)
- [Constants](#)
- [Examples](#)
- [Data Structures](#)
- [Summary of DBMS_SPM Subprograms](#)

See Also:

For more information about "Using SQL Plan Management" in the *Oracle Database SQL Tuning Guide*

167.1 DBMS_SPM Overview

The `DBMS_SPM` package allows the user to manage SQL execution plans using SQL plan management.

SQL plan management prevents performance regressions resulting from sudden changes to the execution plan of a SQL statement by recording and evaluating the execution plans of SQL statements over time, and builds SQL plan baselines composed of a set of existing plans known to be efficient. The SQL plan baselines are then used to preserve performance of corresponding SQL statements, regardless of changes occurring in the system. Common usage scenarios where SQL plan management can improve or preserve SQL performance include:

- A database upgrade that installs a new optimizer version usually results in plan changes for a small percentage of SQL statements, with most of the plan changes resulting in either no performance change or improvement. However, certain plan changes may cause performance regressions. The use of SQL plan baselines significantly minimizes potential performance regressions resulting from a database upgrade.
- Ongoing system and data changes can impact plans for some SQL statements, potentially causing performance regressions. The use of SQL plan baselines helps to minimize performance regressions and stabilize SQL performance.
- Deployment of new application modules means introducing new SQL statements into the system. The application software may use appropriate SQL execution plans developed under a standard test configuration for the new SQL statements. If the system production

configuration differs significantly from the test configuration, SQL plan baselines can be evolved over time to produce better performance.

167.2 DBMS_SPM Security Model

The package is owned by `SYS`. The `EXECUTE` package privilege is required to execute its procedures. Any user granted the `ADMINISTER SQL MANAGEMENT OBJECT` privilege is able to execute the `DBMS_SPM` package.

167.3 DBMS_SPM Constants

The `DBMS_SPM` package provides constants that can be used for specifying parameter values.

These are shown in the following table. These constants are defined as standard input for the `time_limit` parameter of the `EVOLVE_SQL_PLAN_BASELINE` Function.

Table 167-1 DBMS_SPM Constants

| Constant | Type | Value | Description |
|-------------------------|----------------------|----------------------------|---|
| <code>AUTO_LIMIT</code> | <code>INTEGER</code> | <code>2147483647</code> | Oracle determines the appropriate time spent by the <code>EVOLVE_SQL_PLAN_BASELINE</code> Function. |
| <code>NO_LIMIT</code> | <code>INTEGER</code> | <code>2147483647 -1</code> | There is no limit to the time spent by the <code>EVOLVE_SQL_PLAN_BASELINE</code> Function. |

167.4 DBMS_SPM Examples

These examples will help you understand use of `DBMS_SPM`.

Detailed examples are located under the following topics:

- [Migrating Stored Outlines to SQL Plan Baselines](#)
- [Migrating Outlines to Utilize SQL Plan Management Features](#)
- [Migrating Outlines to Preserve Stored Outline Behavior](#)
- [Performing Follow-Up Tasks After Stored Outline Migration](#)

167.5 DBMS_SPM Data Structures

The `DBMS_SPM` package defines a `TABLE` type.

Table Types

- [DBMS_SPM NAMELIST Table Type](#)

167.5.1 DBMS_SPM NAMELIST Table Type

This type allows for a list of names as an input parameter.

Syntax

```
TYPE name_list IS TABLE OF VARCHAR2(30);
```

167.6 Summary of DBMS_SPM Subprograms

This table lists and briefly describes the DBMS_SPM package subprograms.

Table 167-2 DBMS_SPM Package Subprograms

| Subprogram | Description |
|--|--|
| ACCEPT_SQL_PLAN_BASELINE Procedure | Accepts a plan based on the recommendation of an evolve task |
| ALTER_SQL_PLAN_BASELINE Function | Changes an attribute of a single plan or all plans associated with a SQL statement using the attribute name/value format |
| CANCEL_EVOLVE_TASK Procedure | Cancels a currently executing evolve task |
| CONFIGURE Procedure | Sets configuration options for SQL management base, in parameter/value format |
| CREATE_EVOLVE_TASK Function | Creates an advisor task and sets its parameters |
| CREATE_STGTAB_BASELINE Procedure | Creates a staging table that used for transporting SQL plan baselines from one system to another |
| DROP_EVOLVE_TASK Procedure | Drops an evolved task |
| DROP_SQL_PLAN_BASELINE Function | Drops a single plan, or all plans associated with a SQL statement |
| EVOLVE_SQL_PLAN_BASELINE Function | Evolves SQL plan baselines associated with one or more SQL statements |
| EXECUTE_EVOLVE_TASK Function | Executes a previously created evolve task |
| IMPLEMENT_EVOLVE_TASK Function | Implements a plan based on the recommendation of an evolve task |
| INTERRUPT_EVOLVE_TASK Procedure | Interrupts a currently executing evolve task |
| LOAD_PLANS_FROM_CURSOR_CACHE Functions | Loads one or more plans present in the cursor cache for a SQL statement |
| LOAD_PLANS_FROM_AWR Function | Loads the SQL Management Base (SMB) with SQL plan baselines for a set of SQL statements using the plans from the AWR, and returns the number of plans loaded |
| LOAD_PLANS_FROM_SQLSET Function | Loads plans stored in a SQL tuning set (STS) into SQL plan baselines |
| MIGRATE_STORED_OUTLINES Functions | Migrates existing stored outlines to SQL plan baselines |

Table 167-2 (Cont.) DBMS_SPM Package Subprograms

| Subprogram | Description |
|---|--|
| PACK_STGTAB_BASELINE Function | Packs (exports) SQL plan baselines from SQL management base into a staging table |
| RESET_EVOLVE_TASK Procedure | Resets an evolve task to its initial state |
| RESUME_EVOLVE_TASK Procedure | Resumes a previously interrupted task |
| REPORT_AUTO_EVOLVE_TASK Function | Displays the results of an execution of an automatic evolve task. |
| REPORT_EVOLVE_TASK Function | Displays the results of an evolved task |
| SET_EVOLVE_TASK_PARAMETER Procedure | Sets a parameter of an evolve task |
| UNPACK_STGTAB_BASELINE Function | Unpacks (imports) SQL plan baselines from a staging table into SQL management base |

167.6.1 ACCEPT_SQL_PLAN_BASELINE Procedure

The procedure accepts a plan based on the recommendation of an evolve task.

Syntax

```
DBMS_SPM.ACCEPT_SQL_PLAN_BASELINE (
  task_name      IN  VARCHAR2,
  object_id      IN  NUMBER      := NULL,
  task_owner     IN  VARCHAR2    := NULL,
  force         IN  BOOLEAN      := FALSE);
```

Parameters

Table 167-3 ACCEPT_SQL_PLAN_BASELINE Procedure Parameters

| Parameter | Description |
|------------|--|
| task_name | Identifier of task to implement |
| object_id | Identifier of the advisor framework object that represents a single plan. If <code>NULL</code> , the report is generated for all objects. |
| task_owner | Owner of the evolve task. Defaults to the current schema owner. |
| force | Accept the plan even if the advisor did not recommend such an action. The default is <code>FALSE</code> requiring acceptance of the plan only if the plan is verified and shows sufficient improvement in benefit. |

167.6.2 ALTER_SQL_PLAN_BASELINE Function

This function changes an attribute of a single plan or all plans associated with a SQL statement using the attribute name/value format.

Syntax

```
DBMS_SPM.ALTER_SQL_PLAN_BASELINE (
    sql_handle      IN VARCHAR2 := NULL,
    plan_name       IN VARCHAR2 := NULL,
    attribute_name  IN VARCHAR2,
    attribute_value IN VARCHAR2)
RETURN PLS_INTEGER;
```

Parameters

Table 167-4 ALTER_SQL_PLAN_BASELINE Function Parameters

| Parameter | Description |
|-----------------|---|
| sql_handle | SQL statement handle. It identifies plans associated with a SQL statement for an attribute change. If NULL then plan_name must be specified. |
| plan_name | Plan name. It identifies a specific plan. Default NULL means set the attribute for all plans associated with a SQL statement identified by sql_handle. If NULL then sql_handle must be specified. |
| attribute_name | Name of plan attribute to set (see table below). |
| attribute_value | Value of plan attribute to use (see table below) |

Table 167-5 Names & Values for ALTER_SQL_PLAN_BASELINE Function Parameters

| Name | Description | Possible Values |
|-------------|---|-------------------------------|
| enabled | 'YES' means the plan is available for use by the optimizer. It may or may not be used depending on accepted status. | 'YES' or 'NO' |
| fixed | 'YES' means the SQL plan baseline is not evolved over time. A fixed plan takes precedence over a non-fixed plan. | 'YES' or 'NO' |
| autopurge | 'YES' means the plan is purged if it is not used for a time period. 'NO' means it is never purged. | 'YES' or 'NO' |
| plan_name | Name of the plan | String of up to 30 characters |
| description | Plan description. | String of up to 500 bytes |

Return Values

The number of plans altered.

Usage Notes

When a single plan is specified, one of various statuses, or plan name, or description can be altered. When all plans for a SQL statement are specified, one of various statuses, or description can be altered. This function can be called numerous times, each time setting a different plan attribute of same plan(s) or different plan(s).

167.6.3 CANCEL_EVOLVE_TASK Procedure

The procedure cancels a currently executing evolve task. All intermediate results are removed from the task.

Syntax

```
DBMS_SPM.CANCEL_EVOLVE_TASK (
    task_name          IN VARCHAR2);
```

Parameters

Table 167-6 CANCEL_EVOLVE_TASK Procedure Parameters

| Parameter | Description |
|-----------|------------------------------|
| task_name | Identifier of task to cancel |

167.6.4 CONFIGURE Procedure

This procedure sets configuration options for the SQL management base and for the maintenance of SQL plan baselines. You can call this function multiple times, setting a different configuration option each time.

Syntax

```
DBMS_SPM.CONFIGURE (
    parameter_name     IN VARCHAR2,
    parameter_value    IN VARCHAR2 := NULL,
    allow              IN BOOLEAN := TRUE);
```

Parameters

Table 167-7 CONFIGURE Procedure Parameters

| Parameter | Description |
|-----------------|--|
| parameter_name | Name of parameter to set (see table below). |
| parameter_value | Value of parameter to use (see table below). The maximum length of parameter_value is 1000 characters. |
| allow | Whether to include (true) or exclude (false) matching SQL statements and plans for the auto_capture_* parameters. If null, then the procedure ignores the specified parameter. |

Table 167-8 Names and Values for CONFIGURE Procedure Parameters

| Parameter Name | Description | Possible Values |
|----------------------------------|--|---|
| auto_capture_action | Action to include (=) or exclude (<>) for SQL plan management automatic capture, depending on whether allow is TRUE or FALSE. A null value removes the filter for parameter_name entirely. | Action name, for example, R% |
| auto_capture_module | Module to include (=) or exclude (<>) for SQL plan management auto capture, depending on whether allow is TRUE or FALSE. A null value removes the filter for parameter_name entirely. The database only uses this filter when OPTIMIZER_CAPTURE_SQL_PLAN_BASELINES is TRUE. | Module name, for example, LOGGER |
| auto_capture_parsing_schema_name | Parsing schema to include (=) or exclude (<>) for SQL plan management auto capture, depending on whether allow is TRUE or FALSE. A null value removes the filter for parameter_name entirely. The database only uses this filter when OPTIMIZER_CAPTURE_SQL_PLAN_BASELINES is TRUE. | Schema name, for example, HR |
| auto_capture_sql_text | Search pattern to apply to SQL text of LIKE or NOT LIKE, depending on whether allow is TRUE or FALSE. A null value removes the filter for parameter_name entirely. The database only uses this filter when OPTIMIZER_CAPTURE_SQL_PLAN_BASELINES is TRUE. | Text of a SQL statement, for example, SELECT a% |
| auto_spm_evolve_task | Setting to enable or disable the high-frequency SPM Evolve Advisor task. The high-frequency task runs every hour and runs for no longer than 30 minutes. These settings are not configurable. The frequent executions mean that the optimizer has more opportunities to find and evolve better performing plans. The default value is OFF, which means the high-frequency SPM Evolve Advisor task is disabled. In this release, AUTO is equivalent to OFF. The value of allow is ignored. Note: See <i>Oracle Database Licensing Information User Manual</i> for details on which features are supported for different editions and services. | ON, OFF, AUTO |
| plan_retention_weeks | Number of weeks to retain unused plans before the database purges them. A null value resets to the default value of 53 weeks, or 1 year plus 1 week. (This retains plans for annually executing queries.) The value of allow is ignored. | 5–523 (default is 53) |

Table 167-8 (Cont.) Names and Values for CONFIGURE Procedure Parameters

| Parameter Name | Description | Possible Values |
|----------------------|--|----------------------|
| space_budget_percent | Maximum percent of SYSAUX space that can be used for SQL management base. The database issues alerts when this amount is exceeded. A null value resets the percentage to the default value of 10%. The value of allow is ignored. | 1–50 (default is 10) |

Exceptions

Table 167-9 CONFIGURE Exceptions

| Error Number | Description |
|--------------|---------------------------------|
| ORA-38133 | Invalid parameter name |
| ORA-38134 | Invalid parameter value |
| ORA-38150 | Not enough space for new filter |
| ORA-38151 | Module name too long |
| ORA-38152 | Action name too long |
| ORA-38304 | Missing or invalid user name |

Usage Notes

- When `parameter_name` is `auto_capture_sql_text`, the `parameter_value` is an automatic search filter. The filter uses the search pattern of `LIKE parameter_name` when `allow=>>true`. The filter uses the pattern `NOT LIKE parameter_name` when `allow=>>false`.

For all other non-null `parameter_name` values, the search pattern depends on the `allow` setting. The parameter uses an equal sign (=) when `allow=>>true`. The parameter uses a not-equal sign (<>) when `allow=>>false`.
- You can configure multiple automatic capture parameters of different types. You cannot specify multiple values for the same parameter. Instead, the values specified for a particular parameter are combined. For example, specifying `auto_capture_sql_text` to be `'%TABLE1%'`, `TRUE`, and `'%TABLE2%'`, `FALSE` will result in matching SQL text `LIKE '%TABLE1%'` and `NOT LIKE '%TABLE2%'`. The database uses these configuration settings only when the initialization parameter `OPTIMIZER_CAPTURE_SQL_PLAN_BASELINES` is set to `TRUE`.
- A null value for `parameter_value` removes the filter for `parameter_name` entirely. By using `parameter_value=>''` in combination with `allow=FALSE`, you can filter out all values for a parameter, and then create a separate filter to include only specified values. The `DBA_SQL_MANAGEMENT_CONFIG` view shows the current filters.
- The default space budget for SQL management base is no more than ten percent of the size of `SYSAUX` tablespace. The space budget can be set to a maximum of 50%. The default unused plan retention period is one year and one week, which means a plan will be automatically purged if it has not been used for more than a

year. The retention period can be set to a maximum of 523 weeks (i.e. a little over 10 years).

- When the space occupied by SQL management base exceeds the defined space budget limit, a weekly database alert is generated.

Examples

The following example creates a filter for SQL text that is like `SELECT a%`:

```
EXEC DBMS_SPM.CONFIGURE('AUTO_CAPTURE_SQL_TEXT', 'select a%', 'TRUE');
```

The following example filters out the `HR` parsing schema:

```
EXEC DBMS_SPM.CONFIGURE('AUTO_CAPTURE_PARSING_SCHEMA_NAME', 'HR', 'FALSE');
```

The following example removes any existing filters for SQL text:

```
EXEC DBMS_SPM.CONFIGURE('AUTO_CAPTURE_SQL_TEXT', NULL, NULL);
```

The following example removes any `LIKE` or `NOT LIKE` filters for the SQL text `select a%`:

```
EXEC DBMS_SPM.CONFIGURE('AUTO_CAPTURE_SQL_TEXT', 'select a%', NULL);
```

The following example creates a filter with the predicate `(action LIKE 'R%') OR (action LIKE '%E_')`:

```
EXEC DBMS_SPM.CONFIGURE('AUTO_CAPTURE_ACTION', 'R%', 'TRUE');
EXEC DBMS_SPM.CONFIGURE('AUTO_CAPTURE_ACTION', '%E_', 'TRUE');
```

The following example creates a filter with the predicate `NOT(module LIKE 'LOGGER') AND NOT(module LIKE 'UTIL__')`:

```
EXEC DBMS_SPM.CONFIGURE('AUTO_CAPTURE_MODULE', 'LOGGER', 'FALSE');
EXEC DBMS_SPM.CONFIGURE('AUTO_CAPTURE_MODULE', 'UTIL__', 'FALSE');
```

167.6.5 CREATE_EVOLVE_TASK Function

The function has two overloads, both of which create an advisor task and sets its parameters. This version which takes a SQL handle creates an evolve task in order to evolve one or more plans for a given SQL statement.

Syntax

```
DBMS_SPM.CREATE_EVOLVE_TASK (
    sql_handle      IN  VARCHAR2  := NULL,
    plan_name      IN  VARCHAR2  := NULL,
    time_limit     IN  NUMBER     := DBMS_SPM.AUTO_LIMIT,
    task_name      IN  VARCHAR2  := NULL,
    description    IN  VARCHAR2  := NULL)
RETURN VARCHAR2;
```

```
DBMS_SPM.CREATE_EVOLVE_TASK (
    plan_list      IN  DBMS_SPM.NAME_LIST,
    time_limit     IN  NUMBER      := DBMS_SPM.AUTO_LIMIT,
    task_name      IN  VARCHAR2    := NULL,
    description    IN  VARCHAR2    := NULL)
RETURN VARCHAR2;
```

Parameters

Table 167-10 CREATE_EVOLVE_TASK Function Parameters

| Parameter | Description |
|-------------|--|
| sql_handle | Handle of a SQL statement. The default NULL considers all SQL statements with non-accepted plans. |
| plan_list | List of plan names. The plans may belong to different SQL statements. |
| plan_name | Plan identifier. The default NULL considers all non-accepted plans of the specified SQL handle or all SQL statements if the SQL handle is NULL. |
| time_limit | Time limit in number of minutes. The time limit is global and it is used in the following manner. The time limit for first non-accepted plan is equal to the input value. The time limit for the second non-accepted plan is equal to (input value - time spent in first plan verification) and so on. The default DBMS_SPM.AUTO_LIMIT means let the system choose an appropriate time limit based on the number of plan verifications required to be done. The value DBMS_SPM.NO_LIMIT means no time limit. |
| task_name | Evolve task name |
| description | Description of the task (maximum 256 characters) |

Return Values

SQL evolve task unique name

167.6.6 CREATE_STGTAB_BASELINE Procedure

This procedure creates a staging table used for transporting SQL plan baselines from one system to another.

Syntax

```
DBMS_SPM.CREATE_STGTAB_BASELINE (
    table_name      IN  VARCHAR2,
    table_owner     IN  VARCHAR2 := NULL,
    tablespace_name IN  VARCHAR2 := NULL);
```

Parameters

Table 167-11 CREATE_STGTAB_BASELINE Procedure Parameters

| Parameter | Description |
|-----------------|---|
| table_name | Name of staging table to create for the purpose of packing and unpacking SQL plan baselines |
| table_owner | Name of owner of the staging table. Default NULL means current schema is the table owner. |
| tablespace_name | Name of tablespace. Default NULL means create staging table in the default tablespace. |

Usage Notes

The creation of staging table is the first step. To migrate SQL plan baselines from one system to another, the user/DBA has to perform a series of steps as follows:

1. Create a staging table in the source system
2. Select SQL plan baselines in the source system and pack them into the staging table
3. Export staging table into a flat file using Oracle EXP utility or Data Pump
4. Transfer flat file to the target system
5. Import staging table from the flat file using Oracle IMP utility or Data Pump
6. Select SQL plan baselines from the staging table and unpack them into the target system

167.6.7 DROP_EVOLVE_TASK Procedure

The procedure drops an evolved task.

Syntax

```
DBMS_SPM.DROP_EVOLVE_TASK (
    task_name          IN VARCHAR2);
```

Parameters

Table 167-12 DROP_EVOLVE_TASK Procedure Parameters

| Parameter | Description |
|-----------|----------------------------|
| task_name | Identifier of task to drop |

167.6.8 DROP_SQL_PLAN_BASELINE Function

This function drops a single plan, or all plans associated with a SQL statement.

Syntax

```
DBMS_SPM.DROP_SQL_PLAN_BASELINE (
    sql_handle        IN VARCHAR2 := NULL,
    plan_name         IN VARCHAR2 := NULL)
RETURN PLS_INTEGER;
```

Parameters

Table 167-13 DROP_SQL_PLAN_BASELINE Function Parameters

| Parameter | Description |
|------------|---|
| sql_handle | SQL statement handle. It identifies plans associated with a SQL statement that are to be dropped. If NULL then plan_name must be specified. |
| plan_name | Plan name. It identifies a specific plan. Default NULL means to drop all plans associated with the SQL statement identified by sql_handle. |

Return Values

The number of plans dropped

167.6.9 EVOLVE_SQL_PLAN_BASELINE Function

This function evolves SQL plan baselines associated with one or more SQL statements. A SQL plan baseline is evolved when one or more of its non-accepted plans is changed to an accepted plan or plans.

If interrogated by the user (parameter `verify = 'YES'`), the execution performance of each non-accepted plan is compared against the performance of a plan chosen from the associated SQL plan baseline. If the non-accepted plan performance is found to be better than SQL plan baseline performance, the non-accepted plan is changed to an accepted plan provided such action is permitted by the user (parameter `commit = 'YES'`).

The second form of the function employs a plan list format.

Syntax

```
DBMS_SPM.EVOLVE_SQL_PLAN_BASELINE (
  sql_handle   IN VARCHAR2 := NULL,
  plan_name    IN VARCHAR2 := NULL,
  time_limit   IN INTEGER   := DBMS_SPM.AUTO_LIMIT,
  verify       IN VARCHAR2 := 'YES',
  commit       IN VARCHAR2 := 'YES')
RETURN CLOB;

DBMS_SPM.EVOLVE_SQL_PLAN_BASELINE (
  plan_list    IN DBMS_SPM.NAME_LIST,
  time_limit   IN INTEGER   := DBMS_SPM.AUTO_LIMIT,
  verify       IN VARCHAR2 := 'YES',
  commit       IN VARCHAR2 := 'YES')
RETURN CLOB;
```

Parameters

Table 167-14 EVOLVE_SQL_PLAN_BASELINE Function Parameters

| Parameter | Description |
|------------|--|
| sql_handle | SQL statement identifier. Unless <code>plan_name</code> is specified, NULL means to consider all statements with non-accepted plans in their SQL plan baselines. |
| plan_name | Plan identifier. Default NULL means to consider all non-accepted plans in the SQL plan baseline of either the identified SQL statement or all SQL statements if <code>sql_handle</code> is NULL. |
| plan_list | A list of plan names. Each plan in the list can belong to same or different SQL statement. |
| time_limit | Time limit in number of minutes. This applies only if <code>verify = 'YES'</code> . The time limit is global and it is used as follows: The time limit for first non-accepted plan verification is set equal to the input value; the time limit for second non-accepted plan verification is set equal to (input value - time spent in first plan verification); and so on. <ul style="list-style-type: none"> DBMS_SPM.AUTO_LIMIT (Default) lets the system choose an appropriate time limit based on the number of plan verifications required to be done. DBMS_SPM.NO_LIMIT means there is no time limit. A positive integer value represents a user specified time limit. |
| verify | Specifies whether to execute the plans and compare the performance before changing non-accepted plans into accepted plans. A performance verification involves executing a non-accepted plan and a plan chosen from corresponding SQL plan baseline and comparing their performance statistics. If non-accepted plan shows performance improvement, it is changed to an accepted plan. <ul style="list-style-type: none"> 'YES' (Default) - verifies that a non-accepted plan gives better performance before changing it to an accepted plan 'NO' - directs not to execute plans but only to change non-accepted plans into accepted plans |
| commit | Specifies whether to update the ACCEPTED status of non-accepted plans from 'NO' to 'YES'. <ul style="list-style-type: none"> 'YES' (Default) - perform updates of qualifying non-accepted plans and generate a report that shows the updates and the result of performance verification when <code>verify = 'YES'</code>. 'NO' - generate a report without any updates. Note that <code>commit = 'NO'</code> together with <code>verify = 'NO'</code> represents a no-op. |

Return Values

A CLOB containing a formatted text report showing non-accepted plans in sequence, each with a possible change of its ACCEPTED status, and if `verify = 'YES'` the result of their performance verification.

Usage Notes

Invoking this subprogram requires the ADMINISTER SQL MANAGEMENT OBJECT privilege.

167.6.10 EXECUTE_EVOLVE_TASK Function

The function executes a previously created evolve task.

Syntax

```
DBMS_SPM.EXECUTE_EVOLVE_TASK (
    task_name      IN VARCHAR2,
    execution_name IN VARCHAR2 := NULL,
    execution_desc IN VARCHAR2 := NULL);
RETURN VARCHAR2;
```

Parameters

Table 167-15 EXECUTE_EVOLVE_TASK Function Parameters

| Parameter | Description |
|----------------|---|
| task_name | Evolve task name |
| execution_name | Name to qualify and identify an execution. If not specified, it is generated by the advisor and returned by the function. |
| execution_desc | Description of the execution (maximum 256 characters) |

Return Values

Name of the new execution

167.6.11 IMPLEMENT_EVOLVE_TASK Function

The function implements all the actions recommended by an evolve task.

Syntax

```
DBMS_SPM.IMPLEMENT_EVOLVE_TASK (
    task_name      IN VARCHAR2,
    task_owner     IN VARCHAR2 := NULL,
    execution_name IN VARCHAR2 := NULL,
    force          IN BOOLEAN   := FALSE)
RETURN NUMBER;
```

Parameters

Table 167-16 IMPLEMENT_EVOLVE_TASK Function Parameters

| Parameter | Description |
|----------------|---|
| task_name | Identifier of task to report |
| task_owner | Owner of the evolve task. Defaults to the current schema owner. |
| execution_name | Name to qualify and identify an execution. If NULL, the action will be taken for the last task execution. |

Table 167-16 (Cont.) IMPLEMENT_EVOLVE_TASK Function Parameters

| Parameter | Description |
|-----------|---|
| force | Accept all plans even if the advisor did not recommend such an action. The default is <code>FALSE</code> requiring acceptance of the plan only if the plan is verified and shows sufficient improvement in benefit. |

Return Values

The number of plans accepted

167.6.12 INTERRUPT_EVOLVE_TASK Procedure

The procedure interrupts a currently executing evolve task. The task ends its operations as at a normal exit and the user can access the intermediate results. The task can be resumed later.

Syntax

```
DBMS_SPM.INTERRUPT_EVOLVE_TASK (
    task_name          IN  VARCHAR2);
```

Parameters**Table 167-17 INTERRUPT_EVOLVE_TASK Procedure Parameters**

| Parameter | Description |
|-----------|---------------------------------|
| task_name | Identifier of task to interrupt |

167.6.13 LOAD_PLANS_FROM_AWR Function

This function loads the SQL Management Base (SMB) with SQL plan baselines for a set of SQL statements using the plans from the AWR, and returns the number of plans loaded.

Syntax

```
DBMS_SPM.LOAD_PLANS_FROM_AWR
    begin_snap      IN  NUMBER,
    end_snap        IN  NUMBER,
    basic_filter    IN  VARCHAR2 := NULL,
    fixed           IN  VARCHAR2 := 'NO',
    enabled         IN  VARCHAR2 := 'YES',
    commit_rows     IN  NUMBER := 1000)
RETURN PLS_INTEGER;
```

Parameters

Table 167-18 LOAD_PLANS_FROM_AWR Function Parameters

| Parameter | Description |
|--------------|---|
| begin_snap | Begin snapshot |
| end_snap | End snapshot |
| basic_filter | SQL predicate to filter the SQL from AWR. NULL means all plans in AWR are selected. Specifies the SQL predicate that filters the SQL from the shared SQL area defined on attributes of the SQLSET_ROW. |
| fixed | Default 'NO' means the loaded plans will not change the current 'fixed' property of the SQL plan baseline into which they are loaded. |
| enabled | Default 'YES' means the loaded plans will be considered by the optimizer |
| commit_rows | Number of SQL plans to load before doing a periodic commit. |
| dbid | The DBID that is used for imported or PDB-level AWR data. |

Usage Notes

Requires the `Administer SQL Management Object` privilege

See Also:

For information on the `SQLSET_ROW` objects, see [SQLSET_ROW Object Type](#).

167.6.14 LOAD_PLANS_FROM_CURSOR_CACHE Functions

This function loads one or more plans present in the cursor cache for a SQL statement, or a set of SQL statements. It has four overloads: using SQL statement text, using SQL handle, using SQL ID, or using `attribute_name` and `attribute_value` pair.

Syntax

```
DBMS_SPM.LOAD_PLANS_FROM_CURSOR_CACHE (
  sql_id          IN VARCHAR2,
  plan_hash_value IN NUMBER   := NULL,
  sql_text        IN CLOB,
  fixed           IN VARCHAR2 := 'NO',
  enabled         IN VARCHAR2 := 'YES')
RETURN PLS_INTEGER;
```

```
DBMS_SPM.LOAD_PLANS_FROM_CURSOR_CACHE (
  sql_id          IN VARCHAR2,
  plan_hash_value IN NUMBER   := NULL,
```

```

    sql_handle      IN VARCHAR2,
    fixed           IN VARCHAR2 := 'NO',
    enabled         IN VARCHAR2 := 'YES')
RETURN PLS_INTEGER;

DBMS_SPM.LOAD_PLANS_FROM_CURSOR_CACHE (
    sql_id          IN VARCHAR2,
    plan_hash_value IN NUMBER   := NULL,
    fixed           IN VARCHAR2 := 'NO',
    enabled         IN VARCHAR2 := 'YES')
RETURN PLS_INTEGER;

DBMS_SPM.LOAD_PLANS_FROM_CURSOR_CACHE (
    attribute_name IN VARCHAR2,
    attribute_value IN VARCHAR2,
    fixed           IN VARCHAR2 := 'NO',
    enabled         IN VARCHAR2 := 'YES')
RETURN PLS_INTEGER;

```

Parameters

Table 167-19 LOAD_PLANS_FROM_CURSOR_CACHE Function Parameters

| Parameter | Description |
|-----------------|---|
| sql_id | SQL statement identifier. Identifies a SQL statement in the cursor cache. Note: In the third overload the text of identified SQL statement is extracted from cursor cache and is used to identify the SQL plan baseline into which the plan(s) are loaded. If the SQL plan baseline doesn't exist it is created. |
| plan_hash_value | Plan identifier. Default NULL means capture all plans present in the cursor cache for the SQL statement identified by SQL_ID. |
| sql_text | SQL text to use in identifying the SQL plan baseline into which the plans are loaded. If the SQL plan baseline does not exist, it is created. The use of text is crucial when the user tunes a SQL statement by adding hints to its text and then wants to load the resulting plan(s) into the SQL plan baseline of the original SQL statement. |
| sql_handle | SQL handle to use in identifying the SQL plan baseline into which the plans are loaded. The sql_handle must denote an existing SQL plan baseline. The use of handle is crucial when the user tunes a SQL statement by adding hints to its text and then wants to load the resulting plan(s) into the SQL plan baseline of the original SQL statement. |
| fixed | Default 'NO' means the loaded plans are used as non-fixed plans. Value 'YES' means the loaded plans are used as fixed plans and the SQL plan baseline will not be evolved over time. |
| attribute_name | One of possible attribute names: <ul style="list-style-type: none"> • SQL_TEXT" • 'PARSING_SCHEMA_NAME' • 'MODULE' • 'ACTION' |

Table 167-19 (Cont.) LOAD_PLANS_FROM_CURSOR_CACHE Function Parameters

| Parameter | Description |
|-----------------|--|
| attribute_value | Attribute value is used as a search pattern of LIKE predicate if attribute name is 'SQL_TEXT'. Otherwise, it is used as an equality search value. (for example, for specifying attribute_name => 'SQL_TEXT', and attribute_value => '% HR-123 %' means applying SQL_TEXT LIKE '% HR-123 %' as a selection filter. Similarly, specifying attribute_name => 'MODULE', and attribute_value => 'HR' means applying 'MODULE = 'HR' as a plan selection filter). The attribute value is upper-cased except when it is enclosed in double quotes or attribute name is 'SQL_TEXT'. |
| enabled | Default 'YES' means the loaded plans are enabled for use by the optimizer |

Return Values

Number of plans loaded

Usage Notes

Invoking this subprogram requires the ADMINISTER SQL MANAGEMENT OBJECT privilege.

167.6.15 LOAD_PLANS_FROM_SQLSET Function

This function loads plans stored in a SQL tuning set (STS) into SQL plan baselines. The plans loaded from STS are not verified for performance but added as accepted plans to existing or new SQL plan baselines. This function can be used to seed SQL management base with new SQL plan baselines.

Syntax

```
DBMS_SPM.LOAD_PLANS_FROM_SQLSET (
    sqlset_name      IN  VARCHAR2,
    sqlset_owner     IN  VARCHAR2 := NULL,
    basic_filter     IN  VARCHAR2 := NULL,
    fixed            IN  VARCHAR2 := 'NO',
    enabled          IN  VARCHAR2 := 'YES'
    commit_rows     IN  NUMBER   := 1000)
RETURN PLS_INTEGER;
```

Parameters

Table 167-20 LOAD_PLANS_FROM_SQLSET Function Parameters

| Parameter | Description |
|--------------|---|
| sqlset_name | Name of the STS from where the plans are loaded into SQL plan baselines |
| sqlset_owner | Owner of STS. NULL means current schema is the owner. |

Table 167-20 (Cont.) LOAD_PLANS_FROM_SQLSET Function Parameters

| Parameter | Description |
|---------------------------|--|
| <code>basic_filter</code> | A filter applied to the STS to select only qualifying plans to be loaded. The filter can take the form of any <code>WHERE</code> clause predicate that can specified against the view <code>DBA_SQLSET_STATEMENTS</code> . For example <code>basic_filter => 'sql_text like 'select /*LOAD_STS*/%'</code> or <code>basic_filter => 'sql_id='b62q7nc33gzwx''</code> . |
| <code>fixed</code> | Default 'NO' means the loaded plans are used as non-fixed plans. Value 'YES' means the loaded plans are used as fixed plans and the SQL plan baseline will not be evolved over time. |
| <code>enabled</code> | Default 'YES' means the loaded plans are enabled for use by the optimizer |
| <code>commit_rows</code> | Number of SQL plans to load before doing a periodic commit. This helps to shorten the undo log. |

Return Values

The number of plans loaded

Usage Notes

- To load plans from a remote system, first load the plans into an STS on the remote system, export/import the STS from remote to local system, and then use this function.
- To load plans from Automatic Workload Repository (AWR), first load the plans stored in AWR snapshots into an STS, and then use this procedure.
- The user can also capture plans resident in the cursor cache for one or more SQL statements into an STS, and then use this procedure.

167.6.16 MIGRATE_STORED_OUTLINE Functions

This function migrates stored outlines for one or more SQL statements to plan baselines in the SQL management base (SMB). Users can specify which stored outline(s) to be migrated based on outline name, SQL text, or outline category, or migrate all stored outlines in the system to SQL plan baselines.

This second overload of the function migrates stored outlines for one or more SQL statements to plan baselines in the SQL management base (SMB) given one or more outline names.

Syntax

```
DBMS_SPM.MIGRATE_STORED_OUTLINE (
  attribute_name      IN  VARCHAR2,
  attribute_value     IN  CLOB,
  fixed               IN  VARCHAR2 := 'NO')
RETURN CLOB;
```

```
DBMS_SPM.MIGRATE_STORED_OUTLINE (
  outln_list         IN  DBMS_SPM.NAME_LIST,
  fixed              IN  VARCHAR2 := 'NO')
RETURN CLOB;
```

Parameters

Table 167-21 MIGRATE_STORED_OUTLINE Function Parameters

| Parameter | Description |
|------------------------------|---|
| <code>attribute_name</code> | Specifies the type of parameter used in <code>attribute_value</code> to identify the migrated stored outlines. It is case insensitive. Possible values: <ul style="list-style-type: none"> <code>outline_name</code> <code>sql_text</code> <code>category</code> <code>all</code> |
| <code>attribute_value</code> | Based on <code>attribute_name</code> , this can be: <ul style="list-style-type: none"> Name of stored outline to be migrated SQL text of stored outlines to be migrated Category of stored outlines to be migrated NULL if <code>attribute_name</code> is <code>all</code> |
| <code>fixed</code> | NO (default) or YES. Specifies the "fixed" status of the plans generated during migration. By default, plans are generated as "non-fixed" plans. |
| <code>outln_list</code> | List of outline names to be migrated |

Return Values

A CLOB containing a formatted report to describe the statistics during the migration, including:

- Number of stored outlines successfully migrated
- Number of stored outlines (and also the corresponding outline names) failed to be migrated and the reasons for the failure

Usage Note

- When the user specifies an outline name, the function migrates stored outlines to plan baseline based on given outline name, which uniquely identifies a single stored outline to be migrated.
- When the user specifies SQL text, the function migrates all stored outlines created for a given SQL statement. A single SQL statement can have multiple stored outlines created for it under different category names. One plan baseline plan is created for each stored outline. The new plan baselines have category names set to `DEFAULT`. The module name of a plan baseline is set to be the same as the stored outline.
- When the user specifies a category name, the function migrates all stored outlines with the given category name. Only one stored outline exists per category per SQL statement. One plan baseline is created for each stored outline.
- When user specifies to migrate `all`, the function migrates all stored outlines in the system to plan baselines. One plan baseline is created for each stored outline.

167.6.17 PACK_STGTAB_BASELINE Function

This function packs (exports) SQL plan baselines from SQL management base into a staging table.

Syntax

```
DBMS_SPM.PACK_STGTAB_BASELINE (
  table_name      IN VARCHAR2,
  table_owner     IN VARCHAR2 := NULL,
  sql_handle      IN VARCHAR2 := NULL,
  plan_name       IN VARCHAR2 := NULL,
  sql_text        IN CLOB      := NULL,
  creator         IN VARCHAR2 := NULL,  origin          IN VARCHAR2 := NULL,
  enabled         IN VARCHAR2 := NULL,
  accepted        IN VARCHAR2 := NULL,
  fixed           IN VARCHAR2 := NULL,
  module          IN VARCHAR2 := NULL,
  action          IN VARCHAR2 := NULL)
RETURN NUMBER;
```

Parameters

Table 167-22 PACK_STGTAB_BASELINE Function Parameters

| Parameter | Description |
|-------------|---|
| table_name | Name of staging table into which SQL plan baselines are packed (case insensitive unless double quoted) |
| table_owner | Name of staging table owner. Default NULL means current schema is the table owner |
| sql_handle | SQL handle (case sensitive) |
| plan_name | Plan name (case sensitive, % wildcards accepted) |
| sql_text | SQL text string (case sensitive, % wildcards accepted) |
| creator | Creator of SQL plan baseline (case insensitive unless double quoted) |
| origin | Origin of SQL plan baseline, should be 'MANUAL-LOAD', 'AUTO-CAPTURE', 'MANUAL_SQLTUNE' or 'AUTO-SQLTUNE' (case insensitive) |
| enabled | Must be 'YES' or 'NO' (case insensitive) |
| accepted | Must be 'YES' or 'NO' (case insensitive) |
| fixed | Must be 'YES' or 'NO' (case insensitive) |
| module | Module (case sensitive) |
| action | Action (case sensitive) |

Return Values

Number of SQL plan baselines packed

167.6.18 RESET_EVOLVE_TASK Procedure

This procedure resets an evolve task to its initial state.

All intermediate results will be removed from the task. Call this procedure on a task that is not currently executing.

Syntax

```
DBMS_SPM.RESET_EVOLVE_TASK (
    task_name          IN VARCHAR2);
```

Parameters

Table 167-23 RESET_EVOLVE_TASK Procedure Parameters

| Parameter | Description |
|-----------|-----------------------------|
| task_name | Identifier of task to reset |

167.6.19 RESUME_EVOLVE_TASK Procedure

The procedure resumes a previously interrupted task.

Syntax

```
DBMS_SPM.RESUME_EVOLVE_TASK (
    task_name          IN VARCHAR2);
```

Parameters

Table 167-24 RESUME_EVOLVE_TASK Procedure Parameters

| Parameter | Description |
|-----------|------------------------------|
| task_name | Identifier of task to resume |

167.6.20 REPORT_AUTO_EVOLVE_TASK Function

The procedure displays the results of an execution of an automatic evolve task.

Syntax

```
DBMS_SPM.REPORT_AUTO_EVOLVE_TASK (
    type          IN VARCHAR2 := TYPE_TEXT,
    level         IN VARCHAR2 := LEVEL_TYPICAL,
    section       IN VARCHAR2 := SECTION_ALL,
    object_id     IN NUMBER   := NULL,
    execution_name IN VARCHAR2 := NULL)
RETURN CLOB;
```

Parameters

Table 167-25 REPORT_AUTO_EVOLVE_TASK Function Parameters

| Parameter | Description |
|----------------|---|
| type | Type of the report. Possible values are TEXT, HTML, XML |
| level | Format of the report. Possible values are BASIC, TYPICAL, ALL. |
| section | Particular section in the report. Possible values are: SUMMARY, FINDINGS, PLANS, INFORMATION, ERRORS, ALL. |
| object_id | Identifier of the advisor framework object that represents a single plan. If NULL, the report is generated for all objects. |
| execution_name | Name to qualify and identify an execution. If NULL, the report is generated for the last task execution. |

Return Values

The report

167.6.21 REPORT_EVOLVE_TASK Function

The procedure displays the results of an evolved task.

Syntax

```
DBMS_SPM.REPORT_EVOLVE_TASK (
  task_name      IN  VARCHAR2,
  type           IN  VARCHAR2 := TYPE_TEXT,
  level         IN  VARCHAR2 := LEVEL_TYPICAL,
  section       IN  VARCHAR2 := SECTION_ALL,
  object_id     IN  NUMBER   := NULL,
  task_owner    IN  VARCHAR2 := NULL,
  execution_name IN  VARCHAR2 := NULL)
RETURN CLOB;
```

Parameters

Table 167-26 REPORT_EVOLVE_TASK Function Parameters

| Parameter | Description |
|----------------|---|
| task_name | Identifier of task to report |
| type | Type of the report. Possible values are TEXT, HTML, XML |
| level | Format of the report. Possible values are BASIC, TYPICAL, ALL. |
| section | Particular section in the report. Possible values are: SUMMARY, FINDINGS, PLANS, INFORMATION, ERRORS, ALL. |
| object_id | Identifier of the advisor framework object that represents a single plan. If NULL, the report is generated for all objects. |
| task_owner | Owner of the evolve task. Defaults to the current schema owner. |
| execution_name | Name to qualify and identify an execution. If NULL, the report is generated for the last task execution. |

Return Values

The report

167.6.22 SET_EVOLVE_TASK_PARAMETER Procedure

The procedure sets a parameter of an evolve task, either a VARCHAR2 or a NUMBER.

Syntax

```
DBMS_SPM.SET_EVOLVE_TASK_PARAMETER (
    task_name      IN  VARCHAR2,
    parameter      IN  VARCHAR2,
    value          IN  NUMBER);
```

```
DBMS_SPM.SET_EVOLVE_TASK_PARAMETER (
    task_name      IN  VARCHAR2 := NULL,
    parameter      IN  VARCHAR2,
    value          IN  VARCHAR2);
```

Parameters

Table 167-27 SET_EVOLVE_TASK_PARAMETER Procedure Parameters

| Parameter | Description |
|-----------|--|
| task_name | Evolve task name |
| parameter | Name of the parameter to set (see following table) |
| value | Value of the parameter (see following table) |

The following table describes parameters for the SET_EVOLVE_TASK_PARAMETER procedure.

Table 167-28 DBMS_SPM.SET_EVOLVE_TASK_PARAMETER Parameters

| Parameter | Description | Default |
|-----------------------|--|---|
| alternate_plan_source | <p>Determines which sources to search for additional plans:</p> <ul style="list-style-type: none"> AUTO (the database selects the source automatically) AUTOMATIC_WORKLOAD_REPOSITORY CURSOR_CACHE SQL_TUNING_SET <p>You can combine multiple values with the plus sign (+).</p> | <p>The default depends on whether the SPM Evolve Advisor task is automated or manual:</p> <ul style="list-style-type: none"> If automated, the default is AUTO. If manual, the default is CURSOR_CACHE+AUTOMATIC_WORKLOAD_REPOSITORY. |

Table 167-28 (Cont.) DBMS_SPM.SET_EVOLVE_TASK_PARAMETER Parameters

| Parameter | Description | Default |
|-------------------------|---|---|
| alternate_plan_baseline | <p>Determines which alternative plans should be loaded:</p> <ul style="list-style-type: none"> AUTO lets Autonomous Database choose whether to load plans for statements with or without baselines. EXISTING loads alternate plans with for statements with existing baselines. NEW loads alternative plans for statements without a baseline, in which case a new baseline is created. <p>You can combine multiple values with the plus sign (+), as in EXISTING+NEW.</p> | EXISTING |
| alternate_plan_limit | Specifies the maximum number of plans to load in total (that is, not the limit for each SQL statement). | <p>The default depends on whether the SPM Evolve Advisor task is automated or manual:</p> <ul style="list-style-type: none"> If automated, the default is UNLIMITED. If manual, the default is 10. |
| accept_plans | <p>Specifies whether to accept recommended plans automatically.</p> <p>When ACCEPT_PLANS is true, SQL plan management automatically accepts all plans recommended by the task.</p> <p>When ACCEPT_PLANS is false, the task verifies the plans and generates a report of its findings, but does not evolve the plans automatically. You can use a report to identify new SQL plan baselines and accept them manually.</p> | true (regardless of whether the advisor is run automatically or manually) |
| time_limit | Global time limit in seconds. This is the total time allowed for the task. | <p>The default depends on whether the SPM Evolve Advisor task is automated or manual:</p> <ul style="list-style-type: none"> If automated, the default is 3600. If manual, the default is 2147483646. |

See Also:

Oracle Database Licensing Information User Manual for details on which features are supported for different editions and services

167.6.23 UNPACK_STGTAB_BASELINE Function

This function unpacks (imports) SQL plan baselines from a staging table into SQL management base.

Syntax

```
DBMS_SPM.UNPACK_STGTAB_BASELINE (
    table_name      IN VARCHAR2,
    table_owner     IN VARCHAR2 := NULL,
    sql_handle      IN VARCHAR2 := NULL,
    plan_name       IN VARCHAR2 := NULL,
    sql_text        IN CLOB      := NULL,
    creator         IN VARCHAR2 := NULL,    origin          IN VARCHAR2 := NULL,
    enabled         IN VARCHAR2 := NULL,
    accepted        IN VARCHAR2 := NULL,
    fixed           IN VARCHAR2 := NULL,
    module          IN VARCHAR2 := NULL,
    action          IN VARCHAR2 := NULL)
RETURN NUMBER;
```

Parameters

Table 167-29 UNPACK_STGTAB_BASELINE Function Parameters

| Parameter | Description |
|-------------|---|
| table_name | Name of staging table from which SQL plan baselines are unpacked (case insensitive unless double quoted) |
| table_owner | Name of staging table owner. Default NULL means current schema is the table owner |
| sql_handle | SQL handle (case sensitive) |
| plan_name | Plan name (case sensitive, % wildcards accepted) |
| sql_text | SQL text string (case sensitive, % wildcards accepted) |
| creator | Creator of SQL plan baseline (case insensitive unless double quoted) |
| origin | Origin of SQL plan baseline, should be 'MANUAL-LOAD', 'AUTO-CAPTURE', 'MANUAL_SQLTUNE' or 'AUTO-SQLTUNE' (case insensitive) |
| enabled | Must be 'YES' or 'NO' (case insensitive) |
| accepted | Must be 'YES' or 'NO' (case insensitive) |
| fixed | Must be 'YES' or 'NO' (case insensitive) |
| module | Module (case sensitive) |
| action | Action (case sensitive) |

Return Values

Number of plans unpacked

DBMS_SQL

The `DBMS_SQL` package provides an interface to use dynamic SQL to parse any data manipulation language (DML) or data definition language (DDL) statement using PL/SQL.

For example, you can enter a `DROP TABLE` statement from within a stored procedure by using the [PARSE Procedures](#) supplied with the `DBMS_SQL` package.

This chapter contains the following topics:

- [Overview](#)
- [Security Model](#)
- [Constants](#)
- [Exceptions](#)
- [Operational Notes](#)
- [Examples](#)
- [Data Structures](#)
- [Summary of DBMS_SQL Subprograms](#)

See Also:

For more information on native dynamic SQL, see *Oracle Database PL/SQL Language Reference*.

168.1 DBMS_SQL Overview

Oracle lets you write stored procedures and anonymous PL/SQL blocks that use dynamic SQL. Dynamic SQL statements are not embedded in your source program; rather, they are stored in character strings that are input to, or built by, the program at runtime. This enables you to create more general-purpose procedures. For example, dynamic SQL lets you create a procedure that operates on a table whose name is not known until runtime.

Native Dynamic SQL is an alternative to `DBMS_SQL` that lets you place dynamic SQL statements directly into PL/SQL blocks. In most situations, Native Dynamic SQL is easier to use and performs better than `DBMS_SQL`. However, Native Dynamic SQL itself has certain limitations:

- There is no support for so-called Method 4 (for dynamic SQL statements with an unknown number of inputs or outputs)
- There are some tasks that can only be performed using `DBMS_SQL`. For tasks that require `DBMS_SQL`, see *Oracle Database PL/SQL Language Reference*.

The ability to use dynamic SQL from within stored procedures generally follows the model of the Oracle Call Interface (OCI).

 **See Also:**

Oracle Call Interface Programmer's Guide

PL/SQL differs somewhat from other common programming languages, such as C. For example, addresses (also called pointers) are not user-visible in PL/SQL. As a result, there are some differences between the Oracle Call Interface and the `DBMS_SQL` package. These differences include the following:

- The OCI binds by address and the `DBMS_SQL` package binds by value.
- With `DBMS_SQL` you must call `VARIABLE_VALUE` to retrieve the value of an `OUT` parameter for an anonymous block, and you must call `COLUMN_VALUE` after fetching rows to retrieve the values of the columns in the rows into your program.
- The current release of the `DBMS_SQL` package does not provide `CANCEL` cursor procedures.
- Indicator variables are not required, because `NULLs` are fully supported as values of a PL/SQL variable.

168.2 DBMS_SQL Security Model

`DBMS_SQL` is a `SYS`-owned package compiled with `AUTHID CURRENT_USER`. Any `DBMS_SQL` subprogram called from an anonymous PL/SQL block runs with the privileges of the current user.

 **See Also:**

Oracle Database PL/SQL Language Reference for more information about using Invoker Rights or Definer Rights

Preventing Malicious or Accidental Access of Open Cursor Numbers

An error, `ORA-29471`, is raised when any `DBMS_SQL` subprogram is called with a cursor number that does not denote an open cursor. When the error is raised, an alert is issued to the alert log and `DBMS_SQL` becomes inoperable for the life of the session.

If the actual value for the cursor number in a call to the [IS_OPEN Function](#) denotes a cursor currently open in the session, the return value is `TRUE`. If the actual value is `NULL`, then the return value is `FALSE`. Otherwise, this raises an `ORA-29471` error.

Preventing Inappropriate Use of a Cursor

Cursors are protected from security breaches that subvert known existing cursors.

Checks are made when binding and executing. Optionally, checks may be performed for every single `DBMS_SQL` subprogram call. The check is:

- The `current_user` is the same on calling the subprogram as it was on calling the most recent parse.

- The enabled roles on calling the subprogram must be identical to the enabled roles on calling the most recent parse.
- The container is the same on calling the subprogram as it was on calling the most recent parse.

Consistent with the use of definer's rights subprograms, roles do not apply.

If either check fails, then an `ORA-29470` error is raised.

The mechanism for defining when checks are performed is a new overload for the `OPEN_CURSOR` subprogram, which takes a formal parameter, `security_level`, with allowed values `NULL`, `1` and `2`.

- When `security_level = 1` (or is `NULL`), the checks are made only when binding and executing.
- When `security_level = 2`, the checks are always made.

Upgrade Considerations

This security regime is stricter than those in the previous releases. As a consequence, users of `DBMS_SQL` may encounter runtime errors on upgrade.

168.3 DBMS_SQL Constants

The `DBMS_SQL Constants` package provides constants that are used with the `language_flag` parameter of the `PARSE` Procedures.

These constants are described in the following table.

Table 168-1 DBMS_SQL Constants

| Name | Type | Value | Description |
|--------------------|---------|------------|---|
| V6 | INTEGER | 0 | Specifies Oracle database version 6 behavior |
| NATIVE | INTEGER | 1 | Specifies normal behavior for the database to which the program is connected |
| V7 | INTEGER | 2 | Specifies Oracle database version 7 behavior |
| FOREIGN_SYNTA X | INTEGER | 4294967295 | Specifies a non-Oracle database syntax and behavior. The SQL statement to be parsed needs to be translated first using the SQL translation profile set in the database session. The SQL translation profile is a database schema object that directs how SQL statements are translated to Oracle. An error is raised if a profile is not set. |

Related Topics

- [PARSE Procedures](#)
This procedure parses the given statement in the given cursor. All statements are parsed immediately. In addition, DDL statements are run immediately when parsed.

168.4 DBMS_SQL Operational Notes

These operational notes describe processing queries, processing updates, inserts, and deletes, and locating errors.

Processing Queries

If you are using dynamic SQL to process a query, then you must perform the following steps:

1. Specify the variables that are to receive the values returned by the `SELECT` statement by calling the [DEFINE_COLUMN Procedures](#), the [DEFINE_COLUMN_LONG Procedure](#), or the [DEFINE_ARRAY Procedure](#).
2. Run your `SELECT` statement by calling the [EXECUTE Function](#).
3. Call the [FETCH_ROWS Function](#) (or `EXECUTE_AND_FETCH`) to retrieve the rows that satisfied your query.
4. Call [COLUMN_VALUE Procedure](#) or [COLUMN_VALUE_LONG Procedure](#) to determine the value of a column retrieved by the [FETCH_ROWS Function](#) for your query. If you used anonymous blocks containing calls to PL/SQL procedures, then you must call the [VARIABLE_VALUE Procedures](#) to retrieve the values assigned to the output variables of these procedures.

Processing Updates, Inserts, and Deletes

If you are using dynamic SQL to process an `INSERT`, `UPDATE`, or `DELETE`, then you must perform the following steps:

1. Run your `INSERT`, `UPDATE`, or `DELETE` statement by calling the [EXECUTE Function](#).
2. If statements have the `returning` clause, then you must call the [VARIABLE_VALUE Procedures](#) to retrieve the values assigned to the output variables.

Locating Errors

The `DBMS_SQL` package has additional functions for obtaining information about the last referenced cursor in the session. The values returned by these functions are meaningful only immediately after a SQL statement is run. In addition, some error-locating functions are meaningful only after certain `DBMS_SQL` calls. For example, you call the [LAST_ERROR_POSITION Function](#) immediately after calling one of the [PARSE Procedures](#).

168.5 DBMS_SQL Execution Flow

These functions comprise the `DBMS_SQL` execution flow.

1. [OPEN_CURSOR](#)
2. [PARSE](#)
3. [BIND_VARIABLE](#), [BIND_VARIABLE_PKG](#) or [BIND_ARRAY](#)
4. [DEFINE_COLUMN](#), [DEFINE_COLUMN_LONG](#) or [DEFINE_ARRAY](#)
5. [EXECUTE](#)

6. [FETCH_ROWS](#) or [EXECUTE_AND_FETCH](#)
7. [VARIABLE_VALUE](#), [VARIABLE_PKG](#), [COLUMN_VALUE](#) or [COLUMN_VALUE_LONG](#)
8. [CLOSE_CURSOR](#)

168.5.1 OPEN_CURSOR

To process a SQL statement, you must have an open cursor. When you call the `OPEN_CURSOR` Functions, you receive a cursor `ID` number for the data structure representing a valid cursor maintained by Oracle.

These cursors are distinct from cursors defined at the precompiler, OCI, or PL/SQL level, and are used only by the `DBMS_SQL` package.

Related Topics

- [OPEN_CURSOR Functions](#)
This function opens a new cursor.

168.5.2 PARSE

Every SQL statement must be parsed by calling the `PARSE` procedures. Parsing the statement checks the statement's syntax and associates it with the cursor in your program.

You can parse any DML or DDL statement. DDL statements are run on the parse, which performs the implied commit.

The execution flow of `DBMS_SQL` is shown in [Figure 168-1](#).

Figure 168-1 DBMS_SQL Execution Flow

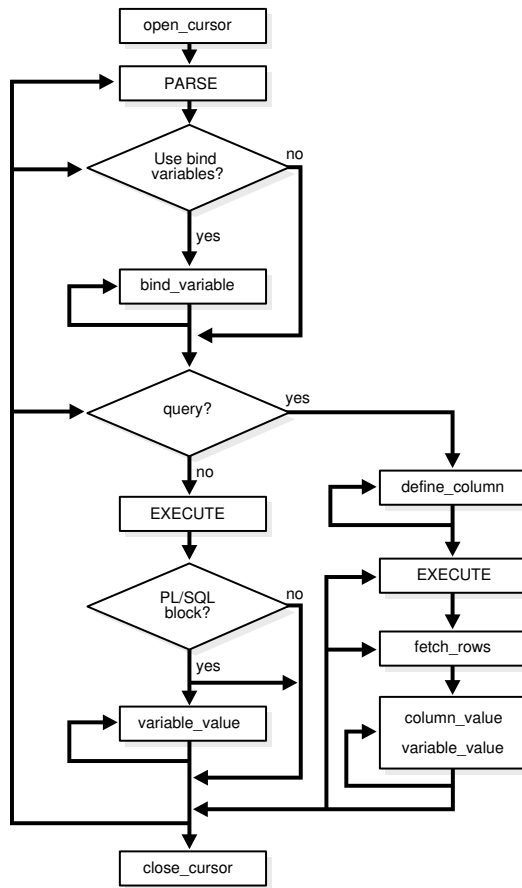

illustration: arpls008
 release: 9
 caption: DBMS_SQL Execution Flow
 date: 7/31/01
 platform: pc
 ref: ADG8013

Related Topics

- [PARSE Procedures](#)
 This procedure parses the given statement in the given cursor. All statements are parsed immediately. In addition, DDL statements are run immediately when parsed.

168.5.3 BIND_VARIABLE, BIND_VARIABLE_PKG or BIND_ARRAY

Many DML statements require that data in your program be input to Oracle. When you define a SQL statement that contains input data to be supplied at runtime, you must use placeholders in the SQL statement to mark where data must be supplied.

For each placeholder in the SQL statement, you must call one of the [BIND_ARRAY Procedures](#), or [BIND_VARIABLE Procedures](#), or the [BIND_VARIABLE_PKG Procedure](#) to supply the value of a variable in your program (or the values of an array) to the placeholder. When the SQL statement is subsequently run, Oracle uses the data that your program has placed in the output and input, or bind variables.

DBMS_SQL can run a DML statement multiple times — each time with a different bind variable. The `BIND_ARRAY` procedure lets you bind a collection of scalars, each value of which is used as an input variable once for each `EXECUTE`. This is similar to the array interface supported by the OCI.

Note that the datatype of the values bound to placeholders cannot be PL/SQL-only datatypes.

168.5.4 DEFINE_COLUMN, DEFINE_COLUMN_LONG, or DEFINE_ARRAY

The `DEFINE_COLUMN`, `DEFINE_COLUMN_LONG`, and `DEFINE_ARRAY` procedures specify the variables that receive `SELECT` values on a query.

The columns of the row being selected in a `SELECT` statement are identified by their relative positions as they appear in the select list, from left to right. For a query, you must call one of the define procedures ([DEFINE_COLUMN Procedures](#), [DEFINE_COLUMN_LONG Procedure](#), or [DEFINE_ARRAY Procedure](#)) to specify the variables that are to receive the `SELECT` values, much the way an `INTO` clause does for a static query.

Use the `DEFINE_COLUMN_LONG` procedure to define `LONG` columns, in the same way that `DEFINE_COLUMN` is used to define non-`LONG` columns. You must call `DEFINE_COLUMN_LONG` before using the [COLUMN_VALUE_LONG Procedure](#) to fetch from the `LONG` column.

Use the `DEFINE_ARRAY` procedure to define a PL/SQL collection into which you want to fetch rows in a single `SELECT` statement. `DEFINE_ARRAY` provides an interface to fetch multiple rows at one fetch. You must call `DEFINE_ARRAY` before using the `COLUMN_VALUE` procedure to fetch the rows.

168.5.5 EXECUTE

Call the `EXECUTE` Function to run your SQL statement.

Related Topics

- [EXECUTE Function](#)
This function executes a given cursor. This function accepts the `ID` number of the cursor and returns the number of rows processed.

168.5.6 FETCH_ROWS or EXECUTE_AND_FETCH

The `FETCH_ROWS` Function retrieves the rows that satisfy the query. Each successive fetch retrieves another set of rows, until the fetch is unable to retrieve any more rows. Instead of calling `EXECUTE` Function and then `FETCH_ROWS`, you may find it more efficient to call `EXECUTE_AND_FETCH` Function if you are calling `EXECUTE` for a single execution.

Related Topics

- [FETCH_ROWS Function](#)
This function fetches a row from a given cursor.
- [EXECUTE Function](#)
This function executes a given cursor. This function accepts the `ID` number of the cursor and returns the number of rows processed.
- [EXECUTE_AND_FETCH Function](#)
This function executes the given cursor and fetches rows.

168.5.7 VARIABLE_VALUE, VARIABLE_VALUE_PKG, COLUMN_VALUE, or COLUMN_VALUE_LONG

The type of call determines which procedure or function to use.

For queries, call the [COLUMN_VALUE Procedure](#) to determine the value of a column retrieved by the [FETCH_ROWS Function](#).

For anonymous blocks containing calls to `PL/SQL` procedures or DML statements with `returning` clause, call the [VARIABLE_VALUE Procedures](#) or the [VARIABLE_VALUE_PKG Procedure](#) to retrieve the values assigned to the output variables when statements were run.

To fetch only part of a `LONG` database column (which can be up to two gigabytes in size), use the [DEFINE_COLUMN_LONG Procedure](#). You can specify the offset (in bytes) into the column value, and the number of bytes to fetch.

168.5.8 CLOSE_CURSOR

When you no longer need a cursor for a session, close the cursor by calling the `CLOSE_CURSOR` Procedure. If you are using an Oracle Open Gateway, then you may need to close cursors at other times as well. Consult your *Oracle Open Gateway* documentation for additional information.

Related Topics

- [CLOSE_CURSOR Procedure](#)
This procedure closes a given cursor.

168.6 DBMS_SQL Exceptions

This exception is raised by the `COLUMN_VALUE` Procedure or the `VARIABLE_VALUE` Procedures when the type of the given `OUT` parameter (for where to put the requested value) is different from the type of the value.

```
inconsistent_type EXCEPTION;  
pragma exception_init(inconsistent_type, -6562);
```

Related Topics

- [COLUMN_VALUE Procedure](#)
This procedure returns the value of the cursor element for a given position in a given cursor. This procedure is used to access the data fetched by calling `FETCH_ROWS`.
- [VARIABLE_VALUE Procedures](#)
This procedure returns the value of the named variable for a given cursor. It is used to return the values of bind variables inside PL/SQL blocks or DML statements with `returning` clause.

168.7 DBMS_SQL Examples

These example procedures use the `DBMS_SQL` package.

Example : Using DBMS_SQL Demo

This example does not need dynamic SQL because the text of the statement is known at compile time, but it illustrates the basic concept underlying the package.

The `DEMO` procedure deletes all of the employees from the `EMP` table whose salaries are greater than the salary that you specify when you run `DEMO`.

```
CREATE OR REPLACE PROCEDURE demo(salary IN NUMBER) AS  
    cursor_name INTEGER;  
    rows_processed INTEGER;  
BEGIN  
    cursor_name := dbms_sql.open_cursor;  
    DBMS_SQL.PARSE(cursor_name, 'DELETE FROM emp WHERE sal > :x',  
                   DBMS_SQL.NATIVE);  
    DBMS_SQL.BIND_VARIABLE(cursor_name, ':x', salary);  
    rows_processed := DBMS_SQL.EXECUTE(cursor_name);  
    DBMS_SQL.CLOSE_CURSOR(cursor_name);  
EXCEPTION  
WHEN OTHERS THEN  
    DBMS_SQL.CLOSE_CURSOR(cursor_name);  
END;
```

Example 2

The following sample procedure is passed a SQL statement, which it then parses and runs:

```
CREATE OR REPLACE PROCEDURE exec(string IN varchar2) AS  
    cursor_name INTEGER;  
    ret INTEGER;  
BEGIN
```

```
cursor_name := DBMS_SQL.OPEN_CURSOR;
```

DDL statements are run by the parse call, which performs the implied commit.

```
DBMS_SQL.PARSE(cursor_name, string, DBMS_SQL.NATIVE);
ret := DBMS_SQL.EXECUTE(cursor_name);
DBMS_SQL.CLOSE_CURSOR(cursor_name);
END;
```

Creating such a procedure enables you to perform the following operations:

- The SQL statement can be dynamically generated at runtime by the calling program.
- The SQL statement can be a DDL statement or a DML without binds.

For example, after creating this procedure, you could make the following call:

```
exec('create table acct(c1 integer)');
```

You could even call this procedure remotely, as shown in the following example. This lets you perform remote DDL.

```
exec@domain.com('CREATE TABLE acct(c1 INTEGER)');
```

Example 3

The following sample procedure is passed the names of a source and a destination table, and copies the rows from the source table to the destination table. This sample procedure assumes that both the source and destination tables have the following columns:

```
id          of type NUMBER
name        of type VARCHAR2(30)
birthdate  of type DATE
```

This procedure does not need the use of dynamic SQL; however, it illustrates the concepts of this package.

```
CREATE OR REPLACE PROCEDURE copy (
    source      IN VARCHAR2,
    destination IN VARCHAR2) IS
    id_var      NUMBER;
    name_var    VARCHAR2(30);
    birthdate_var DATE;
    source_cursor INTEGER;
    destination_cursor INTEGER;
    ignore      INTEGER;
BEGIN

    -- Prepare a cursor to select from the source table:
    source_cursor := dbms_sql.open_cursor;
    DBMS_SQL.PARSE(source_cursor,
        'SELECT id, name, birthdate FROM ' || source,
        DBMS_SQL.NATIVE);
    DBMS_SQL.DEFINE_COLUMN(source_cursor, 1, id_var);
    DBMS_SQL.DEFINE_COLUMN(source_cursor, 2, name_var, 30);
    DBMS_SQL.DEFINE_COLUMN(source_cursor, 3, birthdate_var);
    ignore := DBMS_SQL.EXECUTE(source_cursor);

    -- Prepare a cursor to insert into the destination table:
```

```

destination_cursor := DBMS_SQL.OPEN_CURSOR;
DBMS_SQL.PARSE(destination_cursor,
               'INSERT INTO ' || destination ||
               ' VALUES (:id_bind, :name_bind, :birthdate_bind)',
               DBMS_SQL.NATIVE);

-- Fetch a row from the source table and insert it into the destination table:
LOOP
  IF DBMS_SQL.FETCH_ROWS(source_cursor)>0 THEN
    -- get column values of the row
    DBMS_SQL.COLUMN_VALUE(source_cursor, 1, id_var);
    DBMS_SQL.COLUMN_VALUE(source_cursor, 2, name_var);
    DBMS_SQL.COLUMN_VALUE(source_cursor, 3, birthdate_var);

    -- Bind the row into the cursor that inserts into the destination table. You
    -- could alter this example to require the use of dynamic SQL by inserting an
    -- if condition before the bind.
    DBMS_SQL.BIND_VARIABLE(destination_cursor, ':id_bind', id_var);
    DBMS_SQL.BIND_VARIABLE(destination_cursor, ':name_bind', name_var);
    DBMS_SQL.BIND_VARIABLE(destination_cursor, ':birthdate_bind',
                           birthdate_var);

    ignore := DBMS_SQL.EXECUTE(destination_cursor);
  ELSE
    -- No more rows to copy:
    EXIT;
  END IF;
END LOOP;

-- Commit and close all cursors:
COMMIT;
DBMS_SQL.CLOSE_CURSOR(source_cursor);
DBMS_SQL.CLOSE_CURSOR(destination_cursor);
EXCEPTION
  WHEN OTHERS THEN
    IF DBMS_SQL.IS_OPEN(source_cursor) THEN
      DBMS_SQL.CLOSE_CURSOR(source_cursor);
    END IF;
    IF DBMS_SQL.IS_OPEN(destination_cursor) THEN
      DBMS_SQL.CLOSE_CURSOR(destination_cursor);
    END IF;
    RAISE;
END;
/

```

Example 4: RETURNING clause

With this clause, INSERT, UPDATE, and DELETE statements can return values of expressions in bind variables.

If a single row is inserted, updated, or deleted, then use DBMS_SQL.BIND_VARIABLE to bind these outbinds. To get the values in these bind variables, call DBMS_SQL.VARIABLE_VALUE

Note:

This process is similar to DBMS_SQL.VARIABLE_VALUE, which must be called after running a PL/SQL block with an outbind inside DBMS_SQL.

i) Single-row insert

```

CREATE OR REPLACE PROCEDURE single_Row_insert
  (c1 NUMBER, c2 NUMBER, r OUT NUMBER) IS
  c NUMBER;
  n NUMBER;
  BEGIN
    c := DBMS_SQL.OPEN_CURSOR;
    DBMS_SQL.PARSE(c, 'INSERT INTO tab VALUES (:bnd1, :bnd2) ' ||
      'RETURNING c1*c2 INTO :bnd3', DBMS_SQL.NATIVE);
    DBMS_SQL.BIND_VARIABLE(c, 'bnd1', c1);
    DBMS_SQL.BIND_VARIABLE(c, 'bnd2', c2);
    DBMS_SQL.BIND_VARIABLE(c, 'bnd3', r);
    n := DBMS_SQL.EXECUTE(c);
    DBMS_SQL.VARIABLE_VALUE(c, 'bnd3', r); -- get value of outbind variable
    DBMS_SQL.CLOSE_CURSOR(c);
  END;
/

```

ii) Single-row update

```

CREATE OR REPLACE PROCEDURE single_Row_update
  (c1 NUMBER, c2 NUMBER, r out NUMBER) IS
  c NUMBER;
  n NUMBER;
  BEGIN
    c := DBMS_SQL.OPEN_CURSOR;
    DBMS_SQL.PARSE(c, 'UPDATE tab SET c1 = :bnd1, c2 = :bnd2 ' ||
      'WHERE rownum < 2 ' ||
      'RETURNING c1*c2 INTO :bnd3', DBMS_SQL.NATIVE);
    DBMS_SQL.BIND_VARIABLE(c, 'bnd1', c1);
    DBMS_SQL.BIND_VARIABLE(c, 'bnd2', c2);
    DBMS_SQL.BIND_VARIABLE(c, 'bnd3', r);
    n := DBMS_SQL.EXECUTE(c);
    DBMS_SQL.VARIABLE_VALUE(c, 'bnd3', r); -- get value of outbind variable
    DBMS_SQL.CLOSE_CURSOR(c);
  END;
/

```

iii) Single-row delete

```

CREATE OR REPLACE PROCEDURE single_Row_Delete
  (c1 NUMBER, r OUT NUMBER) IS
  c NUMBER;
  n number;
  BEGIN
    c := DBMS_SQL.OPEN_CURSOR;
    DBMS_SQL.PARSE(c, 'DELETE FROM tab WHERE ROWNUM = :bnd1 ' ||
      'RETURNING c1*c2 INTO :bnd2', DBMS_SQL.NATIVE);
    DBMS_SQL.BIND_VARIABLE(c, 'bnd1', c1);
    DBMS_SQL.BIND_VARIABLE(c, 'bnd2', r);
    n := DBMS_SQL.EXECUTE(c);
    DBMS_SQL.VARIABLE_VALUE(c, 'bnd2', r); -- get value of outbind variable
    DBMS_SQL.CLOSE_CURSOR(c);
  END;
/

```

iv) Multiple-row insert

```

CREATE OR REPLACE PROCEDURE multi_Row_insert
(c1 DBMS_SQL.NUMBER_TABLE, c2 DBMS_SQL.NUMBER_TABLE,
 r OUT DBMS_SQL.NUMBER_TABLE) is
c NUMBER;
n NUMBER;
BEGIN
c := DBMS_SQL.OPEN_CURSOR;
DBMS_SQL.PARSE(c, 'insert into tab VALUES (:bnd1, :bnd2) ' ||
'RETURNING c1*c2 INTO :bnd3', DBMS_SQL.NATIVE);
DBMS_SQL.BIND_ARRAY(c, 'bnd1', c1);
DBMS_SQL.BIND_ARRAY(c, 'bnd2', c2);
DBMS_SQL.BIND_ARRAY(c, 'bnd3', r);
n := DBMS_SQL.EXECUTE(c);
DBMS_SQL.VARIABLE_VALUE(c, 'bnd3', r);-- get value of outbind variable
DBMS_SQL.CLOSE_CURSOR(c);
END;
/

```

v) Multiple-row update.

```

CREATE OR REPLACE PROCEDURE multi_Row_update
(c1 NUMBER, c2 NUMBER, r OUT DBMS_SQL.NUMBER_TABLE) IS
c NUMBER;
n NUMBER;
BEGIN
c := DBMS_SQL.OPEN_CURSOR;
DBMS_SQL.PARSE(c, 'UPDATE tab SET c1 = :bnd1 WHERE c2 = :bnd2 ' ||
'RETURNING c1*c2 INTO :bnd3', DBMS_SQL.NATIVE);
DBMS_SQL.BIND_VARIABLE(c, 'bnd1', c1);
DBMS_SQL.BIND_VARIABLE(c, 'bnd2', c2);
DBMS_SQL.BIND_ARRAY(c, 'bnd3', r);
n := DBMS_SQL.EXECUTE(c);
DBMS_SQL.VARIABLE_VALUE(c, 'bnd3', r);-- get value of outbind variable
DBMS_SQL.CLOSE_CURSOR(c);
END;
/

```

Note:

bnd1 and bnd2 can be arrays too. The value of the expression for all the rows updated will be in bnd3. There is no way to determine which rows were updated for each value of bnd1 and bnd2.

vi) Multiple-row delete

```

CREATE OR REPLACE PROCEDURE multi_row_delete
(c1 DBMS_SQL.NUMBER_TABLE,
 r OUT DBMS_SQL.NUMBER_TABLE) is
c NUMBER;
n NUMBER;
BEGIN
c := DBMS_SQL.OPEN_CURSOR;
DBMS_SQL.PARSE(c, 'DELETE FROM tab WHERE c1 = :bnd1' ||
'RETURNING c1*c2 INTO :bnd2', DBMS_SQL.NATIVE);
DBMS_SQL.BIND_ARRAY(c, 'bnd1', c1);
DBMS_SQL.BIND_ARRAY(c, 'bnd2', r);
n := DBMS_SQL.EXECUTE(c);
DBMS_SQL.VARIABLE_VALUE(c, 'bnd2', r);-- get value of outbind variable

```

```

        DBMS_SQL.CLOSE_CURSOR(c);
    END;
/

```

vii) outbind in bulk PL/SQL

```

CREATE OR REPLACE PROCEDURE foo (n NUMBER, square OUT NUMBER) IS
BEGIN square := n * n; END;/

CREATE OR REPLACE PROCEDURE bulk_plsql
    (n DBMS_SQL.NUMBER_TABLE, square OUT DBMS_SQL.NUMBER_TABLE) IS
c NUMBER;
r NUMBER;
BEGIN
    c := DBMS_SQL.OPEN_CURSOR;
    DBMS_SQL.PARSE(c, 'BEGIN foo(:bnd1, :bnd2); END;', DBMS_SQL.NATIVE);
    DBMS_SQL.BIND_ARRAY(c, 'bnd1', n);
    DBMS_SQL.BIND_ARRAY(c, 'bnd2', square);
    r := DBMS_SQL.EXECUTE(c);
    DBMS_SQL.VARIABLE_VALUE(c, 'bnd2', square);
END;
/

```

Note:

DBMS_SQL.BIND_ARRAY of number_Table internally binds a number. The number of times statement is run depends on the number of elements in an inbind array.

Example 5: Binds and Defines of User-defined Types in DBMS_SQL

```

CREATE TYPE dnames_var IS VARRAY(7) OF VARCHAR2(30)
/

CREATE TABLE depts (region VARCHAR2(25), dept_names dnames_var)
/
INSERT INTO depts VALUES('Europe', dnames_var('Shipping','Sales','Finance'))
/
INSERT INTO depts VALUES('Americas', dnames_var('Sales','Finance','Shipping'))
/
INSERT INTO depts VALUES('Asia',
dnames_var('Finance','Payroll','Shipping','Sales'))
/

CREATE OR REPLACE PROCEDURE update_depts(new_dnames dnames_var, region VARCHAR2)
IS
    some_dnames dnames_var;
    c          NUMBER;
    r          NUMBER;
    sql_stmt   VARCHAR2(32767) :=
        'UPDATE depts SET dept_names = :b1 WHERE region = :b2 RETURNING dept_names
        INTO :b3';
BEGIN
    c := DBMS_SQL.OPEN_CURSOR;

    DBMS_SQL.PARSE(c, sql_stmt, dbms_sql.native);

```

```

DBMS_SQL.BIND_VARIABLE(c, 'b1', new_dnames);
DBMS_SQL.BIND_VARIABLE(c, 'b2', region);
DBMS_SQL.BIND_VARIABLE(c, 'b3', some_dnames);

r := DBMS_SQL.EXECUTE(c);

-- Get value of outbind variable
DBMS_SQL.VARIABLE_VALUE(c, 'b3', some_dnames);

DBMS_SQL.CLOSE_CURSOR(c);

-- select dept_names
sql_stmt := 'SELECT dept_names FROM depts WHERE region = :b1';

c := DBMS_SQL.OPEN_CURSOR;
DBMS_SQL.PARSE(c, sql_stmt, dbms_sql.native);

DBMS_SQL.DEFINE_COLUMN(c, 1, some_dnames);
DBMS_SQL.BIND_VARIABLE(c, 'b1', region);

r := DBMS_SQL.EXECUTE_AND_FETCH(c);

DBMS_SQL.COLUMN_VALUE(c, 1, some_dnames);

DBMS_SQL.CLOSE_CURSOR(c);

-- loop through some_dnames collections
FOR i IN some_dnames.FIRST .. some_dnames.LAST LOOP
    DBMS_OUTPUT.PUT_LINE('Dept. Name = ' || some_dnames(i) || ' Updated!');
END LOOP;
END;
/

DECLARE
    new_dnames dnames_var;
BEGIN
    new_dnames := dnames_var('Benefits', 'Advertising', 'Contracting',
                             'Executive', 'Marketing');
    update_depts(new_dnames, 'Asia');
END;
/

```

168.8 DBMS_SQL Data Structures

The `DBMS_SQL` package defines `RECORD` type and `TABLE` type data structures.

RECORD Types

- [DBMS_SQL DESC_REC Record Type](#) (deprecated)
- [DBMS_SQL DESC_REC2 Record Type](#)
- [DBMS_SQL DESC_REC3 Record Type](#)
- [DBMS_SQL DESC_REC4 Record Type](#)

TABLE Types for DESCRIBE_COLUMNS Procedures

- [DBMS_SQL DESC_TAB Table Type](#)

- [DBMS_SQL DESC_TAB2 Table Type](#)
- [DBMS_SQL DESC_TAB3 Table Type](#)
- [DBMS_SQL DESC_TAB4 Table Type](#)

TABLE Types For Scalar and LOB Collections

DBMS_SQL bulk operations are only supported with these predefined DBMS_SQL TABLE types.

- [DBMS_SQL BFILE_TABLE Table Type](#)
- [DBMS_SQL BINARY_DOUBLE_TABLE Table Type](#)
- [DBMS_SQL BINARY_FLOAT_TABLE Table Type](#)
- [DBMS_SQL BLOB_TABLE Table Type](#)
- [DBMS_SQL CLOB_TABLE Table Type](#)
- [DBMS_SQL DATE_TABLE Table Type](#)
- [DBMS_SQL INTERVAL_DAY_TO_SECOND_TABLE Table Type](#)
- [DBMS_SQL INTERVAL_YEAR_TO_MONTH_TABLE Table Type](#)
- [DBMS_SQL JSON_TABLE Table Type](#)
- [DBMS_SQL NUMBER_TABLE Table Type](#)
- [DBMS_SQL TIME_TABLE Table Type](#)
- [DBMS_SQL TIME_WITH_TIME_ZONE_TABLE Table Type](#)
- [DBMS_SQL TIMESTAMP_TABLE Table Type](#)
- [DBMS_SQL TIMESTAMP_WITH_LTZ_TABLE Table Type](#)
- [DBMS_SQL TIMESTAMP_WITH_TIME_ZONE_TABLE Table Type](#)
- [DBMS_SQL UROWID_TABLE Table Type](#)
- [DBMS_SQL VARCHAR2_TABLE Table Type](#)
- [DBMS_SQL VARCHAR2A Table Type](#)
- [DBMS_SQL VARCHAR2S Table Type](#)

168.8.1 DBMS_SQL DESC_REC Record Type

This record type holds the describe information for a single column in a dynamic query.

Note:

This type has been deprecated in favor of the [DESC_REC2 Record Type](#).

It is the element type of the [DESC_TAB](#) table type and the [DESCRIBE_COLUMNS Procedure](#).

Syntax

```

TYPE desc_rec IS RECORD (
    col_type          BINARY_INTEGER := 0,
    col_max_len       BINARY_INTEGER := 0,
    col_name          VARCHAR2(32)   := '',
    col_name_len      BINARY_INTEGER := 0,
    col_schema_name   VARCHAR2(32)   := '',
    col_schema_name_len BINARY_INTEGER := 0,
    col_precision     BINARY_INTEGER := 0,
    col_scale         BINARY_INTEGER := 0,
    col_charsetid     BINARY_INTEGER := 0,
    col_charsetform   BINARY_INTEGER := 0,
    col_null_ok       BOOLEAN        := TRUE);
TYPE desc_tab IS TABLE OF desc_rec INDEX BY BINARY_INTEGER;

```

Fields**Table 168-2 DESC_REC Fields**

| Field | Description |
|---------------------|--|
| col_type | Type of column |
| col_max_len | Maximum column length |
| col_name | Name of column |
| col_name_len | Length of column name |
| col_schema_name | Column schema name |
| col_schema_name_len | Length of column schema name |
| col_precision | Precision of column |
| col_scale | Scale of column |
| col_charsetid | Column character set id |
| col_charsetform | Column character set form |
| col_null_ok | NULL column flag; TRUE, if NULL possible |

168.8.2 DBMS_SQL DESC_REC2 Record Type

DESC_REC2 is the element type of the DESC_TAB2 table type and the DESCRIBE_COLUMNS2 Procedure.

This record type is identical to DESC_REC except for the col_name field, which has been expanded to the maximum possible size for VARCHAR2. It is therefore preferred to DESC_REC because column name values can be greater than 32 characters. DESC_REC is deprecated as a result.

Syntax

```

TYPE desc_rec2 IS RECORD (
    col_type          binary_integer := 0,
    col_max_len       binary_integer := 0,
    col_name          varchar2(32767) := '',
    col_name_len      binary_integer := 0,
    col_schema_name   varchar2(32)   := '',

```

```

col_schema_name_len binary_integer := 0,
col_precision       binary_integer := 0,
col_scale           binary_integer := 0,
col_charsetid       binary_integer := 0,
col_charsetform     binary_integer := 0,
col_null_ok         boolean         := TRUE);

```

Fields

Table 168-3 DESC_REC2 Fields

| Field | Description |
|---------------------|--|
| col_type | Type of column |
| col_max_len | Maximum column length |
| col_name | Name of column |
| col_name_len | Length of column name |
| col_schema_name | Column schema name |
| col_schema_name_len | Length of column schema name |
| col_precision | Precision of column |
| col_scale | Scale of column |
| col_charsetid | Column character set id |
| col_charsetform | Column character set form |
| col_null_ok | NULL column flag; TRUE, if NULL possible |

This procedure describes the specified column. This is an alternative to DESCRIBE_COLUMNS Procedure.

168.8.3 DBMS_SQL DESC_REC3 Record Type

DESC_REC3 is the element type of the DESC_TAB3 table type and the DESCRIBE_COLUMNS3 Procedure.

DESC_REC3 is identical to DESC_REC2 except for two additional fields to hold the type name (type_name) and type name len (type_name_len) of a column in a dynamic query. These two fields hold the type name and type name length when the column is a user-defined type (a collection or object type). The col_type_name and col_type_name_len fields are only populated when the col_type field's value is 109, the Oracle type number for user-defined types.

Syntax

```

TYPE desc_rec3 IS RECORD (
  col_type           binary_integer := 0,
  col_max_len       binary_integer := 0,
  col_name          varchar2(32767) := '',
  col_name_len      binary_integer := 0,
  col_schema_name   varchar2(32)   := '',
  col_schema_name_len binary_integer := 0,
  col_precision     binary_integer := 0,

```

```

col_scale          binary_integer := 0,
col_charsetid     binary_integer := 0,
col_charsetform   binary_integer := 0,
col_null_ok       boolean := TRUE,
col_type_name     varchar2(32767) := '',
col_type_name_len binary_integer := 0);

```

Fields

Table 168-4 DESC_REC3 Fields

| Field | Description |
|---------------------|---|
| col_type | Type of column |
| col_max_len | Maximum column length |
| col_name | Name of column |
| col_name_len | Length of column name |
| col_schema_name | Column schema name |
| col_schema_name_len | Length of column schema name |
| col_precision | Precision of column |
| col_scale | Scale of column |
| col_charsetid | Column character set ID |
| col_charsetform | Column character set form |
| col_null_ok | NULL column flag; TRUE, if NULL possible |
| col_type_name | User-define type column type name, this field is valid when col_type is 109 |
| col_type_name_len | Length of user-define type column type name, this field is valid when col_type is 109 |

168.8.4 DBMS_SQL DESC_REC4 Record Type

DESC_REC4 is the element type of the DESC_TAB4 table type and the DESCRIBE_COLUMNS3 Procedure.

DESC_REC4 is identical to DESC_REC3 except that it supports longer identifiers in the fields that hold the schema name (col_schema_name) and type name (col_type_name) of a column in a dynamic query.

Syntax

```

TYPE desc_rec4 IS RECORD (
  col_type          binary_integer := 0,
  col_max_len       binary_integer := 0,
  col_name          varchar2(32767) := '',
  col_name_len      binary_integer := 0,
  col_schema_name   DBMS_ID := '',

```

```

col_schema_name_len    binary_integer := 0,
col_precision          binary_integer := 0,
col_scale              binary_integer := 0,
col_charsetid          binary_integer := 0,
col_charsetform        binary_integer := 0,
col_null_ok            boolean := TRUE,
col_type_name          DBMS_ID := '',
col_type_name_len      binary_integer := 0);

```

```

168.8.20 DBMS_SQL TIME_WITH_TIME_ZONE_TABLE Table Type

This is a table of `TIME_TZ_UNCONSTRAINED`.

Syntax

```
TYPE time_with_time_zone_table IS TABLE OF TIME_TZ_UNCONSTRAINED  
INDEX BY BINARY_INTEGER;;
```

168.8.21 DBMS_SQL TIMESTAMP_TABLE Table Type

This is a table of `TIMESTAMP_UNCONSTRAINED`.

Syntax

```
TYPE timestamp_table IS TABLE OF TIMESTAMP_UNCONSTRAINED INDEX BY BINARY_INTEGER;
```

168.8.22 DBMS_SQL TIMESTAMP_WITH_LTZ_TABLE Table Type

This is a table of `TIMESTAMP_LTZ_UNCONSTRAINED`

Syntax

```
TYPE timestamp_with_ltz_table IS TABLE OF  
TIMESTAMP_LTZ_UNCONSTRAINED INDEX BY binary_integer;
```

168.8.23 DBMS_SQL TIMESTAMP_WITH_TIME_ZONE_TABLE Table Type

This is a table of `TIMESTAMP_TZ_UNCONSTRAINED`.

Syntax

```
TYPE timestamp_with_time_zone_Table IS TABLE OF  
TIMESTAMP_TZ_UNCONSTRAINED INDEX BY binary_integer;
```

168.8.24 DBMS_SQL UROWID_TABLE Table Type

This is a table of `UROWID`.

Syntax

```
TYPE urowid_table IS TABLE OF UROWID INDEX BY BINARY_INTEGER;
```

168.8.25 DBMS_SQL VARCHAR2_TABLE Table Type

This is table of `VARCHAR2(2000)`.

Syntax

```
TYPE varchar2_table IS TABLE OF VARCHAR2(2000) INDEX BY BINARY_INTEGER;
```

168.8.26 DBMS_SQL VARCHAR2A Table Type

This is table of `VARCHAR2(32767)`.

Syntax

```
TYPE varchar2a IS TABLE OF VARCHAR2(32767) INDEX BY BINARY_INTEGER;
```

168.8.27 DBMS_SQL VARCHAR2S Table Type

This is table of VARCHAR2 (256).

Note:

This type has been superseded by the [VARCHAR2A Table Type](#). Although it is currently retained for backward compatibility of legacy code, it is in the process of deprecation and will be de-supported in a future release.

Syntax

```
TYPE varchar2s IS TABLE OF VARCHAR2(256) INDEX BY BINARY_INTEGER;
```

168.9 Summary of DBMS_SQL Subprograms

This table lists the DBMS_SQL subprograms and briefly describes them.

Table 168-6 DBMS_SQL Package Subprograms

| Subprogram | Description |
|---|--|
| BIND_ARRAY Procedures | Binds a given value to a given collection. |
| BIND_VARIABLE Procedures | Binds a given value to a given variable. |
| BIND_VARIABLE_PKG Procedure | Binds a given value to a given package variable. |
| CLOSE_CURSOR Procedure | Closes given cursor and frees memory. |
| COLUMN_VALUE Procedure | Returns value of the cursor element for a given position in a cursor. |
| COLUMN_VALUE_LONG Procedure | Returns a selected part of a LONG column, that has been defined using <code>DEFINE_COLUMN_LONG</code> . |
| DEFINE_ARRAY Procedure | Defines a collection to be selected from the given cursor, used only with <code>SELECT</code> statements. |
| DEFINE_COLUMN Procedures | Defines a column to be selected from the given cursor, used only with <code>SELECT</code> statements. |
| DEFINE_COLUMN_CHAR Procedure | Defines a column of type <code>CHAR</code> to be selected from the given cursor, used only with <code>SELECT</code> statements. |
| DEFINE_COLUMN_LONG Procedure | Defines a <code>LONG</code> column to be selected from the given cursor, used only with <code>SELECT</code> statements. |
| DEFINE_COLUMN_RAW Procedure | Defines a column of type <code>RAW</code> to be selected from the given cursor, used only with <code>SELECT</code> statements. |
| DEFINE_COLUMN_ROWID Procedure | Defines a column of type <code>ROWID</code> to be selected from the given cursor, used only with <code>SELECT</code> statements. |
| DESCRIBE_COLUMNS Procedure | Describes the columns for a cursor opened and parsed through <code>DBMS_SQL</code> . |
| DESCRIBE_COLUMNS2 Procedure | Describes the specified column, an alternative to DESCRIBE_COLUMNS Procedure . |

Table 168-6 (Cont.) DBMS_SQL Package Subprograms

| Subprogram | Description |
|---|---|
| DESCRIBE_COLUMNS3 Procedure | Describes the specified column, an alternative to DESCRIBE_COLUMNS Procedure . |
| EXECUTE Function | Executes a given cursor. |
| EXECUTE_AND_FETCH Function | Executes a given cursor and fetch rows. |
| FETCH_ROWS Function | Fetches a row from a given cursor. |
| GET_NEXT_RESULT Procedures | Gets the statement of the next result returned to the caller of the recursive statement or, if this caller sets itself as the client for the recursive statement, the next result returned to this caller as client. |
| IS_OPEN Function | Returns <code>TRUE</code> if given cursor is open. |
| LAST_ERROR_POSITION Function | Returns byte offset in the SQL statement text where the error occurred. |
| LAST_ROW_COUNT Function | Returns cumulative count of the number of rows fetched |
| LAST_ROW_ID Function | Returns <code>ROWID</code> of last row processed. |
| LAST_SQL_FUNCTION_CODE Function | Returns SQL function code for statement. |
| OPEN_CURSOR Functions | Returns cursor ID number of new cursor. |
| PARSE Procedures | Parses given statement. |
| RETURN_RESULT Procedures | Returns the result of an executed statement to the client application. |
| TO_CURSOR_NUMBER Function | Takes an <code>OPENED</code> strongly or weakly-typed ref cursor and transforms it into a <code>DBMS_SQL</code> cursor number. |
| TO_REFCURSOR Function | Takes an <code>OPENED</code> , <code>PARSED</code> , and <code>EXECUTED</code> cursor and transforms/migrates it into a PL/SQL manageable <code>REF CURSOR</code> (a weakly-typed cursor) that can be consumed by PL/SQL native dynamic SQL switched to use native dynamic SQL. |
| VARIABLE_VALUE Procedures | Returns value of named variable for given cursor. |
| VARIABLE_VALUE_PKG Procedure | Returns value of named variable for given cursor. It is used to return the values of bind variables inside PL/SQL blocks or DML statements with returning clause for a declared package. The type of the variable must be declared in the package specification. |

168.9.1 BIND_ARRAY Procedures

This procedure binds a given value or set of values to a given variable in a cursor, based on the name of the variable in the statement.

Syntax

```
DBMS_SQL.BIND_ARRAY (
    c                IN INTEGER,
    name             IN VARCHAR2,
    <table_variable> IN <datatype>
    [,index1        IN INTEGER,
    index2          IN INTEGER] );
```

Where the `<table_variable>` and its corresponding `<datatype>` can be any one of the following matching pairs:

```

clob_tab      Clob_Table
bflt_tab      Binary_Float_Table
bdbl_tab      Binary_Double_Table
blob_tab      Blob_Table
bfile_tab     Bfile_Table
date_tab      Date_Table
j_tab         Json_Table
num_tab       Number_Table
urowid_tab    Urowid_Table
vchr2_tab     Varchar2_Table
tm_tab        Time_Table
ttz_tab       Time_With_Time_Zone_Table
tms_tab       Timestamp_Table
tstz_tab      Timestamp_With_ltz_Table
tstz_tab      Timestamp_With_Time_Zone_Table
ids_tab       Interval_Day_To_Second_Table
iym_tab       Interval_Year_To_Month_Table

```

Notice that the `BIND_ARRAY` procedure is overloaded to accept different datatype.

Parameters

Table 168-7 BIND_ARRAY Procedure Parameters

| Parameter | Description |
|-----------------------------|--|
| <code>c</code> | ID number of the cursor to which you want to bind a value. |
| <code>name</code> | Name of the collection in the statement. |
| <code>table_variable</code> | Local variable that has been declared as <code><datatype></code> . |
| <code>index1</code> | Index for the table element that marks the lower bound of the range. |
| <code>index2</code> | Index for the table element that marks the upper bound of the range. |

Usage Notes

For binding a range, the table must contain the elements that specify the range — `tab(index1)` and `tab(index2)` — but the range does not have to be dense. `index1` must be less than or equal to `index2`. All elements between `tab(index1)` and `tab(index2)` are used in the bind.

If you do not specify indexes in the bind call, and two different binds in a statement specify tables that contain a different number of elements, then the number of elements actually used is the minimum number between all tables. This is also the case if you specify indexes — the minimum range is selected between the two indexes for all tables.

Not all bind variables in a query have to be array binds. Some can be regular binds and the same value are used for each element of the collections in expression evaluations (and so forth).

Bulk Array Binds

Bulk selects, inserts, updates, and deletes can enhance the performance of applications by bundling many calls into one. The `DBMS_SQL` package lets you work on collections of data using the PL/SQL table type.

Table items are unbounded homogeneous collections. In persistent storage, they are like other relational tables and have no intrinsic ordering. But when a table item is brought into the workspace (either by querying or by navigational access of persistent data), or when it is created as the value of a PL/SQL variable or parameter, its elements are given subscripts that can be used with array-style syntax to get and set the values of elements.

The subscripts of these elements need not be dense, and can be any number including negative numbers. For example, a table item can contain elements at locations -10, 2, and 7 only.

When a table item is moved from transient workspace to persistent storage, the subscripts are not stored; the table item is unordered in persistent storage.

At bind time the table is copied out from the PL/SQL buffers into local DBMS_SQL buffers (the same as for all scalar types) and then the table is manipulated from the local DBMS_SQL buffers. Therefore, if you change the table after the bind call, then that change does not affect the way the execute acts.

Types for Scalar and LOB Collections

You can declare a local variable as one of the following table-item types, which are defined as public types in DBMS_SQL.

```

TYPE binary_double_table
    IS TABLE OF BINARY_DOUBLE INDEX BY BINARY_INTEGER;
TYPE binary_float_table
    IS TABLE OF BINARY_FLOAT INDEX BY BINARY_INTEGER;
TYPE bfile_table IS TABLE OF BFILE INDEX BY BINARY_INTEGER;
TYPE blob_table IS TABLE OF BLOB INDEX BY BINARY_INTEGER;
TYPE clob_table IS TABLE OF CLOB INDEX BY BINARY_INTEGER;
TYPE date_table IS TABLE OF DATE INDEX BY BINARY_INTEGER;
TYPE interval_day_to_second_Table
    IS TABLE OF dsinterval_unconstrained
    INDEX BY BINARY_INTEGER;
TYPE interval_year_to_MONTH_Table
    IS TABLE OF yminterval_unconstrained
    INDEX BY BINARY_INTEGER;
TYPE json_table IS TABLE OF JSON INDEX BY BINARY_INTEGER;
TYPE number_table IS TABLE OF NUMBER INDEX BY BINARY_INTEGER;
TYPE time_table IS TABLE OF time_unconstrained
    INDEX BY BINARY_INTEGER;
TYPE time_with_time_zone_table
    IS TABLE OF time_tz_unconstrained
    INDEX BY BINARY_INTEGER;
TYPE timestamp_table
    IS TABLE OF timestamp_unconstrained
    INDEX BY BINARY_INTEGER;
TYPE timestamp_with_ltz_Table
    IS TABLE OF timestamp_ltz_unconstrained
    INDEX BY BINARY_INTEGER;
TYPE timestamp_with_time_zone_Table
    IS TABLE OF timestamp_tz_unconstrained
    INDEX BY BINARY_INTEGER;
TYPE urowid_table IS TABLE OF UROWID INDEX BY BINARY_INTEGER;
TYPE varchar2_table IS TABLE OF VARCHAR2(2000) INDEX BY BINARY_INTEGER;

```

Example 168-1 Examples Using Bulk DML

This series of examples shows how to use bulk array binds (table items) in the SQL DML statements `INSERT`, `UPDATE` and `DELETE`.

Here is an example of a bulk `INSERT` statement that demonstrates adding seven new employees to the `emp` table:

```
DECLARE
  stmt VARCHAR2(200);
  empno_array DBMS_SQL.NUMBER_TABLE;
  empname_array DBMS_SQL.VARCHAR2_TABLE;
  jobs_array DBMS_SQL.VARCHAR2_TABLE;
  mgr_array DBMS_SQL.NUMBER_TABLE;
  hiredate_array DBMS_SQL.VARCHAR2_TABLE;
  sal_array DBMS_SQL.NUMBER_TABLE;
  comm_array DBMS_SQL.NUMBER_TABLE;
  deptno_array DBMS_SQL.NUMBER_TABLE;
  c NUMBER;
  dummy NUMBER;
BEGIN
  empno_array(1) := 9001;
  empno_array(2) := 9002;
  empno_array(3) := 9003;
  empno_array(4) := 9004;
  empno_array(5) := 9005;
  empno_array(6) := 9006;
  empno_array(7) := 9007;

  empname_array(1) := 'Dopey';
  empname_array(2) := 'Grumpy';
  empname_array(3) := 'Doc';
  empname_array(4) := 'Happy';
  empname_array(5) := 'Bashful';
  empname_array(6) := 'Sneezy';
  empname_array(7) := 'Sleepy';

  jobs_array(1) := 'Miner';
  jobs_array(2) := 'Miner';
  jobs_array(3) := 'Miner';
  jobs_array(4) := 'Miner';
  jobs_array(5) := 'Miner';
  jobs_array(6) := 'Miner';
  jobs_array(7) := 'Miner';

  mgr_array(1) := 9003;
  mgr_array(2) := 9003;
  mgr_array(3) := 9003;
  mgr_array(4) := 9003;
  mgr_array(5) := 9003;
  mgr_array(6) := 9003;
  mgr_array(7) := 9003;

  hiredate_array(1) := '06-DEC-2006';
  hiredate_array(2) := '06-DEC-2006';
  hiredate_array(3) := '06-DEC-2006';
  hiredate_array(4) := '06-DEC-2006';
  hiredate_array(5) := '06-DEC-2006';
  hiredate_array(6) := '06-DEC-2006';
  hiredate_array(7) := '06-DEC-2006';
```

```
sal_array(1) := 1000;
sal_array(2) := 1000;
sal_array(3) := 1000;
sal_array(4) := 1000;
sal_array(5) := 1000;
sal_array(6) := 1000;
sal_array(7) := 1000;

comm_array(1) := 0;
comm_array(2) := 0;
comm_array(3) := 0;
comm_array(4) := 0;
comm_array(5) := 0;
comm_array(6) := 0;
comm_array(7) := 0;

deptno_array(1) := 11;
deptno_array(2) := 11;
deptno_array(3) := 11;
deptno_array(4) := 11;
deptno_array(5) := 11;
deptno_array(6) := 11;
deptno_array(7) := 11;

stmt := 'INSERT INTO emp VALUES (
    :num_array, :name_array, :jobs_array, :mgr_array, :hiredate_array,
    :sal_array, :comm_array, :deptno_array)';
c := DBMS_SQL.OPEN_CURSOR;
DBMS_SQL.PARSE(c, stmt, DBMS_SQL.NATIVE);
DBMS_SQL.BIND_ARRAY(c, ':num_array', empno_array);
DBMS_SQL.BIND_ARRAY(c, ':name_array', empname_array);
DBMS_SQL.BIND_ARRAY(c, ':jobs_array', jobs_array);
DBMS_SQL.BIND_ARRAY(c, ':mgr_array', mgr_array);
DBMS_SQL.BIND_ARRAY(c, ':hiredate_array', hiredate_array);
DBMS_SQL.BIND_ARRAY(c, ':sal_array', sal_array);
DBMS_SQL.BIND_ARRAY(c, ':comm_array', comm_array);
DBMS_SQL.BIND_ARRAY(c, ':deptno_array', deptno_array);

dummy := DBMS_SQL.EXECUTE(c);
DBMS_SQL.CLOSE_CURSOR(c);
EXCEPTION WHEN OTHERS THEN
    IF DBMS_SQL.IS_OPEN(c) THEN
        DBMS_SQL.CLOSE_CURSOR(c);
    END IF;
    RAISE;
END;
/
SHOW ERRORS;
```

Here is an example of a bulk UPDATE statement that demonstrates updating salaries for four existing employees in the emp table:

```
DECLARE
    stmt VARCHAR2(200);
    empno_array DBMS_SQL.NUMBER_TABLE;
    salary_array DBMS_SQL.NUMBER_TABLE;
    c NUMBER;
    dummy NUMBER;
BEGIN

    empno_array(1) := 7369;
```

```

empno_array(2) := 7876;
empno_array(3) := 7900;
empno_array(4) := 7934;

salary_array(1) := 10000;
salary_array(2) := 10000;
salary_array(3) := 10000;
salary_array(4) := 10000;

stmt := 'update emp set sal = :salary_array
        WHERE empno = :num_array';
c := DBMS_SQL.OPEN_CURSOR;
DBMS_SQL.PARSE(c, stmt, DBMS_SQL.NATIVE);
DBMS_SQL.BIND_ARRAY(c, ':num_array', empno_array);
DBMS_SQL.BIND_ARRAY(c, ':salary_array', salary_array);
dummy := DBMS_SQL.EXECUTE(c);
DBMS_SQL.CLOSE_CURSOR(c);

EXCEPTION WHEN OTHERS THEN
    IF DBMS_SQL.IS_OPEN(c) THEN
        DBMS_SQL.CLOSE_CURSOR(c);
    END IF;
    RAISE;
END;
/

```

In a **DELETE** statement, for example, you could bind an array in the **WHERE** clause and have the statement be run for each element in the array:

```

DECLARE
    stmt VARCHAR2(200);
    dept_no_array DBMS_SQL.NUMBER_TABLE;
    c NUMBER;
    dummy NUMBER;
begin
    dept_no_array(1) := 10; dept_no_array(2) := 20;
    dept_no_array(3) := 30; dept_no_array(4) := 40;
    dept_no_array(5) := 30; dept_no_array(6) := 40;
    stmt := 'delete from emp where deptno = :dept_array';
    c := DBMS_SQL.OPEN_CURSOR;
    DBMS_SQL.PARSE(c, stmt, DBMS_SQL.NATIVE);
    DBMS_SQL.BIND_ARRAY(c, ':dept_array', dept_no_array, 1, 4);
    dummy := DBMS_SQL.EXECUTE(c);
    DBMS_SQL.CLOSE_CURSOR(c);

    EXCEPTION WHEN OTHERS THEN
        IF DBMS_SQL.IS_OPEN(c) THEN
            DBMS_SQL.CLOSE_CURSOR(c);
        END IF;
        RAISE;
END;
/

```

In the preceding example, only elements 1 through 4 are used as specified by the **BIND_ARRAY** call. Each element of the array potentially deletes a large number of employees from the database.

168.9.2 BIND_VARIABLE Procedures

These procedures bind a given value or set of values to a given variable in a cursor, based on the name of the variable in the statement.

Syntax

```
DBMS_SQL.BIND_VARIABLE (
    c           IN INTEGER,
    name        IN VARCHAR2,
    value       IN <datatype>);
```

Where <datatype> can be any one of the following types:

```
ADT (user-defined object types)
BINARY_DOUBLE
BINARY_FLOAT
BFILE
BLOB
BOOLEAN
CLOB CHARACTER SET ANY_CS
DATE
DSINTERVAL_UNCONSTRAINED
NESTED table
NUMBER
OPAQUE types
REF
TIME_UNCONSTRAINED
TIME_TZ_UNCONSTRAINED
TIMESTAMP_LTZ_UNCONSTRAINED
TIMESTAMP_TZ_UNCONSTRAINED
TIMESTAMP_UNCONSTRAINED
UROWID
VARCHAR2 CHARACTER SET ANY_CS
VARRAY
YMINTERVAL_UNCONSTRAINED
```

Notice that `BIND_VARIABLE` is overloaded to accept different datatype.

The following syntax is also supported for `BIND_VARIABLE`. The square brackets `[]` indicate an optional parameter for the `BIND_VARIABLE` procedure.

```
DBMS_SQL.BIND_VARIABLE (
    c           IN INTEGER,
    name        IN VARCHAR2,
    value       IN VARCHAR2 CHARACTER SET ANY_CS [,out_value_size IN INTEGER]);
```

To bind `CHAR`, `RAW`, and `ROWID` data, you can use the following variations on the syntax:

```
DBMS_SQL.BIND_VARIABLE_CHAR (
    c           IN INTEGER,
    name        IN VARCHAR2,
    value       IN CHAR CHARACTER SET ANY_CS [,out_value_size IN INTEGER]);
```

```
DBMS_SQL.BIND_VARIABLE_RAW (
    c           IN INTEGER,
    name        IN VARCHAR2,
    value       IN RAW [,out_value_size IN INTEGER]);
```

```
DBMS_SQL.BIND_VARIABLE_ROWID (
    c           IN INTEGER,
    name        IN VARCHAR2,
    value       IN ROWID);
```

Pragmas

```
pragma restrict_references(bind_variable,WNDS);
```

Parameters

Table 168-8 BIND_VARIABLE Procedures Parameters

| Parameter | Description |
|----------------|--|
| c | ID number of the cursor to which you want to bind a value. |
| name | Name of the variable in the statement. The length of the bind variable name must be <=30 bytes. |
| value | Value that you want to bind to the variable in the cursor. For IN and IN/OUT variables, the value has the same type as the type of the value being passed in for this parameter. |
| out_value_size | Maximum expected OUT value size, in bytes, for the VARCHAR2, RAW, CHAR OUT or IN/OUT variable. If no size is given, then the length of the current value is used. This parameter must be specified if the value parameter is not initialized. |

Usage Notes

If the variable is an IN or IN/OUT variable or an IN collection, then the given bind value must be valid for the variable or array type. Bind values for OUT variables are ignored.

The bind variables or collections of a SQL statement are identified by their names. When binding a value to a bind variable or bind array, the string identifying it in the statement must contain a leading colon, as shown in the following example:

```
SELECT emp_name FROM emp WHERE SAL > :X;
```

For this example, the corresponding bind call would look similar to

```
BIND_VARIABLE(cursor_name, ':X', 3500);
```

or

```
BIND_VARIABLE (cursor_name, 'X', 3500);
```

168.9.3 BIND_VARIABLE_PKG Procedure

This procedure binds a variable given value or set of values to a given variable in a cursor, based on the name of the variable in the statement. The type of the variable must be declared in the package specification. Bulk operations are not supported for these types.

Syntax

```
DBMS_SQL.BIND_VARIABLE_PKG (
    c           IN INTEGER,
```

```
name          IN VARCHAR2,
value         IN <datatype>;
```

Where <datatype> can be any one of the following data types:

- RECORD
- VARRAY
- NESTED TABLE
- INDEX BY PLS_INTEGER TABLE
- INDEX BY BINARY_INTEGER TABLE

Table 168-9 BIND_VARIABLE_PKG Parameters

| Parameter | Description |
|-----------|---|
| c | ID number of the cursor from which to get the values. |
| name | Name of the variable in the statement for which you are retrieving the value. |
| value | <ul style="list-style-type: none"> • Single row option: Returns the value of the variable for the specified position. Oracle raises the exception <code>ORA-06562, inconsistent_type</code>, if the type of this output parameter differs from the actual type of the value, as defined by the call to <code>BIND_VARIABLE_PKG</code>. • Array option: Local variable that has been declared <table_type> |

Example 168-2 Dynamic SQL using DBMS_SQL.BIND_VARIABLE_PKG to Bind a Package Variable

The variables types are declared in the package specification. The `BIND_VARIABLE_PKG` is used to bind the variable `v1` in the cursor SQL statement.

```
CREATE OR REPLACE PACKAGE ty_pkg AS
  TYPE rec IS RECORD ( n1 NUMBER, n2 NUMBER);
  TYPE trec IS TABLE OF REC INDEX BY BINARY_INTEGER;
  TYPE trect IS TABLE OF NUMBER;
  TYPE trecv IS VARRAY(100) OF NUMBER;
END ty_pkg;
/
CREATE OR REPLACE PROCEDURE dyn_sql_ibbi AS
  dummy NUMBER;
  cur NUMBER;
  v1 ty_pkg.trec;
  str VARCHAR2(3000);
  n1 NUMBER;
  n2 NUMBER;
BEGIN
  FOR i in 1..3 LOOP
    v1(i).n1 := i*10;
    v1(i).n2 := i*20;
  END LOOP;
```

```

str := 'SELECT * FROM TABLE(:v1)' ;
cur := DBMS_SQL.OPEN_CURSOR();
DBMS_SQL.PARSE(cur, str, DBMS_SQL.NATIVE);
DBMS_SQL.BIND_VARIABLE_PKG(cur, ':v1', v1);
dummy := DBMS_SQL.EXECUTE(cur);
DBMS_SQL.DEFINE_COLUMN(cur, 1, n1);
DBMS_SQL.DEFINE_COLUMN(cur, 2, n2);

LOOP
  IF DBMS_SQL.FETCH_ROWS(cur) > 0 THEN
    -- get column values of the row
    DBMS_SQL.COLUMN_VALUE(cur, 1, n1);
    DBMS_SQL.COLUMN_VALUE(cur, 2, n2);
    DBMS_OUTPUT.PUT_LINE('n1 = '||n1||' n2 = '||n2);
  ELSE
    -- No more rows
    EXIT;
  END IF;
END LOOP;
DBMS_SQL.CLOSE_CURSOR(cur);
END dyn_sql_ibbi;
/
EXEC dyn_sql_ibbi;

n1 = 10 n2 = 20
n1 = 20 n2 = 40
n1 = 30 n2 = 60

```

168.9.4 CLOSE_CURSOR Procedure

This procedure closes a given cursor.

Syntax

```
DBMS_SQL.CLOSE_CURSOR (
  c      IN OUT INTEGER);
```

Pragmas

```
pragma restrict_references(close_cursor,RNDS,WNDS);
```

Parameters

Table 168-10 CLOSE_CURSOR Procedure Parameters

| Parameter | Mode | Description |
|-----------|------|---|
| c | IN | ID number of the cursor that you want to close. |
| c | OUT | Cursor is set to null. After you call CLOSE_CURSOR, the memory allocated to the cursor is released and you can no longer fetch from that cursor. |

168.9.5 COLUMN_VALUE Procedure

This procedure returns the value of the cursor element for a given position in a given cursor. This procedure is used to access the data fetched by calling `FETCH_ROWS`.

Syntax

```
DBMS_SQL.COLUMN_VALUE (
  c           IN  INTEGER,
  position    IN  INTEGER,
  value       OUT <datatype>
  [,column_error OUT NUMBER]
  [,actual_length OUT INTEGER]);
```

Where square brackets [] indicate optional parameters and <datatype> can be any one of the following types:

```
BINARY_DOUBLE
BINARY_FLOAT
BFILE
BLOB
CLOB CHARACTER SET ANY_CS
DATE
DSINTERVAL_UNCONSTRAINED
NUMBER
TIME_TZ_UNCONSTRAINED
TIME_UNCONSTRAINED
TIMESTAMP_LTZ_UNCONSTRAINED
TIMESTAMP_TZ_UNCONSTRAINED
TIMESTAMP_UNCONSTRAINED
UROWID
VARCHAR2 CHARACTER SET ANY_CS
YMINTERVAL_UNCONSTRAINED
user-defined object types
collections (VARARRAYs and nested tables)
REFs
Opaque types
```

For variables containing CHAR, RAW, and ROWID data, you can use the following variations on the syntax:

```
DBMS_SQL.COLUMN_VALUE_CHAR (
  c           IN  INTEGER,
  position    IN  INTEGER,
  value       OUT CHAR CHARACTER SET ANY_CS
  [,column_error OUT NUMBER]
  [,actual_length OUT INTEGER]);
```

```
DBMS_SQL.COLUMN_VALUE_RAW (
  c           IN  INTEGER,
  position    IN  INTEGER,
  value       OUT RAW
  [,column_error OUT NUMBER]
  [,actual_length OUT INTEGER]);
```

```
DBMS_SQL.COLUMN_VALUE_ROWID (
  c           IN  INTEGER,
  position    IN  INTEGER,
  value       OUT ROWID
```

```
[,column_error    OUT NUMBER]
[,actual_length   OUT INTEGER]);
```

The following syntax enables the `COLUMN_VALUE` procedure to accommodate bulk operations:

```
DBMS_SQL.COLUMN_VALUE (
  c              IN          INTEGER,
  position      IN          INTEGER,
  <param_name>  IN OUT NOCOPY <table_type>);
```

Where the `<param_name>` and its corresponding `<table_type>` can be any one of these matching pairs:

```
bdbl_tab      Binary_Double_Table
bflt_tab      Binary_Float_Table
bf_tab        Bfile_Table
bl_tab        Blob_Table
cl_tab        Clob_Table
d_tab         Date_Table
ids_tab       Interval_Day_To_Second_Table
iym_tab       Interval_Year_To_Month_Table
j_tab         Json_table
n_tab         Number_Table
tm_tab        Time_Table
ttz_tab       Time_With_Time_Zone_Table
tms_tab       Timestamp_Table
tstz_tab      Timestamp_With_ltz_Table
tstz_tab      Timestamp_With_Time_Zone_Table
ur_tab        Urowid_Table
c_tab         Varchar2_Table
```

Pragmas

```
pragma restrict_references(column_value,RNDS,WNDS);
```

Parameters

Table 168-11 COLUMN_VALUE Procedure Parameters (Single Row)

| Parameter | Description |
|----------------------------|--|
| <code>c</code> | ID number of the cursor from which you are fetching the values. |
| <code>position</code> | Relative position of the column in the cursor. The first column in a statement has position 1. |
| <code>value</code> | Returns the value at the specified column. Oracle raises exception <code>ORA-06562, inconsistent_type</code> , if the type of this output parameter differs from the actual type of the value, as defined by the call to <code>DEFINE_COLUMN</code> . |
| <code>column_error</code> | Returns any error code for the specified column value. |
| <code>actual_length</code> | The actual length, before any truncation, of the value in the specified column. |

Table 168-12 COLUMN_VALUE Procedure Parameters (Bulk)

| Parameter | Description |
|----------------|---|
| <code>c</code> | ID number of the cursor from which you are fetching the values. |

Table 168-12 (Cont.) COLUMN_VALUE Procedure Parameters (Bulk)

| Parameter | Description |
|--------------|---|
| position | Relative position of the column in the cursor. The first column in a statement has position 1. |
| <param_name> | Local variable that has been declared <table_type>. <param_name> is an IN OUT NOCOPY parameter for bulk operations. For bulk operations, the subprogram appends the new elements at the appropriate (implicitly maintained) index. For instance if on utilizing the DEFINE_ARRAY Procedure a batch size (the <code>cnt</code> parameter) of 10 rows was specified and a start index (<code>lower_bound</code>) of 1 was specified, then the first call to this subprogram after calling the FETCH_ROWS Function will populate elements at index 1..10, and the next call will populate elements 11..20, and so on. |

Exceptions

INCONSISTENT_TYPE (ORA-06562) is raised if the type of the given OUT parameter value is different from the actual type of the value. This type was the given type when the column was defined by calling procedure `DEFINE_COLUMN`.

168.9.6 COLUMN_VALUE_LONG Procedure

This procedure gets part of the value of a long column.

Syntax

```
DBMS_SQL.COLUMN_VALUE_LONG (
    c           IN  INTEGER,
    position    IN  INTEGER,
    length      IN  INTEGER,
    offset      IN  INTEGER,
    value       OUT VARCHAR2,
    value_length OUT INTEGER);
```

Pragmas

```
pragma restrict_references (column_value_long, RNDS, WNDS);
```

Parameters

Table 168-13 COLUMN_VALUE_LONG Procedure Parameters

| Parameter | Description |
|--------------|---|
| c | Cursor ID number of the cursor from which to get the value. |
| position | Position of the column of which to get the value. |
| length | Number of bytes of the long value to fetch. |
| offset | Offset into the long field for start of fetch. |
| value | Value of the column as a VARCHAR2. |
| value_length | Number of bytes actually returned in value. |

168.9.7 DEFINE_ARRAY Procedure

This procedure defines the collection for column into which you want to fetch rows (with a `FETCH_ROWS` call). This procedure lets you do batch fetching of rows from a single `SELECT` statement. A single fetch call brings over a number of rows into the PL/SQL aggregate object.

When you fetch the rows, they are copied into `DBMS_SQL` buffers until you run a `COLUMN_VALUE` call, at which time the rows are copied into the table that was passed as an argument to the `COLUMN_VALUE` call.

Scalar and LOB Types for Collections

You can declare a local variable as one of the following table-item types, and then fetch any number of rows into it using `DBMS_SQL`. (These are the same types as you can specify for the `BIND_ARRAY` procedure.)

```

TYPE binary_double_table
    IS TABLE OF BINARY_DOUBLE INDEX BY BINARY_INTEGER;
TYPE binary_float_table
    IS TABLE OF BINARY_FLOAT INDEX BY BINARY_INTEGER;
TYPE bfile_table IS TABLE OF BFILE INDEX BY BINARY_INTEGER;
TYPE blob_table IS TABLE OF BLOB INDEX BY BINARY_INTEGER;
TYPE clob_table IS TABLE OF CLOB INDEX BY BINARY_INTEGER;
TYPE date_table IS TABLE OF DATE INDEX BY BINARY_INTEGER;
TYPE interval_day_to_second_Table
    IS TABLE OF dsinterval_unconstrained
    INDEX BY BINARY_INTEGER;
TYPE interval_year_to_MONTH_Table
    IS TABLE OF yminterval_unconstrained
    INDEX BY BINARY_INTEGER;
TYPE json_table IS TABLE OF JSON INDEX BY BINARY_INTEGER;
TYPE number_table IS TABLE OF NUMBER INDEX BY BINARY_INTEGER;
TYPE time_table IS TABLE OF time_unconstrained
    INDEX BY BINARY_INTEGER;
TYPE time_with_time_zone_table
    IS TABLE OF time_tz_unconstrained
    INDEX BY BINARY_INTEGER;
TYPE timestamp_table
    IS TABLE OF timestamp_unconstrained
    INDEX BY BINARY_INTEGER;
TYPE timestamp_with_ltz_Table
    IS TABLE OF timestamp_ltz_unconstrained
    INDEX BY BINARY_INTEGER;
TYPE timestamp_with_time_zone_Table
    IS TABLE OF timestamp_tz_unconstrained
    INDEX BY BINARY_INTEGER;
TYPE urowid_table IS TABLE OF UROWID INDEX BY BINARY_INTEGER;
TYPE varchar2_table IS TABLE OF VARCHAR2(2000) INDEX BY BINARY_INTEGER;

```

Syntax

```

DBMS_SQL.DEFINE_ARRAY (
    c           IN INTEGER,
    position    IN INTEGER,
    <table_variable> IN <datatype>
    cnt         IN INTEGER,
    lower_bnd   IN INTEGER);

```

Where `<table_variable>` and its corresponding `<datatype>` can be any one of the following matching pairs, `DEFINE_ARRAY` being overloaded to accept different datatypes:

```
clob_tab      Clob_Table
bflt_tab      Binary_Float_Table
bdbl_tab      Binary_Double_Table
blob_tab      Blob_Table
bfile_tab     Bfile_Table
date_tab      Date_Table
j_tab         Json_Table
num_tab       Number_Table
urowid_tab    Urowid_Table
vchr2_tab     Varchar2_Table
tm_tab        Time_Table
ttz_tab       Time_With_Time_Zone_Table
tms_tab       Timestamp_Table
tstz_tab      Timestamp_With_ltz_Table
tstz_tab      Timestamp_With_Time_Zone_Table
ids_tab       Interval_Day_To_Second_Table
iym_tab       Interval_Year_To_Month_Table
```

Pragmas

```
pragma restrict_references(define_array,RNDS,WNDS);
```

The subsequent `FETCH_ROWS` call fetch "count" rows. When the `COLUMN_VALUE` call is made, these rows are placed in positions `lower_bnd`, `lower_bnd+1`, `lower_bnd+2`, and so on. While there are still rows coming, the user keeps issuing `FETCH_ROWS/COLUMN_VALUE` calls. The rows keep accumulating in the table specified as an argument in the `COLUMN_VALUE` call.

Parameters

Table 168-14 `DEFINE_ARRAY` Procedure Parameters

| Parameter | Description |
|-----------------------------|--|
| <code>c</code> | ID number of the cursor to which you want to bind an array. |
| <code>position</code> | Relative position of the column in the array being defined. The first column in a statement has position 1. |
| <code>table_variable</code> | Local variable that has been declared as <code><datatype></code> . |
| <code>cnt</code> | Number of rows that must be fetched. |
| <code>lower_bnd</code> | Results are copied into the collection, starting at this lower bound index. |

Usage Notes

The count (`cnt`) must be an integer greater than zero; otherwise an exception is raised. The `lower_bnd` can be positive, negative, or zero. A query on which a `DEFINE_ARRAY` call was issued cannot contain array binds.

Examples

```
PROCEDURE BULK_PLSQL(deptid NUMBER)
    TYPE namelist IS TABLE OF employees.last_name%TYPE;
```

```

TYPE sallist IS TABLE OF employees.salary%TYPE;
names    namelist;
sals     sallist;
c        NUMBER;
r        NUMBER;
sql_stmt VARCHAR2(32767) :=
    'SELECT last_name, salary FROM employees WHERE department_id = :b1';

BEGIN
    c := DBMS_SQL.OPEN_CURSOR;
    DBMS_SQL.PARSE(c, sql_stmt, dbms_sql.native);

    DBMS_SQL.BIND_VARIABLE(c, 'b1', deptid);

    DBMS_SQL.DEFINE_ARRAY(c, 1, names, 5);
    DBMS_SQL.DEFINE_ARRAY(c, 2, sals, 5);

    r := DBMS_SQL.EXECUTE(c);

    LOOP
        r := DBMS_SQL.FETCH_ROWS(c);
        DBMS_SQL.COLUMN_VALUE(c, 1, names);
        DBMS_SQL.COLUMN_VALUE(c, 2, sals);
        EXIT WHEN r != 5;
    END LOOP;

    DBMS_SQL.CLOSE_CURSOR(c);

    -- loop through the names and sals collections
    FOR i IN names.FIRST .. names.LAST LOOP
        DBMS_OUTPUT.PUT_LINE('Name = ' || names(i) || ', salary = ' || sals(i));
    END LOOP;
END;
/

```

Example 168-3 Example: Defining an Array

The following examples show how to use the `DEFINE_ARRAY` procedure:

```

declare
    c        NUMBER;
    d        NUMBER;
    n_tab    DBMS_SQL.NUMBER_TABLE;
    indx     NUMBER := -10;
BEGIN
    c := DBMS_SQL.OPEN_CURSOR;
    DBMS_SQL.PARSE(c, 'select n from t order by 1', DBMS_SQL.NATIVE);

    DBMS_SQL.DEFINE_ARRAY(c, 1, n_tab, 10, indx);

    d := DBMS_SQL.EXECUTE(c);
    loop
        d := DBMS_SQL.FETCH_ROWS(c);

        DBMS_SQL.COLUMN_VALUE(c, 1, n_tab);

        EXIT WHEN d != 10;
    END LOOP;

    DBMS_SQL.CLOSE_CURSOR(c);

```

```

EXCEPTION WHEN OTHERS THEN
  IF DBMS_SQL.IS_OPEN(c) THEN
    DBMS_SQL.CLOSE_CURSOR(c);
  END IF;
  RAISE;
END;
/

```

Each time the preceding example calls [FETCH_ROWS Function](#), it fetches 10 rows that are kept in `DBMS_SQL` buffers. When the [COLUMN_VALUE Procedure](#) is called, those rows move into the PL/SQL table specified (in this case `n_tab`), at positions -10 to -1, as specified in the `DEFINE` statements. When the second batch is fetched in the loop, the rows go to positions 0 to 9; and so on.

A current index into each array is maintained automatically. This index is initialized to "indx" at `EXECUTE` time and is updated every time `COLUMN_VALUE` is called. If you reexecute at any point, then the current index for each `DEFINE` is reinitialized to "indx".

In this way the entire result of the query is fetched into the table. When `FETCH_ROWS` cannot fetch 10 rows, it returns the number of rows actually fetched (if no rows could be fetched, then it returns zero) and exits the loop.

Here is another example of using the `DEFINE_ARRAY` procedure:

Consider a table `MULTI_TAB` defined as:

```

CREATE TABLE multi_tab (num NUMBER,
                        dat1 DATE,
                        var VARCHAR2(24),
                        dat2 DATE)

```

To select everything from this table and move it into four PL/SQL tables, you could use the following simple program:

```

DECLARE
  c          NUMBER;
  d          NUMBER;
  n_tab     DBMS_SQL.NUMBER_TABLE;
  d_tab1    DBMS_SQL.DATE_TABLE;
  v_tab     DBMS_SQL.VARCHAR2_TABLE;
  d_tab2    DBMS_SQL.DATE_TABLE;
  indx      NUMBER := 10;
BEGIN

  c := DBMS_SQL.OPEN_CURSOR;
  DBMS_SQL.PARSE(c, 'select * from multi_tab order by 1', DBMS_SQL.NATIVE);

  DBMS_SQL.DEFINE_ARRAY(c, 1, n_tab, 5, indx);
  DBMS_SQL.DEFINE_ARRAY(c, 2, d_tab1, 5, indx);
  DBMS_SQL.DEFINE_ARRAY(c, 3, v_tab, 5, indx);
  DBMS_SQL.DEFINE_ARRAY(c, 4, d_tab2, 5, indx);

  d := DBMS_SQL.EXECUTE(c);

  LOOP
    d := DBMS_SQL.FETCH_ROWS(c);

    DBMS_SQL.COLUMN_VALUE(c, 1, n_tab);
    DBMS_SQL.COLUMN_VALUE(c, 2, d_tab1);
    DBMS_SQL.COLUMN_VALUE(c, 3, v_tab);

```

```

        DBMS_SQL.COLUMN_VALUE(c, 4, d_tab2);

        EXIT WHEN d != 5;
    END LOOP;

    DBMS_SQL.CLOSE_CURSOR(c);

/*

```

The four tables can be used for anything. One usage might be to use `BIND_ARRAY` to move the rows to another table by using a statement such as `'INSERT into SOME_T values (:a, :b, :c, :d);`

```

*/

EXCEPTION WHEN OTHERS THEN
    IF DBMS_SQL.IS_OPEN(c) THEN
        DBMS_SQL.CLOSE_CURSOR(c);
    END IF;
    RAISE;
END;
/

```

168.9.8 DEFINE_COLUMN Procedures

This procedure defines a column to be selected from the given cursor. This procedure is only used with `SELECT` cursors.

The column being defined is identified by its relative position in the `SELECT` list of the statement in the given cursor. The type of the `COLUMN` value determines the type of the column being defined.

See also the [DEFINE_COLUMN_CHAR Procedure](#), [DEFINE_COLUMN_LONG Procedure](#), [DEFINE_COLUMN_RAW Procedure](#) and [DEFINE_COLUMN_ROWID Procedure](#).

Syntax

```

DBMS_SQL.DEFINE_COLUMN (
    c                IN INTEGER,
    position         IN INTEGER,
    column           IN <datatype>);

```

Where <datatype> can be any one of the following types:

```

BINARY_DOUBLE
BINARY_FLOAT
BFILE
BLOB
CLOB CHARACTER SET ANY_CS
DATE
DSINTERVAL_UNCONSTRAINED
NUMBER
TIME_UNCONSTRAINED
TIME_TZ_UNCONSTRAINED
TIMESTAMP_LTZ_UNCONSTRAINED
TIMESTAMP_TZ_UNCONSTRAINED
TIMESTAMP_UNCONSTRAINED
UROWID
YMINTERVAL_UNCONSTRAINED
user-defined object types

```

collections (VARRAYs and nested tables)
REFs
Opaque types

Note that `DEFINE_COLUMN` is overloaded to accept different datatypes.

The following syntax is also supported for the `DEFINE_COLUMN` procedure:

```
DBMS_SQL.DEFINE_COLUMN (
    c           IN INTEGER,
    position    IN INTEGER,
    column      IN VARCHAR2 CHARACTER SET ANY_CS,
    column_size IN INTEGER);
```

Pragmas

```
pragma restrict_references(define_column,RNDS,WNDS);
```

Parameters

Table 168-15 `DEFINE_COLUMN` Procedure Parameters

| Parameter | Description |
|--------------------------|---|
| <code>c</code> | ID number of the cursor for the row being defined to be selected |
| <code>position</code> | Relative position of the column in the row being defined. The first column in a statement has position 1. |
| <code>column</code> | Value of the column being defined. The type of this value determines the type for the column being defined. |
| <code>column_size</code> | Maximum expected size of the column value in bytes for columns of type <code>VARCHAR2</code> . |

Usage Notes

When using character length semantics the maximum number of bytes that can be returned for a column value of type `VARCHAR2` is calculated as: `column_size * maximum character byte size for the current character set`. For example, specifying the `column_size` as 10 means that a maximum of 30 (10*3) bytes can be returned when using character length semantics with a UTF8 character set regardless of the number of characters this represents.

168.9.9 `DEFINE_COLUMN_CHAR` Procedure

This procedure defines a column with `CHAR` data to be selected from the given cursor. This procedure is only used with `SELECT` cursors.

The column being defined is identified by its relative position in the `SELECT` list of the statement in the given cursor. The type of the `COLUMN` value determines the type of the column being defined.

See also the [DEFINE_COLUMN Procedures](#), [DEFINE_COLUMN_LONG Procedure](#), [DEFINE_COLUMN_RAW Procedure](#) and [DEFINE_COLUMN_ROWID Procedure](#).

Syntax

```
DBMS_SQL.DEFINE_COLUMN_CHAR (
    c           IN INTEGER,
```

```

position      IN INTEGER,
column        IN CHAR CHARACTER SET ANY_CS,
column_size   IN INTEGER);

```

Pragmas

```
pragma restrict_references(define_column,RNDS,WNDS);
```

Parameters

Table 168-16 DEFINE_COLUMN_CHAR Procedure Parameters

| Parameter | Description |
|-------------|---|
| c | ID number of the cursor for the row being defined to be selected |
| position | Relative position of the column in the row being defined. The first column in a statement has position 1. |
| column | Value of the column being defined. The type of this value determines the type for the column being defined. |
| column_size | Maximum expected size of the column value in characters for columns of type CHAR. |

168.9.10 DEFINE_COLUMN_LONG Procedure

This procedure defines a `LONG` column for a `SELECT` cursor. The column being defined is identified by its relative position in the `SELECT` list of the statement for the given cursor. The type of the `COLUMN` value determines the type of the column being defined.

See also the [DEFINE_COLUMN Procedures](#), [DEFINE_COLUMN_CHAR Procedure](#), [DEFINE_COLUMN_RAW Procedure](#) and [DEFINE_COLUMN_ROWID Procedure](#).

Syntax

```

DBMS_SQL.DEFINE_COLUMN_LONG (
  c          IN INTEGER,
  position   IN INTEGER);

```

Parameters

Table 168-17 DEFINE_COLUMN_LONG Procedure Parameters

| Parameter | Description |
|-----------|---|
| c | ID number of the cursor for the row being defined to be selected. |
| position | Relative position of the column in the row being defined. The first column in a statement has position 1. |

168.9.11 DEFINE_COLUMN_RAW Procedure

This procedure defines a column of type `RAW` to be selected from the given cursor.

This procedure is only used with `SELECT` cursors.

The column being defined is identified by its relative position in the `SELECT` list of the statement in the given cursor. The type of the `COLUMN` value determines the type of the column being defined.

See also the [DEFINE_COLUMN Procedures](#), [DEFINE_COLUMN_CHAR Procedure](#), [DEFINE_COLUMN_LONG Procedure](#) and [DEFINE_COLUMN_ROWID Procedure](#).

Syntax

```
DBMS_SQL.DEFINE_COLUMN_RAW (
    c           IN INTEGER,
    position    IN INTEGER,
    column      IN RAW,
    column_size IN INTEGER);
```

Pragmas

```
pragma restrict_references(define_column,RNDS,WNDS);
```

Parameters

Table 168-18 DEFINE_COLUMN_RAW Procedure Parameters

| Parameter | Description |
|--------------------------|---|
| <code>c</code> | ID number of the cursor for the row being defined to be selected. |
| <code>position</code> | Relative position of the column in the row being defined. The first column in a statement has position 1. |
| <code>column</code> | Value of the column being defined. The type of this value determines the type for the column being defined. |
| <code>column_size</code> | Maximum expected size of the column value in bytes for columns of <code>RAW</code> type. |

168.9.12 DEFINE_COLUMN_ROWID Procedure

This procedure defines a column of type `ROWID` to be selected from the given cursor. This procedure is only used with `SELECT` cursors.

The column being defined is identified by its relative position in the `SELECT` list of the statement in the given cursor. The type of the `COLUMN` value determines the type of the column being defined.

See also the [DEFINE_COLUMN Procedures](#), [DEFINE_COLUMN_CHAR Procedure](#), [DEFINE_COLUMN_LONG Procedure](#) and [DEFINE_COLUMN_RAW Procedure](#).

Syntax

```
DBMS_SQL.DEFINE_COLUMN_ROWID (
    c           IN INTEGER,
    position    IN INTEGER,
    column      IN ROWID);
```

Pragmas

```
pragma restrict_references(define_column,RNDS,WNDS);
```

Parameters

Table 168-19 DEFINE_COLUMN_ROWID Procedure Parameters

| Parameter | Description |
|-----------|---|
| c | ID number of the cursor for the row being defined to be selected |
| position | Relative position of the column in the row being defined. The first column in a statement has position 1. |
| column | Value of the column being defined. The type of this value determines the type for the column being defined. |

168.9.13 DESCRIBE_COLUMNS Procedure

This procedure describes the columns for a cursor opened and parsed through `DBMS_SQL`.

Syntax

```
DBMS_SQL.DESCRIBE_COLUMNS (
    c          IN  INTEGER,
    col_cnt   OUT INTEGER,
    desc_t    OUT DESC_TAB);
```

Parameters

Table 168-20 DESCRIBE_COLUMNS Procedure Parameters

| Parameter | Description |
|-----------|--|
| c | ID number of the cursor for the columns being described |
| col_cnt | Number of columns in the select list of the query |
| desc_t | Describe table to fill in with the description of each of the columns of the query |

Example 168-4 Describe Columns

This code can be used as a substitute to the SQL*Plus `DESCRIBE` call by using a `SELECT *` query on the table that you want to describe.

```
DECLARE
    c          NUMBER;
    d          NUMBER;
    col_cnt   INTEGER;
    f          BOOLEAN;
    rec_tab   DBMS_SQL.DESC_TAB;
    col_num   NUMBER;
    PROCEDURE print_rec(rec in DBMS_SQL.DESC_REC) IS
    BEGIN
        DBMS_OUTPUT.NEW_LINE;
        DBMS_OUTPUT.PUT_LINE('col_type           = ' || rec.col_type);
        DBMS_OUTPUT.PUT_LINE('col_maxlen       = ' || rec.col_max_len);
        DBMS_OUTPUT.PUT_LINE('col_name         = ' || rec.col_name);
        DBMS_OUTPUT.PUT_LINE('col_name_len     = ' || rec.col_name_len);
        DBMS_OUTPUT.PUT_LINE('col_schema_name  = ' || rec.col_schema_name);
```

```

        DBMS_OUTPUT.PUT_LINE('col_schema_name_len = ' ||
rec.col_schema_name_len);
        DBMS_OUTPUT.PUT_LINE('col_precision      = ' ||
rec.col_precision);
        DBMS_OUTPUT.PUT_LINE('col_scale        = ' || rec.col_scale);
        DBMS_OUTPUT.PUT('col_null_ok          = ');
        IF (rec.col_null_ok) THEN
            DBMS_OUTPUT.PUT_LINE('true');
        ELSE
            DBMS_OUTPUT.PUT_LINE('false');
        END IF;
    END;
BEGIN
    c := DBMS_SQL.OPEN_CURSOR;

    DBMS_SQL.PARSE(c, 'SELECT * FROM scott.bonus', DBMS_SQL.NATIVE);

    d := DBMS_SQL.EXECUTE(c);

    DBMS_SQL.DESCRIBE_COLUMNS(c, col_cnt, rec_tab);

/*
 * Following loop could simply be for j in 1..col_cnt loop.
 * Here we are simply illustrating some of the PL/SQL table
 * features.
 */
    col_num := rec_tab.first;
    IF (col_num IS NOT NULL) THEN
        LOOP
            print_rec(rec_tab(col_num));
            col_num := rec_tab.next(col_num);
            EXIT WHEN (col_num IS NULL);
        END LOOP;
    END IF;

    DBMS_SQL.CLOSE_CURSOR(c);
END;
/

```

168.9.14 DESCRIBE_COLUMNS2 Procedure

This procedure describes the specified column. This is an alternative to DESCRIBE_COLUMNS Procedure.

Syntax

```

DBMS_SQL.DESCRIBE_COLUMNS2 (
    c           IN  INTEGER,
    col_cnt     OUT INTEGER,
    desc_t      OUT DESC_TAB2);

```

Pragmas

```

PRAGMA RESTRICT_REFERENCES(describe_columns2,WNDS);

```

Parameters

Table 168-21 DESCRIBE_COLUMNS2 Procedure Parameters

| Parameter | Description |
|-----------|---|
| c | ID number of the cursor for the columns being described. |
| col_cnt | Number of columns in the select list of the query. |
| desc_t | Describe table to fill in with the description of each of the columns of the query. This table is indexed from one to the number of elements in the select list of the query. |

Related Topics

- [DESCRIBE_COLUMNS Procedure](#)
This procedure describes the columns for a cursor opened and parsed through DBMS_SQL.

168.9.15 DESCRIBE_COLUMNS3 Procedure

This procedure describes the specified column. This is an alternative to DESCRIBE_COLUMNS Procedure.

Syntax

```
DBMS_SQL.DESCRIBE_COLUMNS3 (
  c          IN  INTEGER,
  col_cnt   OUT INTEGER,
  desc_t    OUT DESC_TAB3);
```

```
BMS_SQL.DESCRIBE_COLUMNS3 (
  c          IN  INTEGER,
  col_cnt   OUT INTEGER,
  desc_t    OUT DESC_TAB4);
```

Pragmas

```
PRAGMA RESTRICT_REFERENCES(describe_columns3,WNDS);
```

Parameters

Table 168-22 DESCRIBE_COLUMNS3 Procedure Parameters

| Parameter | Description |
|-----------|---|
| c | ID number of the cursor for the columns being described. |
| col_cnt | Number of columns in the select list of the query. |
| desc_t | Describe table to fill in with the description of each of the columns of the query. This table is indexed from one to the number of elements in the select list of the query. |

Usage Notes

The cursor passed in by the cursor ID has to be OPENED and PARSED, otherwise an "invalid cursor id" error is raised.

Examples

```

CREATE TYPE PROJECT_T AS OBJECT
  ( projname          VARCHAR2(20),
    mgr               VARCHAR2(20))
/

CREATE TABLE projecttab(deptno NUMBER, project HR.PROJECT_T)
/

DECLARE
  curid          NUMBER;
  desctab        DBMS_SQL.DESC_TAB3;
  colcnt         NUMBER;
  sql_stmt       VARCHAR2(200) := 'select * from projecttab';
BEGIN

  curid := DBMS_SQL.OPEN_CURSOR;

  DBMS_SQL.PARSE(curid, sql_stmt, DBMS_SQL.NATIVE);

  DBMS_SQL.DESCRIBE_COLUMNS3(curid, colcnt, desctab);

  FOR i IN 1 .. colcnt LOOP
    IF desctab(i).col_type = 109 THEN
      DBMS_OUTPUT.PUT(desctab(i).col_name || ' is user-defined type: ');
      DBMS_OUTPUT.PUT_LINE(desctab(i).col_schema_name || '.' ||
                            desctab(i).col_type_name);
    END IF;
  END LOOP;

  DBMS_SQL.CLOSE_CURSOR(curid);
END;
/

```

Output:

```
PROJECT is user-defined type: HR.PROJECT_T
```

This procedure describes the columns for a cursor opened and parsed through DBMS_SQL.

168.9.16 EXECUTE Function

This function executes a given cursor. This function accepts the ID number of the cursor and returns the number of rows processed.

The return value is only valid for INSERT, UPDATE, and DELETE statements; for other types of statements, including DDL, the return value is undefined and must be ignored.

Syntax

```

DBMS_SQL.EXECUTE (
  c      IN INTEGER)
RETURN INTEGER;

```

Parameters

Table 168-23 EXECUTE Function Parameters

| Parameter | Description |
|-----------|--|
| c | Cursor ID number of the cursor to execute. |

Return Values

Returns number of rows processed

Usage Notes

The `DBMS_SQL` cursor that is returned by the [TO_CURSOR_NUMBER Function](#) performs in the same way as a `DBMS_SQL` cursor that has already been executed. Consequently, calling `EXECUTE` for this cursor will cause an error.

168.9.17 EXECUTE_AND_FETCH Function

This function executes the given cursor and fetches rows.

This function provides the same functionality as calling `EXECUTE` and then calling `FETCH_ROWS`. Calling `EXECUTE_AND_FETCH` instead, however, may reduce the number of network round-trips when used against a remote database.

The `EXECUTE_AND_FETCH` function returns the number of rows actually fetched.

Syntax

```
DBMS_SQL.EXECUTE_AND_FETCH (
    c          IN INTEGER,
    exact      IN BOOLEAN DEFAULT FALSE)
RETURN INTEGER;
```

Pragmas

```
pragma restrict_references (execute_and_fetch,WNDS);
```

Parameters

Table 168-24 EXECUTE_AND_FETCH Function Parameters

| Parameter | Description |
|-----------|---|
| c | ID number of the cursor to execute and fetch. |
| exact | Set to <code>TRUE</code> to raise an exception if the number of rows actually matching the query differs from one. Note: Oracle does not support the exact fetch <code>TRUE</code> option with <code>LONG</code> columns. Even if an exception is raised, the rows are still fetched and available. |

Return Values

Returns designated rows

168.9.18 FETCH_ROWS Function

This function fetches a row from a given cursor.

You can call `FETCH_ROWS` repeatedly as long as there are rows remaining to be fetched. These rows are retrieved into a buffer, and must be read by calling `COLUMN_VALUE`, for each column, after each call to `FETCH_ROWS`.

The `FETCH_ROWS` function accepts the ID number of the cursor to fetch, and returns the number of rows actually fetched.

Syntax

```
DBMS_SQL.FETCH_ROWS (
    c          IN INTEGER)
RETURN INTEGER;
```

Pragmas

```
pragma restrict_references(fetch_rows,WNDS);
```

Parameters

Table 168-25 `FETCH_ROWS` Function Parameters

| Parameter | Description |
|-----------|-------------|
| c | ID number. |

Return Values

Returns a row from a given cursor

168.9.19 GET_NEXT_RESULT Procedures

This procedure gets the statement of the next result returned to the caller of the recursive statement or, if this caller sets itself as the client for the recursive statement, the next result returned to this caller as client.

The statements are returned in same order as they are returned by the [RETURN_RESULT Procedures](#).

Syntax

```
DBMS_SQL.GET_NEXT_RESULT (
    c          IN          INTEGER,
    rc         OUT        SYS_REFCURSOR);
```

```
DBMS_SQL.GET_NEXT_RESULT (
    c          IN          INTEGER,
    rc         OUT        INTEGER);
```

Parameters

Table 168-26 GET_NEXT_RESULT Procedure Parameters

| Parameter | Description |
|-----------|---|
| c | Recursive statement cursor |
| rc | Cursor or ref cursor of the statement of the next returned result |

Exceptions

ORA-01403 no_data_found: This is raised when there is no further returned statement result.

Usage Notes

- After the cursor of a statement result is retrieved, the caller must close the cursor properly when it is no longer needed.
- The cursors for all unretrieved returned statements will be closed after the cursor of the recursive statement is closed.

Examples

```

DECLARE
  c INTEGER;
  rc SYS_REFCURSOR;
BEGIN
  c := DBMS_SQL.OPEN_CURSOR(treat_as_client_for_results => TRUE);
  DBMS_SQL.PARSE(c           => c,
                 statement   => 'begin proc; end;');
  DBMS_SQL.EXECUTE(c);
  LOOP
    BEGIN
      DBMS_SQL.GET_NEXT_RESULT(c, rc);
    EXCEPTIONS
      WHEN no_data_found THEN
        EXIT;
    END;
  LOOP
    FETCH rc INTO ...
    ...
  END LOOP;
END LOOP;
END;
```

168.9.20 IS_OPEN Function

This function checks to see if the given cursor is currently open.

Syntax

```

DBMS_SQL.IS_OPEN (
  c           IN INTEGER)
  RETURN BOOLEAN;
```

Pragmas

```
pragma restrict_references(is_open,RNDS,WNDS);
```

Parameters

Table 168-27 IS_OPEN Function Parameters

| Parameter | Description |
|-----------|--|
| c | Cursor ID number of the cursor to check. |

Return Values

Returns `TRUE` for any cursor number that has been opened but not closed, and `FALSE` for a `NULL` cursor number. Note that the [CLOSE_CURSOR Procedure](#) Procedure `NULLS` out the cursor variable passed to it.

Exceptions

ORA-29471 DBMS_SQL access denied: This is raised if an invalid cursor ID number is detected. Once a session has encountered and reported this error, every subsequent DBMS_SQL call in the same session will raise this error, meaning that DBMS_SQL is non-operational for this session.

168.9.21 LAST_ERROR_POSITION Function

This function returns the byte offset in the SQL statement text where the error occurred. The first character in the SQL statement is at position 0.

Syntax

```
DBMS_SQL.LAST_ERROR_POSITION  
RETURN INTEGER;
```

Pragmas

```
pragma restrict_references(last_error_position,RNDS,WNDS);
```

Return Values

Returns the byte offset in the SQL statement text where the error occurred

Usage Notes

Call this function after a `PARSE` call, before any other DBMS_SQL procedures or functions are called.

168.9.22 LAST_ROW_COUNT Function

This function returns the cumulative count of the number of rows fetched.

Syntax

```
DBMS_SQL.LAST_ROW_COUNT  
RETURN INTEGER;
```

Pragmas

```
pragma restrict_references(last_row_count,RNDS,WNDS);
```

Return Values

Returns the cumulative count of the number of rows fetched

Usage Notes

Call this function after a `FETCH_ROWS` or an `EXECUTE_AND_FETCH` call. If called after an `EXECUTE` call, then the value returned is zero.

168.9.23 LAST_ROW_ID Function

This function returns the `ROWID` of the last row processed.

Syntax

```
DBMS_SQL.LAST_ROW_ID  
    RETURN ROWID;
```

Pragmas

```
pragma restrict_references(last_row_id,RNDS,WNDS);
```

Return Values

Returns the `ROWID` of the last row processed

Usage Notes

Call this function after a `FETCH_ROWS` or an `EXECUTE_AND_FETCH` call.

168.9.24 LAST_SQL_FUNCTION_CODE Function

This function returns the SQL function code for the statement.

These codes are listed in the *Oracle Call Interface Programmer's Guide*.

Syntax

```
DBMS_SQL.LAST_SQL_FUNCTION_CODE  
    RETURN INTEGER;
```

Pragmas

```
pragma restrict_references(last_sql_function_code,RNDS,WNDS);
```

Return Values

Returns the SQL function code for the statement

Usage Notes

You must call this function immediately after the SQL statement is run; otherwise, the return value is undefined.

168.9.25 OPEN_CURSOR Functions

This function opens a new cursor.

The `security_level` parameter allows for application of fine-grained control to the security of the opened cursor.

Syntax

```
DBMS_SQL.OPEN_CURSOR (
    treat_as_client_for_results    IN    BOOLEAN    DEFAULT FALSE)
RETURN INTEGER;
```

```
DBMS_SQL.OPEN_CURSOR (
    security_level                IN    INTEGER,
    treat_as_client_for_results    IN    BOOLEAN    DEFAULT FALSE)
RETURN INTEGER;
```

Parameters

Table 168-28 OPEN_CURSOR Function Parameters

| Parameter | Description |
|--|--|
| <code>security_level</code> | <p>Specifies the level of security protection to enforce on the opened cursor. Valid security level values are 0, 1, and 2. When a NULL argument value is provided to this overload, as well as for cursors opened using the overload of <code>open_cursor</code> without the <code>security_level</code> parameter, the default security level value 1 will be enforced on the opened cursor.</p> <ul style="list-style-type: none"> Level 0 - allows all DBMS_SQL operations on the cursor without any security checks. The cursor may be fetched from, and even re-bound and re-executed, by code running with a different effective userid or roles than those in effect at the time the cursor was parsed. This level of security is off by default. Level 1 - requires that the referenced container, effective userid, and roles of the caller to DBMS_SQL for bind and execute operations on this cursor must be the same as those of the caller of the most recent parse operation on this cursor. Level 2 - requires that the referenced container, effective userid, and roles of the caller to DBMS_SQL for all bind, execute, define, describe, and fetch operations on this cursor must be the same as those of the caller of the most recent parse operation on this cursor. |
| <code>treat_as_client_for_results</code> | <p>Allows the caller of the recursive statement to set itself as the client to receive the statement results returned from the recursive statement to client. The statement results returned may be retrieved by the GET_NEXT_RESULT Procedures.</p> |

Pragmas

```
pragma restrict_references(open_cursor,RNDS,WNDS);
```

Return Values

Returns the cursor ID number of the new cursor

Usage Notes

- When you no longer need this cursor, you must close it explicitly by calling the [CLOSE_CURSOR Procedure](#).
- You can use cursors to run the same SQL statement repeatedly or to run a new SQL statement. When a cursor is reused, the contents of the corresponding cursor data area are reset when the new SQL statement is parsed. It is never necessary to close and reopen a cursor before reusing it.

168.9.26 PARSE Procedures

This procedure parses the given statement in the given cursor. All statements are parsed immediately. In addition, DDL statements are run immediately when parsed.

There are multiple versions of the `PARSE` procedure:

- Taking a `VARCHAR2` statement as an argument
- Taking a segmented string, one taking `VARCHAR2A`, a `TABLE OF VARCHAR2 (32767)`, and another, taking `VARCHAR2S`, a `TABLE OF VARCHAR2 (256)`, as argument. These overloads concatenate elements of a PL/SQL table statement and parse the resulting string. You can use these procedures to parse a statement that is longer than the limit for a single `VARCHAR2` variable by splitting up the statement.
- Taking a `CLOB` statement as an argument. You can use the `CLOB` overload version of the parse procedure to parse a SQL statement larger than 32K bytes.

Syntax

Each version has multiple overloads.

```
DBMS_SQL.PARSE (
    c                IN    INTEGER,
    statement        IN    VARCHAR2,
    language_flag   IN    INTEGER[
[,edition          IN    VARCHAR2 DEFAULT NULL],
    apply_crossedition_trigger IN  VARCHAR2 DEFAULT NULL,
    fire_apply_trigger IN    BOOLEAN DEFAULT TRUE]
[,schema          IN    VARCHAR2 DEFAULT NULL]
[,container       IN    VARCHAR2]);
```

```
DBMS_SQL.PARSE (
    c                IN    INTEGER,
    statement        IN    CLOB,
    language_flag   IN    INTEGER[
[,edition          IN    VARCHAR2 DEFAULT NULL],
    apply_crossedition_trigger IN  VARCHAR2 DEFAULT NULL,
    fire_apply_trigger IN    BOOLEAN DEFAULT TRUE]
[,schema          IN    VARCHAR2 DEFAULT NULL]
[,container       IN    VARCHAR2]);
```

```
DBMS_SQL.PARSE (
    c                IN    INTEGER,
    statement        IN    VARCHAR2A,
```

```

        lb                IN    INTEGER,
        ub                IN    INTEGER,
        lfflg            IN    BOOLEAN,
        language_flag    IN    INTEGER[
[,edition              IN    VARCHAR2 DEFAULT NULL],
        apply_crossedition_trigger IN    VARCHAR2 DEFAULT NULL,
        fire_apply_trigger    IN    BOOLEAN DEFAULT TRUE]
[,schema              IN    VARCHAR2 DEFAULT NULL]
[,container           IN    VARCHAR2]);

DBMS_SQL.PARSE (
    c                IN    INTEGER,
    statement        IN    VARCHAR2s,
    lb                IN    INTEGER,
    ub                IN    INTEGER,
    lfflg            IN    BOOLEAN,
    language_flag    IN    INTEGER[
[,edition              IN    VARCHAR2 DEFAULT NULL],
    apply_crossedition_trigger IN    VARCHAR2 DEFAULT NULL,
    fire_apply_trigger    IN    BOOLEAN DEFAULT TRUE]
[,schema              IN    VARCHAR2 DEFAULT NULL]
[,container           IN    VARCHAR2]);

```

Parameters

Table 168-29 PARSE Procedure Parameters

| Parameter | Description |
|---------------|--|
| c | ID number of the cursor in which to parse the statement. |
| statement | <p>SQL statement to be parsed. SQL statements larger than 32K that may be stored in CLOBs.</p> <p>Unlike a PL/SQL statement, your SQL statement must not include a final semicolon. For example:</p> <pre>DBMS_SQL.PARSE(cursor1, 'BEGIN proc; END;', 2);</pre> <pre>DBMS_SQL.PARSE(cursor1, 'INSERT INTO tab VALUES(1)', 2);</pre> |
| lb | Lower bound for elements in the statement |
| ub | Upper bound for elements in the statement |
| lfflg | If TRUE, then insert a linefeed after each element on concatenation. |
| language_flag | Specifies the behavior for the SQL statement. For more information about the possible values and its corresponding behaviors, see DBMS_SQL Constants |
| edition | <p>Specifies the edition in which to run the statement under the following conditions:</p> <ul style="list-style-type: none"> • If NULL and container is NULL, the statement will be run in the current edition. • If a valid container is specified, passing NULL indicates the statement is to run in the target container's default edition. • Given the user and the edition with which the statement is to be executed, the user must have USE privilege on the edition. <p>The following general conditions apply. The contents of the string are processed as a SQL identifier; double quotation marks must surround the remainder of the string if special characters or lowercase characters are present in the edition's actual name, and if double quotation marks are not used the contents will be uppercased.</p> |

Table 168-29 (Cont.) PARSE Procedure Parameters

| Parameter | Description |
|---|---|
| <code>apply_crossedition_trigger</code> | Specifies the unqualified name of a forward crossedition trigger that is to be applied to the specified SQL. The name is resolved using the <code>edition</code> and <code>current_schema</code> setting in which the statement is to be executed. The trigger must be owned by the user that will execute the statement. If a non-NULL value is specified, the specified crossedition trigger will be executed assuming <code>fire_apply_trigger</code> is TRUE, the trigger is enabled, the trigger is defined on the table which is the target of the statement, the type of the statement matches the trigger's <code>dml_event_clause</code> , any effective WHEN and UPDATE OF restrictions are satisfied, and so on. Other forward crossedition triggers may also be executed, selected using the "crossedition trigger DML rules" applied as if the specified trigger was doing a further DML to the table that is the target of the statement. Non-crossedition triggers and reverse crossedition triggers will not be executed. The contents of the string are processed as a SQL identifier; double quotation marks must surround the remainder of the string if special characters or lowercase characters are present in the trigger's actual name, and if double quotation marks are not used, the contents will be uppercased. |
| <code>fire_apply_trigger</code> | Indicates whether the specified <code>apply_crossedition_trigger</code> is itself to be executed, or must only be a guide used in selecting other triggers. This is typically set FALSE when the statement is a replacement for the actions the <code>apply_crossedition_trigger</code> would itself perform. If FALSE, the specified trigger is not executed, but other triggers are still selected for firing as if the specified trigger was doing a DML to the table that is the target of the statement. The <code>apply_crossedition_trigger</code> and <code>fire_apply_trigger</code> parameters are ignored if the statement is not a DML. |
| <code>schema</code> | Specifies the schema in which to resolve unqualified object names. If NULL, the current schema is the effective user's schema. |
| <code>container</code> | Name of the target container in which the cursor is to run. If NULL or unspecified, the name of the target container is that of the calling container and no container switch is performed. If a valid container name is specified, the current user must be a common user with SET CONTAINER privilege to switch to the target container. If a container switch completes, the effective user will have its default roles. |

Usage Notes

- Using DBMS_SQL to dynamically run DDL statements can cause the program to stop responding. For example, a call to a procedure in a package results in the package being locked until the execution returns to the user side. Any operation that results in a conflicting lock, such as dynamically trying to drop the package before the first lock is released, stops the program from running.
- Because client-side code cannot reference remote package variables or constants, you must explicitly use the values of the constants.

For example, the following code does *not* compile on the client:

```
DBMS_SQL.PARSE(cur_hdl, stmt_str, DBMS_SQL.NATIVE); -- uses constant
DBMS_SQL.NATIVE
```

The following code works on the client, because the argument is explicitly provided:

DBMS_SQL.PARSE(cur_hdl, stmt_str, 1); -- compiles on the client

- The VARCHAR2S type is currently supported for backward compatibility of legacy code. However, you are advised to use VARCHAR2A both for its superior capability and because VARCHAR2S will be deprecated in a future release.
- To parse SQL statements larger than 32 KB, the new CLOB overload version of the PARSE procedure can be used instead of the VARCHAR2A overload.
- If the container parameter value is the same as the calling container, a container switch will not occur. However, the default roles of the current user will be in effect.

Exceptions

If you create a type, procedure, function, or package using DBMS_SQL that has compilation warnings, an ORA-24344 exception is raised, and the PL/SQL unit is still created.

168.9.27 RETURN_RESULT Procedures

This procedure returns the result of an executed statement to the client application.

The result can be retrieved later by the client. Alternatively, it can return the statement result to and be retrieved later by the immediate caller that executes a recursive statement in which this statement result will be returned.

The caller can be:

- A PL/SQL stored procedure executing the recursive statement using DBMS_SQL
- A Java stored procedure using JDBC
- A .NET stored procedure using ADO.NET
- An external procedure using the Oracle Call Interface (OCI)

Syntax

```
DBMS_SQL.RETURN_RESULT(
  rc          IN OUT    SYS_REFCURSOR,
  to_client   IN        BOOLEAN          DEFAULT TRUE);
```

```
DBMS_SQL.RETURN_RESULT(
  rc          IN OUT    INTEGER,
  to_client   IN        BOOLEAN          DEFAULT TRUE);
```

Parameters

Table 168-30 RETURN_RESULT Procedure Parameters

| Parameter | Description |
|-----------|--|
| rc | Statement cursor or ref cursor |
| to_client | Returns (or does not return) the statement result to the client. If not, it is returned to the immediate caller. |

Usage Notes

- Currently only a SQL query can be returned, and the return of statement results over remote procedure calls is not supported.
- Once the statement is returned, it is no longer accessible except by the client or the immediate caller to which it is returned.
- Statement results cannot be returned when the statement being executed by the client or any intermediate recursive statement is a SQL query and an error is raised.
- A ref cursor being returned can be strongly or weakly-typed.
- A query being returned can be partially fetched.
- Because EXECUTE IMMEDIATE statement provides no interface to retrieve the statement results returned from its recursive statement, the cursors of the statement results returned to the caller of the EXECUTE IMMEDIATE statement will be closed when the statement completes. To retrieve the returned statement results from a recursive statement in PL/SQL, use DBMS_SQL to execute the recursive statement.

Examples

```
CREATE PROCEDURE proc AS
  rc1 sys_refcursor;
  rc2 sys_refcursor;
BEGIN
  OPEN rc1 FOR SELECT * FROM t1;
  DBMS_SQL.RETURN_RESULT(rc1);
  OPEN rc2 FOR SELECT * FROM t2;
  DBMS_SQL.RETURN_RESULT(rc2);
END;
/
```

168.9.28 TO_CURSOR_NUMBER Function

This function takes an OPENED strongly or weakly-typed ref cursor and transforms it into a DBMS_SQL cursor number.

Syntax

```
DBMS_SQL.TO_CURSOR_NUMBER (
  rc IN OUT SYS_REFCURSOR)
RETURN INTEGER;
```

Parameters

Table 168-31 TO_CURSOR_NUMBER Function Parameters

| Parameter | Description |
|-----------|---|
| rc | REF CURSOR to be transformed into a cursor number |

Return Values

Returns a DBMS_SQL manageable cursor number transformed from a REF CURSOR

Usage Notes

- The REF CURSOR passed in has to be OPENED, otherwise an error is raised.
- Once the REF CURSOR is transformed into a DBMS_SQL cursor number, the REF CURSOR is no longer accessible by any native dynamic SQL operations.
- The DBMS_SQL cursor that is returned by this subprogram performs in the same way as a DBMS_SQL cursor that has already been executed.

Examples

```

CREATE OR REPLACE PROCEDURE DO_QUERY(sql_stmt VARCHAR2) IS
  TYPE CurType IS REF CURSOR;
  src_cur      CurType;
  curid        NUMBER;
  desctab      DBMS_SQL.DESC_TAB;
  colcnt       NUMBER;
  namevar      VARCHAR2(50);
  numvar       NUMBER;
  datevar      DATE;
  empno        NUMBER := 100;
BEGIN

  -- sql_stmt := 'select ..... from employees where employee_id = :b1';
  OPEN src_cur FOR sql_stmt USING empno;

  -- Switch from native dynamic SQL to DBMS_SQL
  curid := DBMS_SQL.TO_CURSOR_NUMBER (src_cur);

  DBMS_SQL.DESCRIBE_COLUMNS(curid, colcnt, desctab);

  -- Define columns
  FOR i IN 1 .. colcnt LOOP
    IF desctab(i).col_type = 2 THEN
      DBMS_SQL.DEFINE_COLUMN(curid, i, numvar);
    ELSIF desctab(i).col_type = 12 THEN
      DBMS_SQL.DEFINE_COLUMN(curid, i, datevar);
    .....
    ELSE
      DBMS_SQL.DEFINE_COLUMN(curid, i, namevar, 25);
    END IF;
  END LOOP;

  -- Fetch Rows
  WHILE DBMS_SQL.FETCH_ROWS(curid) > 0 LOOP
    FOR i IN 1 .. colcnt LOOP
      IF (desctab(i).col_type = 1) THEN
        DBMS_SQL.COLUMN_VALUE(curid, i, namevar);
      ELSIF (desctab(i).col_type = 2) THEN
        DBMS_SQL.COLUMN_VALUE(curid, i, numvar);
      ELSIF (desctab(i).col_type = 12) THEN
        DBMS_SQL.COLUMN_VALUE(curid, i, datevar);
      ....
    END IF;
  END LOOP;
END LOOP;

  DBMS_SQL.CLOSE_CURSOR(curid);

```

```
END;
/
```

168.9.29 TO_REFCURSOR Function

This function takes an `OPENED`, `PARSED`, and `EXECUTED` cursor and transforms/migrates it into a PL/SQL manageable `REF CURSOR` (a weakly-typed cursor) that can be consumed by PL/SQL native dynamic SQL switched to use native dynamic SQL.

This subprogram is only used with `SELECT` cursors.

Syntax

```
DBMS_SQL.TO_REFCURSOR(
    cursor_number IN OUT INTEGER)
RETURN SYS_REFCURSOR;
```

Parameters

Table 168-32 TO_REFCURSOR Function Parameters

| Parameter | Description |
|----------------------------|--|
| <code>cursor_number</code> | Cursor number of the cursor to be transformed into <code>REF CURSOR</code> |

Return Values

Returns a PL/SQL `REF CURSOR` transformed from a `DBMS_SQL` cursor number

Usage Notes

- The cursor passed in by the `cursor_number` has to be `OPENED`, `PARSED`, and `EXECUTED`; otherwise an error is raised.
- Once the `cursor_number` is transformed into a `REF CURSOR`, the `cursor_number` is no longer accessible by any `DBMS_SQL` operations.
- After a `cursor_number` is transformed into a `REF CURSOR`, using `DBMS_SQL.IS_OPEN` to check to see if the `cursor_number` is still open results in an error.
- If the cursor number was last parsed with a valid container parameter, it cannot be converted to a `REF CURSOR`.

Examples

```
CREATE OR REPLACE PROCEDURE DO_QUERY(mgr_id NUMBER) IS
    TYPE CurType IS REF CURSOR;
    src_cur          CurType;
    curid            NUMBER;
    sql_stmt         VARCHAR2(200);
    ret              INTEGER;
    empnos           DBMS_SQL.Number_Table;
    depts            DBMS_SQL.Number_Table;
BEGIN

    -- DBMS_SQL.OPEN_CURSOR
    curid := DBMS_SQL.OPEN_CURSOR;

    sql_stmt := 'SELECT EMPLOYEE_ID, DEPARTMENT_ID from employees where MANAGER_ID
```

```

= :b1';

DBMS_SQL.PARSE(curid, sql_stmt, DBMS_SQL.NATIVE);
DBMS_SQL.BIND_VARIABLE(curid, 'b1', mgr_id);
ret := DBMS_SQL.EXECUTE(curid);

-- Switch from DBMS_SQL to native dynamic SQL
src_cur := DBMS_SQL.TO_REFCURSOR(curid);

-- Fetch with native dynamic SQL
FETCH src_cur BULK COLLECT INTO empnos, depts;

IF empnos.COUNT > 0 THEN
  DBMS_OUTPUT.PUT_LINE('EMPNO DEPTNO');
  DBMS_OUTPUT.PUT_LINE('-----');
  -- Loop through the empnos and depts collections
  FOR i IN 1 .. empnos.COUNT LOOP
    DBMS_OUTPUT.PUT_LINE(empnos(i) || ' ' || depts(i));
  END LOOP;
END IF;
-- Close cursor
CLOSE src_cur;
END;
/

```

168.9.30 VARIABLE_VALUE Procedures

This procedure returns the value of the named variable for a given cursor. It is used to return the values of bind variables inside PL/SQL blocks or DML statements with **returning clause**.

Syntax

```

DBMS_SQL.VARIABLE_VALUE (
  c          IN  INTEGER,
  name      IN  VARCHAR2,
  value     OUT NOCOPY <datatype>);

```

Where <datatype> can be any one of the following types:

```

ADT (user-defined object types)
BINARY_DOUBLE
BINARY_FLOAT
BFILE
BLOB
BOOLEAN
CLOB CHARACTER SET ANY_CS
DATE
DSINTERVAL_UNCONSTRAINED
NESTED table
NUMBER
OPAQUE types
REF
TIME_UNCONSTRAINED
TIME_TZ_UNCONSTRAINED
TIMESTAMP_LTZ_UNCONSTRAINED
TIMESTAMP_TZ_UNCONSTRAINED
TIMESTAMP_UNCONSTRAINED
UROWID

```

```

VARCHAR2 CHARACTER SET ANY_CS
VARRAY
YMINTERVAL_UNCONSTRAINED

```

For variables containing CHAR, RAW, and ROWID data, you can use the following variations on the syntax:

```

DBMS_SQL.VARIABLE_VALUE_CHAR (
  c          IN  INTEGER,
  name       IN  VARCHAR2,
  value      OUT CHAR CHARACTER SET ANY_CS);

```

```

DBMS_SQL.VARIABLE_VALUE_RAW (
  c          IN  INTEGER,
  name       IN  VARCHAR2,
  value      OUT RAW);

```

```

DBMS_SQL.VARIABLE_VALUE_ROWID (
  c          IN  INTEGER,
  name       IN  VARCHAR2,
  value      OUT ROWID);

```

The following syntax enables the VARIABLE_VALUE procedure to accommodate bulk operations:

```

DBMS_SQL.VARIABLE_VALUE (
  c          IN  INTEGER,
  name       IN  VARCHAR2,
  value      OUT NOCOPY <table_type>);

```

For bulk operations, <table_type> must be a supported DBMS_SQL predefined TABLE type.

See [DBMS_SQL Data Structures](#)

Pragmas

```
pragma restrict_references(variable_value,RNDS,WNDS);
```

Parameters

Table 168-33 VARIABLE_VALUE Procedure Parameters

| Parameter | Description |
|-----------|--|
| c | ID number of the cursor from which to get the values. |
| name | Name of the variable for which you are retrieving the value. |
| value | <ul style="list-style-type: none"> Single row option: Returns the value of the variable for the specified position. Oracle raises the exception <code>ORA-06562, inconsistent_type</code>, if the type of this output parameter differs from the actual type of the value, as defined by the call to <code>BIND_VARIABLE</code>. Array option: Local variable that has been declared <table_type>. For bulk operations, value is an <code>OUT NOCOPY</code> parameter. |

168.9.31 VARIABLE_VALUE_PKG Procedure

This procedure returns the value of the named variable for a given cursor.

It is used to return the values of bind variables of collection or record types inside PL/SQL blocks or DML statements with `returning` clause for a declared package. The type of the variable must be declared in the package specification. Bulk operations are not supported for these types.

Syntax

```
DBMS_SQL.VARIABLE_VALUE_PKG (
  c          IN   INTEGER,
  name      IN   VARCHAR2,
  value     OUT NOCOPY <table_type>);
```

Where <datatype> can be any one of the following data types:

- RECORD
- VARRAY
- NESTED TABLE
- INDEX BY PLS_INTEGER TABLE
- INDEX BY BINARY_INTEGER TABLE

Parameters

Table 168-34 VARIABLE_VALUE_PKG Parameters

| Parameter | Description |
|-----------|--|
| c | ID number of the cursor from which to get the values. |
| name | Name of the variable for which you are retrieving the value. |
| value | <ul style="list-style-type: none"> • Single row option: Returns the value of the variable for the specified position. Oracle raises the exception <code>ORA-06562, inconsistent_type</code>, if the type of this output parameter differs from the actual type of the value, as defined by the call to <code>BIND_VARIABLE_PKG</code>. • Array option: Local variable that has been declared <table_type>. |

Example 168-5 Dynamic SQL using DBMS_SQL.VARIABLE_VALUE_PKG to Get the Value of a Bind Variable

The data types are declared in the package specification. The `VARIABLE_VALUE_PKG` is used to get the value of the bind variable `v2` in the cursor SQL statement.

```
CREATE OR REPLACE PACKAGE ty_pkg AS
TYPE rec IS RECORD
  ( n1 NUMBER,
```

```
        n2 NUMBER);
TYPE trect IS TABLE OF NUMBER;
END ty_pkg;
/
CREATE OR REPLACE PROCEDURE dyn_sql_nt AS
    dummy NUMBER;
    cur    NUMBER;
    v1 ty_pkg.trect;
    v2 ty_pkg.trect;
    str VARCHAR2(3000);
BEGIN
    v1 := ty_pkg.trect(1000);
    str := 'declare v1 ty_pkg.trect; begin v1:=v1; v1(1) := 2000; :v2 :=
v1; end;' ;
    cur := DBMS_SQL.OPEN_CURSOR();
    DBMS_SQL.PARSE(cur, str, DBMS_SQL.NATIVE);
    DBMS_SQL.BIND_VARIABLE_PKG(cur, ':v1', v1);
    DBMS_SQL.BIND_VARIABLE_PKG(cur, ':v2', v2);
    dummy := DBMS_SQL.EXECUTE(cur);
    DBMS_SQL.VARIABLE_VALUE_PKG(cur, ':v2', v2);
    DBMS_OUTPUT.PUT_LINE('n = '
    || v2(1));
    DBMS_SQL.CLOSE_CURSOR(cur);
END dyn_sql_nt;
/
EXEC dyn_sql_nt;

n = 2000
```

DBMS_SQL_MONITOR

The `DBMS_SQL_MONITOR` package provides information about Real-Time SQL Monitoring and Real-Time Database Operation Monitoring.

This chapter contains the following topics:

- [DBMS_SQL_MONITOR Overview](#)
- [DBMS_SQL_MONITOR Security Model](#)
- [DBMS_SQL_MONITOR Constants](#)
- [Summary of DBMS_SQL_MONITOR Subprograms](#)

See Also:

[DBMS_SQLTUNE](#)

169.1 DBMS_SQL_MONITOR Overview

The `DBMS_SQL_MONITOR` package provides information about Real-Time SQL Monitoring and Real-Time Database Operation Monitoring.

These features provide automatic monitoring of SQL statements, PL/SQL blocks, or composite database operations that are considered high-cost. A simple database operation is a single SQL statement or PL/SQL procedure or function. A composite database operation is activity between two defined points in time in a database session. The monitored data is collected in the `V$SQL_MONITOR` and `V$SQL_PLAN_MONITOR` views.

The following subprograms begin and end monitoring of a composite database operation:

- [BEGIN_OPERATION Function](#)
- [END_OPERATION Procedure](#)

The following subprograms report on monitoring data collected in `V$SQL_MONITOR` and `V$SQL_PLAN_MONITOR`:

- [REPORT_SQL_MONITOR Function](#)
- [REPORT_SQL_MONITOR_XML Function](#)
- [REPORT_SQL_MONITOR_LIST Function](#)
- [REPORT_SQL_MONITOR_LIST_XML Function](#)

169.2 DBMS_SQL_MONITOR Security Model

This package is available to `PUBLIC` and executes with invoker's rights privileges. The reporting functions require privileges to select data from the catalog as provided by the role `SELECT_CATALOG_ROLE`.

169.3 DBMS_SQL_MONITOR Constants

The `DBMS_SQL_MONITOR` package uses the constants shown in the following table.

Table 169-1 DBMS_SQL_MONITOR Constants

| Constant | Type | Value | Description |
|--------------------------------|---------------------------|------------------|--|
| <code>FORCE_TRACKING</code> | <code>VARCHAR2(30)</code> | <code>'Y'</code> | Force track the composite database operation when the operation starts |
| <code>NO_FORCE_TRACKING</code> | <code>VARCHAR2(30)</code> | <code>'N'</code> | Do not force track the composite database operation when the operation starts. It is only tracked when it has consumed 5 seconds of CPU or I/O time. |

169.4 Summary of DBMS_SQL_MONITOR Subprograms

This table lists and describes the `DBMS_SQL_MONITOR` package subprograms.

Table 169-2 DBMS_SQL_MONITOR Package Subprograms

| Subprogram | Description |
|--|---|
| BEGIN_OPERATION Function | This function starts a database operation in the current session. |
| END_OPERATION Procedure | This function ends a database operation in the current session. If the specified database operation does not exist, then this function has no effect. |
| REPORT_SQL_MONITOR Function | This function builds a detailed report with monitoring information for a SQL statement, PL/SQL block, or database operation. |
| REPORT_SQL_MONITOR_XML Function | This function is identical to the <code>REPORT_SQL_MONITOR</code> function, except that the return type is <code>XMLType</code> . |
| REPORT_SQL_MONITOR_LIST Function | This function builds a report for all or a subset of database operations that have been monitored by Oracle Database. |
| REPORT_SQL_MONITOR_LIST_XML Function | This function is identical to the <code>REPORT_SQL_MONITOR_LIST</code> function, except that it returns <code>XMLType</code> . |

169.4.1 BEGIN_OPERATION Function

This function starts a database operation in the current session.

Syntax

```
DBMS_SQL_MONITOR.BEGIN_OPERATION (
  dbop_name      IN VARCHAR2,
  dbop_eid       IN NUMBER   := NULL,
  forced_tracking IN VARCHAR2 := NO_FORCE_TRACKING,
  attribute_list IN VARCHAR2 := NULL,
  session_id     IN NUMBER   := NULL,
  session_serial IN NUMBER   := NULL)
RETURN NUMBER;
```

Parameters

Table 169-3 *BEGIN_OPERATION Procedure Parameters*

| Parameter | Description |
|-----------------|---|
| dbop_name | Name for the composite database operation. |
| dbop_eid | Unique identifier for the current execution of the composite database operation. |
| forced_tracking | Whether tracking is forced. Possible values are: <ul style="list-style-type: none"> FORCE_TRACKING - forces the composite database operation to be tracked when the operation starts. You can also use the string variable Y. NO_FORCE_TRACKING - tracks the operation only when it has consumed at least 5 seconds of CPU or I/O time. You can also use the string variable N. See " DBMS_SQL_MONITOR Constants ". |
| attribute_list | List of user-created attributes. It is a comma-separated list of name-value pairs (for example, 'table_name=emp, operation=load'). |
| session_id | Session ID of the session to be monitored. If omitted (or null), then the database monitors the current session. |
| session_serial | Serial number of the session to be monitored. If omitted (or null), then the database uses only the session ID to determine the session. |

Return Values

This function returns the database operation execution ID. If the value is null for dbop_eid, then the database generates a unique value.

169.4.2 END_OPERATION Procedure

This procedure ends a database operation in the current session. If the specified database operation does not exist, then this function has no effect.

Syntax

```
DBMS_SQL_MONITOR.END_OPERATION (
    dbop_name      IN VARCHAR2,
    dbop_eid       IN NUMBER);
```

Parameters

Table 169-4 END_OPERATION Procedure Parameters

| Parameter | Description |
|-----------|---|
| dbop_name | Name of a composite database operation |
| dbop_eid | Unique identifier for the current execution of the composite database operation |

169.4.3 REPORT_SQL_MONITOR Function

This function builds a detailed report with monitoring information for a SQL statement, PL/SQL block, or database operation.

For each operation, it gives key information and associated global statistics. Use this function to get detailed monitoring information for a database operation.

The target database operation for this report can be:

- The last database operation monitored by Oracle Database (default, no parameter).
- The last database operation executed in the specified session and monitored by Oracle Database. The session is identified by its session ID and optionally its serial number (-1 is current session).
- The last execution of a specific database operation identified by its `sql_id`.
- A specific execution of a database operation identified by the combination `sql_id`, `sql_exec_start`, and `sql_exec_id`.
- The last execution of a specific database operation identified by `dbop_name`.
- The specific execution of a database operation identified by the combination `dbop_name`, `dbop_exec_id`.

Syntax

```
DBMS_SQL_MONITOR.REPORT_SQL_MONITOR (
    sql_id          IN VARCHAR2 DEFAULT NULL,
    dbop_name       IN VARCHAR2 DEFAULT NULL,
    dbop_exec_id    IN NUMBER   DEFAULT NULL,
    session_id      IN NUMBER   DEFAULT NULL,
    session_serial  IN NUMBER   DEFAULT NULL,
```

```

sql_exec_start      IN DATE      DEFAULT NULL,
sql_exec_id         IN NUMBER     DEFAULT NULL,
inst_id            IN NUMBER     DEFAULT NULL,
start_time_filter   IN DATE      DEFAULT NULL,
end_time_filter     IN DATE      DEFAULT NULL,
instance_id_filter  IN NUMBER     DEFAULT NULL,
parallel_filter     IN VARCHAR2   DEFAULT NULL,
plan_line_filter    IN NUMBER     DEFAULT NULL,
event_detail        IN VARCHAR2   DEFAULT 'YES',
bucket_max_count    IN NUMBER     DEFAULT 128,
bucket_interval     IN NUMBER     DEFAULT NULL,
base_path           IN VARCHAR2   DEFAULT NULL,
last_refresh_time   IN DATE      DEFAULT NULL,
report_level        IN VARCHAR2   DEFAULT 'TYPICAL',
type               IN VARCHAR2   DEFAULT 'TEXT',
sql_plan_hash_value IN NUMBER     DEFAULT NULL,
con_name           IN VARCHAR2   DEFAULT NULL)
RETURN CLOB;

```

Parameters

Table 169-5 *REPORT_SQL_MONITOR Procedure Parameters*

| Parameter | Description |
|-------------------|--|
| sql_id | SQL_ID of the simple database operation for which monitoring information should be displayed. Use NULL (default) to display monitoring information for the last simple database operation monitored by Oracle. |
| dbop_name | DBOP_NAME for which monitoring information of the composite database operation is displayed |
| dbop_exec_id | Execution ID for the composite database operation for which monitoring information is displayed |
| session_id | Targets only the subset of statements executed and monitored on behalf of the specified session. Default is NULL. Use -1 or USERENV('SID') for the current session. |
| session_serial | In addition to session_id, you can specify the session serial number to ensure the desired session incarnation is targeted. This is ignored when session_id is NULL. |
| sql_exec_start | Time at which execution of the monitored SQL was started. Only applicable when sql_id is specified. Used to display monitoring information for a particular execution of sql_id. When NULL (default), the last execution of sql_id is shown. |
| sql_exec_id | A numeric ID generated internally by SQL monitor to identify different executions of the same SQL statement. Thus each execution will have the same sql_id but a different sql_exec_id. Only applicable when sql_id is specified and is used to display monitoring information for a particular execution of sql_id. When NULL (default), the last execution of sql_id is shown. |
| inst_id | Looks only at queries started on the specified instance. Use -1 to target the current instance. The default, NULL will target all instances. |
| start_time_filter | If not NULL, the report shows activity from V\$ACTIVE_SESSION_HISTORY started after this date. If NULL, the reported activity starts once the targeted database operation has started. |

Table 169-5 (Cont.) REPORT_SQL_MONITOR Procedure Parameters

| Parameter | Description |
|--------------------|--|
| end_time_filter | If not NULL, the report shows activity from V\$ACTIVE_SESSION_HISTORY started before this date. If NULL, the reported activity ends when the targeted database operation has ended or SYSDATE if the operation is still executing. |
| instance_id_filter | Only looks at activity for the specified instance. Use NULL (the default) to target all instances. Only relevant if the query runs in parallel. |
| parallel_filter | Parallel filter applies only to parallel execution and allows you to select only a subset of the processes involved in the parallel execution. The string parallel_filter can be: <ul style="list-style-type: none"> • NULL - target all parallel execution servers as wells as the query coordinator • ['qc'] [servers (<svr_grp>[,] <svr_set>[,] <svr_num>)] where any NULL value is interpreted as ALL |
| plan_line_filter | Selects activity and execution statistics for the specified line number in the plan of a SQL. |
| event_detail | When set to NO, the activity is aggregated by wait_class only. Use YES (default) to aggregate by wait_class, event_name. |
| bucket_max_count | Specifies the maximum number of buckets to create in the report |
| bucket_interval | Represents the exact time interval, in seconds, of all histogram buckets. If specified, bucket_max_count is ignored. |
| base_path | URL path for flex HTML resources since flex HTML format requires access to external files (Java scripts and the flash swf file). |
| last_refresh_time | If not NULL (default), the time when the report was last retrieved (SYSDATE attribute of the report tag). Use this option when you want to display the report of an running query and when that report is refreshed on a regular basis. This optimizes the size of the report since only the new changed information will be returned. In particular, the following will be optimized: <ul style="list-style-type: none"> • SQL text will not be returned when this option is specified • Activity histogram will start at the bucket that intersects that time. The entire content of the bucket is returned, even if last_refresh_time is after the start of that bucket |

Table 169-5 (Cont.) REPORT_SQL_MONITOR Procedure Parameters

| Parameter | Description |
|---------------------|--|
| report_level | <p>Level of detail for the report. Of the following, only one can be specified:</p> <ul style="list-style-type: none"> NONE: Minimum possible BASIC: This is equivalent to <code>sql_text-plan-xplan-sessions-instance-activity_histogram-plan_histogram-metrics</code> where the token "-" implies that report section will not be included in the report. TYPICAL: Everything but <code>plan_histogram</code> ALL: Everything <p>In addition, individual report sections can also be enabled or disabled by using a <code>±section_name</code>. Several sections are defined:</p> <ul style="list-style-type: none"> XPLAN: Shows explain plan. ON by default. PLAN: Shows plan monitoring statistics. ON by default. SESSIONS: Show session details. Applies only to parallel queries. ON by default. INSTANCE: Shows instance details. Applies only to parallel and cross instance queries. ON by default. PARALLEL: An umbrella parameter for specifying sessions as well as instance details ACTIVITY: Shows activity summary at global level, plan line level and session INSTANCE LEVEL: (If applicable). ON by default. BINDS: Shows bind information when available. ON by default. METRICS: Shows metric data (such as CPU and IOs) over time. ON by default ACTIVITY_HISTOGRAM: Shows a histogram of the overall query activity. ON by default. PLAN_HISTOGRAM: Shows activity histogram at plan line level. OFF by default. OTHER: Other information. ON by default. <p>In addition, SQL text can be specified at different levels:</p> <ul style="list-style-type: none"> -SQL_TEXT: No SQL text in report +SQL_TEXT: Alright with partial SQL text, that is, up to the first 2000 chars as stored in <code>GV\$SQL_MONITOR</code> SQL_FULLTEXT: No full SQL text, that is, <code>+sql_text</code> +SQL_FULLTEXT: Show full SQL text (default) |
| type | <p>Report type:</p> <ul style="list-style-type: none"> TEXT: text report (default) HTML: simple HTML report ACTIVE: database active report. Some information (explain plan, <code>activity_histogram</code>, <code>metrics</code> and <code>plan_histogram</code>) is only shown when this type is selected XML: raw data for the report |
| sql_plan_hash_value | Targets only those with the specified plan hash value. Default is NULL. |
| con_name | Container name in a multitenant database. |

Return Values

SQL monitor report, an XML document.

Usage Notes

The user invoking this function must have privilege to access the following fixed views:

- GV\$SQL_MONITOR
- GV\$SQL_PLAN_MONITOR
- GV\$ACTIVE_SESSION_HISTORY
- GV\$SESSION_LONGOPS
- GV\$SQL if SQL full text is requested and its length is greater than 2 KB

169.4.4 REPORT_SQL_MONITOR_XML Function

This function is identical to the `REPORT_SQL_MONITOR` function, except that the return type is `XMLType`.

Related Topics

- [REPORT_SQL_MONITOR Function](#)
This function builds a detailed report with monitoring information for a SQL statement, PL/SQL block, or database operation.

169.4.5 REPORT_SQL_MONITOR_LIST Function

This function builds a report for all or a subset of database operations that have been monitored by Oracle Database.

For each database operation, it gives key information and associated global statistics.

Syntax

```
DBMS_SQL_MONITOR.REPORT_SQL_MONITOR_LIST (
  sql_id              IN VARCHAR2 DEFAULT NULL,
  dbop_name          IN VARCHAR2 DEFAULT NULL,
  monitor_type       IN NUMBER   DEFAULT MONITOR_TYPE_ALL,
  session_id         IN NUMBER   DEFAULT NULL,
  session_serial     IN NUMBER   DEFAULT NULL,
  inst_id            IN NUMBER   DEFAULT NULL,
  active_since_date  IN DATE     DEFAULT NULL,
  active_since_sec   IN NUMBER   DEFAULT NULL,
  last_refresh_time  IN DATE     DEFAULT NULL,
  report_level       IN VARCHAR2 DEFAULT 'TYPICAL',
  auto_refresh       IN NUMBER   DEFAULT NULL,
  base_path          IN VARCHAR2 DEFAULT NULL,
  type               IN VARCHAR2 DEFAULT 'TEXT',
  con_name           IN VARCHAR2 DEFAULT NULL)
RETURN CLOB;
```

Parameters

Table 169-6 *REPORT_SQL_MONITOR_LIST Procedure Parameters*

| Parameter | Description |
|-------------------|---|
| sql_id | SQL_ID of the simple database operation for which monitoring information should be displayed. Use NULL (default) to display monitoring information for the last operation monitored by Oracle Database. |
| dbop_name | DBOP_NAME for which monitoring information of the composite database operation is displayed. |
| monitor_type | Monitor type: <ul style="list-style-type: none"> MONITOR_TYPE_SQL returns only simple database operations MONITOR_TYPE_DBOP returns composite database operations MONITOR_TYPE_ALL returns all types |
| session_id | Targets only the subset of database operations executed and monitored on behalf of the specified session. Default is NULL. Use -1 or USERENV('SID') for the current session. |
| session_serial | In addition to session_id, you can specify the session serial number to ensure the desired session incarnation is targeted. This is ignored when session_id is NULL. |
| inst_id | Looks only at monitored database operations originating from the specified instance. Use -1 to target the instance where the report executed. To target all instances, use NULL (default). |
| active_since_date | If not NULL (default), returns monitored database operations that have been active since the specified time. This includes all operations that are executing, as well as all operations that have completed their execution after the specified start time. |
| active_since_sec | If not NULL (default), returns monitored database operations that have been active since the specified time. This includes all operations that are executing, as well as all operations that have completed their execution after the specified date and time. In this case, the start time is specified relative to the current SYSDATE minus a specified number of seconds. For example, use 3600 to limit the report to all operations that have been active in the past 1 hour. |
| last_refresh_time | If not NULL (default), the time when the list report was last retrieved. This optimizes the case where an application shows the list and refreshes the report on a regular basis (such as once every 5 seconds). In this case, the report will show details about the execution of monitored queries that have been active since the specified last_refresh_time. For other queries, the report returns the execution key (sql_id, sql_exec_start, and sql_exec_id). Also, for queries that have their first refresh time after the specified date, only the SQL execution key and statistics are returned. |
| report_level | Level of detail for the report. The level can be BASIC (SQL text up to 200 character), TYPICAL (which include full SQL text assuming that cursor has not aged out, in which case the SQL text is included up to 2000 characters), or ALL which is the same as TYPICAL. |
| auto_refresh | Specifies the duration in seconds after which report data will be automatically refreshed while the monitored SQL or database operation is still executing. This applies to active report types. |

Table 169-6 (Cont.) REPORT_SQL_MONITOR_LIST Procedure Parameters

| Parameter | Description |
|-----------|--|
| base_path | URL path for flex HTML resources since flex HTML format requires access to external files (java scripts and the flash swf file). |
| type | Report type: <ul style="list-style-type: none"> TEXT: text report (default) HTML: simple HTML report ACTIVE: database active report. Some information (explain plan, activity_histogram, metrics, and plan_histogram) is only shown when this type is selected. XML: raw data for the report |
| con_name | Container name in a multitenant database. |

Return Values

A report in text, XML, or HTML format that contains the list of the database operations monitored.

Usage Notes

- Use the [REPORT_SQL_MONITOR Function](#) to get detailed monitoring information for a single database operation.
- The user invoking this function needs to have the privilege to access the fixed views `GV$SQL_MONITOR` and `GV$SQL`.

169.4.6 REPORT_SQL_MONITOR_LIST_XML Function

This function is identical to the `REPORT_SQL_MONITOR_LIST` function, except that it returns `XMLType`.

Related Topics

- [REPORT_SQL_MONITOR_LIST Function](#)
This function builds a report for all or a subset of database operations that have been monitored by Oracle Database.

DBMS_SQL_TRANSLATOR

The `DBMS_SQL_TRANSLATOR` package provides an interface for creating, configuring, and using SQL translation profiles.

This chapter contains the following topics:

- [Security Model](#)
- [Constants](#)
- [Operational Notes](#)
- [Exceptions](#)
- [Examples](#)
- [Summary of DBMS_SQL_TRANSLATOR Subprograms](#)

See Also:

SQL Translation Framework Architecture and Overview in *Oracle Database Migration Guide*

170.1 DBMS_SQL_TRANSLATOR Security Model

`DBMS_SQL_TRANSLATOR` is an invoker's rights package.

When translating a SQL statement or error, the translator package procedure will be invoked with the same current user and current schema as those in which the SQL statement being parsed. The owner of the translator package must be granted the `TRANSLATE SQL` user privilege on the current user.

Additionally, the current user must be granted the `EXECUTE` privilege on the translator package.

170.2 DBMS_SQL_TRANSLATOR Constants

`DBMS_SQL_TRANSLATOR` defines several constants to use when specifying parameter values.

These are shown in the following table.

Table 170-1 DBMS_SQL_TRANSLATOR Constants

| Constant | Value | Type | Description |
|------------------------------|----------------------|---------------|---|
| ATTR_EDITIONABLE | 'EDITIONABLE' | VARCHAR2 (30) | Name of the SQL translation profile attribute that specifies whether the SQL translation profile becomes an editioned or noneditioned object if editioning is later enabled for the schema object type SQL translation profile in the owner's schema (see Operational Notes) |
| ATTR_FOREIGN_SQL_SYNTAX | 'FOREIGN_SQL_SYNTAX' | VARCHAR2 (30) | Name of the SQL translation profile attribute that indicates if the profile is for translation of foreign SQL syntax (see Operational Notes) |
| ATTR_LOG_TRANSLATION_ERROR | 'TRANSLATION_ERROR' | VARCHAR2 (30) | Name of the SQL translation profile attribute that controls if the profile should log translation error in the database alert log (see Operational Notes) |
| ATTR_RAISE_TRANSLATION_ERROR | 'TRANSLATION_ERROR' | VARCHAR2 (30) | Name of the SQL translation profile attribute that controls if the profile should raise translation error if a SQL statement or error fails to be translated (see Operational Notes) |
| ATTR_TRANSLATE_NEW_SQL | 'TRANSLATE_NEW_SQL' | VARCHAR2 (30) | Name of the SQL translation profile attribute that controls if the profile should translate new SQL statements and errors (see Operational Notes) |
| ATTR_TRACE_TRANSLATION | 'TRACE_TRANSLATION' | VARCHAR2 (30) | Name of the SQL translation profile attribute that controls tracing (see Operational Notes) |
| ATTR_TRANSLATOR | 'TRANSLATOR' | VARCHAR2 (30) | Name of the SQL translation profile attribute that specifies the translator package (see Operational Notes) |
| ATTR_VALUE_TRUE | 'TRUE' | VARCHAR2 (30) | Value to set a SQL translation profile attribute to true (see Operational Notes) |
| ATTR_VALUE_FALSE | 'FALSE' | VARCHAR2 (30) | Value to set a SQL translation profile attribute to false (see Operational Notes) |

170.3 DBMS_SQL_TRANSLATOR Operational Notes

The subprograms that modify a profile have DDL transaction semantics and when invoked will commit any open transaction in the session.

ATTR_EDITIONABLE Constant

Editionable is true by default.

ATTR_FOREIGN_SQL_SYNTAX Constant

Foreign SQL syntax is true by default.

ATTR_LOG_TRANSLATION_ERROR Constant

- If log translation is enabled in a SQL translation profile, an alert log is written to the database alert log if no custom translation is found for a SQL statement or error. This allows the user to catch any error in the custom translation in a profile.
- Log translation error is false by default.

ATTR_RAISE_TRANSLATION_ERROR Constant

Raise translation error is false by default.

ATTR_TRANSLATE_NEW_SQL Constant

- The name of the SQL translation profile attribute that controls if the profile should translate new SQL statements and errors. If so, the translator package, if registered, will translate a new SQL statement or error not already translated in custom translations, and also register the new translation as custom translation. If not, any new SQL statement or error encountered will result in a translation error
- Translate new SQL statements and errors is true by default.

ATTR_TRACE_TRANSLATION Constant

- If tracing is enabled in a SQL translation profile, any SQL statement or error translated by the profile in a database session and its translation is written to the database session's trace file.
- Tracing is disabled by default.

ATTR_TRANSLATOR Constant

- The translator package must be a PL/SQL package with the following three procedures. The [TRANSLATE_SQL Procedure](#) and the [TRANSLATE_ERROR Procedure](#) are called to translate SQL statements and errors. The names of the parameters of the translate procedures must be followed.

```
PROCEDURE TRANSLATE_SQL(  
    sql_text          IN CLOB,  
    translated_text  OUT CLOB);
```

```
PROCEDURE TRANSLATE_ERROR(  
    error_code        IN BINARY_INTEGER,  
    translated_code   OUT BINARY_INTEGER,  
    translated_sqlstate OUT VARCHAR2);
```

Parameters:

```
profile_name      - profile name  
sql_text          - SQL statement to be translated  
translated_text   - translated SQL statement  
error_code        - Oracle error code  
translated_code   - translated error code  
translated_sqlstate - translated SQLSTATE
```

- When NULL is returned in translated_text, translated_code, or translated_sqlstate, it means that no translation is required and the original SQL statement, error code, or SQLSTATE is used instead.
- The name of the translator package follows the naming rules for database packages of the form [schema.]package_name. When the schema and package names are used, they

are set to uppercase by default unless surrounded by double quotation marks. For example, setting a translator package, `translator => 'dbms_tsqL_translator'` is the same as `translator => 'Dbms_Tsql_Translator'` and `translator => 'DBMS_TSQL_TRANSLATOR'`, but not the same as `translator => "dbms_tsqL_translator"`. The default schema name is the profile owner.

- The translator attribute is not set by default.

ATTR_VALUE_TRUE Constant

The value to set a SQL translation profile attribute to true.

ATTR_VALUE_FALSE Constant

The value to set a SQL translation profile attribute to false.

170.4 DBMS_SQL_TRANSLATOR Exceptions

This table lists the exceptions raised by the `DBMS_SQL_TRANSLATOR` package.

Table 170-2 Exceptions Raised by DBMS_SQL_TRANSLATOR

| Exception | Error Code | Description |
|------------------------|------------|---|
| BAD_ARGUMENT | 29261 | Bad argument is passed to the PL/SQL interface |
| INSUFFICIENT_PRIVILEGE | 1031 | User has insufficient privilege for the operation |
| NO_SUCH_PROFILE | 24252 | Profile does not exist |
| NO_SUCH_USER | 1918 | Profile owner does not exist |
| NO_TRANSLATION_FOUND | 24253 | No translation of the SQL statement or error code found |
| PROFILE_EXISTS | 955 | Profile already exists |

170.5 DBMS_SQL_TRANSLATOR Examples

This is an example of basic SQL translation using `DBMS_SQL_TRANSLATOR`.

Basic SQL Translation

```
BEGIN
  DBMS_SQL_TRANSLATOR.CREATE_PROFILE(
    profile_name => 'tsql_application');
  DBMS_SQL_TRANSLATOR.SET_ATTRIBUTE(
    profile_name => 'tsql_application',
    attribute_name => DBMS_SQL_TRANSLATOR.ATTR_TRANSLATOR,
    attribute_value => 'migration_repo.sybase_tsqL_translator');
END;
```

170.6 Summary of DBMS_SQL_TRANSLATOR Subprograms

This table lists the DBMS_SQL_TRANSLATOR subprograms and briefly describes them.

Table 170-3 DBMS_SQL_TRANSLATOR Package Subprograms

| Subprogram | Description |
|--|---|
| CREATE_PROFILE Procedure | Creates a SQL translation profile |
| DEREGISTER_SQL_TRANSLATION Procedure | Deregisters the custom translation of a SQL statement in a SQL translation profile |
| DEREGISTER_ERROR_TRANSLATION Procedure | Deregisters the translation of an Oracle error code and <code>SQLSTATE</code> in a SQL translation profile |
| DROP_PROFILE Procedure | Drops a SQL translation profile and its contents |
| ENABLE_ERROR_TRANSLATION Procedure | Enables or disables a custom translation of an Oracle error code in a SQL translation profile |
| ENABLE_SQL_TRANSLATION Procedure | Enables or disables a custom translation of a SQL statement in a SQL translation profile |
| EXPORT_PROFILE Procedure | Exports the content of a SQL translation profile |
| IMPORT_PROFILE Procedure | Imports the content of a SQL translation profile |
| REGISTER_ERROR_TRANSLATION Procedure | Registers a custom translation of an Oracle error code and <code>SQLSTATE</code> in a SQL translation profile |
| REGISTER_SQL_TRANSLATION Procedure | Registers a custom translation of a SQL statement in a SQL translation profile |
| SET_ATTRIBUTE Procedure | Sets an attribute of a SQL translation profile |
| SQL_HASH Function | Computes the hash value of a SQL statement in a SQL translation profile |
| SQL_ID Function | Computes the SQL identifier of a SQL statement in a SQL translation profile |
| TRANSLATE_ERROR Procedure | Translates an Oracle error code and an ANSI <code>SQLSTATE</code> using a SQL translation profile |
| TRANSLATE_SQL Procedure | Translates a SQL statement using a SQL translation profile |

170.6.1 CREATE_PROFILE Procedure

This procedure creates a SQL translation profile.

Syntax

```
DBMS_SQL_TRANSLATOR.CREATE_PROFILE (
    profile_name    IN VARCHAR2);
```

Parameters

Table 170-4 CREATE_PROFILE Procedure Parameters

| Parameter | Description |
|--------------|-----------------|
| profile_name | Name of profile |

Exceptions

Table 170-5 CREATE_PROFILE Procedure Exceptions

| Exception | Description |
|------------------------|---|
| BAD_ARGUMENT | Bad argument is passed to the PL/SQL interface |
| INSUFFICIENT_PRIVILEGE | User has insufficient privilege for the operation |
| NO_SUCH_USER | Profile owner does not exist |
| PROFILE_EXISTS | Profile already exists |

Usage Notes

- A SQL translation profile is a database schema object that resides in SQL translation profile namespace. Its name follows the naming rules for database objects of the form [schema.]name. When the schema and profile names are used in the DBMS_SQL_TRANSLATOR package, they are uppercased unless surrounded by double quotation marks. For example, the translation profile profile_name => 'tsql_application' is the same as profile_name => 'Tsql_Application' and profile_name => 'TSQL_APPLICATION', but not the same as profile_name => 'tsql_application'.
- A SQL translation profile is an editionable object type.
- A SQL translation profile cannot be created as a common object in a multitenant container database (CDB).
- To destroy a SQL translation profile, use the [DROP_PROFILE Procedure](#).

Examples

```
BEGIN
  DBMS_SQL_TRANSLATOR.CREATE_PROFILE(profile_name => 'tsql_application');
END;
```

170.6.2 DEREGISTER_SQL_TRANSLATION Procedure

This procedure deregisters the custom translation of a SQL statement in a SQL translation profile.

Syntax

```
DBMS_SQL_TRANSLATOR.DEREGISTER_SQL_TRANSLATION (
  profile_name      IN  VARCHAR2,
  sql_text          IN  CLOB);
```

Parameters

Table 170-6 *DEREGISTER_SQL_TRANSLATION Procedure Parameters*

| Parameter | Description |
|--------------|-----------------|
| profile_name | Name of profile |
| sql_text | SQL statement |

Exceptions

Table 170-7 *DEREGISTER_SQL_TRANSLATION Procedure Exceptions*

| Exception | Description |
|------------------------|---|
| BAD_ARGUMENT | Bad argument is passed to the PL/SQL interface |
| INSUFFICIENT_PRIVILEGE | User has insufficient privilege for the operation |
| NO_SUCH_USER | Profile owner does not exist |
| PROFILE_EXISTS | Profile already exists |

Examples

```
BEGIN
  DBMS_SQL_TRANSLATOR.DEREGISTER_SQL_TRANSLATION (
    profile_name => 'tsql_application',
    sql_text     => 'select top 5 * from emp');
END;
```

170.6.3 DEREGISTER_ERROR_TRANSLATION Procedure

This procedure deregisters the translation of an Oracle error code and `SQLSTATE` in a SQL translation profile.

Syntax

```
DBMS_SQL_TRANSLATOR.DEREGISTER_ERROR_TRANSLATION (
  profile_name      IN  VARCHAR2,
  error_code       IN  PLS_INTEGER);
```

Parameters

Table 170-8 *DEREGISTER_ERROR_TRANSLATION Procedure Parameters*

| Parameter | Description |
|--------------|-------------------|
| profile_name | Name of profile |
| error_code | Oracle error code |

Exceptions

Table 170-9 DEREGISTER_ERROR_TRANSLATION Procedure Exceptions

| Exception | Description |
|------------------------|---|
| BAD_ARGUMENT | Bad argument is passed to the PL/SQL interface |
| INSUFFICIENT_PRIVILEGE | User has insufficient privilege for the operation |
| NO_SUCH_USER | Profile owner does not exist |
| NO_SUCH_PROFILE | Profile does not exist |

Examples

```
BEGIN
  DBMS_SQL_TRANSLATOR.DEREGISTER_ERROR_TRANSLATION(
    profile_name => 'tsql_application',
    error_code   => 1);
END;
```

170.6.4 DROP_PROFILE Procedure

This procedure drops a SQL translation profile and its contents.

Syntax

```
DBMS_SQL_TRANSLATOR.DROP_PROFILE (
  profile_name IN VARCHAR2);
```

Parameters

Table 170-10 DROP_PROFILE Procedure Parameters

| Parameter | Description |
|--------------|-----------------|
| profile_name | Name of profile |

Exceptions

Table 170-11 DROP_PROFILE Procedure Exceptions

| Exception | Description |
|------------------------|---|
| BAD_ARGUMENT | Bad argument is passed to the PL/SQL interface |
| INSUFFICIENT_PRIVILEGE | User has insufficient privilege for the operation |
| NO_SUCH_USER | Profile owner does not exist |
| NO_SUCH_PROFILE | Profile does not exist |

Examples

```
BEGIN
  DBMS_SQL_TRANSLATOR.DROP_PROFILE (
```

```

        profile_name => 'tsql_application');
END;
```

170.6.5 ENABLE_ERROR_TRANSLATION Procedure

This procedure enables or disables a custom translation of an Oracle error code in a SQL translation profile.

Syntax

```

DBMS_SQL_TRANSLATOR.ENABLE_ERROR_TRANSLATION (
    profile_name    IN  VARCHAR2,
    sql_text        IN  CLOB,
    enable          IN  BOOLEAN DEFAULT TRUE);
```

Parameters

Table 170-12 *ENABLE_ERROR_TRANSLATION Procedure Parameters*

| Parameter | Description |
|--------------|-----------------------------------|
| profile_name | Name of profile |
| sql_text | SQL statement |
| enable | Enable or disable the translation |

Exceptions

Table 170-13 *ENABLE_ERROR_TRANSLATION Procedure Exceptions*

| Exception | Description |
|------------------------|---|
| BAD_ARGUMENT | Bad argument is passed to the PL/SQL interface |
| INSUFFICIENT_PRIVILEGE | User has insufficient privilege for the operation |
| NO_SUCH_USER | Profile owner does not exist |
| NO_SUCH_PROFILE | Profile does not exist |

Examples

```

BEGIN
    DBMS_SQL_TRANSLATOR.ENABLE_ERROR_TRANSLATION(
        profile_name => 'tsql_application',
        sql_text     => 'SELECT TOP 5 * FROM emp'
        enable       => TRUE);
END;
```

170.6.6 ENABLE_SQL_TRANSLATION Procedure

This procedure enables or disables a custom translation of a SQL statement in a SQL translation profile.

Syntax

```

DBMS_SQL_TRANSLATOR.ENABLE_SQL_TRANSLATION (
    profile_name    IN  VARCHAR2,
```

```
sql_text      IN CLOB,  
enable        IN BOOLEAN DEFAULT TRUE);
```

Parameters

Table 170-14 *ENABLE_SQL_TRANSLATION Procedure Parameters*

| Parameter | Description |
|--------------|-----------------------------------|
| profile_name | Name of profile |
| sql_text | SQL statement |
| enable | Enable or disable the translation |

Exceptions

Table 170-15 *ENABLE_SQL_TRANSLATION Procedure Exceptions*

| Exception | Description |
|------------------------|---|
| BAD_ARGUMENT | Bad argument is passed to the PL/SQL interface |
| INSUFFICIENT_PRIVILEGE | User has insufficient privilege for the operation |
| NO_SUCH_USER | Profile owner does not exist |
| NO_SUCH_PROFILE | Profile does not exist |

Examples

```
BEGIN  
  DBMS_SQL_TRANSLATOR.ENABLE_SQL_TRANSLATION(  
    profile_name => 'tsql_application',  
    sql_text     => 'select top 5 * from emp',  
    enable       => TRUE);  
END;
```

170.6.7 EXPORT_PROFILE Procedure

This procedure exports the content of a SQL translation profile.

Syntax

```
DBMS_SQL_TRANSLATOR.EXPORT_PROFILE (  
  profile_name IN VARCHAR2,  
  content      OUT NOCOPY CLOB);
```

Parameters

Table 170-16 *EXPORT_PROFILE Procedure Parameters*

| Parameter | Description |
|--------------|--------------------|
| profile_name | Name of profile |
| content | Content of profile |

Exceptions

Table 170-17 EXPORT_PROFILE Procedure Exceptions

| Exception | Description |
|------------------------|---|
| BAD_ARGUMENT | Bad argument is passed to the PL/SQL interface |
| INSUFFICIENT_PRIVILEGE | User has insufficient privilege for the operation |
| NO_SUCH_USER | Profile owner does not exist |
| NO_SUCH_PROFILE | Profile does not exist |

Usage Notes

- The content of the SQL translation profile is exported in XML format as follows. Note that the profile name will not be exported.

```
SQLTranslationProfile Translator="translator package name"
                      ForeignSQLSyntax="TRUE|FALSE"
                      TranslateNewSQL="TRUE|FALSE"
                      RaiseTranslationError="TRUE|FALSE"
                      LogTranslationError="TRUE|FALSE"
                      TraceTranslation="TRUE|FALSE"
                      Editionable="TRUE|FALSE">
  <SQLTranslations>
    <SQLTranslation Enabled="TRUE|FALSE">
      <SQLText>original SQL text</SQLText>
      <TranslatedText>translated SQL text</TranslatedText>
    </SQLTranslation>
    ...
  </SQLTranslations>
  <ErrorTranslations>
    <ErrorTranslation Enabled="TRUE|FALSE">
      <ErrorCode>Oracle error code</ErrorCode>
      <TranslatedCode>translated error code</TranslatedCode>
      <TranslatedSQLSTATE>translated SQLSTATE</TranslatedSQLSTATE>
    </ErrorTranslation>
    ...
  </ErrorTranslations>
</SQLTranslationProfile>
```

- To import the content to a SQL translation profile, use the [IMPORT_PROFILE Procedure](#).

Examples

```
DECLARE
  content CLOB;
BEGIN
  DBMS_SQL_TRANSLATOR.EXPORT_PROFILE(
    profile_name => 'tsql_application',
    content      => content);
END;
```

170.6.8 IMPORT_PROFILE Procedure

This procedure imports the content of a SQL translation profile.

Syntax

```
DBMS_SQL_TRANSLATOR.IMPORT_PROFILE (
  profile_name      IN  VARCHAR2,
  content           IN  CLOB);
```

Parameters

Table 170-18 *IMPORT_PROFILE Procedure Parameters*

| Parameter | Description |
|--------------|--------------------|
| profile_name | Name of profile |
| content | Content of profile |

Exceptions

Table 170-19 *IMPORT_PROFILE Procedure Exceptions*

| Exception | Description |
|------------------------|---|
| BAD_ARGUMENT | Bad argument is passed to the PL/SQL interface |
| INSUFFICIENT_PRIVILEGE | User has insufficient privilege for the operation |
| NO_SUCH_USER | Profile owner does not exist |

Usage Notes

- The content of the SQL translation profile must be in XML format as used by the [EXPORT_PROFILE Procedure](#). All elements and attributes are optional.
- If the profile does not exist, it is created. If it exists, the content overrides any existing attribute, translator package, SQL or error translation registration.
- To export the content to a SQL translation profile, use the [EXPORT_PROFILE Procedure](#).

Examples

```
DECLARE
  content CLOB;
BEGIN
  DBMS_SQL_TRANSLATOR.IMPORT_PROFILE(
    profile_name => 'tsql_application',
    content      => content);
END;
```

170.6.9 REGISTER_ERROR_TRANSLATION Procedure

This procedure registers a custom translation of an Oracle error code and `SQLSTATE` in a SQL translation profile.

Syntax

```
DBMS_SQL_TRANSLATOR.REGISTER_ERROR_TRANSLATION (
  profile_name      IN  VARCHAR2,
  error_code       IN  PLS_INTEGER,
  translated_code   IN  PLS_INTEGER DEFAULT NULL,
  translated_sqlstate IN VARCHAR2 DEFAULT NULL,
  enable           IN  BOOLEAN DEFAULT TRUE);
```

Parameters

Table 170-20 REGISTER_ERROR_TRANSLATION Procedure Parameters

| Parameter | Description |
|----------------------------------|-----------------------------------|
| <code>profile_name</code> | Name of profile |
| <code>error_code</code> | Oracle error code |
| <code>translated_code</code> | Translated error code |
| <code>translated_sqlstate</code> | Translated <code>SQLSTATE</code> |
| <code>enable</code> | Enable or disable the translation |

Exceptions

Table 170-21 REGISTER_ERROR_TRANSLATION Procedure Exceptions

| Exception | Description |
|-------------------------------------|---|
| <code>BAD_ARGUMENT</code> | Bad argument is passed to the PL/SQL interface |
| <code>INSUFFICIENT_PRIVILEGE</code> | User has insufficient privilege for the operation |
| <code>NO_SUCH_USER</code> | Profile owner does not exist |
| <code>NO_SUCH_PROFILE</code> | Profile does not exist |

Usage Notes

- When the Oracle Database translates an Oracle error code using a translation profile, it searches for the registered custom translation first, and only invokes the translator package if no match is found.
- When a translation is registered in a profile, it may be disabled. Oracle Database does not search for disabled translations.
- The old translation of the error code and `SQLSTATE`, if present, is replaced with the new translation.
- To deregister a translation, use the [DEREGISTER_ERROR_TRANSLATION Procedure](#).

Examples

```
BEGIN
    DBMS_SQL_TRANSLATOR.REGISTER_ERROR_TRANSLATION(
        profile_name => 'tsql_application',
        error_code   => 1,
        translated_code => 2601);
END;
```

170.6.10 REGISTER_SQL_TRANSLATION Procedure

This procedure registers a custom translation of a SQL statement in a SQL translation profile.

Syntax

```
DBMS_SQL_TRANSLATOR.REGISTER_SQL_TRANSLATION (
    profile_name     IN VARCHAR2,
    sql_text         IN CLOB,
    translated_text  IN CLOB DEFAULT NULL,
    enable           IN BOOLEAN DEFAULT TRUE);
```

Parameters

Table 170-22 REGISTER_SQL_TRANSLATION Procedure Parameters

| Parameter | Description |
|-----------------|-----------------------------------|
| profile_name | Name of profile |
| sql_text | SQL statement |
| translated_text | Translated SQL statement |
| enable | Enable or disable the translation |

Exceptions

Table 170-23 REGISTER_SQL_TRANSLATION Procedure Exceptions

| Exception | Description |
|------------------------|---|
| BAD_ARGUMENT | Bad argument is passed to the PL/SQL interface |
| INSUFFICIENT_PRIVILEGE | User has insufficient privilege for the operation |
| NO_SUCH_USER | Profile owner does not exist |
| NO_SUCH_PROFILE | Profile does not exist |

Usage Notes

- When the Oracle Database translates a statement using a translation profile, it searches for the registered custom translation first, and only invokes the translator package if no match is found.
- When a translation is registered in a profile, it may be disabled. Oracle Database does not search for disabled translations.

- When `translated_text` is NULL, no translation is required and the original statement is used.
- The old translation of the SQL statement, if present, is replaced with the new translation.
- To deregister a translation, use the [DEREGISTER_SQL_TRANSLATION Procedure](#).

Examples

```
BEGIN
  DBMS_SQL_TRANSLATOR.REGISTER_SQL_TRANSLATION(
    profile_name => 'tsql_application',
    sql_text     => 'select top 5 * from emp',
    translated_text => 'SELECT * FROM emp WHERE rownum <= :SYS_N_001');
END;
```

170.6.11 SET_ATTRIBUTE Procedure

This procedure sets an attribute of a SQL translation profile.

Syntax

```
DBMS_SQL_TRANSLATOR.SET_ATTRIBUTE (
  profile_name  IN  VARCHAR2,
  attribute_name IN  VARCHAR2,
  attribute_value IN  VARCHAR2;)
```

Parameters

Table 170-24 *SET_ATTRIBUTE Procedure Parameters*

| Parameter | Description |
|------------------------------|--------------------|
| <code>profile_name</code> | Name of profile |
| <code>attribute_name</code> | Name of attribute |
| <code>attribute_value</code> | Value of attribute |

Exceptions

Table 170-25 *SET_ATTRIBUTE Procedure Exceptions*

| Exception | Description |
|-------------------------------------|---|
| <code>BAD_ARGUMENT</code> | Bad argument is passed to the PL/SQL interface |
| <code>INSUFFICIENT_PRIVILEGE</code> | User has insufficient privilege for the operation |
| <code>NO_SUCH_USER</code> | Profile owner does not exist |
| <code>NO_SUCH_PROFILE</code> | Profile does not exist |

Usage Notes

See [Constants](#)

170.6.12 SQL_HASH Function

This procedure computes the hash value of a SQL statement in the session's SQL translation profile.

Syntax

```
DBMS_SQL_TRANSLATOR.SQL_HASH (
    sql_text          IN CLOB)
RETURN NUMBER DETERMINISTIC;
```

Parameters

Table 170-26 SQL_HASH Function Parameters

| Parameter | Description |
|-----------|---------------|
| sql_text | SQL statement |

Return Values

Returns hash value of the SQL statement in the SQL translation profile

Exceptions

Table 170-27 SQL_HASH Function Exceptions

| Exception | Description |
|--------------|--|
| BAD_ARGUMENT | Bad argument is passed to the PL/SQL interface |

Examples

```
DECLARE
    sqltext CLOB;
    txltext CLOB;
    sqlhash NUMBER;
BEGIN
    sqltext := 'SELECT TOP 1 * FROM emp';
    sqlhash := DBMS_SQL_TRANSLATOR.SQL_HASH (sqltext);
    SELECT translated_text INTO txltext
    FROM user_sql_translations
    WHERE sql_hash = sqlhash
    AND DBMS_LOB.COMPARE (sql_text, sqltext) = 0;
END;
```

170.6.13 SQL_ID Function

This procedure computes the SQL identifier of a SQL statement in a SQL translation profile.

Syntax

```
DBMS_SQL_TRANSLATOR.SQL_ID (
    sql_text          IN CLOB)
RETURN VARCHAR2 DETERMINISTIC;
```

Parameters

Table 170-28 *SQL_ID Function Parameters*

| Parameter | Description |
|-----------|---------------|
| sql_text | SQL statement |

Return Values

Returns the SQL ID of the SQL statement in the SQL translation profile

Exceptions

Table 170-29 *SQL_ID Function Exceptions*

| Exception | Description |
|--------------|--|
| BAD_ARGUMENT | Bad argument is passed to the PL/SQL interface |

Examples

```

DECLARE
  sqltext CLOB;
  sqlid   VARCHAR2(13);
BEGIN
  sqltext := 'SELECT TOP 1 * FROM emp';
  sqlid   := DBMS_SQL_TRANSLATOR.SQL_ID (sqltext);
END;

```

170.6.14 TRANSLATE_ERROR Procedure

This procedure translates an Oracle error code and an ANSI SQLSTATE using the session's SQL translation profile

Syntax

```

DBMS_SQL_TRANSLATOR.TRANSLATE_ERROR (
  error_code          IN          PLS_INTEGER,
  translated_code     OUT         PLS_INTEGER,
  translated_sqlstate OUT NOCOPY VARCHAR2);

```

Parameters

Table 170-30 *TRANSLATE_ERROR Procedure Parameters*

| Parameter | Description |
|---------------------|-----------------------|
| error_code | Oracle error code |
| translated_code | Translated error code |
| translated_sqlstate | Translated SQLSTATE |

Exceptions

Table 170-31 TRANSLATE_ERROR Procedure Exceptions

| Exception | Description |
|------------------------|--|
| BAD_ARGUMENT | Bad argument is passed to the PL/SQL interface |
| INSUFFICIENT_PRIVILEGE | User has insufficient privilege for the operation |
| NO_SUCH_USER | Profile owner does not exist |
| NO_SUCH_PROFILE | Profile does not exist |
| NO_TRANSLATION_FOUND | No translation of the SQL statement or error code is found |

Examples

```

DECLARE
    translated_code      BINARY_INTEGER;
    translated_sqlstate  VARCHAR2(5);
BEGIN
    DBMS_SQL_TRANSLATOR.TRANSLATE_ERROR(
        error_code        => 1,
        translated_code    => translated_code,
        translated_sqlstate => translated_sqlstate);
END;
```

170.6.15 TRANSLATE_SQL Procedure

This procedure translates a SQL statement using a SQL translation profile.

Syntax

```

DBMS_SQL_TRANSLATOR.TRANSLATE_SQL (
    sql_text          IN          CLOB,
    translated_text   OUT NOCOPY CLOB);
```

Parameters

Table 170-32 TRANSLATE_SQL Procedure Parameters

| Parameter | Description |
|-----------------|--------------------------|
| sql_text | SQL statement |
| translated_text | Translated SQL statement |

Exceptions

Table 170-33 TRANSLATE_SQL Procedure Exceptions

| Exception | Description |
|------------------------|---|
| BAD_ARGUMENT | Bad argument is passed to the PL/SQL interface |
| INSUFFICIENT_PRIVILEGE | User has insufficient privilege for the operation |
| NO_SUCH_USER | Profile owner does not exist |

Table 170-33 (Cont.) TRANSLATE_SQL Procedure Exceptions

| Exception | Description |
|-----------------|------------------------|
| NO_SUCH_PROFILE | Profile does not exist |

Examples

```
ALTER SESSION SET SQL_TRANSLATION_PROFILE = tsql_application;
```

```
DECLARE
    translated_text CLOB;
BEGIN
    DBMS_SQL_TRANSLATOR.TRANSLATE_SQL(
        sql_text      => 'select top 5 * from emp',
        translated_text => translated_text);
END;
```

DBMS_SQLDIAG

The DBMS_SQLDIAG package provides an interface to the SQL Diagnosability functionality.

This chapter contains the following topics:

- [DBMS_SQLDIAG Overview](#)
- [DBMS_SQLDIAG Security Model](#)
- [DBMS_SQLDIAG Constants](#)
- [Summary of DBMS_SQLDIAG Subprograms](#)

See Also:

Oracle Database Administrator's Guide for more information about "Managing Diagnostic Data"

171.1 DBMS_SQLDIAG Overview

In the rare case that a SQL statement fails with a critical error, you can run the SQL Repair Advisor to try to repair the failed statement by using the DBMS_SQLDIAG package subprograms.

The SQL Repair Advisor analyzes the statement and in many cases recommends a patch to repair the statement. If you implement the recommendation, the applied SQL patch circumvents the failure by causing the query optimizer to choose an alternate execution plan for future executions.

See Also:

Oracle Database Administrator's Guide for more information about how to run the SQL Repair Advisor using the DBMS_SQLDIAG package subprograms.

171.2 DBMS_SQLDIAG Security Model

You must have the `ADVISOR` role to execute the DBMS_SQLDIAG package.

171.3 DBMS_SQLDIAG Constants

DBMS_SQLDIAG defines constants to use when specifying parameter values.

These constants are shown in the following tables:

- [Table 171-1](#) describes the name of SQL repair advisor as seen by the advisor framework

- [Table 171-2](#) describes SQLDIAG advisor task scope parameter values
- [Table 171-3](#) describes SQLDIAG advisor `time_limit` constants
- [Table 171-4](#) describes possible formats for a report
- [Table 171-5](#) describes possible levels of detail in the report
- [Table 171-6](#) describes possible report sections (comma delimited)
- [Table 171-7](#) describes possible values for the `problem_type` parameter of the `CREATE_DIAGNOSIS_TASK` Functions
- [Table 171-8](#) describes possible values for the `_sql_findings_mode` parameter

Table 171-1 DBMS_SQLDIAG Constants - SQLDIAG Advisor Name

| Constant | Type | Value | Description |
|-------------------|---------------|--------------------|---|
| ADV_SQL_DIAG_NAME | VARCHAR2 (18) | SQL Repair Advisor | Name of SQL repair advisor as seen by the advisor framework |

Table 171-2 DBMS_SQLDIAG Constants - SQLDIAG Advisor Task Scope Parameter Values

| Constant | Type | Value | Description |
|---------------------|---------------|---------------|--|
| SCOPE_COMPREHENSIVE | VARCHAR2 (13) | COMPREHENSIVE | Detailed analysis of the problem which may take more time to execute |
| SCOPE_LIMITED | VARCHAR2 (7) | LIMITED | Brief analysis of the problem |

Table 171-3 DBMS_SQLDIAG Constants - SQLDIAG Advisor time_limit Constants

| Constant | Type | Value | Description |
|--------------------|--------|-------|--|
| TIME_LIMIT_DEFAULT | NUMBER | 1800 | Default time limit for analysis of the problem |

Table 171-4 DBMS_SQLDIAG Constants - Report Type (possible values) Constants

| Constant | Type | Value | Description |
|-----------|--------------|-------|---|
| TYPE_HTML | VARCHAR2 (4) | HTML | Report from the REPORT_DIAGNOSIS_TASK Function in HTML form |
| TYPE_TEXT | VARCHAR2 (4) | TEXT | Report from the REPORT_DIAGNOSIS_TASK Function in text form |

Table 171-4 (Cont.) DBMS_SQLDIAG Constants - Report Type (possible values) Constants

| Constant | Type | Value | Description |
|----------|--------------|-------|--|
| TYPE_XML | VARCHAR2 (3) | XML | Report from the REPORT_DIAGNOSIS_TASK Function in XML form |

Table 171-5 DBMS_SQLDIAG Constants - Report Level (possible values) Constants

| Constant | Type | Value | Description |
|---------------|--------------|---------|---|
| LEVEL_ALL | VARCHAR2 (3) | ALL | Complete report including annotations about statements skipped over |
| LEVEL_BASIC | VARCHAR2 (5) | BASIC | Shows information about every statement analyzed, including recommendations not implemented |
| LEVEL_TYPICAL | VARCHAR2 (7) | TYPICAL | Simple report shows only information about the actions taken by the advisor. |

Table 171-6 DBMS_SQLDIAG Constants - Report Section (possible values) Constants

| Constant | Type | Value | Description |
|---------------------|---------------|-------------|------------------------|
| SECTION_ALL | VARCHAR2 (3) | ALL | All statements |
| SECTION_ERRORS | VARCHAR2 (6) | ERRORS | Statements with errors |
| SECTION_FINDINGS | VARCHAR2 (8) | FINDINGS | Tuning findings |
| SECTION_INFORMATION | VARCHAR2 (11) | INFORMATION | General information |
| SECTION_PLANS | VARCHAR2 (5) | PLANS | Explain plans |
| SECTION_SUMMARY | VARCHAR2 (7) | SUMMARY | Summary information |

Table 171-7 DBMS_SQLDIAG Constants - Problem Type Constants

| Constant | Type | Value | Description |
|--------------------------------|--------|-------|--|
| PROBLEM_TYPE_PERFORMANCE | NUMBER | 1 | User suspects this is a performance problem |
| PROBLEM_TYPE_WRONG_RESULTS | NUMBER | 2 | User suspects the query is giving inconsistent results |
| PROBLEM_TYPE_COMPILATION_ERROR | NUMBER | 3 | User sees a crash in compilation |

Table 171-7 (Cont.) DBMS_SQLDIAG Constants - Problem Type Constants

| Constant | Type | Value | Description |
|----------------------------------|--------|-------|---------------------------------------|
| PROBLEM_TYPE_EXECUTION_ERR OR | NUMBER | 4 | User sees a crash in execution |
| PROBLEM_TYPE_ALT_PLAN_GEN | NUMBER | 5 | User to explore all alternative plans |

Table 171-8 DBMS_SQLDIAG Constants - Findings Filter Constants

| Constant | Type | Value | Description |
|-----------------------------------|--------|-------|---|
| SQLDIAG_FINDINGS_ALL | NUMBER | 1 | Show all possible findings |
| SQLDIAG_FINDINGS_VALIDAT ION | NUMBER | 2 | Show status of validation rules over structures |
| SQLDIAG_FINDINGS_FEATURE S | NUMBER | 3 | Show only features used by the query |
| SQLDIAG_FINDINGS_FILTER_ PLANS | NUMBER | 4 | Show the alternative plans generated by the advisor |
| SQLDIAG_FINDINGS_CR_DIFF | NUMBER | 5 | Show difference between two plans |
| SQLDIAG_FINDINGS_MASK_VA RIANT | NUMBER | 6 | Mask info for testing |
| SQLDIAG_FINDINGS_OBJ_FEA TURES | NUMBER | 7 | Show features usage history |
| SQLDIAG_FINDINGS_BASIC_I NFO | NUMBER | 8 | Show the alternative plans generated by the advisor |

171.4 Summary of DBMS_SQLDIAG Subprograms

This table lists the DBMS_SQLDIAG subprograms and briefly describes them.

Table 171-9 DBMS_SQLDIAG Package Subprograms

| Subprogram | Description |
|---|--|
| ACCEPT_SQL_PATCH Function & Procedure | Accepts a recommended SQL patch as recommended by the specified SQL diagnosis task |
| ALTER_SQL_PATCH Procedure | Alters specific attributes of an existing SQL patch object |
| CANCEL_DIAGNOSIS_TASK Procedure | Cancels a diagnostic task |
| CREATE_DIAGNOSIS_TASK Functions | Creates a diagnostic task in order to diagnose a single SQL statement |

Table 171-9 (Cont.) DBMS_SQLDIAG Package Subprograms

| Subprogram | Description |
|---|--|
| CREATE_SQL_PATCH Function | Creates an SQL patch based on a set of user specified hints for specific statements identified by SQL text. |
| CREATE_STGTAB_SQLPATCH Procedure | Creates the staging table used for transporting SQL patches from one system to another |
| DROP_DIAGNOSIS_TASK Procedure | Drops a diagnostic task |
| DROP_SQL_PATCH Procedure | Drops the named SQL patch from the database |
| EXECUTE_DIAGNOSIS_TASK Procedure | Executes a diagnostic task |
| EXPLAIN_SQL_TESTCASE Function | Explains a SQL test case |
| EXPORT_SQL_TESTCASE Procedures | Exports a SQL test case to a directory |
| EXPORT_SQL_TESTCASE_DIR_BY_INC Function | Generates a SQL Test Case corresponding to the incident ID passed as an argument. |
| EXPORT_SQL_TESTCASE_DIR_BY_TXT Function | Generates a SQL Test Case corresponding to the SQL passed as an argument |
| GET_FIX_CONTROL Function | Returns the value of fix control for a given bug number |
| GET_SQL Function | Imports a SQL test case |
| IMPORT_SQL_TESTCASE Procedures | Imports a SQL test case into a schema |
| INCIDENTID_2_SQL Procedure | Initializes a <code>sql_setrow</code> from an incident ID |
| INTERRUPT_DIAGNOSIS_TASK Procedure | Interrupts a diagnostic task |
| LOAD_SQLSET_FROM_TCB Function | Loads a <code>SQLSET</code> from Test Case Builder (TCB) file |
| PACK_STGTAB_SQLPATCH Procedure | SQL patches into the staging table created by the CREATE_STGTAB_SQLPATCH Procedure |
| REPLAY_SQL_TESTCASE Function | Reports on a diagnostic task |
| REPORT_DIAGNOSIS_TASK Function | Reports on a diagnostic task |
| RESET_DIAGNOSIS_TASK Procedure | Resets a diagnostic task |
| RESUME_DIAGNOSIS_TASK Procedure | Resumes a diagnostic task |
| SET_DIAGNOSIS_TASK_PARAMETER Procedure | Sets a diagnosis task parameter |
| SQL_DIAGNOSE_AND_REPAIR Function | Diagnoses a given SQL statement for a given SQL ID for the given problem type. |
| UNPACK_STGTAB_SQLPATCH Procedure | Unpacks from the staging table populated by a call to the PACK_STGTAB_SQLPATCH Procedure , using the patch data stored in the staging table to create patches on this system |

171.4.1 ACCEPT_SQL_PATCH Function & Procedure

This procedure accepts a recommended SQL patch as recommended by the specified SQL diagnosis task.

Syntax

```
DBMS_SQLDIAG.ACCEPT_SQL_PATCH (
    task_name      IN  VARCHAR2,
    object_id      IN  NUMBER := NULL,
    name           IN  VARCHAR2 := NULL,
    description    IN  VARCHAR2 := NULL,
    category       IN  VARCHAR2 := NULL,
    task_owner     IN  VARCHAR2 := NULL,
    replace        IN  BOOLEAN := FALSE,
    force_match    IN  BOOLEAN := FALSE)
RETURN VARCHAR2;
```

```
DBMS_SQLDIAG.ACCEPT_SQL_PATCH (
    task_name      IN  VARCHAR2,
    object_id      IN  NUMBER := NULL,
    name           IN  VARCHAR2 := NULL,
    description    IN  VARCHAR2 := NULL,
    category       IN  VARCHAR2 := NULL,
    task_owner     IN  VARCHAR2 := NULL,
    replace        IN  BOOLEAN := FALSE,
    force_match    IN  BOOLEAN := FALSE);
```

Parameters

Table 171-10 ACCEPT_SQL_PATCH Function & Procedure Parameters

| Parameter | Description |
|-------------|--|
| taskname | Name of the SQL diagnosis task |
| object_id | Identifier of the advisor framework object representing the SQL statement associated to the diagnosis task |
| name | Name of the patch. It cannot contain double quotation marks. The name is case sensitive. If not specified, the system will generate a unique name for the SQL patch. |
| description | User specified string describing the purpose of this SQL patch. Maximum size of description is 500. |
| category | Category name which must match the value of the <code>SQLDIAGNOSE_CATEGORY</code> parameter in a session for the session to use this patch. It defaults to the value <code>DEFAULT</code> . This is also the default of the <code>SQLDIAGNOSE_CATEGORY</code> parameter. The category must be a valid Oracle identifier. The category name specified is always converted to upper case. The combination of the normalized SQL text and category name create a unique key for a patch. An accept will fail if this combination is duplicated. |
| task_owner | Owner of the diagnosis task. This is an optional parameter that has to be specified to accept a SQL Patch associated to a diagnosis task owned by another user. The current user is the default value. |

Table 171-10 (Cont.) ACCEPT_SQL_PATCH Function & Procedure Parameters

| Parameter | Description |
|-------------|---|
| replace | If the patch already exists, it will be replaced if this argument is TRUE. It is an error to pass a name that is already being used for another signature/category pair, even with replace set to TRUE. |
| force_match | If TRUE this causes SQL Patches to target all SQL statements which have the same text after normalizing all literal values into bind variables. (Note that if a combination of literal values and bind values is used in a SQL statement, no bind transformation occurs.) This is analogous to the matching algorithm used by the FORCE option of the CURSOR_SHARING parameter. If FALSE, literals are not transformed. This is analogous to the matching algorithm used by the EXACT option of the CURSOR_SHARING parameter. |

Return Values

Name of the SQL patch

Usage Notes

Requires CREATE ANY SQL PROFILE privilege

171.4.2 ALTER_SQL_PATCH Procedure

This procedure alters specific attributes of an existing SQL patch object.

Syntax

```
DBMS_SQLDIAG.ALTER_SQL_PATCH (
    name           IN VARCHAR2,
    attribute_name IN VARCHAR2,
    attribute_value IN VARCHAR2);
```

Parameters

Table 171-11 ALTER_SQL_PATCH Procedure Parameters

| Parameter | Description |
|----------------|--|
| name | Name of SQL patch to alter. |
| attribute_name | Name of SQL patch to alter. Possible values: <ul style="list-style-type: none"> STATUS -> can be set to ENABLED or DISABLED NAME -> can be reset to a valid name (must be a valid Oracle identifier and must be unique). DESCRIPTION -> can be set to any string of size no more than 500 CATEGORY -> can be reset to a valid category name (must be valid Oracle identifier and must be unique when combined with normalized SQL text) This parameter is mandatory and is case sensitive. |

Table 171-11 (Cont.) ALTER_SQL_PATCH Procedure Parameters

| Parameter | Description |
|-----------------|---|
| attribute_value | New value of the attribute. See attribute_name for valid attribute values. This parameter is mandatory. |

Usage Notes

Requires ALTER ANY SQL PATCH privilege

171.4.3 CANCEL_DIAGNOSIS_TASK Procedure

This procedure cancels a diagnostic task.

Syntax

```
DBMS_SQLDIAG.CANCEL_DIAGNOSIS_TASK (
    taskname          IN  VARCHAR2);
```

Parameters

Table 171-12 CANCEL_DIAGNOSIS_TASK Procedure Parameters

| Parameter | Description |
|-----------|--------------|
| taskname | Name of task |

171.4.4 CREATE_DIAGNOSIS_TASK Functions

This function creates a diagnostic task in order to diagnose a single SQL statement. It returns a SQL diagnosis task unique name

Syntax

Prepares the diagnosis of a single statement given its text:

```
DBMS_SQLDIAG.CREATE_DIAGNOSIS_TASK (
    sql_text          IN  CLOB,
    bind_list         IN  sql_binds := NULL,
    user_name         IN  VARCHAR2 := NULL,
    scope             IN  VARCHAR2 := SCOPE_COMPREHENSIVE,
    time_limit        IN  NUMBER   := TIME_LIMIT_DEFAULT,
    task_name         IN  VARCHAR2 := NULL,
    description       IN  VARCHAR2 := NULL,
    problem_type      IN  NUMBER   := PROBLEM_TYPE_PERFORMANCE)
RETURN VARCHAR2;
```

Prepares the diagnosis of a single statement from the Cursor Cache given its identifier:

```
DBMS_SQLDIAG.CREATE_DIAGNOSIS_TASK (
    sql_id            IN  VARCHAR2,
    plan_hash_value   IN  NUMBER   := NULL,
    scope             IN  VARCHAR2 := SCOPE_COMPREHENSIVE,
    time_limit        IN  NUMBER   := TIME_LIMIT_DEFAULT,
```

```

task_name          IN  VARCHAR2  := NULL,
description        IN  VARCHAR2  := NULL,
problem_type       IN  NUMBER     := PROBLEM_TYPE_PERFORMANCE)
RETURN VARCHAR2;
```

Prepares the diagnosis of a Sqlset:

```

DBMS_SQLDIAG.CREATE_DIAGNOSIS_TASK (
  sqlset_name      IN VARCHAR2,
  basic_filter     IN VARCHAR2 := NULL,
  object_filter    IN VARCHAR2 := NULL,
  rank1            IN VARCHAR2 := NULL,
  rank2            IN VARCHAR2 := NULL,
  rank3            IN VARCHAR2 := NULL,
  result_percentage IN NUMBER   := NULL,
  result_limit     IN NUMBER   := NULL,
  scope            IN VARCHAR2 := SCOPE_COMPREHENSIVE,
  time_limit       IN NUMBER   := TIME_LIMIT_DEFAULT,
  task_name        IN VARCHAR2 := NULL,
  description       IN VARCHAR2 := NULL,
  plan_filter      IN VARCHAR2 := 'MAX_ELAPSED_TIME',
  sqlset_owner     IN VARCHAR2 := NULL,
  problem_type     IN NUMBER   := PROBLEM_TYPE_PERFORMANCE) RETURN VARCHAR2;
```

Parameters

Table 171-13 CREATE_DIAGNOSIS_TASK Function Parameters

| Parameter | Description |
|-------------------|--|
| sql_text | Text of a SQL statement |
| bind_list | Set of bind values |
| user_name | Username for who the statement/sqlset will be diagnosed |
| scope | Diagnosis scope (limited/comprehensive) |
| time_limit | Maximum duration in seconds for the diagnosis session |
| task_name | Optional diagnosis task name |
| description | Maximum of 256 SQL diagnosis session description |
| problem_type | Determines the goal of the task. Possible values are: <ul style="list-style-type: none"> PROBLEM_TYPE_WRONG_RESULTS PROBLEM_TYPE_COMPILATION_ERROR PROBLEM_TYPE_EXECUTION_ERROR |
| sql_id | Identifier of the statement |
| plan_hash_value | Hash value of the SQL execution plan |
| sqlset_name | Sqlset name |
| basic_filter | SQL predicate to filter the SQL from the SQL tuning set (STS) |
| object_filter | Object filter |
| rank(i) | Order-by clause on the selected SQL |
| result_percentage | Percentage on the sum of a ranking measure |
| result_limit | Top L(imit) SQL from (filtered/ranked) SQL |

Table 171-13 (Cont.) CREATE_DIAGNOSIS_TASK Function Parameters

| Parameter | Description |
|--------------|--|
| plan_filter | Plan filter. It is applicable in case there are multiple plans (plan_hash_value). This filter allows selecting one plan (plan_hash_value) only. Possible values are: <ul style="list-style-type: none"> • LAST_GENERATED: plan with most recent timestamp • FIRST_GENERATED: opposite to LAST_GENERATED • LAST_LOADED: plan with most recent first_load_time stat info • FIRST_LOADED: opposite to LAST_LOADED • MAX_ELAPSED_TIME: plan with maximum elapsed time • MAX_BUFFER_GETS: plan with maximum buffer gets • MAX_DISK_READS: plan with maximum disk reads • MAX_DIRECT_WRITES: plan with maximum direct writes • MAX_OPTIMIZER_COST: plan with maximum optimum cost |
| sqlset_owner | Owner of the sqlset, or null for current schema owner |

171.4.5 CREATE_SQL_PATCH Function

This function creates a SQL patch based on a set of user specified hints for specific statements identified by SQL text.

A SQL patch is usually created automatically by the SQL Repair Advisor to prevent any errors during the compilation or execution of a SQL statement. This function provides a way to manually create a SQL patch based on a set of hints that resolves the error.

Syntax

```
DBMS_SQLDIAG.CREATE_SQL_PATCH (
    sql_text      IN  CLOB,
    hint_text     IN  CLOB,
    name          IN  VARCHAR2  := NULL,
    description   IN  VARCHAR2  := NULL,
    category      IN  VARCHAR2  := NULL,
    validate      IN  BOOLEAN    := TRUE)
RETURN VARCHAR2;
```

```
DBMS_SQLDIAG.CREATE_SQL_PATCH (
    sql_id       IN  VARCHAR2,
    hint_text    IN  CLOB,
    name         IN  VARCHAR2  := NULL,
    description  IN  VARCHAR2  := NULL,
    category     IN  VARCHAR2  := NULL,
    validate     IN  BOOLEAN    := TRUE)
RETURN VARCHAR2;
```

Parameters

Table 171-14 CREATE_SQL_PATCH Function Parameters

| Parameter | Description |
|-------------|--|
| sql_text | Text of the SQL statement |
| sql_id | The SQL identifier for the SQL statement |
| hint_text | Hints to include in the SQL patch |
| name | Optional SQL patch name |
| description | Description of the SQL patch |
| category | Category name |
| validate | Whether to validate the provided hints |

Return Values

Both functions return the SQL patch name.

171.4.6 CREATE_STGTAB_SQLPATCH Procedure

This procedure creates the staging table used for transporting SQL patches from one system to another.

Syntax

```
DBMS_SQLDIAG.CREATE_STGTAB_SQLPATCH (
  table_name      IN  VARCHAR2,
  schema_name     IN  VARCHAR2 := NULL,
  tablespace_name IN  VARCHAR2 := NULL);
```

Parameters

Table 171-15 CREATE_STGTAB_SQLPATCH Procedure Parameters

| Parameter | Description |
|-----------------|--|
| table_name | (Mandatory) Name of the table to create (case-sensitive) |
| schema_name | Schema to create the table in, or NULL for current schema (case-sensitive) |
| tablespace_name | Tablespace to store the staging table within, or NULL for current user's default tablespace (case-sensitive) |

171.4.7 DROP_DIAGNOSIS_TASK Procedure

This procedure drops a diagnostic task.

Syntax

```
DBMS_SQLDIAG.DROP_DIAGNOSIS_TASK (
  taskname      IN  VARCHAR2);
```

Parameters**Table 171-16 DROP_DIAGNOSIS_TASK Procedure Parameters**

| Parameter | Description |
|-----------|--------------|
| taskname | Name of task |

171.4.8 DROP_SQL_PATCH Procedure

This procedure drops the named SQL patch from the database.

Syntax

```
DBMS_SQLDIAG.DROP_SQL_PATCH (
    name      IN VARCHAR2,  ignore  IN BOOLEAN := FALSE);
```

Parameters**Table 171-17 DROP_SQL_PATCH Function & Procedure Parameters**

| Parameter | Description |
|-----------|--|
| name | Name of patch to be dropped. The name is case sensitive. |
| ignore | Ignore errors due to object not existing. |

Usage Notes

Requires `DROP ANY SQL PATCH` privilege

171.4.9 EXECUTE_DIAGNOSIS_TASK Procedure

This procedure executes a diagnostic task.

Syntax

```
DBMS_SQLDIAG.EXECUTE_DIAGNOSIS_TASK (
    taskname      IN VARCHAR2);
```

Parameters**Table 171-18 EXECUTE_DIAGNOSIS_TASK Procedure Parameters**

| Parameter | Description |
|-----------|--------------|
| taskname | Name of task |

171.4.10 EXPLAIN_SQL_TESTCASE Function

This procedure explains a SQL test case.

Syntax

```
DBMS_SQLDIAG.EXPLAIN_SQL_TESTCASE (
    sqlTestCase      IN  CLOB)
RETURN CLOB;
```

Parameters

Table 171-19 EXPLAIN_SQL_TESTCASE Function Parameters

| Parameter | Description |
|-------------|---|
| sqlTestCase | XML document describing the SQL test case |

171.4.11 EXPORT_SQL_TESTCASE Procedures

This procedure exports a SQL test case to a directory.

Syntax

This variant has to be provided with the SQL information.

```
DBMS_SQLDIAG.EXPORT_SQL_TESTCASE (
    directory          IN          VARCHAR2,
    sql_text           IN          CLOB,
    user_name          IN          VARCHAR2 := NULL,
    bind_list          IN          sql_binds := NULL,
    exportEnvironment  IN          BOOLEAN := TRUE,
    exportMetadata     IN          BOOLEAN := TRUE,
    exportData         IN          BOOLEAN := FALSE,
    exportPkgbody      IN          BOOLEAN := FALSE,
    samplingPercent    IN          NUMBER := 100,
    ctrlOptions        IN          VARCHAR2 := NULL,
    timeLimit          IN          NUMBER := 0,
    testcase_name      IN          VARCHAR2 := NULL,
    testcase           IN OUT NOCOPY CLOB,
    preserveSchemaMapping IN      BOOLEAN := FALSE,
    version            IN          VARCHAR2 := 'COMPATIBLE');
```

This variant extracts the SQL information from an incident file.

```
DBMS_SQLDIAG.EXPORT_SQL_TESTCASE (
    directory          IN          VARCHAR2,
    incident_id        IN          VARCHAR2,
    exportEnvironment  IN          BOOLEAN := TRUE,
    exportMetadata     IN          BOOLEAN := TRUE,
    exportData         IN          BOOLEAN := FALSE,
    exportPkgbody      IN          BOOLEAN := FALSE,
    samplingPercent    IN          NUMBER := 100,
    ctrlOptions        IN          VARCHAR2 := NULL,
    timeLimit          IN          NUMBER :=
        DBMS_SQLDIAG.TIME_LIMIT_DEFAULT,
    testcase_name      IN          VARCHAR2 := NULL,
```

```

testcase          IN OUT NOCOPY  CLOB,
preserveSchemaMapping  IN          BOOLEAN := FALSE)
version           IN          VARCHAR2 := 'COMPATIBLE');

```

This variant allow the SQL Test case to be generated from a cursor present in the cursor cache. Use V\$SQL to get the SQL identifier and the SQL hash value.

```

DBMS_SQLDIAG.EXPORT_SQL_TESTCASE (
  directory          IN          VARCHAR2,
  sql_id             IN          VARCHAR2,
  plan_hash_value    IN          NUMBER := NULL,
  exportEnvironment  IN          BOOLEAN := TRUE,
  exportMetadata     IN          BOOLEAN := TRUE,
  exportData         IN          BOOLEAN := FALSE,
  exportPkgbody      IN          BOOLEAN := FALSE,
  samplingPercent    IN          NUMBER := 100,
  ctrlOptions        IN          VARCHAR2 := NULL,
  timeLimit          IN          NUMBER :=
                                DBMS_SQLDIAG.TIME_LIMIT_DEFAULT,
  testcase_name      IN          VARCHAR2 := NULL,
  testcase           IN OUT NOCOPY CLOB,
  preserveSchemaMapping  IN          BOOLEAN := FALSE)
  version           IN          VARCHAR2 := 'COMPATIBLE');

```

Parameters

Table 171-20 EXPORT_SQL_TESTCASE Procedure Parameters

| Parameter | Description |
|-------------------|--|
| directory | Directory to store the various generated files |
| sql_text | Text of the SQL statement to export |
| incident_id | Incident ID containing the offending SQL |
| sql_id | Identifier of the statement in the cursor cache |
| username | Name of the user schema to use to parse the SQL, defaults to SYS |
| bind_list | List of bind values associated to the statement |
| exportEnvironment | TRUE if the compilation environment should be exported |
| exportMetadata | TRUE if the definition of the objects referenced in the SQL should be exported |
| exportData | TRUE if the data of the objects referenced in the SQL should be exported |
| exportPkgbody | TRUE if the body of the packages referenced in the SQL are exported |
| samplingPercent | If is TRUE, specify the sampling percentage to use to create the dump file |

Table 171-20 (Cont.) EXPORT_SQL_TESTCASE Procedure Parameters

| Parameter | Description |
|-------------|--|
| ctrlOptions | <p>Opaque control parameters. For example, to execute three times, set ctrlOptions with the following string: '<parameter name="mexec_count">3</parameter>'.</p> <ul style="list-style-type: none"> name="capture" - BASIC (default) or WITH_RUNTIME_INFO. This parameter defines the mode of TCB capture. <p>BASIC: runs as Oracle release 11g TCB and captures all the information that is captured in that release as well as AWR reports, SQL monitor reports and parameter information.</p> <p>WITH_RUNTIME_INFO: TCB captures runtime information for the SQL, such as dynamic sampling data, list of binds, Dynamic Plan info, along with information captured under BASIC mode.</p> <p>Note this must be the same value as used in the IMPORT_SQL_TESTCASE Procedures.</p> name="mexec_count"—Value is any positive number (N). This parameter tells TCB to execute the statement for N time and capture runtime info at end of each execution. name="stat_history_since"—Value is date. The object statistics history is exported using this parameter. Statistics history after date specified will be exported. name="compress"—This option is used to compress the SQL Test Case Builder output files into a zip file. The possible values are: <ul style="list-style-type: none"> YES NO <p>The default value is NO.</p> name="diag_event"—This option is used to specify the level of trace information to include in the SQL Test Case Builder output. The possible values are: <ul style="list-style-type: none"> ADS COMPILER SQLEXEC_LOW SQLEXEC_MEDIUM SQLEXEC_HIGH SQLEXEC_HIGHEST <p>The default value is ADS + COMPILER.</p> name="problem_type"—This option is used to assign an issue type for a SQL Test Case Builder test case. For example, if a test case is related to performance regression issue, then you can assign the value of PERFORMANCE to the problem_type option. The possible values are : <ul style="list-style-type: none"> PERFORMANCE WRONG_RESULTS COMPILATION_ERROR EXECUTION_ERROR <p>The default value is PERFORMANCE.</p> |

Table 171-20 (Cont.) EXPORT_SQL_TESTCASE Procedure Parameters

| Parameter | Description |
|-----------------------|--|
| timeLimit | How much time should we spend exporting the SQL test case |
| testcaseName | An optional name for the SQL test case. This is used to prefix all the generated scripts |
| testcase | Resulting testcase |
| preserveSchemaMapping | TRUE if the schema (or schemas) are not re-mapped from the original environment to the test environment |
| version | Version of database objects to be extracted. This option is only valid for EXPORT. Database objects or attributes incompatible with the version will not be extracted. <ul style="list-style-type: none"> COMPATIBLE - (default) the version of the metadata corresponds to the database compatibility level and the compatibility release level for feature (as given in the V\$COMPATIBILITY view). Database compatibility must be set to 9.2 or higher. LATEST - the version of the metadata that specifies the current database version. A specific database version. For example, if '10.0.0', this cannot be lower than Oracle Database release 10.0.0. |

Usage Notes

- A SQL test case generates a set of files needed to help reproduce a SQL failure on a different machine. It contains:
 - a dump file containing schemas objects and statistics (.dmp)
 - the explain plan for the statements (in advanced mode)
 - diagnostic information gathered on the offending statement
 - an import script to execute to reload the objects
 - a SQL script to replay system statistics of the source
 - a table of contents file describing the SQL test case
 - metadata. (xxxxmain.xml)
 - a README.txt file that explain the usage of the TCB
 - the outlines used by the statement (ol.xml)
 - a list of parameters set in the exporting db/env (prmimp.sql)
 - a SQL monitor report, if any (smrpt.html)
 - an AWR report, if any (awrrpt.html)
 - a list of binds used in this statement (bndlst.xml)
- You should not run Test Case Builder (TCB) under user SYS. Instead, use another user who can be granted the DBA privilege.
- The default setting for TCB is that data is not exported. However, in some cases data is required, such as to diagnose an outcome with a result that is not optimal.

To export data, call `EXPORT_SQL_TESTCASE` with `exportData=>TRUE` and the data will be imported by default, unless turned OFF by `importData=>FALSE`.

- TCB includes PL/SQL package spec by default, but not the PL/SQL package body. However, you may need to have the package body as well, for example, to invoke the PL/SQL functions, or because you have a Virtual Private Database (VPD) function defined in a package. To export a PL/SQL package body, call `EXPORT_SQL_TESTCASE` with `exportPkgbody=>TRUE`. To import a PL/SQL package body, call [IMPORT_SQL_TESTCASE Procedures](#) with `importPkgbody=>TRUE`.
- To export objects statistics history, the database compatibility should be set to 12.0 or higher.
- This procedure does not export data and statistics on a Global Temporary Table (GTT).

Examples

The user can specify multiple parameters in the `ctrlOptions` encapsulated either by using the `<parameters>` parent tag or without the parent tag.

Using the `<parameters>` tag

```
<parameters>
<parameter name="capture">with_runtime_info</parameter>
<parameter name="mexec_count">1</parameter>
</parameters>
```

Without the `<parameters>` tag

```
<parameter name="capture">with_runtime_info</parameter>
<parameter name="mexec_count">1</parameter>
```

The `compress` option that you can specify in the `ctrlOptions` parameter:

```
opt := '<parameters>
      <parameter name="capture">with_runtime_info</parameter>
      <parameter name="compress">yes</parameter>
      </parameters>';
```

The `diag_event` option that you can specify in the `ctrlOptions` parameter:

```
opt := '<parameters>
      <parameter name="capture">with_runtime_info</parameter>
      <parameter name="compress">yes</parameter>
      </parameters>';
```

The `problem_type` option that you can specify in the `ctrlOptions` parameter:

```
opt := '<parameters>
      <parameter name="capture">with_runtime_info</parameter>
      <parameter name="compress">yes</parameter>
      </parameters>';
```

171.4.12 EXPORT_SQL_TESTCASE_DIR_BY_INC Function

This function generates a SQL test case corresponding to the incident ID passed as an argument. It creates a set of scripts and dump file in the directory passed as an argument.

Syntax

```
DBMS_SQLDIAG.EXPORT_SQL_TESTCASE_DIR_BY_INC (
  incident_id      IN   NUMBER,
  directory        IN   VARCHAR2,
  exportEnvironment IN  VARCHAR2 := 'TRUE',
  exportMetadata  IN  VARCHAR2 := 'TRUE',
  exportData      IN  VARCHAR2 := 'FALSE',
  samplingPercent IN  VARCHAR2 := '100',
  ctrlOptions     IN  VARCHAR2 := NULL,
  version         IN  VARCHAR2 := 'COMPATIBLE')
RETURN BOOLEAN;
```

Parameters

Table 171-21 EXPORT_SQL_TESTCASE_DIR_BY_INC Function Parameters

| Parameter | Description |
|-------------------|---|
| incident_id | Incident ID containing the offending SQL. For more information about Incidents, see <i>Oracle Database Performance Tuning Guide</i> . |
| directory | Directory path to the generated files |
| exportEnvironment | TRUE if the compilation environment should be exported |
| exportMetadata | TRUE if the definition of the objects referenced in the SQL should be exported |
| exportData | TRUE if the data of the objects referenced in the SQL should be exported |
| samplingPercent | If is TRUE, specify the sampling percentage to use to create the dump file |

Table 171-21 (Cont.) EXPORT_SQL_TESTCASE_DIR_BY_INC Function Parameters

| Parameter | Description |
|-------------|---|
| ctrlOptions | <p>Opaque control parameters. For example, to execute three times, set ctrlOptions with the following string: '<parameter name="mexec_count">3</parameter>'.</p> <ul style="list-style-type: none"> capture - BASIC (default) or WITH_RUNTIME_INFO. This parameter defines the mode of TCB capture. BASIC: runs as Oracle release 11g TCB and captures all the information that is captured in that release as well as AWR reports, SQL monitor reports and parameter information. WITH_RUNTIME_INFO: TCB captures runtime information for the SQL, such as dynamic sampling data, list of binds, Dynamic Plan info, along with information captured under BASIC mode. name=mexec_count - Value is any positive number (N). This parameter tells TCB to execute the statement for N time and capture runtime info at end of each execution. name=stat_history_since - Value is date. The object statistics history is exported using this parameter. Statistics history after date specified will be exported. |
| version | <p>Version of database objects to be extracted. This option is only valid for EXPORT. Database objects or attributes incompatible with the version will not be extracted.</p> <ul style="list-style-type: none"> COMPATIBLE - (default) the version of the metadata corresponds to the database compatibility level and the compatibility release level for feature (as given in the V\$COMPATIBILITY view). Database compatibility must be set to 9.2 or higher. LATEST - the version of the metadata that specifies the current database version. A specific database version. For example, if '10.0.0', this cannot be lower than Oracle Database release 10.0.0. |

171.4.13 EXPORT_SQL_TESTCASE_DIR_BY_TXT Function

This function generates a SQL Test Case corresponding to the SQL passed as an argument. It creates a set of scripts and dump files in the directory passed as an argument.

Syntax

```

DBMS_SQLDIAG.EXPORT_SQL_TESTCASE_DIR_BY_TXT (
  incident_id      IN   NUMBER,
  directory        IN   VARCHAR2,
  sql_text         IN   CLOB,
  user_name        IN   VARCHAR2 := 'SYS',
  exportEnvironment IN  VARCHAR2 := 'TRUE',
  exportMetadata   IN  VARCHAR2 := 'TRUE',
  exportData       IN  VARCHAR2 := 'FALSE',
  samplingPercent  IN  VARCHAR2 := '100',
  ctrlOptions      IN  VARCHAR2 := NULL
  version          IN  VARCHAR2 := 'COMPATIBLE')
RETURN BOOLEAN;
```

Parameters

Table 171-22 EXPORT_SQL_TESTCASE_DIR_BY_TXT Function Parameters

| Parameter | Description |
|-------------------|---|
| incident_id | Incident ID containing the offending SQL |
| directory | Directory to store the various generated files |
| sql_text | Text of the SQL statement to explain |
| username | Name of the user schema to use to parse the SQL, defaults to SYS |
| exportEnvironment | TRUE if the compilation environment should be exported |
| exportMetadata | TRUE if the definition of the objects referenced in the SQL should be exported |
| exportData | TRUE if the data of the objects referenced in the SQL should be exported |
| samplingPercent | If is TRUE, specify the sampling percentage to use to create the dump file |
| ctrlOptions | <p>Opaque control parameters. For example, to execute three times, set <code>ctrlOptions</code> with the following string: '<code><parameter name="mexec_count">3</parameter></code>'.</p> <ul style="list-style-type: none"> capture - BASIC (default) or WITH_RUNTIME_INFO. This parameter defines the mode of TCB capture. <ul style="list-style-type: none"> BASIC: runs as Oracle Release 11g TCB and captures all the information that is captured in that release as well as AWR reports, SQL monitor reports and parameter information. WITH_RUNTIME_INFO: TCB captures runtime information for the SQL, such as dynamic sampling data, list of binds, Dynamic Plan info, along with information captured under BASIC mode. name=mexec_count - Value is any positive number (N). This parameter tells TCB to execute the statement for N time and capture runtime info at end of each execution. name=stat_history_since - Value is date. The object statistics history is exported using this parameter. Statistics history after date specified will be exported. |
| version | <p>Version of database objects to be extracted. This option is only valid for EXPORT. Database objects or attributes incompatible with the version will not be extracted.</p> <ul style="list-style-type: none"> COMPATIBLE - (default) the version of the metadata corresponds to the database compatibility level and the compatibility release level for feature (as given in the V\$COMPATIBILITY view). Database compatibility must be set to 9.2 or higher. LATEST - the version of the metadata that specifies the current database version. A specific database version. For example, if '10.0.0', this cannot be lower than Oracle Database Release 10.0.0. |

171.4.14 GET_FIX_CONTROL Function

This function returns the value of fix control for a given bug number.

Syntax

```
DBMS_SQLDIAG.GET_FIX_CONTROL (
    bug_number IN NUMBER)
RETURN NUMBER;
```

Parameters

Table 171-23 GET_FIX_CONTROL Function Parameters

| Parameter | Description |
|------------|-------------|
| bug_number | Bug number |

171.4.15 GET_SQL Function

This function loads a `sql_setrow` from the trace file associated to an the given incident ID.

Syntax

```
DBMS_SQLDIAG.GET_SQL (
    incident_id IN VARCHAR2)
RETURN SQLSET_ROW;
```

Parameters

Table 171-24 GET_SQL Function Parameters

| Parameter | Description |
|-------------|----------------------------|
| incident_id | Identifier of the incident |

171.4.16 IMPORT_SQL_TESTCASE Procedures

This procedure imports a SQL test case into a schema.

Syntax

This variant requires a source directory and SQL Testcase metadata object (in XML format).

```
DBMS_SQLDIAG.IMPORT_SQL_TESTCASE (
    directory          IN VARCHAR2,
    sqlTestCase        IN CLOB,
    importEnvironment  IN BOOLEAN := TRUE,
    importMetadata     IN BOOLEAN := TRUE,
    importData         IN BOOLEAN := TRUE,
    importPkgbody      IN BOOLEAN := FALSE,
    importDiagnosis    IN BOOLEAN := TRUE,
    ignoreStorage      IN BOOLEAN := TRUE,
    ctrlOptions        IN VARCHAR2 := NULL,
    preserveSchemaMapping IN BOOLEAN := FALSE);
```

This variant requires a source directory name of SQL Testcase metadata file.

```
DBMS_SQLDIAG.IMPORT_SQL_TESTCASE (
  directory          IN  VARCHAR2,
  filename           IN  VARCHAR2,
  importEnvironment IN  BOOLEAN := TRUE,
  importMetadata    IN  BOOLEAN := TRUE,
  importData        IN  BOOLEAN := TRUE,
  importPkgbody     IN  BOOLEAN := FALSE,
  importDiagnosis   IN  BOOLEAN := TRUE,
  ignoreStorage     IN  BOOLEAN := TRUE,
  ctrlOptions       IN  VARCHAR2 := NULL,
  preserveSchemaMapping IN BOOLEAN := FALSE);
```

Parameters

Table 171-25 IMPORT_SQL_TESTCASE Procedure Parameters

| Parameter | Description |
|-----------------------|--|
| directory | Directory containing test case files |
| filename | Name of a file containing an XML document describing the SQL test case |
| importEnvironment | TRUE if the compilation environment should be imported |
| importMetadata | TRUE if the definition of the objects referenced in the SQL should be imported |
| importData | TRUE if the data of the objects referenced in the SQL should be imported |
| importPkgbody | TRUE if the body of the packages referenced in the SQL are imported |
| importDiagnosis | TRUE if the diagnostic information associated to the task should be imported |
| ignoreStorage | TRUE if the storage attributes should be ignored |
| ctrlOptions | Opaque control parameters, of which only <code>capture</code> is valid for this subprogram. <ul style="list-style-type: none"> <code>capture</code> - BASIC (default) or WITH_RUNTIME_INFO. This parameter defines the mode of TCB capture. <p>BASIC: runs as Oracle Release 11g TCB and captures all the information that is captured in that release as well as AWR reports, SQL monitor reports and parameter information.</p> <p>WITH_RUNTIME_INFO: TCB captures runtime information for the SQL, such as dynamic sampling data, list of binds, Dynamic Plan info, along with information captured under BASIC mode.</p> |
| preserveSchemaMapping | TRUE if the schema (or schemas) are not re-mapped from the original environment to the test environment (schema mapping in the target database will be identical to the source database). Note that when an import is run with <code>preservesSchemaMapping</code> set to TRUE, if the objects in the schemas exists then the import will overwrite the existing objects. |

Usage Notes

- A SQL test case generates a set of files needed to help reproduce a SQL failure on a different machine. It contains:
 - a dump file containing schemas objects and statistics (.dmp)
 - the explain plan for the statements (in advanced mode)
 - diagnostic information gathered on the offending statement
 - an import script to execute to reload the objects
 - a SQL script to replay system statistics of the source
 - a table of contents file describing the SQL test case
 - metadata. (xxxxxmain.xml)
 - a README.txt file that explain the usage of the TCB
 - the outlines used by the statement (ol.xml)
 - a list of parameters set in the exporting db/env (prmimp.sql)
 - a SQL monitor report, if any (smrpt.html)
 - an AWR report, if any (awrrpt.html)
 - a list of binds used in this statement (bndlst.xml)
- You should not run Test Case Builder (TCB) under user SYS. Instead, use another user who can be granted the DBA privilege
- The default setting for TCB is that data is not exported. However, in some cases data is required, such as to diagnose an outcome with a result that is not optimal. To export data, call [EXPORT_SQL_TESTCASE Procedures](#) with `exportData=>TRUE` and the data will be imported by default, unless turned OFF by `importData=>FALSE`.
- TCB includes PL/SQL package spec by default, but not the PL/SQL package body. However, you may need to have the package body as well, for example, to invoke the PL/SQL functions, or because you have a Virtual Private Database (VPD) function defined in a package. To export a PL/SQL package body, call [EXPORT_SQL_TESTCASE Procedures](#) with `exportPkgbody=>TRUE`. To import a PL/SQL package body, call [IMPORT_SQL_TESTCASE Procedures](#) with `importPkgbody=>TRUE`.
- The `capture` value used when invoking the [EXPORT_SQL_TESTCASE Procedures](#) must be used when calling this procedure.

171.4.17 INCIDENTID_2_SQL Procedure

This procedure initializes a `sql_setrow` from an incident ID.

Syntax

```
DBMS_SQLDIAG.INCIDENTID_2_SQL (
  incident_id  IN      VARCHAR2,
  sql_stmt    OUT     SQLSET_ROW,
  problem_type OUT     NUMBER,
  err_code    OUT     BINARY_INTEGER,
  err_mesg    OUT     VARCHAR2);
```

Parameters

Table 171-26 INCIDENTID_2_SQL Procedure Parameters

| Parameter | Description |
|--------------|---|
| incident_id | Identifier of the incident |
| sql_stmt | Resulting SQL |
| problem_type | Tentative type of SQL problem (currently among PROBLEM_TYPE_COMPILATION_ERROR and PROBLEM_TYPE_EXECUTION_ERROR) |
| err_code | Error code if any otherwise it is set to NULL |
| err_msg | Error message if any otherwise it is set to NULL |

171.4.18 INTERRUPT_DIAGNOSIS_TASK Procedure

This procedure interrupts a diagnostic task.

Syntax

```
DBMS_SQLDIAG.INTERRUPT_DIAGNOSIS_TASK (
    taskname          IN  VARCHAR2);
```

Parameters

Table 171-27 INTERRUPT_DIAGNOSIS_TASK Procedure Parameters

| Parameter | Description |
|-----------|--------------|
| taskname | Name of task |

171.4.19 LOAD_SQLSET_FROM_TCB Function

This function loads a SQLSET from a Test Case Builder file.

Syntax

```
DBMS_SQLDIAG.LOAD_SQLSET_FROM_TCB (
    directory          IN  VARCHAR2,
    filename           IN  VARCHAR2,
    sqlset_name        IN  VARCHAR2 DEFAULT NULL)
RETURN VARCHAR2;
```

Parameters

Table 171-28 LOAD_SQLSET_FROM_TCB Function Parameters

| Parameter | Description |
|-----------|-------------------|
| directory | Name of directory |
| filename | Name of file |

Table 171-28 (Cont.) LOAD_SQLSET_FROM_TCB Function Parameters

| Parameter | Description |
|-------------|----------------|
| sqlset_name | Name of SQLSET |

171.4.20 PACK_STGTAB_SQLPATCH Procedure

This procedure packs SQL patches into the staging table created by a call to the CREATE_STGTAB_SQLPATCH Procedure.

Syntax

```
DBMS_SQLDIAG.PACK_STGTAB_SQLPATCH (
  patch_name          IN  VARCHAR2 := '%',
  patch_category     IN  VARCHAR2 := 'DEFAULT',
  staging_table_name  IN  VARCHAR2,
  staging_schema_owner IN  VARCHAR2 := NULL);
```

Parameters

Table 171-29 PACK_STGTAB_SQLPATCH Procedure Parameters

| Parameter | Description |
|----------------------|--|
| patch_name | Name of patch to pack (% wildcards acceptable, case-sensitive) |
| patch_category | Category to which to pack patches (% wildcards acceptable, case-insensitive) |
| staging_table_name | (Mandatory) Name of the table to use (case-sensitive) |
| staging_schema_owner | Schema where the table resides, or NULL for current schema (case-sensitive) |

Usage Notes

- **Requires:** ADMINISTER SQL PLAN MANAGEMENT OBJECT privilege and INSERT privilege on the staging table
- By default, we move all SQL patches in category DEFAULT. Note that the subprogram issues a COMMIT after packing each SQL patch, so if an error is raised in mid-execution, some patches may be in the staging table.

Related Topics

- [CREATE_STGTAB_SQLPATCH Procedure](#)
This procedure creates the staging table used for transporting SQL patches from one system to another.

171.4.21 REPLAY_SQL_TESTCASE Function

This function automates the reproduction of the SQL Test Case.

Syntax

```
DBMS_SQLDIAG.REPLAY_SQL_TESTCASE (
    directory      IN  VARCHAR2,
    filename       IN  VARCHAR2,
    ctrlOptions    IN  VARCHAR2 := NULL,
    format         IN  VARCHAR2 := 'TEXT')
RETURN CLOB;
```

```
DBMS_SQLDIAG.REPLAY_SQL_TESTCASE (
    directory      IN  VARCHAR2,
    sqlTestCase    IN  CLOB,
    ctrlOptions    IN  VARCHAR2 := NULL,
    format         IN  VARCHAR2 := 'TEXT')
RETURN CLOB;
```

Parameters

Table 171-30 REPLAY_SQL_TESTCASE Function Parameters

| Parameter | Description |
|-------------|---|
| directory | Directory containing test case files |
| filename | Name of a file containing an XML document describing the SQL test case |
| ctrlOptions | <p>Opaque control parameters. For example, to execute three times, set <code>ctrlOptions</code> with the following string: '<parameter name="mexec_count">3</parameter>'.</p> <ul style="list-style-type: none"> replay - EXPLAIN (default), OUTLINE, EXECUTION or OUTLINE EXECUTION. This parameter defines TCB replay functionality. <ul style="list-style-type: none"> EXPLAIN: Replay explains the statement without using outlines OUTLINE: Replay uses outlines mode and explains the statement using outlines EXECUTION: Replay executes the statement without using outlines OUTLINE EXECUTION: Replay executes the statement using outlines <p>Note that if the user gives an incorrect parameter value, then the <code>replay</code> runs in default mode and no error is thrown.</p> name=mexec_count - Value is any positive number (N). This parameter tells TCB to execute the statement for N time and capture runtime info at end of each execution. |
| sqlTestCase | SQL test case |
| format | Format of the replay report. Possible formats are: TEXT, XML and HTML.. |

Examples

TCB Replay Mode: Execute

```
SELECT /* tcbdynpl_1 */ /*+ gather_plan_statistics */ * FROM (SELECT * FROM emp where
emp.sal > 100) emp, dept WHERE emp.deptno = dept.deptno And emp.sal > 1000 /*
tcbdynpl_1 */
```

Explain Plan

Plan Hash Value : 2219294842

| Id | Operation | Name | Rows |
|-----|-----------------------------|----------------|------|
| 0 | SELECT STATEMENT | | 13 |
| * 1 | HASH JOIN | | 13 |
| 2 | NESTED LOOPS | | |
| 3 | NESTED LOOPS | | 13 |
| 4 | STATISTICS COLLECTOR | | |
| 5 | TABLE ACCESS FULL | DEPT | 4 |
| * 6 | INDEX RANGE SCAN | EMP_IDX_DEPTNO | |
| * 7 | TABLE ACCESS BY INDEX ROWID | EMP | 3 |
| * 8 | TABLE ACCESS FULL | EMP | 13 |

Predicate Information (identified by operation id):

```
* 1 - access("EMP"."DEPTNO"="DEPT"."DEPTNO")
* 6 - access("EMP"."DEPTNO"="DEPT"."DEPTNO")
* 7 - filter("EMP"."SAL">1000)
* 8 - filter("EMP"."SAL">1000)
```

Runtime Plan

Plan Hash Value : 2219294842

| Id | Operation | Name | E-Card | A-Card |
|-----|-------------------|------|--------|--------|
| 0 | SELECT STATEMENT | | | 0 |
| * 1 | HASH JOIN | | 13 | 0 |
| 2 | TABLE ACCESS FULL | DEPT | 4 | 0 |
| * 3 | TABLE ACCESS FULL | EMP | 13 | 0 |

Predicate Information (identified by operation id):

```
* 1 - access("EMP"."DEPTNO"="DEPT"."DEPTNO")
* 3 - filter("EMP"."SAL">1000)
```

REPLAY Note:

```
- Replay used dynamic sampling
- Replay forced Dynamic plan
```

171.4.22 REPORT_DIAGNOSIS_TASK Function

This function reports on a diagnostic task. It returns a CLOB containing the desired report.

Syntax

```
DBMS_SQLDIAG.REPORT_DIAGNOSIS_TASK (
  taskname          IN  VARCHAR2,
  type              IN  VARCHAR2  := TYPE_TEXT,
  level            IN  VARCHAR2  := LEVEL_TYPICAL,
  section          IN  VARCHAR2  := SECTION_ALL,
  object_id        IN  NUMBER    := NULL,
  result_limit     IN  NUMBER    := NULL,
  owner_name       IN  VARCHAR2  := NULL)
RETURN CLOB;
```

Parameters

Table 171-31 REPORT_DIAGNOSIS_TASK Function Parameters

| Parameter | Description |
|--------------|--|
| taskname | Name of task to report |
| type | Type of the report. Possible values are: TEXT, HTML, XML (see Table 171-4). |
| level | Format of the recommendations. Possible values are TYPICAL, BASIC, ALL (Table 171-5). |
| section | Particular section in the report. Possible values are: SUMMARY, FINDINGS, PLAN, INFORMATION, ERROR, ALL (Table 171-6). |
| object_id | Identifier of the advisor framework object that represents a given statement in a SQL Tuning Set (STS). |
| result_limit | Number of statements in a STS for which the report is generated |
| owner_name | Name of the task execution to use. If NULL, the report will be generated for the last task execution. |

171.4.23 RESET_DIAGNOSIS_TASK Procedure

This procedure resets a diagnostic task.

Syntax

```
DBMS_SQLDIAG.RESET_DIAGNOSIS_TASK (
  taskname          IN  VARCHAR2);
```

Parameters

Table 171-32 RESET_DIAGNOSIS_TASK Procedure Parameters

| Parameter | Description |
|-----------|--------------|
| taskname | Name of task |

171.4.24 RESUME_DIAGNOSIS_TASK Procedure

This procedure resumes a diagnostic path.

Syntax

```
DBMS_SQLDIAG.RESUME_DIAGNOSIS_TASK (
    taskname          IN  VARCHAR2);
```

Parameters

Table 171-33 RESUME_DIAGNOSIS_TASK Procedure Parameters

| Parameter | Description |
|-----------|--------------|
| taskname | Name of task |

171.4.25 SET_DIAGNOSIS_TASK_PARAMETER Procedure

This procedure is called to update the value of a SQL diagnosis parameter of type VARCHAR2.

The task must be set to its initial state before calling this procedure. The diagnosis parameters that can be set by this procedure are:

- `MODE`: diag scope (comprehensive, limited)
- `_SQLDIAG_FINDING_MODE`: findings in the report (see "Table 171-8" for possible values)

Syntax

```
DBMS_SQLDIAG.SET_DIAGNOSIS_TASK_PARAMETER (
    taskname          IN  VARCHAR2,
    parameter         IN  VARCHAR2,  value          IN  NUMBER);
```

Parameters

Table 171-34 SET_DIAGNOSIS_TASK_PARAMETER Procedure Parameters

| Parameter | Description |
|-----------|--------------------------------------|
| taskname | Identifier of the task to execute |
| parameter | Name of the parameter to set |
| value | New value of the specified parameter |

171.4.26 SQL_DIAGNOSE_AND_REPAIR Function

Diagnoses a given SQL statement for a given SQL ID for the given problem type. This function creates an incident, populate incident metadata with required information like, SQL ID, SQL text, compilation environment, and so on. It also creates a diagnostic task, executes it and accepts SQL PATCH recommendation for a given SQL ID.

Syntax

```
DBMS_SQLDIAG.SQL_DIAGNOSE_AND_REPAIR (
  sql_text          IN   CLOB,
  bind_list         IN   sql_binds := NULL,
  scope             IN   VARCHAR2 := SCOPE_COMPREHENSIVE,
  time_limit        IN   NUMBER    := TIME_LIMIT_DEFAULT,
  problem_type      IN   NUMBER    := PROBLEM_TYPE_PERFORMANCE,
  auto_apply_patch  IN   VARCHAR2  := YES)
RETURN NUMBER;
```

```
DBMS_SQLDIAG.SQL_DIAGNOSE_AND_REPAIR (
  sql_id           IN   VARCHAR2,
  plan_hash_value  IN   NUMBER    := NULL,
  scope            IN   VARCHAR2 := SCOPE_COMPREHENSIVE,
  time_limit       IN   NUMBER    := TIME_LIMIT_DEFAULT,
  problem_type     IN   NUMBER    := PROBLEM_TYPE_PERFORMANCE,
  auto_apply_patch IN   VARCHAR2 := YES)
RETURN NUMBER;
```

```
DBMS_SQLDIAG.SQL_DIAGNOSE_AND_REPAIR (
  incident_id      IN   VARCHAR2,
  scope            IN   VARCHAR2 := SCOPE_COMPREHENSIVE,
  time_limit       IN   NUMBER    := TIME_LIMIT_DEFAULT,
  problem_type     IN   NUMBER    := PROBLEM_TYPE_PERFORMANCE,
  auto_apply_patch IN   VARCHAR2 := YES)
RETURN NUMBER;
```

Parameters

Table 171-35 SQL_DIAGNOSE_AND_REPAIR Function Parameters

| Parameter | Description |
|-----------------|---|
| sql_text | Text of the SQL statement. |
| sql_id | SQL ID of the SQL query. |
| plan_hash_value | The plan to be used for diagnosis. The default value is NULL. |
| bind_list | Binds to be used for diagnosis. The default value is NULL. |
| scope | The scope of diagnostic advisor. Possible values are: <ul style="list-style-type: none"> SCOPE_LIMITED—only index and plan analyze are invoked for a given SQL. SCOPE_COMPREHENSIVE—besides index and plan analyze, auto-tune is called first to tune the statement. The default value is SCOPE_COMPREHENSIVE. |
| time_limit | Time limit for diagnostic task. The default value is TIME_LIMIT_DEFAULT. |

Table 171-35 (Cont.) SQL_DIAGNOSE_AND_REPAIR Function Parameters

| Parameter | Description |
|------------------|---|
| problem_type | <p>Problem type that is being diagnosed. The following problem type are supported:</p> <ul style="list-style-type: none"> PROBLEM_TYPE_PERFORMANCE—performance problem. PROBLEM_TYPE_WRONG_RESULTS—incorrect results. PROBLEM_TYPE_COMPILATION_ERROR—crash during compilation of the statement. PROBLEM_TYPE_EXECUTION_ERROR—crash during execution of the statement. <p>The default value is PROBLEM_TYPE_PERFORMANCE.</p> |
| auto_apply_patch | <p>A value that decides if the recommended SQL patch needs to be accepted. Possible values are:</p> <ul style="list-style-type: none"> YES—accepts the recommended SQL patch. NO—does not accept recommended SQL patch automatically. <p>User need to manually accept the SQL patch.</p> <p>The default value is YES.</p> |

171.4.27 UNPACK_STGTAB_SQLPATCH Procedure

This procedure unpacks from the staging table populated by a call to the PACK_STGTAB_SQLPATCH Procedure. It uses the patch data stored in the staging table to create patches on this system. Users can opt to replace existing patches with patch data when they exist already. In this case, note that it is only possible to replace patches referring to the same statement if the names are the same (see the ACCEPT_SQL_PATCH Function & Procedure).

Syntax

```
DBMS_SQLDIAG.UPPACK_STGTAB_SQLPATCH (
    patch_name          IN  VARCHAR2 := '%',
    patch_category      IN  VARCHAR2 := '%',
    replace             IN  BOOLEAN,
    staging_table_name  IN  VARCHAR2,
    staging_schema_owner IN  VARCHAR2 := NULL);
```

Parameters

Table 171-36 UPPACK_STGTAB_SQLPATCH Procedure Parameters

| Parameter | Description |
|----------------|--|
| patch_name | Name of patch to unpack (% wildcards acceptable, case-sensitive) |
| patch_category | Category from which to unpack patches (% wildcards acceptable, case-insensitive) |

Table 171-36 (Cont.) UPPACK_STGTAB_SQLPATCH Procedure Parameters

| Parameter | Description |
|----------------------|--|
| replace | Replace patches if they already exist. Note that patches cannot be replaced if there is one in the staging table with the same name as an active patch on different SQL. The subprogram raises an error if there an attempt to create a patch that already exists. |
| staging_table_name | (Mandatory) Name of the table to use (case-sensitive) |
| staging_schema_owner | Schema where the table resides, or NULL for current schema (case-sensitive) |

Usage Notes

- **Requires:** ADMINISTER SQL MANAGEMENT OBJECT privilege and SELECT or READ privilege on the staging table
- By default, all SQL patches in the staging table are moved. The function commits after successfully loading each patch. If it fails in creating an individual patch, it raises an error and does not proceed to those remaining in the staging table.

Related Topics

- [PACK_STGTAB_SQLPATCH Procedure](#)
This procedure packs SQL patches into the staging table created by a call to the CREATE_STGTAB_SQLPATCH Procedure.
- [ACCEPT_SQL_PATCH Function & Procedure](#)
This procedure accepts a recommended SQL patch as recommended by the specified SQL diagnosis task.

DBMS_SQLPA

The DBMS_SQLPA package provides the interface to implement the SQL Performance Analyzer.

The chapter contains the following topics:

- [Overview](#)
- [Security Model](#)
- [Summary of DBMS_SQLPA Subprograms](#)

172.1 DBMS_SQLPA Overview

The DBMS_SQLPA package provides a capacity to help users predict the impact of system environment changes on the performance of a SQL workload. The interface lets users build and then compare two different versions of the workload performance, analyze the differences between the two versions, and unmask the SQL statements that might be impacted by the changes.

The package provides a task-oriented interface to implement the SQL Performance Analyzer. For example

1. You use the [CREATE_ANALYSIS_TASK Functions](#) to create an analysis task for a single statement or a group of SQL statements.
2. The [EXECUTE_ANALYSIS_TASK Function & Procedure](#) executes a previously created analysis task.
3. The [REPORT_ANALYSIS_TASK Function](#) displays the results of an analysis task.

172.2 DBMS_SQLPA Security Model

This package is available to PUBLIC and performs its own security checking. All analysis task interfaces (XXX_ANALYSIS_TASK) require privilege ADVISOR.

172.3 Summary of DBMS_SQLPA Subprograms

This table lists the DBMS_SQLPA subprograms and briefly describes them.

Table 172-1 DBMS_SQLPA Package Subprograms

| Subprogram | Description |
|--|---|
| CANCEL_ANALYSIS_TASK Procedure | Cancels the currently executing task analysis of one or more SQL statements |
| CREATE_ANALYSIS_TASK Functions | Creates an advisor task to process and analyze one or more SQL statements |
| DROP_ANALYSIS_TASK Procedure | Drops a SQL analysis task |

Table 172-1 (Cont.) DBMS_SQLPA Package Subprograms

| Subprogram | Description |
|--|--|
| EXECUTE_ANALYSIS_TASK Function & Procedure | Executes a previously created analysis task |
| INTERRUPT_ANALYSIS_TASK Procedure | Interrupts the currently executing analysis task |
| REPORT_ANALYSIS_TASK Function | Displays the results of an analysis task |
| RESET_ANALYSIS_TASK Procedure | Resets the currently executing analysis task to its initial state |
| RESUME_ANALYSIS_TASK Procedure | Resumes a previously interrupted analysis task that was created to process a SQL tuning set. |
| SET_ANALYSIS_TASK_PARAMETER Procedures | Sets the SQL analysis task parameter value |
| SET_ANALYSIS_DEFAULT_PARAMETER Procedures | Sets the SQL analysis task parameter default value |

172.3.1 CANCEL_ANALYSIS_TASK Procedure

This procedure cancels the currently executing analysis task. All intermediate result data is removed from the task.

Syntax

```
DBMS_SQLPA.CANCEL_ANALYSIS_TASK(
    task_name          IN VARCHAR2);
```

Parameters

Table 172-2 CANCEL_ANALYSIS_TASK Procedure Parameters

| Parameter | Description |
|-----------|----------------------------|
| task_name | Name of the task to cancel |

Examples

Canceling a task when there is a need to stop it executing and it is not required to view any already-completed results:

```
EXEC DBMS_SQLPA.CANCEL_ANALYSIS_TASK(:my_task);
```

172.3.2 CREATE_ANALYSIS_TASK Functions

These functions create an advisor task to process and analyze one or more SQL statements.

Note:

A multitenant container database is the only supported architecture in Oracle Database 20c. While the documentation is being revised, legacy terminology may persist. In most cases, "database" and "non-CDB" refer to a CDB or PDB, depending on context. In some contexts, such as upgrades, "non-CDB" refers to a non-CDB from a previous release.

You can use different forms of this function to:

- Create an analysis task for a single statement given its text.
- Create an analysis task for a single statement from the cursor cache given its identifier.
- Create an analysis task for a single statement from the workload repository given a range of snapshot identifiers.
- Create an analysis task for a SQL tuning set.

In all cases, the function creates an advisor task and sets its parameters.

Syntax

SQL text format. This form of the function is called to prepare the analysis of a single statement given its text.

```
DBMS_SQLPA.CREATE_ANALYSIS_TASK(  
    sql_text          IN CLOB,  
    bind_list         IN sql_binds := NULL,  
    parsing_schema    IN VARCHAR2  := NULL,  
    task_name         IN VARCHAR2  := NULL,  
    description       IN VARCHAR2  := NULL)  
RETURN VARCHAR2;
```

SQL ID format. This form of the function is called to prepare the analysis of a single statement from the cursor cache given its identifier.

```
DBMS_SQLPA.CREATE_ANALYSIS_TASK(  
    sql_id           IN VARCHAR2,  
    plan_hash_value  IN NUMBER     := NULL,  
    task_name        IN VARCHAR2   := NULL,  
    con_name         IN VARCHAR2   DEFAULT,  
    description       IN VARCHAR2   := NULL)  
RETURN VARCHAR2;
```

Workload Repository format. This form of the function is called to prepare the analysis of a single statement from the workload repository given a range of snapshot identifiers.

```
DBMS_SQLPA.CREATE_ANALYSIS_TASK(  
    dbid             IN NUMBER      DEFAULT,  
    begin_snap       IN NUMBER,  
    end_snap         IN NUMBER,  
    sql_id           IN VARCHAR2,
```

```

plan_hash_value IN NUMBER      := NULL,
task_name       IN VARCHAR2    := NULL,
description     IN VARCHAR2    := NULL)
con_name        IN VARCHAR2    DEFAULT,
RETURN VARCHAR2;

```

SQLSET format. This form of the function is called to prepare the analysis of a SQL tuning set.

```

DBMS_SQLPA.CREATE_ANALYSIS_TASK(
  sqlset_name     IN VARCHAR2,
  basic_filter    IN VARCHAR2 := NULL,
  con_name        IN VARCHAR2 DEFAULT,
  order_by        IN VARCHAR2 := NULL,
  top_sql         IN VARCHAR2 := NULL,
  task_name       IN VARCHAR2 := NULL,
  description     IN VARCHAR2 := NULL,
  sqlset_owner    IN VARCHAR2 := NULL)
RETURN VARCHAR2;

```

Parameters

Table 172-3 *CREATE_ANALYSIS_TASK* Function Parameters

| Parameter | Description |
|-----------------|--|
| sql_text | Text of a SQL statement |
| bind_list | A set of bind values |
| parsing_schema | Name of the schema where the statement can be compiled |
| task_name | Optional analysis task name |
| dbid | The DBID for imported or PDB-level AWR data. If NULL, then the current database DBID is used |
| con_name | Container for the SPA task. The semantics depend on the function format: For the SQL ID format, this parameter specifies the container from which the database fetches the SQL statement for using with SPA. SPA will analyze the statement in this container. If null, then the database uses the current PDB for SPA analysis. For the AWR format, this parameter specifies the container from whose AWR data the database fetches the SQL statement for using with SPA. SPA will analyze the statement in this container. If null, then the database uses the current PDB for SPA analysis. The following statements are true of all function formats: <ul style="list-style-type: none"> • In a non-CDB, this parameter is ignored. • In a PDB, this parameter must be null or match the container name of the PDB. Otherwise, error occurs. • In a CDB root, this parameter must be null or match the container name of a container in this CDB. Otherwise, error occurs. |
| description | Description of the SQL analysis task to a maximum of 256 characters |
| sql_id | Identifier of a SQL statement |
| plan_hash_value | Hash value of the SQL execution plan |
| begin_snap | Begin snapshot identifier |

Table 172-3 (Cont.) CREATE_ANALYSIS_TASK Function Parameters

| Parameter | Description |
|--------------|---|
| end_snap | End snapshot identifier |
| sqlset_name | SQL tuning set name |
| basic_filter | SQL predicate to filter the SQL from the SQL tuning set |
| order_by | Order-by clause on the selected SQL |
| top_sql | Top N SQL after filtering and ranking |
| sqlset_owner | The owner of the SQL tuning set, or NULL for the current schema owner |

Return Values

A SQL analysis task name that is unique by user (two different users can give the same name to their advisor tasks).

Examples

```
variable stmt_task VARCHAR2(64);
variable sts_task  VARCHAR2(64);

-- Sql text format
EXEC :stmt_task := DBMS_SQLPA.CREATE_ANALYSIS_TASK(
    sql_text => 'select quantity_sold from sales s, times t where s.time_id =
t.time_id and s.time_id = TO_DATE(''24-NOV-00'')');

-- Sql id format (cursor cache)
EXEC :stmt_task := DBMS_SQLPA.CREATE_ANALYSIS_TASK(
    sql_id    => 'ay1m3ssvtrh24');

-- Workload repository format
exec :stmt_task := DBMS_SQLPA.CREATE_ANALYSIS_TASK(
    begin_snap => 1,
    end_snap   => 2,
    sql_id     => 'ay1m3ssvtrh24');

-- Sql tuning set format (first we need to load an STS, then analyze it)
EXEC :sts_task := DBMS_SQLPA.CREATE_ANALYSIS_TASK( -
    sqlset_name => 'my_workload', -
    order_by    => 'BUFFER_GETS', -
    description => 'process workload ordered by buffer gets');
```

172.3.3 DROP_ANALYSIS_TASK Procedure

This procedure drops a SQL analysis task. The task and all its result data are deleted.

Syntax

```
DBMS_SQLPA.DROP_ANALYSIS_TASK(
    task_name      IN VARCHAR2);
```

Parameters

Table 172-4 DROP_ANALYSIS_TASK Procedure Parameters

| Parameter | Description |
|-----------|---------------------------------------|
| task_name | The name of the analysis task to drop |

172.3.4 EXECUTE_ANALYSIS_TASK Function & Procedure

This function and procedure executes a previously created analysis task, the function version returning the new execution name.

Syntax

```
DBMS_SQLPA.EXECUTE_ANALYSIS_TASK(
    task_name          IN VARCHAR2,
    execution_type     IN VARCHAR2          := 'test execute',
    execution_name     IN VARCHAR2          := NULL,
    execution_params   IN dbms_advisor.argList := NULL,
    execution_desc     IN VARCHAR2          := NULL)
RETURN VARCHAR2;
```

```
DBMS_SQLPA.EXECUTE_ANALYSIS_TASK(
    task_name          IN VARCHAR2,
    execution_type     IN VARCHAR2          := 'test execute',
    execution_name     IN VARCHAR2          := NULL,
    execution_params   IN dbms_advisor.argList := NULL,
    execution_desc     IN VARCHAR2          := NULL);
```

Parameters

Table 172-5 EXECUTE_ANALYSIS_TASK Function & Procedure Parameters

| Parameter | Description |
|-----------|-----------------------------------|
| task_name | Identifier of the task to execute |

Table 172-5 (Cont.) EXECUTE_ANALYSIS_TASK Function & Procedure Parameters

| Parameter | Description |
|------------------|--|
| execution_type | Type of the action to perform by the function. If NULL it will default to the value of the <code>DEFAULT_EXECUTION_TYPE</code> parameter. Possible values are: <ul style="list-style-type: none"> [TEST] EXECUTE - test-execute every SQL statement and collect its execution plans and execution statistics. The resulting plans and statistics will be stored in the advisor framework. This is default. EXPLAIN PLAN - generate explain plan for every statement in the SQL workload. This is similar to the EXPLAIN PLAN command. The resulting plans will be stored in the advisor framework in association with the task. COMPARE [PERFORMANCE] - analyze and compare two versions of SQL performance data. The performance data is generated by test-executing or generating explain plan of the SQL statements. Use this option when two executions of type EXPLAIN_PLAN or TEST_EXECUTE already exist in the task CONVERT SQLSET - used to read the statistics captured in a SQL Tuning Set and model them as a task execution. This can be used when you wish to avoid executing the SQL statements because valid data for the experiment already exists in the SQL Tuning Set. |
| execution_name | A name to qualify and identify an execution. If not specified, it will be generated by the advisor and returned by function. |
| execution_params | List of parameters (name, value) for the specified execution. The execution parameters have effect only on the execution for which they are specified. They will override the values for the parameters stored in the task (set through the SET_ANALYSIS_DEFAULT_PARAMETER Procedures). |
| execution_desc | A 256-length string describing the execution |

Usage Notes

SQL performance analyzer task can be executed multiples times without having to reset it. For example, when a task is created to perform a change impact analysis on a SQL workload, the created task has to be executed before making any change in the system environment to build a version of the workload that will be used as a reference for performance analysis. Once the change has been made, a second execution is required to build the post-change version of the workload. Finally, the task has to be executed a third time to let the advisor analyze and compare the performance of the workload in both versions.

Examples

1. Create a task with a purpose of change impact analysis

```
EXEC :tname := DBMS_SQLPA.CREATE_ANALYSIS_TASK(
    sqlset_name => 'my_sts');
```

2. Make baseline or the before change execution

```
EXEC DBMS_SQLPA.EXECUTE_ANALYSIS_TASK(
    task_name      => :tname,
    execution_type => 'test execute',
    execution_name => 'before_change');
```

3. Make change

...

4. Make the after change version of the workload performance

```
EXEC DBMS_SQLPA.EXECUTE_ANALYSIS_TASK(
    task_name      => :tname, -
    execution_type => 'test execute',
    execution_name => 'after_change')
```

5. Compare the two versions of the workload

By default we always compare the results of the two last executions. The SQL Performance Analyzer uses the `elapsed_time` as a default metric for comparison. Here we are changing it to `buffer_gets` instead.

```
EXEC DBMS_SQLPA.SET_ANALYSIS_TASK_PARAMETER(
    :tname, 'comparison_metric', 'buffer_gets');
EXEC DBMS_SQLPA.EXECUTE_ANALYSIS_TASK(
    task_name      => :tname, -
    execution_type => 'compare performance', -
    execution_name => 'after_change');
```

Use the following call if you would like to explicitly specify the two executions to compare as well as the comparison metric to use.

```
EXEC DBMS_SQLPA.EXECUTE_ANALYSIS_TASK(
    task_name      => :tname, -
    execution_type => 'compare performance',
    execution_params => dbms_advisor.arglist(
        'execution_name1',
        'before_change',
        'execution_name2',
        'after_change',
        'comparison_metric',
        'buffer_gets'));
```

172.3.5 INTERRUPT_ANALYSIS_TASK Procedure

This procedure interrupts the currently executing analysis task. All intermediate result data will not be removed from the task.

Syntax

```
DBMS_SQLPA.INTERRUPT_ANALYSIS_TASK(
    task_name      IN VARCHAR2);
```

Parameters

Table 172-6 INTERRUPT_ANALYSIS_TASK Procedure Parameters

| Parameter | Description |
|-----------|--|
| task_name | Identifier of the analysis task to interrupt |

Examples

```
EXEC DBMS_SQLPA.INTERRUPT_ANALYSIS_TASK(:my_task);
```

172.3.6 REPORT_ANALYSIS_TASK Function

This procedure displays the results of an analysis task.

Syntax

```
DBMS_SQLPA.REPORT_ANALYSIS_TASK(
    task_name      IN  VARCHAR2,
    type           IN  VARCHAR2      := 'TEXT',
    level          IN  VARCHAR2      := 'TYPICAL',
    section        IN  VARCHAR2      := 'SUMMARY',
    object_id      IN  NUMBER        := NULL,
    top_sql        IN  NUMBER        := 100,
    execution_name IN  VARCHAR2      := NULL,
    task_owner     IN  VARCHAR2      := NULL,
    order_by       IN  VARCHAR2      := NULL)
RETURN CLOB;
```

Parameters

Table 172-7 REPORT_ANALYSIS_TASK Function Parameters

| Parameter | Description |
|-----------|---|
| task_name | Name of the task to report |
| type | Type of the report to produce. Possible values are TEXT (default), HTML, XML and ACTIVE (see Usage Notes). |
| level | Level of detail in the report: <ul style="list-style-type: none"> • ALL - details of all SQL • BASIC - currently the same as typical • CHANGED - only SQL with changed performance • CHANGED_PLANS - only SQL with plan changes • ERRORS - SQL with errors only • IMPROVED - only improved SQL • REGRESSED - only regressed SQL • TIMEOUT - only SQL which timed-out during execution • TYPICAL (default) - show information about every statement analyzed, including changing and errors • UNCHANGED - only SQL with unchanged performance • UNCHANGED_PLANS - only SQL with unchanged plans • UNSUPPORTED - only SQL not supported by SPAs |

Table 172-7 (Cont.) REPORT_ANALYSIS_TASK Function Parameters

| Parameter | Description |
|----------------|---|
| section | Optionally limit the report to a single section (ALL for all sections): <ul style="list-style-type: none"> SUMMARY (default) - workload summary only ALL - summary and details on SQL |
| object_id | Identifier of the advisor framework object that represents a given SQL in a tuning set (STS) |
| top_sql | Number of SQL statements in a STS for which the report is generated |
| execution_name | Name of the task execution to use. If NULL, the report will be generated for the last task execution. |
| task_owner | Owner of the relevant analysis task. Defaults to the current schema owner. |
| order_by | How to sort SQL statements in the report (summary and body). Possible values: <ul style="list-style-type: none"> CHANGE_DIFF - sort SQL statements by change difference in SQL performance in terms of the comparison Metric NULL (default) - order SQL statement by impact on workload SQL_IMPACT - order SQL statement by change impact on SQL WORKLOAD_IMPACT - same as NULL METRIC_DELTA - same as CHANGE_DIFF |

Return Values

A CLOB containing the desired report.

Usage Notes

ACTIVE reports have a rich, interactive user interface similar to Enterprise Manager while not requiring any EM installation. The report file built is in HTML format so it can be interpreted by most modern browsers. The code powering the active report is downloaded transparently by the web browser when the report is first viewed, hence viewing it requires outside connectivity.

Examples

```
-- Get the whole report for the single statement case.
SELECT DBMS_SQLPA.REPORT_ANALYSIS_TASK(:stmt_task) from dual;

-- Show me the summary for the sts case.
SELECT DBMS_SQLPA.REPORT_ANALYSIS_TASK(:sts_task, 'TEXT', 'TYPICAL', 'SUMMARY')
FROM DUAL;

-- Show me the findings for the statement I'm interested in.
SELECT DBMS_SQLPA.REPORT_ANALYSIS_TASK(:sts_task, 'TEXT', 'TYPICAL', 'ALL', 5)
from dual;
```

172.3.7 RESET_ANALYSIS_TASK Procedure

This procedure is called on an analysis task that is not currently executing to prepare it for re-execution.

All intermediate result data will be deleted.

Syntax

```
DBMS_SQLPA.RESET_ANALYSIS_TASK(
  task_name          IN VARCHAR2);
```

Parameters**Table 172-8** RESET_ANALYSIS_TASK Procedure Parameters

| Parameter | Description |
|-----------|--|
| task_name | Identifier of the analysis task to reset |

Examples

```
-- reset and re-execute a task
EXEC DBMS_SQLPA.RESET_ANALYSIS_TASK(:sts_task);

-- re-execute the task
EXEC DBMS_SQLPA.EXECUTE_ANALYSIS_TASK(:sts_task);
```

172.3.8 RESUME_ANALYSIS_TASK Procedure

This procedure resumes a previously interrupted or `FAILED` (with a fatal error) task execution.

Syntax

```
DBMS_SQLPA.RESUME_ANALYSIS_TASK(
  task_name          IN VARCHAR2,
  basic_filter       IN VARCHAR2 := NULL);
```

Parameters**Table 172-9** RESUME_ANALYSIS_TASK Procedure Parameters

| Parameter | Description |
|--------------|---|
| task_name | Identifier of the analysis task to resume |
| basic_filter | A SQL predicate to filter the SQL from the SQL tuning set. Note that this filter will be applied in conjunction with the basic filter (parameter <code>basic_filter</code>) that was specified when calling the CREATE_ANALYSIS_TASK Functions . |

Usage Notes

Resuming a single SQL analysis task (a task that was created to analyze a single SQL statement as compared to a SQL Tuning Set) is not supported.

Examples

```
-- Interrupt the task
EXEC DBMS_SQLPA.INTERRUPT_ANALYSIS_TASK(:conc_task);

-- Once a task is interrupted, we can elect to reset it, resume it, or check
-- out its results and then decide. For this example we will just resume.
```

```
EXEC DBMS_SQLPA.RESUME_ANALYSIS_TASK(:conc_task);
```

172.3.9 SET_ANALYSIS_TASK_PARAMETER Procedures

This procedure sets the SQL analysis task parameter value.

Syntax

This form of the procedure updates the value of a SQL analysis parameter of type VARCHAR2.

```
DBMS_SQLPA.SET_ANALYSIS_TASK_PARAMETER(
  task_name          IN VARCHAR2,
  parameter          IN VARCHAR2,
  value              IN VARCHAR2,
  test_execute_dop   IN NUMBER DEFAULT 0,
  compare_resultset  IN BOOLEAN DEFAULT TRUE);
```

This form of the procedure updates the value of a SQL analysis parameter of type NUMBER.

```
DBMS_SQLPA.SET_ANALYSIS_TASK_PARAMETER(
  task_name          IN VARCHAR2,
  parameter          IN VARCHAR2,
  value              IN NUMBER,
  test_execute_dop   IN NUMBER DEFAULT 0,
  compare_resultset  IN BOOLEAN DEFAULT TRUE);
```

Parameters

Table 172-10 SET_ANALYSIS_TASK_PARAMETER Procedure Parameters

| Parameter | Description |
|-----------|--|
| task_name | Identifier of the task to execute |
| parameter | Name of the parameter to set. The possible analysis parameters that can be set by this procedure are: <ul style="list-style-type: none"> APPLY_CAPTURED_COMPILEENV: indicates whether the advisor could use the compilation environment captured with the SQL statements. The default is 0 (that is, NO). BASIC_FILTER: basic filter for SQL tuning set CELL_SIMULATION_ENABLED: for more details, see the helper script tcellsim.sql in the ADMIN directory. COMPARISON_METRIC: specify an expression of execution statistics to use in performance comparison (Example: buffer_gets, cpu_time + buffer_gets * 10) DATABASE_LINK: can be set to the global name of a PUBLIC database link. When it is set, SQL Performance Analyzer will use the database link for all TEST EXECUTE and EXPLAIN PLAN operations by sending the SQL statements to the remote database to be processed remotely. The analysis results will still be stored on the local database. DAYS_TO_EXPIRE: number of days until the task is deleted DEFAULT_EXECUTION_TYPE: the task will default to this type of execution when none is specified by the EXECUTE_ANALYSIS_TASK Function & Procedure. |

Table 172-10 (Cont.) SET_ANALYSIS_TASK_PARAMETER Procedure Parameters

| Parameter | Description |
|--------------------|--|
| parameter (contd.) | <ul style="list-style-type: none"> • DISABLE_MULTI_EXEC: SQL statements are executed multiple times and runtime statistics are then averaged. Set this parameter to TRUE to disable this capability. In this case, each SQL in the SQL tuning set is executed only once. • EXECUTE_TRIGGERS: Set this parameter to TRUE to execute all statement-level triggers in the FULLDML mode. If the parameter is set to FALSE, then the triggers will not be executed even in FULLDML mode of test execution. Any changes incurred due to potential execution of triggers are always rolled back by SPA. The default value of this parameter is FALSE. • EXECUTION_DAYS_TO_EXPIRE: number of days until the task's executions will be deleted (without deleting the task) • EXECUTE_FULLDML: TRUE to execute DML statement fully, including acquiring row locks and modifying rows; FALSE (default) to execute only the query part of the DML without modifying data. When TRUE, SQL Performance Analyzer will issue a rollback following DML execution to prevent persistent changes from being made by the DML. • EXECUTION_NAME1: name of the first task execution to analyze • EXECUTION_NAME2: name of the second task execution to analyze • LOCAL_TIME_LIMIT: per-statement time out (seconds) • METRIC_DELTA_THRESHOLD: threshold of the difference between the SQL performance metric before and after the change. The default value is zero. • NUM_ROWS_TO_FETCH: specifies the number of rows to be fetched for an SQL query. You can use one of the following values: <ul style="list-style-type: none"> – ALL_ROWS: Fetches all the rows for an SQL query – AVERAGE: Number of result rows is calculated as the ratio of total rows processed and total executions for each SQL in the STS – AUTO: Number of result rows is determined using the value of <code>optimizer_mode</code> parameter of the optimizer environment captured in the STS. If the value of <code>optimizer_mode</code> is ALL_ROWS, then all result rows will be fetched. If its value is FIRST_ROWS_n, then <code>n</code> result rows will be fetched by the SPA. – A valid number: Fetches the exact number of rows specified by in the SQL query <p>The default value is ALL_ROWS.</p> • PLAN_FILTER: plan filter for SQL tuning set (see SELECT_SQLSET for possible values) • PLAN_LINES_COMPARISON: <ul style="list-style-type: none"> - ALWAYS --line by line comparison of plans in all scenarios.- AUTO -Line by Line comparison of plans only if <code>phv2</code> is not available and <code>phv1</code> is different- NONE (default) - line by line comparison of plans only if <code>phv</code> is unknown |

Table 172-10 (Cont.) SET_ANALYSIS_TASK_PARAMETER Procedure Parameters

| Parameter | Description |
|--------------------|--|
| | <ul style="list-style-type: none"> RANK_MEASURE1: first ranking measure for SQL tuning set RANK_MEASURE2: second possible ranking measure for SQL tuning set RANK_MEASURE3: third possible ranking measure for SQL tuning set REPLACE_SYSDATE_WITH: Returns a fixed date for all calls to SYSDATE within the SPA task execution. You can use one of the following values: <ul style="list-style-type: none"> CURRENT_SYSDATE: SYSDATE calls return the current date. SQLSET_SYSDATE: SYSDATE calls return the value of the column LAST_EXEC_START_TIME in the STS The default value is CURRENT_SYSDATE. RESUME_FILTER: a extra filter for SQL tuning sets besides BASIC_FILTER SQL_IMPACT_THRESHOLD: threshold of a change impact on a SQL statement. Same as the previous parameter, but at the level of the SQL statement. SQL_LIMIT: maximum number of SQL statements to process SQL_PERCENTAGE: percentage filter of SQL tuning set statements SQLSET_NAME: name of the SQL tuning set to associate to the specified task or task execution. This parameter is mainly using in comparing two SQL tuning sets using SPA. SQLSET_OWNER: owner of the SQL tuning set specified using task parameter SQLSET_NAME. TIME_LIMIT: global time out (seconds) WORKLOAD_IMPACT_THRESHOLD: threshold of a SQL statement impact on a workload. Statements which workload change impact is below the absolute value of this threshold will be ignored and not considered for improvement or regression. CON_DBID_MAPPING: provide a mapping of multitenant container database (CDB) IDs. When it is set, SQL Performance Analyzer uses the new CDB ID when it finds a match for the old CDB ID and executes the SQL in that container. |
| parameter (contd.) | |
| value | New value of the specified parameter |
| test_execute_dop | Specifies the requested level of concurrency with which a SPA task should be executed. Values 0 or 1 indicate that the SPA task will run with no additional processes as it used to run in releases prior to Oracle Database 18c Release. A value of n (higher than 1) means that n background SPA processes are being requested to concurrently process the input workload. |

Table 172-10 (Cont.) SET_ANALYSIS_TASK_PARAMETER Procedure Parameters

| Parameter | Description |
|--------------------------------|---|
| <code>compare_resultset</code> | <p>Directs SPA to detect if the result-sets between the two trials being compared are different. If differences are seen in the result-sets of any SQL statement between the two trials being compared, the SPA comparison report will indicate this for every such SQL statement.</p> <ul style="list-style-type: none"> • If set to <code>TRUE</code> the result set comparison will be performed • If set to <code>FALSE</code> result set comparison will not be performed. |

Usage Notes

The actual number of processes granted might be equal to or lower than the number requested using the `test_execute_dop` parameter. This parameter applies only to `test-execute` or `explain plan type` of trials that process a SQL Tuning set.

Examples

To request two concurrent processes to execute the SPA task:

```
dbms_sqlpa.set_analysis_task_parameter(:tname,'TEST_EXECUTE_DOP',2)
```

To enable result-set validation

```
exec
dbms_sqlpa.set_analysis_task_parameter(:atname,'COMPARE_RESULTSET','TRUE')
```

To disable result-set validation:

```
exec
dbms_sqlpa.set_analysis_task_parameter(:atname,'COMPARE_RESULTSET','FALSE')
```

172.3.10 SET_ANALYSIS_DEFAULT_PARAMETER Procedures

This procedure sets the SQL analysis task parameter default value.

Syntax

This form of the procedure updates the default value of an analyzer parameter of type `VARCHAR2`.

```
DBMS_SQLPA.SET_ANALYSIS_DEFAULT_PARAMETER(
  parameter IN VARCHAR2,
  value     IN VARCHAR2);
```

This form of the procedure updates the default value of an analyzer parameter of type `NUMBER`.

```
DBMS_SQLPA.SET_ANALYSIS_DEFAULT_PARAMETER(
    parameter IN VARCHAR2,
    value     IN NUMBER);
```

Parameters

Table 172-11 SET_ANALYSIS_DEFAULT_PARAMETER Procedure Parameters

| Parameter | Description |
|-----------|--|
| parameter | <p>Name of the parameter to set. The possible analysis parameters that can be set by this procedure are:</p> <ul style="list-style-type: none"> • APPLY_CAPTURED_COMPILEENV: indicates whether the advisor could use the compilation environment captured with the SQL statements. The default is 0 (that is, NO). • BASIC_FILTER: basic filter for SQL tuning set • COMPARISON_METRIC: specify an expression of execution statistics to use in performance comparison (Example: <code>buffer_gets, cpu_time + buffer_gets * 10</code>) • DATABASE_LINK: can be set to the global name of a PUBLIC database link. When it is set, SQL Performance Analyzer will use the database link for all <code>TEST EXECUTE</code> and <code>EXPLAIN PLAN</code> operations by sending the SQL statements to the remote database to be processed remotely. The analysis results will still be stored on the local database. • DAYS_TO_EXPIRE: number of days until the task is deleted • DEFAULT_EXECUTION_TYPE: the task will default to this type of execution when none is specified by the EXECUTE_ANALYSIS_TASK Function & Procedure. • EXECUTE_FULLDML: <code>TRUE</code> to execute DML statement fully, including acquiring row locks and modifying rows; <code>FALSE</code> (default) to execute only the query part of the DML without modifying data. When <code>TRUE</code>, SQL Performance Analyzer will issue a rollback following DML execution to prevent persistent changes from being made by the DML. • EXECUTION_DAYS_TO_EXPIRE: number of days until the tasks's executions will be deleted (without deleting the task) • EXECUTION_NAME1: name of the first task execution to analyze • EXECUTION_NAME2: name of the second task execution to analyze • LOCAL_TIME_LIMIT: per-statement time out (seconds) |

Table 172-11 (Cont.) SET_ANALYSIS_DEFAULT_PARAMETER Procedure Parameters

| Parameter | Description |
|--------------------|--|
| parameter (contd.) | <ul style="list-style-type: none"> • PLAN_FILTER: plan filter for SQL tuning set (see SELECT_SQLSET for possible values) • RANK_MEASURE1: first ranking measure for SQL tuning set • RANK_MEASURE2: second possible ranking measure for SQL tuning set • RANK_MEASURE3: third possible ranking measure for SQL tuning set • RESUME_FILTER: a extra filter for SQL tuning sets besides BASIC_FILTER • SQL_IMPACT_THRESHOLD: threshold of a change impact on a SQL statement. Same as the previous parameter, but at the level of the SQL statement. • SQL_LIMIT: maximum number of SQL statements to process • SQL_PERCENTAGE: percentage filter of SQL tuning set statements • TIME_LIMIT: global time out (seconds) • WORKLOAD_IMPACT_THRESHOLD: threshold of a SQL statement impact on a workload. Statements which workload change impact is below the absolute value of this threshold will be ignored and not considered for improvement or regression. |
| value | New value of the specified parameter |

DBMS_SQLQ

The `DBMS_SQLQ` package provides the interface for configuring quarantine thresholds for execution plans of SQL statements. If any of the Resource Manager thresholds is equal to or less than the quarantine threshold specified in a SQL statement's quarantine configuration, then the SQL statement is not allowed to run, if it uses the execution plan specified in its quarantine configuration.

This chapter contains the following topics:

- [DBMS_SQLQ Overview](#)
- [Summary of DBMS_SQLQ Subprograms](#)

173.1 DBMS_SQLQ Overview

The `DBMS_SQLQ` package provides the interface for configuring quarantine thresholds for execution plans of SQL statements. If any of the Resource Manager thresholds is equal to or less than the quarantine threshold specified in a SQL statement's quarantine configuration, then the SQL statement is not allowed to run, if it uses the execution plan specified in its quarantine configuration.

You can use the `DBMS_SQLQ` package subprograms to:

- create quarantine configurations for execution plans of SQL statements and specify quarantine thresholds for their resource consumption
- query quarantine thresholds specified in quarantine configurations
- delete quarantine configurations
- transfer quarantine configurations from one database to another

173.2 Summary of DBMS_SQLQ Subprograms

This table lists the `DBMS_SQLQ` subprograms and briefly describes them.

Table 173-1 DBMS_SQLQ Package Subprograms

| Procedure | Description |
|--|---|
| ALTER_QUARANTINE Procedure | Specifies a quarantine threshold in a quarantine configuration for execution plans of a SQL statement |
| CREATE_QUARANTINE_BY_SQL_ID Function | Creates a quarantine configuration for execution plans of a SQL statement using SQL ID |
| CREATE_QUARANTINE_BY_SQL_TEXT Function | Creates a quarantine configuration for execution plans of a SQL statement using SQL text |
| CREATE_STGTAB_QUARANTINE Procedure | Creates a staging table to store quarantine configurations |
| DROP_QUARANTINE Procedure | Deletes a quarantine configuration |

Table 173-1 (Cont.) DBMS_SQLQ Package Subprograms

| Procedure | Description |
|---|--|
| GET_PARAM_VALUE_QUARANTINE Function | Returns the value for a quarantine threshold specified in a quarantine configuration |
| PACK_STGTAB_QUARANTINE Function | Adds one or more quarantine configurations to a staging table |
| UNPACK_STGTAB_QUARANTINE Function | Creates quarantine configurations in a database from a staging table |

173.2.1 ALTER_QUARANTINE Procedure

This procedure specifies a quarantine threshold for a resource in a quarantine configuration for execution plans of a SQL statement.

Syntax

```
DBMS_SQLQ.ALTER_QUARANTINE (
    quarantine_name    IN VARCHAR2,
    parameter_name    IN VARCHAR2,
    parameter_value    IN VARCHAR2);
```

Parameters

Table 173-2 ALTER_QUARANTINE Procedure Parameters

| Parameter | Description |
|-----------------|---|
| quarantine_name | Name of the quarantine configuration. |
| parameter_name | Name of the resource for which quarantine threshold needs to be specified. You can specify any one of the following values: <ul style="list-style-type: none"> CPU_TIME: CPU time ELAPSED_TIME: Elapsed time IO_MEGABYTES: I/O in megabytes IO_REQUESTS: Number of physical I/O requests IO_LOGICAL: Number of logical I/O requests ENABLED: Flag to enable or disable the quarantine configuration. Specify YES to enable it and NO to disable it. The default value is YES. AUTOPURGE: Flag to enable or disable automatic purging of the quarantine configuration. If it is set to YES, the quarantine configuration is automatically purged after 53 weeks, if not used. If it is set to NO, the quarantine configuration is never purged. The default value is YES. |

Table 173-2 (Cont.) ALTER_QUARANTINE Procedure Parameters

| Parameter | Description |
|-----------------|--|
| parameter_value | Quarantine threshold for the resource specified in parameter_name. |

Examples

In the following example, the quarantine threshold specified for CPU time is 5 seconds and elapsed time is 10 seconds for the quarantine configuration

SQL_QUARANTINE_3z0mwuq3aqsm8cfe7a0e4.

```
BEGIN

  DBMS_SQLQ.ALTER_QUARANTINE (
    QUARANTINE_NAME => 'SQL_QUARANTINE_3z0mwuq3aqsm8cfe7a0e4',
    PARAMETER_NAME  => 'CPU_TIME',
    PARAMETER_VALUE => '5');

  DBMS_SQLQ.ALTER_QUARANTINE (
    QUARANTINE_NAME => 'SQL_QUARANTINE_3z0mwuq3aqsm8cfe7a0e4',
    PARAMETER_NAME  => 'ELAPSED_TIME',
    PARAMETER_VALUE => '10');

END;
/
```

When the SQL statement is executed using the execution plan specified in the quarantine configuration, and if the Resource Manager threshold for CPU time is 5 seconds or less, or elapsed time is 10 seconds or less, then the SQL statement is not allowed to run.

173.2.2 CREATE_QUARANTINE_BY_SQL_ID Function

This function creates a quarantine configuration for execution plans of a SQL statement based on SQL ID.

Syntax

```
DBMS_SQLQ.CREATE_QUARANTINE_BY_SQL_ID (
  sql_id          IN VARCHAR2,
  plan_hash_value IN NUMBER DEFAULT NULL)
RETURN VARCHAR2;
```

Parameters**Table 173-3 CREATE_QUARANTINE_BY_SQL_ID Function Parameters**

| Parameter | Description |
|-----------|------------------------------|
| sql_id | SQL ID of the SQL statement. |

Table 173-3 (Cont.) CREATE_QUARANTINE_BY_SQL_ID Function Parameters

| Parameter | Description |
|-----------------|---|
| plan_hash_value | Hash value of the execution plan of the SQL statement. Default value is NULL. When it is NULL, the quarantine configuration applies to all the execution plans of the SQL statement. |

Return Value

Name of the quarantine configuration.

Examples

The following example creates a quarantine configuration for the SQL statement having the SQL ID of 8vu7s907prbgr. The quarantine configuration applies to all the execution plans of the SQL statement.

```
DECLARE
    quarantine_config VARCHAR2(30);
BEGIN
    quarantine_config := DBMS_SQLQ.CREATE_QUARANTINE_BY_SQL_ID(SQL_ID =>
'8vu7s907prbgr');
END;
/
```

The following example creates a quarantine configuration for the execution plan having the hash value of 3488063716 for the SQL statement having the SQL ID of 8vu7s907prbgr.

```
DECLARE
    quarantine_config VARCHAR2(30);
BEGIN
    quarantine_config := DBMS_SQLQ.CREATE_QUARANTINE_BY_SQL_ID(SQL_ID =>
'8vu7s907prbgr', PLAN_HASH_VALUE => '3488063716');
END;
/
```

173.2.3 CREATE_QUARANTINE_BY_SQL_TEXT Function

This function creates a quarantine configuration for execution plans of a SQL statement based on SQL text.

Syntax

```
DBMS_SQLQ.CREATE_QUARANTINE_BY_SQL_TEXT (
    sql_text          IN CLOB,
    plan_hash_value  IN NUMBER DEFAULT NULL)
RETURN VARCHAR2;
```

Parameters

Table 173-4 CREATE_QUARANTINE_BY_SQL_TEXT Function Parameters

| Parameter | Description |
|-----------------|---|
| sql_text | SQL statement. |
| plan_hash_value | Hash value of the execution plan of the SQL statement. Default value is NULL. When it is NULL, the quarantine configuration applies to all the execution plans of the SQL statement. |

Return Value

Name of the quarantine configuration.

Examples

The following example creates a quarantine configuration that applies to all the execution plans of the SQL statement 'select count(*) from emp'.

```
DECLARE
  quarantine_config VARCHAR2(30);
BEGIN
  quarantine_config := DBMS_SQLQ.CREATE_QUARANTINE_BY_SQL_TEXT(SQL_TEXT =>
to_clob('select count(*) from emp'));
END;
/
```

The following example creates a quarantine configuration for the execution plan having the hash value of 3488063716 for the SQL statement having the SQL text of 'select count(*) from emp'.

```
DECLARE
  quarantine_config VARCHAR2(30);
BEGIN
  quarantine_config := DBMS_SQLQ.CREATE_QUARANTINE_BY_SQL_TEXT(SQL_TEXT =>
to_clob('select count(*) from emp'), PLAN_HASH_VALUE => '3488063716');
END;
/
```

173.2.4 CREATE_STGTAB_QUARANTINE Procedure

This procedure creates a staging table to store the quarantine configurations, so that the staging table can be exported from the current database and imported into another database, thus enabling the quarantine configurations to be used across databases.

Syntax

```
DBMS_SQLQ.CREATE_STGTAB_QUARANTINE (
  staging_table_name   IN VARCHAR2,
  staging_table_owner  IN VARCHAR2 DEFAULT NULL,
  tablespace_name     IN VARCHAR2 DEFAULT NULL);
```

Parameters

Table 173-5 CREATE_STGTAB_QUARANTINE Procedure Parameters

| Parameter | Description |
|---------------------|---|
| staging_table_name | Name of the staging table. |
| staging_table_owner | Name of the schema owner of the staging table. Default value is NULL, which means the database user executing this procedure is set as the staging table owner. |
| tablespace_name | Name of the tablespace in which the staging table needs to be created. Default value is NULL, which means the staging table is created in the default tablespace of the database. |

Examples

The following example creates the staging table `TBL_STG_QUARANTINE` in the default tablespace of the database and sets its table owner to the database user executing this procedure.

```
BEGIN
  DBMS_SQLQ.CREATE_STGTAB_QUARANTINE(STAGING_TABLE_NAME => 'TBL_STG_QUARANTINE');
END;
/
```

173.2.5 DROP_QUARANTINE Procedure

This procedure deletes a quarantine configuration.

Syntax

```
DBMS_SQLQ.DROP_QUARANTINE(quarantine_name IN VARCHAR2);
```

Parameters

Table 173-6 DROP_QUARANTINE Procedure Parameters

| Parameter | Description |
|-----------------|---|
| quarantine_name | Name of the quarantine configuration to delete. |

Examples

The following example deletes the quarantine configuration having the name `SQL_QUARANTINE_3z0mwuq3aqsm8cfe7a0e4`.

```
BEGIN
  DBMS_SQLQ.DROP_QUARANTINE('SQL_QUARANTINE_3z0mwuq3aqsm8cfe7a0e4');
END;
/
```

173.2.6 GET_PARAM_VALUE_QUARANTINE Function

This function returns the quarantine threshold for a resource specified in a quarantine configuration.

Syntax

```
DBMS_SQLQ.GET_PARAM_VALUE_QUARANTINE (
    quarantine_name  IN VARCHAR2,
    parameter_name  IN VARCHAR2)
RETURN VARCHAR2;
```

Parameters

Table 173-7 GET_PARAM_VALUE_QUARANTINE Function Parameters

| Parameter | Description |
|-----------------|--|
| quarantine_name | Name of the quarantine configuration. |
| parameter_name | Resource for which the quarantine threshold needs to be retrieved. |

Return Value

Returns the quarantine threshold for a resource specified in a quarantine configuration.

Examples

The following example returns the quarantine threshold for CPU time specified in the quarantine configuration having the name `SQL_QUARANTINE_3z0mwuq3aqsm8cfe7a0e4`.

```
DECLARE
    quarantine_config_setting_value VARCHAR2(30);
BEGIN
    quarantine_config_setting_value := DBMS_SQLQ.GET_PARAM_VALUE_QUARANTINE (
        QUARANTINE_NAME =>
        'SQL_QUARANTINE_3z0mwuq3aqsm8cfe7a0e4',
        PARAMETER_NAME  => 'CPU_TIME');
END;
```

173.2.7 PACK_STGTAB_QUARANTINE Function

This function adds one or more quarantine configurations into a staging table.

Syntax

```
DBMS_SQLQ.PACK_STGTAB_QUARANTINE (
    staging_table_name  IN VARCHAR2,
    staging_table_owner IN VARCHAR2 DEFAULT NULL,
    name                IN VARCHAR2 DEFAULT '%',
    sql_text            IN VARCHAR2 DEFAULT '%');
```

```

    enabled          IN VARCHAR2 DEFAULT NULL)
RETURN NUMBER;
```

Parameters

Table 173-8 PACK_STGTAB_QUARANTINE Function Parameters

| Parameter | Description |
|---------------------|---|
| staging_table_name | Name of the staging table in which the quarantine configurations need to be added. |
| staging_table_owner | Name of the schema owner of the staging table. Default value is NULL, which means the database user executing this procedure is set as the staging table owner. |
| name | Name of the quarantine configuration. Its value is case-sensitive and it accepts wildcard characters. |
| sql_text | SQL statement text. Its value is case-sensitive and it accepts wildcard characters. |
| enabled | Flag indicating whether the quarantine configuration should be enabled or disabled. If it is set to YES, then the quarantine configuration is enabled, else it is disabled. Default value is NULL, which means the quarantine configuration is disabled by default. |

Return Value

Number of quarantine configurations added to the staging table.

Examples

The following example adds all the quarantine configurations having the names starting with SQL_QUARANTINE_ into the staging table TBL_STG_QUARANTINE.

```

DECLARE
    quarantine_configs NUMBER;
BEGIN
    quarantine_configs := DBMS_SQLQ.PACK_STGTAB_QUARANTINE (
        STAGING_TABLE_NAME => 'TBL_STG_QUARANTINE',
        NAME => 'SQL_QUARANTINE_%');
END;
```

173.2.8 UNPACK_STGTAB_QUARANTINE Function

This function creates quarantine configurations in a database from a staging table.

Syntax

```

DBMS_SQLQ.UNPACK_STGTAB_QUARANTINE (
    staging_table_name  IN VARCHAR2,
    staging_table_owner IN VARCHAR2 DEFAULT NULL,
    name               IN VARCHAR2 DEFAULT '%',
```

```

    sql_text          IN VARCHAR2 DEFAULT '%',
    enabled           IN VARCHAR2 DEFAULT NULL)
RETURN NUMBER;
```

Parameters

Table 173-9 UNPACK_STGTAB_QUARANTINE Function Parameters

| Parameter | Description |
|---------------------|---|
| staging_table_name | Name of the staging table from which the quarantine configurations need to be created in the database. |
| staging_table_owner | Name of the schema owner of the staging table. Default value is <code>NULL</code> , which means the database user executing this procedure is set as the staging table owner. |
| name | Name of the quarantine configuration. Its value is case-sensitive and it accepts wildcard characters. |
| sql_text | SQL statement text. Its value is case-sensitive and it accepts wildcard characters. |
| enabled | Flag indicating whether the quarantine configuration should be enabled or disabled. If its value is <code>YES</code> , then the quarantine configuration is enabled, else it is disabled. Default value is <code>NULL</code> , which means the quarantine configuration is disabled by default. |

Return Value

Number of quarantine configurations created in the database from the staging table.

Examples

The following example creates the quarantine configurations in the database from all the quarantine configurations stored in the staging table `TBL_STG_QUARANTINE`.

```

DECLARE
    quarantine_configs NUMBER;
BEGIN
    quarantine_configs := DBMS_SQLQ.UNPACK_STGTAB_QUARANTINE (
        STAGING_TABLE_NAME => 'TBL_STG_QUARANTINE');
END;
```

DBMS_SQLSET

The `DBMS_SQLSET` package provides an interface to manage SQL tuning sets.

This package provides the same subprograms, although in some cases with slightly different names, as the SQL tuning set subprograms in `DBMS_SQLTUNE`. The difference is that `DBMS_SQLSET` does not require the Oracle Tuning Pack.

This chapter contains the following topics:

- [DBMS_SQLSET Overview](#)
- [DBMS_SQLSET Security Model](#)
- [DBMS_SQLSET Data Structures](#)
- [Summary of DBMS_SQLSET Subprograms](#)

174.1 DBMS_SQLSET Overview

Use this package to manage SQL tuning sets.

**Note:**

All `DBMS_SQLSET` subprograms have equivalents in the `DBMS_SQLTUNE` package.

SQL tuning sets store SQL statements along with the following information:

- The execution context, such as the parsing schema name and bind values
- Execution statistics such as average elapsed time and execution count
- Execution plans, which are the sequence of operations that the database performs to run SQL statements
- Row source statistics such as the number of rows processed for each operation executed within the plan

You can create SQL tuning sets by filtering or ranking SQL statements from several sources:

- The shared SQL area using the [SELECT_CURSOR_CACHE Function](#)
- Top SQL statements from the Automatic Workload Repository using the [SELECT_WORKLOAD_REPOSITORY Function](#)
- Other SQL tuning sets using the [SELECT_SQLSET Function](#)
- SQL Performance Analyzer task comparison results using the [SELECT_SQLPA_TASK Function](#)
- SQL Trace files using the [SELECT_SQL_TRACE Function](#)
- A user-defined workload

The complete group of subprograms listed in [Summary of DBMS_SQLSET Subprograms](#) facilitates this functionality. As examples:

- The [CREATE_SQLSET Procedure and Function](#) creates a SQL tuning set object in the database.
- The [LOAD_SQLSET Procedure](#) populates the SQL tuning set with a set of selected SQL.
- The [CAPTURE_CURSOR_CACHE Procedure](#) collects SQL statements from the shared SQL area over a specified time interval, attempting to build a realistic picture of database workload.

174.2 DBMS_SQLSET Security Model

This package is available to `PUBLIC` and performs its own security checking.

SQL tuning set subprograms require either the `ADMINISTER SQL TUNING SET` or the `ADMINISTER ANY SQL TUNING SET` privilege. Users having the `ADMINISTER SQL TUNING SET` privilege can only create and modify a SQL tuning set that they own. The `ADMINISTER ANY SQL TUNING SET` privilege allows users to manipulate all SQL tuning sets, even those owned by other users. For example, you can use [CREATE_SQLSET Procedure and Function](#) to create a SQL tuning set to be owned by a different user. In this case, the different user need not have the `ADMINISTER SQL TUNING SET` privilege to manipulate the SQL tuning set.

174.3 DBMS_SQLSET Data Structures

The `SELECT_*` subprograms in the `DBMS_SQLTUNE` package return objects of the `SQLSET_ROW` type.

Object Types

- [SQLSET_ROW Object Type](#)

174.3.1 SQLSET_ROW Object Type

The `SQLSET_ROW` object models the content of a SQL tuning set for the user.

Logically, a SQL tuning set is a collection of `SQLSET_ROW` objects. Each `SQLSET_ROW` contains a single SQL statement along with its execution context, statistics, binds, and plan. The `SELECT_*` subprograms each model a data source as a collection of `SQLSET_ROW` objects, with each object uniquely identified by (`sql_id`, `plan_hash_value`). Similarly, the `LOAD_SQLSET` procedure takes as input a cursor whose row type is `SQLSET_ROW`, treating each `SQLSET_ROW` in isolation according to the policies requested by the user.

Several subprograms package accept basic filters on the content of a SQL tuning set or data source. These filters are expressed in terms of the attributes within the `SQLSET_ROW` as defined.

Syntax

```
CREATE TYPE sqlset_row AS object (  
    sql_id                VARCHAR(13),
```

```

force_matching_signature NUMBER,
sql_text                 CLOB,
object_list              sql_objects,
bind_data                RAW(2000),
parsing_schema_name     VARCHAR2(30),
module                  VARCHAR2(48),
action                  VARCHAR2(32),
elapsed_time            NUMBER,
cpu_time                NUMBER,
buffer_gets             NUMBER,
disk_reads              NUMBER,
direct_writes           NUMBER,
rows_processed          NUMBER,
fetches                 NUMBER,
executions              NUMBER,
end_of_fetch_count      NUMBER,
optimizer_cost          NUMBER,
optimizer_env           RAW(2000),
priority                NUMBER,
command_type            NUMBER,
first_load_time         VARCHAR2(19),
stat_period             NUMBER,
active_stat_period      NUMBER,
other                   CLOB,
plan_hash_value         NUMBER,
sql_plan                sql_plan_table_type,
bind_list               sql_binds,
con_dbid                NUMBER,
last_exec_start_time    VARCHAR2(19))

```

Attributes

Table 174-1 SQLSET_ROW Attributes

| Attribute | Description |
|----------------------------|--|
| sql_id | Unique SQL ID. |
| forcing_matching_signature | Signature with literals, case, and whitespace removed. |
| sql_text | Full text for the SQL statement. |
| object_list | Currently not implemented. |
| bind_data | Bind data as captured for this SQL. Note that you cannot stipulate an argument for this parameter and also for <code>bind_list</code> - they are mutually exclusive. |
| parsing_schema_name | Schema where the SQL is parsed. |
| module | Last application module for the SQL. |
| action | Last application action for the SQL. |
| elapsed_time | Sum total elapsed time for this SQL statement. |
| cpu_time | Sum total CPU time for this SQL statement. |
| buffer_gets | Sum total number of buffer gets. |

Table 174-1 (Cont.) SQLSET_ROW Attributes

| Attribute | Description |
|----------------------|---|
| disk_reads | Sum total number of disk reads. |
| direct_writes | Sum total number of direct path writes. |
| rows_processed | Sum total number of rows processed by this SQL. |
| fetches | Sum total number of fetches. |
| executions | Total executions of this SQL statement. |
| end_of_fetch_count | Number of times the SQL statement was fully executed with all of its rows fetched. |
| optimizer_cost | Optimizer cost for this SQL. |
| optimizer_env | Optimizer environment for this SQL statement. |
| priority | User-defined priority (1,2,3). |
| command_type | Statement type, such as INSERT or SELECT. |
| first_load_time | Load time of the parent cursor. |
| stat_period | Period of time (seconds) when the statistics of this SQL statement were collected. |
| active_stat_period | Effective period of time (in seconds) during which the SQL statement was active. |
| other | Other column for user-defined attributes. |
| plan_hash_value | Plan hash value of the plan. |
| sql_plan | Execution plan for the SQL statement. |
| bind_list | List of user-specified binds for the SQL statement. This is used for user-specified workloads. Note that you cannot stipulate an argument for this parameter and also for bind_data: they are mutually exclusive. |
| con_dbid | DBID of the PDB or CDB root. |
| last_exec_start_time | Most recent execution start time of this SQL statement. |

174.4 Summary of DBMS_SQLSET Subprograms

This table lists the DBMS_SQLSET subprograms and briefly describes them.

Table 174-2 DBMS_SQLSET Package Subprograms

| Subprogram | Description |
|--|--|
| ADD_REFERENCE Function | This procedure adds a new reference to an existing SQL tuning set to indicate its use by a client. |
| CAPTURE_CURSOR_CACHE Procedure | This procedure captures a workload from the shared SQL area into a SQL tuning set. |
| CREATE_SQLSET Procedure and Function | This procedure or function creates a SQL tuning set object in the database. |

Table 174-2 (Cont.) DBMS_SQLSET Package Subprograms

| Subprogram | Description |
|---|--|
| CREATE_STGTAB Procedure | This procedure creates a staging table through which SQL tuning sets are imported and exported. |
| DELETE_SQLSET Procedure | This procedure deletes a set of SQL statements from a SQL tuning set. |
| DROP_SQLSET Procedure | This procedure drops a SQL tuning set if it is not active. |
| LOAD_SQLSET Procedure | This procedure populates the SQL tuning set with a set of selected SQL statements. You can call the procedure multiple times to add new SQL statements or replace attributes of existing statements. |
| PACK_STGTAB Procedure | This procedure copies one or more SQL tuning sets from their location in the SYS schema to a staging table created by the CREATE_STGTAB procedure. |
| REMAP_STGTAB Procedure | This procedure changes the tuning set names and owners in the staging table so that they can be unpacked with different values. |
| REMOVE_REFERENCE Procedure | This procedure deactivates a SQL tuning set to indicate that it is no longer used by the client. |
| SELECT_CURSOR_CACHE Function | This function collects SQL statements from the workload repository. |
| SELECT_SQL_TRACE Function | This table function reads the content of one or more trace files and returns the SQL statements it finds in the format of <code>sqlset_row</code> . |
| SELECT_SQLPA_TASK Function | This function collects SQL statements from a SQL Performance Analyzer comparison task. |
| SELECT_SQLSET Function | This is a table function that reads the contents of a SQL tuning set. |
| SELECT_WORKLOAD_REPOSITORY Function | This function collects SQL statements from the workload repository. |
| UNPACK_STGTAB Procedure | This procedure copies one or more SQL tuning sets from their location in the staging table into the SQL tuning sets schema, making them proper SQL tuning sets. |
| UPDATE_SQLSET Procedures | This overloaded procedure updates selected fields for SQL statements in a SQL tuning set. |

174.4.1 ADD_REFERENCE Function

This procedure adds a new reference to an existing SQL tuning set to indicate its use by a client.

Syntax

```
DBMS_SQLSET.ADD_REFERENCE (  
    sqlset_name IN VARCHAR2,  
    description IN VARCHAR2 := NULL,  
    sqlset_owner IN VARCHAR2 :=NULL)  
RETURN NUMBER;
```

Parameters

The parameters are identical for `DBMS_SQLTUNE.ADD_SQLSET_REFERENCE` and `DBMS_SQLSET.ADD_REFERENCE`.

Table 174-3 ADD_SQLSET_REFERENCE and ADD_REFERENCE Function Parameters

| Parameter | Description |
|---------------------------|--|
| <code>sqlset_name</code> | Specifies the name of the SQL tuning set. |
| <code>description</code> | Provides an optional description of the usage of SQL tuning set. The description is truncated if longer than 256 characters. |
| <code>sqlset_owner</code> | Specifies the owner of the SQL tuning set, or <code>NULL</code> for the current schema owner. |

Return Values

The identifier of the added reference.

Usage Notes

Adding a reference to a SQL tuning set prevents the tuning set from being modified while it is being used. Invoking SQL Tuning Advisor on the SQL tuning set adds a reference automatically, so use `ADD_REFERENCE` only when the automatically generated reference is not sufficient. The `ADD_REFERENCE` function returns a reference ID that you can later supply to the `REMOVE_SQLSET_REFERENCE` procedure. Query the `DBA_SQLSET_REFERENCES` view to find all references to a specified SQL tuning set.

Examples

This example generates a reference to the SQL tuning set named `my_workload` and stores it in the `b_rid` variable.

```
VARIABLE b_rid NUMBER;  
EXEC :b_rid := DBMS_SQLSET.ADD_REFERENCE(sqlset_name => 'my_workload',  
description => 'my sts ref');
```

174.4.2 CAPTURE_CURSOR_CACHE Procedure

This procedure captures a workload from the shared SQL area into a SQL tuning set.

The procedure polls the cache multiple times over a time period, and updates the workload data stored there. It can execute over as long a period as required to capture an entire system workload.

Syntax

```
DBMS_SQLSET.CAPTURE_CURSOR_CACHE (
    sqlset_name      IN VARCHAR2,
    time_limit       IN POSITIVE := 1800,
    repeat_interval  IN POSITIVE := 300,
    capture_option   IN VARCHAR2 := 'MERGE',
    capture_mode     IN NUMBER    := MODE_REPLACE_OLD_STATS,
    basic_filter     IN VARCHAR2 := NULL,
    sqlset_owner    IN VARCHAR2 := NULL,
    recursive_sql   IN VARCHAR2 := HAS_RECURSIVE_SQL);
```

Parameters

The parameters are the same for both `DBMS_SQLTUNE.CAPTURE_CURSOR_CACHE_SQLSET` and `DBMS_SQLSET.CAPTURE_CURSOR_CACHE`.

Table 174-4 CAPTURE_CURSOR_CACHE_SQLSET and CAPTURE_CURSOR_CACHE Procedure Parameters

| Parameter | Description |
|------------------------------|--|
| <code>sqlset_name</code> | Specifies the SQL tuning set name |
| <code>time_limit</code> | Defines the total amount of time, in seconds, to execute. |
| <code>repeat_interval</code> | Defines the amount of time, in seconds, to pause between sampling. |
| <code>capture_option</code> | Specifies whether to insert new statements, update existing statements, or both. Values are <code>INSERT</code> , <code>UPDATE</code> , or <code>MERGE</code> . The values are the same as for <code>load_option</code> in <code>load_sqlset</code> . |
| <code>capture_mode</code> | Specifies the capture mode (<code>UPDATE</code> and <code>MERGE</code> capture options). Possible values: <ul style="list-style-type: none"> <code>MODE_REPLACE_OLD_STATS</code> — Replaces statistics when the number of executions is greater than the number stored in the SQL tuning set <code>MODE_ACCUMULATE_STATS</code> — Adds new values to current values for SQL that is already stored. Note that this mode detects if a statement has been aged out, so the final value for a statistics is the sum of the statistics of all cursors that statement existed under. |
| <code>basic_filter</code> | Defines a filter to apply to the shared SQL area for each sample. If <code>basic_filter</code> is not set by the caller, then the subprogram captures only statements of type <code>CREATE TABLE</code> , <code>INSERT</code> , <code>SELECT</code> , <code>UPDATE</code> , <code>DELETE</code> , and <code>MERGE</code> . |
| <code>sqlset_owner</code> | Specifies the owner of the SQL tuning set or <code>NULL</code> for current schema owner |

Table 174-4 (Cont.) CAPTURE_CURSOR_CACHE_SQLSET and CAPTURE_CURSOR_CACHE Procedure Parameters

| Parameter | Description |
|----------------------------|---|
| <code>recursive_sql</code> | Defines a filter that includes recursive SQL in the SQL tuning set (<code>HAS_RECURSIVE_SQL</code>) or excludes it (<code>NO_RECURSIVE_SQL</code>). |

Examples

In this example capture takes place over a 30-second period, polling the cache once every five seconds. This captures all statements run during that period but not before or after. If the same statement appears a second time, the process replaces the stored statement with the new occurrence.

Note that in production systems the time limit and repeat interval would be set much higher. You should tune the `time_limit` and `repeat_interval` parameters based on the workload time and shared SQL area turnover properties of your system.

```
EXEC DBMS_SQLSET.CAPTURE_CURSOR_CACHE( -
                                     sqlset_name    =>
'my_workload', -
                                     time_limit     => 30, -
                                     repeat_interval => 5);
```

In the following call you accumulate execution statistics as you go. This option produces an accurate picture of the cumulative activity of each cursor, even across age-outs, but it is more expensive than the previous example.

```
EXEC DBMS_SQLSET.CAPTURE_CURSOR_CACHE( -
                                     sqlset_name    => 'my_workload', -
                                     time_limit     => 30, -
                                     repeat_interval => 5, -
                                     capture_mode   =>
DBMS_SQLSET.MODE_ACCUMULATE_STATS);
```

This call performs a very inexpensive capture where you only insert new statements and do not update their statistics once they have been inserted into the SQL tuning set

```
EXEC DBMS_SQLSET.CAPTURE_CURSOR_CACHE( -
                                     sqlset_name    => 'my_workload', -
                                     time_limit     => 30, -
                                     repeat_interval => 5, -
                                     capture_option  => 'INSERT');
```

174.4.3 CREATE_SQLSET Procedure and Function

This procedure or function creates a SQL tuning set object in the database.

Syntax

```
DBMS_SQLSET.CREATE_SQLSET (  
    sqlset_name IN VARCHAR2,  
    description IN VARCHAR2 := NULL  
    sqlset_owner IN VARCHAR2 := NULL);
```

```
DBMS_SQLSET.CREATE_SQLSET (  
    sqlset_name IN VARCHAR2 := NULL,  
    description IN VARCHAR2 := NULL,  
    sqlset_owner IN VARCHAR2 := NULL)  
RETURN VARCHAR2;
```

Parameters

Table 174-5 CREATE_SQLSET Procedure Parameters

| Parameter | Description |
|--------------|---|
| sqlset_name | Specifies the name of the created SQL tuning set. The name is the name passed to the function. If no name is passed to the function, then the function generates an automatic name. |
| description | Provides an optional description of the SQL tuning set. |
| sqlset_owner | Specifies the owner of the SQL tuning set, or NULL for the current schema owner. |

Return Values

Specifies the name of the created SQL tuning set. The name is the name passed to the function. If no name is passed to the function, then the function generates an automatic name.

Examples

```
EXEC DBMS_SQLSET.CREATE_SQLSET(-  
    sqlset_name => 'my_workload', -  
    description => 'complete application workload');
```

174.4.4 CREATE_STGTAB Procedure

This procedure creates a staging table through which SQL tuning sets are imported and exported.

Syntax

```
DBMS_SQLSET.CREATE_STGTAB (
    table_name      IN VARCHAR2,
    schema_name     IN VARCHAR2 := NULL,
    tablespace_name IN VARCHAR2 := NULL,
    db_version      IN NUMBER   := NULL);
```

Parameters

Table 174-6 CREATE_STGTAB_SQLSET and CREATE_STGTAB Procedure Parameters

| Parameter | Description |
|-----------------|---|
| table_name | Specifies the of the table to create. The name is case sensitive. |
| schema_name | Defines the schema in which to create the table, or NULL for the current schema. The name is case sensitive. |
| tablespace_name | Specifies the tablespace in which to store the staging table, or NULL for the default tablespace of the current user. The name is case sensitive. |
| db_version | Specifies the database version that determines the format of the staging table. You can also create an older database version staging table to export an STS to an older database version. Use one of the following values: <ul style="list-style-type: none"> • NULL (default) — Specifies the current database version. • STS_STGTAB_10_2_VERSION — Specifies the 10.2 database version. • STS_STGTAB_11_1_VERSION — Specifies the 11.1 database version. • STS_STGTAB_11_2_VERSION — Specifies the 11.2 database version. • STS_STGTAB_12_1_VERSION — Specifies the 12.1 database version. • STS_STGTAB_12_2_VERSION — Specifies the 12.2 database version. |

Examples

Create a staging table for packing and eventually exporting a SQL tuning sets:

```
EXEC DBMS_SQLSET.CREATE_STGTAB(table_name => 'STGTAB_SQLSET');
```

Create a staging table to pack a SQL tuning set in Oracle Database 12c Release 1 (12.1.0.2) format:

```
BEGIN
    DBMS_SQLSET.CREATE_STGTAB (
        table_name => 'STGTAB_SQLSET_121'
    ,    db_version => DBMS_SQLSET.STS_STGTAB_12_1_VERSION );
END;
```

174.4.5 DELETE_SQLSET Procedure

This procedure deletes a set of SQL statements from a SQL tuning set.

Syntax

```
DBMS_SQLSET.DELETE_SQLSET (
  sqlset_name   IN  VARCHAR2,
  basic_filter  IN  VARCHAR2 := NULL,
  sqlset_owner  IN  VARCHAR2 := NULL);
```

Parameters

Table 174-7 DELETE_SQLSET Procedure Parameters

| Parameter | Description |
|--------------|---|
| sqlset_name | Specifies the name of the SQL tuning set. |
| basic_filter | Specifies the SQL predicate to filter the SQL from the SQL tuning set. This basic filter is used as a where clause on the SQL tuning set content to select a desired subset of SQL from the SQL tuning set. |
| sqlset_owner | Specifies the owner of the SQL tuning set, or NULL for current schema owner. |

Examples

```
-- Delete all statements in a sql tuning set.
EXEC DBMS_SQLSET.DELETE_SQLSET(sqlset_name => 'my_workload');

-- Delete all statements in a sql tuning set which ran for less than a second
EXEC DBMS_SQLSET.DELETE_SQLSET(sqlset_name => 'my_workload', -
                               basic_filter => 'elapsed_time < 1000000');
```

174.4.6 DROP_SQLSET Procedure

This procedure drops a SQL tuning set if it is not active.

Syntax

```
DBMS_SQLSET.DROP_SQLSET (
  sqlset_name   IN  VARCHAR2,
  sqlset_owner  IN  VARCHAR2 := NULL);
```

Parameters

Table 174-8 DROP_SQLSET Procedure Parameters

| Parameter | Description |
|-------------|---|
| sqlset_name | Specifies the name of the SQL tuning set. |

Table 174-8 (Cont.) DROP_SQLSET Procedure Parameters

| Parameter | Description |
|--------------|--|
| sqlset_owner | Specifies the owner of the SQL tuning set, or NULL for current schema owner. |

Usage Notes

You cannot drop a SQL tuning set when it is referenced by one or more clients.

Examples

```
-- Drop the sqlset.
EXEC DBMS_SQLSET.DROP_SQLSET ('my_workload');
```

174.4.7 LOAD_SQLSET Procedure

This procedure populates the SQL tuning set with a set of selected SQL statements. You can call the procedure multiple times to add new SQL statements or replace attributes of existing statements.

Syntax

```
DBMS_SQLSET.LOAD_SQLSET (
  sqlset_name      IN VARCHAR2,
  populate_cursor  IN sqlset_cursor,
  load_option      IN VARCHAR2 := 'INSERT',
  update_option    IN VARCHAR2 := 'REPLACE',
  update_condition IN VARCHAR2 := NULL,
  update_attributes IN VARCHAR2 := NULL,
  ignore_null      IN BOOLEAN := TRUE,
  commit_rows      IN POSITIVE := NULL,
  sqlset_owner     IN VARCHAR2 := NULL);
```

Parameters

Table 174-9 LOAD_SQLSET Procedure Parameters

| Parameter | Description |
|-----------------|--|
| sqlset_name | Specifies the name of SQL tuning set to be loaded. |
| populate_cursor | Specifies the cursor reference to the SQL tuning set to be loaded. |
| load_option | Specifies which statements are loaded into the SQL tuning set. The possible values are: <ul style="list-style-type: none"> INSERT (default) — Adds only new statements. UPDATE — Updates existing the SQL statements and ignores any new statements. MERGE — Inserts new statements and updates the information of the existing ones. |

Table 174-9 (Cont.) LOAD_SQLSET Procedure Parameters

| Parameter | Description |
|-------------------|---|
| update_option | <p>Specifies how existing SQL statements are updated.</p> <p>This parameter is considered only if <code>load_option</code> is specified with <code>UPDATE</code> or <code>MERGE</code> as an option. The possible values are:</p> <ul style="list-style-type: none"> • <code>REPLACE</code> (default) — Updates the statement using the new statistics, bind list, object list, and so on. • <code>ACCUMULATE</code> — Combines attributes when possible (for example, statistics such as <code>elapsed_time</code>), and otherwise replaces the existing values (for example, module and action) with the provided values. The SQL statement attributes that can be accumulated are: <code>elapsed_time</code>, <code>buffer_gets</code>, <code>direct_writes</code>, <code>disk_reads</code>, <code>row_processed</code>, <code>fetches</code>, <code>executions</code>, <code>end_of_fetch_count</code>, <code>stat_period</code> and <code>active_stat_period</code>. |
| update_condition | <p>Specifies when to perform the update.</p> <p>The procedure only performs the update when the specified condition is satisfied. The condition can refer to either the data source or destination. The condition must use the following prefixes to refer to attributes from the source or the destination:</p> <ul style="list-style-type: none"> • <code>OLD</code> — Refers to statement attributes from the SQL tuning set (destination). • <code>NEW</code> — Refers to statement attributes from the input statements (source). |
| update_attributes | <p>Specifies the list of SQL statement attributes to update during a merge or update.</p> <p>The possible values are:</p> <ul style="list-style-type: none"> • <code>NULL</code> (default) — Specifies the content of the input cursor except the execution context. On other terms, it is equivalent to <code>ALL</code> without execution contexts such as module and action. • <code>BASIC</code> — Specifies statistics and binds only. • <code>TYPICAL</code> — Specifies <code>BASIC</code> with SQL plans (without row source statistics) and without an object reference list. • <code>ALL</code> — Specifies all attributes, including the execution context attributes such as module and action. • List of comma separated attribute names to update: <ul style="list-style-type: none"> – <code>EXECUTION_CONTEXT</code> – <code>EXECUTION_STATISTICS</code> – <code>SQL_BINDS</code> – <code>SQL_PLAN</code> – <code>SQL_PLAN_STATISTICS</code> (similar to <code>SQL_PLAN</code> with added row source statistics) |
| ignore_null | <p>Specifies whether to update attributes when the new value is <code>NULL</code>.</p> <p>If <code>TRUE</code>, then the procedure does not update an attribute when the new value is <code>NULL</code>. That is, do not override with <code>NULL</code> values unless intentional.</p> |

Table 174-9 (Cont.) LOAD_SQLSET Procedure Parameters

| Parameter | Description |
|---------------------------|--|
| <code>commit_rows</code> | Specifies whether to commit statements after DML. If a value is provided, then the load commits after each specified number of statements is inserted. If <code>NULL</code> is provided, then the load commits only once, at the end of the operation. Providing a value for this argument enables you to monitor the progress of a SQL tuning set load operation in the <code>DBA_SQLSET</code> views. The <code>STATEMENT_COUNT</code> value increases as new SQL statements are loaded. |
| <code>sqlset_owner</code> | Defines the owner of the SQL tuning set, or the current schema owner (or <code>NULL</code> for the current owner). |

Exceptions

- This procedure returns an error when `sqlset_name` is invalid, or a corresponding SQL tuning set does not exist, or the `populate_cursor` is incorrect and cannot be executed.
- Exceptions are also raised when invalid filters are provided. Filters can be invalid either because they don't parse (for example, they refer to attributes not in `sqlset_row`), or because they violate the user's privileges.

Usage Notes

Rows in the input `populate_cursor` must be of type `SQLSET_ROW`.

Examples

In this example, you create and populate a SQL tuning set with all shared SQL area statements with an elapsed time of 5 seconds or more, excluding statements that belong to `SYS` schema. You select all attributes of the SQL statements and load them in the tuning set using the default mode. The default mode loads only new statements because the SQL tuning set is empty.

```
-- create the tuning set
EXEC DBMS_SQLSET.CREATE_SQLSET('my_workload');

-- populate the tuning set from the shared SQL area
DECLARE
  cur DBMS_SQLSET.SQLSET_CURSOR;
BEGIN
  OPEN cur FOR
    SELECT VALUE(P)
      FROM table(
        DBMS_SQLSET.SELECT_CURSOR_CACHE(
          'parsing_schema_name <> 'SYS' AND elapsed_time > 5000000',
          NULL, NULL, NULL, NULL, 1, NULL,
          'ALL')) P;

  DBMS_SQLSET.LOAD_SQLSET(sqlset_name => 'my_workload',
    populate_cursor => cur);
```

```
END;
/
```

Now you want to augment this information with what is stored in the workload repository (AWR). You populate the tuning set with 'ACCUMULATE' as your `update_option` because it is assumed the cursors currently in the cache have aged out since the snapshot was taken.

You omit the `elapsed_time` filter because it is assumed that any statement captured in AWR is important, but still you throw away the SYS-parsed cursors to avoid recursive SQL.

```
DECLARE
  cur DBMS_SQLSET.SQLSET_CURSOR;
BEGIN
  OPEN cur FOR
    SELECT VALUE(P)
      FROM table(
        DBMS_SQLSET.SELECT_WORKLOAD_REPOSITORY(1,2,
                                                'parsing_schema_name <>'
                                                'SYS',
                                                NULL, NULL, NULL, NULL,
                                                1,
                                                NULL,
                                                'ALL')) P;

  DBMS_SQLSET.LOAD_SQLSET(sqlset_name      => 'my_workload',
                          populate_cursor => cur,
                          load_option     => 'MERGE',
                          update_option   => 'ACCUMULATE');
END;
```

The following example is a simple load that only inserts new statements from the workload repository, skipping existing ones (in the SQL tuning set). Note that 'INSERT' is the default value for the `load_option` argument of the `LOAD_SQLSET` procedure.

```
DECLARE
  cur sys_refcursor;
BEGIN
  OPEN cur FOR
    SELECT VALUE(P)
      FROM table(DBMS_SQLSET.SELECT_WORKLOAD_REPOSITORY(1,2)) P;
  DBMS_SQLSET.LOAD_SQLSET(sqlset_name => 'my_workload', populate_cursor =>
cur);
END;
/
```

The next example demonstrates a load with `UPDATE` option. This updates statements that already exist in the SQL tuning set but does not add new ones. By default, old statistics are replaced by their new values.

```
DECLARE
  cur sys_refcursor;
BEGIN
  OPEN cur FOR
```

```

SELECT VALUE(P)
FROM table(DBMS_SQLSET.SELECT_CURSOR_CACHE) P;

DBMS_SQLSET.LOAD_SQLSET(sqlset_name      => 'my_workload',
                        populate_cursor => cur,
                        load_option     => 'UPDATE');

END;
/

```

174.4.8 PACK_STGTAB Procedure

This procedure copies one or more SQL tuning sets from their location in the SYS schema to a staging table created by the CREATE_STGTAB procedure.

Syntax

```

DBMS_SQLSET.PACK_STGTAB (
  sqlset_name      IN VARCHAR2,
  sqlset_owner     IN VARCHAR2 := NULL,
  staging_table_name IN VARCHAR2,
  staging_schema_owner IN VARCHAR2 := NULL,
  db_version       IN NUMBER   := NULL);

```

Parameters

The parameters are identical for the DBMS_SQLTUNE.PACK_STGTAB_SQLSET and DBMS_SQLSET.PACK_STGTAB procedures.

Table 174-10 PACK_STGTAB_SQLSET and PACK_STGTAB Procedure Parameters

| Parameter | Description |
|----------------------|--|
| sqlset_name | Specifies the name of the SQL tuning set to pack. The name is case sensitive. Wildcard characters (%) are permitted. |
| sqlset_owner | Specifies the category from which to pack SQL tuning sets. The name is case sensitive. Wildcard characters (%) are permitted. |
| staging_table_name | Specifies the name of the table to use. The value is case sensitive. |
| staging_schema_owner | Specifies the schema where the table resides, or NULL for the current schema. The value is case sensitive. |
| db_version | Specifies the database version that determines the format of the staging table. You can also create an older database version staging table to export an STS to an older database version. Use any of the following values: <ul style="list-style-type: none"> NULL (default) — Specifies the current database version. STS_STGTAB_10_2_VERSION — Specifies the 10.2 database version. STS_STGTAB_11_1_VERSION — Specifies the 11.1 database version. STS_STGTAB_11_2_VERSION — Specifies the 11.2 database version. |

Usage Notes

- To move more than one SQL tuning set, call this procedure multiple times. You can then move the populated staging table to a destination database using any method, such as a database link or Oracle Data Pump, and then unpack the SQL tuning set in the destination database.
- This function issues a `COMMIT` after packing each SQL tuning set. If an error is raised mid-execution, then clear the staging table by deleting its rows.

Examples

Put all SQL tuning sets on the database in the staging table:

```
BEGIN
  DBMS_SQLSET.PACK_STGTAB(
    sqlset_name      => '%'
  ,   sqlset_owner   => '%'
  ,   staging_table_name => 'STGTAB_SQLSET');
END;
```

Put only those SQL tuning sets owned by the current user in the staging table:

```
BEGIN
  DBMS_SQLSET.PACK_STGTAB(
    sqlset_name      => '%'
  ,   staging_table_name => 'STGTAB_SQLSET');
END;
```

Pack a specific SQL tuning set:

```
BEGIN
  DBMS_SQLSET.PACK_STGTAB(
    sqlset_name      => 'my_workload'
  ,   staging_table_name => 'STGTAB_SQLSET');
END;
```

Pack a second SQL tuning set:

```
BEGIN
  DBMS_SQLSET.PACK_STGTAB(
    sqlset_name      => 'workload_subset'
  ,   staging_table_name => 'STGTAB_SQLSET');
END;
```

Pack the STS `my_workload_subset` into a staging table `stgtab_sqlset` created for Oracle Database 11g Release 2 (11.2):

```
BEGIN
  DBMS_SQLSET.PACK_STGTAB(
    sqlset_name      => 'workload_subset'
  ,   staging_table_name => 'STGTAB_SQLSET'
```

```
, db_version          => DBMS_SQLSET.STS_STGTAB_11_2_VERSION);
END;
```

174.4.9 REMAP_STGTAB Procedure

This procedure changes the tuning set names and owners in the staging table so that they can be unpacked with different values.

Syntax

```
DBMS_SQLSET.REMAP_STGTAB (
  old_sqlset_name      IN VARCHAR2,
  old_sqlset_owner     IN VARCHAR2 := NULL,
  new_sqlset_name      IN VARCHAR2 := NULL,
  new_sqlset_owner     IN VARCHAR2 := NULL,
  staging_table_name   IN VARCHAR2,
  staging_schema_owner IN VARCHAR2 := NULL,
  old_con_dbid         IN NUMBER   := NULL,
  new_con_dbid         IN NUMBER   := NULL);
);
```

Parameters

The parameters are identical for the DBMS_SQLTUNE.REMAP_STGTAB_SQLSET and DBMS_SQLSET.REMAP_SQLSET procedures.

Table 174-11 REMAP_STGTAB_SQLSET and REMAP_SQLSET Procedure Parameters

| Parameter | Description |
|----------------------|---|
| old_sqlset_name | Specifies the name of the tuning set to target for a remap operation. Wildcard characters (%) are not supported. |
| old_sqlset_owner | Specifies the new name of the tuning set owner to target for a remap operation. NULL for current schema owner |
| new_sqlset_name | Specifies the new name for the tuning set, or NULL to keep the same tuning set name. |
| new_sqlset_owner | Specifies the new owner for the tuning set, or NULL to keep the same owner name. |
| staging_table_name | Specifies the name of the table on which to perform the remap operation. The value is case sensitive. |
| staging_schema_owner | Specifies the name of staging table owner, or NULL for the current schema owner. The value is case sensitive. |
| old_con_dbid | Specifies the old container DBID to be remapped to a new container DBID. Specify NULL to use the same container DBID. You must provide both old_con_dbid and new_con_dbid for the remap to succeed. |
| new_con_dbid | Specifies the new container DBID to replace with the old container DBID. Specify NULL to use the same container DBID. You must provide both old_con_dbid and new_con_dbid for the remap to succeed. |

Usage Notes

Call this procedure multiple times to remap more than one tuning set name or owner. This procedure only handles one tuning set per call.

Examples

```

-- Change the name of an STS in the staging table before unpacking it.
BEGIN
  DBMS_SQLSET.REMAP_STGTAB(
    old_sqlset_name =>
'my_workload'
    , old_sqlset_owner => 'SH'
    , new_sqlset_name =>
'imp_workload'
    , staging_table_name => 'STGTAB_SQLSET');

-- Change the owner of an STS in the staging table before unpacking it.
  DBMS_SQLSET.REMAP_STGTAB(
    old_sqlset_name => 'imp_workload'
    , old_sqlset_owner => 'SH'
    , new_sqlset_owner => 'SYS'
    , staging_table_name => 'STGTAB_SQLSET');
END;

```

174.4.10 REMOVE_REFERENCE Procedure

This procedure deactivates a SQL tuning set to indicate that it is no longer used by the client.

Syntax

```

DBMS_SQLSET.REMOVE_REFERENCE (
  sqlset_name   IN VARCHAR2,
  reference_id  IN NUMBER,
  sqlset_owner  IN VARCHAR2 := NULL,
  force_remove  IN NUMBER   := 0);

```

Parameters

The parameters are identical for the `DBMS_SQLTUNE.REMOVE_SQLSET_REFERENCE` and `DBMS_SQLSET.REMOVE_REFERENCE` procedures.

Table 174-12 REMOVE_SQLSET_REFERENCE and REMOVE_REFERENCE Procedure Parameters

| Parameter | Description |
|---------------------------|--|
| <code>sqlset_name</code> | Specifies the name of the SQL tuning set. |
| <code>reference_id</code> | Specifies the identifier of the reference to remove. |
| <code>sqlset_owner</code> | Specifies the owner of the SQL tuning set (or <code>NULL</code> for the current schema owner). |

Table 174-12 (Cont.) REMOVE_SQLSET_REFERENCE and REMOVE_REFERENCE Procedure Parameters

| Parameter | Description |
|---------------------------|---|
| <code>force_remove</code> | Specifies whether references can be removed for other users (1) or whether they cannot be removed (0). Setting this parameter to 1 only takes effect when the user has the ADMINISTER ANY SQL TUNING SET privilege. Otherwise, the database only removes references owned by the user. |

Examples

You can remove references on a given SQL tuning set when you finish using it and want to make it writable again. The following example removes the reference to `my_workload`:

```
EXEC DBMS_SQLSET.REMOVE_REFERENCE(sqlset_name => 'my_workload', -
                                reference_id => :rid);
```

Use the `DBA_SQLSET_REFERENCES` view to find all references to a given SQL tuning set.

174.4.11 SELECT_CURSOR_CACHE Function

This function collects SQL statements from the shared SQL area.

Syntax

```
DBMS_SQLSET.SELECT_CURSOR_CACHE (
  basic_filter      IN  VARCHAR2 := NULL,
  object_filter    IN  VARCHAR2 := NULL,
  ranking_measure1 IN  VARCHAR2 := NULL,
  ranking_measure2 IN  VARCHAR2 := NULL,
  ranking_measure3 IN  VARCHAR2 := NULL,
  result_percentage IN  NUMBER   := 1,
  result_limit     IN  NUMBER   := NULL,
  attribute_list   IN  VARCHAR2 := 'TYPICAL',
  recursive_sql   IN  VARCHAR2 := HAS_RECURSIVE_SQL)
RETURN sys.sqlset PIPELINED;
```

Parameters

Table 174-13 SELECT_CURSOR_CACHE Function Parameters

| Parameter | Description |
|---------------------------|--|
| <code>basic_filter</code> | Specifies the SQL predicate that filters the SQL from the shared SQL area defined on attributes of the <code>SQLSET_ROW</code> . If <code>basic_filter</code> is not set by the caller, then the subprogram captures only statements of the type CREATE TABLE, INSERT, SELECT, UPDATE, DELETE, and MERGE. |

Table 174-13 (Cont.) SELECT_CURSOR_CACHE Function Parameters

| Parameter | Description |
|---------------------------------|--|
| <code>object_filter</code> | Currently not supported. |
| <code>ranking_measure(n)</code> | Defines an <code>ORDER BY</code> clause on the selected SQL. |
| <code>result_percentage</code> | Specifies a filter that picks the top <i>n</i> % according to the supplied ranking measure. The value applies only if one ranking measure is supplied. |
| <code>result_limit</code> | Defines the top limit SQL from the filtered source ranked by the ranking measure. |
| <code>attribute_list</code> | Specifies the list of SQL statement attributes to return in the result. Possible values are: <ul style="list-style-type: none"> • <code>TYPICAL</code> — Specifies <code>BASIC</code> plus SQL plan (without row source statistics) and without object reference list (default). • <code>BASIC</code> — Specifies all attributes (such as execution statistics and binds) except the plans. The execution context is always part of the result. • <code>ALL</code> — Specifies all attributes. • Comma-separated list of attribute names. This values returns only a subset of SQL attributes: <ul style="list-style-type: none"> – <code>EXECUTION_STATISTICS</code> – <code>BIND_LIST</code> – <code>OBJECT_LIST</code> – <code>SQL_PLAN</code> – <code>SQL_PLAN_STATISTICS</code> — Similar to <code>SQL_PLAN</code> plus row source statistics |
| <code>recursive_sql</code> | Specifies that the filter must include recursive SQL in the SQL tuning set (<code>HAS_RECURSIVE_SQL</code> , which is the default) or exclude it (<code>NO_RECURSIVE_SQL</code>). |

Return Values

This function returns a one `SQLSET_ROW` per `SQL_ID` or `PLAN_HASH_VALUE` pair found in each data source.

Usage Notes

- Filters provided to this function are evaluated as part of a SQL run by the current user. As such, they are executed with that user's security privileges and can contain any constructs and subqueries that user can access, but no more.
- Users need privileges on the shared SQL area views.

Example 174-1 Statements with 500 or More Buffer Gets

This query obtains the SQL IDs and SQL text for statements with 500 buffer gets:

```
SELECT SQL_ID, SQL_TEXT
FROM TABLE(DBMS_SQLSET.SELECT_CURSOR_CACHE('buffer_gets > 500'))
ORDER BY sql_id;
```

Example 174-2 All Information About a Statement

The following query obtains all information about the SQL statement with the SQL ID 4rm4183czbs7j:

```
SELECT * FROM TABLE(DBMS_SQLSET.SELECT_CURSOR_CACHE('sql_id =
''4rm4183czbs7j''));
```

Example 174-3 Multiple Plans for a SQL Statement

A data source may store multiple plans for each SQL statement. The output of the SELECT_CURSOR_CACHE function is a SQL row set object that is uniquely identified by SQL ID and plan hash value. This example queries the plan hash values for the statement with the SQL ID ay1m3ssvtrh24:

```
SELECT sql_id, plan_hash_value
FROM table(DBMS_SQLSET.select_cursor_cache('sql_id =
''ay1m3ssvtrh24''))
ORDER BY sql_id, plan_hash_value;
```

Example 174-4 Processing All Statements in the Shared SQL Area

This example processes all statements in the shared SQL area:

```
DECLARE
  cur sys_refcursor;
BEGIN
  OPEN cur FOR
    SELECT VALUE(p)
    FROM TABLE(DBMS_SQLSET.SELECT_CURSOR_CACHE) p;

  -- Process each statement in cursor (or pass cursor to load_sqlset).

  CLOSE cur;
END;
/
```

Example 174-5 Process Statements Not Parsed by SYS

This example processes all statements not parsed in the SYS schema:

```
DECLARE
  cur sys_refcursor;
BEGIN
  OPEN cur for
    SELECT VALUE(p)
    FROM TABLE(
      DBMS_SQLSET.SELECT_CURSOR_CACHE('parsing_schema_name <>
''SYS'')) p;

  -- Process each statement (or pass cursor to load_sqlset).

  CLOSE cur;
```

```
end;  
/
```

Example 174-6 All Statements from an Application Module and Action

This example processes all statements from a specified application module and action:

```
DECLARE  
  cur sys_refcursor;  
BEGIN  
  OPEN cur FOR  
    SELECT VALUE(p)  
    FROM TABLE(  
      DBMS_SQLSET.SELECT_CURSOR_CACHE(  
        'module = 'MY_APPLICATION' and action = 'MY_ACTION''') p;  
  
  -- Process each statement (or pass cursor to load_sqlset)  
  
  CLOSE cur;  
END;/
```

Example 174-7 All Statements Whose Elapsed Time Is At Least Five Seconds

This example processes all statements that ran for at least five seconds:

```
DECLARE  
  cur sys_refcursor;  
BEGIN  
  OPEN cur FOR  
    SELECT VALUE(P)  
    FROM table(DBMS_SQLSET.SELECT_CURSOR_CACHE('elapsed_time > 5000000')) P;  
  
  -- Process each statement (or pass cursor to load_sqlset)  
  
  CLOSE cur;  
END;  
/
```

Example 174-8 Statements Parsed in the APPS Schema

This example processes all SQL statements that were parsed in the APPS schema and had more than 100 buffer gets:

```
DECLARE  
  cur sys_refcursor;  
BEGIN  
  OPEN cur FOR  
    SELECT VALUE(p)  
    FROM TABLE(  
      DBMS_SQLSET.SELECT_CURSOR_CACHE(  
        'buffer_gets > 100 and parsing_schema_name = 'APPS''')p;  
  
  -- Process each statement (or pass cursor to load_sqlset)
```

```

    CLOSE cur;
END;
/

```

Example 174-9 Plans and SQL Statements

This example processes all SQL statements exceeding 5 seconds. It also selects the plans for these statements. For performance reasons, the example selects execution statistics and SQL binds. The `SQL_PLAN` attribute of `sqlset_row` is NULL.

```

-- select all statements exceeding 5 seconds in elapsed time, but also
-- select the plans (by default we only select execution stats and
-- binds
-- for performance reasons - in this case the SQL_PLAN attribute of
-- sqlset_row
-- is NULL)
DECLARE
    cur sys_refcursor;
BEGIN
    OPEN cur FOR
        SELECT VALUE(p)
        FROM TABLE(DBMS_SQLSET.SELECT_CURSOR_CACHE(
            basic_filter      => 'elapsed_time > 5000000',
            object_filter     => NULL,
            ranking_measure1  => NULL,
            ranking_measure2  => NULL,
            ranking_measure3  => NULL,
            result_percentage => 1,
            result_limit      => NULL,
            attribute_list    => 'EXECUTION_STATISTICS, SQL_BINDS, SQL_PLAN',
            recursive_sql     => HAS_RECURSIVE_SQL)) p;

    -- Process each statement (or pass cursor to load_sqlset)

    CLOSE cur;
END;/

```

Example 174-10 Top 100 Statements Ordered by Elapsed Time

This example selects the top 100 statements in the shared SQL area, ordered by elapsed time:

```

DECLARE
    cur sys_refcursor;
BEGIN
    OPEN cur FOR
        SELECT VALUE(p)
        FROM TABLE(DBMS_SQLSET.SELECT_CURSOR_CACHE(
            basic_filter      => NULL,
            object_filter     => NULL,
            ranking_measure_1 => 'ELAPSED_TIME',
            ranking_measure_2 => NULL,
            ranking_measure_3 => NULL,
            result_percentage => 1,

```

```

        result_limit      => 100,
        attribute_list    => 'TYPICAL',
        recursive_sql     => HAS_RECURSIVE_SQL))) p;

-- Process each statement (or pass cursor to load_sqlset)

CLOSE cur;
END;
/

```

Example 174-11 Statements Responsible for Most Buffer Gets

This example processes statements that cumulatively account for 90% of the buffer gets in the shared SQL area. The buffer gets of all statements added together is approximately 90% of the sum of all statements currently in the shared SQL area.

```

DECLARE
  cur sys_refcursor;
BEGIN
  OPEN cur FOR
    SELECT VALUE(P)
    FROM table(DBMS_SQLSET.SELECT_CURSOR_CACHE(
      basic_filter      => NULL,
      object_filter     => NULL,
      ranking_measure_1 => 'BUFFER_GETS',
      ranking_measure_2 => NULL,
      ranking_measure_3 => NULL,
      result_percentage => .9,
      result_limit      => NULL,
      attribute_list    => 'TYPICAL',
      recursive_sql     => HAS_RECURSIVE_SQL))) p;

-- Process each statement (or pass cursor to load_sqlset).

CLOSE cur;
END;
/

```

174.4.12 SELECT_SQL_TRACE Function

This table function reads the content of one or more trace files and returns the SQL statements it finds in the format of `sqlset_row`.

Syntax

```

DBMS_SQLSET.SELECT_SQL_TRACE (
  directory          IN VARCHAR2,
  file_name          IN VARCHAR2 := NULL,
  mapping_table_name IN VARCHAR2 := NULL,
  mapping_table_owner IN VARCHAR2 := NULL,
  select_mode        IN POSITIVE := SINGLE_EXECUTION,
  options            IN BINARY_INTEGER := LIMITED_COMMAND_TYPE,
  pattern_start      IN VARCHAR2 := NULL,

```

```

pattern_end          IN VARCHAR2 := NULL,
result_limit        IN POSITIVE := NULL)
RETURN sys.sqlset PIPELINED;

```

Parameters

Table 174-14 SELECT_SQL_TRACE Function Parameters

| Parameter | Description |
|---------------------|---|
| directory | Defines the directory object containing the trace files. This field is mandatory. |
| file_name | Specifies all or part of the name of the trace files. If NULL, then the function uses the current or most recent file in the specified location or path. '%' wildcards are supported for matching trace file names. |
| mapping_table_name | Specifies the mapping table name. Note that the mapping table name is case insensitive. If the mapping table name is NULL, then the function uses the mappings in the current database. |
| mapping_table_owner | Specifies the mapping table owner. If it is NULL, then the function uses the current user. |
| select_mode | Specifies the mode for selecting SQL from the trace. Possible values are: <ul style="list-style-type: none"> SINGLE_EXECUTION — Returns one execution of a SQL. This is the default. ALL_EXECUTIONS — Returns all executions. |
| options | Specifies which types of SQL statements are returned. <ul style="list-style-type: none"> LIMITED_COMMAND_TYPE — Returns the SQL statements with the command types CREATE, INSERT, SELECT, UPDATE, DELETE, and MERGE. This value is the default. ALL_COMMAND_TYPE — Returns the SQL statements with all command types. |
| pattern_start | Specifies the delimiting pattern of the trace file sections to consider. CURRENTLY INOPERABLE. |
| pattern_end | Specifies the closing delimiting pattern of the trace file sections to process. CURRENTLY INOPERABLE. |
| result_limit | Specifies the top SQL from the filtered source. Default to MAXSB4 if NULL. |

Return Values

This function returns a `SQLSET_ROW` object.

Usage Notes

The ability to create a directory object for the system directory creates a potential security issue. For example, in a CDB, all containers write trace files to the same directory. A local user with `SELECT` privileges on this directory can read the contents of trace files belonging to any container.

To prevent this type of unauthorized access, copy the files from the default SQL trace directory into a different directory, and then create a directory object. Use the `PATH_PREFIX` clause of the `CREATE PLUGGABLE DATABASE` statement to ensure that all directory object paths associated with the PDB are restricted to the specified directory or its subdirectories.

Examples

The following code shows how to enable SQL trace for a few SQL statements and load the results into a SQL tuning set:

```
-- turn on the SQL trace in the capture database
ALTER SESSION SET EVENTS '10046 TRACE NAME CONTEXT FOREVER, LEVEL 4'

-- run sql statements
SELECT 1 FROM DUAL;
SELECT COUNT(*) FROM dba_tables WHERE table_name = :mytab;

ALTER SESSION SET EVENTS '10046 TRACE NAME CONTEXT OFF';

-- create mapping table from the capture database
CREATE TABLE mapping AS
SELECT object_id id, owner, substr(object_name, 1, 30) name
   FROM dba_objects
   WHERE object_type NOT IN ('CONSUMER GROUP', 'EVALUATION CONTEXT',
                             'FUNCTION', 'INDEXTYPE', 'JAVA CLASS',
                             'JAVA DATA', 'JAVA RESOURCE', 'LIBRARY',
                             'LOB', 'OPERATOR', 'PACKAGE',
                             'PACKAGE BODY', 'PROCEDURE', 'QUEUE',
                             'RESOURCE PLAN', 'TRIGGER', 'TYPE',
                             'TYPE BODY')

UNION ALL
SELECT user_id id, username owner, NULL name
   FROM dba_users;

-- create the directory object where the SQL traces are stored
CREATE DIRECTORY SQL_TRACE_DIR as '/home/foo/trace';

-- create the STS
EXEC DBMS_SQLSET.CREATE_SQLSET('my_sts', 'test purpose');

-- load the SQL statements into STS from SQL TRACE
DECLARE
  cur sys_refcursor;
BEGIN
  OPEN cur FOR
  SELECT value(p)
     FROM TABLE(
       DBMS_SQLSET.SELECT_SQL_TRACE(
         directory=>'SQL_TRACE_DIR',
         file_name=>'%trc',
         mapping_table_name=>'mapping')) p;
  DBMS_SQLSET.LOAD_SQLSET('my_sts', cur);
  CLOSE cur;
END;
/
```

174.4.13 SELECT_SQLPA_TASK Function

This function collects SQL statements from a SQL Performance Analyzer comparison task.

 **See Also:**

Oracle Database Testing Guide for a `SELECT_SQLPA_TASK` example

Syntax

```
DBMS_SQLSET.SELECT_SQLPA_TASK(  
    task_name          IN VARCHAR2,  
    task_owner         IN VARCHAR2 := NULL,  
    execution_name     IN VARCHAR2 := NULL,  
    level_filter       IN VARCHAR2 := 'REGRESSED',  
    basic_filter       IN VARCHAR2 := NULL,  
    object_filter      IN VARCHAR2 := NULL,  
    attribute_list     IN VARCHAR2 := 'TYPICAL')  
RETURN sys.sqlset PIPELINED;
```

Parameters

Table 174-15 SELECT_SQLPA_TASK Function Parameters

| Parameter | Description |
|-----------------------------|--|
| <code>task_name</code> | Specifies the name of the SQL Performance Analyzer task. |
| <code>task_owner</code> | Specifies the owner of the SQL Performance Analyzer task. If NULL, then assume the current user. |
| <code>execution_name</code> | Specifies the name of the SQL Performance Analyzer task execution (type <code>COMPARE PERFORMANCE</code>) from which the provided filters will be applied. If NULL, then assume the most recent <code>COMPARE PERFORMANCE</code> execution. |

Table 174-15 (Cont.) SELECT_SQLPA_TASK Function Parameters

| Parameter | Description |
|----------------|---|
| level_filter | <p>Specifies which subset of SQL statements to include. Same format as DBMS_SQLPA.REPORT_ANALYSIS_TASK.LEVEL, with some possible strings removed.</p> <ul style="list-style-type: none"> IMPROVED includes only improved SQL. REGRESSED includes only regressed SQL (default). CHANGED includes only SQL with changed performance. UNCHANGED includes only SQL with unchanged performance. CHANGED_PLANS includes only SQL with plan changes. UNCHANGED_PLANS includes only SQL with unchanged plans. ERRORS includes only SQL with errors only. MISSING_SQL includes only missing SQL statements (across STS). NEW_SQL includes only new SQL statements (across STS). |
| basic_filter | Specifies the SQL predicate to filter the SQL in addition to the level filters. |
| object_filter | Currently not supported. |
| attribute_list | <p>Defines the SQL statement attributes to return in the result.</p> <p>Possible values are:</p> <ul style="list-style-type: none"> TYPICAL — Returns BASIC plus the SQL plan (without row source statistics) and without an object reference list. This is the default. BASIC — Returns all attributes (such as execution statistics and binds) except the plans. The execution context is always part of the result. ALL — Returns all attributes. Comma-separated list of attribute names this allows to return only a subset of SQL attributes: EXECUTION_STATISTICS, SQL_BINDS, SQL_PLAN_STATISTICS (similar to SQL_PLAN + row source statistics). |

Return Values

This function returns a SQL tuning set object.

Usage Notes

For example, you can use this function to create a SQL tuning set containing the subset of SQL statements that regressed during a SQL Performance Analyzer (SPA) experiment. You can also specify other arbitrary filters.

174.4.14 SELECT_SQLSET Function

This is a table function that reads the contents of a SQL tuning set.

Syntax

```
DBMS_SQLSET.SELECT_SQLSET (
  sqlset_name      IN  VARCHAR2,
  basic_filter     IN  VARCHAR2 := NULL,
  object_filter    IN  VARCHAR2 := NULL,
  ranking_measure1 IN  VARCHAR2 := NULL,
  ranking_measure2 IN  VARCHAR2 := NULL,
  ranking_measure3 IN  VARCHAR2 := NULL,
```

```

result_percentage IN NUMBER := 1,
result_limit     IN NUMBER := NULL)
attribute_list   IN VARCHAR2 := 'TYPICAL',
plan_filter      IN VARCHAR2 := NULL,
sqlset_owner     IN VARCHAR2 := NULL,
recursive_sql    IN VARCHAR2 := HAS_RECURSIVE_SQL)
RETURN sys.sqlset PIPELINED;
```

Parameters

Table 174-16 SELECT_SQLSET Function Parameters

| Parameter | Description |
|------------------------|--|
| sqlset_name | Specifies the name of the SQL tuning set to query. |
| basic_filter | Specifies the SQL predicate to filter the SQL from the SQL tuning set defined on attributes of the <code>SQLSET_ROW</code> . |
| object_filter | Currently not supported. |
| ranking_measure(n) | Specifies an <code>ORDER BY</code> clause on the selected SQL. |
| result_percentage | Specifies a filter that picks the top <i>n%</i> according to the supplied ranking measure. Note that this parameter applies only if one ranking measure is supplied. |
| result_limit | The top limit SQL from the filtered source, ranked by the ranking measure. |
| attribute_list | Defines the SQL statement attributes to return in the result. The possible values are: <ul style="list-style-type: none"> • BASIC — Returns all attributes (such as execution statistics and binds) except the plans. The execution context is included in the result. • TYPICAL — Returns BASIC plus the SQL plan, but without row source statistics and without the object reference list. This is the default. • ALL — Returns all attributes. • Comma-separated list of attribute names. This value enables the function to return only a subset of SQL attributes: <ul style="list-style-type: none"> – EXECUTION_STATISTICS – SQL_BINDS – SQL_PLAN_STATISTICS (similar to <code>SQL_PLAN</code> plus row source statistics) |

Table 174-16 (Cont.) SELECT_SQLSET Function Parameters

| Parameter | Description |
|----------------------------|---|
| <code>plan_filter</code> | <p>Specifies the plan filter.</p> <p>This parameter enables you to select a single plan when a statement has multiple plans. Possible values are:</p> <ul style="list-style-type: none"> • <code>LAST_GENERATED</code> — Returns the plan with the most recent timestamp. • <code>FIRST_GENERATED</code> — Returns the plan with the least recent timestamp. • <code>LAST_LOADED</code> — Returns the plan with the most recent <code>FIRST_LOAD_TIME</code> statistical information. • <code>FIRST_LOADED</code> — Returns the plan with the least recent <code>FIRST_LOAD_TIME</code> statistical information. • <code>MAX_ELAPSED_TIME</code> — Returns the plan with the maximum elapsed time. • <code>MAX_BUFFER_GETS</code> — Returns the plan with the maximum buffer gets. • <code>MAX_DISK_READS</code> — Returns the plan with the maximum disk reads. • <code>MAX_DIRECT_WRITES</code> — Returns the plan with the maximum direct writes. • <code>MAX_OPTIMIZER_COST</code> — Returns the plan with the maximum optimizer cost value. |
| <code>sqlset_owner</code> | Specifies the owner of the SQL tuning set, or <code>NULL</code> for the current schema owner. |
| <code>recursive_sql</code> | Specifies that the filter must include recursive SQL in the SQL tuning set (<code>HAS_RECURSIVE_SQL</code> , which is the default) or exclude it (<code>NO_RECURSIVE_SQL</code>). |

Return Values

This function returns one `SQLSET_ROW` per `SQL_ID` or `PLAN_HASH_VALUE` pair found in each data source.

Usage Notes

Filters provided to this function are evaluated as part of a SQL run by the current user. As such, they are executed with that user's security privileges and can contain any constructs and subqueries that user can access, but no more.

Examples

```
-- select from a sql tuning set
DECLARE
  cur sys_refcursor;
BEGIN
  OPEN cur FOR
    SELECT VALUE (P)
      FROM table(DBMS_SQLSET.SELECT_SQLSET('my_workload')) P;

  -- Process each statement (or pass cursor to load_sqlset)
```

```

    CLOSE cur;
END;
/

```

174.4.15 SELECT_WORKLOAD_REPOSITORY Function

This function collects SQL statements from the workload repository.

The overloaded forms enable you to collect SQL statements from the following sources:

- Snapshots between `begin_snap` and `end_snap`
- A workload repository baseline

Syntax

```

DBMS_SQLSET.SELECT_WORKLOAD_REPOSITORY (
    begin_snap      IN NUMBER,
    end_snap        IN NUMBER,
    basic_filter    IN VARCHAR2 := NULL,
    object_filter   IN VARCHAR2 := NULL,
    ranking_measure1 IN VARCHAR2 := NULL,
    ranking_measure2 IN VARCHAR2 := NULL,
    ranking_measure3 IN VARCHAR2 := NULL,
    result_percentage IN NUMBER := 1,
    result_limit    IN NUMBER := NULL,
    attribute_list  IN VARCHAR2 := 'TYPICAL',
    recursive_sql   IN VARCHAR2 := HAS_RECURSIVE_SQL,
    dbid            IN NUMBER := NULL)
RETURN sys.sqlset PIPELINED;

```

```

DBMS_SQLSET.SELECT_WORKLOAD_REPOSITORY (
    baseline_name  IN VARCHAR2,
    basic_filter    IN VARCHAR2 := NULL,
    object_filter   IN VARCHAR2 := NULL,
    ranking_measure1 IN VARCHAR2 := NULL,
    ranking_measure2 IN VARCHAR2 := NULL,
    ranking_measure3 IN VARCHAR2 := NULL,
    result_percentage IN NUMBER := 1,
    result_limit    IN NUMBER := NULL,
    attribute_list  IN VARCHAR2 := 'TYPICAL',
    recursive_sql   IN VARCHAR2 := HAS_RECURSIVE_SQL,
    dbid            IN NUMBER := NULL)
RETURN sys.sqlset PIPELINED;

```

Parameters

Table 174-17 SELECT_WORKLOAD_REPOSITORY Function Parameters

| Parameter | Description |
|-------------------------|---|
| <code>begin_snap</code> | Defines the beginning AWR snapshot (non-inclusive). |
| <code>end_snap</code> | Defines the ending AWR snapshot (inclusive). |

Table 174-17 (Cont.) SELECT_WORKLOAD_REPOSITORY Function Parameters

| Parameter | Description |
|------------------------|---|
| baseline_name | Specifies the name of the AWR baseline period. |
| basic_filter | Specifies the SQL predicate to filter the SQL from the workload repository. The filter is defined on attributes of the <code>SQLSET_ROW</code> . If <code>basic_filter</code> is not set by the caller, then the subprogram captures only statements of type <code>CREATE TABLE</code> , <code>INSERT</code> , <code>SELECT</code> , <code>UPDATE</code> , <code>DELETE</code> , and <code>MERGE</code> . |
| object_filter | Currently not supported. |
| ranking_measure(n) | Defines an <code>ORDER BY</code> clause on the selected SQL. |
| result_percentage | Specifies a filter that picks the top <i>n</i> % according to the supplied ranking measure. Note that this percentage applies only if one ranking measure is given. |
| result_limit | Specifies the top limit SQL from the source according to the supplied ranking measure. |
| attribute_list | Specifies the SQL statement attributes to return in the result. The possible values are: <ul style="list-style-type: none"> • <code>TYPICAL</code> — Returns <code>BASIC</code> plus SQL plan (without row source statistics) and without object reference list. This is the default. • <code>BASIC</code> — Returns all attributes (such as execution statistics and binds) are returned except the plans. The execution context is always part of the result. • <code>ALL</code> — Returns all attributes • Comma-separated list of attribute names this allows to return only a subset of SQL attributes: <code>EXECUTION_STATISTICS</code>, <code>SQL_BINDS</code>, <code>SQL_PLAN_STATISTICS</code> (similar to <code>SQL_PLAN</code> plus row source statistics). |
| recursive_sql | Specifies the filter that includes recursive SQL in the SQL tuning set (<code>HAS_RECURSIVE_SQL</code>) or excludes it (<code>NO_RECURSIVE_SQL</code>). |
| dbid | Specifies the DBID for imported or PDB-level AWR data. If <code>NULL</code> , then the function uses the current database DBID. |

Return Values

This function returns one `SQLSET_ROW` per `SQL_ID` or `PLAN_HASH_VALUE` pair found in each data source.

Usage Notes

Filters provided to this function are evaluated as part of a SQL run by the current user. As such, they are executed with that user's security privileges and can contain any constructs and subqueries that user can access, but no more.

Examples

```
-- select statements from snapshots 1-2
DECLARE
  cur sys_refcursor;
BEGIN
```

```

OPEN cur FOR
  SELECT VALUE (P)
  FROM table(DBMS_SQLSET.SELECT_WORKLOAD_REPOSITORY(1,2)) P;

-- Process each statement (or pass cursor to load_sqlset)

CLOSE cur;
END;
/

```

174.4.16 UNPACK_STGTAB Procedure

This procedure copies one or more SQL tuning sets from their location in the staging table into the SQL tuning sets schema, making them proper SQL tuning sets.

Syntax

```

DBMS_SQLSET.UNPACK_STGTAB (
  sqlset_name          IN VARCHAR2 := '%',
  sqlset_owner         IN VARCHAR2 := NULL,
  replace              IN BOOLEAN,
  staging_table_name   IN VARCHAR2,
  staging_schema_owner IN VARCHAR2 := NULL);

```

Parameters

The parameters are identical for DBMS_SQLTUNE.UNPACK_STGTAB_SQLSET and DBMS_SQLSET.UNPACK_STGTAB.

Table 174-18 UNPACK_STGTAB_SQLSET and UNPACK_STGTAB Procedure Parameters

| Parameter | Description |
|----------------------|--|
| sqlset_name | Specifies the name of the tuning set to unpack (not null). Wildcard characters (%) are supported to unpack multiple tuning sets in a single call. For example, specify % to unpack all tuning sets from the staging table. |
| sqlset_owner | Specifies the name of tuning set owner, or NULL for the current schema owner. Wildcard characters (%) are supported. |
| replace | Specifies whether to replace an existing SQL tuning set. If FALSE, then this procedure raises errors when you try to create a tuning set that already exists. |
| staging_table_name | Specifies the name of the staging table, moved after a call to the DBMS_SQLTUNE.PACK_STGTAB_SQLSET or DBMS_SQLSET.PACK_STGTAB procedure (case-sensitive). |
| staging_schema_owner | Specifies the name of staging table owner, or NULL for the current schema owner (case-sensitive). |

Examples

```
-- unpack all STS in the staging table
EXEC DBMS_SQLSET.UNPACK_STGTAB(sqlset_name      => '%', -
                               sqlset_owner     => '%', -
                               replace          => FALSE, -
                               staging_table_name => 'STGTAB_SQLSET');

-- errors can arise during STS unpack when a STS in the staging table has the
-- same name/owner as STS on the system. In this case, users should call
-- remap_stgtab_sqlset to patch the staging table and with which to call
unpack
-- Replace set to TRUE.
EXEC DBMS_SQLSET.UNPACK_STGTAB(sqlset_name      => '%', -
                               sqlset_owner     => '%', -
                               replace          => TRUE, -
                               staging_table_name => 'STGTAB_SQLSET');
```

174.4.17 UPDATE_SQLSET Procedures

This overloaded procedure updates selected fields for SQL statements in a SQL tuning set.

Syntax

```
DBMS_SQLSET.UPDATE_SQLSET (
  sqlset_name      IN  VARCHAR2,
  sql_id           IN  VARCHAR2,
  plan_hash_value  IN  NUMBER := NULL,
  attribute_name   IN  VARCHAR2,
  attribute_value  IN  VARCHAR2 := NULL,
  sqlset_owner     IN  VARCHAR2 := NULL);
```

```
DBMS_SQLSET.UPDATE_SQLSET (
  sqlset_name      IN  VARCHAR2,
  sql_id           IN  VARCHAR2,
  plan_hash_value  IN  NUMBER := NULL,
  attribute_name   IN  VARCHAR2,
  attribute_value  IN  NUMBER := NULL,
  sqlset_owner     IN  VARCHAR2 := NULL);
```

Parameters

Table 174-19 UPDATE_SQLSET Procedure Parameters

| Parameter | Description |
|-----------------|---|
| sqlset_name | Specifies the name of the SQL tuning set. |
| sql_id | Specifies the identifier of the SQL statement to be updated. |
| plan_hash value | Specifies the hash value of the execution plan for a SQL statement. Use this parameter when you want to update the attribute for a specific plan for a statement, but not all plans for the statement. |

Table 174-19 (Cont.) UPDATE_SQLSET Procedure Parameters

| Parameter | Description |
|-----------------|--|
| attribute_name | <p>Specifies the name of the attribute to be modified.</p> <p>You can update the text field for <code>MODULE</code>, <code>ACTION</code>, <code>PARSING_SCHEMA_NAME</code>, and <code>OTHER</code>. The only numerical field that you can update is <code>PRIORITY</code>.</p> <p>If a statement has multiple plans, then the procedure changes the attribute value for all plans.</p> |
| attribute_value | <p>Specifies the new value of the attribute.</p> |

DBMS_SQLTUNE

The `DBMS_SQLTUNE` package is the interface for tuning SQL on demand. The related package `DBMS_AUTO_SQLTUNE` package provides the interface for SQL Tuning Advisor run as an automated task.

The chapter contains the following topics:

- [DBMS_SQLTUNE Overview](#)
- [DBMS_SQLTUNE Security Model](#)
- [DBMS_SQLTUNE Data Structures](#)
- [DBMS_SQLTUNE Subprogram Groups](#)
- [Summary of DBMS_SQLTUNE Subprograms](#)

See Also:

["DBMS_AUTO_SQLTUNE Overview"](#)

175.1 DBMS_SQLTUNE Overview

The `DBMS_SQLTUNE` package provides a number of interrelated areas of functionality.

This section contains the following topics:

- [DBMS_SQLTUNE SQL Tuning Advisor Subprograms](#)
- [DBMS_SQLTUNE SQL Profile Subprograms](#)
- [DBMS_SQLTUNE SQL Tuning Set Subprograms](#)

SQL Tuning Advisor

SQL Tuning Advisor is one of a suite of advisors, a set of expert systems that identifies and helps resolve database performance problems. Specifically, SQL Tuning Advisor automates tuning of problematic SQL statements. It takes one or more SQL statements as input and gives precise advice on how to tune the statements. The advisor provides the advice in the form of SQL actions for tuning the SQL along with their expected performance benefit.

The group of [DBMS_SQLTUNE SQL Tuning Advisor Subprograms](#) provide a task-oriented interface that enables you to access the advisor. You can call the following subprograms in the order given to use some of SQL Tuning Advisor's features:

1. [CREATE_TUNING_TASK Functions](#) creates a tuning task for tuning one or more SQL statements.
2. The [EXECUTE_TUNING_TASK Function and Procedure](#) executes a previously created tuning task.

3. The [REPORT_TUNING_TASK Function](#) displays the results of a tuning task.
4. You use the [SCRIPT_TUNING_TASK Function](#) to create a SQL*Plus script which can then be executed to implement a set of Advisor recommendations

SQL Profile Subprograms

SQL Tuning Advisor may recommend the creation of a SQL profile to improve the performance of a statement. SQL profiles consist of auxiliary statistics specific to the statement. The query optimizer makes estimates about cardinality, selectivity, and cost that can sometimes be off by a significant amount, resulting in poor execution plans. The SQL profile addresses this problem by collecting additional information using sampling and partial execution techniques to adjust these estimates.

The group of [DBMS_SQLTUNE SQL Profile Subprograms](#) provides a mechanism for delivering statistics to the optimizer that targets one particular SQL statement, and helps the optimizer make good decisions for that statement by giving it the most accurate statistical information possible. For example:

- You can use the [ACCEPT_SQL_PROFILE Procedure and Function](#) to accept a SQL profile recommended by SQL Tuning Advisor.
- You can alter the `STATUS`, `NAME`, `DESCRIPTION`, and `CATEGORY` attributes of an existing SQL profile with the [ALTER_SQL_PROFILE Procedure](#).
- You can drop a SQL profile with the [DROP_SQL_PROFILE Procedure](#).

SQL Tuning Sets

SQL tuning sets store SQL statements along with the following information:

- The execution context, such as the parsing schema name and bind values
- Execution statistics such as average elapsed time and execution count
- Execution plans, which are the sequence of operations that the database performs to run SQL statements
- Row source statistics such as the number of rows processed for each operation executed within the plan

You can create SQL tuning sets by filtering or ranking SQL statements from several sources:

- The shared SQL area using the [SELECT_CURSOR_CACHE Function](#)
- Top SQL statements from the Automatic Workload Repository using the [SELECT_WORKLOAD_REPOSITORY Function](#)
- Other SQL tuning sets using the [SELECT_SQLSET Function](#)
- SQL Performance Analyzer task comparison results using the [SELECT_SQLPA_TASK Function](#)
- SQL Trace files using the [SELECT_SQL_TRACE Function](#)
- A user-defined workload

The complete group of [DBMS_SQLTUNE SQL Tuning Set Subprograms](#) facilitates this functionality. As examples:

- The [CREATE_SQLSET Procedure and Function](#) creates a SQL tuning set object in the database.

- The [LOAD_SQLSET Procedure](#) populates the SQL tuning set with a set of selected SQL.
- The [CAPTURE_CURSOR_CACHE_SQLSET Procedure](#) collects SQL statements from the shared SQL area over a specified time interval, attempting to build a realistic picture of database workload.

 **Note:**

When manipulating SQL tuning sets, you can use [DBMS_SQLSET](#) as an alternative to `DBMS_SQLTUNE`.

Import and Export of SQL Tuning Sets and SQL Profiles

Use `DBMS_SQLTUNE` subprograms to move SQL profiles and SQL tuning sets from one system to another using a common programmatic model. In both cases, you create a staging table on the source database and populate this staging table with the relevant data. You then move that staging table to the destination system following the method of your choice (such as Oracle Data Pump, or a database link), where it is used to reconstitute the objects in their original form. The following steps are implemented by means of subprograms included in this package:

1. To create the staging table on the source system, call the [CREATE_STGTAB_SQLPROF Procedure](#) or the [CREATE_STGTAB_SQLSET Procedure](#).
2. To populate the staging table with information from the source system, call the [PACK_STGTAB_SQLPROF Procedure](#) or [PACK_STGTAB_SQLSET Procedure](#).
3. Move the staging table to the destination system.
4. To re-create the object on the new system, call the [UNPACK_STGTAB_SQLPROF Procedure](#) or the [UNPACK_STGTAB_SQLSET Procedure](#).

 **See Also:**

Oracle Database SQL Tuning Guide for more information about programmatic flow

Automatic Tuning Task Functions

The automated system task `SYS_AUTO_SQL_TUNING_TASK` is created by the database as part of the catalog scripts. This task automatically chooses a set of high-load SQL from AWR and runs SQL Tuning Advisor on this SQL. The automated task performs the same comprehensive analysis as any other SQL Tuning task.

You can obtain a report on the activity of the Automatic SQL Tuning task through the `DBMS_AUTO_SQLTUNE.REPORT_AUTO_TUNING_TASK` API.

 **See Also:**

[DBMS_AUTO_SQLTUNE](#) for the list of subprograms that you can use to manage the automated SQL tuning task.

Real-Time SQL Monitoring

Real-time SQL Monitoring enables DBAs or performance analysts to monitor the execution of long-running SQL statements while they are executing. Both cursor statistics (such as CPU times and IO times) and execution plan statistics (such as number of output rows, memory and temp space used) are updated in almost real time during statement execution. The `V$SQL_MONITOR` and `V$SQL_PLAN_MONITOR` views expose these statistics. In addition, `DBMS_SQLTUNE` provides the `REPORT_SQL_MONITOR` and `REPORT_SQL_MONITOR_LIST` functions to report monitoring information.

Note:

`DBMS_SQL_MONITOR` also contains the `REPORT_SQL_MONITOR` and `REPORT_SQL_MONITOR_LIST` functions.

Tuning a Standby Database Workload

In some cases, a standby database can assume a reporting role in addition to its data protection role. The standby database can have its own workload of queries, some of which may require tuning. You can issue SQL Tuning Advisor statements on a standby database, which is read-only. A standby-to-primary database link enables `DBMS_SQLTUNE` to write data to and read data from the primary database. The procedures that are eligible for tuning standby workloads include the `database_link_to` parameter.

175.2 DBMS_SQLTUNE Security Model

This package is available to `PUBLIC` and performs its own security checking.

Note the following:

- Because SQL Tuning Advisor relies on the advisor framework, all tuning task interfaces (`*_TUNING_TASK`) require the `ADVISOR` privilege.
- SQL tuning set subprograms (`*_SQLSET`) require either of the following privileges:
 - `ADMINISTER SQL TUNING SET`
You can only create and modify a SQL tuning set that you own.
 - `ADMINISTER ANY SQL TUNING SET`
You can operate on all SQL tuning sets, even those owned by other users.
- In earlier releases, three different privileges were needed to invoke subprograms involving SQL profiles:
 - `CREATE ANY SQL PROFILE`
 - `ALTER ANY SQL PROFILE`
 - `DROP ANY SQL PROFILE`

The preceding privileges have been deprecated in favor of `ADMINISTER SQL MANAGEMENT OBJECT`.

175.3 DBMS_SQLTUNE Data Structures

The `SELECT_*` subprograms in the `DBMS_SQLTUNE` package return objects of the `SQLSET_ROW` type.

Object Types

- [SQLSET_ROW Object Type](#)

175.3.1 SQLSET_ROW Object Type

The `SQLSET_ROW` object models the content of a SQL tuning set for the user.

Logically, a SQL tuning set is a collection of `SQLSET_ROW` objects. Each `SQLSET_ROW` contains a single SQL statement along with its execution context, statistics, binds, and plan. The `SELECT_*` subprograms each model a data source as a collection of `SQLSET_ROW` objects, with each object uniquely identified by `(sql_id, plan_hash_value)`. Similarly, the `LOAD_SQLSET` procedure takes as input a cursor whose row type is `SQLSET_ROW`, treating each `SQLSET_ROW` in isolation according to the policies requested by the user.

Several subprograms package accept basic filters on the content of a SQL tuning set or data source. These filters are expressed in terms of the attributes within the `SQLSET_ROW` as defined.

Syntax

```
CREATE TYPE sqlset_row AS object (
  sql_id                VARCHAR(13),
  force_matching_signature NUMBER,
  sql_text              CLOB,
  object_list           sql_objects,
  bind_data             RAW(2000),
  parsing_schema_name   VARCHAR2(30),
  module               VARCHAR2(48),
  action               VARCHAR2(32),
  elapsed_time         NUMBER,
  cpu_time             NUMBER,
  buffer_gets          NUMBER,
  disk_reads           NUMBER,
  direct_writes        NUMBER,
  rows_processed        NUMBER,
  fetches              NUMBER,
  executions           NUMBER,
  end_of_fetch_count   NUMBER,
  optimizer_cost        NUMBER,
  optimizer_env        RAW(2000),
  priority             NUMBER,
  command_type         NUMBER,
  first_load_time      VARCHAR2(19),
  stat_period          NUMBER,
  active_stat_period   NUMBER,
  other                CLOB,
  plan_hash_value      NUMBER,
```

```

sql_plan          sql_plan_table_type,
bind_list         sql_binds,
con_dbid         NUMBER,
last_exec_start_time  VARCHAR2(19))

```

Attributes

Table 175-1 SQLSET_ROW Attributes

| Attribute | Description |
|----------------------------|--|
| sql_id | Unique SQL ID. |
| forcing_matching_signature | Signature with literals, case, and whitespace removed. |
| sql_text | Full text for the SQL statement. |
| object_list | Currently not implemented. |
| bind_data | Bind data as captured for this SQL. Note that you cannot stipulate an argument for this parameter and also for <code>bind_list</code> - they are mutually exclusive. |
| parsing_schema_name | Schema where the SQL is parsed. |
| module | Last application module for the SQL. |
| action | Last application action for the SQL. |
| elapsed_time | Sum total elapsed time for this SQL statement. |
| cpu_time | Sum total CPU time for this SQL statement. |
| buffer_gets | Sum total number of buffer gets. |
| disk_reads | Sum total number of disk reads. |
| direct_writes | Sum total number of direct path writes. |
| rows_processed | Sum total number of rows processed by this SQL. |
| fetches | Sum total number of fetches. |
| executions | Total executions of this SQL statement. |
| end_of_fetch_count | Number of times the SQL statement was fully executed with all of its rows fetched. |
| optimizer_cost | Optimizer cost for this SQL. |
| optimizer_env | Optimizer environment for this SQL statement. |
| priority | User-defined priority (1,2,3). |
| command_type | Statement type, such as <code>INSERT</code> or <code>SELECT</code> . |
| first_load_time | Load time of the parent cursor. |
| stat_period | Period of time (seconds) when the statistics of this SQL statement were collected. |
| active_stat_period | Effective period of time (in seconds) during which the SQL statement was active. |
| other | Other column for user-defined attributes. |
| plan_hash_value | Plan hash value of the plan. |
| sql_plan | Execution plan for the SQL statement. |

Table 175-1 (Cont.) SQLSET_ROW Attributes

| Attribute | Description |
|-----------------------------------|---|
| <code>bind_list</code> | List of user-specified binds for the SQL statement. This is used for user-specified workloads. Note that you cannot stipulate an argument for this parameter and also for <code>bind_data</code> : they are mutually exclusive. |
| <code>con_dbid</code> | DBID of the PDB or CDB root. |
| <code>last_exec_start_time</code> | Most recent execution start time of this SQL statement. |

175.4 DBMS_SQLTUNE Subprogram Groups

DBMS_SQLTUNE subprograms are grouped by function.

- [DBMS_SQLTUNE SQL Tuning Advisor Subprograms](#)
- [DBMS_SQLTUNE SQL Profile Subprograms](#)
- [DBMS_SQLTUNE SQL Tuning Set Subprograms](#)
- [DBMS_SQLTUNE Real-Time SQL Monitoring Subprograms](#)
- [DBMS_SQLTUNE SQL Performance Reporting Subprograms](#)

175.4.1 DBMS_SQLTUNE SQL Tuning Advisor Subprograms

This subprogram group provides an interface to manage SQL tuning tasks.

Table 175-2 SQL Tuning Task Subprograms

| Subprogram | Description |
|--|--|
| " CANCEL_TUNING_TASK Procedure " | Cancels the currently executing tuning task |
| " CREATE_SQL_PLAN_BASELINE Procedure " | Creates a SQL plan baseline for an existing plan |
| " CREATE_TUNING_TASK Functions " | Creates a tuning of a single statement or SQL tuning set for either SQL Tuning Advisor |
| " DROP_TUNING_TASK Procedure " | Drops a SQL tuning task |
| " EXECUTE_TUNING_TASK Function and Procedure " | Executes a previously created tuning task |
| " IMPLEMENT_TUNING_TASK Procedure " | Implements a set of SQL profile recommendations made by SQL Tuning Advisor |
| " INTERRUPT_TUNING_TASK Procedure " | Interrupts the currently executing tuning task |
| " REPORT_AUTO_TUNING_TASK Function " | Displays a report from the automatic tuning task, reporting on a range of executions |
| " REPORT_TUNING_TASK Function " | Displays the results of a tuning task |
| " RESET_TUNING_TASK Procedure " | Resets the currently executing tuning task to its initial state |
| " RESUME_TUNING_TASK Procedure " | Resumes a previously interrupted task that was created to process a SQL tuning set |

Table 175-2 (Cont.) SQL Tuning Task Subprograms

| Subprogram | Description |
|--|---|
| " SCHEDULE_TUNING_TASK Function " | Creates a tuning task and schedules its execution as a scheduler job |
| " SCRIPT_TUNING_TASK Function " | Creates a SQL*Plus script which can then be executed to implement a set of SQL Tuning Advisor recommendations |
| " SET_TUNING_TASK_PARAMETER Procedures " | Updates the value of a SQL tuning parameter of type VARCHAR2 or NUMBER |

"[Summary of DBMS_SQLTUNE Subprograms](#)" contains a complete listing of all subprograms in the package.

175.4.2 DBMS_SQLTUNE SQL Profile Subprograms

This subprogram group provides an interface to manage SQL profiles.

Table 175-3 SQL Profile Subprograms

| Subprogram | Description |
|---|---|
| ACCEPT_ALL_SQL_PROFILES Procedure | Accepts all SQL profiles recommended by a specific execution of a tuning task |
| ACCEPT_SQL_PROFILE Procedure and Function | Creates a SQL profile for the specified tuning task |
| ALTER_SQL_PROFILE Procedure | Alters specific attributes of an existing SQL profile object |
| CREATE_STGTAB_SQLPROF Procedure | Creates the staging table used for copying SQL profiles from one system to another |
| DROP_SQL_PROFILE Procedure | Drops the named SQL profile from the database |
| PACK_STGTAB_SQLPROF Procedure | Moves profile data out of the SYS schema into the staging table |
| REMAP_STGTAB_SQLPROF Procedure | Changes the profile data values kept in the staging table prior to performing an unpack operation |
| SQLTEXT_TO_SIGNATURE Function | Returns a SQL text's signature |
| UNPACK_STGTAB_SQLPROF Procedure | Uses the profile data stored in the staging table to create profiles on this system |

"[Summary of DBMS_SQLTUNE Subprograms](#)" contains a complete listing of all subprograms in the package.

175.4.3 DBMS_SQLTUNE SQL Tuning Set Subprograms

This subprogram group provides an interface to manage SQL tuning sets.

Table 175-4 SQL Tuning Set Subprograms

| Subprogram | Description |
|---|--|
| ADD_SQLSET_REFERENCE Function | Adds a new reference to an existing SQL tuning set to indicate its use by a client |
| CAPTURE_CURSOR_CACHE_SQLSET Procedure | Over a specified time interval incrementally captures a workload from the shared SQL area into a SQL tuning set |
| CREATE_SQLSET Procedure and Function | Creates a SQL tuning set object in the database |
| CREATE_STGTAB_SQLSET Procedure | Creates a staging table through which SQL Tuning Sets are imported and exported |
| DELETE_SQLSET Procedure | Deletes a set of SQL statements from a SQL tuning set |
| DROP_SQLSET Procedure | Drops a SQL tuning set if it is not active |
| LOAD_SQLSET Procedure | Populates the SQL tuning set with a set of selected SQL |
| PACK_STGTAB_SQLSET Procedure | Copies tuning sets out of the SYS schema into the staging table |
| REMAP_STGTAB_SQLSET Procedure | Changes the tuning set names and owners in the staging table so that they can be unpacked with different values than they had on the host system |
| REMOVE_SQLSET_REFERENCE Procedure | Deactivates a SQL tuning set to indicate it is no longer used by the client |
| SELECT_CURSOR_CACHE Function | Collects SQL statements from the shared SQL area |
| SELECT_SQL_TRACE Function | Reads the content of one or more trace files and returns the SQL statements it finds in the format of <code>sqlset_row</code> |
| SELECT_SQLPA_TASK Function | Collects SQL statements from a SQL performance analyzer comparison task |
| SELECT_SQLSET Function | Collects SQL statements from an existing SQL tuning set |
| SELECT_WORKLOAD_REPOSITORY Function | Collects SQL statements from the workload repository |
| UNPACK_STGTAB_SQLSET Procedure | Copies one or more SQL tuning sets from the staging table |
| UPDATE_SQLSET Procedures | Updates whether selected string fields for a SQL statement in a SQL tuning set or the set numerical attributes of a SQL in a SQL tuning set |

The [Summary of DBMS_SQLTUNE Subprograms](#) contains a complete listing of all subprograms in the package.

175.4.4 DBMS_SQLTUNE Real-Time SQL Monitoring Subprograms

This subprogram group provides function to report on monitoring data collected in `V$SQL_MONITOR` and `V$SQL_PLAN_MONITOR`.

Table 175-5 Real-Time SQL Monitoring Subprograms

| Subprogram | Description |
|--|---|
| REPORT_SQL_MONITOR Function | Reports on Real-Time SQL Monitoring |
| REPORT_SQL_MONITOR_LIST Function | Builds a report for all or a subset of statements monitored by Oracle Database |
| REPORT_SQL_MONITOR_LIST_XML Function | Builds an XML report for all or a subset of statements monitored by Oracle Database |

175.4.5 DBMS_SQLTUNE SQL Performance Reporting Subprograms

This subprogram group provides detailed reports on SQL performance using statistics from the shared SQL area and automatic workload repository (AWR).

Table 175-6 SQL Performance Reporting Subprograms

| Subprogram | Description |
|--|--|
| REPORT_SQL_DETAIL Function | This function reports on a specific SQL ID. |
| REPORT_SQL_MONITOR Function | This function builds a report (text, simple HTML, active HTML, XML) for the monitoring information collected on behalf of the targeted statement execution. |
| REPORT_SQL_MONITOR_LIST Function | This function builds a report for all or a sub-set of statements monitored by Oracle. For each statement, the subprogram gives key information and associated global statistics. |
| REPORT_TUNING_TASK Function | This function displays the results of a tuning task. |
| REPORT_TUNING_TASK_XML Function | This function displays an XML report of a tuning task. |

175.5 Summary of DBMS_SQLTUNE Subprograms

This table lists the DBMS_SQLTUNE subprograms and briefly describes them.

Table 175-7 DBMS_SQLTUNE Package Subprograms

| Subprogram | Description | Group |
|---|--|---|
| ACCEPT_ALL_SQL_PROFILES Procedure | Accepts all SQL profiles recommended by a particular execution of a particular tuning task | DBMS_SQLTUNE SQL Profile Subprograms |
| ACCEPT_SQL_PROFILE Procedure and Function | Creates a SQL profile for the specified tuning task | DBMS_SQLTUNE SQL Profile Subprograms |
| ADD_SQLSET_REFERENCE Function | Adds a new reference to an existing SQL tuning set to indicate its use by a client | DBMS_SQLTUNE SQL Tuning Set Subprograms |
| ALTER_SQL_PROFILE Procedure | Alters specific attributes of an existing SQL profile object | DBMS_SQLTUNE SQL Profile Subprograms |

Table 175-7 (Cont.) DBMS_SQLTUNE Package Subprograms

| Subprogram | Description | Group |
|--|---|---|
| CANCEL_TUNING_TASK Procedure | Cancels the currently executing tuning task | DBMS_SQLTUNE SQL Tuning Advisor Subprograms |
| CAPTURE_CURSOR_CACHE_SQLSET Procedure | Over a specified time interval incrementally captures a workload from the shared SQL area into a SQL tuning set | DBMS_SQLTUNE SQL Tuning Set Subprograms |
| CREATE_SQL_PLAN_BASELINE Procedure | Creates a SQL plan baseline for an existing plan | DBMS_SQLTUNE SQL Tuning Advisor Subprograms |
| CREATE_SQLSET Procedure and Function | Creates a SQL tuning set object in the database | DBMS_SQLTUNE SQL Tuning Set Subprograms |
| CREATE_STGTAB_SQLPROF Procedure | Creates the staging table used for copying SQL profiles from one system to another | DBMS_SQLTUNE SQL Profile Subprograms |
| CREATE_STGTAB_SQLSET Procedure | Creates a staging table through which SQL tuning sets are imported and exported | DBMS_SQLTUNE SQL Tuning Set Subprograms |
| CREATE_TUNING_TASK Functions | Creates a tuning of a single statement or SQL tuning set for either SQL Tuning Advisor | DBMS_SQLTUNE SQL Tuning Advisor Subprograms |
| DELETE_SQLSET Procedure | Deletes a set of SQL statements from a SQL tuning set | DBMS_SQLTUNE SQL Tuning Set Subprograms |
| DROP_SQL_PROFILE Procedure | Drops the named SQL profile from the database | DBMS_SQLTUNE SQL Profile Subprograms |
| DROP_SQLSET Procedure | Drops a SQL tuning set if it is not active | DBMS_SQLTUNE SQL Tuning Set Subprograms |
| DROP_TUNING_TASK Procedure | Drops a SQL tuning task | DBMS_SQLTUNE SQL Tuning Advisor Subprograms |
| EXECUTE_TUNING_TASK Function and Procedure | Executes a previously created tuning task | DBMS_SQLTUNE SQL Tuning Advisor Subprograms |
| IMPLEMENT_TUNING_TASK Procedure | implements a set of SQL profile recommendations made by SQL Tuning Advisor | DBMS_SQLTUNE SQL Tuning Advisor Subprograms |
| INTERRUPT_TUNING_TASK Procedure | Interrupts the currently executing tuning task | DBMS_SQLTUNE SQL Tuning Advisor Subprograms |
| LOAD_SQLSET Procedure | Populates the SQL tuning set with a set of selected SQL | DBMS_SQLTUNE SQL Tuning Set Subprograms |
| PACK_STGTAB_SQLPROF Procedure | Moves profile data out of the SYS schema into the staging table | DBMS_SQLTUNE SQL Profile Subprograms |
| PACK_STGTAB_SQLSET Procedure | Moves tuning sets out of the SYS schema into the staging table | DBMS_SQLTUNE SQL Tuning Set Subprograms |

Table 175-7 (Cont.) DBMS_SQLTUNE Package Subprograms

| Subprogram | Description | Group |
|--|---|--|
| REMAP_STGTAB_SQLPROF Procedure | Changes the profile data values kept in the staging table prior to performing an unpack operation | DBMS_SQLTUNE SQL Profile Subprograms |
| REMAP_STGTAB_SQLSET Procedure | Changes the tuning set names and owners in the staging table so that they can be unpacked with different values than they had on the host system | DBMS_SQLTUNE SQL Tuning Set Subprograms |
| REMOVE_SQLSET_REFERENCE Procedure | Deactivates a SQL tuning set to indicate it is no longer used by the client | DBMS_SQLTUNE SQL Tuning Set Subprograms |
| REPORT_AUTO_TUNING_TASK Function | Displays a report from the automatic tuning task, reporting on a range of subtasks | DBMS_SQLTUNE SQL Tuning Set Subprograms |
| REPORT_SQL_DETAIL Function | Reports on a specific SQL ID | DBMS_SQLTUNE SQL Performance Reporting Subprograms |
| REPORT_SQL_MONITOR Function | Builds a report (text, simple HTML, active HTML, XML) for the monitoring information collected on behalf of the targeted statement execution | DBMS_SQLTUNE Real-Time SQL Monitoring Subprograms |
| REPORT_SQL_MONITOR_LIST Function | Builds a report for all or a subset of statements monitored by Oracle Database. For each statement, the subprogram gives key information and associated global statistics | DBMS_SQLTUNE Real-Time SQL Monitoring Subprograms |
| REPORT_SQL_MONITOR_LIST_XML Function | Equivalent to the <code>REPORT_SQL_MONITOR_LIST</code> function, except that it returns <code>XMLType</code> | DBMS_SQLTUNE Real-Time SQL Monitoring Subprograms |
| REPORT_TUNING_TASK Function | Displays the results of a tuning task | DBMS_SQLTUNE SQL Performance Reporting Subprograms |
| REPORT_TUNING_TASK_XML Function | Displays an XML report of a tuning task | DBMS_SQLTUNE SQL Performance Reporting Subprograms |
| RESET_TUNING_TASK Procedure | Resets the currently executing tuning task to its initial state | DBMS_SQLTUNE SQL Tuning Advisor Subprograms |
| RESUME_TUNING_TASK Procedure | Resumes a previously interrupted task that was created to process a SQL tuning set | DBMS_SQLTUNE SQL Tuning Advisor Subprograms |

Table 175-7 (Cont.) DBMS_SQLTUNE Package Subprograms

| Subprogram | Description | Group |
|--|---|---|
| SCHEDULE_TUNING_TASK Function | Creates a SQL tuning task and schedule its execution as a scheduler job | DBMS_SQLTUNE SQL Tuning Advisor Subprograms |
| SCRIPT_TUNING_TASK Function | Creates a SQL*Plus script which can then be executed to implement a set of SQL Tuning Advisor recommendations | DBMS_SQLTUNE SQL Tuning Advisor Subprograms |
| SELECT_CURSOR_CACHE Function | Collects SQL statements from the shared SQL area | DBMS_SQLTUNE SQL Tuning Set Subprograms |
| SELECT_SQL_TRACE Function | Reads the content of one or more trace files and returns the SQL statements it finds in the format of <code>sqlset_row</code> | DBMS_SQLTUNE SQL Tuning Set Subprograms |
| SELECT_SQLPA_TASK Function | Collects SQL statements from a SQL Performance Analyzer comparison task | DBMS_SQLTUNE SQL Tuning Set Subprograms |
| SELECT_SQLSET Function | Collects SQL statements from an existing SQL tuning set | DBMS_SQLTUNE SQL Tuning Set Subprograms |
| SELECT_WORKLOAD_REPOSITORY Function | Collects SQL statements from the workload repository | DBMS_SQLTUNE SQL Tuning Set Subprograms |
| SET_TUNING_TASK_PARAMETER Procedures | Updates the value of a SQL tuning parameter of type <code>VARCHAR2</code> or <code>NUMBER</code> | DBMS_SQLTUNE SQL Tuning Advisor Subprograms |
| SQLTEXT_TO_SIGNATURE Function | Returns a SQL text's signature | DBMS_SQLTUNE SQL Profile Subprograms |
| UNPACK_STGTAB_SQLPROFILE Procedure | Uses the profile data stored in the staging table to create profiles on this system | DBMS_SQLTUNE SQL Profile Subprograms |
| UNPACK_STGTAB_SQLSET Procedure | Moves one or more SQL tuning sets from the staging table | DBMS_SQLTUNE SQL Tuning Set Subprograms |
| UPDATE_SQLSET Procedures | Updates selected fields for a SQL statement in a SQL tuning set | DBMS_SQLTUNE SQL Tuning Set Subprograms |

175.5.1 ACCEPT_ALL_SQL_PROFILES Procedure

This procedure accepts all SQL profiles recommended by a specific execution of a tuning task, and sets the attributes of the SQL profiles according to the parameter values passed by the user.

See Also:

[DBMS_SQLTUNE SQL Profile Subprograms](#) for other subprograms in this group

Syntax

```
DBMS_SQLTUNE.ACCEPT_ALL_SQL_PROFILES (
  task_name          IN VARCHAR2,
  category           IN VARCHAR2 := NULL,
  replace            IN BOOLEAN  := FALSE,
  force_match        IN BOOLEAN  := FALSE,
  profile_type       IN VARCHAR2 := REGULAR_PROFILE,
  autotune_period    IN NUMBER   := NULL,
  execution_name     IN VARCHAR2 := NULL,
  task_owner         IN VARCHAR2 := NULL,
  description        IN VARCHAR2 := NULL,
  database_link_to   IN VARCHAR2 := NULL);
```

Parameters

Table 175-8 ACCEPT_ALL_SQL_PROFILES Procedure Parameters

| Parameter | Description |
|--------------|--|
| task_name | The (mandatory) name of the SQL tuning task |
| category | This is the category name which must match the value of the <code>SQLTUNE_CATEGORY</code> parameter in a session for the session to use this SQL profile. It defaults to the value "DEFAULT". This is also the default of the <code>SQLTUNE_CATEGORY</code> parameter. The category must be a valid Oracle identifier. The category name specified is always converted to upper case. The combination of the normalized SQL text and category name creates a unique key for a SQL profile. An <code>ACCEPT_SQL_PROFILE</code> fails if this combination is duplicated. |
| replace | If the profile already exists, it is replaced if this argument is <code>TRUE</code> . It is an error to pass a name that is already being used for another signature/category pair, even with <code>replace</code> set to <code>TRUE</code> . |
| force_match | If <code>TRUE</code> this causes SQL profiles to target all SQL statements which have the same text after normalizing all literal values into bind variables. (Note that if a combination of literal values and bind values is used in a SQL statement, no bind transformation occurs.) This is analogous to the matching algorithm used by the <code>FORCE</code> option of the <code>cursor_sharing</code> parameter. If <code>FALSE</code> , literals are not transformed. This is analogous to the matching algorithm used by the <code>EXACT</code> option of the <code>cursor_sharing</code> parameter. |
| profile_type | Options: <ul style="list-style-type: none"> <code>REGULAR_PROFILE</code> - profile without a change to parallel execution (Default, equivalent to <code>NULL</code>). Note that if the SQL statement currently has a parallel execution plan, the regular profile will cause the optimizer to choose a different, but still parallel, execution plan. <code>PX_PROFILE</code> - regular profile with a change to parallel execution |

Table 175-8 (Cont.) ACCEPT_ALL_SQL_PROFILES Procedure Parameters

| Parameter | Description |
|-------------------------------|---|
| <code>autotune_period</code> | <p>The time period for the automatic SQL tuning. This setting applies only to the automatic SQL Tuning Advisor task. Possible values are as follows:</p> <ul style="list-style-type: none"> • null or negative value (default) - all or full. The result includes all task executions. • 0 - result of the current or most recent task execution. • 1 - result for the most recent 24-hour period. • 7 - result for the most recent 7-day period. <p>The procedure interprets any other value as the time of the most recent task execution minus the value of this argument.</p> |
| <code>execution_name</code> | Name of the task execution to use. If null, then the procedure generates the report for the most recent task execution. |
| <code>task_owner</code> | Owner of the tuning task. This is an optional parameter that must be specified to accept a SQL profile associated to a tuning task owned by another user. The current user is the default value. |
| <code>description</code> | A user specified string describing the purpose of the SQL profile. The description is truncated if longer than 256 characters. The maximum size is 500 characters. |
| <code>database_link_to</code> | <p>Name of a database link that exists on a standby database. The link specifies the connection to a primary database. By default, the value is null, which means that the SQL Tuning Advisor session is local.</p> <p>Use <code>DBMS_SQLTUNE</code> to tune high-load SQL statements running on a standby database in an Active Data Guard scenario. When you execute <code>REPORT_TUNING_TASK</code> locally on the standby database, the function uses the database link to obtain the data from the primary database, and then constructs it locally on the standby database.</p> <p>The <code>database_link_to</code> parameter must specify a private database link. This link must be owned by <code>SYS</code> and accessed by the default privileged user <code>SYS\$UMF</code>. The following sample statement creates a link named <code>lnk_to_pri</code>:</p> <pre>CREATE DATABASE LINK lnk_to_pri CONNECT TO SYS\$UMF IDENTIFIED BY password USING 'inst1';</pre> |

Security Model

The `ADMINISTER SQL MANAGEMENT OBJECT` privilege is required. The `CREATE ANY SQL PROFILE` privilege is deprecated.

175.5.2 ACCEPT_SQL_PROFILE Procedure and Function

This subprogram creates a SQL profile recommended by SQL Tuning Advisor.

The SQL text is normalized for matching purposes although it is stored in the data dictionary in denormalized form for readability. SQL text is provided through a reference to the SQL

Tuning task. If the referenced SQL statement does not exist, then the database reports an error.

    profile_type  IN  VARCHAR2 := REGULAR_PROFILE,
    database_link_to IN  VARCHAR2 := NULL)
RETURN VARCHAR2;
```

Parameters

Table 175-9 ACCEPT_SQL_PROFILE Procedure and Function Parameters

| Parameter | Description |
|-------------|--|
| task_name | The (mandatory) name of the SQL tuning task |
| object_id | The identifier of the advisor framework object representing the SQL statement associated with the tuning task |
| name | The name of the SQL profile. It cannot contain double quotation marks. The name is case sensitive. If not specified, the system generates a unique name for the SQL profile. |
| description | A user specified string describing the purpose of the SQL profile. The description is truncated if longer than 256 characters. The maximum size is 500 characters. |

Table 175-9 (Cont.) ACCEPT_SQL_PROFILE Procedure and Function Parameters

| Parameter | Description |
|--------------|--|
| category | The category name. This name must match the value of the <code>SQLTUNE_CATEGORY</code> parameter in a session for the session to use this SQL profile. It defaults to the value "DEFAULT". This is also the default of the <code>SQLTUNE_CATEGORY</code> parameter. The category must be a valid Oracle identifier. The category name specified is always converted to upper case. The combination of the normalized SQL text and category name creates a unique key for a SQL profile. An <code>ACCEPT_SQL_PROFILE</code> fails if this combination is duplicated. |
| task_owner | Owner of the tuning task. This is an optional parameter that has to be specified to accept a SQL profile associated to a tuning task owned by another user. The current user is the default value. |
| replace | If the profile already exists, it is replaced if this argument is <code>TRUE</code> . It is an error to pass a name that is already being used for another signature/category pair, even with <code>replace</code> set to <code>TRUE</code> . |
| force_match | If <code>TRUE</code> this causes SQL profiles to target all SQL statements which have the same text after normalizing all literal values into bind variables. (Note that if a combination of literal values and bind values is used in a SQL statement, no bind transformation occurs.) This is analogous to the matching algorithm used by the <code>FORCE</code> option of the <code>cursor_sharing</code> parameter. If <code>FALSE</code> , literals are not transformed. This is analogous to the matching algorithm used by the <code>EXACT</code> option of the <code>cursor_sharing</code> parameter. |
| profile_type | Options: <ul style="list-style-type: none"> • <code>REGULAR_PROFILE</code> - profile without a change to parallel execution (Default, equivalent to <code>NULL</code>). The following sample statement creates a link named lnk_to_pri:</p> <pre>CREATE DATABASE LINK lnk_to_pri CONNECT TO SYS\$UMF IDENTIFIED BY password USING 'inst1';</pre> |

Return Values

The name of the SQL profile.

Usage Notes

The ADMINISTER SQL MANAGEMENT OBJECT privilege is required. The CREATE ANY SQL PROFILE privilege is deprecated.

Examples

You use both the procedure and the function versions of the subprogram in the same way except you must specify a return value to invoke the function. Here we give examples of the procedure only.

In this example, you tune a single SQL statement from the workload repository and you create the SQL profile recommended by SQL Tuning Advisor.

```
VARIABLE stmt_task VARCHAR2(64);
VARIABLE sts_task VARCHAR2(64);

-- create a tuning task tune the statement
EXEC :stmt_task := DBMS_SQLTUNE.CREATE_TUNING_TASK(
    begin_snap => 1, -
    end_snap   => 2, -
    sql_id     => 'ay1m3ssvtrh24');

-- execute the resulting task
EXEC DBMS_SQLTUNE.EXECUTE_TUNING_TASK(:stmt_task);
```

```
EXEC DBMS_SQLTUNE.ACCEPT_SQL_PROFILE(:stmt_task);
```

Note that you do not have to specify the ID (that is, `object_id`) for the advisor framework object created by SQL Tuning Advisor to represent the tuned SQL statement.

You might also want to accept the recommended SQL profile in a different category, (for example, `TEST`), so that it is not used by default.

```
EXEC DBMS_SQLTUNE.ACCEPT_SQL_PROFILE (
    task_name => :stmt_task, -
    category  => 'TEST');
```

You can use command `ALTER SESSION SET SQLTUNE_CATEGORY = 'TEST'` to see how this profile behaves.

The following call creates a SQL profile that targets any SQL statement with the same `force_matching_signature` as the tuned statement.

```
EXEC DBMS_SQLTUNE.ACCEPT_SQL_PROFILE (task_name => :stmt_task, -
                                       force_match => TRUE);
```

In the following example, you tune a SQL tuning set, and you create a SQL profile for only one of the SQL statements in the SQL tuning set. The SQL statement is represented by an advisor framework object with ID equal to 5. You must pass an object ID to the `ACCEPT_SQL_PROFILE` procedure because there are potentially many SQL profiles for the tuning task. This object ID is given along with the report.

```
EXEC :sts_task := DBMS_SQLTUNE.CREATE_TUNING_TASK ( -
    sqlset_name => 'my_workload', -
    rank1      => 'ELAPSED_TIME', -
    time_limit  => 3600,          -
    description => 'my workload ordered by elapsed time');

-- execute the resulting task
EXEC DBMS_SQLTUNE.EXECUTE_TUNING_TASK(:sts_task);

-- create the profile for the sql statement corresponding to object_id = 5.
EXEC DBMS_SQLTUNE.ACCEPT_SQL_PROFILE (
    task_name => :sts_task, -
    object_id => 5);
```

175.5.3 ADD_SQLSET_REFERENCE Function

This procedure adds a new reference to an existing SQL tuning set to indicate its use by a client.

See Also:

[DBMS_SQLTUNE SQL Tuning Set Subprograms](#) for other subprograms in this group

Syntax

```
DBMS_SQLTUNE.ADD_SQLSET_REFERENCE (
  sqlset_name IN VARCHAR2,
  description IN VARCHAR2 := NULL)
RETURN NUMBER;
```

Parameters

The parameters are identical for `DBMS_SQLTUNE.ADD_SQLSET_REFERENCE` and `DBMS_SQLSET.ADD_REFERENCE`.

Table 175-10 ADD_SQLSET_REFERENCE and ADD_REFERENCE Function Parameters

| Parameter | Description |
|---------------------------|--|
| <code>sqlset_name</code> | Specifies the name of the SQL tuning set. |
| <code>description</code> | Provides an optional description of the usage of SQL tuning set. The description is truncated if longer than 256 characters. |
| <code>sqlset_owner</code> | Specifies the owner of the SQL tuning set, or <code>NULL</code> for the current schema owner. |

Return Values

The identifier of the added reference.

Examples

You can add reference to a SQL tuning set. This prevents the tuning set from being modified while it is being used. References are automatically added when you invoke SQL Tuning Advisor on the SQL tuning set, so you should use this function for custom purposes only. The function returns a reference ID that is used to remove it later. You use the `REMOVE_SQLSET_REFERENCE` procedure to delete references to a SQL tuning set.

```
VARIABLE rid NUMBER;
EXEC :rid := DBMS_SQLTUNE.ADD_SQLSET_REFERENCE( -
```

```
sqlset_name => 'my_workload', -
description => 'my sts reference');
```

You can use the `DBA_SQLSET_REFERENCES` view to find all references on a given SQL tuning set.

175.5.4 ALTER_SQL_PROFILE Procedure

This procedure alters specific attributes of an existing SQL profile object.

The following attributes can be altered (using these attribute names):

- `STATUS` can be set to `ENABLED` or `DISABLED`.
- `NAME` can be reset to a valid name which must be a valid Oracle identifier and must be unique.
- `DESCRIPTION` can be set to any string of size no more than 500 characters.
- `CATEGORY` can be reset to a valid category name which must be a valid Oracle identifier and must be unique when combined with normalized SQL text).

See Also:

[DBMS_SQLTUNE SQL Profile Subprograms](#) for other subprograms in this group

Syntax

```
DBMS_SQLTUNE.ALTER_SQL_PROFILE (
    name           IN  VARCHAR2,
    attribute_name IN  VARCHAR2,
    value          IN  VARCHAR2);
```

Parameters

Table 175-11 ALTER_SQL_PROFILE Procedure Parameters

| Parameter | Description |
|-----------------------------|--|
| <code>name</code> | The (mandatory) name of the existing SQL profile to alter |
| <code>attribute_name</code> | The (mandatory) attribute name to alter (case insensitive) using valid attribute names |
| <code>value</code> | The (mandatory) new value of the attribute using valid attribute values |

Usage Notes

Requires the `ALTER ANY SQL PROFILE` privilege.

Examples

```
-- Disable a profile, so it is not be used by any sessions.
EXEC DBMS_SQLTUNE.ALTER_SQL_PROFILE ( name           => :pname, -
```

```

attribute_name => 'STATUS', -
value          => 'DISABLED');

-- Enable it back:
EXEC DBMS_SQLTUNE.ALTER_SQL_PROFILE ( name          => :pname, -
attribute_name => 'STATUS', -
value          => 'ENABLED');

-- Change the category of the profile so it is used only by sessions
-- with category set to TEST.
-- Use ALTER SESSION SET SQLTUNE_CATEGORY = 'TEST' to see how this
profile
-- behaves.
EXEC DBMS_SQLTUNE.ALTER_SQL_PROFILE ( name          => :pname, -
attribute_name => 'CATEGORY', -
value          => 'TEST');

-- Change it back:
EXEC DBMS_SQLTUNE.ALTER_SQL_PROFILE ( name          => :pname, -
attribute_name => 'CATEGORY', -
value          => 'DEFAULT');

```

175.5.5 CANCEL_TUNING_TASK Procedure

This procedure cancels the currently executing tuning task. All intermediate result data is deleted.

See Also:

[DBMS_SQLTUNE SQL Tuning Advisor Subprograms](#) for other subprograms in this group

Syntax

```
DBMS_SQLTUNE.CANCEL_TUNING_TASK (
  task_name          IN VARCHAR2);
```

Parameters

Table 175-12 CANCEL_TUNING_TASK Procedure Parameters

| Parameter | Description |
|-----------|--|
| task_name | Specifies the name of the task to cancel |

Examples

You cancel a task when you need to stop it executing and do not require to view any already-completed results.

```
EXEC DBMS_SQLTUNE.CANCEL_TUNING_TASK(:my_task);
```

175.5.6 CAPTURE_CURSOR_CACHE_SQLSET Procedure

This procedure captures a workload from the shared SQL area into a SQL tuning set.

The procedure polls the cache multiple times over a time period, and updates the workload data stored there. It can execute over as long a period as required to capture an entire system workload.

See Also:

[DBMS_SQLTUNE SQL Tuning Set Subprograms](#) for other subprograms in this group

Syntax

```
DBMS_SQLTUNE.CAPTURE_CURSOR_CACHE_SQLSET (
  sqlset_name          IN VARCHAR2,
  time_limit           IN POSITIVE := 1800,
  repeat_interval      IN POSITIVE := 300,
  capture_option       IN VARCHAR2 := 'MERGE',
  capture_mode         IN NUMBER   := MODE_REPLACE_OLD_STATS,
  basic_filter         IN VARCHAR2 := NULL,
  sqlset_owner         IN VARCHAR2 := NULL,
  recursive_sql       IN VARCHAR2 := HAS_RECURSIVE_SQL);
```

Parameters

The parameters are the same for both `DBMS_SQLTUNE.CAPTURE_CURSOR_CACHE_SQLSET` and `DBMS_SQLSET.CAPTURE_CURSOR_CACHE`.

Table 175-13 CAPTURE_CURSOR_CACHE_SQLSET and CAPTURE_CURSOR_CACHE Procedure Parameters

| Parameter | Description |
|------------------------------|--|
| <code>sqlset_name</code> | Specifies the SQL tuning set name |
| <code>time_limit</code> | Defines the total amount of time, in seconds, to execute. |
| <code>repeat_interval</code> | Defines the amount of time, in seconds, to pause between sampling. |
| <code>capture_option</code> | Specifies whether to insert new statements, update existing statements, or both. Values are <code>INSERT</code> , <code>UPDATE</code> , or <code>MERGE</code> . The values are the same as for <code>load_option</code> in <code>load_sqlset</code> . |

Table 175-13 (Cont.) CAPTURE_CURSOR_CACHE_SQLSET and CAPTURE_CURSOR_CACHE Procedure Parameters

| Parameter | Description |
|---------------|---|
| capture_mode | Specifies the capture mode (UPDATE and MERGE capture options). Possible values: <ul style="list-style-type: none"> MODE_REPLACE_OLD_STATS — Replaces statistics when the number of executions is greater than the number stored in the SQL tuning set MODE_ACCUMULATE_STATS — Adds new values to current values for SQL that is already stored. Note that this mode detects if a statement has been aged out, so the final value for a statistics is the sum of the statistics of all cursors that statement existed under. |
| basic_filter | Defines a filter to apply to the shared SQL area for each sample. If basic_filter is not set by the caller, then the subprogram captures only statements of type CREATE TABLE, INSERT, SELECT, UPDATE, DELETE, and MERGE. |
| sqlset_owner | Specifies the owner of the SQL tuning set or NULL for current schema owner |
| recursive_sql | Defines a filter that includes recursive SQL in the SQL tuning set (HAS_RECURSIVE_SQL) or excludes it (NO_RECURSIVE_SQL). |

Examples

In this example capture takes place over a 30-second period, polling the cache once every five seconds. This captures all statements run during that period but not before or after. If the same statement appears a second time, the process replaces the stored statement with the new occurrence.

Note that in production systems the time limit and repeat interval would be set much higher. You should tune the time_limit and repeat_interval parameters based on the workload time and shared SQL area turnover properties of your system.

```
EXEC DBMS_SQLTUNE.CAPTURE_CURSOR_CACHE_SQLSET( -
                                     sqlset_name      =>
'my_workload', -
                                     time_limit       => 30, -
                                     repeat_interval => 5);
```

In the following call you accumulate execution statistics as you go. This option produces an accurate picture of the cumulative activity of each cursor, even across age-outs, but it is more expensive than the previous example.

```
EXEC DBMS_SQLTUNE.CAPTURE_CURSOR_CACHE_SQLSET( -
                                     sqlset_name      => 'my_workload', -
                                     time_limit       => 30, -
                                     repeat_interval => 5, -
                                     capture_mode     =>
dbms_sqltune.MODE_ACCUMULATE_STATS);
```

This call performs a very inexpensive capture where you only insert new statements and do not update their statistics once they have been inserted into the SQL tuning set

```
EXEC DBMS_SQLTUNE.CAPTURE_CURSOR_CACHE_SQLSET( -
                                     sqlset_name      => 'my_workload', -
                                     time_limit       => 30, -
                                     repeat_interval  => 5, -
                                     capture_option   => 'INSERT');
```

175.5.7 CREATE_SQL_PLAN_BASELINE Procedure

This procedure creates a SQL plan baseline for an execution plan. It can be used in the context of an Alternative Plan Finding made by SQL Tuning Advisor.

See Also:

[DBMS_SQLTUNE SQL Tuning Advisor Subprograms](#) for other subprograms in this group

Syntax

```
DBMS_SQLTUNE.CREATE_SQL_PLAN_BASELINE (
  task_name          IN VARCHAR2,
  object_id         IN NUMBER      := NULL,
  plan_hash_value    IN NUMBER,
  owner_name        IN VARCHAR2   := NULL,
  database_link_to  IN VARCHAR2   := NULL);
```

Parameters

Table 175-14 CREATE_SQL_PLAN_BASELINE Procedure Parameters

| Parameter | Description |
|-----------------|--|
| task_name | Name of the task for which to get a script |
| object_id | Object ID to which the SQL corresponds |
| plan_hash_value | Plan to create plan baseline |
| owner_name | Owner of the relevant tuning task. Defaults to the current schema owner. |

Table 175-14 (Cont.) CREATE_SQL_PLAN_BASELINE Procedure Parameters

| Parameter | Description |
|------------------|--|
| database_link_to | <p>Name of a database link that exists on a standby database.</p> <p>The link specifies the connection to a primary database. By default, the value is null, which means that the SQL Tuning Advisor session is local.</p> <p>Use DBMS_SQLTUNE to tune high-load SQL statements running on a standby database in an Active Data Guard scenario. When you execute REPORT_TUNING_TASK locally on the standby database, the function uses the database link to obtain the data from the primary database, and then constructs it locally on the standby database.</p> <p>The database_link_to parameter must specify a private database link. This link must be owned by SYS and accessed by the default privileged user SYS\$UMF. The following sample statement creates a link named lnk_to_pri:</p> <pre>CREATE DATABASE LINK lnk_to_pri CONNECT TO SYS\$UMF IDENTIFIED BY password USING 'inst1';</pre> |

175.5.8 CREATE_SQLSET Procedure and Function

This procedure or function creates a SQL tuning set object in the database.

Syntax

```
DBMS_SQLTUNE.CREATE_SQLSET (
  sqlset_name IN VARCHAR2,
  description IN VARCHAR2 := NULL
  sqlset_owner IN VARCHAR2 := NULL);
```

```
DBMS_SQLTUNE.CREATE_SQLSET (
  sqlset_name IN VARCHAR2 := NULL,
  description IN VARCHAR2 := NULL,
  sqlset_owner IN VARCHAR2 := NULL)
RETURN VARCHAR2;
```

Parameters

Table 175-15 CREATE_SQLSET Procedure Parameters

| Parameter | Description |
|--------------|---|
| sqlset_name | Specifies the name of the created SQL tuning set. The name is the name passed to the function. If no name is passed to the function, then the function generates an automatic name. |
| description | Provides an optional description of the SQL tuning set. |
| sqlset_owner | Specifies the owner of the SQL tuning set, or NULL for the current schema owner. |

Examples

```
EXEC DBMS_SQLTUNE.CREATE_SQLSET(-
  sqlset_name => 'my_workload', -
  description => 'complete application workload');
```

175.5.9 CREATE_STGTAB_SQLPROF Procedure

This procedure creates the staging table used for copying SQL profiles from one system to another.

See Also:

[DBMS_SQLTUNE SQL Profile Subprograms](#) for other subprograms in this group

Syntax

```
DBMS_SQLTUNE.CREATE_STGTAB_SQLPROF (
  table_name          IN VARCHAR2,
  schema_name        IN VARCHAR2 := NULL,
  tablespace_name     IN VARCHAR2 := NULL);
```

Parameters

Table 175-16 CREATE_STGTAB_SQLPROF Procedure Parameters

| Parameter | Description |
|-----------------|---|
| table_name | The name of the table to create (case-insensitive unless double quoted). |
| schema_name | The schema to create the table in, or NULL for the current schema (case-insensitive unless double quoted). |
| tablespace_name | The tablespace to store the staging table within, or NULL for the default tablespace of the current user (case-insensitive unless double quoted). |

Usage Notes

- Call this procedure once before issuing a call to the [PACK_STGTAB_SQLPROF Procedure](#).
- To put different SQL profiles in different staging tables, you can call this procedure multiple times.
- This is a DDL operation, so it does not occur within a transaction.

Examples

Create a staging table to store profile data that can be moved to another system.

```
EXEC DBMS_SQLTUNE.CREATE_STGTAB_SQLPROF (table_name => 'PROFILE_STGTAB');
```

175.5.10 CREATE_STGTAB_SQLSET Procedure

This procedure creates a staging table through which SQL tuning sets are imported and exported.

See Also:

[DBMS_SQLTUNE SQL Tuning Set Subprograms](#) for other subprograms in this group

Syntax

```
DBMS_SQLTUNE.CREATE_STGTAB_SQLSET (
  table_name          IN VARCHAR2,
  schema_name        IN VARCHAR2 := NULL,
  tablespace_name    IN VARCHAR2 := NULL,
  db_version         IN NUMBER   := NULL);
```

Parameters

Table 175-17 CREATE_STGTAB_SQLSET and CREATE_STGTAB Procedure Parameters

| Parameter | Description |
|-----------------|---|
| table_name | Specifies the name of the table to create. The name is case sensitive. |
| schema_name | Defines the schema in which to create the table, or NULL for the current schema. The name is case sensitive. |
| tablespace_name | Specifies the tablespace in which to store the staging table, or NULL for the default tablespace of the current user. The name is case sensitive. |
| db_version | Specifies the database version that determines the format of the staging table. You can also create an older database version staging table to export an STS to an older database version. Use one of the following values: <ul style="list-style-type: none"> NULL (default) — Specifies the current database version. STS_STGTAB_10_2_VERSION — Specifies the 10.2 database version. STS_STGTAB_11_1_VERSION — Specifies the 11.1 database version. STS_STGTAB_11_2_VERSION — Specifies the 11.2 database version. STS_STGTAB_12_1_VERSION — Specifies the 12.1 database version. STS_STGTAB_12_2_VERSION — Specifies the 12.2 database version. |

Security Model

You must have CREATE TABLE permissions in the specified schema and tablespace.

Usage Notes

- Call this procedure once before packing the SQL set.

- To have different tuning sets in different staging tables, you can call this procedure multiple times.
- This is a DDL operation, so it does not occur within a transaction.
- The staging table contains nested table columns and indexes, so it should not be renamed.

Examples

Create a staging table for packing and eventually exporting a SQL tuning sets

```
EXEC DBMS_SQLTUNE.CREATE_STGTAB_SQLSET(table_name => 'STGTAB_SQLSET');
```

Create a staging table to pack a SQL tuning set in Oracle Database 11g Release 2 (11.2) format

```
BEGIN
  DBMS_SQLTUNE.CREATE_STGTAB_SQLSET(
    table_name => 'STGTAB_SQLSET'
  ,   db_version => DBMS_SQLTUNE.STS_STGTAB_11_2_VERSION );
END;
```

175.5.11 CREATE_TUNING_TASK Functions

This function creates a SQL Tuning Advisor task.

Note:

A multitenant container database is the only supported architecture in Oracle Database 20c. While the documentation is being revised, legacy terminology may persist. In most cases, "database" and "non-CDB" refer to a CDB or PDB, depending on context. In some contexts, such as upgrades, "non-CDB" refers to a non-CDB from a previous release.

You can use different forms of this function to:

- Create a tuning task for a single statement given its text.
- Create a tuning task for a single statement from the shared SQL area given its identifier.
- Create a tuning task for a single statement from the workload repository given a range of snapshot identifiers.
- Create a tuning task for a SQL tuning set.
- Create a tuning task for SQL Performance Analyzer.

In all cases, the function mainly creates a SQL Tuning Advisor task and sets its parameters.

**See Also:**

[DBMS_SQLTUNE SQL Tuning Advisor Subprograms](#) for other subprograms in this group

Syntax**SQL text format:**

```
DBMS_SQLTUNE.CREATE_TUNING_TASK (
  sql_text          IN CLOB,
  bind_list         IN sql_binds := NULL,
  user_name         IN VARCHAR2 := NULL,
  scope             IN VARCHAR2 := SCOPE_COMPREHENSIVE,
  time_limit        IN NUMBER    := TIME_LIMIT_DEFAULT,
  task_name         IN VARCHAR2 := NULL,
  description       IN VARCHAR2 := NULL,
  con_name          IN VARCHAR2 := NULL,
  database_link_to IN VARCHAR2 := NULL)
RETURN VARCHAR2;
```

SQL ID format:

```
DBMS_SQLTUNE.CREATE_TUNING_TASK (
  sql_id           IN VARCHAR2,
  plan_hash_value IN NUMBER    := NULL,
  scope           IN VARCHAR2 := SCOPE_COMPREHENSIVE,
  time_limit      IN NUMBER    := TIME_LIMIT_DEFAULT,
  task_name       IN VARCHAR2 := NULL,
  description     IN VARCHAR2 := NULL,
  con_name        IN VARCHAR2 := NULL,
  database_link_to IN VARCHAR2 := NULL)
RETURN VARCHAR2;
```

AWR format:

```
DBMS_SQLTUNE.CREATE_TUNING_TASK (
  begin_snap      IN NUMBER,
  end_snap        IN NUMBER,
  sql_id          IN VARCHAR2,
  plan_hash_value IN NUMBER    := NULL,
  scope           IN VARCHAR2 := SCOPE_COMPREHENSIVE,
  time_limit      IN NUMBER    := TIME_LIMIT_DEFAULT,
  task_name       IN VARCHAR2 := NULL,
  description     IN VARCHAR2 := NULL,
  con_name        IN VARCHAR2 := NULL,
  dbid           IN NUMBER    := NULL,
  database_link_to IN VARCHAR2 := NULL)
RETURN VARCHAR2;
```

SQL tuning set format:

```
DBMS_SQLTUNE.CREATE_TUNING_TASK (
  sqlset_name      IN VARCHAR2,
  basic_filter     IN VARCHAR2 := NULL,
  object_filter    IN VARCHAR2 := NULL,
  rank1            IN VARCHAR2 := NULL,
  rank2            IN VARCHAR2 := NULL,
  rank3            IN VARCHAR2 := NULL,
  result_percentage IN NUMBER   := NULL,
  result_limit     IN NUMBER   := NULL,
  scope            IN VARCHAR2 := SCOPE_COMPREHENSIVE,
  time_limit       IN NUMBER   := TIME_LIMIT_DEFAULT,
  task_name        IN VARCHAR2 := NULL,
  description      IN VARCHAR2 := NULL,
  plan_filter      IN VARCHAR2 := 'MAX_ELAPSED_TIME',
  sqlset_owner     IN VARCHAR2 := NULL,
  database_link_to IN VARCHAR2 := NULL)
RETURN VARCHAR2;
```

SQL Performance Analyzer format:

```
DBMS_SQLTUNE.CREATE_TUNING_TASK (
  spa_task_name    IN VARCHAR2,
  spa_task_owner   IN VARCHAR2 := NULL,
  spa_compare_exec IN VARCHAR2 := NULL,
  basic_filter     IN VARCHAR2 := NULL,
  time_limit       IN NUMBER   := TIME_LIMIT_DEFAULT,
  task_name        IN VARCHAR2 := NULL,
  description      IN VARCHAR2 := NULL)
RETURN VARCHAR2;
```

Parameters

Table 175-18 *CREATE_TUNING_TASK Function Parameters*

| Parameter | Description |
|-----------------|--|
| sql_text | Specifies the text of a SQL statement. |
| begin_snap | Specifies the begin snapshot identifier. |
| end_snap | Specifies the end snapshot identifier. |
| sql_id | Specifies the identifier of a SQL statement. |
| bind_list | Defines an ordered list of bind values in ANYDATA type. NOTE: This parameter is not supported on a standby database. |
| plan_hash_value | Specifies the hash value of the SQL execution plan. |
| sqlset_name | Specifies the SQL tuning set name. |
| basic_filter | Specifies the predicate used to filter the SQL from the SQL tuning set. |
| object_filter | Specifies the object filter. |
| rank(i) | Specifies an ORDER BY clause on the selected SQL statement. |

Table 175-18 (Cont.) CREATE_TUNING_TASK Function Parameters

| Parameter | Description |
|-------------------|--|
| result_percentage | Specifies the percentage on the sum of a ranking measure. |
| result_limit | Specifies the top L(limit) SQL from the filtered or ranked SQL. |
| user_name | Specifies the user name for whom the statement is to be tuned. |
| scope | Specifies the tuning scope: <ul style="list-style-type: none"> LIMITED: SQL Tuning Advisor produces recommendations based on statistical checks, access path analysis, and SQL structure analysis. SQL profile recommendations are not generated. COMPREHENSIVE: SQL Tuning Advisor carries out all the analysis it performs under limited scope plus SQL profiling. |
| time_limit | Specifies the maximum duration in seconds for the tuning session. |
| task_name | Specifies an optional tuning task name. |
| description | Provides a description of the SQL tuning session, up to a maximum of 256 characters. |
| plan_filter | Specifies the plan filter. It is applicable when multiple plans (plan_hash_value) are associated with the same statement. This filter allows for selecting one plan (plan_hash_value) only. Possible values are: <ul style="list-style-type: none"> LAST_GENERATED: most recent timestamp FIRST_GENERATED: earliest timestamp, the opposite to LAST_GENERATED LAST_LOADED: most recent first_load_time statistics information FIRST_LOADED: earliest first_load_time statistics information, the opposite to LAST_LOADED MAX_ELAPSED_TIME: maximum elapsed time MAX_BUFFER_GETS: maximum buffer gets MAX_DISK_READS: maximum disk reads MAX_DIRECT_WRITES: maximum direct writes MAX_OPTIMIZER_COST: maximum optimizer cost |
| sqlset_owner | Specifies the owner of the SQL tuning set, or NULL for the current schema owner. |
| spa_task_name | Specifies the name of the SQL Performance Analyzer task whose regressions are to be tuned. |
| spa_task_owner | Specifies the owner of specified SQL Performance Analyzer task or NULL for current user. |
| spa_compare_exec | Specifies the execution name of the Compare Performance trial of SQL Performance Analyzer task. If NULL, then the advisor uses the most recent execution of the given SQL Performance Analyzer task, of type COMPARE PERFORMANCE. |
| dbid | Specifies the DBID for imported or PDB-level AWR data. If NULL, then the current database DBID is used. |

Table 175-18 (Cont.) CREATE_TUNING_TASK Function Parameters

| Parameter | Description |
|-------------------------------|--|
| <code>con_name</code> | <p>Specifies the container for the tuning task. The semantics depend on the function format:</p> <ul style="list-style-type: none"> For the SQL text format, this parameter specifies the container in which SQL Tuning Advisor tunes the SQL statement. If null (default), then SQL Tuning Advisor uses the current container. For the SQL ID format, this parameter specifies the container from which the database fetches the SQL statement for tuning. SQL Tuning Advisor tunes the statement in this container. If null, then the database uses the current PDB for tuning, fetches the statement from the cursor cache of all valid containers executing the SQL statement, and tunes the most expensive statement in its container. For the AWR format, this parameter specifies the container from whose AWR data the database fetches the SQL statement for tuning. SQL Tuning Advisor tunes the statement in this container. If null, then the database uses the current PDB for tuning, fetches the statement from the AWR of all valid containers that have this SQL statement, and tunes the most expensive statement in its container. <p>The following statements are true of all function formats:</p> <ul style="list-style-type: none"> In a non-CDB, this parameter is ignored. In a PDB, this parameter must be null or match the container name of the PDB. Otherwise, an error occurs. In a CDB root, this parameter must be null or match the container name of a container in this CDB. Otherwise, an error occurs. |
| <code>database_link_to</code> | <p>The link specifies the connection to a primary database. By default, the value is null, which means that the SQL Tuning Advisor session is local. Use <code>DBMS_SQLTUNE</code> to tune high-load SQL statements running on a standby database in an Active Data Guard scenario. When you execute <code>REPORT_TUNING_TASK</code> locally on the standby database, the function uses the database link to obtain the data from the primary database, and then constructs it locally on the standby database.</p> <p>The <code>database_link_to</code> parameter must specify a private database link. This link must be owned by <code>SYS</code> and accessed by the default privileged user <code>SYS\$UMF</code>. The following sample statement creates a link named <code>lnk_to_pri</code>:</p> <pre>CREATE DATABASE LINK lnk_to_pri CONNECT TO SYS\$UMF IDENTIFIED BY password USING 'inst1';</pre> |

Return Values

A SQL tuning task name that is unique by user (two different users can give the same name to their advisor tasks).

Usage Notes

With regard to the form of this subprogram that takes a SQL tuning set, filters provided to this function are evaluated as part of a SQL run by the current user. As such, they are executed

with that user's security privileges and can contain any constructs and subqueries that user can access, but no more.

Example 175-1 Examples

The following examples assume the following variable definitions:

```
VARIABLE stmt_task      VARCHAR2(64);  
VARIABLE sts_task       VARCHAR2(64);  
VARIABLE spa_tune_task  VARCHAR2(64);
```

Example 175-2 Create Tuning Task with SQL Text Format

```
EXEC :stmt_task := DBMS_SQLTUNE.CREATE_TUNING_TASK( -  
    sql_text => 'SELECT quantity_sold FROM sales s, times t WHERE  
s.time_id = t.time_id AND s.time_id = TO_DATE(''24-NOV-00'')');
```

Example 175-3 Create Tuning Task with SQL ID Format

```
EXEC :stmt_task := DBMS_SQLTUNE.CREATE_TUNING_TASK(sql_id =>  
'ay1m3ssvtrh24');  
  
EXEC :stmt_task := DBMS_SQLTUNE.CREATE_TUNING_TASK(sql_id =>  
'ay1m3ssvtrh24', -  
    scope => 'LIMITED');  
  
EXEC :stmt_task := DBMS_SQLTUNE.CREATE_TUNING_TASK(sql_id =>  
'ay1m3ssvtrh24', -  
    time_limit => 600);
```

Example 175-4 Create Tuning Task with AWR Snapshot Format

```
EXEC :stmt_task := DBMS_SQLTUNE.CREATE_TUNING_TASK(begin_snap => 1, -  
    end_snap => 2, sql_id => 'ay1m3ssvtrh24');
```

Example 175-5 Create Tuning Task with SQL Tuning Set Format

This example creates a task that tunes SQL statements in order by buffer gets, and also sets a time limit of one hour. The default ranking measure is elapsed time.

```
EXEC :sts_task := DBMS_SQLTUNE.CREATE_TUNING_TASK( -  
    sqlset_name => 'my_workload', -  
    rank1       => 'BUFFER_GETS', -  
    time_limit  => 3600, -  
    description => 'tune my workload ordered by buffer gets');
```

Example 175-6 Create Tuning Task with SPA Task Format

This example tunes the SQL statement that were reported as having regressed from the compare performance execution of the SQL Performance Analyzer task named `task_123`.

```
EXEC :spa_tune_task := DBMS_SQLTUNE.CREATE_TUNING_TASK(
    spa_task_name      => 'task_123',
    spa_task_owner     => 'SCOTT',
    spa_compare_exec   => 'exec1');
```

Example 175-7 Creating SQL Tuning Task on Standby Database

This example creates a tuning task on the standby database. The `tune_stby_wkld` task uses the `lnk_to_primary` database link to write data to the primary database, which is open read/write.

```
VAR tname VARCHAR2(30);
VAR query VARCHAR2(500);
EXEC :tname := 'tune_stby_wkld';
EXEC :query := 'SELECT /*+ FULL(t)*/ coll FROM table1 t WHERE coll=9000';
EXEC :tname := DBMS_SQLTUNE.CREATE_TUNING_TASK(sql_text => :query,-
    task_name => :tname, database_link_to => 'lnk_to_primary');
```

175.5.12 DELETE_SQLSET Procedure

This procedure deletes a set of SQL statements from a SQL tuning set.

Syntax

```
DBMS_SQLTUNE.DELETE_SQLSET (
    sqlset_name   IN   VARCHAR2,
    basic_filter  IN   VARCHAR2 := NULL,
    sqlset_owner  IN   VARCHAR2 := NULL);
```

Parameters

Table 175-19 DELETE_SQLSET Procedure Parameters

| Parameter | Description |
|---------------------------|---|
| <code>sqlset_name</code> | Specifies the name of the SQL tuning set. |
| <code>basic_filter</code> | Specifies the SQL predicate to filter the SQL from the SQL tuning set. This basic filter is used as a where clause on the SQL tuning set content to select a desired subset of SQL from the SQL tuning set. |
| <code>sqlset_owner</code> | Specifies the owner of the SQL tuning set, or <code>NULL</code> for current schema owner. |

Examples

```
-- Delete all statements in a sql tuning set.
EXEC DBMS_SQLTUNE.DELETE_SQLSET(sqlset_name => 'my_workload');
```

```
-- Delete all statements in a sql tuning set which ran for less than a
second
EXEC DBMS_SQLTUNE.DELETE_SQLSET(sqlset_name => 'my_workload', -
                                basic_filter => 'elapsed_time <
1000000');
```

175.5.13 DROP_SQL_PROFILE Procedure

This procedure drops the named SQL profile from the database.

See Also:

[DBMS_SQLTUNE SQL Profile Subprograms](#) for other subprograms in this group

Syntax

```
DBMS_SQLTUNE.DROP_SQL_PROFILE (
    name          IN VARCHAR2,
    ignore        IN BOOLEAN := FALSE);
```

Parameters

Table 175-20 DROP_SQL_PROFILE Procedure Parameters

| Parameter | Description |
|-----------|--|
| name | The (mandatory) name of SQL profile to be dropped. The name is case sensitive. |
| ignore | Ignores errors due to object not existing |

Usage Notes

Requires the `DROP ANY SQL PROFILE` privilege.

Examples

```
-- Drop the profile:
EXEC DBMS_SQLTUNE.DROP_SQL_PROFILE(:pname);
```

175.5.14 DROP_SQLSET Procedure

This procedure drops a SQL tuning set if it is not active.

See Also:

[DBMS_SQLTUNE SQL Tuning Set Subprograms](#) for other subprograms in this group

Syntax

```
DBMS_SQLTUNE.DROP_SQLSET (  
    sqlset_name    IN  VARCHAR2,  
    sqlset_owner  IN  VARCHAR2 := NULL);
```

Parameters

Table 175-21 DROP_SQLSET Procedure Parameters

| Parameter | Description |
|--------------|--|
| sqlset_name | Specifies the name of the SQL tuning set. |
| sqlset_owner | Specifies the owner of the SQL tuning set, or NULL for current schema owner. |

Usage Notes

You cannot drop a SQL tuning set when it is referenced by one or more clients.

Examples

```
-- Drop the sqlset.  
EXEC DBMS_SQLTUNE.DROP_SQLSET ('my_workload');
```

175.5.15 DROP_TUNING_TASK Procedure

This procedure drops a SQL tuning task. The task and all its result data are deleted.

See Also:

[DBMS_SQLTUNE SQL Tuning Advisor Subprograms](#) for other subprograms in this group

Syntax

```
DBMS_SQLTUNE.DROP_TUNING_TASK (
  task_name          IN VARCHAR2);
```

Parameters

Table 175-22 DROP_TUNING_TASK Procedure Parameters

| Parameter | Description |
|-----------|--|
| task_name | Specifies name of the tuning task to drop. |

175.5.16 EXECUTE_TUNING_TASK Function and Procedure

This function and procedure executes a previously created tuning task. Both the function and the procedure run in the context of a new task execution. The difference is that the function version returns that new execution name.

See Also:

[DBMS_SQLTUNE SQL Tuning Advisor Subprograms](#) for other subprograms in this group

Syntax

```
DBMS_SQLTUNE.EXECUTE_TUNING_TASK (
  task_name          IN VARCHAR2,
  execution_name     IN VARCHAR2                := NULL,
  execution_params   IN dbms_advisor.argList    := NULL,
  execution_desc     IN VARCHAR2                := NULL,
  database_link_to   IN VARCHAR2                := NULL)
RETURN VARCHAR2;
```

```
DBMS_SQLTUNE.EXECUTE_TUNING_TASK (
  task_name          IN VARCHAR2,
  execution_name     IN VARCHAR2                := NULL,
  execution_params   IN dbms_advisor.argList    := NULL,
  execution_desc     IN VARCHAR2                := NULL,
  database_link_to   IN VARCHAR2                := NULL);
```

Parameters

Table 175-23 EXECUTE_TUNING_TASK Function & Procedure Parameters

| Parameter | Description |
|-----------|-------------------------------------|
| task_name | Name of the tuning task to execute. |

Table 175-23 (Cont.) EXECUTE_TUNING_TASK Function & Procedure Parameters

| Parameter | Description |
|-------------------------------|---|
| <code>execution_name</code> | A name to qualify and identify an execution. If not specified, it is generated by the advisor and returned by function. |
| <code>execution_params</code> | List of parameters (name, value) for the specified execution. The execution parameters have effect only on the execution for which they are specified. They override the values for the parameters stored in the task (set through the SET_TUNING_TASK_PARAMETER Procedures). |
| <code>execution_desc</code> | A 256-length string describing the execution. |
| <code>database_link_to</code> | <p>Name of a database link that exists on a standby database. The link specifies the connection to a primary database. By default, the value is null, which means that the SQL Tuning Advisor session is local.</p> <p>Use <code>DBMS_SQLTUNE</code> to tune high-load SQL statements running on a standby database in an Active Data Guard scenario. When you execute <code>REPORT_TUNING_TASK</code> locally on the standby database, the function uses the database link to obtain the data from the primary database, and then constructs it locally on the standby database.</p> <p>The <code>database_link_to</code> parameter must specify a private database link. This link must be owned by <code>SYS</code> and accessed by the default privileged user <code>SYS\$UMF</code>. The following sample statement creates a link named <code>lnk_to_pri</code>:</p> <pre>CREATE DATABASE LINK lnk_to_pri CONNECT TO SYS\$UMF IDENTIFIED BY password USING 'inst1';</pre> |

Usage Notes

A tuning task can be executed multiples times without having to reset it.

Examples

```
EXEC DBMS_SQLTUNE.EXECUTE_TUNING_TASK(:stmt_task);
```

175.5.17 IMPLEMENT_TUNING_TASK Procedure

This procedure implements a set of SQL profile recommendations made by SQL Tuning Advisor.

Executing `IMPLEMENT_TUNING_TASK` is equivalent to executing the [SCRIPT_TUNING_TASK Function](#) and then running the script.

See Also:

[DBMS_SQLTUNE SQL Tuning Advisor Subprograms](#) for other subprograms in this group

Syntax

```
DBMS_SQLTUNE.IMPLEMENT_TUNING_TASK(
    task_name          IN  VARCHAR2,
    rec_type           IN  VARCHAR2 := REC_TYPE_SQL_PROFILES,
    owner_name         IN  VARCHAR2 := NULL,
    execution_name     IN  VARCHAR2 := NULL,
    database_link_to   IN  VARCHAR2 := NULL);
```

Parameters

Table 175-24 IMPLEMENT_TUNING_TASK Procedure Parameters

| Parameter | Description |
|------------------|--|
| task_name | Name of the tuning task for which to implement recommendations. |
| rec_type | Filter the types of recommendations to implement. Only 'PROFILES' is supported. |
| owner_name | Owner of the relevant tuning task or NULL for the current user. |
| execution_name | Name of the task execution to use. If NULL, then the procedure implements recommendations from the last task execution. |
| database_link_to | Name of a database link that exists on a standby database. The link specifies the connection to a primary database. By default, the value is null, which means that the SQL Tuning Advisor session is local. Use DBMS_SQLTUNE to tune high-load SQL statements running on a standby database in an Active Data Guard scenario. When you execute REPORT_TUNING_TASK locally on the standby database, the function uses the database link to obtain the data from the primary database, and then constructs it locally on the standby database. The database_link_to parameter must specify a private database link. This link must be owned by SYS and accessed by the default privileged user SYS\$UMF. The following sample statement creates a link named lnk_to_pri: <pre>CREATE DATABASE LINK lnk_to_pri CONNECT TO SYS\$UMF IDENTIFIED BY password USING 'inst1';</pre> |

175.5.18 INTERRUPT_TUNING_TASK Procedure

This procedure interrupts the currently executing tuning task. The task ends its operations as it would at normal exit so that the user can access the intermediate results.

See Also:

[DBMS_SQLTUNE SQL Tuning Advisor Subprograms](#) for other subprograms in this group

Syntax

```
DBMS_SQLTUNE.INTERRUPT_TUNING_TASK (  
    task_name          IN VARCHAR2);
```

Parameters

Table 175-25 INTERRUPT_TUNING_TASK Procedure Parameters

| Parameter | Description |
|-----------|--------------------------------------|
| task_name | Name of the tuning task to interrupt |

Examples

```
EXEC DBMS_SQLTUNE.INTERRUPT_TUNING_TASK(:my_task);
```

175.5.19 LOAD_SQLSET Procedure

This procedure populates the SQL tuning set with a set of selected SQL statements. You can call the procedure multiple times to add new SQL statements or replace attributes of existing statements.

See Also:

[DBMS_SQLTUNE SQL Tuning Set Subprograms](#) for other subprograms in this group

Syntax

```
DBMS_SQLTUNE.LOAD_SQLSET (  
    sqlset_name      IN VARCHAR2,  
    populate_cursor  IN sqlset_cursor,  
    load_option      IN VARCHAR2 := 'INSERT',  
    update_option    IN VARCHAR2 := 'REPLACE',  
    update_condition IN VARCHAR2 := NULL,
```

```

update_attributes IN VARCHAR2 := NULL,
ignore_null      IN BOOLEAN  := TRUE,
commit_rows     IN POSITIVE  := NULL,
sqlset_owner    IN VARCHAR2 := NULL);

```

Parameters

Table 175-26 LOAD_SQLSET Procedure Parameters

| Parameter | Description |
|------------------|---|
| sqlset_name | Specifies the name of SQL tuning set to be loaded. |
| populate_cursor | Specifies the cursor reference to the SQL tuning set to be loaded. |
| load_option | Specifies which statements are loaded into the SQL tuning set. The possible values are: <ul style="list-style-type: none"> INSERT (default) — Adds only new statements. UPDATE — Updates existing the SQL statements and ignores any new statements. MERGE — Inserts new statements and updates the information of the existing ones. |
| update_option | Specifies how existing SQL statements are updated. This parameter is considered only if load_option is specified with UPDATE or MERGE as an option. The possible values are: <ul style="list-style-type: none"> REPLACE (default) — Updates the statement using the new statistics, bind list, object list, and so on. ACCUMULATE — Combines attributes when possible (for example, statistics such as elapsed_time), and otherwise replaces the existing values (for example, module and action) with the provided values. The SQL statement attributes that can be accumulated are: elapsed_time, buffer_gets, direct_writes, disk_reads, row_processed, fetches, executions, end_of_fetch_count, stat_period and active_stat_period. |
| update_condition | Specifies when to perform the update. The procedure only performs the update when the specified condition is satisfied. The condition can refer to either the data source or destination. The condition must use the following prefixes to refer to attributes from the source or the destination: <ul style="list-style-type: none"> OLD — Refers to statement attributes from the SQL tuning set (destination). NEW — Refers to statement attributes from the input statements (source). |

Table 175-26 (Cont.) LOAD_SQLSET Procedure Parameters

| Parameter | Description |
|--------------------------------|---|
| <code>update_attributes</code> | <p>Specifies the list of SQL statement attributes to update during a merge or update.</p> <p>The possible values are:</p> <ul style="list-style-type: none"> • <code>NULL</code> (default) — Specifies the content of the input cursor except the execution context. On other terms, it is equivalent to <code>ALL</code> without execution contexts such as module and action. • <code>BASIC</code> — Specifies statistics and binds only. • <code>TYPICAL</code> — Specifies <code>BASIC</code> with SQL plans (without row source statistics) and without an object reference list. • <code>ALL</code> — Specifies all attributes, including the execution context attributes such as module and action. • List of comma separated attribute names to update: <ul style="list-style-type: none"> – <code>EXECUTION_CONTEXT</code> – <code>EXECUTION_STATISTICS</code> – <code>SQL_BINDS</code> – <code>SQL_PLAN</code> – <code>SQL_PLAN_STATISTICS</code> (similar to <code>SQL_PLAN</code> with added row source statistics) |
| <code>ignore_null</code> | <p>Specifies whether to update attributes when the new value is <code>NULL</code>.</p> <p>If <code>TRUE</code>, then the procedure does not update an attribute when the new value is <code>NULL</code>. That is, do not override with <code>NULL</code> values unless intentional.</p> |
| <code>commit_rows</code> | <p>Specifies whether to commit statements after DML.</p> <p>If a value is provided, then the load commits after each specified number of statements is inserted. If <code>NULL</code> is provided, then the load commits only once, at the end of the operation.</p> <p>Providing a value for this argument enables you to monitor the progress of a SQL tuning set load operation in the <code>DBA_SQLSET</code> views. The <code>STATEMENT_COUNT</code> value increases as new SQL statements are loaded.</p> |
| <code>sqlset_owner</code> | <p>Defines the owner of the SQL tuning set, or the current schema owner (or <code>NULL</code> for the current owner).</p> |

Exceptions

- This procedure returns an error when `sqlset_name` is invalid, or a corresponding SQL tuning set does not exist, or the `populate_cursor` is incorrect and cannot be executed.
- Exceptions are also raised when invalid filters are provided. Filters can be invalid either because they don't parse (for example, they refer to attributes not in `sqlset_row`), or because they violate the user's privileges.

Usage Notes

Rows in the input `populate_cursor` must be of type `SQLSET_ROW`.

Examples

In this example, you create and populate a SQL tuning set with all shared SQL area statements with an elapsed time of 5 seconds or more excluding statements that belong to SYS schema (to simulate an application user workload). You select all attributes of the SQL statements and load them in the tuning set using the default mode, which loads only new statements, since the SQL tuning set is empty.

```
-- create the tuning set
EXEC DBMS_SQLTUNE.CREATE_SQLSET('my_workload');
-- populate the tuning set from the shared SQL area
DECLARE
  cur DBMS_SQLTUNE.SQLSET_CURSOR;
BEGIN
  OPEN cur FOR
    SELECT VALUE(P)
      FROM table(
        DBMS_SQLTUNE.SELECT_CURSOR_CACHE(
          'parsing_schema_name <> ''SYS'' AND elapsed_time > 5000000',
          NULL, NULL, NULL, NULL, 1, NULL,
          'ALL')) P;

  DBMS_SQLTUNE.LOAD_SQLSET(sqlset_name => 'my_workload',
    populate_cursor => cur);
END;
/
```

Suppose now you wish to augment this information with what is stored in the workload repository (AWR). You populate the tuning set with 'ACCUMULATE' as your `update_option` because it is assumed the cursors currently in the cache had aged out since the snapshot was taken.

You omit the `elapsed_time` filter because it is assumed that any statement captured in AWR is important, but still you throw away the SYS-parsed cursors to avoid recursive SQL.

```
DECLARE
  cur DBMS_SQLTUNE.SQLSET_CURSOR;
BEGIN
  OPEN cur FOR
    SELECT VALUE(P)
      FROM table(
        DBMS_SQLTUNE.SELECT_WORKLOAD_REPOSITORY(1,2,
          'parsing_schema_name
<> ''SYS'',
          NULL, NULL, NULL, NULL,
          1,
          NULL,
          'ALL')) P;

  DBMS_SQLTUNE.LOAD_SQLSET(sqlset_name      => 'my_workload',
    populate_cursor => cur,
    Using DBMS_SQLTUNE
    load_option => 'MERGE',
```

```

update_option => 'ACCUMULATE');
END;

```

The following example is a simple load that only inserts new statements from the workload repository, skipping existing ones (in the SQL tuning set). Note that 'INSERT' is the default value for the `load_option` argument of the `LOAD_SQLSET` procedure.

```

DECLARE
  cur sys_refcursor;
BEGIN
  OPEN cur FOR
  SELECT VALUE(P)
  FROM table(DBMS_SQLTUNE.SELECT_WORKLOAD_REPOSITORY(1,2)) P;
  DBMS_SQLTUNE.LOAD_SQLSET(sqlset_name => 'my_workload', populate_cursor =>
cur);
END;
/

```

The next example demonstrates a load with `UPDATE` option. This updates statements that already exist in the SQL tuning set but does not add new ones. By default, old statistics are replaced by their new values.

```

DECLARE
  cur sys_refcursor;
BEGIN
  OPEN cur FOR
  SELECT VALUE(P)
  FROM table(DBMS_SQLTUNE.SELECT_CURSOR_CACHE) P;

  DBMS_SQLTUNE.LOAD_SQLSET(sqlset_name      => 'my_workload',
                           populate_cursor => cur,
                           load_option     => 'UPDATE');
END;
/

```

175.5.20 PACK_STGTAB_SQLPROF Procedure

This procedure copies profile data from the `SYS.` schema into the staging table.

See Also:

[DBMS_SQLTUNE SQL Profile Subprograms](#) for other subprograms in this group

Syntax

```

DBMS_SQLTUNE.PACK_STGTAB_SQLPROF (
  profile_name      IN VARCHAR2 := '%',
  profile_category  IN VARCHAR2 := 'DEFAULT',

```

```

staging_table_name    IN VARCHAR2,
staging_schema_owner  IN VARCHAR2 := NULL);

```

Parameters

Table 175-27 PACK_STGTAB_SQLPROF Procedure Parameters

| Parameter | Description |
|----------------------|--|
| profile_name | The name of the profile to pack (% wildcards acceptable, case-sensitive) |
| profile_category | The category to pack profiles from (% wildcards acceptable, case-sensitive) |
| staging_table_name | The name of the table to use (case-insensitive unless double quoted). Required. |
| staging_schema_owner | The schema where the table resides, or NULL for current schema (case-insensitive unless double quoted) |

Security Model

This procedure requires `ADMINISTER SQL MANAGEMENT OBJECT` privilege and `INSERT` privilege on the staging table.

Usage Notes

This function issues a `COMMIT` after packing each SQL profile. If an error is raised mid-execution, then clear the staging table by deleting its rows.

Examples

Put only those profiles in the `DEFAULT` category into the staging table. This corresponds to all profiles used by default on this system.

```

EXEC DBMS_SQLTUNE.PACK_STGTAB_SQLPROF (staging_table_name =>
'PROFILE_STGTAB');

```

This is another example where you put all profiles into the staging table. Note this moves profiles that are not currently being used by default but are in other categories, such as for testing purposes.

```

EXEC DBMS_SQLTUNE.PACK_STGTAB_SQLPROF (profile_category => '%', -
staging_table_name =>
'PROFILE_STGTAB');

```

175.5.21 PACK_STGTAB_SQLSET Procedure

This procedure copies one or more SQL tuning sets from their location in the SYS schema to a staging table created by the CREATE_STGTAB_SQLSET procedure.

See Also:

[DBMS_SQLTUNE SQL Tuning Set Subprograms](#) for other subprograms in this group

Syntax

```
DBMS_SQLTUNE.PACK_STGTAB_SQLSET (
  sqlset_name          IN VARCHAR2,
  sqlset_owner         IN VARCHAR2 := NULL,
  staging_table_name   IN VARCHAR2,
  staging_schema_owner IN VARCHAR2 := NULL,
  db_version           IN NUMBER   := NULL);
```

Examples

Put all SQL tuning sets on the database in the staging table:

```
BEGIN
  DBMS_SQLTUNE.PACK_STGTAB_SQLSET(
    sqlset_name      => '%'
  , sqlset_owner    => '%'
  , staging_table_name => 'STGTAB_SQLSET');
END;
```

Put only those SQL tuning sets owned by the current user in the staging table:

```
BEGIN
  DBMS_SQLTUNE.PACK_STGTAB_SQLSET(
    sqlset_name      => '%'
  , staging_table_name => 'STGTAB_SQLSET');
END;
```

Pack a specific SQL tuning set:

```
BEGIN
  DBMS_SQLTUNE.PACK_STGTAB_SQLSET(
    sqlset_name      => 'my_workload'
  , staging_table_name => 'STGTAB_SQLSET');
END;
```

Pack a second SQL tuning set:

```
BEGIN
  DBMS_SQLTUNE.PACK_STGTAB_SQLSET(
    sqlset_name      => 'workload_subset'
  ,   staging_table_name => 'STGTAB_SQLSET');
END;
```

Pack the STS `my_workload_subset` into a staging table `stgtab_sqlset` created for Oracle Database 11g Release 1 (11.2):

```
BEGIN
  DBMS_SQLTUNE.PACK_STGTAB_SQLSET(
    sqlset_name      => 'workload_subset'
  ,   staging_table_name => 'STGTAB_SQLSET'
  ,   db_version      => DBMS_SQLTUNE.STS_STGTAB_11_2_VERSION);
END;
```

175.5.22 REMAP_STGTAB_SQLPROF Procedure

This procedure changes the profile data values kept in the staging table prior to performing an unpack operation.

You can use this procedure to change the category of a profile. You can also use it to change the name of a profile if one already exists on the system with the same name.

See Also:

[DBMS_SQLTUNE SQL Profile Subprograms](#) for other subprograms in this group

Syntax

```
DBMS_SQLTUNE.REMAP_STGTAB_SQLPROF (
  old_profile_name      IN VARCHAR2,
  new_profile_name      IN VARCHAR2 := NULL,
  new_profile_category  IN VARCHAR2 := NULL,
  staging_table_name    IN VARCHAR2,
  staging_schema_owner  IN VARCHAR2 := NULL);
```

Parameters

Table 175-28 REMAP_STGTAB_SQLPROF Procedure Parameters

| Parameter | Description |
|-------------------------------|--|
| <code>old_profile_name</code> | The name of the profile to target for a remap operation (case-sensitive) |

Table 175-28 (Cont.) REMAP_STGTAB_SQLPROF Procedure Parameters

| Parameter | Description |
|-----------------------------------|---|
| <code>new_profile_name</code> | The new name of the profile, or NULL to remain the same (case-sensitive) |
| <code>new_profile_category</code> | The new category for the profile, or NULL to remain the same (case-sensitive) |
| <code>staging_table_name</code> | The name of the table on which to perform the remap operation (case-sensitive). Required. |
| <code>staging_schema_owner</code> | The schema where the table resides, or NULL for current schema (case-sensitive) |

Security Model

This procedure requires the `UPDATE` privilege on the staging table.

Examples

Change the name of a profile before we unpack, to avoid conflicts

```
BEGIN
  DBMS_SQLTUNE.REMAP_STGTAB_SQLPROF(
    old_profile_name => :pname
  ,   new_profile_name => 'IMP' || :pname
  ,   staging_table_name => 'PROFILE_STGTAB');
END;
```

Change the SQL profile in the staging table to be 'TEST' category before we import it. This way users can test the profile on the new system before it is active.

```
BEGIN
  DBMS_SQLTUNE.REMAP_STGTAB_SQLPROF(
    old_profile_name => :pname
  ,   new_profile_category => 'TEST'
  ,   staging_table_name => 'PROFILE_STGTAB');
END;
```

175.5.23 REMAP_STGTAB_SQLSET Procedure

This procedure changes the tuning set names and owners in the staging table so that they can be unpacked with different values.

**See Also:**

[DBMS_SQLTUNE SQL Profile Subprograms](#) for other subprograms in this group

Syntax

```
DBMS_SQLTUNE.REMAP_STGTAB_SQLSET (
    old_sqlset_name      IN VARCHAR2,
    old_sqlset_owner    IN VARCHAR2 := NULL,
    new_sqlset_name     IN VARCHAR2 := NULL,
    new_sqlset_owner    IN VARCHAR2 := NULL,
    staging_table_name  IN VARCHAR2,
    staging_schema_owner IN VARCHAR2 := NULL,
    old_con_dbid        IN NUMBER   := NULL,
    new_con_dbid        IN NUMBER   := NULL);
);
```

Parameters

The parameters are identical for the DBMS_SQLTUNE.REMAP_STGTAB_SQLSET and DBMS_SQLSET.REMAP_SQLSET procedures.

Table 175-29 REMAP_STGTAB_SQLSET and REMAP_SQLSET Procedure Parameters

| Parameter | Description |
|----------------------|---|
| old_sqlset_name | Specifies the name of the tuning set to target for a remap operation. Wildcard characters (%) are not supported. |
| old_sqlset_owner | Specifies the new name of the tuning set owner to target for a remap operation. NULL for current schema owner |
| new_sqlset_name | Specifies the new name for the tuning set, or NULL to keep the same tuning set name. |
| new_sqlset_owner | Specifies the new owner for the tuning set, or NULL to keep the same owner name. |
| staging_table_name | Specifies the name of the table on which to perform the remap operation. The value is case sensitive. |
| staging_schema_owner | Specifies the name of staging table owner, or NULL for the current schema owner. The value is case sensitive. |
| old_con_dbid | Specifies the old container DBID to be remapped to a new container DBID. Specify NULL to use the same container DBID. You must provide both old_con_dbid and new_con_dbid for the remap to succeed. |
| new_con_dbid | Specifies the new container DBID to replace with the old container DBID. Specify NULL to use the same container DBID. You must provide both old_con_dbid and new_con_dbid for the remap to succeed. |

Usage Notes

Call this procedure multiple times to remap more than one tuning set name or owner. This procedure only handles one tuning set per call.

Examples

```
-- Change the name of an STS in the staging table before unpacking it.
BEGIN
```

```

    DBMS_SQLTUNE.REMAP_STGTAB_SQLSET(
        old_sqlset_name =>
'my_workload'
    ,   old_sqlset_owner => 'SH'
    ,   new_sqlset_name =>
'imp_workload'
    ,   staging_table_name => 'STGTAB_SQLSET');

-- Change the owner of an STS in the staging table before unpacking it.
DBMS_SQLTUNE.REMAP_STGTAB_SQLSET(
    old_sqlset_name => 'imp_workload'
    ,   old_sqlset_owner => 'SH'
    ,   new_sqlset_owner => 'SYS'
    ,   staging_table_name => 'STGTAB_SQLSET');
END;
```

175.5.24 REMOVE_SQLSET_REFERENCE Procedure

This procedure deactivates a SQL tuning set to indicate that it is no longer used by the client.

See Also:

[DBMS_SQLTUNE SQL Tuning Set Subprograms](#) for other subprograms in this group

Syntax

```

DBMS_SQLTUNE.REMOVE_SQLSET_REFERENCE (
    sqlset_name   IN  VARCHAR2,
    reference_id  IN  NUMBER,
    sqlset_owner  IN  VARCHAR2 := NULL,
    force_remove  IN  NUMBER   := 0);
```

Parameters

The parameters are identical for the `DBMS_SQLTUNE.REMOVE_SQLSET_REFERENCE` and `DBMS_SQLSET.REMOVE_REFERENCE` procedures.

Table 175-30 REMOVE_SQLSET_REFERENCE and REMOVE_REFERENCE Procedure Parameters

| Parameter | Description |
|---------------------------|--|
| <code>sqlset_name</code> | Specifies the name of the SQL tuning set. |
| <code>reference_id</code> | Specifies the identifier of the reference to remove. |
| <code>sqlset_owner</code> | Specifies the owner of the SQL tuning set (or <code>NULL</code> for the current schema owner). |

Table 175-30 (Cont.) REMOVE_SQLSET_REFERENCE and REMOVE_REFERENCE Procedure Parameters

| Parameter | Description |
|---------------------------|---|
| <code>force_remove</code> | Specifies whether references can be removed for other users (1) or whether they cannot be removed (0). Setting this parameter to 1 only takes effect when the user has the ADMINISTER ANY SQL TUNING SET privilege. Otherwise, the database only removes references owned by the user. |

Examples

You can remove references on a given SQL tuning set when you finish using it and want to make it writable again. The following example removes the reference to `my_workload`:

```
EXEC DBMS_SQLTUNE.REMOVE_SQLSET_REFERENCE( -
    sqlset_name => 'my_workload', -
    reference_id => :rid,
    sqlset_owner => NULL,
    force_remove => 0);
```

To find all references to a given SQL tuning set, query the `DBA_SQLSET_REFERENCES` view.

175.5.25 REPORT_AUTO_TUNING_TASK Function

This function displays a report from the automatic tuning task.

This function reports on a range of task executions, whereas the [REPORT_TUNING_TASK Function](#) reports on a single execution. Note that this function is deprecated with Oracle Database 11g Release 2 (11.2) in favor of `DBMS_AUTO_SQLTUNE.REPORT_AUTO_TUNING_TASK`.

See Also:

- [DBMS_SQLTUNE SQL Tuning Set Subprograms](#) for other subprograms in this group
- [REPORT_AUTO_TUNING_TASK Function](#)

Syntax

```
DBMS_SQLTUNE.REPORT_AUTO_TUNING_TASK(
    begin_exec    IN VARCHAR2 := NULL,
    end_exec      IN VARCHAR2 := NULL,
    type          IN VARCHAR2 := TYPE_TEXT,
    level         IN VARCHAR2 := LEVEL_TYPICAL,
    section       IN VARCHAR2 := SECTION_ALL,
```

```

object_id      IN NUMBER      := NULL,
result_limit   IN NUMBER      := NULL)
RETURN CLOB;
```

Parameters

Table 175-31 REPORT_AUTO_TUNING_TASK Function Parameters

| Parameter | Description |
|--------------|--|
| begin_exec | Specifies the name of the execution from which to begin the report. NULL retrieves a report on the most recent run. |
| end_exec | Specifies the name of the execution at which to end the report. NULL retrieves a report on the most recent run. |
| type | Specifies the type of the report to produce. Possible values are TYPE_TEXT which produces a text report |
| level | Specifies the level of detail in the report: <ul style="list-style-type: none"> LEVEL_BASIC: simple version of the report. Just show info about the actions taken by the advisor. LEVEL_TYPICAL: show information about every statement analyzed, including requests not implemented. LEVEL_ALL: highly detailed report level, also provides annotations about statements skipped over. |
| section | Limits the report to a single section (ALL for all sections): <ul style="list-style-type: none"> SECTION_SUMMARY - summary information SECTION_FINDINGS - tuning findings SECTION_PLAN - explain plans SECTION_INFORMATION - general information SECTION_ERROR - statements with errors SECTION_ALL - all statements |
| object_id | Specifies the advisor framework object ID that represents a single statement to restrict reporting to. Specify NULL for all statements. Only valid for reports that target a single execution. |
| result_limit | Specifies the maximum number of SQL statements to show in the report. |

Return Values

A CLOB containing the desired report.

175.5.26 REPORT_SQL_DETAIL Function

This function builds a report for a specific SQLID. For each SQLID it gives various statistics and details as obtained from the v\$sql views and AWR.

See Also:

[DBMS_SQLTUNE SQL Performance Reporting Subprograms](#) for other subprograms in this group

Syntax

```

DBMS_SQLTUNE.REPORT_SQL_DETAIL (
  sql_id                IN  VARCHAR2  DEFAULT NULL,
  sql_plan_hash_value  IN  NUMBER     DEFAULT NULL,
  start_time           IN  DATE        DEFAULT NULL,
  duration             IN  NUMBER     DEFAULT NULL,
  inst_id              IN  NUMBER     DEFAULT NULL,
  dbid                 IN  NUMBER     DEFAULT NULL,
  event_detail        IN  VARCHAR2    DEFAULT 'YES',
  bucket_max_count    IN  NUMBER     DEFAULT 128,
  bucket_interval     IN  NUMBER     DEFAULT NULL,
  top_n                IN  NUMBER     DEFAULT 10,
  report_level        IN  VARCHAR2    DEFAULT 'TYPICAL',
  type                IN  VARCHAR2    DEFAULT 'ACTIVE',
  data_source         IN  VARCHAR2    DEFAULT 'AUTO',
  end_time             IN  DATE        DEFAULT NULL,
  duration_stats      IN  NUMBER     DEFAULT NULL,
  con_name            IN  VARCHAR2    DEFAULT NULL)
RETURN CLOB;

```

Parameters

Table 175-32 REPORT_SQL_DETAIL Function Parameters

| Parameter | Description |
|---------------------|---|
| sql_id | SQLID for which monitoring information should be displayed. If NULL (the default), display statistics for the SQLID of the last SQL statement executed in the current session. |
| sql_plan_hash_value | Displays SQL statistics and details for a specific plan_hash_value. If NULL (default), displays statistics and details for all plans of the SQL_ID. |
| start_time | If specified, shows SQL activity (from GV\$ACTIVE_SESSION_HISTORY) starting at this time. On Oracle RAC, the minimum start_time is the earliest sample_time of the in-memory ASH buffers across all instances. If NULL (default), one hour before the current time. |
| duration | Duration of activity in seconds for the report. If NULL (default) uses a value of 1 hour. |
| inst_id | Target instance to get SQL details from. If NULL, uses data from all instances. If 0 or -1, uses current instance. |
| dbid | DBID from which to get SQL details. If NULL, uses current DBID. |
| event_detail | When set to 'NO', the activity is aggregated by wait_class only. Use 'YES' (the default) to aggregate by (wait_class, event_name). |
| bucket_max_count | If specified, this should be the maximum number of histogram buckets created in the report. If not specified, a value of 128 is used. |
| bucket_interval | If specified, this represents the exact time interval in seconds, of all histogram buckets. If specified, bucket_max_count is ignored. |
| top_n | Controls the number of entries to display per dimension in the top dimensions section. If not specified, a default value of 10 is used. |

Table 175-32 (Cont.) REPORT_SQL_DETAIL Function Parameters

| Parameter | Description |
|--------------|---|
| report_level | <p>Level of detail for the report, either 'BASIC', 'TYPICAL' or 'ALL'. Default assumes 'TYPICAL'. Their meanings are explained below.</p> <p>In addition, individual report sections can also be enabled or disabled by using a +/- <i>section_name</i>. Several sections are defined:</p> <ul style="list-style-type: none"> 'TOP' - Show top values for the ASH dimensions for a SQL statement; ON by default 'SPM' - Show existing plan baselines for a SQL statement; OFF by default 'MISMATCH' - Show reasons for creating new child cursors (sharing criteria violations); OFF by default. 'STATS' - Show SQL execution statistics per plan from GV\$SQLAREA_PLAN_HASH; ON by default 'ACTIVITY' - Show top activity from ASH for each plan of a SQL statement; ON by default 'ACTIVITY_ALL' - Show top activity from ASH for each line of the plan for a SQL statement; OFF by default 'HISTOGRAM' - Show activity histogram for each plan of a SQL statement (plan time line histogram); ON by default 'SESSIONS' - Show activity for top sessions for each plan of a SQL statement; OFF by default 'MONITOR' - Show show one monitored SQL execution per execution plan; ON by default 'XPLAN' - Show execution plans; ON by default 'BINDS' - show captured bind data; ON by default <p>In addition, SQL text can be specified at different levels:</p> <ul style="list-style-type: none"> -SQL_TEXT - No SQL text in report +SQL_TEXT - OK with partial SQL text up to the first 2000 chars as stored in GV\$SQL_MONITOR -SQL_FULLTEXT - No full SQL text (+SQL_TEXT) +SQL_FULLTEXT - Show full SQL text (default value) <p>The meanings of the three top-level report levels are:</p> <ul style="list-style-type: none"> NONE - minimum possible BASIC - SQL_TEXT+STATS+ACTIVITY+HISTOGRAM TYPICAL - SQL_FULLTEXT+TOP+STATS+ACTIVITY+HISTOGRAM+XPLAN+MONITOR ALL - everything <p>Only one of these 4 levels can be specified and, if it is, it has to be at the start of the REPORT_LEVEL string</p> |
| type | <p>Report format: 'ACTIVE' by default. Can also be 'XML' (see Usage Notes).</p> |
| data_source | <p>Determines the data source of SQL data based on one of the following values:</p> <ul style="list-style-type: none"> MEMORY: The data source is GV\$ view DISK: The data source is DBA_HIST_* view AUTO: Automatically determines the data source based on the time frame (default) |

Table 175-32 (Cont.) REPORT_SQL_DETAIL Function Parameters

| Parameter | Description |
|----------------|--|
| end_time | If specified, shows SQL activity from start_time to end_time. If NULL (default), shows SQL activity for systimestamp. |
| duration_stats | Duration of additional SQL execution statistics from AWR (in hours), for the report. If NULL (default), then the duration of 24 hours is considered. |
| con_name | Name of the multitenant container database (CDB). |

Security Model

The invoker needs the EXECUTE privilege on the [DBMS_XPLAN](#) package.

Return Values

A CLOB containing the desired report.

Usage Notes

- ACTIVE reports have a rich, interactive user interface similar to Enterprise Manager while not requiring any EM installation. The report file built is in HTML format, so it can be interpreted by most modern browsers. The code powering the active report is downloaded transparently by the web browser when the report is first viewed, hence viewing it requires outside connectivity.
- The invoker needs the SELECT or READ privilege on the following views:
 - V\$SESSION
 - DBA_ADVISOR_FINDINGS
 - V\$DATABASE
 - GV\$ASH_INFO
 - GV\$ACTIVE_SESSION_HISTORY
 - GV\$SQLAREA_PLAN_HASH
 - GV\$SQL
 - DBA_HIST_SNAPSHOT
 - DBA_HIST_WR_CONTROL
 - DBA_HIST_ACTIVE_SESS_HISTORY
 - DBA_HIST_SQLSTAT
 - DBA_HIST_SQL_BIND_METADATA
 - DBA_HIST_SQLTEXT
 - DBA_SQL_PLAN_BASELINES
 - DBA_SQL_PROFILES
 - DBA_ADVISOR_TASKS
 - DBA_SERVICES

- DBA_USERS
- DBA_OBJECTS
- DBA_PROCEDURES

175.5.27 REPORT_SQL_MONITOR Function

This function builds a report (text, simple HTML, active HTML, XML) for the monitoring information collected on behalf of the targeted statement execution.

See Also:

[Real-Time SQL Monitoring](#) for other subprograms in this group

Syntax

```
DBMS_SQLTUNE.REPORT_SQL_MONITOR (
  sql_id                IN VARCHAR2  DEFAULT NULL,
  dbop_name             IN VARCHAR2  DEFAULT NULL,
  dbop_exec_id         IN NUMBER     DEFAULT NULL,
  session_id           IN NUMBER     DEFAULT NULL,
  session_serial       IN NUMBER     DEFAULT NULL,
  sql_exec_start       IN DATE       DEFAULT NULL,
  sql_exec_id         IN NUMBER     DEFAULT NULL,
  inst_id              IN NUMBER     DEFAULT NULL,
  start_time_filter    IN DATE       DEFAULT NULL,
  end_time_filter      IN DATE       DEFAULT NULL,
  instance_id_filter  IN NUMBER     DEFAULT NULL,
  parallel_filter      IN VARCHAR2  DEFAULT NULL,
  plan_line_filter    IN NUMBER     DEFAULT NULL,
  event_detail         IN VARCHAR2  DEFAULT 'YES',
  bucket_max_count    IN NUMBER     DEFAULT 128,
  bucket_interval     IN NUMBER     DEFAULT NULL,
  base_path            IN VARCHAR2  DEFAULT NULL,
  last_refresh_time   IN DATE       DEFAULT NULL,
  report_level        IN VARCHAR2  DEFAULT 'TYPICAL',
  type                IN VARCHAR2  DEFAULT 'TEXT',
  sql_plan_hash_value IN NUMBER     DEFAULT NULL,
  con_name            IN VARCHAR2  DEFAULT NULL,
  report_id           IN NUMBER     DEFAULT NULL)
RETURN CLOB;
```

Parameters

Table 175-33 REPORT_SQL_MONITOR Function Parameters

| Parameter | Description |
|-----------|--|
| sql_id | SQL_ID for which monitoring information should be displayed. Use NULL (the default) to report on the last statement monitored by Oracle. |

Table 175-33 (Cont.) REPORT_SQL_MONITOR Function Parameters

| Parameter | Description |
|--------------------|---|
| dbop_name | DBOP_NAME for which monitoring information of the composite database operation is displayed. |
| dbop_exec_id | Execution ID for the composite database operation for which monitoring information is displayed. |
| session_id | If not NULL, this parameters targets only the sub-set of statements executed by the specified session. Default is NULL. Use USERENV('SID') for current session. |
| session_serial | In addition to the session_id parameter, one can also specify its session serial to ensure that the desired session incarnation is targeted. This parameter is ignored when session_id is NULL. |
| sql_exec_start | This parameter, along with sql_exec_id, is only applicable when sql_id is also specified. Jointly, they can be used to display monitoring information associated to any execution of the statement identified by sql_id, assuming that this statement was monitored. When NULL (the default), the last monitored execution of SQL sql_id is shown. |
| sql_exec_id | This parameter, along with sql_exec_start, is only applicable when sql_id is also specified. Jointly, they can be used to display monitoring information associated to any execution of the statement identified by sql_id, assuming that this statement was monitored. When NULL (the default), the last monitored execution of SQL sql_id is shown. |
| inst_id | Only considers statements started on the specified instance. Use -1 to target the login instance. NULL (default) targets all instances. |
| start_time_filter | If not NULL, the report considers only the activity (from GV\$ACTIVE_SESSION_HISTORY) recorded after the specified date. If NULL, the reported activity starts when the execution of the targeted SQL statement has started. |
| end_time_filter | If not NULL, the report shows only the activity (from GV\$ACTIVE_SESSION_HISTORY) collected before the date end_time_filter. If NULL, the reported activity ends when the targeted SQL statement execution has ended or is the current time if the statement is still executing. |
| instance_id_filter | Only applies when the execution runs parallel across multiple Oracle Real Application Cluster (Oracle RAC) instances. This parameter allows to only report the activity of the specified instance. Use a NULL value (the default) to include the activity on all instances where the parallel query was executed. |

Table 175-33 (Cont.) REPORT_SQL_MONITOR Function Parameters

| Parameter | Description |
|--------------------------------|--|
| <code>parallel_filter</code> | <p>Applies only to parallel execution and allows reporting the activity of only a subset of the processes involved in the parallel execution (Query Coordinator and/or Parallel eXecution servers). The value of this parameter can be:</p> <ul style="list-style-type: none"> • NULL to target all processes • <code>[qc][servers(<svr_grp>[,] <svr_set>[,] <srv_num>)]</code>: 'qc' stands for query coordinator and <code>servers()</code> stipulate which PX servers to consider. <p>The following examples show how to target a subset of the parallel processes:</p> <ul style="list-style-type: none"> • <code>qc</code>: targets only the query coordinator • <code>servers(1)</code>: targets all parallel execution servers in group number 1. Note that statement running parallel have one main server group (group number 1) plus one additional group for each nested sub-query running parallel. • <code>servers(,2)</code>: targets all parallel execution servers from any group but only running in set 1 of each group (each group has at most two set of parallel execution servers) • <code>servers(1,1)</code>: consider only group 1, set 1 • <code>servers(1,2,4)</code>: consider only group 1, set 2, server number 4. This reports for a single parallel server process • <code>qc servers(1,2,4)</code>: same as above by also including the query coordinator |
| <code>event_detail</code> | <p>When value is 'YES' (the default), reported activity from <code>GV\$ACTIVE_SESSION_HISTORY</code> is aggregated by (<code>wait_class</code>, <code>event_name</code>). Use 'NO' to only aggregate by <code>wait_class</code>.</p> |
| <code>bucket_max_count</code> | <p>If specified, this should be the maximum number of histogram buckets created in the report</p> |
| <code>bucket_interval</code> | <p>If specified, this represents the exact time interval in seconds, of all histogram buckets. If specified, <code>bucket_max_count</code> is ignored.</p> |
| <code>base_path</code> | <p>URL path for flex HTML resources since flex HTML format is required to access external files (java scripts and the flash SWF file itself)</p> |
| <code>last_refresh_time</code> | <p>If not NULL (default is NULL), the time when the report was last retrieved (see <code>SYSDATE</code> attribute of the report tag). Use this option to display the report of a running query, and when the report is refreshed on a regular basis. This optimizes the size of the report since only the new or changed information is returned. In particular, the following are optimized:</p> <ul style="list-style-type: none"> • SQL text is not returned when this option is specified • activity histogram starts at the bucket that intersect at that time. The entire content of the bucket is returned, even if <code>last_refresh_time</code> is after the start of that bucket |

Table 175-33 (Cont.) REPORT_SQL_MONITOR Function Parameters

| Parameter | Description |
|-----------------------|--|
| report_level | <p>Level of detail for the report: 'NONE', 'BASIC', 'TYPICAL' or 'ALL'. Default assumes 'TYPICAL'.</p> <p>In addition, individual report sections can also be enabled or disabled by using a +/- <i>section_name</i>. Several sections are defined:</p> <ul style="list-style-type: none"> 'XPLAN' - Show explain plan; ON by default 'PLAN' - Show plan monitoring statistics; ON by default 'SESSIONS' - Show session details. Applies only to parallel queries; ON by default 'INSTANCE' - Show instance details. Applies only to parallel and cross instance; ON by default 'PARALLEL' - An umbrella parameter for specifying sessions+instance details 'ACTIVITY' - Show activity summary at global level, plan line level and session or instance level (if applicable); ON by default 'BINDS' - Show bind information when available; ON by default 'METRICS' - Show metric data (CPU, I/Os, ...) over time; ON by default 'ACTIVITY_HISTOGRAM' - Show an histogram of the overall query activity; ON by default 'PLAN_HISTOGRAM' - Show activity histogram at plan line level; OFF by default 'OTHER' - Other info; ON by default <p>In addition, SQL text can be specified at different levels:</p> <ul style="list-style-type: none"> SQL_TEXT - No SQL text in report +SQL_TEXT - OK with partial SQL text up to the first 2000 chars as stored in GV\$SQL_MONITOR -SQL_FULLTEXT - No full SQL text (+SQL_TEXT) +SQL_FULLTEXT - Show full SQL text (default value) |
| report_level (contd.) | <p>The meanings of the three top-level report levels are:</p> <ul style="list-style-type: none"> NONE - minimum possible +BASIC - SQL_TEXT-PLAN-XPLAN-SESSIONS-INSTANCE-ACTIVITY_HISTOGRAM-PLAN_HISTOGRAM-METRICS TYPICAL - everything but PLAN_HISTOGRAM ALL - everything <p>Only one of these 4 levels can be specified and, if it is, it has to be at the start of the REPORT_LEVEL string</p> |
| type | Report format, 'TEXT' by default. Can be 'TEXT', 'HTML', 'XML' or 'ACTIVE' (see Usage Notes). |
| sql_plan_hash_value | Target only those SQL executions with the specified plan_hash_value. Default is NULL. |
| con_name | Name of the multitenant container database (CDB). |
| report_id | ID of the report in auto-report repository. Report IDs can be found in DBA_HIST_REPORTS. |

Return Values

A CLOB containing the desired report.

Usage Notes

- The target SQL statement for this report can be:
 - The most recent SQL statement monitored by Oracle Database. This is the default behavior, so there is no need to specify any parameter.
 - The most recent SQL statement executed by a specific session and monitored by Oracle. The session is identified by its session id and optionally its serial number. For example, use `session_id =>` for the current session or `session_id => 20, session_serial => 103` for session ID 20, serial number 103.
 - The most recent execution of a specific statement identified by its `sql_id`.
 - A specific execution of a SQL statement identified by its execution key (`sql_id`, `sql_exec_start` and `sql_exec_id`).
- This report produces performance data exposed by several fixed views, listed below. For this reason, the invoker of the report function must have privilege to select data from these fixed views (such as the `SELECT_CATALOG` role).
 - `GV$SQL_MONITOR`
 - `GV$SQL_PLAN_MONITOR`
 - `GV$SQL_PLAN`
 - `GV$ACTIVE_SESSION_HISTORY`
 - `GV$SESSION_LONGOPS`
 - `GV$SQL`
- The `bucket_max_count` and `bucket_interval` parameters control the activity histogram. By default, the maximum number of buckets is set to 128. The database derives the `bucket_interval` value based on this count. The `bucket_interval` (value is in seconds) is computed such that it is the smallest possible power of 2 value (starting at 1 second) without exceeding the maximum number of buckets. For example, if the query has executed for 600 seconds, then the database selects a `bucket_interval` of 8 seconds (a power of two). The database chooses the value of 8 because $600/8 = 74$, which is less than 128 buckets maximum. Smaller than 8 seconds would be 4 seconds, which would lead to more buckets than the 128 maximum. If `bucket_interval` is specified, then the database uses the specified value instead of deriving it from `bucket_max_count`.
- `ACTIVE` reports have a rich, interactive user interface similar to Enterprise Manager, while not requiring any EM installation.

The report file is in HTML format. The code powering the active report is downloaded transparently by the web browser when the report is first viewed. Therefore, viewing the report requires outside connectivity.

 **See Also:**

Oracle Database SQL Tuning Guide for more information about SQL real-time monitoring.

175.5.28 REPORT_SQL_MONITOR_LIST Function

This function builds a report for all or a subset of statements monitored by Oracle Database. For each statement, the subprogram gives key information and associated global statistics.

Use the [REPORT_SQL_MONITOR Function](#) to get detailed monitoring information for a single SQL statement.

 **See Also:**

[Real-Time SQL Monitoring](#) for other subprograms in this group

Syntax

```
DBMS_SQLTUNE.REPORT_SQL_MONITOR_LIST (
  sql_id                IN VARCHAR2  DEFAULT NULL,
  session_id            IN NUMBER    DEFAULT NULL,
  session_serial        IN NUMBER    DEFAULT NULL,
  inst_id               IN NUMBER    DEFAULT NULL,
  active_since_date     IN DATE      DEFAULT NULL,
  active_since_sec      IN NUMBER    DEFAULT NULL,
  active_before_date    IN DATE      DEFAULT NULL,
  last_refresh_time     IN DATE      DEFAULT NULL,
  dbop_name             IN VARCHAR2  DEFAULT NULL,
  monitor_type          IN NUMBER    DEFAULT MONITOR_TYPE_ALL,
  max_sqltext_length    IN NUMBER    DEFAULT NULL,
  top_n_count           IN NUMBER    DEFAULT NULL,
  top_n_rankby          IN VARCHAR2  DEFAULT 'LAST_ACTIVE_TIME',
  report_level          IN VARCHAR2  DEFAULT 'TYPICAL',
  auto_refresh          IN NUMBER    DEFAULT NULL,
  base_path             IN VARCHAR2  DEFAULT NULL,
  type                  IN VARCHAR2  DEFAULT 'TEXT',
  con_name              IN VARCHAR2  DEFAULT NULL,
  top_n_detail_count    IN NUMBER    DEFAULT NULL)
RETURN CLOB;
```

Parameters

Table 175-34 REPORT_SQL_MONITOR_LIST Function Parameters

| Parameter | Description |
|--------------------|--|
| sql_id | SQL_ID for which monitoring information should be displayed. Use NULL (the default) to report on the last statement monitored by Oracle. |
| session_id | If not NULL, then this parameter targets only the subset of statements executed by the specified session. Default is NULL. Use -1 or USERENV('SID') for current session. |
| session_serial | In addition to the session_id parameter, you can also specify its session serial to ensure that the desired session incarnation is targeted. This parameter is ignored when session_id is NULL. |
| inst_id | Only considers statements started on the specified instance. Use -1 to target the login instance. NULL (default) targets all instances. |
| active_since_date | If not NULL (default), returns only monitored statements active since the specified time. This includes all statements that are still executing along with all statements that have completed their execution after the specified date and time. |
| active_since_sec | Same as active_since_date but with the date specified relative to the current SYSDATE minus a specified number of seconds. For example, use 3600 to apply a limit of 1 hour. |
| active_before_date | If not NULL (default), returns only monitored statements that have been active before the specified date and time. |
| last_refresh_time | If not NULL (default), the date and time when the list report was last retrieved. This optimizes the case where an application shows the list and refreshes the report on a regular basis (such as once every 5 seconds). In this case, the report shows detail about the execution of monitored queries that active since the specified last_refresh_time. For other queries, the report returns the execution key (sql_id, sql_exec_start, sql_exec_id). For queries with a first refresh time after the specified date, the function returns only the SQL execution key and statistics. |
| dbop_name | DB operation name. Specify NULL to display all the monitored DB operations. |
| monitor_type | Type of the SQL Monitor operation. Specify one of the following values: <ul style="list-style-type: none"> MONITOR_TYPE_SQL - Returns only SQL statements MONITOR_TYPE_DBOP - Returns only database operations MONITOR_TYPE_ALL - Returns SQL statements as well as database operations |
| max_sqltext_length | Maximum length of the SQL text. Default is NULL (no limit). |
| top_n_count | Limits the number of top-N SQL statements that need to be included in the report. |

Table 175-34 (Cont.) REPORT_SQL_MONITOR_LIST Function Parameters

| Parameter | Description |
|--------------------|---|
| top_n_rankby | Specifies the attribute to rank the SQL statements. Specify this value when top_n_count value is not NULL. The ranking of an SQL statement is done based on one of the following values: <ul style="list-style-type: none"> LAST_ACTIVE_TIME - Last active date and time (top N most recent) DURATION - Total duration of execution DB_TIME - DB time used CPU_TIME - CPU time used IO_REQUESTS - Number of I/O requests IO_BYTES - Number of I/O bytes |
| report_level | Level of detail for the report. The level is one of the following: <ul style="list-style-type: none"> BASIC - SQL text up to 200 characters TYPICAL - include full SQL text assuming that cursor has not aged out, in which case the SQL text is included up to 2000 characters ALL - currently the same as TYPICAL |
| auto_refresh | Currently non-operational, reserved for future use. |
| base_path | URL path for flex HTML resources because flex HTML format is required to access external files (java scripts and the flash SWF file itself). |
| type | Report format: TEXT (default), HTML, or XML. |
| con_name | Name of the multitenant container database (CDB) |
| top_n_detail_count | Limits the number of top-N SQL statements for which the SQL monitor details need to be included in the report. |

Return Values

A report for the list of SQL statements that have been monitored. The report type is text, XML, or HTML.

Usage Notes

You must have the privilege to access the following fixed views: GV\$SQL_MONITOR and GV\$SQL.

See Also:

Oracle Database SQL Tuning Guide for more information about SQL real-time monitoring.

175.5.29 REPORT_TUNING_TASK Function

This function displays the results of a tuning task. By default the report is in text format.

See Also:

[DBMS_SQLTUNE SQL Performance Reporting Subprograms](#) for other subprograms in this group

Syntax

```
DBMS_SQLTUNE.REPORT_TUNING_TASK (
  task_name          IN   VARCHAR2,
  type               IN   VARCHAR2   := 'TEXT',
  level              IN   VARCHAR2   := 'TYPICAL',
  section            IN   VARCHAR2   := ALL,
  object_id          IN   NUMBER     := NULL,
  result_limit       IN   NUMBER     := NULL,
  owner_name         IN   VARCHAR2   := NULL,
  execution_name     IN   VARCHAR2   := NULL,
  database_link_to  IN   VARCHAR2   := NULL)
RETURN CLOB;
```

Parameters

Table 175-35 REPORT_TUNING_TASK Function Parameters

| Parameter | Description |
|-----------|---|
| task_name | Name of the tuning task. |
| type | Type of the report to produce. Possible values are <code>TEXT</code> which produces a text report. |
| level | Level of detail in the report: <ul style="list-style-type: none"> <code>BASIC</code>: simple version of the report. Just show info about the actions taken by the advisor. <code>TYPICAL</code>: show information about every statement analyzed, including requests not implemented. <code>ALL</code>: highly detailed report level, also provides annotations about statements skipped over. |
| section | Section of the report to include. You can limit the report to any of the following single sections (<code>ALL</code> for all sections): <ul style="list-style-type: none"> <code>SUMMARY</code> - Summary information <code>FINDINGS</code> - Tuning findings <code>PLAN</code> - Explain plans <code>INFORMATION</code> - General information <code>ERROR</code> - Statements with errors <code>ALL</code> - All statements |

Table 175-35 (Cont.) REPORT_TUNING_TASK Function Parameters

| Parameter | Description |
|------------------|--|
| object_id | Advisor framework object ID that represents a single statement to restrict reporting to. NULL for all statements. Only valid for reports that target a single execution. |
| result_limit | Maximum number of SQL statements to show in the report. |
| owner_name | Owner of the relevant tuning task. The default is the current schema owner. |
| execution_name | Name of the task execution to use. If NULL, then the function generates the report for the last task execution. |
| database_link_to | Name of a database link that exists on a standby database. The link specifies the connection to a primary database. By default, the value is null, which means that the SQL Tuning Advisor session is local. Use DBMS_SQLTUNE to tune high-load SQL statements running on a standby database in an Active Data Guard scenario. When you execute REPORT_TUNING_TASK locally on the standby database, the function uses the database link to obtain the data from the primary database, and then constructs it locally on the standby database. The database_link_to parameter must specify a private database link. This link must be owned by SYS and accessed by the default privileged user SYS\$UMF. The following sample statement creates a link named lnk_to_pri: <pre>CREATE DATABASE LINK lnk_to_pri CONNECT TO SYS\$UMF IDENTIFIED BY password USING 'inst1';</pre> |

Return Values

A CLOB containing the desired report.

Examples

```
-- Display the report for a single statement.
SELECT DBMS_SQLTUNE.REPORT_TUNING_TASK(:stmt_task)
FROM DUAL;

-- Display the summary for a SQL tuning set.
SELECT DBMS_SQLTUNE.REPORT_TUNING_TASK(:sts_task, 'TEXT', 'TYPICAL',
'SUMMARY')
FROM DUAL;

-- Display the findings for a specific statement.
SELECT DBMS_SQLTUNE.REPORT_TUNING_TASK(:sts_task, 'TEXT',
'TYPICAL','FINDINGS', 5)
FROM DUAL;
```

175.5.30 REPORT_TUNING_TASK_XML Function

This function displays an XML report of a tuning task.

See Also:

[DBMS_SQLTUNE SQL Performance Reporting Subprograms](#) for other subprograms in this group

Syntax

```
DBMS_SQLTUNE.REPORT_TUNING_TASK_LIST_XML(
  task_name      IN   VARCHAR2      := NULL,
  level          IN   VARCHAR2      := LEVEL_TYPICAL,
  section        IN   VARCHAR2      := SECTION_ALL,
  object_id      IN   NUMBER         := NULL,
  result_limit   IN   NUMBER         := 160,
  owner_name     IN   VARCHAR2      := NULL,
  execution_name IN   VARCHAR2      := NULL,
  autotune_period IN NUMBER         := NULL,
  report_tag     IN   VARCHAR2      := NULL)
RETURN XMLTYPE;
```

Parameters

Table 175-36 REPORT_TUNING_TASK_XML Function Parameters

| Parameter | Description |
|-----------|--|
| task_name | Name of the tuning task. |
| level | Level of detail in the report: <ul style="list-style-type: none"> BASIC: simple version of the report. Just show info about the actions taken by the advisor. TYPICAL: show information about every statement analyzed, including requests not implemented. ALL: highly detailed report level, also provides annotations about statements skipped over. |
| section | Section of the report to include. You can limit the report to any of the following single sections (ALL for all sections): <ul style="list-style-type: none"> SUMMARY - Summary information ALL - All statements |
| object_id | Advisor framework object ID that represents a single statement to restrict reporting to. NULL for all statements. Only valid for reports that target a single execution. |

Table 175-36 (Cont.) REPORT_TUNING_TASK_XML Function Parameters

| Parameter | Description |
|-----------------|---|
| result_limit | The number of statements in a SQL tuning set or snapshot range for which the report is generated. The default is 160 (20 statements * 8 categories). The categories are as follows: <ul style="list-style-type: none"> • Profile • Index • Restructure SQL • Alternate plan • Statistics • Errors • Information • No findings |
| owner_name | Owner of the relevant tuning task. The default is the current schema owner. |
| execution_name | Name of the task execution to use. If NULL, then the function generates the report for the most recent task execution. |
| autotune_period | The time period for the automatic SQL tuning. This setting applies only to the automatic SQL Tuning Advisor task. Possible values are as follows: <ul style="list-style-type: none"> • Null or negative value (default) — All or full. The result includes all task executions. • 0 — Result of the current or most recent task execution. • 1 — Result for the most recent 24-hour period. • 7 — Result for the most recent 7-day period. The procedure interprets any other value as the time of the most recent task execution minus the value of this argument. |
| report_tag | The name of the root XML tag. By default, the tag is the report reference generated by the reporting framework. |

Return Values

A CLOB containing the desired report.

175.5.31 RESET_TUNING_TASK Procedure

This procedure is called on a tuning task that is not currently executing to prepare it for re-execution.

 **See Also:**
[DBMS_SQLTUNE SQL Tuning Advisor Subprograms](#) for other subprograms in this group

Syntax

```
DBMS_SQLTUNE.RESET_TUNING_TASK(
  task_name          IN VARCHAR2);
```

Parameters

Table 175-37 RESET_TUNING_TASK Procedure Parameters

| Parameter | Description |
|-----------|--------------------------------------|
| task_name | The name of the tuning task to reset |

Examples

```
-- reset and re-execute a task
EXEC DBMS_SQLTUNE.RESET_TUNING_TASK(:sts_task);

-- re-execute the task
EXEC DBMS_SQLTUNE.EXECUTE_TUNING_TASK(:sts_task);
```

175.5.32 RESUME_TUNING_TASK Procedure

This procedure resumes a previously interrupted task that was created to process a SQL tuning set.

See Also:

[DBMS_SQLTUNE SQL Tuning Advisor Subprograms](#) for other subprograms in this group

Syntax

```
DBMS_SQLTUNE.RESUME_TUNING_TASK(
  task_name          IN VARCHAR2,
  basic_filter       IN VARCHAR2 := NULL);
```

Parameters

Table 175-38 RESUME_TUNING_TASK Procedure Parameters

| Parameter | Description |
|--------------|--|
| task_name | The name of the tuning task to resume. |
| basic_filter | A SQL predicate to filter the SQL from the SQL tuning set. Note that this filter is applied in conjunction with the parameter <code>basic_filteri</code> when calling CREATE_TUNING_TASK Functions . |

Usage Notes

Resuming a single SQL tuning task (a task that was created to tune a single SQL statement as compared to a SQL tuning set) is not supported.

Examples

```
-- Interrupt the task
EXEC DBMS_SQLTUNE.INTERRUPT_TUNING_TASK(:conc_task);

-- Once a task is interrupted, we can elect to reset it, resume it, or
check
-- out its results and then decide. For this example we will just
resume.

EXEC DBMS_SQLTUNE.RESUME_TUNING_TASK(:conc_task);
```

175.5.33 SCHEDULE_TUNING_TASK Function

This function creates a tuning task for a single SQL statement and schedules a DBMS_SCHEDULER job to execute the tuning task. One form of the function finds the information about the statement to be tuned in the shared SQL area, whereas the other finds the information in AWR.

See Also:

[DBMS_SQLTUNE SQL Tuning Advisor Subprograms](#) for other subprograms in this group

Syntax

Shared SQL Area Format:

```
DBMS_SQLTUNE.SCHEDULE_TUNING_TASK(
  sql_id          IN VARCHAR2,
  plan_hash_value IN NUMBER           := NULL,
  start_date      IN TIMESTAMP WITH TIME ZONE := NULL,
  scope           IN VARCHAR2         :=
SCOPE_COMPREHENSIVE,
  time_limit      IN NUMBER           := TIME_LIMIT_DEFAULT,
  task_name       IN VARCHAR2         := NULL,
  description     IN VARCHAR2         := NULL,
  con_name        IN VARCHAR2         := NULL)
RETURN VARCHAR2;
```

AWR Format:

```
DBMS_SQLTUNE.SCHEDULE_TUNING_TASK(
  begin_snap      IN NUMBER,
  end_snap        IN NUMBER,
```

```

sql_id          IN VARCHAR2,
plan_hash_value IN NUMBER           := NULL,
start_date      IN TIMESTAMP WITH TIME ZONE := NULL,
scope          IN VARCHAR2         := SCOPE_COMPREHENSIVE,
time_limit     IN NUMBER           := TIME_LIMIT_DEFAULT,
task_name      IN VARCHAR2         := NULL,
description    IN VARCHAR2         := NULL,
con_name       IN VARCHAR2         := NULL,
dbid          IN NUMBER           := NULL)
RETURN VARCHAR2;

```

Parameters

Table 175-39 SCHEDULE_TUNING_TASK Function Parameters

| Parameter | Description |
|-----------------|--|
| begin_snap | The beginning snapshot identifier. The range is exclusive, which means that SQL statements in this snapshot ID are not included. |
| end_snap | The end snapshot identifier. The range is inclusive, which means that SQL statements in this snapshot ID are included. |
| sql_id | The SQL ID of the statement to be tuned. |
| plan_hash_value | The plan hash value of the statement to be tuned. For example, the tuning job fetches captured binds for this SQL plan. |
| start_date | The date on which the schedule becomes valid. If null, then SQL Tuning Advisor immediately executes the task. |
| scope | The scope of the tuning job: limited, or comprehensive. |
| time_limit | The maximum duration in seconds for the SQL tuning session. |
| task_name | Optional SQL tuning task name. |
| description | Description of the SQL tuning session. The description can contain a maximum of 256 characters. |
| con_name | The container from which SQL Tuning Advisor accesses the SQL statement information. |
| dbid | DBID for imported or PDB-level AWR data. If NULL, then the current database DBID is used. |

Security Model

The caller must possess the `CREATE JOB` privilege for the job.

Return Values

A SQL tuning task name that is unique for each user. Multiple users can assign the same name to their advisor tasks.

Usage Notes

- The task is scheduled only once.
- The name of the scheduler job is created as follows:
`sqltune_job_taskid_orahash(systemtimestamp)`.

175.5.34 SCRIPT_TUNING_TASK Function

This function creates a SQL*Plus script which can then be executed to implement a set of SQL Tuning Advisor recommendations.

See Also:

[DBMS_SQLTUNE SQL Tuning Advisor Subprograms](#) for other subprograms in this group

Syntax

```
DBMS_SQLTUNE.SCRIPT_TUNING_TASK (
  task_name          IN VARCHAR2,
  rec_type           IN VARCHAR2  := REC_TYPE_ALL,
  object_id          IN NUMBER    := NULL,
  result_limit       IN NUMBER    := NULL,
  owner_name         IN VARCHAR2  := NULL,
  execution_name     IN VARCHAR2  := NULL,
  database_link_to  IN VARCHAR2  := NULL)
RETURN CLOB;
```

Parameters

Table 175-40 SCRIPT_TUNING_TASK Function Parameters

| Parameter | Description |
|----------------|--|
| task_name | Name of the tuning task for which to apply a script. |
| rec_type | Filter the script by types of recommendations to include. You can use any subset of the following values, separated by commas: 'ALL:' 'PROFILES' 'STATISTICS' 'INDEXES'. For example, a script with profiles and statistics would use the filter 'PROFILES, STATISTICS'. |
| object_id | Optionally filters by a single object ID. |
| result_limit | Optionally shows commands for only top <i>n</i> SQL (ordered by object_id and ignored if an object_id is also specified). |
| owner_name | Owner of the relevant tuning task. Defaults to the current schema owner. |
| execution_name | Name of the task execution to use. If NULL, the script is generated for the last task execution. |

Table 175-40 (Cont.) SCRIPT_TUNING_TASK Function Parameters

| Parameter | Description |
|------------------|---|
| database_link_to | <p>Name of a database link that exists on a standby database. The link specifies the connection to a primary database. By default, the value is null, which means that the SQL Tuning Advisor session is local.</p> <p>Use DBMS_SQLTUNE to tune high-load SQL statements running on a standby database in an Active Data Guard scenario. When you execute REPORT_TUNING_TASK locally on the standby database, the function uses the database link to obtain the data from the primary database, and then constructs it locally on the standby database.</p> <p>The database_link_to parameter must specify a private database link. This link must be owned by SYS and accessed by the default privileged user SYS\$UMF. The following sample statement creates a link named lnk_to_pri:</p> <pre>CREATE DATABASE LINK lnk_to_pri CONNECT TO SYS\$UMF IDENTIFIED BY password USING 'inst1';</pre> |

Return Values

Returns a script in the form of a CLOB.

Usage Notes

- After the script is returned, check it before executing it.
- Wrap with a call to DBMS_ADVISOR.CREATE_FILE to put it into a file.

Examples

```
SET LINESIZE 140

-- Get a script for all actions recommended by the task.
SELECT DBMS_SQLTUNE.SCRIPT_TUNING_TASK(:stmt_task) FROM DUAL;

-- Get a script of only the sql profiles we should create.
SELECT DBMS_SQLTUNE.SCRIPT_TUNING_TASK(:stmt_task, 'PROFILES') FROM DUAL;

-- Get a script of only stale / missing stats
SELECT DBMS_SQLTUNE.SCRIPT_TUNING_TASK(:stmt_task, 'STATISTICS') FROM DUAL;

-- Get a script with recommendations about only one SQL statement when we
have
-- tuned an entire STS.
SELECT DBMS_SQLTUNE.SCRIPT_TUNING_TASK(:sts_task, 'ALL', 5) FROM DUAL;
```

175.5.35 SELECT_CURSOR_CACHE Function

This function collects SQL statements from the shared SQL area.

See Also:

[DBMS_SQLTUNE SQL Tuning Set Subprograms](#) for other subprograms in this group

Syntax

```
DBMS_SQLTUNE.SELECT_CURSOR_CACHE (
  basic_filter      IN   VARCHAR2 := NULL,
  object_filter    IN   VARCHAR2 := NULL,
  ranking_measure1 IN   VARCHAR2 := NULL,
  ranking_measure2 IN   VARCHAR2 := NULL,
  ranking_measure3 IN   VARCHAR2 := NULL,
  result_percentage IN   NUMBER   := 1,
  result_limit     IN   NUMBER   := NULL,
  attribute_list   IN   VARCHAR2 := NULL,
  recursive_sql    IN   VARCHAR2 := HAS_RECURSIVE_SQL)
RETURN sys.sqlset PIPELINED;
```

Parameters

Table 175-41 SELECT_CURSOR_CACHE Function Parameters

| Parameter | Description |
|-------------------------|---|
| basic_filter | Specifies the SQL predicate that filters the SQL from the shared SQL area defined on attributes of the SQLSET_ROW. If basic_filter is not set by the caller, then the subprogram captures only statements of the type CREATE TABLE, INSERT, SELECT, UPDATE, DELETE, and MERGE. |
| object_filter | Currently not supported. |
| ranking_measure(n)) | Defines an ORDER BY clause on the selected SQL. |
| result_percentage | Specifies a filter that picks the top n% according to the supplied ranking measure. The value applies only if one ranking measure is supplied. |
| result_limit | Defines the top limit SQL from the filtered source ranked by the ranking measure. |

Table 175-41 (Cont.) SELECT_CURSOR_CACHE Function Parameters

| Parameter | Description |
|-----------------------------|--|
| <code>attribute_list</code> | <p>Specifies the list of SQL statement attributes to return in the result.</p> <p>Possible values are:</p> <ul style="list-style-type: none"> • <code>TYPICAL</code> — Specifies <code>BASIC</code> plus SQL plan (without row source statistics) and without object reference list (default). • <code>BASIC</code> — Specifies all attributes (such as execution statistics and binds) except the plans. The execution context is always part of the result. • <code>ALL</code> — Specifies all attributes. • Comma-separated list of attribute names. <p>This values returns only a subset of SQL attributes:</p> <ul style="list-style-type: none"> – <code>EXECUTION_STATISTICS</code> – <code>BIND_LIST</code> – <code>OBJECT_LIST</code> – <code>SQL_PLAN</code> – <code>SQL_PLAN_STATISTICS</code> — Similar to <code>SQL_PLAN</code> plus row source statistics |
| <code>recursive_sql</code> | <p>Specifies that the filter must include recursive SQL in the SQL tuning set (<code>HAS_RECURSIVE_SQL</code>, which is the default) or exclude it (<code>NO_RECURSIVE_SQL</code>).</p> |

Return Values

This function returns a one `SQLSET_ROW` per `SQL_ID` or `PLAN_HASH_VALUE` pair found in each data source.

Usage Notes

- Filters provided to this function are evaluated as part of a SQL run by the current user. As such, they are executed with that user's security privileges and can contain any constructs and subqueries that user can access, but no more.
- Users need privileges on the shared SQL area views.

Examples

```
-- Get sql ids and sql text for statements with 500 buffer gets.
SELECT sql_id, sql_text
FROM table(DBMS_SQLTUNE.SELECT_CURSOR_CACHE('buffer_gets > 500'))
ORDER BY sql_id;

-- Get all the information we have about a particular statement.
SELECT *
FROM table(DBMS_SQLTUNE.SELECT_CURSOR_CACHE('sql_id = ''4rm4183czbs7j''));

-- Notice that some statements can have multiple plans. The output of the
-- SELECT_XXX table functions is unique by (sql_id, plan_hash_value). This
-- is
-- because a data source can store multiple plans per sql statement.
SELECT sql_id, plan_hash_value
FROM table(dbms_sqltune.select_cursor_cache('sql_id = ''ay1m3ssvtrh24''))
```

```
ORDER BY sql_id, plan_hash_value;

-- PL/SQL examples: load_sqlset is called after opening a cursor,
along the
-- lines given below

-- Select all statements in the shared SQL area.
DECLARE
  cur sys_refcursor;
BEGIN
  OPEN cur FOR
    SELECT value(P)
    FROM table(DBMS_SQLTUNE.SELECT_CURSOR_CACHE) P;

  -- Process each statement (or pass cursor to load_sqlset).

  CLOSE cur;
END;/

-- Look for statements not parsed by SYS.
DECLARE
  cur sys_refcursor;
BEGIN
  OPEN cur for
    SELECT VALUE(P)
    FROM table(
      DBMS_SQLTUNE.SELECT_CURSOR_CACHE('parsing_schema_name <>
''SYS''')) P;

  -- Process each statement (or pass cursor to load_sqlset).

  CLOSE cur;
end;/

-- All statements from a particular module/action.
DECLARE
  cur sys_refcursor;
BEGIN
  OPEN cur FOR
    SELECT VALUE(P)
    FROM table(
      DBMS_SQLTUNE.SELECT_CURSOR_CACHE(
        'module = ''MY_APPLICATION'' and action = ''MY_ACTION''')) P;

  -- Process each statement (or pass cursor to load_sqlset)

  CLOSE cur;
END;/

-- all statements that ran for at least five seconds
DECLARE
  cur sys_refcursor;
```

```
BEGIN
  OPEN cur FOR
    SELECT VALUE(P)
      FROM table(DBMS_SQLTUNE.SELECT_CURSOR_CACHE('elapsed_time > 5000000')) P;

  -- Process each statement (or pass cursor to load_sqlset)

  CLOSE cur;
end;/

-- select all statements that pass a simple buffer_gets threshold and
-- are coming from an APPS user
DECLARE
  cur sys_refcursor;
BEGIN
  OPEN cur FOR
    SELECT VALUE(P)
      FROM table(
        DBMS_SQLTUNE.SELECT_CURSOR_CACHE(
          'buffer_gets > 100 and parsing_schema_name = ''APPS'''))P;

  -- Process each statement (or pass cursor to load_sqlset)

  CLOSE cur;
end;/

-- select all statements exceeding 5 seconds in elapsed time, but also
-- select the plans (by default we only select execution stats and binds
-- for performance reasons - in this case the SQL_PLAN attribute of
sqlset_row
-- is NULL)
DECLARE
  cur sys_refcursor;
BEGIN
  OPEN cur FOR
    SELECT VALUE(P)
      FROM table(dbms_sqltune.select_cursor_cache(
        'elapsed_time > 5000000', NULL, NULL, NULL, NULL, 1, NULL,
        'EXECUTION_STATISTICS, SQL_BINDS, SQL_PLAN')) P;

  -- Process each statement (or pass cursor to load_sqlset)

  CLOSE cur;
END;/

-- Select the top 100 statements in the shared SQL area ordering by
elapsed_time.
DECLARE
  cur sys_refcursor;
BEGIN
  OPEN cur FOR
    SELECT VALUE(P)
```

```

        FROM table(DBMS_SQLTUNE.SELECT_CURSOR_CACHE(NULL,
                                                    NULL,
                                                    'ELAPSED_TIME', NULL,
NULL,
                                                    1,
                                                    100)) P;

-- Process each statement (or pass cursor to load_sqlset)

CLOSE cur;
end;/

-- Select the set of statements which cumulatively account for 90% of
the
-- buffer gets in the shared SQL area. This means that the buffer
gets of all
-- of these statements added up is approximately 90% of the sum of all
-- statements currently in the cache.
DECLARE
    cur sys_refcursor;
BEGIN
    OPEN cur FOR
        SELECT VALUE(P)
        FROM table(DBMS_SQLTUNE.SELECT_CURSOR_CACHE(NULL,
                                                    NULL,
                                                    'BUFFER_GETS', NULL,
NULL,
                                                    .9)) P;

/

```

175.5.36 SELECT_SQL_TRACE Function

This table function reads the content of one or more trace files and returns the SQL statements it finds in the format of `sqlset_row`.

See Also:

[DBMS_SQLTUNE SQL Tuning Set Subprograms](#) for other subprograms in this group

Syntax

```

DBMS_SQLTUNE.SELECT_SQL_TRACE (
    directory          IN VARCHAR2,
    file_name          IN VARCHAR2 := NULL,

```

```

mapping_table_name      IN VARCHAR2 := NULL,
mapping_table_owner     IN VARCHAR2 := NULL, ,
select_mode             IN POSITIVE := SINGLE_EXECUTION,
options                 IN BINARY_INTEGER := LIMITED_COMMAND_TYPE,
pattern_start           IN VARCHAR2 := NULL,
pattern_end             IN VARCHAR2 := NULL,
result_limit            IN POSITIVE := NULL)
RETURN sys.sqlset PIPELINED;

```

Parameters

Table 175-42 SELECT_SQL_TRACE Function Parameters

| Parameter | Description |
|---------------------|---|
| directory | Defines the directory object containing the trace files. This field is mandatory. |
| file_name | Specifies all or part of the name of the trace files. If NULL, then the function uses the current or most recent file in the specified location or path. '%' wildcards are supported for matching trace file names. |
| mapping_table_name | Specifies the mapping table name. Note that the mapping table name is case insensitive. If the mapping table name is NULL, then the function uses the mappings in the current database. |
| mapping_table_owner | Specifies the mapping table owner. If it is NULL, then the function uses the current user. |
| select_mode | Specifies the mode for selecting SQL from the trace. Possible values are: <ul style="list-style-type: none"> SINGLE_EXECUTION — Returns one execution of a SQL. This is the default. ALL_EXECUTIONS — Returns all executions. |
| options | Specifies which types of SQL statements are returned. <ul style="list-style-type: none"> LIMITED_COMMAND_TYPE — Returns the SQL statements with the command types CREATE, INSERT, SELECT, UPDATE, DELETE, and MERGE. This value is the default. ALL_COMMAND_TYPE — Returns the SQL statements with all command types. |
| pattern_start | Specifies the delimiting pattern of the trace file sections to consider. CURRENTLY INOPERABLE. |
| pattern_end | Specifies the closing delimiting pattern of the trace file sections to process. CURRENTLY INOPERABLE. |
| result_limit | Specifies the top SQL from the filtered source. Default to MAXSB4 if NULL. |

Return Values

This function returns a `SQLSET_ROW` object.

Usage Notes

The ability to create a directory object for the system directory creates a potential security issue. For example, in a CDB, all containers write trace files to the same directory. A local user with `SELECT` privileges on this directory can read the contents of trace files belonging to any container.

To prevent this type of unauthorized access, copy the files from the default SQL trace directory into a different directory, and then create a directory object. Use the `PATH_PREFIX` clause of the `CREATE PLUGGABLE DATABASE` statement to ensure that all directory object paths associated with the PDB are restricted to the specified directory or its subdirectories.

Examples

The following code shows how to enable SQL trace for a few SQL statements and load the results into a SQL tuning set:

```
-- turn on the SQL trace in the capture database
ALTER SESSION SET EVENTS '10046 TRACE NAME CONTEXT FOREVER, LEVEL 4'

-- run sql statements
SELECT 1 FROM DUAL;
SELECT COUNT(*) FROM dba_tables WHERE table_name = :mytab;

ALTER SESSION SET EVENTS '10046 TRACE NAME CONTEXT OFF';

-- create mapping table from the capture database
CREATE TABLE mapping AS
SELECT object_id id, owner, substr(object_name, 1, 30) name
   FROM dba_objects
   WHERE object_type NOT IN ('CONSUMER GROUP', 'EVALUATION CONTEXT',
                             'FUNCTION', 'INDEXTYPE', 'JAVA CLASS',
                             'JAVA DATA', 'JAVA RESOURCE', 'LIBRARY',
                             'LOB', 'OPERATOR', 'PACKAGE',
                             'PACKAGE BODY', 'PROCEDURE', 'QUEUE',
                             'RESOURCE PLAN', 'TRIGGER', 'TYPE',
                             'TYPE BODY')

UNION ALL
SELECT user_id id, username owner, NULL name
   FROM dba_users;

-- create the directory object where the SQL traces are stored
CREATE DIRECTORY SQL_TRACE_DIR as '/home/foo/trace';

-- create the STS
EXEC DBMS_SQLTUNE.CREATE_SQLSET('my_sts', 'test purpose');

-- load the SQL statements into STS from SQL TRACE
DECLARE
   cur sys_refcursor;
BEGIN
   OPEN cur FOR
   SELECT value(p)
      FROM TABLE(
         DBMS_SQLTUNE.SELECT_SQL_TRACE(
            directory=>'SQL_TRACE_DIR',
            file_name=>'%trc',
            mapping_table_name=>'mapping')) p;
   DBMS_SQLTUNE.LOAD_SQLSET('my_sts', cur);
   CLOSE cur;
```

```
END;
/
```

175.5.37 SELECT_SQLPA_TASK Function

This function collects SQL statements from a SQL Performance Analyzer comparison task.

 **See Also:**

- [DBMS_SQLTUNE SQL Tuning Set Subprograms](#) for other subprograms in this group
- *Oracle Database Testing Guide* for a `SELECT_SQLPA_TASK` example

Syntax

```
DBMS_SQLTUNE.SELECT_SQLPA_TASK (
  task_name          IN VARCHAR2,
  task_owner         IN VARCHAR2 := NULL,
  execution_name     IN VARCHAR2 := NULL,
  level_filter       IN VARCHAR2 := 'REGRESSED',
  basic_filter       IN VARCHAR2 := NULL,
  object_filter      IN VARCHAR2 := NULL,
  attribute_list     IN VARCHAR2 := 'TYPICAL')
RETURN sys.sqlset PIPELINED;
```

Parameters

Table 175-43 SELECT_SQLPA_TASK Function Parameters

| Parameter | Description |
|-----------------------------|--|
| <code>task_name</code> | Specifies the name of the SQL Performance Analyzer task. |
| <code>task_owner</code> | Specifies the owner of the SQL Performance Analyzer task. If <code>NULL</code> , then assume the current user. |
| <code>execution_name</code> | Specifies the name of the SQL Performance Analyzer task execution (type <code>COMPARE PERFORMANCE</code>) from which the provided filters will be applied. If <code>NULL</code> , then assume the most recent <code>COMPARE PERFORMANCE</code> execution. |

Table 175-43 (Cont.) SELECT_SQLPA_TASK Function Parameters

| Parameter | Description |
|----------------|---|
| level_filter | <p>Specifies which subset of SQL statements to include. Same format as DBMS_SQLPA.REPORT_ANALYSIS_TASK.LEVEL, with some possible strings removed.</p> <ul style="list-style-type: none"> IMPROVED includes only improved SQL. REGRESSED includes only regressed SQL (default). CHANGED includes only SQL with changed performance. UNCHANGED includes only SQL with unchanged performance. CHANGED_PLANS includes only SQL with plan changes. UNCHANGED_PLANS includes only SQL with unchanged plans. ERRORS includes only SQL with errors only. MISSING_SQL includes only missing SQL statements (across STS). NEW_SQL includes only new SQL statements (across STS). |
| basic_filter | Specifies the SQL predicate to filter the SQL in addition to the level filters. |
| object_filter | Currently not supported. |
| attribute_list | <p>Defines the SQL statement attributes to return in the result.</p> <p>Possible values are:</p> <ul style="list-style-type: none"> TYPICAL — Returns BASIC plus the SQL plan (without row source statistics) and without an object reference list. This is the default. BASIC — Returns all attributes (such as execution statistics and binds) except the plans. The execution context is always part of the result. ALL — Returns all attributes. Comma-separated list of attribute names this allows to return only a subset of SQL attributes: EXECUTION_STATISTICS, SQL_BINDS, SQL_PLAN_STATISTICS (similar to SQL_PLAN + row source statistics). |

Return Values

This function returns a SQL tuning set object.

Usage Notes

For example, you can use this function to create a SQL tuning set containing the subset of SQL statements that regressed during a SQL Performance Analyzer (SPA) experiment. You can also specify other arbitrary filters.

175.5.38 SELECT_SQLSET Function

This is a table function that reads the contents of a SQL tuning set.

See Also:

[DBMS_SQLTUNE SQL Tuning Set Subprograms](#) for other subprograms in this group

Syntax

```

DBMS_SQLTUNE.SELECT_SQLSET (
  sqlset_name      IN  VARCHAR2,
  basic_filter     IN  VARCHAR2 := NULL,
  object_filter    IN  VARCHAR2 := NULL,
  ranking_measure1 IN  VARCHAR2 := NULL,
  ranking_measure2 IN  VARCHAR2 := NULL,
  ranking_measure3 IN  VARCHAR2 := NULL,
  result_percentage IN  NUMBER   := 1,
  result_limit     IN  NUMBER   := NULL)
attribute_list    IN  VARCHAR2 := NULL,
plan_filter       IN  VARCHAR2 := NULL,
sqlset_owner      IN  VARCHAR2 := NULL,
recursive_sql     IN  VARCHAR2 := HAS_RECURSIVE_SQL)
RETURN sys.sqlset PIPELINED;

```

Parameters

Table 175-44 SELECT_SQLSET Function Parameters

| Parameter | Description |
|--------------------|---|
| sqlset_name | Specifies the name of the SQL tuning set to query. |
| basic_filter | Specifies the SQL predicate to filter the SQL from the SQL tuning set defined on attributes of the <code>SQLSET_ROW</code> . |
| object_filter | Currently not supported. |
| ranking_measure(n) | Specifies an <code>ORDER BY</code> clause on the selected SQL. |
| result_percentage | Specifies a filter that picks the top <i>n</i> % according to the supplied ranking measure. Note that this parameter applies only if one ranking measure is supplied. |
| result_limit | The top limit SQL from the filtered source, ranked by the ranking measure. |
| attribute_list | Defines the SQL statement attributes to return in the result. The possible values are: <ul style="list-style-type: none"> • <code>BASIC</code> — Returns all attributes (such as execution statistics and binds) except the plans. The execution context is included in the result. • <code>TYPICAL</code> — Returns <code>BASIC</code> plus the SQL plan, but without row source statistics and without the object reference list. This is the default. • <code>ALL</code> — Returns all attributes. • Comma-separated list of attribute names. This value enables the function to return only a subset of SQL attributes: <ul style="list-style-type: none"> – <code>EXECUTION_STATISTICS</code> – <code>SQL_BINDS</code> – <code>SQL_PLAN_STATISTICS</code> (similar to <code>SQL_PLAN</code> plus row source statistics) |

Table 175-44 (Cont.) SELECT_SQLSET Function Parameters

| Parameter | Description |
|----------------------------|---|
| <code>plan_filter</code> | <p>Specifies the plan filter.</p> <p>This parameter enables you to select a single plan when a statement has multiple plans. Possible values are:</p> <ul style="list-style-type: none"> • <code>LAST_GENERATED</code> — Returns the plan with the most recent timestamp. • <code>FIRST_GENERATED</code> — Returns the plan with the least recent timestamp. • <code>LAST_LOADED</code> — Returns the plan with the most recent <code>FIRST_LOAD_TIME</code> statistical information. • <code>FIRST_LOADED</code> — Returns the plan with the least recent <code>FIRST_LOAD_TIME</code> statistical information. • <code>MAX_ELAPSED TIME</code> — Returns the plan with the maximum elapsed time. • <code>MAX_BUFFER_GETS</code> — Returns the plan with the maximum buffer gets. • <code>MAX_DISK_READS</code> — Returns the plan with the maximum disk reads. • <code>MAX_DIRECT_WRITES</code> — Returns the plan with the maximum direct writes. • <code>MAX_OPTIMIZER_COST</code> — Returns the plan with the maximum optimizer cost value. |
| <code>sqlset_owner</code> | Specifies the owner of the SQL tuning set, or <code>NULL</code> for the current schema owner. |
| <code>recursive_sql</code> | Specifies that the filter must include recursive SQL in the SQL tuning set (<code>HAS_RECURSIVE_SQL</code> , which is the default) or exclude it (<code>NO_RECURSIVE_SQL</code>). |

Return Values

This function returns one `SQLSET_ROW` per `SQL_ID` or `PLAN_HASH_VALUE` pair found in each data source.

Usage Notes

Filters provided to this function are evaluated as part of a SQL run by the current user. As such, they are executed with that user's security privileges and can contain any constructs and subqueries that user can access, but no more.

Examples

```
-- select from a sql tuning set
DECLARE
  cur sys_refcursor;
BEGIN
  OPEN cur FOR
    SELECT VALUE (P)
      FROM table(dbms_sqltune.select_sqlset('my_workload')) P;

  -- Process each statement (or pass cursor to load_sqlset)

  CLOSE cur;
END;
/
```

175.5.39 SELECT_WORKLOAD_REPOSITORY Function

This function collects SQL statements from the workload repository.

The overloaded forms enable you to collect SQL statements from the following sources:

- Snapshots between `begin_snap` and `end_snap`
- A workload repository baseline

Syntax

```
DBMS_SQLTUNE.SELECT_WORKLOAD_REPOSITORY (
  begin_snap      IN NUMBER,
  end_snap        IN NUMBER,
  basic_filter    IN VARCHAR2 := NULL,
  object_filter   IN VARCHAR2 := NULL,
  ranking_measure1 IN VARCHAR2 := NULL,
  ranking_measure2 IN VARCHAR2 := NULL,
  ranking_measure3 IN VARCHAR2 := NULL,
  result_percentage IN NUMBER := 1,
  result_limit    IN NUMBER := NULL,
  attribute_list  IN VARCHAR2 := NULL,
  recursive_sql   IN VARCHAR2 := HAS_RECURSIVE_SQL,
  dbid            IN NUMBER := NULL)
RETURN sys.sqlset PIPELINED;
```

```
DBMS_SQLTUNE.SELECT_WORKLOAD_REPOSITORY (
  baseline_name   IN VARCHAR2,
  basic_filter    IN VARCHAR2 := NULL,
  object_filter   IN VARCHAR2 := NULL,
  ranking_measure1 IN VARCHAR2 := NULL,
  ranking_measure2 IN VARCHAR2 := NULL,
  ranking_measure3 IN VARCHAR2 := NULL,
  result_percentage IN NUMBER := 1,
  result_limit    IN NUMBER := NULL,
  attribute_list  IN VARCHAR2 := NULL,
  recursive_sql   IN VARCHAR2 := HAS_RECURSIVE_SQL,
  dbid            IN NUMBER := NULL)
RETURN sys.sqlset PIPELINED;
```

Parameters

Table 175-45 SELECT_WORKLOAD_REPOSITORY Function Parameters

| Parameter | Description |
|----------------------------|---|
| <code>begin_snap</code> | Defines the beginning AWR snapshot (non-inclusive). |
| <code>end_snap</code> | Defines the ending AWR snapshot (inclusive). |
| <code>baseline_name</code> | Specifies the name of the AWR baseline period. |

Table 175-45 (Cont.) SELECT_WORKLOAD_REPOSITORY Function Parameters

| Parameter | Description |
|---------------------------------|---|
| <code>basic_filter</code> | Specifies the SQL predicate to filter the SQL from the workload repository. The filter is defined on attributes of the <code>SQLSET_ROW</code> . If <code>basic_filter</code> is not set by the caller, then the subprogram captures only statements of type <code>CREATE TABLE</code> , <code>INSERT</code> , <code>SELECT</code> , <code>UPDATE</code> , <code>DELETE</code> , and <code>MERGE</code> . |
| <code>object_filter</code> | Currently not supported. |
| <code>ranking_measure(n)</code> | Defines an <code>ORDER BY</code> clause on the selected SQL. |
| <code>result_percentage</code> | Specifies a filter that picks the top <i>n</i> % according to the supplied ranking measure. Note that this percentage applies only if one ranking measure is given. |
| <code>result_limit</code> | Specifies the top limit SQL from the source according to the supplied ranking measure. |
| <code>attribute_list</code> | Specifies the SQL statement attributes to return in the result. The possible values are: <ul style="list-style-type: none"> <code>TYPICAL</code> — Returns <code>BASIC</code> plus SQL plan (without row source statistics) and without object reference list. This is the default. <code>BASIC</code> — Returns all attributes (such as execution statistics and binds) are returned except the plans. The execution context is always part of the result. <code>ALL</code> — Returns all attributes Comma-separated list of attribute names this allows to return only a subset of SQL attributes: <code>EXECUTION_STATISTICS</code>, <code>SQL_BINDS</code>, <code>SQL_PLAN_STATISTICS</code> (similar to <code>SQL_PLAN</code> plus row source statistics). |
| <code>recursive_sql</code> | Specifies the filter that includes recursive SQL in the SQL tuning set (<code>HAS_RECURSIVE_SQL</code>) or excludes it (<code>NO_RECURSIVE_SQL</code>). |
| <code>dbid</code> | Specifies the DBID for imported or PDB-level AWR data. If <code>NULL</code> , then the function uses the current database DBID. |

Return Values

This function returns one `SQLSET_ROW` per `SQL_ID` or `PLAN_HASH_VALUE` pair found in each data source.

Usage Notes

Filters provided to this function are evaluated as part of a SQL run by the current user. As such, they are executed with that user's security privileges and can contain any constructs and subqueries that user can access, but no more.

Examples

```
-- select statements from snapshots 1-2
DECLARE
  cur sys_refcursor;
BEGIN
  OPEN cur FOR
    SELECT VALUE (P)
```

```

        FROM table(dbms_sqltune.select_workload_repository(1,2)) P;

    -- Process each statement (or pass cursor to load_sqlset)

    CLOSE cur;
END;
/

```

175.5.40 SET_TUNING_TASK_PARAMETER Procedures

This procedure updates the value of a SQL tuning parameter of type `VARCHAR2` or `NUMBER`.

See Also:

[DBMS_SQLTUNE SQL Tuning Set Subprograms](#) for other subprograms in this group

Syntax

```

DBMS_SQLTUNE.SET_TUNING_TASK_PARAMETER (
    task_name          IN  VARCHAR2,
    parameter          IN  VARCHAR2,
    value              IN  VARCHAR2,
    database_link_to  IN  VARCHAR2);

```

```

DBMS_SQLTUNE.SET_TUNING_TASK_PARAMETER (
    task_name          IN  VARCHAR2,
    parameter          IN  VARCHAR2,
    value              IN  NUMBER,
    database_link_to  IN  VARCHAR2);
);

```

Parameters

Table 175-46 SET_TUNING_TASK_PARAMETER Procedure Parameters

| Parameter | Description |
|-----------|-----------------------------------|
| task_name | Identifier of the task to execute |

Table 175-46 (Cont.) SET_TUNING_TASK_PARAMETER Procedure Parameters

| Parameter | Description |
|-----------|--|
| parameter | <p>Name of the parameter to set. The possible tuning parameters that can be set by this procedure using the parameter in the form VARCHAR2:</p> <ul style="list-style-type: none"> • APPLY_CAPTURED_COMPILEENV: indicates whether the advisor could use the compilation environment captured with the SQL statements. The default is 0 (that is, NO). • BASIC_FILTER: basic filter for SQL tuning set • DAYS_TO_EXPIRE: number of days until the task is deleted • DEFAULT_EXECUTION_TYPE: the task defaults to this type of execution when none is specified by the EXECUTE_TUNING_TASK Function and Procedure • EXECUTION_DAYS_TO_EXPIRE: number of days until the tasks's executions is deleted (without deleting the task) • LOCAL_TIME_LIMIT: per-statement time out (seconds) • MODE: tuning scope (comprehensive, limited) • OBJECT_FILTER: object filter for SQL tuning set • PLAN_FILTER: plan filter for SQL tuning set (see SELECT_SQLSET for possible values) • RANK_MEASURE1: first ranking measure for SQL tuning set • RANK_MEASURE2: second possible ranking measure for SQL tuning set • RANK_MEASURE3: third possible ranking measure for SQL tuning set • RESUME_FILTER: a extra filter for SQL tuning sets besides BASIC_FILTER • SQL_LIMIT: maximum number of SQL statements to tune • SQL_PERCENTAGE: percentage filter of SQL tuning set statements • TEST_EXECUTE: FULL/AUTO/OFF. <ul style="list-style-type: none"> * FULL - test-execute for as much time as necessary, up to the local time limit for the SQL (or the global task time limit if no SQL time limit is set) * AUTO - test-execute for an automatically-chosen time proportional to the tuning time * OFF - do not test-execute • TIME_LIMIT: global time out (seconds) • USERNAME: username under which the statement is parsed |
| value | New value of the specified parameter |

Table 175-46 (Cont.) SET_TUNING_TASK_PARAMETER Procedure Parameters

| Parameter | Description |
|------------------|--|
| database_link_to | <p>Name of a database link that exists on a standby database.</p> <p>The link specifies the connection to a primary database. By default, the value is null, which means that the SQL Tuning Advisor session is local.</p> <p>Use DBMS_SQLTUNE to tune high-load SQL statements running on a standby database in an Active Data Guard scenario. When you execute REPORT_TUNING_TASK locally on the standby database, the function uses the database link to obtain the data from the primary database, and then constructs it locally on the standby database.</p> <p>The database_link_to parameter must specify a private database link. This link must be owned by SYS and accessed by the default privileged user SYS\$UMF. The following sample statement creates a link named lnk_to_pri:</p> <pre>CREATE DATABASE LINK lnk_to_pri CONNECT TO SYS\$UMF IDENTIFIED BY password USING 'inst1';</pre> |

Usage Notes

When setting automatic tuning task parameters, use the [SET_AUTO_TUNING_TASK_PARAMETER Procedures](#) in the [DBMS_AUTO_SQLTUNE](#) package.

175.5.41 SQLTEXT_TO_SIGNATURE Function

This function returns a SQL text's signature. The signature can be used to identify SQL text in dba_sql_profiles.

 **See Also:**
[DBMS_SQLTUNE SQL Profile Subprograms](#) for other subprograms in this group

Syntax

```
DBMS_SQLTUNE.SQLTEXT_TO_SIGNATURE (
  sql_text      IN CLOB,
  force_match  IN BOOLEAN  := FALSE)
RETURN NUMBER;
```

Parameters

Table 175-47 SQLTEXT_TO_SIGNATURE Function Parameters

| Parameter | Description |
|-------------|---|
| sql_text | SQL text whose signature is required. Required. |
| force_match | If TRUE, this returns a signature that supports SQL matching with literal values transformed into bind variables. If FALSE, returns the signature based on the text with literals not transformed |

Return Values

This function returns the signature of the specified SQL text.

175.5.42 UNPACK_STGTAB_SQLPROF Procedure

This procedure copies profile data stored in the staging table to create profiles on the system.

See Also:

[DBMS_SQLTUNE SQL Profile Subprograms](#) for other subprograms in this group

Syntax

```
DBMS_SQLTUNE.UNPACK_STGTAB_SQLPROF (
  profile_name          IN VARCHAR2 := '%',
  profile_category     IN VARCHAR2 := 'DEFAULT',
  replace              IN BOOLEAN,
  staging_table_name    IN VARCHAR2,
  staging_schema_owner IN VARCHAR2 := NULL);
```

Parameters

Table 175-48 UNPACK_STGTAB_SQLPROF Procedure Parameters

| Parameter | Description |
|--------------------|---|
| profile_name | The name of the profile to unpack (% wildcards acceptable, case-sensitive) |
| profile_category | The category from which to unpack profiles (% wildcards acceptable, case-sensitive) |
| replace | The option to replace profiles if they already exist. Note that profiles cannot be replaced if one in the staging table has the same name as an active profile in a different SQL statement. If FALSE, this function raises errors if you try to create a profile that already exists |
| staging_table_name | The name of the table on which to perform the remap operation (case-insensitive unless double quoted). Required. |

Table 175-48 (Cont.) UNPACK_STGTAB_SQLPROF Procedure Parameters

| Parameter | Description |
|--------------------------|--|
| staging_schem a_owner | The schema where the table resides, or NULL for current schema (case-insensitive unless double quoted) |

Usage Notes

Using this procedure requires the `CREATE ANY SQL PROFILE` privilege and the `SELECT` privilege on staging table.

Examples

```
-- Unpack all profiles stored in a staging table.
BEGIN
  DBMS_SQLTUNE.UNPACK_STGTAB_SQLPROF(
    replace           => FALSE
  ,   staging_table_name => 'PROFILE_STGTAB');
END;

-- If there is a failure during the unpack operation, you can find the
-- profile
-- that caused the error and perform a remap_stgtab_sqlprof operation
-- targeting it.
-- You can resume the unpack operation by setting replace to TRUE so that
-- the profiles that were already created are replaced.
BEGIN
  DBMS_SQLTUNE.UNPACK_STGTAB_SQLPROF(
    replace           => TRUE
  ,   staging_table_name => 'PROFILE_STGTAB');
END;
```

175.5.43 UNPACK_STGTAB_SQLSET Procedure

This procedure copies one or more SQL tuning sets from their location in the staging table into the SQL tuning sets schema, making them proper SQL tuning sets.

**See Also:**

[DBMS_SQLTUNE SQL Tuning Set Subprograms](#) for other subprograms in this group

Syntax

```
DBMS_SQLTUNE.UNPACK_STGTAB_SQLSET (
  sqlset_name      IN VARCHAR2 := '%',
  sqlset_owner     IN VARCHAR2 := NULL,
  replace          IN BOOLEAN,
```

```
staging_table_name IN VARCHAR2,
staging_schema_owner IN VARCHAR2 := NULL);
```

Parameters

The parameters are identical for DBMS_SQLTUNE.UNPACK_STGTAB_SQLSET and DBMS_SQLSET.UNPACK_STGTAB.

Table 175-49 UNPACK_STGTAB_SQLSET and UNPACK_STGTAB Procedure Parameters

| Parameter | Description |
|----------------------|--|
| sqlset_name | Specifies the name of the tuning set to unpack (not null). Wildcard characters (%) are supported to unpack multiple tuning sets in a single call. For example, specify % to unpack all tuning sets from the staging table. |
| sqlset_owner | Specifies the name of tuning set owner, or NULL for the current schema owner. Wildcard characters (%) are supported. |
| replace | Specifies whether to replace an existing SQL tuning set. If FALSE, then this procedure raises errors when you try to create a tuning set that already exists. |
| staging_table_name | Specifies the name of the staging table, moved after a call to the DBMS_SQLTUNE.PACK_STGTAB_SQLSET or DBMS_SQLSET.PACK_STGTAB procedure (case-sensitive). |
| staging_schema_owner | Specifies the name of staging table owner, or NULL for the current schema owner (case-sensitive). |

Examples

```
-- unpack all STS in the staging table
EXEC DBMS_SQLTUNE.UNPACK_STGTAB_SQLSET(sqlset_name      => '%', -
                                       sqlset_owner      => '%', -
                                       replace            => FALSE, -
                                       staging_table_name =>
'STGTAB_SQLSET');
```

```
-- errors can arise during STS unpack when a STS in the staging table
-- has the
-- same name/owner as STS on the system. In this case, users should
-- call
-- remap_stgtab_sqlset to patch the staging table and with which to
-- call unpack
-- Replace set to TRUE.
EXEC DBMS_SQLTUNE.UNPACK_STGTAB_SQLSET(sqlset_name      => '%', -
                                       sqlset_owner      => '%', -
                                       replace            => TRUE, -
                                       staging_table_name =>
'STGTAB_SQLSET');
```

175.5.44 UPDATE_SQLSET Procedures

This overloaded procedure updates selected fields for SQL statements in a SQL tuning set.

See Also:

[DBMS_SQLTUNE SQL Tuning Set Subprograms](#) for other subprograms in this group

Syntax

```
DBMS_SQLTUNE.UPDATE_SQLSET (
  sqlset_name      IN  VARCHAR2,
  sql_id           IN  VARCHAR2,
  attribute_name   IN  VARCHAR2,
  attribute_value  IN  VARCHAR2 := NULL);
```

```
DBMS_SQLTUNE.UPDATE_SQLSET (
  sqlset_name      IN  VARCHAR2,
  sql_id           IN  VARCHAR2,
  attribute_name   IN  VARCHAR2,
  attribute_value  IN  NUMBER := NULL);
```

Parameters

Table 175-50 UPDATE_SQLSET Procedure Parameters

| Parameter | Description |
|-----------------|--|
| sqlset_name | Specifies the name of the SQL tuning set. |
| sql_id | Specifies the identifier of the SQL statement to be updated. |
| plan_hash value | Specifies the hash value of the execution plan for a SQL statement. Use this parameter when you want to update the attribute for a specific plan for a statement, but not all plans for the statement. |
| attribute_name | Specifies the name of the attribute to be modified. You can update the text field for MODULE, ACTION, PARSING_SCHEMA_NAME, and OTHER. The only numerical field that you can update is PRIORITY. If a statement has multiple plans, then the procedure changes the attribute value for all plans. |
| attribute_value | Specifies the new value of the attribute. |

DBMS_STAT_FUNCS

The `DBMS_STAT_FUNCS` package provides statistical functions.

This chapter contains the following topic:

- [Summary of DBMS_STAT_FUNCS Subprograms](#)

176.1 Summary of DBMS_STAT_FUNCS Subprograms

This table lists and briefly describes the `DBMS_STAT_FUNCS` subprograms.

Table 176-1 DBMS_STAT_FUNCS Package Subprograms

| Subprogram | Description |
|--|--|
| EXPONENTIAL_DIST_FIT Procedure | Tests how well a sample of values fits an exponential distribution |
| NORMAL_DIST_FIT Procedure | Tests how well a sample of values fits a normal distribution |
| POISSON_DIST_FIT Procedure | Tests how well a sample of values fits a Poisson distribution |
| SUMMARY Procedure | Summarizes a numerical column of a table |
| UNIFORM_DIST_FIT Procedure | Tests how well a sample of values fits a uniform distribution |
| WEIBULL_DIST_FIT Procedure | Tests how well a sample of values fits a Weibull distribution |

176.1.1 EXPONENTIAL_DIST_FIT Procedure

This procedure tests how well a sample of values fits an exponential distribution.

Syntax

```
DBMS_STAT_FUNCS.EXPONENTIAL_DIST_FIT (
  ownername   IN   VARCHAR2,
  tablename   IN   VARCHAR2,
  columnname  IN   VARCHAR2,
  test_type   IN   VARCHAR2 DEFAULT 'KOLMOGOROV_SMIRNOV',
  lambda      IN   NUMBER,
  mu          IN   NUMBER,
  sig        OUT  NUMBER);
```

Parameters

Table 176-2 EXPONENTIAL_DIST_FIT Procedure Parameters

| Parameter | Description |
|------------------------|-------------------------------------|
| <code>ownername</code> | The schema where the table resides. |

Table 176-2 (Cont.) EXPONENTIAL_DIST_FIT Procedure Parameters

| Parameter | Description |
|------------|---|
| tablename | The table where the column resides. |
| columnname | The column of the table against which to run the test. |
| test_type | The type of test to use: 'CHI_SQUARED', 'KOLMOGOROV_SMIRNOV' or 'ANDERSON_DARLING'. |
| lambda | The scale parameter. |
| mu | The location parameter. |
| sig | The goodness of fit value, based on test type. A small value indicates a significant difference between the sample and the exponential distribution. A number close to 1 indicates a close match. |

176.1.2 NORMAL_DIST_FIT Procedure

This procedure tests how well a sample of values fits a normal distribution.

Syntax

```
DBMS_STAT_FUNCS.NORMAL_DIST_FIT (
  ownername   IN   VARCHAR2,
  tablename   IN   VARCHAR2,
  columnname  IN   VARCHAR2,
  test_type   IN   VARCHAR2 DEFAULT 'SHAPIRO_WILKS',
  mean        IN   NUMBER,
  stdev       IN   NUMBER,
  sig         OUT  NUMBER);
```

Parameters

Table 176-3 NORMAL_DIST_FIT Procedure Parameters

| Parameter | Description |
|------------|--|
| ownername | The schema where the table resides. |
| tablename | The table where the column resides. |
| columnname | The column of the table against which to run the test. |
| test_type | The type of test to use: 'CHI_SQUARED', 'KOLMOGOROV_SMIRNOV', 'ANDERSON_DARLING' or 'SHAPIRO_WILKS'. |
| mean | The mean of the distribution against which to compare. |
| stdev | The standard deviation of the distribution against which to compare. |
| sig | The goodness of fit value, based on test type. A small value indicates a significant difference between the sample and the normal distribution. A number close to 1 indicates a close match. |

176.1.3 POISSON_DIST_FIT Procedure

This procedure tests how well a sample of values fits a Poisson distribution.

Syntax

```
DBMS_STAT_FUNCS.POISSON_DIST_FIT (
  ownername   IN   VARCHAR2,
  tablename   IN   VARCHAR2,
  columnname  IN   VARCHAR2,
  test_type   IN   VARCHAR2 DEFAULT 'KOLMOGOROV_SMIRNOV',
  lambda      IN   NUMBER,
  sig         OUT  NUMBER);
```

Parameters

Table 176-4 POISSON_DIST_FIT Procedure Parameters

| Parameter | Description |
|------------|---|
| ownername | The schema where the table resides. |
| tablename | The table where the column resides. |
| columnname | The column of the table against which to run the test. |
| test_type | The type of test to use: 'KOLMOGOROV_SMIRNOV' or 'ANDERSON_DARLING'. |
| lambda | The lambda parameter is the shape parameter. |
| sig | The goodness of fit value, based on test type. A small value indicates a significant difference between the sample and the Poisson distribution. A number close to 1 indicates a close match. |

176.1.4 SUMMARY Procedure

This procedure summarizes the numerical column specified in the `columnname` of `tablename`.

The summary is returned as a Summary Type. Note that most of the output of `SUMMARY` can be obtained with currently available SQL.

Syntax

```
DBMS_STAT_FUNCS.SUMMARY (
  ownername   IN   VARCHAR2,
  tablename   IN   VARCHAR2,
  columnname  IN   VARCHAR2,
  sigma_value IN   NUMBER DEFAULT 3,
  s           OUT  SummaryType);
```

Parameters

Table 176-5 SUMMARY Procedure Parameters

| Parameter | Description |
|-----------|-------------------------------------|
| ownername | The schema where the table resides. |

Table 176-5 (Cont.) SUMMARY Procedure Parameters

| Parameter | Description |
|-------------|--|
| tablename | The table where the column resides. |
| columnname | The column of the table to be summarized. |
| sigma_value | The number of sigmas for the set of extreme values, defaults to 3. |
| s | The Record containing summary information about given column. |

Definition of SummaryType

```

TYPE n_arr IS VARRAY(5) of NUMBER;
TYPE num_table IS TABLE of NUMBER;
TYPE summaryType IS RECORD (
    count          NUMBER,
    min            NUMBER,
    max            NUMBER,
    range          NUMBER,
    mean           NUMBER,
    cmode          num_table,
    variance       NUMBER,
    stddev         NUMBER,
    quantile_5    NUMBER,
    quantile_25   NUMBER,
    median         NUMBER,
    quantile_75   NUMBER,
    quantile_95   NUMBER,
    plus_x_sigma  NUMBER,
    minus_x_sigma NUMBER,
    extreme_values num_table,
    top_5_values  n_arr,
    bottom_5_values n_arr);

```

176.1.5 UNIFORM_DIST_FIT Procedure

This procedure tests well a sample of values fits a uniform distribution.

Syntax

```

DBMS_STAT_FUNCS.UNIFORM_DIST_FIT (
    ownername  IN   VARCHAR2,
    tablename  IN   VARCHAR2,
    columnname IN   VARCHAR2,
    var_type   IN   VARCHAR2 DEFAULT 'CONTINUOUS',
    test_type  IN   VARCHAR2 DEFAULT 'KOLMOGOROV_SMIRNOV',
    paramA     IN   NUMBER,
    paramB     IN   NUMBER,
    sig        OUT  NUMBER);

```

Parameters

Table 176-6 UNIFORM_DIST_FIT Procedure Parameters

| Parameter | Description |
|------------|---|
| ownername | The schema where the table resides. |
| tablename | The table where the column resides. |
| columnname | The column of the table against which to run the test. |
| var_type | The type of distribution: 'CONTINUOUS' (the default) or 'DISCRETE' |
| test_type | The type of test to use: 'CHI_SQUARED', 'KOLMOGOROV_SMIRNOV' or 'ANDERSON_DARLING'. |
| paramA | Parameter A estimated from the sample (the location parameter). |
| paramB | Parameter B estimated from the sample (the scale parameter). |
| sig | The goodness of fit value, based on test type. A small value indicates a significant difference between the sample and the uniform distribution. A number close to 1 indicates a close match. |

176.1.6 WEIBULL_DIST_FIT Procedure

This procedure tests how well a sample of values fits a Weibull distribution.

Syntax

```
DBMS_STAT_FUNCS.WEIBULL_DIST_FIT (
  ownername   IN   VARCHAR2,
  tablename   IN   VARCHAR2,
  columnname  IN   VARCHAR2,
  test_type   IN   VARCHAR2 DEFAULT 'KOLMOGOROV_SMIRNOV',
  alpha       IN   NUMBER,
  mu          IN   NUMBER,
  beta        IN   NUMBER,
  sig         OUT  NUMBER);
```

Parameters

Table 176-7 WEIBULL_DIST_FIT Procedure Parameters

| Parameter | Description |
|------------|---|
| ownername | The schema where the table resides. |
| tablename | The table where the column resides. |
| columnname | The column of the table against which to run the test. |
| test_type | The type of test to use: 'CHI_SQUARED', 'KOLMOGOROV_SMIRNOV' or 'ANDERSON_DARLING'. |
| alpha | The scale parameter. |
| mu | The location parameter. |
| beta | The slope/shape parameter. |

Table 176-7 (Cont.) WEIBULL_DIST_FIT Procedure Parameters

| Parameter | Description |
|------------------|---|
| sig | The goodness of fit value, based on test type. A small value indicates a significant difference between the sample and the Weibull distribution. A number close to 1 indicates a close match. |

DBMS_STATS

With the `DBMS_STATS` package you can view and modify optimizer statistics gathered for database objects.

Users can also collect statistics on Global Temporary Tables (GTTs) using the `DBMS_STATS` package. However, `DBMS_STATS` cannot collect statistics on Private Temporary Tables (PTTs).

This chapter contains the following topics:

- [DBMS_STATS Overview](#)
- [DBMS_STATS Deprecated Subprograms](#)
- [DBMS_STATS Types](#)
- [DBMS_STATS Constants](#)
- [DBMS_STATS Operational Notes](#)
- [DBMS_STATS Data Structures](#)
- [Summary of DBMS_STATS Subprograms](#)

See Also:

- *Oracle Database SQL Tuning Guide*
- *Oracle Database Administrator's Guide*

177.1 DBMS_STATS Overview

To improve performance, the database enables you to collect optimizer statistics.

Note:

By default, the database collects statistics automatically, so this package is intended only for specialized cases.

Optimizer statistics can reside in the data dictionary or in a table created in the user's schema. You can also collect and manage user-defined statistics for tables and domain indexes using this package. For example, if you invoke the `DELETE_COLUMN_STATS` procedure on a column for which an association is defined, the database deletes both user-defined and standard statistics for this column.

Only optimizer statistics stored in the data dictionary have an effect on the cost-based optimizer. You can also use `DBMS_STATS` to gather statistics in parallel.

Optimizer Statistics Advisor inspects the statistics gathering process, automatically diagnoses problems in the existing practices for gathering statistics, and then generates a report of findings and recommendations. The advisor task runs automatically in the maintenance window. However, you can also run the job on demand.

**See Also:**

Oracle Database SQL Tuning Guide to learn how to manage optimizer statistics

177.2 DBMS_STATS Deprecated Subprograms

Oracle recommends that you do not use deprecated subprograms. Support for deprecated features is for backward compatibility only.

Starting with Oracle Database 11g Release 2 (11.2), the following subprograms are obsolete:

- [GET_PARAM Function](#)
Instead, use [GET_PREFS Function](#)
- [SET_PARAM Procedure](#)
Instead, use [SET_GLOBAL_PREFS Procedure](#)
- [RESET_PARAM_DEFAULTS Procedure](#)
Instead use [RESET_GLOBAL_PREF_DEFAULTS Procedure](#)

The following subprogram is deprecated with Oracle Database 12c and later:

- [GENERATE_STATS](#)

This procedure is replaced by the [GATHER_INDEX_STAT](#) procedure.

**See Also:**

"[GATHER_INDEX_STATS Procedure](#)"

177.3 DBMS_STATS Types

Histograms

Types for the minimum and maximum values and histogram endpoints include the following:

```
TYPE numarray IS VARRAY(2050) OF NUMBER;  
TYPE datearray IS VARRAY(2050) OF DATE;  
TYPE chararray IS VARRAY(2050) OF VARCHAR2(4000);  
TYPE rawarray IS VARRAY(2050) OF RAW(2000);  
TYPE fltarray IS VARRAY(2050) OF BINARY_FLOAT;  
TYPE dblarray IS VARRAY(2050) OF BINARY_DOUBLE;
```

Stale Tables

Types for listing stale tables include the following:

```

TYPE ObjectElem IS RECORD (
  ownname    VARCHAR2(30),    -- owner
  objtype    VARCHAR2(6),    -- 'TABLE' or 'INDEX'
  objname    VARCHAR2(30),    -- table/index
  partname   VARCHAR2(30),    -- partition
  subpartname VARCHAR2(30));  -- subpartition
TYPE ObjectTab IS TABLE OF ObjectElem;

```

Statistics Difference Reports

Use the following type to displays a statistics difference report:

```

TYPE DiffRepElem IS RECORD (
  report      CLOB,          -- stats difference report
  maxdiffpct NUMBER);      -- max stats difference (percentage)
TYPE DiffRepTab IS TABLE OF DiffRepElem;

```

Optimizer Statistics Advisor

The following type represents database objects for which you can gather statistics:

```

TYPE ObjectElem IS RECORD (
  ownname      dbms_quoted_id, -- owner
  objtype      VARCHAR2(6),    -- 'TABLE' or 'INDEX'
  objname      dbms_quoted_id, -- table/index
  partname     dbms_quoted_id, -- partition
  subpartname  dbms_quoted_id -- subpartition
);
TYPE ObjectTab IS TABLE OF ObjectElem;

```

Note:

Make sure to maintain `satisfy_obj_filter` when the `ObjectElem` type is changed

The following type represents an operation:

```

TYPE StatsAdvOpr IS RECORD (
  name  VARCHAR2(64), -- name of the operation
  param VARCHAR2(4000)
); -- XML containing parameters and their values
TYPE StatsAdvOprTab IS TABLE OF StatsAdvOpr;

```

The following type represents a filter list:

```

TYPE StatsAdvFilter IS RECORD (
  rulename VARCHAR2(64), -- rule name
  objlist  ObjectTab,    -- object filter list
  oprlist  StatsAdvOprTab, -- operation filter list

```

```
include BOOLEAN);      -- include/exclude elements in the list
TYPE StatsAdvFilterTab IS TABLE OF StatsAdvFilter;
```

177.4 DBMS_STATS Constants

The `DBMS_STATS` package defines several constants to use specifying parameter values.

Table 177-1 DBMS_STATS Constants

| Name | Type | Description |
|-------------------------------|--------------------------|--|
| <code>ADD_GLOBAL_PREFS</code> | NUMBER | Copies global preferences |
| <code>AUTO_CASCADE</code> | BOOLEAN | Lets Oracle decide whether to collect statistics for indexes or not |
| <code>AUTO_DEGREE</code> | NUMBER | Lets Oracle select the degree of parallelism based on size of the object, number of CPUs and initialization parameters |
| <code>AUTO_INVALIDATE</code> | BOOLEAN | Lets Oracle decide when to invalidate dependent cursors |
| <code>AUTO_SAMPLE_SIZE</code> | NUMBER | Indicates that auto-sample size algorithms should be used |
| <code>PURGE_ALL</code> | TIMESTAMP WITH TIME ZONE | A flag that can be passed to the PURGE_STATS Procedure and unconditionally deletes all the history statistics. The deletion uses <code>TRUNCATE</code> statements on the various dictionary statistics tables holding the history of statistics. |
| <code>RECLAIM_SYNOPSIS</code> | TIMESTAMP WITH TIME ZONE | A constant used for reclaiming synopsis table space. |

177.5 DBMS_STATS Operational Notes

Observe these operational notes when using the `DBMS_STATS` package.

The `DBMS_STATS` subprograms perform the following general operations:

- [Gathering Optimizer Statistics](#)
- [Setting or Getting Statistics](#)
- [Deleting Statistics](#)
- [Transferring Statistics](#)
- [Locking or Unlocking Statistics](#)
- [Restoring and Purging Statistics History](#)
- [User-Defined Statistics](#)
- [Pending Statistics](#)
- [Comparing Statistics](#)

- [Extended Statistics](#)
- [Optimizer Statistics Advisor](#)

Most of the `DBMS_STATS` procedures include the three parameters `statown`, `stattab`, and `statid`. These parameters enable you to store statistics in your own tables (outside of the dictionary), which does not affect the optimizer. Therefore, you can maintain and experiment with sets of statistics.

The `stattab` parameter specifies the name of a table in which to hold statistics, and it is assumed that it resides in the same schema as the object for which statistics are collected (unless the `statown` parameter is specified). You can create multiple tables with different `stattab` identifiers to hold separate sets of statistics.

Additionally, you can maintain different sets of statistics within a single `stattab` by using the `statid` parameter, which avoids cluttering the user's schema.

For the `SET` and `GET` procedures, if `stattab` is not provided (that is, `NULL`), then the operation works directly on the dictionary statistics; therefore, you do not need to create these statistics tables if they only plan to modify the dictionary directly. However, if `stattab` is not `NULL`, then the `SET` or `GET` operation works on the specified user statistics table, and not the dictionary.

You can change the default values of some of the parameters of `DBMS_STATS` procedures using the [SET_DATABASE_PREFS Procedure](#), [SET_GLOBAL_PREFS Procedure](#), [SET_SCHEMA_PREFS Procedure](#) and [SET_TABLE_PREFS Procedure](#).

Most procedures in this package commit the current transaction, perform the operation, and then commit again.

Most of the procedures have a `force` parameter that enables you to override a lock on statistics. Whenever statistics in dictionary are modified, old versions of statistics are saved automatically for future restoring.

Gathering Optimizer Statistics

Use the following subprograms to gather certain classes of optimizer statistics, with possible performance improvements over the `ANALYZE` command:

- [GATHER_DATABASE_STATS Procedures](#)
- [GATHER_DICTIONARY_STATS Procedure](#)
- [GATHER_FIXED_OBJECTS_STATS Procedure](#)
- [GATHER_INDEX_STATS Procedure](#)
- [GATHER_SCHEMA_STATS Procedures](#)
- [GATHER_SYSTEM_STATS Procedure](#)
- [GATHER_TABLE_STATS Procedure](#)

The `GATHER_*` procedures also collect user-defined statistics for columns and domain indexes.

The `statown`, `stattab`, and `statid` parameters instruct the package to back up current statistics in the specified table before gathering new statistics.

Oracle also provides the following procedure for generating statistics for derived objects when you have sufficient statistics on related objects:

[GENERATE_STATS Procedure](#)

Setting or Getting Statistics

Use the following subprograms to store and retrieve individual column-related, index-related, and table-related statistics:

[PREPARE_COLUMN_VALUES](#) Procedures
[PREPARE_COLUMN_VALUES_NVARCHAR](#) Procedure
[PREPARE_COLUMN_VALUES_ROWID](#) Procedure

[SEED_COL_USAGE](#) Procedure
[SET_INDEX_STATS](#) Procedures
[SET_SYSTEM_STATS](#) Procedure
[SET_TABLE_STATS](#) Procedure

[GET_COLUMN_STATS](#) Procedures
[GET_INDEX_STATS](#) Procedures
[GET_SYSTEM_STATS](#) Procedure
[GET_TABLE_STATS](#) Procedure

In the special versions of the `SET_*_STATS` procedures for setting user-defined statistics, the following, if provided, are stored in the dictionary or user statistics table:

- User-defined statistics
- Owner of statistics type
- Name of statistics type

The user-defined statistics and the corresponding statistics type are inserted into the `USTATS$` dictionary table. You can specify user-defined statistics without specifying the statistics type name.

The special versions of the `GET_*_STATS` procedures return user-defined statistics and the statistics type owner and name as `OUT` arguments corresponding to the schema object specified. If user-defined statistics are not collected, `NULL` values are returned.

Deleting Statistics

The `DELETE_*` procedures delete both user-defined statistics and the standard statistics for the given schema object.

[DELETE_COLUMN_STATS](#) Procedure
[DELETE_DATABASE_STATS](#) Procedure
[DELETE_DICTIONARY_STATS](#) Procedure
[DELETE_FIXED_OBJECTS_STATS](#) Procedure
[DELETE_INDEX_STATS](#) Procedure
[DELETE_SCHEMA_STATS](#) Procedure
[DELETE_SYSTEM_STATS](#) Procedure
[DELETE_TABLE_STATS](#) Procedure

Note that `DELETE_TABLE_STATS`, `DELETE_DICTIONARY_STATS`, `DELETE_DATABASE_STATS` and `DELETE_SCHEMA_STATS` have a parameter `stat_category` which specifies which statistics to delete. The parameter accepts multiple values separated by comma. The supported values are 'OBJECT_STATS' (table statistics, column statistics and index statistics) and 'SYNOPSIS' (auxiliary statistics created when statistics are incrementally maintained). The default is 'OBJECT_STATS, SYNOPSIS'.

Transferring Statistics

Use the following procedures for creating and dropping the user statistics table.

[CREATE_STAT_TABLE Procedure](#)

[DROP_STAT_TABLE Procedure](#)

Use the following procedures to transfer statistics

- from the dictionary to a user statistics table ([EXPORT_*](#))
- from a user statistics table to the dictionary ([IMPORT_*](#))

[EXPORT_COLUMN_STATS Procedure](#)

[EXPORT_DATABASE_STATS Procedure](#)

[EXPORT_DICTIONARY_STATS Procedure](#)

[EXPORT_FIXED_OBJECTS_STATS Procedure](#)

[EXPORT_INDEX_STATS Procedure](#)

[EXPORT_SCHEMA_STATS Procedure](#)

[EXPORT_SYSTEM_STATS Procedure](#)

[EXPORT_TABLE_STATS Procedure](#)

[IMPORT_COLUMN_STATS Procedure](#)

[IMPORT_DATABASE_STATS Procedure](#)

[IMPORT_DICTIONARY_STATS Procedure](#)

[IMPORT_FIXED_OBJECTS_STATS Procedure](#)

[IMPORT_INDEX_STATS Procedure](#)

[IMPORT_SCHEMA_STATS Procedure](#)

[IMPORT_SYSTEM_STATS Procedure](#)

[IMPORT_TABLE_STATS Procedure](#)

 **Note:**

Oracle does not support export or import of statistics across databases of different character sets.

Locking or Unlocking Statistics

Use the following procedures to lock and unlock statistics on objects.

[LOCK_PARTITION_STATS Procedure](#)

[LOCK_SCHEMA_STATS Procedure](#)

[LOCK_TABLE_STATS Procedure](#)

[UNLOCK_PARTITION_STATS Procedure](#)

[UNLOCK_SCHEMA_STATS Procedure](#)

[UNLOCK_TABLE_STATS Procedure](#)

The `LOCK_*` procedures either freeze the current set of the statistics or to keep the statistics untouched. When statistics on a table are locked, all the statistics depending on the table, including table statistics, column statistics, histograms and statistics on all dependent indexes, are considered to be locked.

Restoring and Purging Statistics History

Use the following procedures to restore statistics as of a specified timestamp. This is useful in case newly collected statistics leads to some sub-optimal execution plans and the administrator wants to revert to the previous set of statistics.

[RESET_GLOBAL_PREF_DEFAULTS Procedure](#)
[RESTORE_DATABASE_STATS Procedure](#)
[RESTORE_DICTIONARY_STATS Procedure](#)
[RESTORE_FIXED_OBJECTS_STATS Procedure](#)
[RESTORE_SCHEMA_STATS Procedure](#)
[RESTORE_SYSTEM_STATS Procedure](#)
[RESTORE_TABLE_STATS Procedure](#)

Whenever statistics in dictionary are modified, old versions of statistics are saved automatically for future restoring. The old statistics are purged automatically at regular intervals based on the statistics history retention setting and the time of recent statistics gathering performed in the system. Retention is configurable using the [ALTER_STATS_HISTORY_RETENTION Procedure](#).

The other `DBMS_STATS` procedures related to restoring statistics are:

- [PURGE_STATS Procedure](#): This procedure lets you manually purge old versions beyond a time stamp.
- [GET_STATS_HISTORY_RETENTION Function](#): This function gets the current statistics history retention value.
- [GET_STATS_HISTORY_AVAILABILITY Function](#): This function gets the oldest time stamp where statistics history is available. Users cannot restore statistics to a time stamp older than the oldest time stamp.

`RESTORE_*` operations are not supported for user defined statistics.

User-Defined Statistics

The `DBMS_STATS` package supports operations on user-defined statistics. When a domain index or column is associated with a statistics type (using the `associate` statement), operations on the index or column manipulate user-defined statistics. For example, gathering statistics for a domain index (for which an association with a statistics type exists) using the [GET_INDEX_STATS Procedures](#) invokes the user-defined statistics collection method of the associated statistics type. Similarly, delete, transfer, import, and export operations manipulate user-defined statistics.

`SET_*` and `GET_*` operations for user-defined statistics are also supported using a special version of the `SET` and `GET` interfaces for columns and indexes.

`EXPORT_*`, `IMPORT_*` and `RESTORE_*` operations are not supported for user defined statistics.

Pending Statistics

The package gathers statistics and stores it in the dictionary by default. User's can store these statistics in the system's private area instead of the dictionary by turning the `PUBLISH` option to `FALSE` using the `SET*PREFS` procedures. The default value for `PUBLISH` is `TRUE`. The statistics stored in private area are not used by Cost Based Optimizer unless parameter `optimizer_use_pending_statistics` is set to `TRUE`. The

default value of this parameter is `FALSE` and this boolean parameter can be set at the session/system level. Users can verify the impact of the new statistics on query plans by using the pending statistics on a session.

Pending statistics provide a mechanism to verify the impact of the new statistics on query plans before making them available for general use. There are two scenarios to verify the query plans:

- Export the pending statistics (use the [EXPORT_PENDING_STATS Procedure](#)) to a test system, then run the query workload and check the performance or plans.
- Set `optimizer_use_pending_statistics` to `TRUE` in a session on the system where pending statistics have been gathered, run the workload, and check the performance or plans.

After the performance or query plans have been verified, you can publish the pending statistics using the [PUBLISH_PENDING_STATS Procedure](#) if the performance is acceptable, or delete the pending statistics using [DELETE_PENDING_STATS Procedure](#) if it is not.

Pending statistics can be published, exported, or deleted. The following procedures are provided to manage pending statistics:

- [DELETE_PENDING_STATS Procedure](#)
- [EXPORT_PENDING_STATS Procedure](#)
- [PUBLISH_PENDING_STATS Procedure](#)

Comparing Statistics

You can use the `DIFF_TABLE_STATS_*` statistics to compare statistics for a table from two different sources. The statistics can be from:

- Two different user statistics tables
- A single user statistics table containing two sets of statistics that can be identified using `statids`
- A user statistics table and dictionary history
- Pending statistics

The functions also compare the statistics of the dependent objects (indexes, columns, partitions). They display statistics of the objects from both sources if the difference between those statistics exceeds a certain threshold. The threshold can be specified as an argument to the function, with a default of 10%. The database uses the statistics corresponding to the first source (`stattab1` or `time1`) as a basis for computing the differential percentage.

Extended Statistics

This package enables you to collect statistics for column groups and expressions. The statistics collected for column groups and expressions are called "extended statistics".

Statistics on column groups are used by optimizer for accounting correlation between columns. For example, if a query has predicates `c1=1` and `c2=1` and if there are statistics on column group (c1, c2), the optimizer uses these statistics for estimating the combined cardinality of the predicates. The optimizer uses the expression statistics to estimate cardinality of predicates on those expressions. The extended statistics are similar to column statistics. The procedures that take columns names accept extended statistics names in place of column names.

Related subprograms:

Optimizer Statistics Advisor

Optimizer Statistics Advisor is built-in diagnostic software that helps use to use best practices to manage optimizer statistics. The advisor analyzes how you are currently gathering statistics (using manual scripts, explicitly setting parameters, and so on), the effectiveness of existing statistics gathering jobs, and the quality of the gathered statistics. The advisor generates findings for any issues it finds. Based on these findings, the advisor provides recommendations, which it stores in `DBA_ADVISOR_RECOMMENDATIONS`.

The advisor organizes rules into the following classes:

- **System**
This class checks the preferences for statistics collection, status of the automated statistics gathering job, use of SQL plan directives, and so on. Rules in this class have the value `SYSTEM` in `V$STATS_ADVISOR_RULES.RULE_TYPE`.
- **Operation**
This class checks whether statistics collection uses the defaults, test statistics are created using the `SET_*_STATS` procedures, and so on. Rules in this class have the value `OPERATION` in `V$STATS_ADVISOR_RULES.RULE_TYPE`.
- **Object**
This class checks for the quality of the statistics, staleness of statistics, unnecessary collection of statistics, and so on. Rules in this class have the value `OBJECT` in `V$STATS_ADVISOR_RULES.RULE_TYPE`.

All Optimizer Statistics Advisor subprograms require the `ADVISOR` privilege. All procedures and functions execute using the invoker's privilege for the operation instead of the task owner's privilege. For example, if a user without the `ANALYZE ANY DICTIONARY` privilege creates a task `t1`, and if a DBA then executes this task, then the task execution checks for `SYS` objects. Another example is a task that is executed by `user1`, interrupted, and then resumed by `user2`. In this case, the checks of the resumed execution are based on the privilege of `user2` rather than `user1`.

You can use the following subprograms to manage Optimizer Statistics Advisor:

- [CANCEL_ADVISOR_TASK Procedure](#)
- [CONFIGURE_ADVISOR_FILTER Function](#)
- [CONFIGURE_ADVISOR_OBJ_FILTER Function](#)
- [CONFIGURE_ADVISOR_OPR_FILTER Functions](#)
- [CONFIGURE_ADVISOR_RULE_FILTER Function](#)
- [CREATE_ADVISOR_TASK Function](#)

- [DROP_ADVISOR_TASK](#) Procedure
- [EXECUTE_ADVISOR_TASK](#) Function
- [GET_ADVISOR_OPR_FILTER](#) Procedure
- [GET_ADVISOR_RECS](#) Function
- [IMPLEMENT_ADVISOR_TASK](#) Function
- [INTERRUPT_ADVISOR_TASK](#) Procedure
- [REPORT_ADVISOR_TASK](#) Function
- [RESET_ADVISOR_TASK](#) Procedure
- [RESUME_ADVISOR_TASK](#) Procedure
- [SCRIPT_ADVISOR_TASK](#) Function
- [SET_ADVISOR_TASK_PARAMETER](#) Procedure

177.6 DBMS_STATS Data Structures

The `DBMS_STATS` package defines a `RECORD` type.

RECORD Types

- [STAT_REC](#) Record Type

177.6.1 DBMS_STATS STAT_REC Record Type

This record type is provided for users in case they want to set column statistics manually. Its fields allow specifying column min/max values, as well as a histogram for a column.

Syntax

```
TYPE STATREC IS RECORD (  
    epc    NUMBER,  
    minval RAW(2000),  
    maxval RAW(2000),  
    bkvals NUMARRAY,  
    novals NUMARRAY,  
    chvals CHARARRAY,  
    eavals RAWARRAY,  
    rpcnts NUMARRAY,  
    eavs   NUMBER);
```

Fields of the Record type COMPARISON_TYPE (STAT_REC Attributes)**Table 177-2 STAT_REC Attributes**

| Field | Description |
|--------|---|
| epc | Number of buckets in histogram |
| minval | Minimum value |
| maxval | Maximum value |
| bkvals | Array of bucket numbers |
| novals | Array of normalized end point values |
| chvals | Array of dumped end point values |
| eavals | Array of end point actual values |
| rpcnts | Array of end point value frequencies |
| eavs | A number indicating whether actual end point values are needed in the histogram. If using the PREPARE_COLUMN_VALUES Procedures , this field will be automatically filled. |

177.7 Summary of DBMS_STATS Subprograms

This table lists the DBMS_STATS subprograms and briefly describes them.

Table 177-3 DBMS_STATS Package Subprograms

| Subprogram | Description |
|---|---|
| ALTER_STATS_HISTORY_RETENTION Procedure | Changes the statistics history retention value |
| CANCEL_ADVISOR_TASK Procedure | Cancels an Optimizer Statistics Advisor execution |
| CONFIGURE_ADVISOR_FILTER Function | Configures the filter list for an Optimizer Statistics Advisor task |
| CONFIGURE_ADVISOR_OBJ_FILTER Function | Configures an object filter for an Optimizer Statistics Advisor task |
| CONFIGURE_ADVISOR_OPR_FILTER Functions | Configures an operation filter for an Optimizer Statistics Advisor task |
| CONFIGURE_ADVISOR_RULE_FILTER Function | Configures a rule filter for an Optimizer Statistics Advisor task |
| CREATE_ADVISOR_TASK Function | Creates an advisor task for the Optimizer Statistics Advisor |
| CONVERT_RAW_VALUE Procedures | Converts the internal representation of a minimum value, maximum value, or histogram endpoint actual value into a datatype-specific value |
| CONVERT_RAW_VALUE_NVARCHAR Procedure | Converts the internal representation of a minimum value, maximum value, or histogram endpoint actual value into a datatype-specific value |
| CONVERT_RAW_VALUE_ROWID Procedure | Converts the internal representation of a minimum value, maximum value, or histogram endpoint actual value into a datatype-specific value |

Table 177-3 (Cont.) DBMS_STATS Package Subprograms

| Subprogram | Description |
|--|--|
| COPY_TABLE_STATS Procedure | Copies the statistics of the source [sub] partition to the destination [sub] partition after scaling |
| CREATE_EXTENDED_STATS Function | Creates a virtual column for a user specified column group or an expression in a table |
| CREATE_STAT_TABLE Procedure | Creates a table with name <code>stattab</code> in <code>ownname</code> 's schema which is capable of holding statistics |
| DELETE_COLUMN_STATS Procedure | Deletes column-related statistics |
| DELETE_DATABASE_PREFS Procedure | Deletes the statistics preferences of all the tables |
| DELETE_DATABASE_STATS Procedure | Deletes statistics for the entire database |
| DELETE_DICTIONARY_STATS Procedure | Deletes statistics for all dictionary schemas ('SYS', 'SYSTEM' and database component schemas) |
| DELETE_FIXED_OBJECTS_STATS Procedure | Deletes statistics of all fixed tables |
| DELETE_INDEX_STATS Procedure | Deletes index-related statistics |
| DELETE_PENDING_STATS Procedure | Deletes the private statistics that have been collected but have not been published |
| DELETE_PROCESSING_RATE Procedure | Deletes the processing rate of a given statistics source. If the source is not specified, it deletes the statistics of all the sources |
| DELETE_SCHEMA_PREFS Procedure | Deletes the statistics preferences of all the tables owned by the specified owner name |
| DELETE_SCHEMA_STATS Procedure | Deletes schema-related statistics |
| DELETE_SYSTEM_STATS Procedure | Deletes system statistics |
| DELETE_TABLE_PREFS Procedure | Deletes statistics preferences of the specified table in the specified schema |
| DELETE_TABLE_STATS Procedure | Deletes table-related statistics |
| DIFF_TABLE_STATS_IN_HISTORY Function | Compares statistics for a table from two timestamps in past and compare the statistics as of that timestamps |
| DIFF_TABLE_STATS_IN_PENDING Function | Compares pending statistics and statistics as of a timestamp or statistics from dictionary |
| DIFF_TABLE_STATS_IN_STATTAB Function | Compares statistics for a table from two different sources |
| DROP_ADVISOR_TASK Procedure | Drops the specified Optimizer Statistics Advisor task |
| DROP_EXTENDED_STATS Procedure | Drops the statistics entry that is created for the user specified extension |
| DROP_STAT_TABLE Procedure | Drops a user statistics table created by <code>CREATE_STAT_TABLE</code> |
| EXECUTE_ADVISOR_TASK Function | Executes a previously created Optimizer Statistics Advisor task |

Table 177-3 (Cont.) DBMS_STATS Package Subprograms

| Subprogram | Description |
|---|---|
| EXPORT_COLUMN_STAT S Procedure | Retrieves statistics for a particular column and stores them in the user statistics table identified by <code>stattab</code> |
| EXPORT_DATABASE_PR EFS Procedure | Exports the statistics preferences of all the tables |
| EXPORT_DATABASE_ST ATS Procedure | Retrieves statistics for all objects in the database and stores them in the user statistics table identified by <code>statown.stattab</code> |
| EXPORT_DICTIONARY_S TATS Procedure | Retrieves statistics for all dictionary schemas ('SYS', 'SYSTEM' and RDBMS component schemas) and stores them in the user statistics table identified by <code>stattab</code> |
| EXPORT_FIXED_OBJECT S_STATS Procedure | Retrieves statistics for fixed tables and stores them in the user statistics table identified by <code>stattab</code> |
| EXPORT_INDEX_STATS Procedure | Retrieves statistics for a particular index and stores them in the user statistics table identified by <code>stattab</code> |
| EXPORT_PENDING_STAT S Procedure | Exports the statistics gathered and stored as pending |
| EXPORT_SCHEMA_PREF S Procedure | Exports the statistics preferences of all the tables owned by the specified owner name |
| EXPORT_SCHEMA_STAT S Procedure | Retrieves statistics for all objects in the schema identified by <code>ownname</code> and stores them in the user statistics table identified by <code>stattab</code> |
| EXPORT_SYSTEM_STAT S Procedure | Retrieves system statistics and stores them in the user statistics table |
| EXPORT_TABLE_PREFS Procedure | Exports statistics preferences of the specified table in the specified schema into the specified statistics table |
| EXPORT_TABLE_STATS Procedure | Retrieves statistics for a particular table and stores them in the user statistics table |
| FLUSH_DATABASE_MONI TORING_INFO Procedure | Flushes in-memory monitoring information for all the tables to the dictionary |
| GATHER_DATABASE_ST ATS Procedures | Gathers statistics for all objects in the database |
| GATHER_DICTIONARY_S TATS Procedure | Gathers statistics for dictionary schemas 'SYS', 'SYSTEM' and schemas of RDBMS components |
| GATHER_FIXED_OBJECT S_STATS Procedure | Gathers statistics of fixed objects |
| GATHER_INDEX_STATS Procedure | Gathers index statistics |
| GATHER_PROCESSING_ RATE Procedure | Starts the job of gathering the processing rates which end after <code>interval</code> defined in minutes |
| GATHER_SCHEMA_STAT S Procedures | Gathers statistics for all objects in a schema |
| GATHER_SYSTEM_STAT S Procedure | Gathers system statistics |
| GATHER_TABLE_STATS Procedure | Gathers table and column (and index) statistics |

Table 177-3 (Cont.) DBMS_STATS Package Subprograms

| Subprogram | Description |
|---|--|
| GENERATE_STATS Procedure | Generates object statistics from previously collected statistics of related objects |
| GET_ADVISOR_OPR_FILTER Procedure | Creates an operation filter for an Optimizer Statistics Advisor operation |
| GET_ADVISOR_RECS Function | Generates a recommendation report for the specified item |
| GET_COLUMN_STATS Procedures | Gets all column-related information |
| GET_INDEX_STATS Procedures | Gets all index-related information |
| GET_PARAM Function | Gets the default value of parameters of DBMS_STATS procedures (see DBMS_STATS Deprecated Subprograms) |
| GET_PREFS Function | Gets the default value of the specified preference |
| GET_STATS_HISTORY_AVAILABILITY Function | Gets the oldest timestamp where statistics history is available |
| GET_STATS_HISTORY_RETENTION Function | Returns the current statistics history retention value |
| GET_SYSTEM_STATS Procedure | Gets system statistics from <code>stattab</code> , or from the dictionary if <code>stattab</code> is NULL |
| GET_TABLE_STATS Procedure | Gets all table-related information |
| IMPLEMENT_ADVISOR_TASK Function | Implements the recommendations made by Optimizer Statistics Advisor |
| IMPORT_COLUMN_STATS Procedure | Retrieves statistics for a particular column from the user statistics table identified by <code>stattab</code> and stores them in the dictionary |
| IMPORT_DATABASE_PREFS Procedure | Imports the statistics preferences of all the tables |
| IMPORT_DATABASE_STATS Procedure | Retrieves statistics for all objects in the database from the user statistics table and stores them in the dictionary |
| IMPORT_DICTIONARY_STATS Procedure | Retrieves statistics for all dictionary schemas ('SYS', 'SYSTEM' and RDBMS component schemas) from the user statistics table and stores them in the dictionary |
| IMPORT_FIXED_OBJECTS_STATS Procedure | Retrieves statistics for fixed tables from the user statistics table identified by <code>stattab</code> and stores them in the dictionary |
| IMPORT_INDEX_STATS Procedure | Retrieves statistics for a particular index from the user statistics table identified by <code>stattab</code> and stores them in the dictionary |
| IMPORT_SCHEMA_PREFS Procedure | Imports the statistics preferences of all the tables owned by the specified owner name |
| IMPORT_SCHEMA_STATS Procedure | Retrieves statistics for all objects in the schema identified by <code>ownname</code> from the user statistics table and stores them in the dictionary |
| IMPORT_SYSTEM_STATS Procedure | Retrieves system statistics from the user statistics table and stores them in the dictionary |
| IMPORT_TABLE_PREFS Procedure | Sets the statistics preferences of the specified table in the specified schema |

Table 177-3 (Cont.) DBMS_STATS Package Subprograms

| Subprogram | Description |
|--|---|
| IMPORT_TABLE_STATS Procedure | Retrieves statistics for a particular table from the user statistics table identified by <code>stattab</code> and stores them in the dictionary |
| INTERRUPT_ADVISOR_TASK Procedure | Interrupts a currently executing Optimizer Statistics Advisor task. |
| LOCK_PARTITION_STATS Procedure | Locks statistics for a partition |
| LOCK_SCHEMA_STATS Procedure | Locks the statistics of all tables of a schema |
| LOCK_TABLE_STATS Procedure | Locks the statistics on the table |
| MERGE_COL_USAGE Procedure | Merges column usage information from a source database, by means of a <code>dblink</code> , into the local database |
| PREPARE_COLUMN_VALUES Procedures | Converts user-specified minimum, maximum, and histogram endpoint datatype-specific values into Oracle's internal representation for future storage using the SEED_COL_USAGE Procedure |
| PREPARE_COLUMN_VALUES_NVARCHAR Procedure | Converts user-specified minimum, maximum, and histogram endpoint datatype-specific values into Oracle's internal representation for future storage using the SEED_COL_USAGE Procedure |
| PREPARE_COLUMN_VALUES_ROWID Procedure | Converts user-specified minimum, maximum, and histogram endpoint datatype-specific values into Oracle's internal representation for future storage using the SEED_COL_USAGE Procedure |
| PUBLISH_PENDING_STATS Procedure | Publishes the statistics gathered and stored as pending |
| PURGE_STATS Procedure | Purges old versions of statistics saved in the dictionary |
| REMAP_STAT_TABLE Procedure | Remaps the names of objects in the user statistics table |
| REPORT_ADVISOR_TASK Function | Reports the results of an Optimizer Advisor Task. |
| REPORT_COL_USAGE Function | Reports the recorded column (group) usage information |
| REPORT_GATHER_AUTO_STATS Function | Runs the auto statistics gathering job in reporting mode |
| REPORT_GATHER_DATABASE_STATS Functions | Runs the GATHER_DATABASE_STATS Procedures in reporting mode. |
| REPORT_GATHER_DICTIONARY_STATS Functions | Runs the GATHER_DICTIONARY_STATS Procedure in reporting mode |
| REPORT_GATHER_FIXED_OBJECTS_STATS Function | Runs the GATHER_FIXED_OBJECTS_STATS Procedure in reporting mode |
| REPORT_GATHER_SCHEMA_STATS Functions | Runs the GATHER_SCHEMA_STATS Procedures in reporting mode |
| REPORT_GATHER_TABLE_STATS Function | Runs the GATHER_TABLE_STATS Procedure in reporting mode |

Table 177-3 (Cont.) DBMS_STATS Package Subprograms

| Subprogram | Description |
|---|--|
| REPORT_STATS_OPERATIONS Function | Generates a report of all statistics operations that take place between two timestamps which may or may not have been provided |
| RESET_ADVISOR_TASK Procedure | Resets an Optimizer Statistics Advisor task execution to its initial state. Only reset a task that is not currently executing |
| RESET_COL_USAGE Procedure | Resets the recorded column (group) usage information |
| RESET_GLOBAL_PREFS Procedure | Resets the default values of all parameters to Oracle recommended values |
| RESET_PARAM_DEFAULTS Procedure | Resets global preferences to default values (see DBMS_STATS Deprecated Subprograms) |
| RESTORE_DICTIONARY_STATS Procedure | Restores statistics of all dictionary tables (tables of 'SYS', 'SYSTEM' and RDBMS component schemas) as of a specified timestamp |
| RESTORE_FIXED_OBJECTS_STATS Procedure | Restores statistics of all fixed tables as of a specified timestamp |
| RESTORE_SCHEMA_STATS Procedure | Restores statistics of all tables of a schema as of a specified timestamp |
| RESTORE_SYSTEM_STATS Procedure | Restores statistics of all tables of a schema as of a specified timestamp |
| RESTORE_TABLE_STATS Procedure | Restores statistics of a table as of a specified timestamp (<i>as_of_timestamp</i>), as well as statistics of associated indexes and columns |
| RESUME_ADVISOR_TASK Procedure | Resumes an interrupted task. It only resumes the execution that was most recently interrupted |
| SCRIPT_ADVISOR_TASK Function | Retrieves the script that implements the recommended actions for the problems found by Optimizer Statistics Advisor |
| SEED_COL_USAGE Procedure | Iterates over the SQL statements in the specified SQL tuning set, compiles them and seeds column usage information for the columns that appear in these statements |
| SET_ADVISOR_TASK_PARAMETER Procedure | Updates the value of an Optimizer Statistics Advisor task parameter |
| SET_COLUMN_STATS Procedures | Sets column-related information |
| SET_DATABASE_PREFS Procedure | Sets the statistics preferences of all the tables |
| SET_GLOBAL_PREFS Procedure | Sets the global statistics preferences |
| SET_INDEX_STATS Procedures | Sets index-related information |
| SET_PARAM Procedure | Sets default values for parameters of DBMS_STATS procedures (see DBMS_STATS Deprecated Subprograms) |
| SET_PROCESSING_RATE Procedure | Sets the value of rate of processing for a given operation |
| SET_SCHEMA_PREFS Procedure | Sets the statistics preferences of all the tables owned by the specified owner name |

Table 177-3 (Cont.) DBMS_STATS Package Subprograms

| Subprogram | Description |
|--|---|
| SET_SYSTEM_STATS Procedure | Sets system statistics |
| SET_TABLE_PREFS Procedure | Sets the statistics preferences of the specified table in the specified schema |
| SET_TABLE_STATS Procedure | Sets table-related information |
| SHOW_EXTENDED_STAT_S_NAME Function | Returns the name of the virtual column that is created for the user-specified extension |
| TRANSFER_STATS Procedure | Transfers statistics for specified table(s) from a remote database specified by <code>dblink</code> to the local database |
| UNLOCK_PARTITION_STATS Procedure | Unlocks the statistics for a partition |
| UNLOCK_SCHEMA_STATS Procedure | Unlocks the statistics on all the tables in schema |
| UNLOCK_TABLE_STATS Procedure | Unlocks the statistics on the table |
| UPGRADE_STAT_TABLE Procedure | Upgrades user statistics on an older table |

177.7.1 ALTER_STATS_HISTORY_RETENTION Procedure

This procedure changes the statistics history retention value.

Statistics history retention is used by both the automatic purge and [PURGE_STATS Procedure](#).

Syntax

```
DBMS_STATS.ALTER_STATS_HISTORY_RETENTION (
    retention      IN      NUMBER);
```

Parameters

Table 177-4 ALTER_STATS_HISTORY_RETENTION Procedure Parameters

| Parameter | Description |
|------------------------|--|
| <code>retention</code> | <p>The retention time in days. The statistics history will be retained for at least these many number of days. The valid range is [1,365000]. Also you can use the following values for special purposes:</p> <ul style="list-style-type: none"> -1: Statistics history is never purged by automatic purge 0: Old statistics are never saved. The automatic purge will delete all statistics history NULL: Change statistics history retention to default value |

Usage Notes

To run this procedure, you must have the `SYSDBA` or both `ANALYZE ANY DICTIONARY` and `ANALYZE ANY` system privilege.

Exceptions

ORA-20000: Insufficient privileges

177.7.2 CANCEL_ADVISOR_TASK Procedure

This procedure cancels an Optimizer Statistics Advisor execution. The advisor removes all intermediate results of the current execution from the task.

Syntax

```
DBMS_STATS.CANCEL_ADVISOR_TASK (  
    task_name IN VARCHAR2);
```

Parameters

Table 177-5 CANCEL_ADVISOR_TASK Procedure Parameters

| Parameter | Description |
|------------------------|--|
| <code>task_name</code> | The name of the Optimizer Statistics Advisor task. |

Security Model

Note the following:

- To execute this subprogram, you must have the `ADVISOR` privilege.
- You must be the owner of the task.
- This subprogram executes using invoker's rights.

Consider a case in which a task is executed by one user, interrupted, and then resumed by a different user. In this case, Optimizer Statistics Advisor bases its checks of the resumed execution on the privilege of the user who resumed the task.

Exceptions

- ORA-20000: Insufficient privileges
- ORA-20001: Invalid input values
- ORA-20012: Optimizer Statistics Advisor errors

Usage Notes

To be canceled or interrupted, the specified task must be currently executing.

Example 177-1 Canceling an Optimizer Statistics Advisor

In this example, you start a SQL*Plus session, and then create and execute an advisor task named `my_task`:

```
DECLARE
  v_tname  VARCHAR2(128) := 'my_task';
  v_ename  VARCHAR2(128) := NULL;
BEGIN
  -- create a task
  v_tname := DBMS_STATS.CREATE_ADVISOR_TASK(v_tname);

  -- execute the task
  v_ename := DBMS_STATS.EXECUTE_ADVISOR_TASK(v_tname);
END;
/
```

In a separate terminal, you start a second SQL*Plus session, and then execute the following program:

```
EXEC DBMS_STATS.CANCEL_ADVISOR_TASK('my_task');
```

The first session returns an ORA-13632 to indicate the cancelation of the task:

```
ORA-13632: The user cancelled the current operation.
```

177.7.3 CONFIGURE_ADVISOR_FILTER Function

This function configures the filter list for an Optimizer Statistics Advisor task. Filters are useful for excluding irrelevant findings from a report.

Syntax

```
DBMS_STATS.CONFIGURE_ADVISOR_FILTER (
  task_name          IN   VARCHAR2,
  stats_adv_opr_type IN   VARCHAR2,
  configuration_type IN   VARCHAR2,
  filter             IN   StatsAdvFilterTab := NULL)
RETURN CLOB;
```

Parameters

Table 177-6 CONFIGURE_ADVISOR_FILTER Function Parameters

| Parameter | Description |
|---------------------------------|---|
| <code>task_name</code> | The name of the Optimizer Statistics Advisor task. |
| <code>stats_adv_opr_type</code> | The type of operation to configure. Possible values are <code>EXECUTE</code> , <code>REPORT</code> , <code>SCRIPT</code> , and <code>IMPLEMENT</code> . The function permits you to specify a combination of operation types by using the plus (+) operator, for example, <code>EXECUTE +REPORT</code> . If this parameter is null, then the filter applies to all types of advisor operations. |

Table 177-6 (Cont.) CONFIGURE_ADVISOR_FILTER Function Parameters

| Parameter | Description |
|---------------------------------|--|
| <code>configuration_type</code> | The type of configuration. Possible values are as follows: <ul style="list-style-type: none"> • <code>SET</code>: Sets the specified filter list values. The submitted filter overrides existing filter values. • <code>CLEAR</code>: Clears the existing values for the specified filter. • <code>SHOW</code>: Shows the current values of the specified filter. |
| <code>filter</code> | The list of filter items for the script. |

Security Model

Note the following:

- To execute this subprogram, you must have the `ADVISOR` privilege.
- You must be the owner of the task.
- This subprogram executes using invoker's rights.

Return Values

This function returns a CLOB that contains the configuration of the provided filter in XML format.

Exceptions

- `ORA-20000`: Insufficient privileges
- `ORA-20001`: Invalid input values
- `ORA-20012`: Optimizer Statistics Advisor errors

Usage Notes

To provide fine-grained control and a unified interface across all procedures, `DBMS_STATS` provides the `StatsAdvFilter` type. You can use this data type to instantiate and construct a table of filters. You can then pass a parameter of type `StatsAdvFilter` to `CONFIGURE_ADVISOR_FILTER` along with a Boolean variable that specifies either of the following:

- Inclusion list
Only include these objects in the check.
- Exclusion list
Do not include these objects in the check.

You can also pass in a parameter specifying whether to replace the existing list. This list only filters object-level and operation-level items. The advisor always checks system-level rules.

You can create the following types of filters:

- Rule filter
This filter takes a rule name as input. Obtain rule names from the `V$STATS_ADVISOR_RULES` view.

- Operation filter

This filter is an exact match filter that takes in the name of the operation and an XML string representation of all the parameter values in the call. To obtain the XML, see the notes section of the `DBA_OPTSTAT_OPERATIONS` view. To obtain the filter for an operation, use `DBMS_STATS.GET_ADVISOR_OPR_FILTER`.

- Object filter

This filter accept an owner name and an object name. Wildcards (%) are supported in the owner name and object name. When an object name is null or %, it means a filter for all the objects in the specified schema. If the owner name is also null or %, it means a default filter for all objects in the system.

If none of the filters is specified, then the function recognizes the filter as setting the global default value of filtering (include or exclude). During the check, if no filter has been specified for a rule, operation, or object, then the function uses the default value to determine whether to include or exclude it.

Example 177-2 Enabling and Disabling Rules

You may want to turn off checks for all rules except for a specific rule. In this example, you want to check whether SQL plan directives have been disabled.

```

DECLARE
  v_task_name    VARCHAR2(128)           := 'my_task';
  v_ret          VARCHAR2(128);
  filter         DBMS_STATS.StatsAdvFilter := null;
  filterTab     DBMS_STATS.StatsAdvFilterTab := null;
  v_counter      NUMBER                 := 0;
  v_filterReport CLOB;
BEGIN
  -- Create the advisor task
  v_ret := DBMS_STATS.CREATE_ADVISOR_TASK(v_task_name);

  -- Initialize the filter table
  filterTab := DBMS_STATS.StatsAdvFilterTab();

  -- First filter: set filters to be FALSE by default
  filter.include := FALSE;

  -- Add this filter to the filter table
  v_counter := v_counter + 1;
  filterTab.extend;
  filterTab(v_counter) := filter;

  -- Second filter: turn on filter for one rule
  filter.include := TRUE;
  filter.rulename := 'TurnOnSQLPlanDirective';

  -- Add the SQL plan directive filter to the filter table
  v_counter := v_counter + 1;
  filterTab.extend;
  filterTab(v_counter) := filter;

  v_filterReport := DBMS_STATS.CONFIGURE_ADVISOR_FILTER(
                    task_name           => v_task_name,

```

```

        stats_adv_opr_type => NULL,
        configuration_type => 'SET',
        filter              => filterTab);
    -- Drop the task
    DBMS_STATS.DROP_ADVISOR_TASK(v_task_name);
END;
```

Example 177-3 Configuring an Operations Filter

In this example, your shop uses customized scripts to gather statistics for a table. If you do not want to see a specific statistics operation in the report, then you can specify an operations filter.

```

DECLARE
    v_task_name    VARCHAR2(128)           := 'my_task';
    v_ret          VARCHAR2(128);
    filter         DBMS_STATS.StatsAdvFilter := null;
    filterTab     DBMS_STATS.StatsAdvFilterTab := null;
    opr           DBMS_STATS.StatsAdvOpr;
    oprTab        DBMS_STATS.StatsAdvOprTab;
    v_oprCnt      NUMBER                   := 0;
    TYPE numTab IS TABLE OF NUMBER;
    opr_tab       numTab;
    v_filterReport CLOB;

BEGIN
    -- Create the advisor task
    v_ret := DBMS_STATS.CREATE_ADVISOR_TASK(v_task_name);

    -- Initialize filter table
    filterTab := DBMS_STATS.StatsAdvFilterTab();

    -- Initialize operations filter
    oprTab := DBMS_STATS.StatsAdvOprTab();

    SELECT ID
           BULK COLLECT INTO opr_tab
    FROM   WRI$_OPTSTAT_OPR
    WHERE  OPERATION = 'set_table_stats'
    AND    TARGET = 'HR.EMPLOYEES';

    -- Populate the operations table
    FOR i IN 1..opr_tab.count LOOP

        -- Use the procedure GET_ADVISOR_OPR_FILTER to construct
        -- an operation filter
        DBMS_STATS.GET_ADVISOR_OPR_FILTER(opr_tab(i), opr);

        v_oprCnt := v_oprCnt + 1;
        oprTab.extend;
        oprTab(v_oprCnt) := opr;

    END LOOP;

    filter.include := FALSE;
```

```
filter.oprlist := oprTab;

-- Add to filter table
filterTab.extend;
filterTab(1) := filter;

v_filterReport := DBMS_STATS.CONFIGURE_ADVISOR_FILTER(
    task_name          => v_task_name,
    stats_adv_opr_type => NULL,
    configuration_type => 'SET',
    filter             => filterTab);

-- Drop the task
DBMS_STATS.DROP_ADVISOR_TASK(v_task_name);

END;
```

Example 177-4 Reporting on a Specific Schema

In this example, you want to generate a report only for the `sh` schema. Also, you want to skip the `sh.products` table. You create an object filter as follows:

```
DECLARE
    v_task_name      VARCHAR2(128)           := 'my_task';
    v_ret            VARCHAR2(128);
    filter           DBMS_STATS.StatsAdvFilter := null;

obj.objname := 'PRODUCTS';

-- Add to the object table
v_objCnt := v_objCnt + 1;
objTab.extend;
objTab(v_objCnt) := obj;

filter.objlist := objTab;

-- Add the object filter to the filter table
v_counter := v_counter + 1;
filterTab.extend;
filterTab(v_counter) := filter;

v_filterReport :=
DBMS_STATS.CONFIGURE_ADVISOR_FILTER(
    task_name          => v_task_name,
```

```

stats_adv_opr_type => NULL,
configuration_type => 'SET',
filter              => filterTab);

-- Drop the task
DBMS_STATS.DROP_ADVISOR_TASK(v_task_name);
END;
```

177.7.4 CONFIGURE_ADVISOR_OBJ_FILTER Function

This function configures an object filter for an Optimizer Statistics Advisor task.

Syntax

```

DBMS_STATS.CONFIGURE_ADVISOR_OBJ_FILTER (
  task_name          IN VARCHAR2,
  stats_adv_opr_type IN VARCHAR2,
  rule_name          IN VARCHAR2,
  ownname            IN VARCHAR2,
  tablename          IN VARCHAR2,
  action             IN VARCHAR2)
RETURN CLOB;
```

Parameters

Table 177-7 CONFIGURE_ADVISOR_OBJ_FILTER Function Parameters

| Parameter | Description |
|--------------------|---|
| task_name | The name of the Optimizer Statistics Advisor task. |
| stats_adv_opr_type | The type of operation to configure. Possible values are EXECUTE, REPORT, SCRIPT, and IMPLEMENT. See " CONFIGURE_ADVISOR_RULE_FILTER Function ". |
| rule_name | The name of the rule to configure. If null, the function applies the filter to all operation-level rules. |
| ownname | The owner name of the operation target. If null, the function applies the filter to all owner names. |
| tablename | The table name of the operation target. |
| action | The configuration action to take for the specified rule. See " CONFIGURE_ADVISOR_RULE_FILTER Function ". |

Security Model

Note the following:

- To execute this subprogram, you must have the `ADVISOR` privilege.
- You must be the owner of the task.
- This subprogram executes using invoker's rights.

Return Values

This function returns an XML CLOB that contains the updated values of the filter.

Exceptions

- **ORA-20000:** Insufficient privileges
- **ORA-20001:** Invalid input values
- **ORA-20012:** Optimizer Statistics Advisor errors

177.7.5 CONFIGURE_ADVISOR_OPR_FILTER Functions

This overloaded function configures an operation filter for an Optimizer Statistics Advisor task.

Syntax

```
DBMS_STATS.CONFIGURE_ADVISOR_OPR_FILTER (
    task_name          IN VARCHAR2,
    stats_adv_opr_type IN VARCHAR2,
    rule_name          IN VARCHAR2,
    operation_name     IN VARCHAR2,
    action             IN VARCHAR2)
RETURN CLOB;
```

```
DBMS_STATS.CONFIGURE_ADVISOR_OPR_FILTER (
    task_name          IN VARCHAR2,
    stats_adv_opr_type IN VARCHAR2,
    rule_name          IN VARCHAR2,
    operation_name     IN VARCHAR2,
    ownname            IN VARCHAR2,
    tabname            IN VARCHAR2,
    action             IN VARCHAR2)
RETURN CLOB;
```

```
DBMS_STATS.CONFIGURE_ADVISOR_OPR_FILTER (
    task_name          IN VARCHAR2,
    stats_adv_opr_type IN VARCHAR2,
    rule_name          IN VARCHAR2,
    operation_id       IN NUMBER,
    action             IN VARCHAR2)
RETURN CLOB;
```

Parameters

Table 177-8 CONFIGURE_ADVISOR_OPR_FILTER Function Parameters

| Parameter | Description |
|-----------|--|
| task_name | The name of the Optimizer Statistics Advisor task. |

Table 177-8 (Cont.) CONFIGURE_ADVISOR_OPR_FILTER Function Parameters

| Parameter | Description |
|--------------------|--|
| stats_adv_opr_type | The type of operation to configure. Possible values are EXECUTE, REPORT, SCRIPT, and IMPLEMENT. See " CONFIGURE_ADVISOR_RULE_FILTER Function ". |
| rule_name | The name of the rule to configure. If null, the function applies the filter to all operation-level rules. |
| operation_name | The name of the operation. For example, an operation name could be gather_table_stats. This value cannot be null. |
| operation_id | The ID of the operation to configure. The filter applies to any operation with the same signature as the specified operation ID. If two operations have the same signature, then they have the same value for every parameter. View the operation ID in DBA_OPSTAT_OPERATIONS.ID. This value cannot be null. |
| ownname | The owner name of the operation target. This value cannot be null. |
| tabname | The table name of the operation target. |
| action | The configuration action to take for the specified rule. See " CONFIGURE_ADVISOR_RULE_FILTER Function ". |

Security Model

Note the following:

- To execute this subprogram, you must have the `ADVISOR` privilege.
- You must be the owner of the task.
- This subprogram executes using invoker's rights.

Return Values

This function returns an XML CLOB that contains the updated values of the filter.

Exceptions

- ORA-20000: Insufficient privileges
- ORA-20001: Invalid input values
- ORA-20012: Optimizer Statistics Advisor errors

Example 177-5 Excluding Operations for Gathering Table Statistics

In this example, your goal is to exclude operations that gather table statistics in the `hr` schema. User account `stats` has been granted the `DBA` role, `ADVISOR` privilege, and `SELECT ON DBA_OPTSTAT_OPERATIONS` privilege. You perform the following steps:

1. Log in to the database as `stats`.
2. Drop any existing task named `opt_adv_task1`.

```
DECLARE
  v_tname VARCHAR2(32767);
BEGIN
  v_tname := 'opt_adv_task1';
```

```

        DBMS_STATS.DROP_ADVISOR_TASK(v_tname);
    END;
/

```

3. Create a procedure named `opr_filter` that configures a task to advise on all operations *except* those that gather statistics for tables in the `hr` schema.

```

CREATE OR REPLACE PROCEDURE opr_filter(p_tname IN VARCHAR2) IS
    v_retc CLOB;
BEGIN
    -- For all rules, prevent the advisor from operating
    -- on the operations selected in the following query
    FOR rec IN
        (SELECT ID FROM DBA_OPTSTAT_OPERATIONS WHERE OPERATION =
'gather_table_stats' AND TARGET LIKE 'HR.%')
    LOOP
        v_retc := DBMS_STATS.CONFIGURE_ADVISOR_OPR_FILTER(
            task_name          => p_tname
            , stats_adv_opr_type => NULL
            , rule_name         => NULL
            , operation_id      => rec.id
            , action            => 'DISABLE');
    END LOOP;
END;
/
SHOW ERRORS

```

4. Create a task named `opt_adv_task1`, and then execute the `opr_filter` procedure for this task.

```

DECLARE
    v_tname VARCHAR2(32767);
    v_ret VARCHAR2(32767);
BEGIN
    v_tname := 'opt_adv_task1';
    v_ret := DBMS_STATS.CREATE_ADVISOR_TASK(v_tname);
    opr_filter(v_tname);
END;
/

```

5. Execute the task `opt_adv_task1`.

```

DECLARE
    v_tname VARCHAR2(32767);
    v_ret VARCHAR2(32767);
begin
    v_tname := 'opt_adv_task1';
    v_ret := DBMS_STATS.EXECUTE_ADVISOR_TASK(v_tname);
END;
/

```

6. Print the report.

```

SPOOL /tmp/rep.txt
SET LONG 1000000
COLUMN report FORMAT A200
SET LINESIZE 250
SET PAGESIZE 1000

SELECT DBMS_STATS.REPORT_ADVISOR_TASK(
        task_name      => 'opt_adv_task1'
      , execution_name => NULL
      , type            => 'TEXT'
      , section         => 'ALL'
    ) AS report
FROM   DUAL;
SPOOL OFF

```

 **See Also:**

177.7.6 CONFIGURE_ADVISOR_RULE_FILTER Function

This function configures a rule filter for an Optimizer Statistics Advisor task.

Syntax

```

DBMS_STATS.CONFIGURE_ADVISOR_RULE_FILTER (
    task_name      IN   VARCHAR2,
    stats_adv_opr_Type IN VARCHAR2,
    rule_name      IN   VARCHAR2,
    action         IN   VARCHAR2)
RETURN CLOB;

```

Parameters**Table 177-9** SCRIPT_ADVISOR_TASK Function Parameters

| Parameter | Description |
|--------------------|---|
| task_name | The name of the Optimizer Statistics Advisor task. |
| stats_adv_opr_type | The type of operation to configure. Possible values are EXECUTE, REPORT, SCRIPT, and IMPLEMENT. You can specify a combination of operation types, for example, EXECUTE +REPORT. If this parameter is null, then the filter applies to all types of Optimizer Statistics Advisor operations. |
| rule_name | The name of the rule to configure. If null, the function applies the filter to all rules. |

Table 177-9 (Cont.) SCRIPT_ADVISOR_TASK Function Parameters

| Parameter | Description |
|-----------|--|
| action | The configuration action to take for the specified rule. Possible values are: <ul style="list-style-type: none"> • ENABLE: Enables the filter • DISABLE: Disables the filter • DELETE: Deletes the filter • SHOW: Shows the current filter value |

Security Model

Note the following:

- To execute this subprogram, you must have the `ADVISOR` privilege.
- You must be the owner of the task.
- This subprogram executes using invoker's rights.

Return Values

This function returns an XML CLOB that contains the updated values of the filter.

Exceptions

- ORA-20000: Insufficient privileges
- ORA-20001: Invalid input values
- ORA-20012: Optimizer Statistics Advisor errors

177.7.7 CONVERT_RAW_VALUE Procedures

This procedure converts the internal representation of a minimum value, maximum value, or histogram endpoint actual value into a datatype-specific value.

The `minval`, `maxval`, and `eavals` fields of the `StatRec` structure as filled in by `GET_COLUMN_STATS` or `PREPARE_COLUMN_VALUES` are appropriate values for input.

Syntax

```
DBMS_STATS.CONVERT_RAW_VALUE (
    rawval    RAW,
    resval OUT BINARY_FLOAT);
```

```
DBMS_STATS.CONVERT_RAW_VALUE (
    rawval    RAW,
    resval OUT BINARY_DOUBLE);
```

```
DBMS_STATS.CONVERT_RAW_VALUE (
    rawval    RAW,
    resval OUT DATE);
```

```
DBMS_STATS.CONVERT_RAW_VALUE (
    rawval    RAW,
    resval OUT NUMBER);
```

```
DBMS_STATS.CONVERT_RAW_VALUE (
    rawval    RAW,
    resval OUT VARCHAR2);
```

Parameters

Table 177-10 CONVERT_RAW_VALUE Procedure Parameters

| Parameter | Description |
|-----------|---|
| rawval | Raw representation of a column minimum, maximum, histogram end point actual value |
| resval | Converted, type-specific value |

Usage Notes

No special privilege or role is needed to invoke this procedure.

177.7.8 CONVERT_RAW_VALUE_NVARCHAR Procedure

This procedure converts the internal representation of a a minimum value, maximum value, or histogram end point actual value.

The `minval`, `maxval` and `eavals` fields of the `StatRec` structure as filled in by `GET_COLUMN_STATS` or `PREPARE_COLUMN_VALUES` are appropriate values for input.

Syntax

```
DBMS_STATS.CONVERT_RAW_VALUE_NVARCHAR (
    rawval    RAW,
    resval OUT NVARCHAR2);
```

Parameters

Table 177-11 CONVERT_RAW_VALUE_NVARCHAR Procedure Parameters

| Parameter | Description |
|-----------|---|
| rawval | The raw representation of a column minimum or maximum datatype-specific output parameters |
| resval | The converted, type-specific value |

Usage Notes

No special privilege or role is needed to invoke this procedure.

177.7.9 CONVERT_RAW_VALUE_ROWID Procedure

This procedure converts the internal representation of a a minimum value, maximum value, or histogram end point actual value.

The `minval`, `maxval` and `eavals` fields of the `StatRec` structure as filled in by `GET_COLUMN_STATS` or `PREPARE_COLUMN_VALUES` are appropriate values for input.

Syntax

```
DBMS_STATS.CONVERT_RAW_VALUE_ROWID (
    rawval    RAW,
    resval OUT ROWID);
```

Pragmas

```
pragma restrict_references(convert_raw_value_rowid, WNDS, RNDS, WNPS, RNPS);
```

Parameters

Table 177-12 CONVERT_RAW_VALUE_ROWID Procedure Parameters

| Parameter | Description |
|-----------|---|
| rawval | The raw representation of a column minimum or maximum datatype-specific output parameters |
| resval | The converted, type-specific value |

Usage Notes

No special privilege or role is needed to invoke this procedure.

177.7.10 COPY_TABLE_STATS Procedure

This procedure copies statistics of all dependent object such as columns and local indexes. If the statistics for source are not available then nothing is copied. It can optionally scale the statistics (such as the number of blks, or number of rows) based on the given `scale_factor`.

Syntax

```
DBMS_STATS.COPY_TABLE_STATS (
    ownname          VARCHAR2,
    tabname          VARCHAR2,
    srcpartname      VARCHAR2,
    dstpartname      VARCHAR2,
    scale_factor     VARCHAR2 DEFAULT 1,
    flags            NUMBER DEFAULT NULL,
    force            BOOLEAN DEFAULT FALSE);
```

Parameters

Table 177-13 COPY_TABLE_STATS Procedure Parameters

| Parameter | Description |
|--------------|--|
| ownname | Schema of the table of source and destination [sub] partitions |
| tabname | Table name of source and destination [sub] partitions |
| srcpartname | Source [sub] partition |
| dstpartname | Destination [sub] partition |
| scale_factor | Scale factor to scale nblks, nrows etc. in dstpartname |

Table 177-13 (Cont.) COPY_TABLE_STATS Procedure Parameters

| Parameter | Description |
|-----------|---|
| flags | For internal Oracle use (should be left as <code>NULL</code>) |
| force | When value of this argument is <code>TRUE</code> copy statistics even if the destination [sub]partition is locked |

Security Model

To invoke this procedure you must be owner of the table, or you need the `ANALYZE ANY` privilege. For objects owned by `SYS`, you need to be either the owner of the table, or you need the `ANALYZE ANY DICTIONARY` privilege or the `SYSDBA` privilege.

Exceptions

ORA-20000: Invalid [sub]partition name

ORA-20001: Bad input value

Usage Notes

This procedure updates the minimum and maximum values of destination partition for the first partitioning column as follows:

- If the partitioning type is `HASH`, then the minimum and maximum values of the destination partition are same as that of the source partition.
- If the partitioning type is `LIST`, then the behavior depends on the setting of the destination partition:
 - If the destination partition is a `NOT DEFAULT` partition, then the following statements are true:
 - * The minimum value of the destination partition is set to the minimum value of the value list that describes the destination partition.
 - * The maximum value of the destination partition is set to the maximum value of the value list that describes the destination partition.
 - Alternatively, if the destination partition is a `DEFAULT` partition, then the following statements are true:
 - * The minimum value of the destination partition is set to the minimum value of the source partition.
 - * The maximum value of the destination partition is set to the maximum value of the source partition.
- If the partitioning type is `RANGE`, then the following statements are true:
 - The minimum value of the destination partition is set to the high bound of previous partition unless the destination partition is the first partition. For the first partition, the minimum value is set to the high bound of the destination partition.
 - The maximum value of the destination partition is set to the high bound of the destination partition unless the high bound of the destination partition is

MAXVALUE, in which case the maximum value of the destination partition is set to the high bound of the previous partition.

- If the source partition column's minimum value is equal to its maximum value, and if both are equal to the source partition's lower bound, and if it has a single distinct value, then the destination partition column's minimum and maximum values are both set to the destination partition's lower bound. This is done for all partitioning columns.

If the above condition does not apply, second and subsequent partitioning columns are updated as follows. The destination partition column's maximum value is set to the greater of the destination partition upper bound and the source partition column's maximum value, with one exception. If the destination partition is D and its preceding partition is $D-1$ and the key column to be adjusted is C_n , the maximum value for C_n is set to the upper bound of D (ignoring the maximum value of the source partition column) provided that the upper bounds of the previous key column C_{n-1} are the same in partitions D and $D-1$.

- If the minimum and maximum values are different for a column after modifications, and if the number of distinct values is less than 1, then the number of distinct values is updated as 2.
- If the source or destination is a partition of a composite partitioned table, then this procedure does not copy statistics of the underlying subpartitions.

177.7.11 CREATE_ADVISOR_TASK Function

This function creates an advisor task for the Optimizer Statistics Advisor.

Syntax

```
DBMS_STATS.CREATE_ADVISOR_TASK (
    task_name    IN    VARCHAR2    := NULL)
RETURN VARCHAR2;
```

Parameters

Table 177-14 CREATE_ADVISOR_TASK Function Parameters

| Parameter | Description |
|-----------|---|
| task_name | Name of the task. If the task name is already specified, then the function uses the specified task name. Otherwise, the function generates a new task name automatically. |

Security Model

Note the following:

- To execute this subprogram, you must have the `ADVISOR` privilege.
- This subprogram executes using invoker's rights.

Return Values

This function returns the unique name of the Optimizer Statistics Advisor task.

Exceptions

ORA-20000: Insufficient privileges / creating extension is not supported

ORA-20001: Error when processing extension

ORA-20012: Optimizer Statistics Advisor errors

Example 177-6 Creating and Executing a Task

This example creates an Optimizer Statistics Advisor task named `my_task`, and then executes it.

```
DECLARE
  v_tname  VARCHAR2(128) := 'my_task';
BEGIN
  -- create a task
  v_tname := DBMS_STATS.CREATE_ADVISOR_TASK(v_tname);
  -- execute the task
  v_tname := DBMS_STATS.EXECUTE_ADVISOR_TASK(v_tname);
END;
```

Note:

Oracle Database SQL Tuning Guide to learn how manage Optimizer Statistics Advisor

177.7.12 CREATE_EXTENDED_STATS Function

This function creates a column statistics entry in the system for a user-specified column group or an expression in a table.

The database gathers statistics for this extension when a user-initiated or automatic statistics gathering job gathers statistics for the table. Statistics for such an extension are called **extended statistics**. This function returns the name of this newly created entry for the extension.

This second form of this function creates statistics extensions based on the column group usage recorded by the [SEED_COL_USAGE Procedure](#). This function returns a report of extensions created.

Syntax

```
DBMS_STATS.CREATE_EXTENDED_STATS (
  ownname  VARCHAR2,
  tabname  VARCHAR2,
  extension VARCHAR2)
RETURN VARCHAR2;
```

```
DBMS_STATS.CREATE_EXTENDED_STATS (
  ownname  VARCHAR2,
  tabname  VARCHAR2)
RETURN CLOB;
```

Parameters

Table 177-15 CREATE_EXTENDED_STATS Function Parameters

| Parameter | Description |
|-----------|--|
| ownname | Owner name of a table |
| tabname | Name of the table |
| extension | Can be either a column group or an expression. Suppose the specified table has columns <code>c1</code> , <code>c2</code> . An example column group is "(<code>c1</code> , <code>c2</code>)". An example expression is "(<code>c1</code> + <code>c2</code>)". |

Return Values

This function returns the name of this newly created entry for the extension.

Exceptions

ORA-20000: Insufficient privileges / creating extension is not supported

ORA-20001: Error when processing extension

ORA-20007: Extension already exists

ORA-20008: Reached the upper limit on number of extensions

Usage Notes

To invoke this procedure you must be owner of the table, or have the `ANALYZE ANY` privilege. For objects owned by `SYS`, you must be either the owner of the table, or have either the `ANALYZE ANY DICTIONARY` or `SYSDBA` privilege.

The extension has the following restrictions:

- The extension cannot contain a virtual column.
- Extensions cannot be created on tables owned by `SYS`.
- Extensions cannot be created on cluster tables, index organized tables, temporary tables, or external tables.
- The total number of extensions in a table cannot be greater than a maximum of (20, 10% of number of non-virtual columns in the table).
- The number of columns in a column group must be in the range [2, 32].
- A column cannot appear more than once in a column group.
- The extension can contain an expression only if a corresponding virtual column has been created.
- An expression must contain at least one column.
- An expression cannot contain a subquery.
- The `COMPATIBLE` parameter must be 11.0.0.0.0 or greater.

177.7.13 CREATE_STAT_TABLE Procedure

This procedure creates a table with name `stattab` in `ownname`'s schema which is capable of holding statistics. The columns and types that compose this table are not relevant as it should be accessed solely through the procedures in this package.

Syntax

```
DBMS_STATS.CREATE_STAT_TABLE (
  ownname          VARCHAR2,
  stattab          VARCHAR2,
  tblspace         VARCHAR2 DEFAULT NULL,
  global_temporary BOOLEAN DEFAULT FALSE);
```

Parameters

Table 177-16 CREATE_STAT_TABLE Procedure Parameters

| Parameter | Description |
|-------------------------------|--|
| <code>ownname</code> | Name of the schema |
| <code>stattab</code> | Name of the table to create. This value should be passed as the <code>stattab</code> parameter to other procedures when the user does not want to modify the dictionary statistics directly. |
| <code>tblspace</code> | Tablespace in which to create the statistics tables. If none is specified, then they are created in the user's default tablespace. |
| <code>global_temporary</code> | Whether or not the table should be created as a global temporary table |

Security Model

To invoke this procedure you need whichever privileges are required for creating a table in the specified schema.

Exceptions

ORA-20000: Table already exists or insufficient privileges

ORA-20001: Tablespace does not exist

177.7.14 DELETE_COLUMN_STATS Procedure

This procedure deletes column-related statistics.

Syntax

```
DBMS_STATS.DELETE_COLUMN_STATS (
  ownname          VARCHAR2,
  tabname          VARCHAR2,
  colname          VARCHAR2,
  partname         VARCHAR2 DEFAULT NULL,
  stattab          VARCHAR2 DEFAULT NULL,
  statid           VARCHAR2 DEFAULT NULL,
```

```

cascade_parts BOOLEAN DEFAULT TRUE,
statown       VARCHAR2 DEFAULT NULL,
no_invalidate BOOLEAN DEFAULT to_no_invalidate_type (
                get_param('NO_INVALIDATE')),
force         BOOLEAN DEFAULT FALSE,
col_stat_type VARCHAR2 DEFAULT 'ALL';

```

Parameters

Table 177-17 DELETE_COLUMN_STATS Procedure Parameters

| Parameter | Description |
|---------------|---|
| ownname | Name of the schema |
| tablename | Name of the table to which this column belongs |
| colname | Name of the column or extension |
| partname | Name of the table partition for which to delete the statistics. If the table is partitioned and if partname is NULL, then global column statistics are deleted. |
| stattab | User statistics table identifier describing from where to delete the statistics. If stattab is NULL, then the statistics are deleted directly from the dictionary. |
| statid | Identifier (optional) to associate with these statistics within stattab (Only pertinent if stattab is not NULL). |
| cascade_parts | If the table is partitioned and if partname is NULL, then setting this to true causes the deletion of statistics for this column for all underlying partitions as well. |
| statown | Schema containing stattab (if different than ownname) |
| no_invalidate | Controls the invalidation of dependent cursors when statistics are gathered. The parameter takes the following values: <ul style="list-style-type: none"> TRUE: Dependent cursors are not invalidated. FALSE: Dependent cursors are marked for immediate invalidation. AUTO: This is the default value. Rolling invalidation is used to invalidate all dependent cursors over a period of time. The performance impact on the database is reduced especially in cases where a large number of cursors are invalidated. The default can be changed using the SET_DATABASE_PREFS Procedure , SET_GLOBAL_PREFS Procedure , SET_SCHEMA_PREFS Procedure and SET_TABLE_PREFS Procedure . |
| force | When value of this argument is TRUE, deletes column statistics even if locked |
| col_stat_type | Type of column statistics to be deleted. This argument takes the following values: <ul style="list-style-type: none"> HISTOGRAM - delete column histogram only ALL - delete base column statistics and histogram |

Exceptions

ORA-20000: Object does not exist or insufficient privileges

ORA-20005: Object statistics are locked

Usage Notes

To invoke this procedure you must be owner of the table, or you need the `ANALYZE ANY` privilege. For objects owned by `SYS`, you need to be either the owner of the table, or you need the `ANALYZE ANY DICTIONARY` privilege or the `SYSDBA` privilege.

177.7.15 DELETE_DATABASE_PREFS Procedure

This procedure deletes the statistics preferences set for all non-system tables. You can include system tables by passing `TRUE` for the `add_sys` parameter.

Syntax

```
DBMS_STATS.DELETE_DATABASE_PREFS (
    pname          IN  VARCHAR2,
    add_sys        IN  BOOLEAN DEFAULT FALSE);
```

Parameters

Table 177-18 DELETE_DATABASE_PREFS Procedure Parameters

| Parameter | Description |
|----------------------|---|
| <code>pname</code> | <p>Preference name. The existing value for following preferences can be deleted and default preference values will be used:</p> <ul style="list-style-type: none"> • APPROXIMATE_NDV_ALGORITHM • AUTO_STAT_EXTENSIONS • CASCADE • DEGREE • ESTIMATE_PERCENT • GLOBAL_TEMP_TABLE_STATS • GRANULARITY • INCREMENTAL • INCREMENTAL_LEVEL • INCREMENTAL_STALENESS • METHOD_OPT • NO_INVALIDATE • OPTIONS • PREFERENCE_OVERRIDES_PARAMETER • PUBLISH • STALE_PERCENT • STAT_CATEGORY • TABLE_CACHED_BLOCKS |
| <code>add_sys</code> | Determines whether <code>SYS</code> tables will be included. |

Table 177-19 Statistics Preferences

| Preference | Description |
|---------------------------|--|
| APPROXIMATE_NDV_ALGORITHM | <p>Specifies the synopsis generation algorithm. A synopsis is special type of statistic that tracks the number of distinct values (NDV) for each column in a partition. Consider a synopsis as an internal management structure that samples distinct values.</p> <p>You can specify the following preferences:</p> <ul style="list-style-type: none"> • REPEAT OR HYPERLOGLOG This is the default. If INCREMENTAL is enabled on the table, then the database preserves the format of any existing synopses that use the adaptive sampling algorithm. However, the database creates any new synopses in HyperLogLog format. This approach is attractive when existing performance is acceptable, and you do not want to incur the performance cost of reformatting legacy content. • ADAPTIVE SAMPLING The database uses the adaptive sampling algorithm for all synopses. This is the most conservative option. • HYPERLOGLOG The database uses the HyperLogLog algorithm for all new and stale synopses. In contrast to adaptive sampling, the HyperLogLog algorithm uses a randomization technique. The advantages of HyperLogLog over adaptive sampling are: <ul style="list-style-type: none"> – The accuracy of the new algorithm is similar to the original algorithm. – The memory required is significantly lower, which typically leads to huge reductions in synopsis size. |
| AUTO_STAT_EXTENSIONS | <p>Controls the automatic creation of extensions when database statistics are gathered.</p> <p>You can set the following values:</p> <ul style="list-style-type: none"> • ON — When applicable, a SQL plan directive can trigger the creation of column group statistics based on usage of columns in the predicates in the workload. • OFF — The database does not create column group statistics automatically. The database creates them only when the CREATE_EXTENDED_STATS function is executed, or when extended statistics are specified explicitly in the METHOD_OPT clause of DBMS_STATS. This is the default. |
| CASCADE | Determines whether index statistics are collected as part of gathering table statistics. |
| DEGREE | Determines degree of parallelism used for gathering statistics. |
| ESTIMATE_PERCENT | Determines the percentage of rows to estimate. |
| GLOBAL_TEMP_TABLE_STATS | Controls whether the statistics gathered for a global temporary table should be stored as shared statistics or session statistics. |
| GRANULARITY | Determines the granularity of statistics to collect. This value is only relevant for partitioned tables. |
| INCREMENTAL | Determines whether the global statistics of a partitioned table will be maintained without doing a full table scan. |
| INCREMENTAL_LEVEL | Controls which synopses to collect when INCREMENTAL preference is set to TRUE. |

Table 177-19 (Cont.) Statistics Preferences

| Preference | Description |
|-----------------------|--|
| INCREMENTAL_STALENESS | <p>Specifies when a partition or subpartition is considered stale. This parameter takes an enumeration of values, such as 'USE_STALE_PERCENT' and 'USE_LOCKED_STATS'. You can also specify multiple values, such as 'USE_STALE_PERCENT,USE_LOCKED_STATS,ALLOW_MIXED_FORMAT'.</p> <p>The parameter accepts the following values:</p> <ul style="list-style-type: none"> • USE_STALE_PERCENT—A partition or subpartition is not considered stale when DML changes are below the threshold set by the STALE_PERCENT preference. For example, assume that STALE_PERCENT is 10. You specify USE_STALE_PERCENT for INCREMENTAL_STALENESS. The partition has 5% DML changes. The database does not regather statistics. Assume a different case in which STALE_PERCENT is 10. You specify USE_STALE_PERCENT for INCREMENTAL_STALENESS. However, in this case the partition is locked and has 20% of DML changes. Because the partition is locked, the database does not regather statistics. • USE_LOCKED_STATS—Locked partitions or subpartitions statistics are never considered stale, regardless of DML changes. For example, assume that STALE_PERCENT is 10. You specify 'USE_LOCKED_STATS, USE_STALE_PERCENT'. The partition, which is locked, has 20% DML changes. The partition is not considered stale. The database uses existing statistics to derive global statistics. • ALLOW_MIXED_FORMAT—Adaptive sampling synopses and HyperLogLog synopses are permitted to coexist. • NULL—A partition or subpartition is considered stale when it has any DML changes. For example, assume that STALE_PERCENT is 10. You specify the value 'NULL' for INCREMENTAL_STALENESS. The partition has 5% of DML changes. The database regathers statistics. <p>Note that the following two executions are different:</p> <pre>EXEC DBMS_STATS.SET_TABLE_PREFS ('sh', 'sales', 'INCREMENTAL_STALENESS', 'NULL');</pre> <pre>EXEC DBMS_STATS.SET_TABLE_PREFS ('sh', 'sales', 'INCREMENTAL_STALENESS', null);</pre> <p>The first execution uses single quotes to set the preference to the value NULL, whereas the second sets the preference to the default, which is ALLOW_MIXED_FORMAT.</p> |

Table 177-19 (Cont.) Statistics Preferences

| Preference | Description |
|--------------------------------|---|
| METHOD_OPT | Controls column statistics collection and histogram creation. When setting preference on global, schema, database or dictionary level, only 'FOR ALL' syntax is allowed. |
| NO_INVALIDATE | Controls the invalidation of dependent cursors when statistics are gathered. The parameter takes the following values: <ul style="list-style-type: none"> TRUE: Dependent cursors are not invalidated. FALSE: Dependent cursors are marked for immediate invalidation. AUTO: This is the default value. Rolling invalidation is used to invalidate all dependent cursors over a period of time. The performance impact on the database is reduced especially in cases where a large number of cursors are invalidated. The default can be changed using the SET_DATABASE_PREFS Procedure , SET_GLOBAL_PREFS Procedure , SET_SCHEMA_PREFS Procedure and SET_TABLE_PREFS Procedure . |
| OPTIONS | Determines the <code>options</code> parameter used in the GATHER_TABLE_STATS Procedure . |
| PREFERENCE_OVERRIDES_PARAMETER | Determines whether to override the input value of a parameter with the preference value of that parameter for a statistics operation. Possible values are: <ul style="list-style-type: none"> TRUE — Ignores input parameter values, and uses the value of the corresponding preference. FALSE — Obeys input parameter values. Specifying this preference does not change the order of precedence of table, global, and default. |
| PUBLISH | Determines whether the database publishes newly gathered statistics after the gathering job completes. You can gather statistics without publishing them immediately. This technique enables you to test new statistics before publishing them. |
| STALE_PERCENT | Determines the percentage of rows in a table that have to change before the statistics on that table are deemed stale and should be regathered. |
| STAT_CATEGORY | Specifies which statistics to import or export, accepting multiple values separated by a comma. Values supported: <ul style="list-style-type: none"> OBJECT_STATS — table statistics, column statistics and index statistics (default) SYNOPSIS — information to support incremental statistics REALTIME_STATS — Specifies only real-time statistics. MODELS — supports import, export, and deletion for regression models in real-time stats. The value 'OBJECT_STATS, SYNOPSIS, REALTIME_STATS, MODELS' specifies table statistics, column statistics, index statistics, and synopsis. The default value is 'OBJECT_STATS, SYNOPSIS, REALTIME_STATS, MODELS'. |

Table 177-19 (Cont.) Statistics Preferences

| Preference | Description |
|---------------------|---|
| TABLE_CACHED_BLOCKS | Specifies the average number of blocks assumed to be cached in the buffer cache when calculating the index clustering factor. The preference applies only when gathering statistics using DBMS_STATS. Index statistics gathered during CREATE INDEX or REBUILD INDEX operations will use the default value 1. |

Security Model

To run this procedure, you must have the SYSDBA role or both ANALYZE ANY DICTIONARY and ANALYZE ANY system privileges.

Exceptions

ORA-20000: Insufficient privileges

ORA-20001: Invalid or illegal input values

Usage Notes

All pname arguments are of type VARCHAR2 and values are enclosed in quotes, even when they represent numbers.

Example 177-7 Examples

```
DBMS_STATS.DELETE_DATABASE_PREFS('CASCADE', FALSE);
DBMS_STATS.DELETE_DATABASE_PREFS('ESTIMATE_PERCENT', TRUE);
```

177.7.16 DELETE_DATABASE_STATS Procedure

This procedure deletes statistics for all the tables in a database.

Syntax

```
DBMS_STATS.DELETE_DATABASE_STATS (
  stattab      VARCHAR2 DEFAULT NULL,
  statid       VARCHAR2 DEFAULT NULL,
  statown      VARCHAR2 DEFAULT NULL,
  no_invalidate  BOOLEAN  DEFAULT to_no_invalidate_type (
                                     get_param('NO_INVALIDATE')),
  force        BOOLEAN  DEFAULT FALSE,
  stat_category VARCHAR2 DEFAULT DEFAULT_DEL_STAT_CATEGORY);
```

Parameters

Table 177-20 DELETE_DATABASE_STATS Procedure Parameters

| Parameter | Description |
|---------------|---|
| stattab | User statistics table identifier describing from where to delete the statistics. If stattab is NULL, then the statistics are deleted directly in the dictionary. |
| statid | Identifier (optional) to associate with these statistics within stattab (Only pertinent if stattab is not NULL) |
| statown | Schema containing stattab (if different from current schema) |
| no_invalidate | Controls the invalidation of dependent cursors when statistics are gathered. The parameter takes the following values: <ul style="list-style-type: none"> TRUE: Dependent cursors are not invalidated. FALSE: Dependent cursors are marked for immediate invalidation. AUTO: This is the default value. Rolling invalidation is used to invalidate all dependent cursors over a period of time. The performance impact on the database is reduced especially in cases where a large number of cursors are invalidated. <p>The default can be changed using the SET_DATABASE_PREFS Procedure, SET_GLOBAL_PREFS Procedure, SET_SCHEMA_PREFS Procedure and SET_TABLE_PREFS Procedure.</p> |
| force | When the value of this argument is TRUE, deletes statistics of tables in a database even if they are locked |
| stat_category | Statistics to delete. It accepts multiple values separated by comma: <ul style="list-style-type: none"> OBJECT_STATS — table statistics, column statistics and index statistics SYNOPSIS — information to support incremental statistics REALTIME_STATS — specifies only real-time statistics. MODELS — supports import, export, and deletion for regression models in real-time stats. <p>The default is 'OBJECT_STATS, SYNOPSIS, REALTIME_STATS, MODELS'</p> |

Exceptions

ORA-20000: Object does not exist or insufficient privileges

Usage Notes

To run this procedure, you need to have the SYSDBA role or both ANALYZE ANY DICTIONARY and ANALYZE ANY system privileges.

177.7.17 DELETE_DICTIONARY_STATS Procedure

This procedure deletes statistics for all dictionary schemas ('SYS', 'SYSTEM' and RDBMS component schemas).

Syntax

```
DBMS_STATS.DELETE_DICTIONARY_STATS (
  statab          VARCHAR2 DEFAULT NULL,
  statid          VARCHAR2 DEFAULT NULL,
  statown        VARCHAR2 DEFAULT NULL,
  no_invalidate  BOOLEAN  DEFAULT to_no_invalidate_type (
                                get_param('NO_INVALIDATE')),
  stattype       VARCHAR2 DEFAULT 'ALL',
  force          BOOLEAN  DEFAULT FALSE,
  stat_category  VARCHAR2 DEFAULT DEFAULT_DEL_STAT_CATEGORY);
```

Parameters

Table 177-21 DELETE_DICTIONARY_STATS Procedure Parameters

| Parameter | Description |
|---------------|---|
| statab | User statistics table identifier describing from where to delete the statistics. If statab is NULL, then the statistics are deleted directly in the dictionary. |
| statid | Identifier (optional) to associate with these statistics within statab (Only pertinent if statab is not NULL) |
| statown | Schema containing statab (if different from current schema) |
| no_invalidate | Controls the invalidation of dependent cursors when statistics are gathered. The parameter takes the following values: <ul style="list-style-type: none"> TRUE: Dependent cursors are not invalidated. FALSE: Dependent cursors are marked for immediate invalidation. AUTO: This is the default value. Rolling invalidation is used to invalidate all dependent cursors over a period of time. The performance impact on the database is reduced especially in cases where a large number of cursors are invalidated. <p>The default can be changed using the SET_DATABASE_PREFS Procedure, SET_GLOBAL_PREFS Procedure, SET_SCHEMA_PREFS Procedure and SET_TABLE_PREFS Procedure.</p> |
| stattype | Statistics type |
| force | When the value of this argument is TRUE, deletes statistics of tables in a database even if they are locked |

Table 177-21 (Cont.) DELETE_DICTIONARY_STATS Procedure Parameters

| Parameter | Description |
|---------------|---|
| stat_category | <p>Statistics to delete. It accepts multiple values separated by comma:</p> <ul style="list-style-type: none"> • OBJECT_STATS — table statistics, column statistics and index statistics • SYNOPSES — information to support incremental statistics • REALTIME_STATS — Specifies only real-time statistics. • MODELS — supports import, export, and deletion for regression models in real-time stats. <p>The default is 'OBJECT_STATS, SYNOPSES, REALTIME_STATS, MODELS'</p> |

Usage Notes

You must have the SYSDBA or both ANALYZE ANY DICTIONARY and ANALYZE ANY system privilege to execute this procedure.

Exceptions

ORA-20000: Object does not exist or insufficient privileges

ORA-20002: Bad user statistics table, may need to upgrade it

177.7.18 DELETE_FIXED_OBJECTS_STATS Procedure

This procedure deletes statistics of all fixed tables.

Syntax

```
DBMS_STATS.DELETE_FIXED_OBJECTS_STATS (
    statab          VARCHAR2 DEFAULT NULL,
    statid          VARCHAR2 DEFAULT NULL,
    statown        VARCHAR2 DEFAULT NULL,
    no_invalidate  BOOLEAN  DEFAULT to_no_invalidate_type (
                                get_param('NO_INVALIDATE')),
    force          BOOLEAN  DEFAULT FALSE);
```

Parameters

Table 177-22 DELETE_FIXED_OBJECTS_STATS Procedure Parameters

| Parameter | Description |
|-----------|--|
| statab | The user statistics table identifier describing from where to delete the current statistics. If statab is NULL, the statistics will be deleted directly in the dictionary. |
| statid | The (optional) identifier to associate with these statistics within statab. This only applies if statab is not NULL. |
| statown | Schema containing statab (if different from current schema) |

Table 177-22 (Cont.) DELETE_FIXED_OBJECTS_STATS Procedure Parameters

| Parameter | Description |
|---------------|--|
| no_invalidate | <p>Controls the invalidation of dependent cursors when statistics are gathered. The parameter takes the following values:</p> <ul style="list-style-type: none"> • TRUE: Dependent cursors are not invalidated. • FALSE: Dependent cursors are marked for immediate invalidation. • AUTO: This is the default value. Rolling invalidation is used to invalidate all dependent cursors over a period of time. The performance impact on the database is reduced especially in cases where a large number of cursors are invalidated. <p>The default can be changed using the SET_DATABASE_PREFS Procedure, SET_GLOBAL_PREFS Procedure, SET_SCHEMA_PREFS Procedure and SET_TABLE_PREFS Procedure.</p> |
| force | <p>Ignores the statistics lock on objects and deletes the statistics if set to TRUE</p> |

Usage Notes

You must have the SYSDBA or ANALYZE ANY DICTIONARY system privilege to execute this procedure.

Exceptions

ORA-20000: Insufficient privileges

ORA-20002: Bad user statistics table, may need to upgrade it

177.7.19 DELETE_INDEX_STATS Procedure

This procedure deletes index-related statistics.

Syntax

```
DBMS_STATS.DELETE_INDEX_STATS (
  ownname          VARCHAR2,
  indname          VARCHAR2,
  partname         VARCHAR2 DEFAULT NULL,
  stattab         VARCHAR2 DEFAULT NULL,
  statid          VARCHAR2 DEFAULT NULL,
  cascade_parts   BOOLEAN   DEFAULT TRUE,
  statown         VARCHAR2 DEFAULT NULL,
  no_invalidate   BOOLEAN   DEFAULT to_no_invalidate_type (
                                     get_param('NO_INVALIDATE')),
  stattype        VARCHAR2 DEFAULT 'ALL',
  force           BOOLEAN   DEFAULT FALSE);
  stat_category   VARCHAR2 DEFAULT DEFAULT_DEL_STAT_CATEGORY);
```

Parameters

Table 177-23 DELETE_INDEX_STATS Procedure Parameters

| Parameter | Description |
|-----------|--------------------|
| ownname | Name of the schema |

Table 177-23 (Cont.) DELETE_INDEX_STATS Procedure Parameters

| Parameter | Description |
|---------------|---|
| indname | Name of the index |
| partname | Name of the index partition for which to delete the statistics. If the index is partitioned and if partname is NULL, then index statistics are deleted at the global level. |
| stattab | User statistics table identifier describing from where to delete the statistics. If stattab is NULL, then the statistics are deleted directly from the dictionary. |
| statid | Identifier (optional) to associate with these statistics within stattab (Only pertinent if stattab is not NULL) |
| cascade_parts | If the index is partitioned and if partname is NULL, then setting this to TRUE causes the deletion of statistics for this index for all underlying partitions as well |
| statown | Schema containing stattab (if different than ownname) |
| no_invalidate | Controls the invalidation of dependent cursors when statistics are gathered. The parameter takes the following values: <ul style="list-style-type: none"> TRUE: Dependent cursors are not invalidated. FALSE: Dependent cursors are marked for immediate invalidation. AUTO: This is the default value. Rolling invalidation is used to invalidate all dependent cursors over a period of time. The performance impact on the database is reduced especially in cases where a large number of cursors are invalidated. <p>The default can be changed using the SET_DATABASE_PREFS Procedure, SET_GLOBAL_PREFS Procedure, SET_SCHEMA_PREFS Procedure and SET_TABLE_PREFS Procedure.</p> |
| stattype | Statistics type |
| force | When value of this argument is TRUE, deletes index statistics even if locked |
| stat_category | Statistics to delete. It accepts multiple values separated by comma: <ul style="list-style-type: none"> OBJECT_STATS — table statistics, column statistics and index statistics SYNOPSIS — information to support incremental statistics REALTIME_STATS — Specifies only real-time statistics. MODELS — supports import, export, and deletion for regression models in real-time stats. <p>The default is 'OBJECT_STATS, SYNOPSIS, REALTIME_STATS, MODELS'</p> |

Exceptions

ORA-20000: Object does not exist or insufficient privileges

ORA-20005: Object statistics are locked

Usage Notes

To invoke this procedure you must be owner of the table, or you need the `ANALYZE ANY` privilege. For objects owned by `SYS`, you need to be either the owner of the table, or you need the `ANALYZE ANY DICTIONARY` privilege or the `SYSDBA` privilege.

177.7.20 DELETE_PENDING_STATS Procedure

This procedure is used to delete the pending statistics that have been collected but have not been published.

Syntax

```
DBMS_STATS.DELETE_PENDING_STATS (  
    ownname      IN  VARCHAR2  DEFAULT USER,  
    tablename    IN  VARCHAR2);
```

Parameters

Table 177-24 DELETE_PENDING_STATS Procedure Parameters

| Parameter | Description |
|-----------|-------------|
| ownname | Owner name |
| tablename | Table name |

Security Model

To run this procedure, you need to have the same privilege for gathering statistics on the tables that will be affected by this procedure. The default owner is the user who runs the procedure.

Exceptions

ORA-20000: Insufficient privileges

Usage Notes

If the parameter `tablename` is `NULL` delete applies to all tables of the specified schema.

Examples

```
DBMS_STATS.DELETE_PENDING_STATS('SH', 'SALES');
```

177.7.21 DELETE_PROCESSING_RATE Procedure

This procedure deletes the processing rate of a given statistics source. If the source is not specified, it deletes the statistics of all the sources.

Syntax

```
DBMS_STATS.DELETE_PROCESSING_RATE (  
    stat_source  IN  VARCHAR2  DEFAULT NULL);
```

Parameters

Table 177-25 DELETE_PROCESSING_RATE Procedure Parameters

| Parameter | Description |
|-------------|---|
| stat_source | Source of processing rates: <ul style="list-style-type: none"> 'MANUAL': values set by the user manually using the SET_PROCESSING_RATE Procedure 'CALIBRATION': values collected by the calibration GATHER_PROCESSING_RATE Procedure run explicitly by the user 'FEEDBACK': values obtained by time feedback |

Usage Notes

You require the `OPTIMIZER_PROCESSING_RATE` role to run this procedure since `AUTO DOP` uses processing rates to determine the optimal degree of parallelism for a SQL statement.

Exceptions

ORA-20000: Object does not exist or insufficient privileges

ORA-20001: Invalid or illegal input value

177.7.22 DELETE_SCHEMA_PREFS Procedure

This procedure is used to delete the statistics preferences of all the tables owned by the specified owner name.

Syntax

```
DBMS_STATS.DELETE_SCHEMA_PREFS (
    ownname IN VARCHAR2,
    pname   IN VARCHAR2);
```

Parameters

Table 177-26 DELETE_SCHEMA_PREFS Procedure Parameters

| Parameter | Description |
|-----------|-------------|
| ownname | Owner name |

Table 177-26 (Cont.) DELETE_SCHEMA_PREFS Procedure Parameters

| Parameter | Description |
|-----------|--|
| pname | <p>Preference name. The existing value for following preferences can be deleted and default preference values will be used:</p> <ul style="list-style-type: none"> • APPROXIMATE_NDV_ALGORITHM • AUTO_STAT_EXTENSIONS • CASCADE • DEGREE • ESTIMATE_PERCENT • GLOBAL_TEMP_TABLE_STATS • GRANULARITY • INCREMENTAL • INCREMENTAL_LEVEL • INCREMENTAL_STALENESS • METHOD_OPT • NO_INVALIDATE • OPTIONS • PREFERENCE_OVERRIDES_PARAMETER • PUBLISH • STALE_PERCENT • TABLE_CACHED_BLOCKS |

Table 177-27 Statistics Preferences

| Preference | Description |
|---------------------------|---|
| APPROXIMATE_NDV_ALGORITHM | <p>Specifies the synopsis generation algorithm. A synopsis is special type of statistic that tracks the number of distinct values (NDV) for each column in a partition. You can consider a synopsis as an internal management structure that samples distinct values.</p> <p>You can set the following values:</p> <ul style="list-style-type: none"> • REPEAT OR HYPERLOGLOG <p>This is the default. If INCREMENTAL is enabled on the table, then the database preserves the format of any existing synopses that use the adaptive sampling algorithm. However, the database creates any new synopses in HyperLogLog format.</p> • ADAPTIVE SAMPLING <p>The database uses the adaptive sampling algorithm for all synopses.</p> • HYPERLOGLOG <p>The database uses the HyperLogLog algorithm for all new and stale synopses.</p> |

Table 177-27 (Cont.) Statistics Preferences

| Preference | Description |
|---------------------------|---|
| AUTO_STAT_EXTENSIONS | <p>Controls the automatic creation of extensions when database statistics are gathered.</p> <p>You can set the following values:</p> <ul style="list-style-type: none"> • ON — When applicable, a SQL plan directive can trigger the creation of column group statistics based on usage of columns in the predicates in the workload. • OFF— The database does not create column group statistics automatically. The database creates them only when the <code>CREATE_EXTENDED_STATS</code> function is executed, or when extended statistics are specified explicitly in the <code>METHOD_OPT</code> clause of <code>DBMS_STATS</code>. This is the default. |
| CASCADE | Determines whether index statistics are collected as part of gathering table statistics. |
| COORDINATOR_TRIGGER_SHARD | <p>User of each shard uses this preference to determine whether to allow shard coordinator to interact with the statistics gathering in each shards.</p> <p>While gathering the statistics in shard coordinator, if the statistics in one of the shards are not up to date, the shard coordinator will try to trigger the statistics gathering in that shard. By using this preference, user can execute or ignore that command from the shard coordinator.</p> <p>You can set the following values:</p> <ul style="list-style-type: none"> • TRUE—Allows the shard coordinator trigger the statistics gathering on sharded table in local shard if the statistics on local shard are stale. • FALSE—Ignores the statistics gathering command triggered from the shard coordinator. <p>The default value is <code>FALSE</code>.</p> |
| DEGREE | Determines the degree of parallelism used for gathering statistics. |
| ESTIMATE_PERCENT | The value determines the percentage of rows to estimate. |
| METHOD_OPT | Controls column statistics collection and histogram creation. When setting preferences at the global, schema, database, or dictionary level, only <code>FOR ALL</code> syntax is allowed. |

Table 177-27 (Cont.) Statistics Preferences

| Preference | Description |
|-------------------|--|
| NO_INVALIDATE | <p>Controls the invalidation of dependent cursors when statistics are gathered. The parameter takes the following values:</p> <ul style="list-style-type: none"> • TRUE: Dependent cursors are not invalidated. • FALSE: Dependent cursors are marked for immediate invalidation. • AUTO: This is the default value. Rolling invalidation is used to invalidate all dependent cursors over a period of time. The performance impact on the database is reduced especially in cases where a large number of cursors are invalidated. <p>The default can be changed using the SET_DATABASE_PREFS Procedure, SET_GLOBAL_PREFS Procedure, SET_SCHEMA_PREFS Procedure and SET_TABLE_PREFS Procedure.</p> |
| GRANULARITY | The value determines granularity of statistics to collect (only pertinent if the table is partitioned) |
| PUBLISH | This value determines whether or not newly gathered statistics will be published once the gather job has completed. |
| INCREMENTAL | This value determines whether or not the global statistics of a partitioned table will be maintained without doing a full table scan. |
| INCREMENTAL_LEVEL | This value controls what synopses to collect when INCREMENTAL preference is set to TRUE. |

Table 177-27 (Cont.) Statistics Preferences

| Preference | Description |
|-----------------------|---|
| INCREMENTAL_STALENESS | <p>Specifies when a partition or subpartition is considered stale. This parameter takes an enumeration of values, such as 'USE_STALE_PERCENT' and 'USE_LOCKED_STATS'. You can also specify multiple values, such as 'USE_STALE_PERCENT,USE_LOCKED_STATS,ALLOW_MIXED_FORMAT'.</p> <p>The parameter accepts the following values:</p> <ul style="list-style-type: none"> • USE_STALE_PERCENT—A partition or subpartition is not considered stale when DML changes are below the threshold set by the <code>STALE_PERCENT</code> preference. <ul style="list-style-type: none"> For example, assume that <code>STALE_PERCENT</code> is 10. You specify <code>USE_STALE_PERCENT</code> for <code>INCREMENTAL_STALENESS</code>. The partition has 5% DML changes. The database does not regather statistics. Assume a different case in which <code>STALE_PERCENT</code> is 10. You specify <code>USE_STALE_PERCENT</code> for <code>INCREMENTAL_STALENESS</code>. However, in this case the partition is locked and has 20% of DML changes. Because the partition is locked, the database does not regather statistics. • USE_LOCKED_STATS—Locked partitions or subpartitions statistics are never considered stale, regardless of DML changes. <ul style="list-style-type: none"> For example, assume that <code>STALE_PERCENT</code> is 10. You specify 'USE_LOCKED_STATS, USE_STALE_PERCENT'. The partition, which is locked, has 20% DML changes. The partition is not considered stale. The database uses existing statistics to derive global statistics. • ALLOW_MIXED_FORMAT—Adaptive sampling synopses and HyperLogLog synopses are permitted to coexist. • NULL—A partition or subpartition is considered stale when it has any DML changes. <ul style="list-style-type: none"> For example, assume that <code>STALE_PERCENT</code> is 10. You specify the value 'NULL' for <code>INCREMENTAL_STALENESS</code>. The partition has 5% of DML changes. The database regathers statistics. <p>Note that the following two executions are different:</p> <pre>EXEC DBMS_STATS.SET_TABLE_PREFS ('sh', 'sales', 'INCREMENTAL_STALENESS', 'NULL');</pre> <pre>EXEC DBMS_STATS.SET_TABLE_PREFS ('sh', 'sales', 'INCREMENTAL_STALENESS', null);</pre> |

Table 177-27 (Cont.) Statistics Preferences

| Preference | Description |
|-------------------------|---|
| ROOT_TRIGGER_PDB | <p>The first execution uses single quotes to set the preference to the value <code>NULL</code>, whereas the second sets the preference to the default, which is <code>ALLOW_MIXED_FORMAT</code>.</p> <p>The application PDB user, uses this preference to determine whether to allow the application root to interact with the statics gathering in PDB.</p> <p>During the statistics gathering of a metadata linked table in the application root, if the statistics in a PDB are in stale state, the application root triggers the statistics gathering for the particular PDB. Using this preference, the user can either execute or ignore the command from the application root.</p> <p>You can set the following values:</p> <ul style="list-style-type: none"> • <code>TRUE</code>—Allows the application root trigger the statistics gathering on metadata linked table in application PDB if the statistics on PDB are stale. • <code>FALSE</code>—Ignores the statistics gathering command triggered from application root. <p>The default value is <code>FALSE</code>.</p> |
| STALE_PERCENT | <p>This value determines the percentage of rows in a table that have to change before the statistics on that table are deemed stale and should be regathered.</p> |
| GLOBAL_TEMP_TABLE_STATS | <p>This controls whether the statistics gathered for a global temporary table should be stored as shared statistics or session statistics.</p> |
| TABLE_CACHED_BLOCKS | <p>Specifies the average number of blocks assumed to be cached in the buffer cache when calculating the index clustering factor. The preference applies only when gathering statistics using <code>DBMS_STATS</code>. Index statistics gathered during <code>CREATE INDEX</code> or <code>REBUILD INDEX</code> operations will use the default value 1.</p> |
| OPTIONS | <p>Determines the <code>options</code> parameter used in the GATHER_TABLE_STATS Procedure.</p> |

 **Note:**

CDB root, different from application root, never triggers statistics gathering on the PDBs and it is not controlled by this preference.

Security Model

To run this procedure, you must be the object owner, or have the `SYSDBA` privilege, or have the `ANALYZE ANY` system privilege.

Exceptions

ORA-20000: Insufficient privileges / Schema "<schema>" does not exist

ORA-20001: Invalid or Illegal input values

Usage Notes

All arguments are of type VARCHAR2 and values are enclosed in quotes, even when they represent numbers.

Examples

```
DBMS_STATS.DELETE_SCHEMA_PREFS('SH', 'CASCADE');
DBMS_STATS.DELETE_SCHEMA_PREFS('SH', 'ESTIMATE_PERCENT');
DBMS_STATS.DELETE_SCHEMA_PREFS('SH', 'DEGREE');
```

Oracle Database SQL Tuning Guide to learn how to manage optimizer statistics preferences

177.7.23 DELETE_SCHEMA_STATS Procedure

This procedure deletes statistics for an entire schema.

Syntax

```
DBMS_STATS.DELETE_SCHEMA_STATS (
  ownname          VARCHAR2,
  statab           VARCHAR2 DEFAULT NULL,
  statid           VARCHAR2 DEFAULT NULL,
  statown          VARCHAR2 DEFAULT NULL,
  no_invalidate    BOOLEAN DEFAULT to_no_invalidate_type (
                                     get_param('NO_INVALIDATE')),
  force            BOOLEAN DEFAULT FALSE,
  stat_category    VARCHAR2 DEFAULT DEFAULT_DEL_STAT_CATEGORY);
```

Parameters

Table 177-28 DELETE_SCHEMA_STATS Procedure Parameters

| Parameter | Description |
|-----------|---|
| ownname | Specifies the name of the schema. |
| statab | Identifies the table where statistics are stored. If statab is NULL, then the procedure deletes statistics directly from the data dictionary. |
| statid | Specifies the identifier (optional) associated with these statistics within statab. This parameter is only relevant if statab is not NULL. |

Table 177-28 (Cont.) DELETE_SCHEMA_STATS Procedure Parameters

| Parameter | Description |
|---------------|---|
| statown | Specifies the schema containing <code>stattab</code> (if different than <code>ownname</code>). |
| no_invalidate | Controls the invalidation of dependent cursors when statistics are gathered. The parameter takes the following values: <ul style="list-style-type: none"> • TRUE: Dependent cursors are not invalidated. • FALSE: Dependent cursors are marked for immediate invalidation. • AUTO: This is the default value. Rolling invalidation is used to invalidate all dependent cursors over a period of time. The performance impact on the database is reduced especially in cases where a large number of cursors are invalidated. <p>You can change the default using the SET_DATABASE_PREFS Procedure, SET_GLOBAL_PREFS Procedure, SET_SCHEMA_PREFS Procedure and SET_TABLE_PREFS Procedure.</p> |
| force | Indicates whether to force the deletion for locked statistics. When the value is TRUE, this procedure deletes table statistics even if locked. |
| stat_category | Specifies which statistics to process. The following values are supported: <ul style="list-style-type: none"> • OBJECT_STATS — Specifies table statistics, column statistics, and index statistics. • SYNOPSES — Specifies metadata for incremental statistics. • REALTIME_STATS — Specifies only real-time statistics. • MODELS — supports import, export, and deletion for regression models in real-time stats. <p>You can specify a list of comma-delimited values. For example, 'OBJECT_STATS, SYNOPSES' specifies table statistics, column statistics, index statistics, and synopses. The default value is 'OBJECT_STATS, SYNOPSES, REALTIME_STATS, MODELS'.</p> |

Security Model

To invoke this procedure you must be owner of the table or have the `ANALYZE ANY` privilege. For objects owned by `SYS`, you must be either the owner of the table or have either the `ANALYZE ANY DICTIONARY` privilege or the `SYSDBA` privilege.

Exceptions

ORA-20000: Object does not exist or insufficient privileges

177.7.24 DELETE_SYSTEM_STATS Procedure

This procedure deletes workload statistics (collected using the 'INTERVAL' or 'START' and 'STOP' options) and resets the default to `noworkload` statistics (collected using 'NOWORKLOAD' option), if `stattab` is not specified. If `stattab` is specified, the subprogram deletes all system statistics with the associated `statid` from the `stattab`.

Syntax

```
DBMS_STATS.DELETE_SYSTEM_STATS (
  stattab      VARCHAR2 DEFAULT NULL,
  statid       VARCHAR2 DEFAULT NULL,
  statown      VARCHAR2 DEFAULT NULL);
```

Parameters

Table 177-29 DELETE_SYSTEM_STATS Procedure Parameters

| Parameter | Description |
|-----------|--|
| stattab | Identifier of the user statistics table where the statistics will be saved |
| statid | Optional identifier associated with the statistics saved in the stattab |
| statown | Schema containing stattab (if different from current schema) |

Exceptions

ORA-20000: Object does not exist or insufficient privileges

ORA-20002: Bad user statistics table; may need to be upgraded

Usage Notes

To run this procedure, you need the GATHER_SYSTEM_STATISTICS role.

177.7.25 DELETE_TABLE_PREFS Procedure

This procedure deletes the optimizer statistics preferences of the specified table in the specified schema.

Syntax

```
DBMS_STATS.DELETE_TABLE_PREFS (
    ownname    IN  VARCHAR2,
    tablename  IN  VARCHAR2,
    pname      IN  VARCHAR2);
```

Parameters

Table 177-30 DELETE_TABLE_PREFS Procedure Parameters

| Parameter | Description |
|-----------|-------------|
| ownname | Owner name |
| tablename | Table name |

Table 177-30 (Cont.) DELETE_TABLE_PREFS Procedure Parameters

| Parameter | Description |
|-----------|---|
| pname | <p>Preference name. The existing value for following preferences can be deleted and default preference values will be used:</p> <ul style="list-style-type: none"> • APPROXIMATE_NDV_ALGORITHM • AUTO_STAT_EXTENSIONS • CASCADE • DEGREE • ESTIMATE_PERCENT • GRANULARITY • GLOBAL_TEMP_STATS • INCREMENTAL • INCREMENTAL_LEVEL • INCREMENTAL_STALENESS • METHOD_OPT • NO_INVALIDATE • OPTIONS • PREFERENCE_OVERRIDES_PARAMETER • PUBLISH • STALE_PERCENT • STAT_CATEGORY • TABLE_CACHED_BLOCKS |

Table 177-31 Statistics Preferences

| Preference | Description |
|---------------------------|--|
| APPROXIMATE_NDV_ALGORITHM | <p>Specifies the synopsis generation algorithm. A synopsis is special type of statistic that tracks the number of distinct values (NDV) for each column in a partition. Consider a synopsis as an internal management structure that samples distinct values.</p> <p>You can specify the following preferences:</p> <ul style="list-style-type: none"> • REPEAT OR HYPERLOGLOG This is the default. If INCREMENTAL is enabled on the table, then the database preserves the format of any existing synopses that use the adaptive sampling algorithm. However, the database creates any new synopses in HyperLogLog format. This approach is attractive when existing performance is acceptable, and you do not want to incur the performance cost of reformatting legacy content. • ADAPTIVE SAMPLING The database uses the adaptive sampling algorithm for all synopses. This is the most conservative option. • HYPERLOGLOG The database uses the HyperLogLog algorithm for all new and stale synopses. In contrast to adaptive sampling, the HyperLogLog algorithm uses a randomization technique. The advantages of HyperLogLog over adaptive sampling are: <ul style="list-style-type: none"> – The accuracy of the new algorithm is similar to the original algorithm. – The memory required is significantly lower, which typically leads to huge reductions in synopsis size. |
| AUTO_STAT_EXTENSIONS | <p>Controls the automatic creation of extensions when database statistics are gathered.</p> <p>You can set the following values:</p> <ul style="list-style-type: none"> • ON — When applicable, a SQL plan directive can trigger the creation of column group statistics based on usage of columns in the predicates in the workload. • OFF— The database does not create column group statistics automatically. The database creates them only when the CREATE_EXTENDED_STATS function is executed, or when extended statistics are specified explicitly in the METHOD_OPT clause of DBMS_STATS. This is the default. |
| CASCADE | Determines whether index statistics are collected as part of gathering table statistics. |
| DEGREE | Determines the degree of parallelism used for gathering statistics. |
| ESTIMATE_PERCENT | Determines the percentage of rows to estimate. |
| GRANULARITY | Determines granularity of statistics to collect. This value is only relevant for partitioned tables. |

Table 177-31 (Cont.) Statistics Preferences

| Preference | Description |
|-------------------------|---|
| GLOBAL_TEMP_TABLE_STATS | Controls whether the statistics gathered for a global temporary table should be stored as shared statistics or session statistics. |
| INCREMENTAL | This value determines whether or not the global statistics of a partitioned table will be maintained without doing a full table scan. |
| INCREMENTAL_LEVEL | This value controls what synopses to collect when INCREMENTAL preference is set to TRUE. |

Table 177-31 (Cont.) Statistics Preferences

| Preference | Description |
|-----------------------|---|
| INCREMENTAL_STALENESS | <p>Specifies when a partition or subpartition is considered stale. This parameter takes an enumeration of values, such as 'USE_STALE_PERCENT' and 'USE_LOCKED_STATS'. You can also specify multiple values, such as 'USE_STALE_PERCENT,USE_LOCKED_STATS,ALLOW_MIXED_FORMAT'.</p> <p>The parameter accepts the following values:</p> <ul style="list-style-type: none"> • USE_STALE_PERCENT—A partition or subpartition is not considered stale when DML changes are below the threshold set by the STALE_PERCENT preference. For example, assume that STALE_PERCENT is 10. You specify USE_STALE_PERCENT for INCREMENTAL_STALENESS. The partition has 5% DML changes. The database does not regather statistics. Assume a different case in which STALE_PERCENT is 10. You specify USE_STALE_PERCENT for INCREMENTAL_STALENESS. However, in this case the partition is locked and has 20% of DML changes. Because the partition is locked, the database does not regather statistics. • USE_LOCKED_STATS—Locked partitions or subpartitions statistics are never considered stale, regardless of DML changes. For example, assume that STALE_PERCENT is 10. You specify 'USE_LOCKED_STATS, USE_STALE_PERCENT'. The partition, which is locked, has 20% DML changes. The partition is not considered stale. The database uses existing statistics to derive global statistics. • ALLOW_MIXED_FORMAT—Adaptive sampling synopses and HyperLogLog synopses are permitted to coexist. • NULL—A partition or subpartition is considered stale when it has any DML changes. For example, assume that STALE_PERCENT is 10. You specify the value 'NULL' for INCREMENTAL_STALENESS. The partition has 5% of DML changes. The database regathers statistics. <p>Note that the following two executions are different:</p> <pre>EXEC DBMS_STATS.SET_TABLE_PREFS ('sh', 'sales', 'INCREMENTAL_STALENESS', 'NULL');</pre> <pre>EXEC DBMS_STATS.SET_TABLE_PREFS ('sh', 'sales', 'INCREMENTAL_STALENESS', null);</pre> |

Table 177-31 (Cont.) Statistics Preferences

| Preference | Description |
|--------------------------------|---|
| METHOD_OPT | The first execution uses single quotes to set the preference to the value NULL, whereas the second sets the preference to the default, which is ALLOW_MIXED_FORMAT. Controls column statistics collection and histogram creation. When setting preference at the global, schema, database, or dictionary level, only 'FOR ALL' syntax is allowed. |
| NO_INVALIDATE | The value controls the invalidation of dependent cursors of the tables for which statistics are being gathered. |
| OPTIONS | Determines the options parameter used in the GATHER_TABLE_STATS Procedure . |
| PREFERENCE_OVERRIDES_PARAMETER | Determines whether to override the input value of a parameter with the preference value of that parameter for a statistics operation. Possible values are: <ul style="list-style-type: none"> TRUE — Ignores input parameter values, and uses the value of the corresponding preference. FALSE — Obeys input parameter values. Specifying this preference does not change the order of precedence of table, global, and default. |
| PUBLISH | Determines whether newly gathered statistics will be published after the statistics gathering job has completed. |
| STALE_PERCENT | Determines the percentage of rows in a table that have to change before the statistics on that table are deemed stale and should be regathered. |
| STAT_CATEGORY | Specifies which statistics to import or export, accepting multiple values separated by a comma. Values supported: <ul style="list-style-type: none"> OBJECT_STATS — table statistics, column statistics and index statistics (default) SYNOPSIS — information to support incremental statistics REALTIME_STATS — specifies only real-time statistics. MODELS — supports import, export, and deletion for regression models in real-time stats. The value 'OBJECT_STATS, SYNOPSIS' specifies table statistics, column statistics, index statistics, and synopsis. The default value is 'OBJECT_STATS, SYNOPSIS, REALTIME_STATS, MODELS'. |
| TABLE_CACHED_BLOCKS | Specifies the average number of blocks assumed to be cached in the buffer cache when calculating the index clustering factor. The preference applies only when gathering statistics using DBMS_STATS. Index statistics gathered during CREATE INDEX or REBUILD INDEX operations will use the default value 1. |

Exceptions

ORA-20000: Insufficient privileges

ORA-20001: Invalid or Illegal input values

Usage Notes

- To run this procedure, you need to connect as owner of the table, be granted `ANALYZE` privilege on the table, or `ANALYZE ANY` system privilege.
- All arguments are of type `VARCHAR2` and values are enclosed in quotes, even when they represent numbers.

Examples

```
DBMS_STATS.DELETE_TABLE_PREFS('SH', 'SALES', 'CASCADE');
DBMS_STATS.DELETE_TABLE_PREFS('SH', 'SALES', 'DEGREE');
```

See Also:

Oracle Database SQL Tuning Guide to learn how to manage optimizer statistics preferences

177.7.26 DELETE_TABLE_STATS Procedure

This procedure deletes table-related statistics.

Syntax

```
DBMS_STATS.DELETE_TABLE_STATS (
  ownname          VARCHAR2,
  tablename        VARCHAR2,
  partname         VARCHAR2 DEFAULT NULL,
  statab          VARCHAR2 DEFAULT NULL,
  statid          VARCHAR2 DEFAULT NULL,
  cascade_parts   BOOLEAN   DEFAULT TRUE,
  cascade_columns BOOLEAN   DEFAULT TRUE,
  cascade_indexes BOOLEAN   DEFAULT TRUE,
  statown         VARCHAR2 DEFAULT NULL,
  no_invalidate   BOOLEAN   DEFAULT to_no_invalidate_type (
                                get_param('NO_INVALIDATE')),
  force           BOOLEAN   DEFAULT FALSE,
  stat_category   VARCHAR2 DEFAULT DEFAULT_DEL_STAT_CATEGORY);
```

Parameters

Table 177-32 DELETE_TABLE_STATS Procedure Parameters

| Parameter | Description |
|------------------------|--|
| <code>ownname</code> | Specifies the name of the schema. |
| <code>tablename</code> | Specifies the name of the table to which this column belongs. |
| <code>partname</code> | Specifies the name of the table partition or subpartition from which to get the statistics. If the table is partitioned and if <code>partname</code> is <code>NULL</code> , then the statistics are retrieved from the global table level. |

Table 177-32 (Cont.) DELETE_TABLE_STATS Procedure Parameters

| Parameter | Description |
|-----------------|---|
| stattab | Identifies the user statistics table where statistics will be retrieved. If <code>stattab</code> is NULL, then the procedure retrieves statistics directly from the dictionary. |
| statid | Specifies the identifier (optional) associated with these statistics within <code>stattab</code> . This parameter is only relevant if <code>stattab</code> is not NULL. |
| cascade_parts | Specifies whether the procedure should operate on underlying partitions. If the table is partitioned, and if <code>partname</code> is NULL, then specifying TRUE deletes statistics for underlying partitions. |
| cascade_columns | Indicates whether to invoke the <code>DELETE_COLUMN_STATS</code> procedure. If TRUE, then this procedure calls <code>DELETE_COLUMN_STATS</code> for all underlying columns. |
| cascade_indexes | Indicates whether to invoke the <code>DELETE_INDEX_STATS</code> procedure. If TRUE, then this procedure calls <code>DELETE_INDEX_STATS</code> for all underlying columns. |
| statown | Specifies the schema containing <code>stattab</code> (if different than <code>ownname</code>). |
| no_invalidate | Controls the invalidation of dependent cursors when statistics are gathered. The parameter takes the following values: <ul style="list-style-type: none"> TRUE: Dependent cursors are not invalidated. FALSE: Dependent cursors are marked for immediate invalidation. AUTO: This is the default value. Rolling invalidation is used to invalidate all dependent cursors over a period of time. The performance impact on the database is reduced especially in cases where a large number of cursors are invalidated. <p>You can change the default using the SET_DATABASE_PREFS Procedure, SET_GLOBAL_PREFS Procedure, SET_SCHEMA_PREFS Procedure and SET_TABLE_PREFS Procedure.</p> |
| force | Indicates whether to force the deletion for locked statistics. When the value is TRUE, this procedure deletes table statistics even if locked. |
| stat_category | Specifies which statistics to process. The following values are supported: <ul style="list-style-type: none"> OBJECT_STATS — specifies table statistics, column statistics, and index statistics. SYNOPSIS — specifies metadata for incremental statistics. REALTIME_STATS — specifies only real-time statistics. MODELS — supports import, export, and deletion for regression models in real-time stats. <p>You can specify a list of comma-delimited values. For example, 'OBJECT_STATS, SYNOPSIS' specifies table statistics, column statistics, index statistics, and synopses.</p> <p>The default value is 'OBJECT_STATS, SYNOPSIS, REALTIME_STATS, MODELS'.</p> |

Security Model

To invoke this procedure you must be owner of the table or have the `ANALYZE ANY` privilege. For objects owned by `SYS`, you must be either the owner of the table or have either the `ANALYZE ANY DICTIONARY` privilege or the `SYSDBA` privilege.

Exceptions

ORA-20000: Object does not exist or insufficient privileges

ORA-20002: Bad user statistics table, may need to upgrade it

ORA-20005: Object statistics are locked

177.7.27 DIFF_TABLE_STATS_IN_HISTORY Function

This function compares statistics for a table as of two specified timestamps.

Syntax

```
DBMS_STATS.DIFF_TABLE_STATS_IN_HISTORY(
  ownname      IN  VARCHAR2,
  tablename    IN  VARCHAR2,
  time1        IN  TIMESTAMP WITH TIME ZONE,
  time2        IN  TIMESTAMP WITH TIME ZONE DEFAULT NULL,
  pctthreshold IN  NUMBER                      DEFAULT 10)
RETURN DiffRepTab pipelined;
```

Parameters

Table 177-33 DIFF_TABLE_STATS_IN_HISTORY Function Parameters

| Parameter | Description |
|--------------|--|
| ownname | Specifies the owner of the table. Specify NULL for current schema. |
| tablename | Specifies the table for which statistics are to be compared. |
| time1 | Specifies the first timestamp for comparison. |
| time2 | Specifies the second timestamp for comparison. |
| pctthreshold | Specifies the threshold limit. The function reports differences in statistics only if the change percentage exceeds this limit. The default value is 10. |

Security Model

To invoke this procedure you must be owner of the table or have the `ANALYZE ANY` privilege. For objects owned by `SYS`, you must be either the owner of the table or have either the `ANALYZE ANY DICTIONARY` privilege or the `SYSDBA` privilege.

Usage Notes

If the second timestamp is `NULL`, then the function compares the current statistics in the data dictionary with the statistics as of the first timestamp.

177.7.28 DIFF_TABLE_STATS_IN_PENDING Function

This function compares pending statistics to either the current statistics in the data dictionary, or user-specified historical statistics.

Syntax

```
DBMS_STATS.DIFF_TABLE_STATS_IN_PENDING(
  ownname      IN  VARCHAR2,
  tablename    IN  VARCHAR2,
```

```

        timestamp      IN  TIMESTAMP WITH TIME ZONE,
        pctthreshold   IN  NUMBER  DEFAULT 10)
RETURN DiffRepTab pipelined;

```

Parameters

Table 177-34 DIFF_TABLE_STATS_IN_PENDING Function Parameters

| Parameter | Description |
|--------------|---|
| ownname | Owner of the table. Specify NULL for the current schema. |
| tablename | Table for which statistics are to be compared. |
| timestamp | Timestamp in the statistics history that corresponds to the desired statistics. If the timestamp is NULL, then this function compares the current statistics in the dictionary with the pending statistics (default). |
| pctthreshold | Limit for reporting. The function reports difference in statistics only if it exceeds the specified limit. The default value is 10. |

Security Model

To invoke this procedure you must be owner of the table, or you must have the `ANALYZE ANY` privilege. For objects owned by `SYS`, you must be either the owner of the table, or you must have either the `ANALYZE ANY DICTIONARY` privilege or the `SYSDBA` privilege.

177.7.29 DIFF_TABLE_STATS_IN_STATTAB Function

This function compares table statistics from two sources.

The function can obtain statistics from the following sources:

- Two user statistics tables
- A single user statistics table containing two sets of statistics that can be identified using `statids`
- A user statistics table and dictionary

The function also compares the statistics of the dependent objects: indexes, columns, and partitions. It displays statistics of the objects from both sources when the difference between those statistics exceeds a certain threshold (%). You can specify this threshold as an argument to the function. The function uses the statistics corresponding to the first source (`stattab1` or `time1`) as the basis for computing the difference percentage.

Syntax

```

DBMS_STATS.DIFF_TABLE_STATS_IN_STATTAB (
    ownname      IN  VARCHAR2,
    tablename    IN  VARCHAR2,
    stattab1     IN  VARCHAR2,
    stattab2     IN  VARCHAR2 DEFAULT NULL,
    pctthreshold IN  NUMBER  DEFAULT 10,
    statid1      IN  VARCHAR2 DEFAULT NULL,
    statid2      IN  VARCHAR2 DEFAULT NULL,

```

```

    statablown    IN  VARCHAR2 DEFAULT NULL,
    statab2own   IN  VARCHAR2 DEFAULT NULL)
RETURN DiffRepTab pipelined;

```

Parameters

Table 177-35 DIFF_TABLE_STATS_IN_STATTAB Function Parameters

| Parameter | Description |
|--------------|--|
| ownname | Specifies the owner of the table. Specify <code>NULL</code> for current schema. |
| tablename | Specifies the table for which statistics are to be compared. |
| statab1 | Specifies the user statistics table 1. |
| statab2 | Specifies the user statistics table 2. If <code>NULL</code> , the function compares statistics in <code>statab1</code> with current statistics in the data dictionary. This is the default. To compare two sets within the statistics table, specify the same table as <code>statab1</code> (see <code>statid</code> below). |
| pctthreshold | Specifies the percent thresholds for comparison. The function reports difference in statistics only if it exceeds this limit. The default value is 10. |
| statid1 | (optional) Identifies statistics set within <code>statab1</code> . |
| statid2 | (optional) Identifies statistics set within <code>statab2</code> . |
| statablown | Specifies the schema containing <code>statab1</code> (if other than <code>ownname</code>). |
| statab2own | Specifies the schema containing <code>statab2</code> (if other than <code>ownname</code>). |

Security Model

To invoke this procedure you must be owner of the table or have the `ANALYZE ANY` privilege. For objects owned by `SYS`, you must be either the owner of the table or have either the `ANALYZE ANY DICTIONARY` privilege or the `SYSDBA` privilege.

177.7.30 DROP_ADVISOR_TASK Procedure

This procedure drops the specified Optimizer Statistics Advisor task.

Syntax

```

DBMS_STATS.DROP_ADVISOR_TASK (
    task_name IN VARCHAR2);

```

Parameters

Table 177-36 DROP_ADVISOR_TASK Procedure Parameters

| Parameter | Description |
|-----------|--|
| task_name | The name of the Optimizer Statistics Advisor task. |

Security Model

Note the following:

- To execute this subprogram, you must have the `ADVISOR` privilege.
- You must be the owner of the task.
- This subprogram executes using invoker's rights.

Exceptions

- `ORA-20000`: Insufficient privileges
- `ORA-20001`: Invalid input values
- `ORA-20012`: Optimizer Statistics Advisor errors

Example 177-8 Dropping an Optimizer Statistics Advisor Task

This example drops the Optimizer Statistics Advisor task named `my_task`:

```
EXEC DBMS_STATS.DROP_ADVISOR_TASK('my_task');
```

177.7.31 DROP_EXTENDED_STATS Procedure

This function drops the statistics entry that is created for the user specified extension.

This cancels the effects of the [CREATE_EXTENDED_STATS Function](#).

Syntax

```
DBMS_STATS.DROP_EXTENDED_STATS (
    ownname    VARCHAR2,
    tablename  VARCHAR2,
    extension  VARCHAR2);
```

Parameters

Table 177-37 DROP_EXTENDED_STATS Procedure Parameters

| Parameter | Description |
|------------------------|---|
| <code>ownname</code> | Owner name of a table |
| <code>tablename</code> | Name of the table |
| <code>extension</code> | Can be either a column group or an expression. Suppose the specified table has two column <code>c1</code> , <code>c2</code> . An example column group can be " <code>(c1, c2)</code> " and an example expression can be " <code>(c1 + c2)</code> ". |

Exceptions

- `ORA-20000`: Insufficient privileges or extension does not exist
- `ORA-20001`: Error when processing extension

Usage Notes

- To invoke this procedure you must be owner of the table, or you need the `ANALYZE ANY` privilege. For objects owned by `SYS`, you need to be either the owner of the table, or you need the `ANALYZE ANY DICTIONARY` privilege or the `SYSDBA` privilege.

- If no extended statistics set is created for the extension, this function throws an error.

177.7.32 DROP_STAT_TABLE Procedure

This procedure drops a user statistics table.

Syntax

```
DBMS_STATS.DROP_STAT_TABLE (
    ownname VARCHAR2,
    statab VARCHAR2);
```

Parameters

Table 177-38 DROP_STAT_TABLE Procedure Parameters

| Parameter | Description |
|-----------|----------------------------------|
| ownname | Name of the schema |
| statab | User statistics table identifier |

Exceptions

ORA-20000: Table does not exists or insufficient privileges.

Usage Notes

To invoke this procedure you need the privileges for dropping the specified table.

177.7.33 EXECUTE_ADVISOR_TASK Function

This function executes a previously created Optimizer Statistics Advisor task.

Syntax

```
DBMS_STATS.EXECUTE_ADVISOR_TASK (
    task_name      IN  VARCHAR2,
    execution_name IN  VARCHAR2 := NULL)
RETURN VARCHAR2;
```

Parameters

Table 177-39 EXECUTE_ADVISOR_TASK Parameters

| Parameter | Description |
|----------------|---|
| task_name | Name of the Optimizer Statistics Advisor task. |
| execution_name | A name that qualifies and identifies an advisor execution. If not specified, then the advisor automatically generates it. If the specified execution conflicts with the name of an existing execution, then the function returns an error. |

Security Model

Note the following:

- To execute this subprogram, you must have the `ADVISOR` privilege.
- You must be the owner of the task.
- You can execute this subprogram for `AUTO_STATS_ADVISOR_TASK`, which is predefined.
- This subprogram executes using invoker's rights.

The results of performing this task depend on the privileges of the executing user:

- `SYSTEM` level

Only users with both the `ANALYZE ANY` and `ANALYZE ANY DICTIONARY` privileges can perform this task on system-level rules.

- Operation level

The results depend on the following privileges:

- Users with both the `ANALYZE ANY` and `ANALYZE ANY DICTIONARY` privileges can perform this task for all statistics operations.
- Users with the `ANALYZE ANY` privilege but *not* the `ANALYZE ANY DICTIONARY` privilege can perform this task for statistics operations related to any schema except `SYS`.
- Users with the `ANALYZE ANY DICTIONARY` privilege but *not* the `ANALYZE ANY` privilege can perform this task for statistics operations related to their own schema and the `SYS` schema.
- Users with neither the `ANALYZE ANY` nor the `ANALYZE ANY DICTIONARY` privilege can only perform this operation for statistics operations relating to their own schema.

- Object level

Users can perform this task for any object for which they have statistics collection privileges.

Exceptions

- `ORA-20000`: Insufficient privileges
- `ORA-20001`: Invalid input values
- `ORA-20012`: Optimizer Statistics Advisor errors

Returns

This function returns the name of the new execution.

Usage Notes

The results of the execution depend on user privileges and the type of rules:

- System

To perform the operation on system-level rules, you must have both the `ANALYZE ANY` and `ANALYZE ANY DICTIONARY` privileges.

- **Operation**

If you have the `ANALYZE ANY` and `ANALYZE ANY DICTIONARY` privileges, then you can execute this function for all operations. If you have only the `ANALYZE ANY` privilege, then you can execute this function for operations related to any schemas except `SYS`. If you have only the `ANALYZE ANY DICTIONARY` privilege, then you can execute this function for operations related to any schemas, including `SYS`. If you have neither the `ANALYZE ANY` nor the `ANALYZE ANY DICTIONARY` privilege, then you can execute this function only for operations in your own schema.

- **Object**

If you have the privilege to collect statistics for an object, then you can execute this function for the object.

Example 177-9 Creating and Executing a Task

This example creates an Optimizer Statistics Advisor task named `my_task`, and then executes it.

```
DECLARE
  v_tname  VARCHAR2(128) := 'my_task';
BEGIN
  -- create a task
  v_tname := DBMS_STATS.CREATE_ADVISOR_TASK(v_tname);
  -- execute the task
  v_tname := DBMS_STATS.EXECUTE_ADVISOR_TASK(v_tname);
END;
```

177.7.34 EXPORT_COLUMN_STATS Procedure

This procedure exports statistics for a specified column and stores them in the user statistics table identified by `stattab`.

Syntax

```
DBMS_STATS.EXPORT_COLUMN_STATS (
  ownname  VARCHAR2,
  tablename VARCHAR2,
  colname  VARCHAR2,
  partname VARCHAR2 DEFAULT NULL,
  stattab  VARCHAR2,
  statid   VARCHAR2 DEFAULT NULL,
  statown  VARCHAR2 DEFAULT NULL);
```

Parameters

Table 177-40 EXPORT_COLUMN_STATS Procedure Parameters

| Parameter | Description |
|-----------|---|
| ownname | Name of the schema |
| tabname | Name of the table to which this column belongs |
| colname | Name of the column or extension |
| partname | Name of the table partition. If the table is partitioned and if partname is NULL, then global and partition column statistics are exported. |
| stattab | User statistics table identifier describing where to store the statistics |
| statid | Identifier (optional) to associate with these statistics within stattab |
| statown | Schema containing stattab (if different than ownname) |

Security Model

To invoke this procedure you must be owner of the table or have the `ANALYZE ANY` privilege. For objects owned by `SYS`, you must be either the owner of the table or have either the `ANALYZE ANY DICTIONARY` privilege or the `SYSDBA` privilege.

Exceptions

ORA-20000: Object does not exist or insufficient privileges

Usage Notes

Oracle Database does not support export or import of statistics across databases of different character sets.

177.7.35 EXPORT_DATABASE_PREFS Procedure

This procedure is used to export the statistics preferences of all the tables, excluding the tables owned by Oracle. These tables can be included by passing `TRUE` for the `add_sys` parameter.

Syntax

```
DBMS_STATS.EXPORT_DATABASE_PREFS (
    stattab      IN  VARCHAR2,
    statid       IN  VARCHAR2 DEFAULT NULL,
    statown      IN  VARCHAR2 DEFAULT NULL
    add_sys      IN  BOOLEAN DEFAULT FALSE);
```

Parameters

Table 177-41 EXPORT_DATABASE_PREFS Procedure Parameters

| Parameter | Description |
|-----------|--|
| stattab | Statistics table name to where statistics should be exported |

Table 177-41 (Cont.) EXPORT_DATABASE_PREFS Procedure Parameters

| Parameter | Description |
|-----------|--|
| statid | (Optional) Identifier to associate with these statistics within statab |
| statown | Schema containing statab (if other than ownname) |
| add_sys | Value TRUE will include the Oracle-owned tables |

Exceptions

ORA-20000: Insufficient privileges

Usage Notes

- To run this procedure, you need to have the SYSDBA role, or both ANALYZE ANY DICTIONARY and ANALYZE ANY system privileges.
- All arguments are of type VARCHAR2 and values are enclosed in quotes.
- Oracle does not support export or import of statistics across databases of different character sets.

Examples

```
DBMS_STATS.EXPORT_DATABASE_PREFS('STATTAB', statown=>'SH');
```

177.7.36 EXPORT_DATABASE_STATS Procedure

This procedure exports statistics for all objects in the database and stores them in the user statistics tables identified by statown.statab.

Syntax

```
DBMS_STATS.EXPORT_DATABASE_STATS (
    statab          VARCHAR2,
    statid          VARCHAR2 DEFAULT NULL,
    statown         VARCHAR2 DEFAULT NULL,
    stat_category  VARCHAR2 DEFAULT DEFAULT_STAT_CATEGORY);
```

Parameters

Table 177-42 EXPORT_DATABASE_STATS Procedure Parameters

| Parameter | Description |
|-----------|---|
| statab | User statistics table identifier describing where to store the statistics |
| statid | Identifier (optional) to associate with these statistics within statab |
| statown | Schema containing statab (if different from current schema) |

Table 177-42 (Cont.) EXPORT_DATABASE_STATS Procedure Parameters

| Parameter | Description |
|---------------|---|
| stat_category | <p>Specifies what statistics to import, accepting multiple values separated by a comma. Values supported:</p> <ul style="list-style-type: none"> • OBJECT_STATS — table statistics, column statistics and index statistics (default). • SYNOPSIS — information to support incremental statistics. • REALTIME_STATS — specifies only real-time statistics. <p>If 'OBJECT_STATS, SYNOPSIS' is specified, table statistics, column statistics, index statistics and synopsis are deleted.</p> |

Security Model

To invoke this procedure you must be owner of the table or have the `ANALYZE ANY` privilege. For objects owned by `SYS`, you must be either the owner of the table or have either the `ANALYZE ANY DICTIONARY` privilege or the `SYSDBA` privilege.

Exceptions

ORA-20000: Object does not exist or insufficient privileges

Usage Notes

Oracle Database does not support export or import of statistics across databases of different character sets.

177.7.37 EXPORT_DICTIONARY_STATS Procedure

This procedure exports statistics for all data dictionary schemas (`SYS`, `SYSTEM`, and RDBMS component schemas) and stores them in the user statistics table identified by `stattab`.

Syntax

```
DBMS_STATS.EXPORT_DICTIONARY_STATS (
  stattab          VARCHAR2,
  statid          VARCHAR2 DEFAULT NULL,
  statown         VARCHAR2 DEFAULT NULL,
  stat_category   VARCHAR2 DEFAULT DEFAULT_STAT_CATEGORY);
```

Parameters

Table 177-43 EXPORT_DICTIONARY_STATS Procedure Parameters

| Parameter | Description |
|-----------|--|
| stattab | User statistics table identifier describing where to store the statistics |
| statid | Identifier (optional) to associate with these statistics within <code>stattab</code> |
| statown | Schema containing <code>stattab</code> (if different from current schema) |

Table 177-43 (Cont.) EXPORT_DICTIONARY_STATS Procedure Parameters

| Parameter | Description |
|---------------|---|
| stat_category | <p>Specifies what statistics to import, accepting multiple values separated by a comma. Values supported:</p> <ul style="list-style-type: none"> OBJECT_STATS — table statistics, column statistics and index statistics (default) SYNOPSIS — information to support incremental statistics REALTIME_STATS — specifies only real-time statistics. <p>If 'OBJECT_STATS, SYNOPSIS' is specified, table statistics, column statistics, index statistics and synopses are deleted.</p> |

Security Model

To invoke this procedure you must be owner of the table or have the `ANALYZE ANY` privilege. For objects owned by `SYS`, you must be either the owner of the table or have either the `ANALYZE ANY DICTIONARY` privilege or the `SYSDBA` privilege.

Exceptions

ORA-20000: Object does not exist or insufficient privileges

ORA-20002: Bad user statistics table, may need to upgrade it

Usage Notes

Oracle Database does not support export or import of statistics across databases of different character sets.

177.7.38 EXPORT_FIXED_OBJECTS_STATS Procedure

This procedure exports statistics for fixed tables and stores them in the user statistics table identified by `stattab`.

Syntax

```
DBMS_STATS.EXPORT_FIXED_OBJECTS_STATS (
  stattab  VARCHAR2,
  statid   VARCHAR2 DEFAULT NULL,
  statown  VARCHAR2 DEFAULT NULL);
```

Parameters**Table 177-44 EXPORT_FIXED_OBJECTS_STATS Procedure Parameters**

| Parameter | Description |
|-----------|--|
| stattab | User statistics table identifier describing where to store the statistics |
| statid | Identifier (optional) to associate with these statistics within <code>stattab</code> |
| statown | Schema containing <code>stattab</code> (if different from current schema) |

Security Model

To invoke this procedure you must be owner of the table or have the `ANALYZE ANY` privilege. For objects owned by `SYS`, you must be either the owner of the table or have either the `ANALYZE ANY DICTIONARY` privilege or the `SYSDBA` privilege.

Exceptions

ORA-20000: Object does not exist or insufficient privileges

ORA-20002: Bad user statistics table, may need to upgrade it

Usage Notes

Oracle Database does not support export or import of statistics across databases of different character sets.

177.7.39 EXPORT_INDEX_STATS Procedure

This procedure retrieves statistics for a particular index and stores them in the user statistics table identified by `stattab`.

Syntax

```
DBMS_STATS.EXPORT_INDEX_STATS (
    ownname  VARCHAR2,
    indname  VARCHAR2,
    partname VARCHAR2 DEFAULT NULL,
    stattab  VARCHAR2,
    statid   VARCHAR2 DEFAULT NULL,
    statown  VARCHAR2 DEFAULT NULL);
```

Parameters

Table 177-45 EXPORT_INDEX_STATS Procedure Parameters

| Parameter | Description |
|-----------------------|---|
| <code>ownname</code> | Name of the schema |
| <code>indname</code> | Name of the index |
| <code>partname</code> | Name of the index partition. If the index is partitioned and if <code>partname</code> is <code>NULL</code> , then global and partition index statistics are exported. |
| <code>stattab</code> | User statistics table identifier describing where to store the statistics |
| <code>statid</code> | Identifier (optional) to associate with these statistics within <code>stattab</code> |
| <code>statown</code> | Schema containing <code>stattab</code> (if different than <code>ownname</code>) |

Exceptions

ORA-20000: Object does not exist or insufficient privileges

Usage Notes

- To invoke this procedure you must be owner of the table, or you need the `ANALYZE ANY` privilege. For objects owned by `SYS`, you need to be either the owner of the table, or you need the `ANALYZE ANY DICTIONARY` privilege or the `SYSDBA` privilege.
- Oracle does not support export or import of statistics across databases of different character sets.

177.7.40 EXPORT_PENDING_STATS Procedure

This procedure is used to export the statistics gathered and stored as pending.

Syntax

```
DBMS_STATS.EXPORT_PENDING_STATS (
  ownname      IN  VARCHAR2  DEFAULT USER,
  tablename    IN  VARCHAR2,
  stattab      IN  VARCHAR2,
  statid       IN  VARCHAR2  DEFAULT NULL,
  statown      IN  VARCHAR2  DEFAULT USER);
```

Parameters

Table 177-46 EXPORT_PENDING_STATS Procedure Parameters

| Parameter | Description |
|------------------------|--|
| <code>ownname</code> | Owner name |
| <code>tablename</code> | Table name |
| <code>stattab</code> | Statistics table name to where to export the statistics |
| <code>statid</code> | (Optional) Identifier to associate with these statistics within <code>stattab</code> |
| <code>statown</code> | Schema containing <code>stattab</code> (if other than <code>ownname</code>) |

Exceptions

ORA-20000: Object does not exist or insufficient privileges

Usage Notes

- If the parameter `tablename` is `NULL` then export applies to all tables of the specified schema.
- The default owner/schema is the user who runs the procedure.
- To run this procedure, you need to have the same privilege for gathering statistics on the tables that will be touched by this procedure.
- All arguments are of type `VARCHAR2` and values are enclosed in quotes.
- Oracle does not support export or import of statistics across databases of different character sets.

Examples

```
DBMS_STATS.EXPORT_PENDING_STATS(NULL, NULL, 'MY_STAT_TABLE');
```

177.7.41 EXPORT_SCHEMA_PREFS Procedure

This procedure is used to export the statistics preferences of all the tables owned by the specified owner name.

Syntax

```
DBMS_STATS.EXPORT_SCHEMA_PREFS (
  ownname      IN  VARCHAR2,
  stattab      IN  VARCHAR2,
  statid       IN  VARCHAR2 DEFAULT NULL,
  statown      IN  VARCHAR2 DEFAULT NULL);
```

Parameters

Table 177-47 EXPORT_SCHEMA_PREFS Procedure Parameters

| Parameter | Description |
|-----------|---|
| ownname | Owner name |
| stattab | Statistics table name to where to export the statistics |
| statid | (Optional) Identifier to associate with these statistics within stattab |
| statown | Schema containing stattab (if different than ownname) |

Exceptions

ORA-20000: Object does not exist or insufficient privileges

Usage Notes

- To run this procedure, you need to connect as owner, or have the SYSDBA privilege, or have the ANALYZE ANY system privilege.
- All arguments are of type VARCHAR2 and values are enclosed in quotes.
- Oracle does not support export or import of statistics across databases of different character sets.

Examples

```
DBMS_STATS.EXPORT_SCHEMA_PREFS('SH', 'STAT');
```

177.7.42 EXPORT_SCHEMA_STATS Procedure

This procedure exports statistics for all objects in the schema identified by ownname and stores them in the user statistics tables identified by stattab.

Syntax

```
DBMS_STATS.EXPORT_SCHEMA_STATS (
  ownname      VARCHAR2,
  stattab      VARCHAR2,
  statid       VARCHAR2 DEFAULT NULL,
```

```
statown          VARCHAR2 DEFAULT NULL,
stat_category    VARCHAR2 DEFAULT DEFAULT_STAT_CATEGORY);
```

Parameters

Table 177-48 EXPORT_SCHEMA_STATS Procedure Parameters

| Parameter | Description |
|---------------|--|
| ownname | Specifies the name of the schema. |
| stattab | Identifies the user statistics table in which to store the exported statistics. |
| statid | Specifies the identifier (optional) associated with these statistics within stattab. |
| statown | Specifies the schema containing stattab (if different than ownname). |
| stat_category | <p>Specifies which statistics to process. The following values are supported:</p> <ul style="list-style-type: none"> OBJECT_STATS — specifies table statistics, column statistics, and index statistics SYNOPSIS — specifies metadata for incremental statistics REALTIME_STATS — specifies only real-time statistics <p>You can specify a list of comma-delimited values. For example, 'OBJECT_STATS, SYNOPSIS' specifies table statistics, column statistics, index statistics, and synopsis.</p> <p>The default value is 'OBJECT_STATS, SYNOPSIS, REALTIME_STATS'.</p> |

Security Model

To invoke this procedure you must be owner of the table or have the `ANALYZE ANY` privilege. For objects owned by `SYS`, you must be either the owner of the table or have either the `ANALYZE ANY DICTIONARY` privilege or the `SYSDBA` privilege.

Exceptions

ORA-20000: Object does not exist or insufficient privileges

Usage Notes

Oracle Database does not support export or import of statistics across databases of different character sets.

177.7.43 EXPORT_SYSTEM_STATS Procedure

This procedure retrieves system statistics and stores them in the user statistics table, identified by `stattab`.

Syntax

```
DBMS_STATS.EXPORT_SYSTEM_STATS (
  stattab          VARCHAR2,
  statid           VARCHAR2 DEFAULT NULL,
  statown          VARCHAR2 DEFAULT NULL);
```

Parameters

Table 177-49 EXPORT_SYSTEM_STATS Procedure Parameters

| Parameter | Description |
|-----------|--|
| stattab | Identifier of the user statistics table that describes where the statistics will be stored |
| statid | Optional identifier associated with the statistics stored from the stattab |
| statown | Schema containing stattab (if different from current schema) |

Security Model

To run this procedure, you must have the `GATHER_SYSTEM_STATISTICS` role.

Exceptions

ORA-20000: Object does not exist or insufficient privileges

ORA-20002: Bad user statistics table; may need to be upgraded

ORA-20003: Unable to export system statistics

Usage Notes

Oracle Database does not support the export or import of statistics across databases of different character sets.

177.7.44 EXPORT_TABLE_PREFS Procedure

This procedure is used to export the statistics preferences of the specified table in the specified schema into the specified statistics table.

Syntax

```
DBMS_STATS.EXPORT_TABLE_PREFS (
  ownname      IN  VARCHAR2,
  tablename    IN  VARCHAR2,
  stattab      IN  VARCHAR2,
  statid       IN  VARCHAR2 DEFAULT NULL,
  statown      IN  VARCHAR2 DEFAULT NULL);
```

Parameters

Table 177-50 EXPORT_TABLE_PREFS Procedure Parameters

| Parameter | Description |
|-----------|---|
| ownname | Owner name |
| tablename | Table name |
| stattab | Statistics table name where to export the statistics |
| statid | Optional identifier to associate with these statistics within stattab |

Table 177-50 (Cont.) EXPORT_TABLE_PREFS Procedure Parameters

| Parameter | Description |
|-----------|--|
| statown | Schema containing <code>stattab</code> (if other than <code>ownname</code>) |

Exceptions

ORA-20000: Object does not exist or insufficient privileges

Usage Notes

- To run this procedure, you need to connect as owner of the table, or have the `ANALYZE ANY` system privilege.
- All arguments are of type `VARCHAR2` and values are enclosed in quotes.
- Oracle does not support export or import of statistics across databases of different character sets.

Examples

```
DBMS_STATS.EXPORT_TABLE_PREFS('SH', 'SALES', 'STAT');
```

177.7.45 EXPORT_TABLE_STATS Procedure

This procedure exports statistics for a specified table (including associated index statistics) and stores them in the user statistics table identified by `stattab`.

Syntax

```
DBMS_STATS.EXPORT_TABLE_STATS (
  ownname          VARCHAR2,
  tablename        VARCHAR2,
  partname         VARCHAR2 DEFAULT NULL,
  stattab         VARCHAR2,
  statid          VARCHAR2 DEFAULT NULL,
  cascade         BOOLEAN  DEFAULT TRUE,
  statown         VARCHAR2 DEFAULT NULL,
  stat_category   VARCHAR2 DEFAULT DEFAULT_STAT_CATEGORY);
```

Parameters

Table 177-51 EXPORT_TABLE_STATS Procedure Parameters

| Parameter | Description |
|-----------|---|
| ownname | Specifies the name of the schema. |
| tablename | Specifies the name of the table. |
| partname | Specifies the name of the table partition. If the table is partitioned, and if <code>partname</code> is <code>NULL</code> , then the procedure exports global and partition statistics. |

Table 177-51 (Cont.) EXPORT_TABLE_STATS Procedure Parameters

| Parameter | Description |
|---------------|--|
| stattab | Specifies the identifier (optional) associated with these statistics within stattab. |
| statid | Specifies the identifier (optional) associated with these statistics within stattab. |
| cascade | Indicates whether to export column and index statistics. If TRUE, then the procedure exports column and index statistics for the specified table. This is the default. |
| statown | Specifies the schema containing stattab (if different than ownname). |
| stat_category | <p>Specifies which statistics to process. The following values are supported:</p> <ul style="list-style-type: none"> OBJECT_STATS — specifies table statistics, column statistics, and index statistics SYNOPSIS — specifies metadata for incremental statistics REALTIME_STATS — specifies only real-time statistics <p>You can specify a list of comma-delimited values. For example, 'OBJECT_STATS, SYNOPSIS' specifies table statistics, column statistics, index statistics, and synopses.</p> <p>The default value is 'OBJECT_STATS, SYNOPSIS, REALTIME_STATS'.</p> |

Security Model

To invoke this procedure you must be owner of the table or have the `ANALYZE ANY` privilege. For objects owned by `SYS`, you must be either the owner of the table or have either the `ANALYZE ANY DICTIONARY` privilege or the `SYSDBA` privilege.

Exceptions

ORA-20000: Object does not exist or insufficient privileges

Usage Notes

Oracle Database does not support export or import of statistics across databases of different character sets.

177.7.46 FLUSH_DATABASE_MONITORING_INFO Procedure

This procedure saves monitoring information for all tables in the dictionary. The database immediately updates corresponding entries in the `*_TAB_MODIFICATIONS`, `*_TAB_STATISTICS` and `*_IND_STATISTICS` views.

Syntax

```
DBMS_STATS.FLUSH_DATABASE_MONITORING_INFO;
```

Security Model

The `ANALYZE ANY` system privilege is required to run this procedure.

Exceptions

ORA-20000: Insufficient privileges

Usage Notes

Starting in Oracle Database 12c Release 2 (12.2), you do not need to call `FLUSH_DATABASE_MONITORING_INFO` to view the latest information in `*_TAB_STATISTICS` and `*_IND_STATISTICS` because these views show statistics cached in the SGA and stored on disk. Because the `GATHER_*_STATS` procedures internally save monitoring information to disk, it is not necessary to run this procedure before gathering statistics.

Oracle Database SQL Tuning Guide to learn how to set optimizer statistics preferences

177.7.47 GATHER_DATABASE_STATS Procedures

This procedure gathers statistics for all objects in the database.

Syntax

```

DBMS_STATS.GATHER_DATABASE_STATS (
  estimate_percent NUMBER      DEFAULT to_estimate_percent_type
                               (get_param('ESTIMATE_PERCENT')),
  block_sample      BOOLEAN    DEFAULT FALSE,
  method_opt       VARCHAR2   DEFAULT get_param('METHOD_OPT'),
  degree           NUMBER     DEFAULT to_degree_type(get_param('DEGREE')),
  granularity      VARCHAR2   DEFAULT GET_PARAM('GRANULARITY'),
  cascade         BOOLEAN    DEFAULT to_cascade_type(get_param('CASCADE')),
  stattab         VARCHAR2   DEFAULT NULL,
  statid          VARCHAR2   DEFAULT NULL,
  options         VARCHAR2   DEFAULT 'GATHER',
  objlist         OUT         ObjectTab,
  statown        VARCHAR2   DEFAULT NULL,
  gather_sys      BOOLEAN    DEFAULT TRUE,
  no_invalidate   BOOLEAN    DEFAULT to_no_invalidate_type (
                               get_param('NO_INVALIDATE')),
  obj_filter_list ObjectTab  DEFAULT NULL);

```

```

DBMS_STATS.GATHER_DATABASE_STATS (
  estimate_percent NUMBER      DEFAULT to_estimate_percent_type
                               (get_param('ESTIMATE_PERCENT')),
  block_sample      BOOLEAN    DEFAULT FALSE,
  method_opt       VARCHAR2   DEFAULT get_param('METHOD_OPT'),
  degree           NUMBER     DEFAULT to_degree_type(get_param('DEGREE')),
  granularity      VARCHAR2   DEFAULT GET_PARAM('GRANULARITY'),
  cascade         BOOLEAN    DEFAULT to_cascade_type(get_param('CASCADE')),
  stattab         VARCHAR2   DEFAULT NULL,
  statid          VARCHAR2   DEFAULT NULL,
  options         VARCHAR2   DEFAULT 'GATHER',
  statown        VARCHAR2   DEFAULT NULL,
  gather_sys      BOOLEAN    DEFAULT TRUE,
  no_invalidate   BOOLEAN    DEFAULT to_no_invalidate_type (

```

```

                                get_param('NO_INVALIDATE')),
obj_filter_list ObjectTab DEFAULT NULL);

```

Parameters

Table 177-52 GATHER_DATABASE_STATS Procedure Parameters

| Parameter | Description |
|------------------|---|
| estimate_percent | <p>Determines the percentage of rows to sample. The valid range is between 0.000001 and 100. Use the constant <code>DBMS_STATS.AUTO_SAMPLE_SIZE</code> to enable the database to determine the appropriate sample size for optimal statistics. This is the default.</p> <p>You can change the default value using the SET_DATABASE_PREFS Procedure, SET_GLOBAL_PREFS Procedure, SET_SCHEMA_PREFS Procedure and SET_TABLE_PREFS Procedure.</p> |
| block_sample | <p>Determines whether the database uses random block sampling (<code>TRUE</code>) or random row sampling (<code>FALSE</code>). The default is <code>FALSE</code>.</p> <p>Random block sampling is more efficient, but if the data is not randomly distributed on disk, then sample values may be somewhat correlated. This parameter is only relevant when estimating statistics.</p> |
| method_opt | <p>When setting preference on global, schema, database or dictionary level, only 'FOR ALL' syntax is allowed.:</p> <ul style="list-style-type: none"> • <code>FOR ALL [INDEXED HIDDEN] COLUMNS [size_clause]</code> <code>size_clause</code> is defined as <code>size_clause := SIZE {integer REPEAT AUTO SKEWONLY}</code> <ul style="list-style-type: none"> - <code>integer</code> : Number of histogram buckets. Must be in the range [1,2048]. - <code>REPEAT</code> : Collects histograms only on the columns that already have histograms. - <code>AUTO</code> : Oracle determines the columns on which to collect histograms based on data distribution and the workload of the columns. - <code>SKEWONLY</code> : Oracle determines the columns on which to collect histograms based on the data distribution of the columns. <p>The default is <code>FOR ALL COLUMNS SIZE AUTO</code>. The value can be changed using the SET_DATABASE_PREFS Procedure, SET_GLOBAL_PREFS Procedure, SET_SCHEMA_PREFS Procedure and SET_TABLE_PREFS Procedure.</p> |

Table 177-52 (Cont.) GATHER_DATABASE_STATS Procedure Parameters

| Parameter | Description |
|-------------|---|
| degree | <p>Determines the degree of parallelism used for gathering statistics. The default for <code>degree</code> is <code>NULL</code>. <code>NULL</code> means to use the table default value specified by the <code>DEGREE</code> clause in the <code>CREATE TABLE</code> or <code>ALTER TABLE</code> statement. Change the default using the <code>SET_DATABASE_PREFS</code>, <code>SET_GLOBAL_PREFS</code>, <code>SET_SCHEMA_PREFS</code>, and <code>SET_TABLE_PREFS</code> procedures. <code>NULL</code> means use the table default value specified by the <code>DEGREE</code> clause in the <code>CREATE TABLE</code> or <code>ALTER TABLE</code> statement.</p> <p>Use the constant <code>DBMS_STATS.DEFAULT_DEGREE</code> to specify the default value based on the initialization parameters. The <code>AUTO_DEGREE</code> value determines the degree of parallelism automatically. The degree is between 1 (serial execution) and <code>DEFAULT_DEGREE</code> (the system default value based on number of CPUs and initialization parameters), according to the size of the object. When using <code>DEGREE=>NULL</code>, <code>DEGREE=>n</code>, or <code>DEGREE=>DBMS_STATS.DEFAULT_DEGREE</code>, the current implementation of <code>DBMS_STATS</code> may use serial execution when the size of the object does not warrant parallel execution.</p> |
| granularity | <p>Granularity of statistics to collect (only pertinent if the table is partitioned).</p> <p>'ALL' - Gathers all (subpartition, partition, and global) statistics</p> <p>'AUTO' - Determines the granularity based on the partitioning type. This is the default value.</p> <p>'DEFAULT' - Gathers global and partition-level statistics. This option is obsolete, and while currently supported, it is included in the documentation for legacy reasons only. You should use the 'GLOBAL AND PARTITION' for this functionality. Note that the default value is now 'AUTO'.</p> <p>'GLOBAL' - Gathers global statistics</p> <p>'GLOBAL AND PARTITION' - Gathers the global and partition level statistics. No subpartition level statistics are gathered even if it is a composite partitioned object.</p> <p>'PARTITION' - Gathers partition-level statistics</p> <p>'SUBPARTITION' - Gathers subpartition-level statistics</p> |
| cascade | <p>Determines whether to collect index statistics as part of gathering table statistics.</p> <p>Specifying this option is equivalent to running the <code>GATHER_INDEX_STATS</code> procedure on each index of the table. Use the constant <code>DBMS_STATS.AUTO_CASCADE</code> to enable the database to determine whether index statistics need to be collected. This is the default. You can change the default using the <code>SET_DATABASE_PREFS</code>, <code>SET_GLOBAL_PREFS</code>, <code>SET_SCHEMA_PREFS</code>, and <code>SET_TABLE_PREFS</code> procedures.</p> |
| stattab | <p>User statistics table identifier describing where to save the current statistics.</p> <p>The statistics table is assumed to reside in the same schema as the object being analyzed, so there must be one such table in each schema to use this option.</p> |

Table 177-52 (Cont.) GATHER_DATABASE_STATS Procedure Parameters

| Parameter | Description |
|---------------|---|
| statid | Identifier (optional) to associate with these statistics within <code>stattab</code> . |
| options | <p>Specifies which objects require statistics to be gathered. Valid values are as follows:</p> <ul style="list-style-type: none"> • <code>GATHER</code> — Gathers statistics on all objects in the database. This is the default. • <code>GATHER AUTO</code> — Gathers all necessary statistics automatically. The database implicitly determines which objects need new statistics and determines how to gather those statistics. When <code>GATHER AUTO</code> is specified, the only additional valid parameters are <code>comp_id</code>, <code>no_invalidate</code>, <code>stattab</code>, <code>statid</code>, and <code>statown</code>; all other parameter settings will be ignored. Also, the database returns a list of objects processed. • <code>GATHER STALE</code> — Gathers statistics on stale objects by querying the <code>*_TAB_MODIFICATIONS</code> views. Also, the database returns a list of objects found to be stale. • <code>GATHER EMPTY</code> — Gathers statistics on objects that currently have no statistics. Also, the database returns a list of objects found to have no statistics. • <code>LIST AUTO</code> — Returns a list of objects to be processed with <code>GATHER AUTO</code>. • <code>LIST STALE</code> — Returns list of stale objects as determined by looking at the <code>*_TAB_MODIFICATIONS</code> views. • <code>LIST EMPTY</code> — Returns a list of objects that currently have no statistics. |
| objlist | List of objects found to be stale or empty |
| statown | Schema containing <code>stattab</code> (if different from current schema) |
| gather_sys | Gathers statistics on the objects owned by the <code>SYS</code> user. |
| no_invalidate | <p>Controls the invalidation of dependent cursors when statistics are gathered. The parameter takes the following values:</p> <ul style="list-style-type: none"> • <code>TRUE</code>: Dependent cursors are not invalidated. • <code>FALSE</code>: Dependent cursors are marked for immediate invalidation. • <code>AUTO</code>: This is the default value. Rolling invalidation is used to invalidate all dependent cursors over a period of time. The performance impact on the database is reduced especially in cases where a large number of cursors are invalidated. <p>If set to <code>TRUE</code>, then the database not invalidate dependent cursors. If set to <code>FALSE</code>, then the procedure invalidates dependent cursors immediately.</p> |

Table 177-52 (Cont.) GATHER_DATABASE_STATS Procedure Parameters

| Parameter | Description |
|-----------------|--|
| obj_filter_list | A list of object filters. When provided, GATHER_DATABASE_STATS will gather statistics only on objects which satisfy at least one object filter in the list as needed. In a single object filter, we can specify the constraints on the object attributes. The attribute values specified in the object filter are case-insensitive unless double-quoted. Wildcard is allowed in the attribute values. Suppose non-NULL values s1, s2, ... are specified for attributes a1, a2, ... in one object filter. An object o is said to satisfy this object filter if (o.a1 like s1) or (o.a2 like s2) or ... is true. |

Exceptions

ORA-20000: Insufficient privileges

ORA-20001: Bad input value

Usage Notes

To run this procedure, you need to have the SYSDBA role or both ANALYZE ANY DICTIONARY and ANALYZE ANY system privileges.

If the GATHER AUTO option is used then frequency histograms will be created using a sample rather than a full scan. The following scenario shows where GATHER AUTO is used:

- A table is created like this: CREATE TABLE NEWTAB as SELECT * FROM
This will create statistics on NEWTAB but no histograms.
- Next, the DBA creates the histograms using GATHER AUTO on gather_table_stats.
- The FREQUENCY histograms on NEWTAB will be created using a sample rather than a full table scan.

177.7.48 GATHER_DICTIONARY_STATS Procedure

This procedure gathers statistics for dictionary schemas SYS, SYSTEM and schemas of RDBMS components.

Syntax

```
DBMS_STATS.GATHER_DICTIONARY_STATS (
  comp_id          VARCHAR2 DEFAULT NULL,
  estimate_percent NUMBER   DEFAULT to_estimate_percent_type
                        (get_param('ESTIMATE_PERCENT')),
  block_sample    BOOLEAN   DEFAULT FALSE,
  method_opt      VARCHAR2 DEFAULT get_param('METHOD_OPT'),
  degree          NUMBER   DEFAULT to_degree_type(get_param('DEGREE')),
  granularity     VARCHAR2 DEFAULT GET_PARAM('GRANULARITY'),
  cascade         BOOLEAN   DEFAULT to_cascade_type(get_param('CASCADE')),
  stattab        VARCHAR2 DEFAULT NULL,
  statid         VARCHAR2 DEFAULT NULL,
  options        VARCHAR2 DEFAULT 'GATHER AUTO',
  objlist        OUT      ObjectTab,
  statown        VARCHAR2 DEFAULT NULL,
```

```

no_invalidate      BOOLEAN  DEFAULT to_no_invalidate_type (
                                get_param('NO_INVALIDATE')),
obj_filter_list   ObjectTab DEFAULT NULL);

DBMS_STATS.GATHER_DICTIONARY_STATS (
  comp_id          VARCHAR2  DEFAULT NULL,
  estimate_percent NUMBER  DEFAULT

to_estimate_percent_type(GET_PARAM('ESTIMATE_PERCENT')),
  block_sample    BOOLEAN  DEFAULT FALSE,
  method_opt      VARCHAR2  DEFAULT GET_PARAM('METHOD_OPT'),
  degree          NUMBER  DEFAULT to_degree_type(GET_PARAM('DEGREE')),
  granularity     VARCHAR2  DEFAULT GET_PARAM('GRANULARITY'),
  cascade         BOOLEAN  DEFAULT to_cascade_type(GET_PARAM('CASCADE')),
  stattab        VARCHAR2  DEFAULT NULL,
  statid         VARCHAR2  DEFAULT NULL,
  options        VARCHAR2  DEFAULT 'GATHER AUTO',
  statown        VARCHAR2  DEFAULT NULL,
  no_invalidate  BOOLEAN  DEFAULT
                                to_no_invalidate_type(get_param('NO_INVALIDATE')),
  obj_filter_list ObjectTab DEFAULT NULL);

```

Parameters

Table 177-53 GATHER_DICTIONARY_STATS Procedure Parameters

| Parameter | Description |
|------------------|--|
| comp_id | Component id of the schema to analyze. NULL results in the analysis of schemas for all RDBMS components. Refer to the COMP_ID column of DBA_REGISTRY view. The procedure always gather statistics on SYS and SYSTEM schemas regardless of this argument. |
| estimate_percent | Percentage of rows to estimate (NULL means compute). The valid range is [0.000001, 100]. Use the constant DBMS_STATS.AUTO_SAMPLE_SIZE to have Oracle determine the appropriate sample size for good statistics. This is the default. The default value can be changed using the SET_DATABASE_PREFS Procedure , SET_GLOBAL_PREFS Procedure , SET_SCHEMA_PREFS Procedure and SET_TABLE_PREFS Procedure . |
| block_sample | Determines whether or not to use random block sampling instead of random row sampling. Random block sampling is more efficient, but if the data is not randomly distributed on disk then the sample values may be somewhat correlated. Only pertinent when performing estimate statistics. |

Table 177-53 (Cont.) GATHER_DICTIONARY_STATS Procedure Parameters

| Parameter | Description |
|------------|---|
| method_opt | <p>The method options. This parameter accepts the following values:</p> <ul style="list-style-type: none"> • FOR ALL [INDEXED HIDDEN] COLUMNS [size_clause] size_clause is defined as size_clause := SIZE {integer REPEAT AUTO SKEWONLY} <ul style="list-style-type: none"> - integer : Number of histogram buckets. Must be in the range [1,2048]. - REPEAT : Collects histograms only on the columns that already have histograms. - AUTO : Oracle determines the columns on which to collect histograms based on data distribution and the workload of the columns. - SKEWONLY : Oracle determines the columns on which to collect histograms based on the data distribution of the columns. <p>The default is FOR ALL COLUMNS SIZE AUTO. The default value can be changed using the SET_DATABASE_PREFS Procedure, SET_GLOBAL_PREFS Procedure, SET_SCHEMA_PREFS Procedure and SET_TABLE_PREFS Procedure.</p> |
| degree | <p>Degree of parallelism. The default for degree is NULL. The default value can be changed using the SET_DATABASE_PREFS Procedure, SET_GLOBAL_PREFS Procedure, SET_SCHEMA_PREFS Procedure and SET_TABLE_PREFS Procedure. NULL means use the table default value specified by the DEGREE clause in the CREATE TABLE or ALTER TABLE statement. Use the constant DBMS_STATS.DEFAULT_DEGREE to specify the default value based on the initialization parameters. The AUTO_DEGREE value determines the degree of parallelism automatically. This is between 1 (serial execution) and DEFAULT_DEGREE (the system default value based on number of CPUs and initialization parameters) according to the size of the object. When using DEGREE=>NULL, DEGREE=>n, or DEGREE=>DBMS_STATS.DEFAULT_DEGREE, the current implementation of DBMS_STATS may use serial execution if the size of the object does not warrant parallel execution.</p> |

Table 177-53 (Cont.) GATHER_DICTIONARY_STATS Procedure Parameters

| Parameter | Description |
|-------------|--|
| granularity | <p>Granularity of statistics to collect (only pertinent if the table is partitioned).</p> <p>'ALL' - Gathers all (subpartition, partition, and global) statistics</p> <p>'AUTO' - Determines the granularity based on the partitioning type. This is the default value.</p> <p>'DEFAULT' - Gathers global and partition-level statistics. This option is obsolete, and while currently supported, it is included in the documentation for legacy reasons only. You should use the 'GLOBAL AND PARTITION' for this functionality. Note that the default value is now 'AUTO'.</p> <p>'GLOBAL' - Gathers global statistics</p> <p>'GLOBAL AND PARTITION' - Gathers the global and partition level statistics. No subpartition level statistics are gathered even if it is a composite partitioned object.</p> <p>'PARTITION' - Gathers partition-level statistics</p> <p>'SUBPARTITION' - gathers subpartition-level statistics</p> |
| cascade | <p>Gathers statistics on indexes also. Index statistics gathering will not be parallelized. Using this option is equivalent to running the GATHER_INDEX_STATS Procedure on each of the indexes in the schema in addition to gathering table and column statistics. Use the constant <code>DBMS_STATS.AUTO_CASCADE</code> to have Oracle determine whether index statistics to be collected or not. This is the default. The default value can be changed using the SET_DATABASE_PREFS Procedure, SET_GLOBAL_PREFS Procedure, SET_SCHEMA_PREFS Procedure and SET_TABLE_PREFS Procedure.</p> |
| stattab | <p>User statistics table identifier describing where to save the current statistics</p> |
| statid | <p>The (optional) identifier to associate with these statistics within stattab</p> |

Table 177-53 (Cont.) GATHER_DICTIONARY_STATS Procedure Parameters

| Parameter | Description |
|-----------------|--|
| options | <p>Specifies which objects require statistics to be gathered. Valid values are as follows:</p> <ul style="list-style-type: none"> • GATHER AUTO — Gathers all necessary statistics automatically. This is the default. The database implicitly determines which objects need new statistics and determines how to gather those statistics. When GATHER AUTO is specified, the only additional valid parameters are <code>comp_id</code>, <code>no_invalidate</code>, <code>stattab</code>, <code>statid</code>, and <code>statown</code>; all other parameter settings will be ignored. Also, the database returns a list of objects processed. • GATHER — Gathers statistics on all objects in the relevant schema. • GATHER STALE — Gathers statistics on stale objects by querying the <code>*_TAB_MODIFICATIONS</code> views. Also, the database returns a list of objects found to be stale. • GATHER EMPTY — Gathers statistics on objects that currently have no statistics. Also, the database returns a list of objects found to have no statistics. • LIST AUTO — Returns a list of objects to be processed with GATHER AUTO. • LIST STALE — Returns list of stale objects as determined by looking at the <code>*_TAB_MODIFICATIONS</code> views. • LIST EMPTY — Returns a list of objects that currently have no statistics. |
| objlist | The list of objects found to be stale or empty. |
| statown | Schema containing <code>stattab</code> , if different from the current schema. |
| no_invalidate | <p>Controls the invalidation of dependent cursors when statistics are gathered. The parameter takes the following values:</p> <ul style="list-style-type: none"> • TRUE: Dependent cursors are not invalidated. • FALSE: Dependent cursors are marked for immediate invalidation. • AUTO: This is the default value. Rolling invalidation is used to invalidate all dependent cursors over a period of time. The performance impact on the database is reduced especially in cases where a large number of cursors are invalidated. <p>You can change the default using the SET_DATABASE_PREFS Procedure, SET_GLOBAL_PREFS Procedure, SET_SCHEMA_PREFS Procedure and SET_TABLE_PREFS Procedure.</p> |
| obj_filter_list | <p>A list of object filters. When provided, this will gather statistics only on objects which satisfy at least one object filter in the list as needed. In a single object filter, we can specify the constraints on the object attributes. The attribute values specified in the object filter are case-insensitive unless double-quoted. Wildcard is allowed in the attribute values. Suppose non-NULL values <code>s1</code>, <code>s2</code>, ... are specified for attributes <code>a1</code>, <code>a2</code>, ... in one object filter. An object <code>o</code> is said to satisfy this object filter if (<code>o.a1</code> like <code>s1</code>) and (<code>o.a2</code> like <code>s2</code>) and ... is true. See Applying an Object Filter List.</p> |

Usage Notes

You must have the SYSDBA or both ANALYZE ANY DICTIONARY and ANALYZE ANY system privilege to execute this procedure.

If the GATHER AUTO option is used then frequency histograms will be created using a sample rather than a full scan. The following scenario shows where GATHER AUTO is used:

- A table is created like this: `CREATE TABLE NEWTAB as SELECT * FROM`
This will create statistics on NEWTAB but no histograms.
- Next, the DBA creates the histograms using GATHER AUTO on gather_table_stats.
- The FREQUENCY histograms on NEWTAB will be created using a sample rather than a full table scan.

Exceptions

ORA-20000: Index does not exist or insufficient privileges

ORA-20001: Bad input value

ORA-20002: Bad user statistics table, may need to upgrade it

177.7.49 GATHER_FIXED_OBJECTS_STATS Procedure

This procedure gathers statistics for all fixed objects (dynamic performance tables).

Syntax

```
DBMS_STATS.GATHER_FIXED_OBJECTS_STATS (
  statab          VARCHAR2 DEFAULT NULL,
  statid          VARCHAR2 DEFAULT NULL,
  statown         VARCHAR2 DEFAULT NULL,
  no_invalidate  BOOLEAN  DEFAULT to_no_invalidate_type (
                                     get_param('NO_INVALIDATE')));
```

Parameters

Table 177-54 GATHER_FIXED_OBJECTS_STATS Procedure Parameters

| Parameter | Description |
|-----------|--|
| statab | User statistics table identifier describing where to save the current statistics |
| statid | Identifier to associate with these statistics within statab (optional) |
| statown | Schema containing statab (if different from current schema) |

Table 177-54 (Cont.) GATHER_FIXED_OBJECTS_STATS Procedure Parameters

| Parameter | Description |
|---------------|---|
| no_invalidate | Does not invalidate the dependent cursors if set to TRUE. The procedure invalidates the dependent cursors immediately if set to FALSE. Use DBMS_STATS.AUTO_INVALIDATE. to have Oracle decide when to invalidate dependent cursors. This is the default. The default can be changed using the SET_DATABASE_PREFS Procedure , SET_GLOBAL_PREFS Procedure , SET_SCHEMA_PREFS Procedure and SET_TABLE_PREFS Procedure . |

Usage Notes

You must have the SYSDBA or ANALYZE ANY DICTIONARY system privilege to execute this procedure.

Exceptions

ORA-20000: Insufficient privileges

ORA-20001: Bad input value

ORA-20002: Bad user statistics table, may need to upgrade it

177.7.50 GATHER_INDEX_STATS Procedure

This procedure gathers index statistics. It attempts to parallelize as much of the work as possible.

Restrictions are described in the individual parameters. This operation will not parallelize with certain types of indexes, including cluster indexes, domain indexes, and bitmap join indexes. The `granularity` and `no_invalidate` arguments are not relevant to these types of indexes.

Syntax

```
DBMS_STATS.GATHER_INDEX_STATS (
  ownname          VARCHAR2,
  indname          VARCHAR2,
  partname         VARCHAR2 DEFAULT NULL,
  estimate_percent NUMBER   DEFAULT to_estimate_percent_type
                                     (GET_PARAM('ESTIMATE_PERCENT')),
  statab           VARCHAR2 DEFAULT NULL,
  statid           VARCHAR2 DEFAULT NULL,
  statown         VARCHAR2 DEFAULT NULL,
  degree           NUMBER   DEFAULT to_degree_type(get_param('DEGREE')),
  granularity      VARCHAR2 DEFAULT GET_PARAM('GRANULARITY'),
  no_invalidate    BOOLEAN   DEFAULT to_no_invalidate_type
                                     (GET_PARAM('NO_INVALIDATE')),
  force            BOOLEAN   DEFAULT FALSE);
```

Parameters

Table 177-55 GATHER_INDEX_STATS Procedure Parameters

| Parameter | Description |
|------------------|--|
| ownname | Schema of index to analyze |
| indname | Name of index |
| partname | Name of partition |
| estimate_percent | Percentage of rows to estimate (NULL means compute). The valid range is [0.000001, 100]. Use the constant <code>DBMS_STATS.AUTO_SAMPLE_SIZE</code> to have Oracle determine the appropriate sample size for good statistics. This is the default. The default value can be changed using the SET_DATABASE_PREFS Procedure , SET_GLOBAL_PREFS Procedure , SET_SCHEMA_PREFS Procedure and SET_TABLE_PREFS Procedure . |
| stattab | User statistics table identifier describing where to save the current statistics |
| statid | Identifier (optional) to associate with these statistics within <code>stattab</code> |
| statown | Schema containing <code>stattab</code> (if different than <code>ownname</code>) |
| degree | Degree of parallelism. The default for <code>degree</code> is NULL. The default value can be changed using the SET_DATABASE_PREFS Procedure , SET_GLOBAL_PREFS Procedure , SET_SCHEMA_PREFS Procedure and SET_TABLE_PREFS Procedure . NULL means use the table default value specified by the <code>DEGREE</code> clause in the <code>CREATE TABLE</code> or <code>ALTER TABLE</code> statement. Use the constant <code>DBMS_STATS.DEFAULT_DEGREE</code> to specify the default value based on the initialization parameters. The <code>AUTO_DEGREE</code> value determines the degree of parallelism automatically. This is between 1 (serial execution) and <code>DEFAULT_DEGREE</code> (the system default value based on number of CPUs and initialization parameters) according to the size of the object. When using <code>DEGREE=>NULL</code> , <code>DEGREE=>n</code> , or <code>DEGREE=>DBMS_STATS.DEFAULT_DEGREE</code> , the current implementation of <code>DBMS_STATS</code> may use serial execution if the size of the object does not warrant parallel execution. |

Table 177-55 (Cont.) GATHER_INDEX_STATS Procedure Parameters

| Parameter | Description |
|----------------------------|--|
| <code>granularity</code> | Granularity of statistics to collect (only pertinent if the table is partitioned). 'ALL' - Gathers all (subpartition, partition, and global) statistics 'AUTO' - Determines the granularity based on the partitioning type. This is the default value. 'DEFAULT' - Gathers global and partition-level statistics. This option is obsolete, and while currently supported, it is included in the documentation for legacy reasons only. You should use the 'GLOBAL AND PARTITION' for this functionality. Note that the default value is now 'AUTO'. 'GLOBAL' - Gathers global statistics 'GLOBAL AND PARTITION' - Gathers the global and partition level statistics. No subpartition level statistics are gathered even if it is a composite partitioned object. 'PARTITION' - Gathers partition-level statistics 'SUBPARTITION' - Gathers subpartition-level statistics. |
| <code>no_invalidate</code> | Does not invalidate the dependent cursors if set to TRUE. The procedure invalidates the dependent cursors immediately if set to FALSE. Use <code>DBMS_STATS.AUTO_INVALIDATE</code> to have Oracle decide when to invalidate dependent cursors. This is the default. The default can be changed using the SET_DATABASE_PREFS Procedure , SET_GLOBAL_PREFS Procedure , SET_SCHEMA_PREFS Procedure and SET_TABLE_PREFS Procedure . |
| <code>force</code> | Gather statistics on object even if it is locked |

Exceptions

ORA-20000: Index does not exist or insufficient privileges

ORA-20001: Bad input value

Usage Notes

To invoke this procedure you must be owner of the table, or you need the `ANALYZE ANY` privilege. For objects owned by `SYS`, you need to be either the owner of the table, or you need the `ANALYZE ANY DICTIONARY` privilege or the `SYSDBA` privilege.

177.7.51 GATHER_PROCESSING_RATE Procedure

This procedure starts the job of gathering the processing rates which end after an `interval` defined in minutes.

Syntax

```
DBMS_STATS.GATHER_PROCESSING_RATE (
  gathering_mode      IN   VARCHAR2  DEFAULT 'START',
  interval            IN   NUMBER     DEFAULT NULL);
```

Parameters

Table 177-56 GATHER_PROCESSING_RATE Procedure Parameters

| Parameter | Description |
|----------------|---|
| gathering_mode | Mode: 'START' or 'END'. The mode is based on the Active Session History (ASH) data when invoked with 'START' option. It stops gathering when invoked with 'END' option. When invoked with 'START', 'interval' option can be specified optionally. If interval is not specified, its default value is set to 60 minutes. |
| interval | Time interval (number of minutes) for which the processing must be gathered |

Usage Notes

- You require the `OPTIMIZER_PROCESSING_RATE` role to run this procedure.
- `AUTO DOP` uses processing rates to determine the optimal degree of parallelism for a SQL statement.

Exceptions

ORA-20000: Object does not exist or insufficient privileges

ORA-20001: Invalid or illegal input value

177.7.52 GATHER_SCHEMA_STATS Procedures

This procedure gathers statistics for all objects in a schema.

Syntax

```
DBMS_STATS.GATHER_SCHEMA_STATS (
    ownname          VARCHAR2,
    estimate_percent NUMBER   DEFAULT to_estimate_percent_type
                        (get_param('ESTIMATE_PERCENT')),
    block_sample     BOOLEAN  DEFAULT FALSE,
    method_opt       VARCHAR2 DEFAULT get_param('METHOD_OPT'),
    degree           NUMBER   DEFAULT to_degree_type(get_param('DEGREE')),
    granularity      VARCHAR2 DEFAULT GET_PARAM('GRANULARITY'),
    cascade          BOOLEAN  DEFAULT to_cascade_type(get_param('CASCADE')),
    stattab         VARCHAR2 DEFAULT NULL,
    statid          VARCHAR2 DEFAULT NULL,
    options          VARCHAR2 DEFAULT 'GATHER',
    objlist         OUT       ObjectTab,
    statown         VARCHAR2 DEFAULT NULL,
    no_invalidate   BOOLEAN  DEFAULT to_no_invalidate_type (
                        get_param('NO_INVALIDATE')),
    force           BOOLEAN  DEFAULT FALSE,
    obj_filter_list ObjectTab DEFAULT NULL);
```

```
DBMS_STATS.GATHER_SCHEMA_STATS (
    ownname          VARCHAR2,
    estimate_percent NUMBER   DEFAULT to_estimate_percent_type
                        (get_param('ESTIMATE_PERCENT')),
    block_sample     BOOLEAN  DEFAULT FALSE,
```

```

method_opt      VARCHAR2 DEFAULT get_param('METHOD_OPT'),
degree          NUMBER   DEFAULT to_degree_type(get_param('DEGREE')),
granularity     VARCHAR2 DEFAULT GET_PARAM('GRANULARITY'),
cascade        BOOLEAN  DEFAULT to_cascade_type(get_param('CASCADE')),
stattab        VARCHAR2 DEFAULT NULL,
statid         VARCHAR2 DEFAULT NULL,
options        VARCHAR2 DEFAULT 'GATHER',
statown        VARCHAR2 DEFAULT NULL,
no_invalidate  BOOLEAN  DEFAULT to_no_invalidate_type (
                get_param('NO_INVALIDATE')),
force          BOOLEAN  DEFAULT FALSE,
obj_filter_list ObjectTab DEFAULT NULL);

```

Parameters

Table 177-57 GATHER_SCHEMA_STATS Procedure Parameters

| Parameter | Description |
|------------------|---|
| ownname | Schema to analyze (NULL means current schema) |
| estimate_percent | <p>Determines the percentage of rows to sample.</p> <p>The valid range is between 0.000001 and 100. Use the constant <code>DBMS_STATS.AUTO_SAMPLE_SIZE</code> to enable the database to determine the appropriate sample size for optimal statistics. This is the default.</p> <p>You can change the default value using the SET_DATABASE_PREFS Procedure, SET_GLOBAL_PREFS Procedure, SET_SCHEMA_PREFS Procedure and SET_TABLE_PREFS Procedure.</p> |
| block_sample | Whether or not to use random block sampling instead of random row sampling. Random block sampling is more efficient, but if the data is not randomly distributed on disk, then the sample values may be somewhat correlated. Only pertinent when doing an estimate statistics. |
| method_opt | <p>Accepts:</p> <ul style="list-style-type: none"> • <code>FOR ALL [INDEXED HIDDEN] COLUMNS [size_clause]</code> <code>size_clause</code> is defined as <code>size_clause := SIZE {integer REPEAT AUTO SKEWONLY}</code> <ul style="list-style-type: none"> - <code>integer</code>: Number of histogram buckets. Must be in the range [1,2048]. - <code>REPEAT</code>: Collects histograms only on the columns that already have histograms - <code>AUTO</code>: Oracle determines the columns on which to collect histograms based on data distribution and the workload of the columns. - <code>SKEWONLY</code>: Oracle determines the columns on which to collect histograms based on the data distribution of the columns. <p>The default is <code>FOR ALL COLUMNS SIZE AUTO</code>. The default value can be changed using the SET_DATABASE_PREFS Procedure, SET_GLOBAL_PREFS Procedure, SET_SCHEMA_PREFS Procedure and SET_TABLE_PREFS Procedure.</p> |

Table 177-57 (Cont.) GATHER_SCHEMA_STATS Procedure Parameters

| Parameter | Description |
|-------------|---|
| degree | Degree of parallelism. The default for <code>degree</code> is <code>NULL</code> . The default value can be changed using the SET_DATABASE_PREFS Procedure , SET_GLOBAL_PREFS Procedure , SET_SCHEMA_PREFS Procedure and SET_TABLE_PREFS Procedure . <code>NULL</code> means use the table default value specified by the <code>DEGREE</code> clause in the <code>CREATE TABLE</code> or <code>ALTER TABLE</code> statement. Use the constant <code>DBMS_STATS.DEFAULT_DEGREE</code> to specify the default value based on the initialization parameters. The <code>AUTO_DEGREE</code> value determines the degree of parallelism automatically. This is between 1 (serial execution) and <code>DEFAULT_DEGREE</code> (the system default value based on number of CPUs and initialization parameters) according to the size of the object. When using <code>DEGREE=>NULL</code> , <code>DEGREE=>n</code> , or <code>DEGREE=>DBMS_STATS.DEFAULT_DEGREE</code> , the current implementation of <code>DBMS_STATS</code> may use serial execution if the size of the object does not warrant parallel execution. |
| granularity | Granularity of statistics to collect (only pertinent if the table is partitioned). ' <code>ALL</code> ' - Gathers all (subpartition, partition, and global) statistics ' <code>AUTO</code> ' - Determines the granularity based on the partitioning type. This is the default value. ' <code>DEFAULT</code> ' - Gathers global and partition-level statistics. This option is obsolete, and while currently supported, it is included in the documentation for legacy reasons only. You should use the ' <code>GLOBAL AND PARTITION</code> ' for this functionality. Note that the default value is now ' <code>AUTO</code> '. ' <code>GLOBAL</code> ' - Gathers global statistics ' <code>GLOBAL AND PARTITION</code> ' - Gathers the global and partition level statistics. No subpartition level statistics are gathered even if it is a composite partitioned object. ' <code>PARTITION</code> ' - Gathers partition-level statistics ' <code>SUBPARTITION</code> ' - Gathers subpartition-level statistics. |
| cascade | Gather statistics on the indexes as well. Using this option is equivalent to running the GATHER_INDEX_STATS Procedure on each of the indexes in the schema in addition to gathering table and column statistics. Use the constant <code>DBMS_STATS.AUTO_CASCADE</code> to have Oracle determine whether index statistics to be collected or not. This is the default. The default value can be changed using the SET_DATABASE_PREFS Procedure , SET_GLOBAL_PREFS Procedure , SET_SCHEMA_PREFS Procedure and SET_TABLE_PREFS Procedure . |
| stattab | User statistics table identifier describing where to save the current statistics |
| statid | Identifier (optional) to associate with these statistics within <code>stattab</code> |

Table 177-57 (Cont.) GATHER_SCHEMA_STATS Procedure Parameters

| Parameter | Description |
|-----------------|--|
| options | <p>Specifies which objects require statistics to be gathered. Valid values are as follows:</p> <ul style="list-style-type: none"> GATHER — Gathers statistics on all objects in the schema. This is the default. GATHER AUTO — Gathers all necessary statistics automatically. The database implicitly determines which objects need new statistics and determines how to gather those statistics. When GATHER AUTO is specified, the only additional valid parameters are comp_id, no_invalidate, statab, statid, and statown; all other parameter settings will be ignored. Also, the database returns a list of objects processed. GATHER STALE — Gathers statistics on stale objects by querying the *_TAB_MODIFICATIONS views. Also, the database returns a list of objects found to be stale. GATHER EMPTY — Gathers statistics on objects that currently have no statistics. Also, the database returns a list of objects found to have no statistics. LIST AUTO — Returns a list of objects to be processed with GATHER AUTO. LIST STALE — Returns list of stale objects as determined by looking at the *_TAB_MODIFICATIONS views. LIST EMPTY — Returns a list of objects that currently have no statistics. |
| objlist | List of objects found to be stale or empty |
| statown | Schema containing statab (if different than ownname) |
| no_invalidate | Does not invalidate the dependent cursors if set to TRUE. The procedure invalidates the dependent cursors immediately if set to FALSE. Use DBMS_STATS.AUTO_INVALIDATE. to have Oracle decide when to invalidate dependent cursors. This is the default. The default can be changed using the SET_DATABASE_PREFS Procedure , SET_GLOBAL_PREFS Procedure , SET_SCHEMA_PREFS Procedure and SET_TABLE_PREFS Procedure . |
| force | Gather statistics on objects even if they are locked |
| obj_filter_list | A list of object filters. When provided, GATHER_SCHEMA_STATS will gather statistics only on objects which satisfy at least one object filter in the list as needed. In a single object filter, we can specify the constraints on the object attributes. The attribute values specified in the object filter are case- insensitive unless double-quoted. Wildcard is allowed in the attribute values. Suppose non-NULL values s1, s2, ... are specified for attributes a1, a2, ... in one object filter. An object o is said to satisfy this object filter if (o.a1 like s1) and (o.a2 like s2) and ... is true. |

Usage Notes

To invoke this procedure you must be owner of the table, or you need the `ANALYZE ANY` privilege. For objects owned by `SYS`, you must be either the owner of the table, or you need the `ANALYZE ANY DICTIONARY` privilege or the `SYSDBA` privilege.

If the `GATHER AUTO` option is used then frequency histograms will be created using a sample rather than a full scan. The following scenario shows where `GATHER AUTO` is used:

- A table is created like this: `CREATE TABLE NEWTAB as SELECT * FROM`
This will create statistics on `NEWTAB` but no histograms.
- Next, the DBA creates the histograms using `GATHER AUTO` on `gather_table_stats`.
- The `FREQUENCY` histograms on `NEWTAB` will be created using a sample rather than a full table scan.

Exceptions

ORA-20000: Schema does not exist or insufficient privileges

ORA-20001: Bad input value

Examples

Applying an Object Filter List

The following example specifies that the tables `SH.SALES` and `SH.COSTS`, if stale, will have statistics gathered upon them.

```
DECLARE
    filter_lst DBMS_STATS.OBJECTTAB := DBMS_STATS.OBJECTTAB();
BEGIN
    filter_lst.extend(2);
    filter_lst(1).ownname := 'SH';
    filter_lst(1).objname := 'SALES';
    filter_lst(2).ownname := 'SH';
    filter_lst(2).objname := 'COSTS';
    DBMS_STATS.GATHER_SCHEMA_STATS(ownname=>'SH',obj_filter_list=>filter_lst);
END;
```

177.7.53 GATHER_SYSTEM_STATS Procedure

This procedure gathers system statistics.

Syntax

```
DBMS_STATS.GATHER_SYSTEM_STATS (
    gathering_mode    VARCHAR2 DEFAULT 'NOWORKLOAD',
    interval          INTEGER   DEFAULT NULL,
    stattab           VARCHAR2 DEFAULT NULL,
    statid            VARCHAR2 DEFAULT NULL,
    statown           VARCHAR2 DEFAULT NULL);
```

Parameters

Table 177-58 GATHER_SYSTEM_STATS Procedure Parameters

| Parameter | Description |
|----------------|---|
| gathering_mode | <p>Specifies the mode in which the database gathers system statistics. Possible values are:</p> <ul style="list-style-type: none"> • NOWORKLOAD The database captures performance characteristics of the I/O system. Gathering may take a few minutes and depends on the size of the database. During this period, the database estimates the average read seek time and transfer speed for the I/O system. This mode is suitable for the all workloads. To fine tune system statistics for the workload, use START and STOP or the INTERVAL option. If you gather both NOWORKLOAD and workload-specific statistics (statistics collected using INTERVAL or START and STOP), the optimizer uses the workload statistics. Collected components include cpuspeednw, ioseektim, and iotfrspeed. • INTERVAL The database captures system activity during a specified interval in minutes. This parameter works in combination with the interval parameter. The database creates or updates system statistics in the dictionary or stattab. You can use GATHER_SYSTEM_STATS (gathering_mode=>'STOP') to stop gathering earlier than scheduled. Collected components include maxthr, slavethr, cpuspeed, sreadtim, mreadtim, and mbrc. • START STOP The database captures system activity during specified start and stop times and refreshes the dictionary or stattab with statistics for the elapsed period. The database ignores the INTERVAL value. Collected components include maxthr, slavethr, cpuspeed, sreadtim, mreadtim, and mbrc. • EXADATA In this mode, gathered system statistics take into account the unique capabilities of Oracle Exadata, such as large I/O size and high I/O throughput. The database sets multiblock read count and I/O throughput statistics along with CPU speed. |
| interval | Specifies the number of minutes in which to gather system statistics. This parameter applies only when gathering_mode='INTERVAL' . |
| stattab | Specifies the table in which the database stores the statistics. |
| statid | Specifies an optional identifier associated with the statistics saved in stattab . |
| statown | Specifies the schema containing stattab , if different from the current schema. |

Exceptions

ORA-20000: Object does not exist or insufficient privileges

ORA-20001: Invalid input value

ORA-20002: Bad user statistics table; may need to be upgraded

ORA-20003: Unable to gather system statistics

ORA-20004: Error in the INTERVAL mode: system parameter job_queue_processes must be >0

Usage Notes

To run this procedure, you must have the GATHER_SYSTEM_STATISTICS role.

Examples

Assume that you want to perform database application processing OLTP transactions during the day and run reports at night.

To collect daytime system statistics, gather statistics for 720 minutes. Store the statistics in the MYSTATS table.

```
BEGIN
  DBMS_STATS.GATHER_SYSTEM_STATS (
    interval => 720,
    statab   => 'mystats',
    statid   => 'OLTP');
END;
```

To collect nighttime system statistics, gather statistics for 720 minutes. Store the statistics in the MYSTATS table.

```
BEGIN
  DBMS_STATS.GATHER_SYSTEM_STATS (
    interval => 720,
    statab   => 'mystats',
    statid   => 'OLAP');
END;
```

Update the dictionary with the gathered statistics.

```
VARIABLE jobno number;
BEGIN
  DBMS_JOB.SUBMIT (:jobno, 'DBMS_STATS.IMPORT_SYSTEM_STATS
    ('mystats','OLTP');'
    sysdate, 'sysdate + 1');
  COMMIT;
END;

BEGIN
  DBMS_JOB.SUBMIT (:jobno, 'DBMS_STATS.IMPORT_SYSTEM_STATS
    ('mystats','OLAP');'
    sysdate + 0.5, 'sysdate + 1');
  COMMIT;
END;
```

177.7.54 GATHER_TABLE_STATS Procedure

This procedure gathers table, column, and index statistics. It attempts to parallelize as much work as possible, but there are some restrictions, which are described in the individual parameters.

Syntax

```
DBMS_STATS.GATHER_TABLE_STATS (
  ownname          VARCHAR2,
  tabname          VARCHAR2,
  partname         VARCHAR2 DEFAULT NULL,
  estimate_percent NUMBER   DEFAULT to_estimate_percent_type
                        (get_param('ESTIMATE_PERCENT')),
  block_sample     BOOLEAN  DEFAULT FALSE,
  method_opt       VARCHAR2 DEFAULT get_param('METHOD_OPT'),
  degree           NUMBER   DEFAULT to_degree_type(get_param('DEGREE')),
  granularity      VARCHAR2 DEFAULT GET_PARAM('GRANULARITY'),
  cascade          BOOLEAN  DEFAULT to_cascade_type(get_param('CASCADE')),
  statab          VARCHAR2 DEFAULT NULL,
  statid           VARCHAR2 DEFAULT NULL,
  statown         VARCHAR2 DEFAULT NULL,
  no_invalidate    BOOLEAN  DEFAULT to_no_invalidate_type (
                        get_param('NO_INVALIDATE')),
  stattype         VARCHAR2 DEFAULT 'DATA',
  force           BOOLEAN  DEFAULT FALSE,
  context          DBMS_STATS.CCONTEXT DEFAULT NULL, -- non operative
  options         VARCHAR2 DEFAULT get_param('OPTIONS');
```

Parameters

Table 177-59 GATHER_TABLE_STATS Procedure Parameters

| Parameter | Description |
|------------------|--|
| ownname | Schema containing the table. |
| tabname | Name of the table. |
| partname | Name of the partition. |
| estimate_percent | Determines the percentage of rows to sample. The valid range is between 0.000001 and 100. Use the constant <code>DBMS_STATS.AUTO_SAMPLE_SIZE</code> to enable the database to determine the appropriate sample size for optimal statistics. This is the default. You can change the default value using the SET_DATABASE_PREFS Procedure , SET_GLOBAL_PREFS Procedure , SET_SCHEMA_PREFS Procedure and SET_TABLE_PREFS Procedure . |
| block_sample | Determines whether the database uses random block sampling (<code>TRUE</code>) or random row sampling (<code>FALSE</code>). The default is <code>FALSE</code> . Random block sampling is more efficient, but if the data is not randomly distributed on disk, then sample values may be somewhat correlated. This parameter is only relevant when estimating statistics. |

Table 177-59 (Cont.) GATHER_TABLE_STATS Procedure Parameters

| Parameter | Description |
|------------|---|
| method_opt | <p>METHOD_OPT - When setting preference on global, schema, database or dictionary level, only 'FOR ALL' syntax is allowed. Other than that, method_opt accepts either of the following options, or both in combination:</p> <ul style="list-style-type: none"> • FOR ALL [INDEXED HIDDEN] COLUMNS [size_clause] • FOR COLUMNS [column_clause] [size_clause] <p>size_clause is defined as size_clause := SIZE {integer REPEAT AUTO SKEWONLY}</p> <p>column_clause is defined as column_clause := column_name extension name extension</p> <ul style="list-style-type: none"> - integer: Number of histogram buckets. Must be in the range [1,2048]. - REPEAT: Collects histograms only on the columns that already have histograms - AUTO: Oracle determines the columns on which to collect histograms based on data distribution and the workload of the columns. - SKEWONLY: Oracle determines the columns on which to collect histograms based on the data distribution of the columns. - column_name: Name of a column - extension: can be either a column group in the format of (column_name, Column_name [, ...]) or an expression <p>The default is FOR ALL COLUMNS SIZE AUTO. The default value can be changed using the SET_DATABASE_PREFS Procedure, SET_GLOBAL_PREFS Procedure, SET_SCHEMA_PREFS Procedure and SET_TABLE_PREFS Procedure.</p> |
| degree | <p>Determines the degree of parallelism used for gathering statistics.</p> <p>The default for degree is NULL. NULL means to use the table default value specified by the DEGREE clause in the CREATE TABLE or ALTER TABLE statement. Change the default using the SET_DATABASE_PREFS, SET_GLOBAL_PREFS, SET_SCHEMA_PREFS, and SET_TABLE_PREFS procedures. NULL means use the table default value specified by the DEGREE clause in the CREATE TABLE or ALTER TABLE statement.</p> <p>Use the constant DBMS_STATS.DEFAULT_DEGREE to specify the default value based on the initialization parameters. The AUTO_DEGREE value determines the degree of parallelism automatically. The degree is between 1 (serial execution) and DEFAULT_DEGREE (the system default value based on number of CPUs and initialization parameters), according to the size of the object. When using DEGREE=>NULL, DEGREE=>n, or DEGREE=>DBMS_STATS.DEFAULT_DEGREE, the current implementation of DBMS_STATS may use serial execution when the size of the object does not warrant parallel execution.</p> |

Table 177-59 (Cont.) GATHER_TABLE_STATS Procedure Parameters

| Parameter | Description |
|-------------|---|
| granularity | <p>Granularity of statistics to collect (only pertinent if the table is partitioned).</p> <p>'ALL' - Gathers all (subpartition, partition, and global) statistics</p> <p>'APPROX_GLOBAL AND PARTITION' - similar to 'GLOBAL AND PARTITION' but in this case the global statistics are aggregated from partition level statistics. This option will aggregate all statistics except the number of distinct values for columns and number of distinct keys of indexes. The existing histograms of the columns at the table level are also aggregated. The aggregation will use only partitions with statistics, so to get accurate global statistics, users should make sure to have statistics for all partitions. Global statistics are gathered if partname is NULL or if the aggregation cannot be performed (for example, if statistics for one of the partitions is missing).</p> <p>'AUTO' - Determines the granularity based on the partitioning type. This is the default value.</p> <p>'DEFAULT' - Gathers global and partition-level statistics. This option is obsolete, and while currently supported, it is included in the documentation for legacy reasons only. You should use the 'GLOBAL AND PARTITION' for this functionality. Note that the default value is now 'AUTO'.</p> <p>'GLOBAL' - Gathers global statistics</p> <p>'GLOBAL AND PARTITION' - Gathers the global and partition level statistics. No subpartition level statistics are gathered even if it is a composite partitioned object.</p> <p>'PARTITION' - Gathers partition-level statistics</p> <p>'SUBPARTITION' - Gathers subpartition-level statistics.</p> |
| cascade | <p>Determines whether to collect index statistics as part of gathering table statistics.</p> <p>Specifying this option is equivalent to running the GATHER_INDEX_STATS procedure on each index of the table. Use the constant DBMS_STATS.AUTO_CASCADE to enable the database to determine whether index statistics need to be collected. This is the default. You can change the default using the SET_DATABASE_PREFS, SET_GLOBAL_PREFS, SET_SCHEMA_PREFS, and SET_TABLE_PREFS procedures.</p> |
| stattab | User statistics table identifier describing where to save the current statistics |
| statid | Identifier (optional) to associate with these statistics within stattab |
| statown | Schema containing stattab (if different than ownname) |

Table 177-59 (Cont.) GATHER_TABLE_STATS Procedure Parameters

| Parameter | Description |
|---------------|---|
| no_invalidate | <p>Controls the invalidation of dependent cursors when statistics are gathered. The parameter takes the following values:</p> <ul style="list-style-type: none"> TRUE: Dependent cursors are not invalidated. FALSE: Dependent cursors are marked for immediate invalidation. AUTO: This is the default value. Rolling invalidation is used to invalidate all dependent cursors over a period of time. The performance impact on the database is reduced especially in cases where a large number of cursors are invalidated. <p>If set to TRUE, then the database not invalidate dependent cursors. If set to FALSE, then the procedure invalidates dependent cursors immediately.</p> |
| stattype | <p>Statistics type. The only value allowed is DATA.</p> |
| force | <p>Gather statistics of table even if it is locked</p> |
| context | <p>Not used.</p> |
| options | <p>Determines the options parameter used in the GATHER_TABLE_STATS procedure. The preference takes the following values:</p> <ul style="list-style-type: none"> GATHER — Gathers statistics for all objects in the table. This is the default. GATHER AUTO — Oracle recommends using GATHER AUTO to gather necessary statistics, such as histograms, after a table has been bulk loaded and acquired online statistics. This is applicable only to tables that are not using INCREMENTAL statistics. <p>For partitioned tables using INCREMENTAL statistics, GATHER_TABLE_STATS with GATHER AUTO will gather statistics for a table if it is marked stale or has no statistics. In addition, statistics will be gathered for partitions and sub-partitions that are marked stale or have no statistics.</p> <p>For tables not using INCREMENTAL statistics, GATHER_TABLE_STATS with GATHER AUTO may gather statistics for partitions and sub-partitions, even if they are not marked stale.</p> |

Usage Notes

To invoke this procedure you must be owner of the table, or you need the ANALYZE ANY privilege. For objects owned by SYS, you need to be either the owner of the table, or you need the ANALYZE ANY DICTIONARY privilege or the SYSDBA privilege.

Index statistics collection can be parallelized except for cluster, domain and join indexes.

If the GATHER AUTO option is used then frequency histograms will be created using a sample rather than a full scan. The following scenario shows where GATHER AUTO is used:

- A table is created like this: `CREATE TABLE NEWTAB as SELECT * FROM`
This will create statistics on NEWTAB but no histograms.
- Next, the DBA creates the histograms using `GATHER AUTO on gather_table_stats`.

- The FREQUENCY histograms on NEWTAB will be created using a sample rather than a full table scan.

Exceptions

ORA-20000: Table does not exist or insufficient privileges

ORA-20001: Bad input value

Examples

An extension can be either a column group (see Example 1) or an expression (see Example 2).

Example 1

```
DBMS_STATS.GATHER_TABLE_STATS(
  'SH', 'SALES', method_opt => 'FOR COLUMNS (empno, deptno)');
```

Example 2

```
DBMS_STATS.GATHER_TABLE_STATS(
  'SH', 'SALES', method_opt => 'FOR COLUMNS (sal+comm)');
```

177.7.55 GENERATE_STATS Procedure

This **deprecated procedure** generates object statistics from previously collected statistics of related objects. The currently supported objects are b-tree and bitmap indexes.

Note:

This subprogram has been deprecated and replaced by improved technology. It is maintained only for purposes of backward compatibility. As an alternative, use the GATHER_INDEX_STAT procedure. See "[GATHER_INDEX_STATS Procedure](#)".

Syntax

```
DBMS_STATS.GENERATE_STATS (
  ownname    VARCHAR2,
  objname    VARCHAR2,
  organized  NUMBER DEFAULT 7,
  force      BOOLEAN default FALSE);
```

Parameters

Table 177-60 GENERATE_STATS Procedure Parameters

| Parameter | Description |
|-----------|------------------|
| ownname | Schema of object |
| objname | Name of object |

Table 177-60 (Cont.) GENERATE_STATS Procedure Parameters

| Parameter | Description |
|-----------|--|
| organized | Amount of ordering associated between the index and its underlying table. A heavily organized index would have consecutive index keys referring to consecutive rows on disk for the table (the same block). A heavily disorganized index would have consecutive keys referencing different table blocks on disk. This parameter is only used for b-tree indexes. The number can be in the range of 0-10, with 0 representing a completely organized index and 10 a completely disorganized one. |
| force | If TRUE, generates statistics for the target object even if it is locked |

Usage Notes

To invoke this procedure you must be owner of the table, or you need the `ANALYZE ANY` privilege. For objects owned by `SYS`, you need to be either the owner of the table, or you need the `ANALYZE ANY DICTIONARY` privilege or the `SYSDBA` privilege.

For fully populated schemas, the gather procedures should be used instead when more accurate statistics are desired.

Exceptions

ORA-20000: Unsupported object type of object does not exist

ORA-20001: Invalid option or invalid statistics

177.7.56 GET_ADVISOR_OPR_FILTER Procedure

This procedure creates an operation filter for an Optimizer Statistics Advisor task.

Syntax

```
DBMS_STATS.GET_ADVISOR_OPR_FILTER (
  opr_id          IN          NUMBER,
  opr_filter      IN OUT NOCOPY StatsAdvOpr);
```

Parameters

Table 177-61 GET_ADVISOR_OPR_FILTER Procedure Parameters

| Parameter | Description |
|------------|--|
| opr_id | The ID of the statistics operation stored in the <code>DBA_OPTSTAT_OPERATIONS</code> view. |
| opr_filter | The Optimizer Statistics Advisor filter that is generated based on the specified statistics operation. |

Security Model

Note the following:

- To execute this subprogram, you must have the `ADVISOR` privilege.
- You must be the owner of the task.
- This subprogram executes using invoker's rights.

Exceptions

- `ORA-20000`: Insufficient privileges
- `ORA-20001`: Invalid input values
- `ORA-20012`: Optimizer Statistics Advisor errors

Usage Notes

You can specify the filter using either the operation ID or the filter ID, but not both at the same time.

177.7.57 GET_ADVISOR_RECS Function

This function generates a recommendation report for the specified item.

Syntax

```
DBMS_STATS.GET_ADVISOR_RECS (
  ownname      IN   VARCHAR2,
  tablename    IN   VARCHAR2,
  rec          IN   VARCHAR2,
  type         IN   VARCHAR2   := 'TEXT')
RETURN CLOB;
```

Parameters

Table 177-62 GET_ADVISOR_RECS Function Parameters

| Parameter | Description |
|------------------------|---|
| <code>ownname</code> | The owner of the table. |
| <code>tablename</code> | The name of the table. |
| <code>rec</code> | <p>The Optimizer Statistics Advisor recommendation.</p> <ul style="list-style-type: none"> • <code>INCREMENTAL</code> When only a small number of range partitions are modified, this option improves the performance of statistics gathering dramatically. However, it requires additional space to store synopses for maintaining incremental statistics. The report analyzes this trade-off. • <code>CONCURRENT</code> The report recommends either setting the <code>CONCURRENT</code> preference, or specifying <code>AUTO_DEGREE</code> for individual tables. If the system resources and usage satisfies the conditions, the advisor always recommends setting <code>CONCURRENT</code> first. The advisor only recommends <code>AUTO_DEGREE</code> when statistics gathering on an individual table take a long time and the <code>CONCURRENT</code> preference is already set. |

Table 177-62 (Cont.) GET_ADVISOR_RECS Function Parameters

| Parameter | Description |
|-----------|---|
| type | Type of the report: TEXT, HTML, or XML. |

Security Model

Note the following:

- To execute this subprogram, you must have the `ADVISOR` privilege.
- You must have the privileges to gather statistics for the objects for which recommendations are generated.
- You must be the owner of the task.
- This subprogram executes using invoker's rights.

Usage Notes

The advisor does not make recommendations for manual statistics gathering. The database only make recommendations for automatic statistics gathering jobs, with the main goal of finishing the job within the maintenance window. As long as the automatic job finishes, the database does not make further recommendations.

Exceptions

- `ORA-20000`: Insufficient privileges
- `ORA-20001`: Invalid input values
- `ORA-20012`: Optimizer Statistics Advisor errors

177.7.58 GET_COLUMN_STATS Procedures

These overloaded procedures get column-related statistics. In the user-defined statistics version, the procedure returns the type of statistics stored.

Syntax

```
DBMS_STATS.GET_COLUMN_STATS (
  ownname          VARCHAR2,
  tabname          VARCHAR2,
  colname          VARCHAR2,
  partname         VARCHAR2 DEFAULT NULL,
  statab           VARCHAR2 DEFAULT NULL,
  statid           VARCHAR2 DEFAULT NULL,
  distcnt OUT      NUMBER,
  density OUT      NUMBER,
  nullcnt OUT      NUMBER,
  srec OUT         StatRec,
  avgclen OUT      NUMBER,
  statown          VARCHAR2 DEFAULT NULL,
  realtime_stats  BOOLEAN iDEFAULT TRUE);
```

Use the following for user-defined statistics:

```
DBMS_STATS.GET_COLUMN_STATS (
  ownname          VARCHAR2,
  tablename        VARCHAR2,
  colname          VARCHAR2,
  partname         VARCHAR2 DEFAULT NULL,
  statab           VARCHAR2 DEFAULT NULL,
  statid           VARCHAR2 DEFAULT NULL,
  ext_stats        OUT RAW,
  stattyown        OUT VARCHAR2 DEFAULT NULL,
  stattyname       OUT VARCHAR2 DEFAULT NULL,
  statown          VARCHAR2 DEFAULT NULL);
```

Parameters

Table 177-63 GET_COLUMN_STATS Procedure Parameters

| Parameter | Description |
|----------------|--|
| ownname | Name of the schema |
| tablename | Specifies the name of the table to which this column belongs. |
| colname | Specifies the name of the column or extension. |
| partname | Specifies the name of the table partition from which to get the statistics. If the table is partitioned, and if partname is NULL, then the procedure retrieves statistics at the global table level. |
| statab | Specifies the statistics table ID describing where to retrieve the statistics. If statab is NULL, then the procedure retrieves statistics directly from the data dictionary. |
| statid | Specifies an optional identifier associated with these statistics within statab. This parameter is only relevant when statab is not NULL. |
| ext_stats | Specifies the user-defined statistics. |
| stattyown | Specifies the schema of the statistics type. |
| stattyname | Specifies the name of the statistics type. |
| distcnt | Specifies the number of distinct values. |
| density | Specifies the column density. |
| nullcnt | Specifies the number of NULL values. |
| srec | Specifies the structure holding the internal representation of the column minimum, maximum, and histogram values. |
| avgclen | Specifies the average length of the column (in bytes). |
| statown | Specifies the schema containing statab (if different than ownname). |
| realtime_stats | Specifies whether to include real-time statistics. The default value is TRUE. When realtime_stats is FALSE, the database only includes optimizer statistics that were gathered by the GATHER_*_STATS procedures. |

Security Model

To invoke this procedure you must be owner of the table or have the `ANALYZE ANY` privilege. For objects owned by `SYS`, you must be the owner of the table, or have either the `ANALYZE ANY DICTIONARY` privilege or the `SYSDBA` privilege.

Exceptions

ORA-20000: Object does not exist or insufficient privileges or no statistics have been stored for requested object

Usage Notes

Before invoking this procedure, ensure that the table exists.

177.7.59 GET_INDEX_STATS Procedures

This overloaded procedure gets all index-related statistics. In the form of this procedure that deals with user-defined statistics, the statistics type returned is the type stored, in addition to the user-defined statistics.

Syntax

```
DBMS_STATS.GET_INDEX_STATS (
  ownname          VARCHAR2,
  indname          VARCHAR2,
  partname         VARCHAR2 DEFAULT NULL,
  stattab         VARCHAR2 DEFAULT NULL,
  statid          VARCHAR2 DEFAULT NULL,
  numrows         OUT NUMBER,
  numlblks        OUT NUMBER,
  numdist         OUT NUMBER,
  avglblk         OUT NUMBER,
  avgdblks        OUT NUMBER,
  clstfct         OUT NUMBER,
  indlevel        OUT NUMBER,
  statown         VARCHAR2 DEFAULT NULL);
```

```
DBMS_STATS.GET_INDEX_STATS (
  ownname          VARCHAR2,
  indname          VARCHAR2,
  partname         VARCHAR2 DEFAULT NULL,
  stattab         VARCHAR2 DEFAULT NULL,
  statid          VARCHAR2 DEFAULT NULL,
  numrows         OUT NUMBER,
  numlblks        OUT NUMBER,
  numdist         OUT NUMBER,
  avglblk         OUT NUMBER,
  avgdblks        OUT NUMBER,
  clstfct         OUT NUMBER,
  indlevel        OUT NUMBER,
  statown         VARCHAR2 DEFAULT NULL,
  guessq          OUT NUMBER);
```

Use the following form of the procedure for user-defined statistics:

```
DBMS_STATS.GET_INDEX_STATS (
  ownname          VARCHAR2,
  indname          VARCHAR2,
  partname         VARCHAR2 DEFAULT NULL,
  statab          VARCHAR2 DEFAULT NULL,
  statid          VARCHAR2 DEFAULT NULL,
  ext_stats       OUT RAW,
  stattyown       OUT VARCHAR2 DEFAULT NULL,
  stattyname      OUT VARCHAR2 DEFAULT NULL,
  statown         VARCHAR2 DEFAULT NULL);
```

Parameters

Table 177-64 GET_INDEX_STATS Procedure Parameters

| Parameter | Description |
|------------|--|
| ownname | Name of the schema |
| indname | Name of the index |
| partname | Name of the index partition for which to get the statistics. If the index is partitioned and if <code>partname</code> is <code>NULL</code> , then the statistics are retrieved for the global index level. |
| statab | User statistics table identifier describing from where to retrieve the statistics. If <code>statab</code> is <code>NULL</code> , then the statistics are retrieved directly from the dictionary. |
| statid | Identifier (optional) to associate with these statistics within <code>statab</code> (Only pertinent if <code>statab</code> is not <code>NULL</code>) |
| ext_stats | User-defined statistics |
| stattyown | Schema of the statistics type |
| stattyname | Name of the statistics type |
| numrows | Number of rows in the index (partition) |
| numlblks | Number of leaf blocks in the index (partition) |
| numdist | Number of distinct keys in the index (partition) |
| avglblk | Average integral number of leaf blocks in which each distinct key appears for this index (partition) |
| avgdblk | Average integral number of data blocks in the table pointed to by a distinct key for this index (partition) |
| clstfct | Clustering factor for the index (partition) |
| indlevel | Height of the index (partition) |
| statown | Schema containing <code>statab</code> (if different than <code>ownname</code>) |
| guessq | Guess quality for the index (partition) |

Security Model

Before invoking this procedure, ensure that the table exists. To invoke this procedure you must be owner of the table, or you need the `ANALYZE ANY` privilege. For objects owned by `SYS`,

you need to be either the owner of the table, or you need the `ANALYZE ANY DICTIONARY` privilege or the `SYSDBA` privilege.

Exceptions

ORA-20000: Object does not exist or insufficient privileges or no statistics have been stored for requested object

Usage Notes

- The optimizer uses the cached data to estimate number of cached blocks for index or statistics table access. The database calculates the total cost of the operation by combining the I/O cost of reading not cached blocks from disk, the CPU cost of getting cached blocks from the buffer cache, and the CPU cost of processing the data.
- The database maintains `cachedblk` and `cachehit` at all times. However, the database uses the corresponding caching statistics for optimization as part of the table and index statistics only when the user calls the `DBMS_STATS.GATHER_[TABLE/INDEX/SCHEMA/DATABASE]_STATS` procedure for automatic mode or `DBMS_STATS.GATHER_SYSTEM_STATS` for manual mode. To prevent the user from utilizing inaccurate and unreliable data, the optimizer computes a “confidence factor” for each `cachehit` and a `cachedblk` for each object. If the confidence factor for the value meets confidence criteria, then the database uses this value; otherwise, the database uses defaults.
- The automatic maintenance algorithm for object caching statistics assumes that only one major database workload exists. The algorithm adjusts statistics to this workload, ignoring other "minor" workloads. If this assumption is false, then you must use manual mode for maintaining object caching statistics.
- The object caching statistics maintenance algorithm for automatic mode prevents you from using statistics in the following situations:
 - When not enough data has been analyzed, such as when an object has been recently created
 - When the system does not have one major workload resulting in averages not corresponding to real values

Oracle Database SQL Tuning Guide to learn how to manage optimizer statistics

177.7.60 GET_PARAM Function

This function returns the default value of parameters of DBMS_STATS procedures.

Note:

This subprogram has been replaced by improved technology and is maintained only for purposes of backward compatibility. In this case, use the [GET_PREFS Function](#).

See also [DBMS_STATS Deprecated Subprograms](#).

Syntax

```
DBMS_STATS.GET_PARAM (  
    pname      IN  VARCHAR2)  
RETURN VARCHAR2;
```

Parameters

Table 177-65 GET_PARAM Function Parameters

| Parameter | Description |
|-----------|----------------|
| pname | Parameter name |

Exceptions

ORA-20001: Invalid input values

177.7.61 GET_PREFS Function

This function returns the default value of the specified preference.

Syntax

```
DBMS_STATS.GET_PREFS (  
    pname      IN  VARCHAR2,  
    ownname    IN  VARCHAR2 DEFAULT NULL,  
    tablename  IN  VARCHAR2 DEFAULT NULL)  
RETURN VARCHAR2;
```

Parameters

Table 177-66 GET_PREFS Function Parameters

| Parameter | Description |
|-----------|--|
| pname | <p>Preference name. The possible values are:</p> <ul style="list-style-type: none"> • APPROXIMATE_NDV_ALGORITHM • AUTO_STAT_EXTENSIONS • AUTO_TASK_STATUS • AUTO_TASK_MAX_RUN_TIME • AUTO_TASK_INTERVAL • CASCADE • CONCURRENT • DEGREE • ESTIMATE_PERCENT • GLOBAL_TEMP_TABLE_STATS • GRANULARITY • INCREMENTAL • INCREMENTAL_STALENESS • INCREMENTAL_LEVEL • METHOD_OPT • NO_INVALIDATE • OPTIONS • PREFERENCE_OVERRIDES_PARAMETER • PUBLISH • STALE_PERCENT • STAT_CATEGORY • TABLE_CACHED_BLOCKS • WAIT_TIME_TO_UPDATE_STATUS |
| ownname | Owner name |
| tabname | Table name |

Table 177-67 Preference Descriptions

| Preference Name | Description |
|---------------------------|---|
| APPROXIMATE_NDV_ALGORITHM | <p>Specifies the synopsis generation algorithm. A synopsis is special type of statistic that tracks the number of distinct values (NDV) for each column in a partition. Consider a synopsis as an internal management structure that samples distinct values.</p> <p>You can specify the following preferences:</p> <ul style="list-style-type: none"> REPEAT OR HYPERLOGLOG <p>This is the default. If INCREMENTAL is enabled on the table, then the database preserves the format of any existing synopses that use the adaptive sampling algorithm. However, the database creates any new synopses in HyperLogLog format. This approach is attractive when existing performance is acceptable, and you do not want to incur the performance cost of reformatting legacy content.</p> ADAPTIVE SAMPLING <p>The database uses the adaptive sampling algorithm for all synopses. This is the most conservative option.</p> HYPERLOGLOG <p>The database uses the HyperLogLog algorithm for all new and stale synopses. In contrast to adaptive sampling, the HyperLogLog algorithm uses a randomization technique. The advantages of HyperLogLog over adaptive sampling are:</p> <ul style="list-style-type: none"> The accuracy of the new algorithm is similar to the original algorithm. The memory required is significantly lower, which typically leads to huge reductions in synopsis size. |
| AUTO_STAT_EXTENSIONS | <p>Controls the automatic creation of extensions when database statistics are gathered.</p> <p>You can set the following values:</p> <ul style="list-style-type: none"> ON — When applicable, a SQL plan directive can trigger the creation of column group statistics based on usage of columns in the predicates in the workload. OFF — The database does not create column group statistics automatically. The database creates them only when the CREATE_EXTENDED_STATS function is executed, or when extended statistics are specified explicitly in the METHOD_OPT clause of DBMS_STATS. This is the default. |
| AUTO_TASK_STATUS | <p>Enables or disables the high-frequency automatic optimizer statistics collection. Values are:</p> <ul style="list-style-type: none"> ON — Enables high-frequency automatic optimizer statistics collection. OFF — Disables high-frequency automatic optimizer statistics collection. This is the default. |

Table 177-67 (Cont.) Preference Descriptions

| Preference Name | Description |
|-------------------------|--|
| AUTO_TASK_MAX_RUN_TIME | Configures the maximum run time in seconds of an execution of high-frequency automatic optimizer statistics collection. The maximum value is 3600 (equal to 1 hour), which is the default. |
| AUTO_TASK_INTERVAL | Specifies the interval in seconds between executions of high-frequency automatic optimizer statistics collection. The minimum value is 60. The default is 900 (equal to 15 minutes). |
| CASCADE | Determines whether index statistics are collected as part of gathering table statistics. |
| CONCURRENT | Determines whether statistics are gathered concurrently on multiple objects, or serially, one object at a time. Valid values are: <ul style="list-style-type: none"> MANUAL — Concurrency is enabled only for manual statistics gathering. AUTOMATIC — Concurrency is enabled only for the automatic statistics gathering. ALL — Concurrency is enabled for both manual and automatic statistics gathering. OFF — Concurrency is disabled for both manual and automatic statistics. |
| DEGREE | Determines degree of parallelism used for gathering statistics. |
| ESTIMATE_PERCENT | Determines the percentage of rows to sample. The valid range is between 0.000001 and 100. Use the constant DBMS_STATS.AUTO_SAMPLE_SIZE to enable the database to determine the appropriate sample size for optimal statistics. This is the default. |
| GLOBAL_TEMP_TABLE_STATS | Controls whether the statistics gathered for a global temporary table should be stored as shared statistics or session statistics. This preference takes two values: <ul style="list-style-type: none"> SHARED — All sessions see the same set of statistics SESSION — Statistics gathered by the GATHER_TABLE_STATS procedure on a global temporary table are session-specific. Thus, the database only uses them for queries issued in the same session as the statistics gathering process. The database deletes session-specific statistics when a session terminates. |

Table 177-67 (Cont.) Preference Descriptions

| Preference Name | Description |
|-----------------|---|
| GRANULARITY | <p>Determines the granularity of statistics to collect. This preference is only relevant for partitioned tables.</p> <p>The following values are valid:</p> <ul style="list-style-type: none"> • ALL — Gathers all statistics: subpartition, partition, and global. • AUTO — Determines the granularity based on the partitioning type. This is the default value. • DEFAULT — Gathers global and partition-level statistics. This option is obsolete, and while currently supported, it is included in the documentation for legacy reasons only. Use GLOBAL AND PARTITION for this functionality. • GLOBAL — Gathers global statistics. • GLOBAL AND PARTITION — Gathers the global and partition level statistics. No subpartition level statistics are gathered even if it is a composite partitioned object. • PARTITION — Gathers partition-level statistics. • SUBPARTITION — Gathers subpartition-level statistics. |
| INCREMENTAL | <p>Determines whether the global statistics for a partitioned table are maintained without performing a full table scan.</p> <p>When a table is partitioned, an application typically loads data into a new partition. As new partitions are added and data is loaded, global table statistics must be kept up to date. If the following conditions are met, then the database updates the global table statistics by scanning only the changed partitions instead of the entire table:</p> <ul style="list-style-type: none"> • The INCREMENTAL value for the partitioned table is set to TRUE. • The PUBLISH value for the partitioned table is set to TRUE. • The user specifies AUTO_SAMPLE_SIZE for ESTIMATE_PERCENT and AUTO for GRANULARITY when gathering statistics on the table. <p>If the INCREMENTAL value for the partitioned table was set to FALSE (default value), then the database uses a full table scan to maintain the global statistics. This technique is a much more resource-intensive and time-consuming operation for large tables.</p> |

Table 177-67 (Cont.) Preference Descriptions

| Preference Name | Description |
|-------------------|--|
| INCREMENTAL_LEVEL | <p>Controls which synopses to collect when INCREMENTAL preference is set to TRUE. It takes the following values:</p> <ul style="list-style-type: none"> • PARTITION — Gathers partition-level synopses. This is the default value. If PARTITION is set on a nonpartitioned table, then the database does not gather synopses. • TABLE — Gathers table-level synopses. Specify this value when you want to exchange this table with a partition. Before the exchange, you can run GATHER_TABLE_STATS on this table with INCREMENTAL set to TRUE and INCREMENTAL_LEVEL to TABLE. The result is that the database gathers table-level synopses on this table. After the exchange, the partition has synopses that come from the table-level synopses of the table before the exchange. You can only use preference value in the SET_TABLE_PREFS procedure: this value is not allowed in the other SET_*_PREFS procedures. |

Table 177-67 (Cont.) Preference Descriptions

| Preference Name | Description |
|-----------------------|--|
| INCREMENTAL_STALENESS | <p>Specifies when a partition or subpartition is considered stale. This parameter takes an enumeration of values, such as 'USE_STALE_PERCENT' and 'USE_LOCKED_STATS'. You can also specify multiple values, such as 'USE_STALE_PERCENT,USE_LOCKED_STATS,ALLOW_MIXED_FORMAT'.</p> <p>The parameter accepts the following values:</p> <ul style="list-style-type: none"> • USE_STALE_PERCENT—A partition or subpartition is not considered stale when DML changes are below the threshold set by the STALE_PERCENT preference. For example, assume that STALE_PERCENT is 10. You specify USE_STALE_PERCENT for INCREMENTAL_STALENESS. The partition has 5% DML changes. The database does not regather statistics. Assume a different case in which STALE_PERCENT is 10. You specify USE_STALE_PERCENT for INCREMENTAL_STALENESS. However, in this case the partition is locked and has 20% of DML changes. Because the partition is locked, the database does not regather statistics. • USE_LOCKED_STATS—Locked partitions or subpartitions statistics are never considered stale, regardless of DML changes. For example, assume that STALE_PERCENT is 10. You specify 'USE_LOCKED_STATS, USE_STALE_PERCENT'. The partition, which is locked, has 20% DML changes. The partition is not considered stale. The database uses existing statistics to derive global statistics. • ALLOW_MIXED_FORMAT—Adaptive sampling synopses and HyperLogLog synopses are permitted to coexist. • NULL—A partition or subpartition is considered stale when it has any DML changes. For example, assume that STALE_PERCENT is 10. You specify the value 'NULL' for INCREMENTAL_STALENESS. The partition has 5% of DML changes. The database regathers statistics. |

Table 177-67 (Cont.) Preference Descriptions

| Preference Name | Description |
|-----------------|--|
| METHOD_OPT | <p>Note that the following two executions are different:</p> <pre data-bbox="857 405 1317 495">EXEC DBMS_STATS.SET_TABLE_PREFS ('sh', 'sales', 'INCREMENTAL_STALENESS', 'NULL');</pre> <pre data-bbox="857 562 1292 653">EXEC DBMS_STATS.SET_TABLE_PREFS ('sh', 'sales', 'INCREMENTAL_STALENESS', null);</pre> <p>The first execution uses single quotes to set the preference to the value NULL, whereas the second sets the preference to the default, which is ALLOW_MIXED_FORMAT.</p> |
| | <p>Controls column statistics collection and histogram creation. When setting preferences at the global, schema, database, or dictionary level, only FOR ALL syntax is allowed:</p> <ul data-bbox="857 961 1373 1024" style="list-style-type: none"> • FOR ALL [INDEXED HIDDEN] COLUMNS [size_clause] <p>The size_clause is defined as size_clause := SIZE {integer REPEAT AUTO SKEWONLY}</p> <p>integer — Specifies the number of histogram buckets. The number must be between 1 and 2048.</p> <p>REPEAT — Collects histograms only on the columns that already have histograms.</p> <p>AUTO — Determines the columns on which to collect histograms based on data distribution and the workload of the columns.</p> <p>SKEWONLY — Determines the columns on which to collect histograms based on the data distribution of the columns.</p> <p>The default is FOR ALL COLUMNS SIZE AUTO. You can change the value using the SET_DATABASE_PREFS Procedure, SET_GLOBAL_PREFS Procedure, SET_SCHEMA_PREFS Procedure and SET_TABLE_PREFS Procedure.</p> |

Table 177-67 (Cont.) Preference Descriptions

| Preference Name | Description |
|--------------------------------|---|
| NO_INVALIDATE | <p>Controls the invalidation of dependent cursors when statistics are gathered. The parameter takes the following values:</p> <ul style="list-style-type: none"> TRUE: Dependent cursors are not invalidated. FALSE: Dependent cursors are marked for immediate invalidation. AUTO: This is the default value. Rolling invalidation is used to invalidate all dependent cursors over a period of time. The performance impact on the database is reduced especially in cases where a large number of cursors are invalidated. <p>If set to TRUE, then the database not invalidate dependent cursors. If set to FALSE, then the procedure invalidates dependent cursors immediately.</p> |
| OPTIONS | <p>Determines the <code>options</code> parameter used in the <code>GATHER_TABLE_STATS</code> procedure. The preference takes the following values:</p> <ul style="list-style-type: none"> GATHER — Gathers statistics for all objects in the table. This is the default. GATHER AUTO — Oracle recommends using GATHER AUTO to gather necessary statistics, such as histograms, after a table has been bulk loaded and acquired online statistics. This is applicable only to tables that are not using INCREMENTAL statistics. <p>For partitioned tables using INCREMENTAL statistics, GATHER_TABLE_STATS with GATHER AUTO will gather statistics for a table if it is marked stale or has no statistics. In addition, statistics will be gathered for partitions and sub-partitions that are marked stale or have no statistics.</p> <p>For tables not using INCREMENTAL statistics, GATHER_TABLE_STATS with GATHER AUTO may gather statistics for partitions and sub-partitions, even if they are not marked stale.</p> |
| PREFERENCE_OVERRIDES_PARAMETER | <p>Determines whether to override the input value of a parameter with the preference value of that parameter for a statistics operation. Possible values are:</p> <ul style="list-style-type: none"> TRUE — Ignores input parameter values, and uses the value of the corresponding preference. FALSE — Obeys input parameter values. <p>Specifying this preference does not change the order of precedence of table, global, and default.</p> |
| PUBLISH | <p>Determines whether the database publishes newly gathered statistics after the gathering job completes. You can gather statistics without publishing them immediately. This technique enables you to test new statistics before publishing them.</p> |

Table 177-67 (Cont.) Preference Descriptions

| Preference Name | Description |
|---------------------------|--|
| STALE_PERCENT | <p>Determines the percentage of rows in a table that must change before the statistics on that table are stale and need to be regathered.</p> <p>The valid domain for <code>stale_percent</code> is non-negative numbers. The default value is 10, which means that a table having more than 10% of changes is considered stale.</p> |
| STAT_CATEGORY | <p>Specifies which statistics to import or export, accepting multiple values separated by a comma. Values supported:</p> <ul style="list-style-type: none"> • <code>OBJECT_STATS</code> - table statistics, column statistics and index statistics (default) • <code>SYNOPSIS</code> - information to support incremental statistics • <code>REALTIME_STATS</code> — specifies only real-time statistics. <p>The value '<code>OBJECT_STATS, SYNOPSIS</code>' specifies table statistics, column statistics, index statistics, and synopses.</p> |
| TABLE_CACHED_BLOCKS | <p>Specifies the average number of blocks assumed to be cached in the buffer cache when calculating the index clustering factor. The preference applies only when gathering statistics using <code>DBMS_STATS</code>. Index statistics gathered during <code>CREATE INDEX</code> or <code>REBUILD INDEX</code> operations will use the default value 1.</p> |
| WAIT_TIME_TO_UPDATE_STATS | <p>Specifies the number of minutes before timing out for locks and pins required for updating statistics. It accepts values in the range 0 to 65535. The default value is 15 minutes. The value 0 gets the locks and pins in no-wait mode.</p> |

Security Model

No special privilege or role is needed to invoke this procedure. To gather statistics concurrently, however, you must either have the DBA role, or have the following privileges in addition to privileges that are required for gathering statistics: `CREATE JOB`, `MANAGE SCHEDULER`, and `MANAGE ANY QUEUE`.

Exceptions

- **ORA-20000: Unable to gather statistics concurrently: Resource Manager is not enabled.**
- **ORA-20001: Invalid input values**

Usage Notes

Note the following guidelines:

- The `CONCURRENT` preference determines whether statistics are gathered concurrently when the user issues `GATHER_*_STATS` procedures. `DBMS_STATS` can

collect statistics for a single object in parallel based on the value of the `DEGREE` parameter. However, parallelism is limited to one object. The `CONCURRENT` preference extends the scope of parallelism to multiple database objects. This approach is primarily intended for multi-CPU systems, and may not be suitable for small databases on single-CPU computers.

To gather statistics concurrently, Resource Manager must be enabled, and the setting for the `JOB_QUEUE_PROCESSES` initialization parameter must be at least 4.

- If the `ownname` and `tabname` are provided, and if a preference has been entered for the table, then the function returns the preference as specified for the table. In all other cases, it returns the global preference if it has been specified, otherwise it returns the default value.

Oracle Database SQL Tuning Guide to learn how to get optimizer statistics preferences

177.7.62 GET_STATS_HISTORY_AVAILABILITY Function

This function returns oldest timestamp where statistics history is available. Users cannot restore statistics to a timestamp older than this one.

Syntax

```
DBMS_STATS.GET_STATS_HISTORY_AVAILABILITY  
RETURN TIMESTAMP WITH TIMEZONE;
```

Usage Notes

No special privilege or role is needed to invoke this procedure.

177.7.63 GET_STATS_HISTORY_RETENTION Function

This function returns the current statistics history retention value.

Syntax

```
DBMS_STATS.GET_STATS_HISTORY_RETENTION  
RETURN NUMBER;
```

Usage Notes

No special privilege or role is needed to invoke this procedure.

177.7.64 GET_SYSTEM_STATS Procedure

This procedure gets system statistics from `stattab`, or from the dictionary if `stattab` is `NULL`.

Syntax

```
DBMS_STATS.GET_SYSTEM_STATS (  
    status OUT VARCHAR2,
```

```

dstart  OUT  DATE,
dstop   OUT  DATE,
pname   IN   VARCHAR2,
pvalue  OUT  NUMBER,
statab  IN   VARCHAR2 DEFAULT NULL,
statid  IN   VARCHAR2 DEFAULT NULL,
statown IN   VARCHAR2 DEFAULT NULL);

```

Parameters

Table 177-68 GET_SYSTEM_STATS Procedure Parameters

| Parameter | Description |
|-----------|---|
| status | Output is one of the following: <ul style="list-style-type: none"> COMPLETED: AUTOGATHERING: MANUALGATHERING: BADSTATS: |
| dstart | Date when statistics gathering started. If status = MANUALGATHERING, the start date is returned. |
| dstop | Date when statistics gathering stopped. <ul style="list-style-type: none"> If status = COMPLETE, the finish date is returned. If status = AUTOGATHERING, the future finish date is returned. If status = BADSTATS, the must-finished-by date is returned. |
| pname | The parameter name to get, which can have one of the following values: <ul style="list-style-type: none"> iotfrspeed - I/O transfer speed in bytes for each millisecond ioseektim - seek time + latency time + operating system overhead time, in milliseconds sreadtim - average time to read single block (random read), in milliseconds mreadtim - average time to read an mbrc block at once (sequential read), in milliseconds cpuspeed - average number of CPU cycles for each second, in millions, captured for the workload (statistics collected using 'INTERVAL' or 'START' and 'STOP' options) cpuspeednw - average number of CPU cycles for each second, in millions, captured for the no-workload (statistics collected using 'NOWORKLOAD' option. mbrc - average multiblock read count for sequential read, in blocks maxthr - maximum I/O system throughput, in bytes/second slavethr - average slave I/O throughput, in bytes/second |
| pvalue | Parameter value to get |
| statab | Identifier of the user statistics table where the statistics will be obtained. If statab is NULL, the statistics will be obtained from the dictionary. |
| statid | Optional identifier associated with the statistics saved in the statab |

Table 177-68 (Cont.) GET_SYSTEM_STATS Procedure Parameters

| Parameter | Description |
|-----------|---|
| statown | Schema containing statab (if different from current schema) |

Exceptions

ORA-20000: Object does not exist or insufficient privileges

ORA-20002: Bad user statistics table; may need to be upgraded

ORA-20003: Unable to gather system statistics

ORA-20004: Parameter does not exist

Usage Notes

To run this procedure, you need the GATHER_SYSTEM_STATISTICS role.

177.7.65 GET_TABLE_STATS Procedure

This overloaded procedure gets all table-related statistics.

Syntax

```
DBMS_STATS.GET_TABLE_STATS (
  ownname          VARCHAR2,
  tablename         VARCHAR2,
  partname          VARCHAR2 DEFAULT NULL,
  statab            VARCHAR2 DEFAULT NULL,
  statid            VARCHAR2 DEFAULT NULL,
  numrows           OUT NUMBER,
  numblks           OUT NUMBER,
  avgrlen           OUT NUMBER,
  statown           VARCHAR2 DEFAULT NULL,
  realtime_stats    BOOLEAN DEFAULT TRUE);
```

```
DBMS_STATS.GET_TABLE_STATS (
  ownname          VARCHAR2,
  tablename         VARCHAR2,
  partname          VARCHAR2 DEFAULT NULL,
  statab            VARCHAR2 DEFAULT NULL,
  statid            VARCHAR2 DEFAULT NULL,
  numrows           OUT NUMBER,
  numblks           OUT NUMBER,
  avgrlen           OUT NUMBER,
  statown           VARCHAR2 DEFAULT NULL,
  im_imcu_count    OUT NUMBER,
  im_block_count    OUT NUMBER,
```

```

scanrate          OUT NUMBER,
realtime_stats    BOOLEAN DEFAULT TRUE);

```

```

DBMS_STATS.GET_TABLE_STATS (
  ownname          VARCHAR2,
  tabname          VARCHAR2,
  partname         VARCHAR2 DEFAULT NULL,
  statab           VARCHAR2 DEFAULT NULL,
  statid           VARCHAR2 DEFAULT NULL,
  numrows         OUT NUMBER,
  numblks         OUT NUMBER,
  avgrlen         OUT NUMBER,
  cachedblk       OUT NUMBER,
  cachehit        OUT NUMBER,
  realtime_stats  BOOLEAN DEFAULT TRUE);

```

Parameters

Table 177-69 GET_TABLE_STATS Procedure Parameters

| Parameter | Description |
|----------------|---|
| ownname | Specifies the name of the schema. |
| tabname | Specifies the name of the table to which this column belongs. |
| partname | Specifies the name of the table partition from which to get the statistics. If the table is partitioned and if <code>partname</code> is <code>NULL</code> , then the statistics are retrieved from the global table level. |
| statab | Specifies the user statistics table ID. This ID describes where to retrieve the statistics. If <code>statab</code> is <code>NULL</code> , then the procedure gathers statistics directly from the data dictionary. |
| statid | Specifies the optional ID associates with these statistics within <code>statab</code> . This ID is only relevant when <code>statab</code> is not <code>NULL</code> . |
| numrows | Specifies the number of rows in the table or partition. |
| numblks | Specifies the number of blocks in the table or partition. |
| avgrlen | Specifies the average row length for the table or partition. |
| statown | Specifies the schema containing <code>statab</code> (if different from <code>ownname</code>). |
| im_imcu_count | Specifies the number of In-Memory Compression Units (IMCUs) in the table or partition. |
| im_block_count | Specifies the number of In-Memory blocks in the table or partition. An In-Memory block corresponds to a specific data block on disk. If the table is fully populated in the IM column store, then the number of In-Memory blocks equals the number of data blocks. |
| scanrate | Specifies the rate, in MB/s, at which the database scans external tables. This parameter is relevant only for external tables. |

Table 177-69 (Cont.) GET_TABLE_STATS Procedure Parameters

| Parameter | Description |
|-----------------------------|--|
| <code>realtime_stats</code> | Specifies whether to include real-time statistics. The default value is <code>TRUE</code> . When <code>realtime_stats</code> is <code>FALSE</code> , the database only includes optimizer statistics that were gathered by the <code>GATHER_*_STATS</code> procedures. |
| <code>cachedblk</code> | For internal use only. |
| <code>cachehit</code> | For internal use only. |

Security Model

Before invoking this procedure, ensure that the table exists. To invoke this procedure you must be owner of the table, or you need the `ANALYZE ANY` privilege. For objects owned by `SYS`, you must be either the owner of the table, or have the `ANALYZE ANY DICTIONARY` or `SYSDBA` privilege.

Exceptions

ORA-20000: Object does not exist or insufficient privileges or no statistics have been stored for requested object

ORA-20002: Bad user statistics table; may need to upgrade it

Usage Notes

- The optimizer uses the cached data to estimate number of cached blocks for index or statistics table access. The database calculates the total cost of the operation by combining the I/O cost of reading not cached blocks from disk, the CPU cost of getting cached blocks from the buffer cache, and the CPU cost of processing the data.
- The database maintains `cachedblk` and `cachehit` at all times. However, the database uses the corresponding caching statistics for optimization as part of the table and index statistics only when the user calls the `DBMS_STATS.GATHER*_STATS` procedure for automatic mode or `DBMS_STATS.GATHER_SYSTEM_STATS` for manual mode. To prevent the user from utilizing inaccurate and unreliable data, the optimizer computes a “confidence factor” for each `cachehit` and a `cachedblk` for each object. If the confidence factor for the value meets confidence criteria, then the database uses this value; otherwise, the database uses defaults.
- The automatic maintenance algorithm for object caching statistics assumes that only one major database workload exists. The algorithm adjusts statistics to this workload, ignoring other “minor” workloads. If this assumption is false, then you must use manual mode for maintaining object caching statistics.
- The object caching statistics maintenance algorithm for automatic mode prevents you from using statistics in the following situations
 - When not enough data has been analyzed, such as when an object has been recently created
 - When the system does not have one major workload resulting in averages not corresponding to real values
- The database does not support export or import of statistics across databases of different character sets.

**See Also:**

Oracle Database SQL Tuning Guide to learn how to manage optimizer statistics preferences

177.7.66 IMPLEMENT_ADVISOR_TASK Function

This function implements the recommendations made by Optimizer Statistics Advisor.

Syntax

```
DBMS_STATS.IMPLEMENT_ADVISOR_TASK (
  task_name          IN   VARCHAR2,
  execution_name     IN   VARCHAR2   := NULL,
  level              IN   VARCHAR2   := 'TYPICAL')
RETURN CLOB;
```

Parameters

Table 177-70 IMPLEMENT_ADVISOR_TASK Function Parameters

| Parameter | Description |
|----------------|---|
| task_name | The name of the Optimizer Statistics Advisor task. |
| execution_name | A name that qualifies and identifies an advisor execution. If not specified, then the advisor automatically generates it. If the specified execution conflicts with the name of an existing execution, then the function returns an error. |
| level | The level of the implementation. Possible values are <ul style="list-style-type: none"> • ALL: Ignores the filters and implements all recommendations. • TYPICAL: Implements the recommendations according to the filters in place. |

Security Model

Note the following:

- To execute this subprogram, you must have the `ADVISOR` privilege.
- You must be the owner of the task.
- You can execute this subprogram for `AUTO_STATS_ADVISOR_TASK`, which is predefined.
- This subprogram executes using invoker's rights.

The results of performing this task depend on the privileges of the executing user:

- `SYSTEM` level
Only users with both the `ANALYZE ANY` and `ANALYZE ANY DICTIONARY` privileges can perform this task on system-level rules.
- Operation level

The results depend on the following privileges:

- Users with both the `ANALYZE ANY` and `ANALYZE ANY DICTIONARY` privileges can perform this task for all statistics operations.
 - Users with the `ANALYZE ANY` privilege but *not* the `ANALYZE ANY DICTIONARY` privilege can perform this task for statistics operations related to any schema except `SYS`.
 - Users with the `ANALYZE ANY DICTIONARY` privilege but *not* the `ANALYZE ANY` privilege can perform this task for statistics operations related to their own schema and the `SYS` schema.
 - Users with neither the `ANALYZE ANY` nor the `ANALYZE ANY DICTIONARY` privilege can only perform this operation for statistics operations relating to their own schema.
- Object level
Users can perform this task for any object for which they have statistics collection privileges.

Return Values

This function returns an XML CLOB that indicates which recommendations were successfully implemented.

Exceptions

- ORA-20000: Insufficient privileges
- ORA-20001: Invalid input values
- ORA-20012: Optimizer Statistics Advisor errors

Example 177-10 Implementing Optimizer Statistics Advisor Recommendations

This script illustrates a basic Optimizer Statistics Advisor session. It creates a task, executes it, generates a report, and then implements the recommendations.

```

DECLARE
  v_tname      VARCHAR2(128) := 'my_task';
  v_ename      VARCHAR2(128) := NULL;
  v_report     CLOB := null;
  v_script     CLOB := null;
  v_imp_result CLOB;
BEGIN
  -- create a task
  v_tname := DBMS_STATS.CREATE_ADVISOR_TASK(v_tname);

  -- execute the task
  v_ename := DBMS_STATS.EXECUTE_ADVISOR_TASK(v_tname);

  -- view the task report
  v_report := DBMS_STATS.REPORT_ADVISOR_TASK(v_tname);
  DBMS_OUTPUT.PUT_LINE(v_report);

  -- implement all recommendations
  v_imp_result := DBMS_STATS.IMPLEMENT_ADVISOR_TASK(v_tname);
END;
```

177.7.67 IMPORT_COLUMN_STATS Procedure

This procedure retrieves statistics for a particular column from the user statistics table identified by `stattab` and stores them in the dictionary.

Syntax

```
DBMS_STATS.IMPORT_COLUMN_STATS (
    ownname          VARCHAR2,
    tabname          VARCHAR2,
    colname          VARCHAR2,
    partname         VARCHAR2 DEFAULT NULL,
    stattab          VARCHAR2,
    statid           VARCHAR2 DEFAULT NULL,
    statown          VARCHAR2 DEFAULT NULL,
    no_invalidate   BOOLEAN DEFAULT to_no_invalidate_type (
                                                get_param('NO_INVALIDATE')),
    force            BOOLEAN DEFAULT FALSE);
```

Parameters

Table 177-71 IMPORT_COLUMN_STATS Procedure Parameters

| Parameter | Description |
|----------------------------|--|
| <code>ownname</code> | Name of the schema |
| <code>tabname</code> | Name of the table to which this column belongs |
| <code>colname</code> | Name of the column or extension |
| <code>partname</code> | Name of the table partition. If the table is partitioned and if <code>partname</code> is <code>NULL</code> , then global and partition column statistics are imported. |
| <code>stattab</code> | User statistics table identifier describing from where to retrieve the statistics |
| <code>statid</code> | Identifier to associate with these statistics within <code>stattab</code> (optional) |
| <code>statown</code> | Schema containing <code>stattab</code> (if different than <code>ownname</code>) |
| <code>no_invalidate</code> | Controls the invalidation of dependent cursors when statistics are gathered. The parameter takes the following values: <ul style="list-style-type: none"> <code>TRUE</code>: Dependent cursors are not invalidated. <code>FALSE</code>: Dependent cursors are marked for immediate invalidation. <code>AUTO</code>: This is the default value. Rolling invalidation is used to invalidate all dependent cursors over a period of time. The performance impact on the database is reduced especially in cases where a large number of cursors are invalidated. <p>You can change the default using the SET_DATABASE_PREFS Procedure, SET_GLOBAL_PREFS Procedure, SET_SCHEMA_PREFS Procedure and SET_TABLE_PREFS Procedure.</p> |
| <code>force</code> | If set to <code>TRUE</code> , imports statistics even if statistics are locked |

Usage Notes

To invoke this procedure you must be owner of the table, or you need the `ANALYZE ANY` privilege. For objects owned by `SYS`, you need to be either the owner of the table, or you need the `ANALYZE ANY DICTIONARY` privilege or the `SYSDBA` privilege.

Exceptions

ORA-20000: Object does not exist or insufficient privileges

ORA-20001: Invalid or inconsistent values in the user statistics table

ORA-20005: Object statistics are locked

Usage Notes

Oracle does not support export or import of statistics across databases of different character sets.

177.7.68 IMPORT_DATABASE_PREFS Procedure

This procedure is used to import the statistics preferences of all the tables, excluding the tables owned by Oracle. These tables can be included by passing `TRUE` for the `add_sys` parameter.

Syntax

```
DBMS_STATS.IMPORT_DATABASE_PREFS (
    statab      IN  VARCHAR2,
    statid      IN  VARCHAR2 DEFAULT NULL,
    statown     IN  VARCHAR2 DEFAULT NULL,
    add_sys     IN  BOOLEAN DEFAULT FALSE);
```

Parameters

Table 177-72 IMPORT_DATABASE_PREFS Procedure Parameters

| Parameter | Description |
|----------------------|---|
| <code>statab</code> | Statistics table name where to import the statistics |
| <code>statid</code> | Optional identifier to associate with these statistics within <code>statab</code> |
| <code>statown</code> | Schema containing <code>statab</code> (if different than <code>ownname</code>) |
| <code>add_sys</code> | Value <code>TRUE</code> will include the Oracle-owned tables |

Exceptions

ORA-20000: Insufficient privileges.

Usage Notes

- To run this procedure, you need to have the `SYSDBA` role, or both `ANALYZE ANY DICTIONARY` and `ANALYZE ANY` system privileges.
- Oracle does not support export or import of statistics across databases of different character sets.

Examples

```
DBMS_STATS.IMPORT_DATABASE_PREFS('STATTAB', statown=>'SH');
```

177.7.69 IMPORT_DATABASE_STATS Procedure

This procedure imports statistics for all objects in the database from the user statistics table and stores them in the data dictionary.

Syntax

```
DBMS_STATS.IMPORT_DATABASE_STATS (
  stattab          VARCHAR2,
  statid           VARCHAR2 DEFAULT NULL,
  statown          VARCHAR2 DEFAULT NULL,
  no_invalidate   BOOLEAN DEFAULT to_no_invalidate_type(
                                     get_param('NO_INVALIDATE')),
  force           BOOLEAN DEFAULT FALSE,
  stat_category   VARCHAR2 DEFAULT DEFAULT_STAT_CATEGORY);
```

Parameters

Table 177-73 IMPORT_DATABASE_STATS Procedure Parameters

| Parameter | Description |
|---------------|---|
| stattab | Specifies the statistics table that contains the statistics to be imported. |
| statid | Identifier (optional) to associate with these statistics within stattab |
| statown | Schema containing stattab (if different from current schema) |
| no_invalidate | Controls the invalidation of dependent cursors when statistics are gathered. The parameter takes the following values: <ul style="list-style-type: none"> TRUE: Dependent cursors are not invalidated. FALSE: Dependent cursors are marked for immediate invalidation. AUTO: This is the default value. Rolling invalidation is used to invalidate all dependent cursors over a period of time. The performance impact on the database is reduced especially in cases where a large number of cursors are invalidated. The default can be changed using the SET_DATABASE_PREFS Procedure , SET_GLOBAL_PREFS Procedure , SET_SCHEMA_PREFS Procedure and SET_TABLE_PREFS Procedure . |
| force | Overrides statistics locked at the object (table) level: <ul style="list-style-type: none"> TRUE - Ignores the statistics lock and imports the statistics FALSE - The statistics will be imported only if they are not locked |
| stat_category | Specifies what statistics to import, accepting multiple values separated by a comma. Values supported: <ul style="list-style-type: none"> OBJECT_STATS — table statistics, column statistics and index statistics SYNOPSIS — information to support incremental statistics REALTIME_STATS — specifies only real-time statistics. The default value is 'OBJECT_STATS, SYNOPSIS, MODELS'. |

Security Model

You must have either the SYSDBA privilege or both the ANALYZE ANY DICTIONARY and ANALYZE ANY system privileges.

Exceptions

ORA-20000: Object does not exist or insufficient privileges

ORA-20001: Invalid or inconsistent values in the user statistics table

Usage Notes

Oracle Database does not support export or import of statistics across databases of different character sets.

177.7.70 IMPORT_DICTIONARY_STATS Procedure

This procedure imports statistics for all data dictionary schemas (SYS, SYSTEM, and RDBMS component schemas) from the user statistics table and stores them in the dictionary.

Syntax

```
DBMS_STATS.IMPORT_DICTIONARY_STATS (
    statab          VARCHAR2,
    statid          VARCHAR2 DEFAULT NULL,
    statown         VARCHAR2 DEFAULT NULL,
    no_invalidate   BOOLEAN DEFAULT to_no_invalidate_type(
        get_param('NO_INVALIDATE')),
    force           BOOLEAN DEFAULT FALSE,
    stat_category   VARCHAR2 DEFAULT DEFAULT_STAT_CATEGORY);
```

Parameters

Table 177-74 IMPORT_DICTIONARY_STATS Procedure Parameters

| Parameter | Description |
|---------------|---|
| statab | User statistics table identifier describing from where to retrieve the statistics |
| statid | The (optional) identifier to associate with these statistics within statab |
| statown | Schema containing statab (if different from current schema) |
| no_invalidate | Controls the invalidation of dependent cursors when statistics are gathered. The parameter takes the following values: <ul style="list-style-type: none"> TRUE: Dependent cursors are not invalidated. FALSE: Dependent cursors are marked for immediate invalidation. AUTO: This is the default value. Rolling invalidation is used to invalidate all dependent cursors over a period of time. The performance impact on the database is reduced especially in cases where a large number of cursors are invalidated. <p>The default can be changed using the SET_DATABASE_PREFS Procedure, SET_GLOBAL_PREFS Procedure, SET_SCHEMA_PREFS Procedure and SET_TABLE_PREFS Procedure.</p> |

Table 177-74 (Cont.) IMPORT_DICTIONARY_STATS Procedure Parameters

| Parameter | Description |
|---------------|--|
| force | <p>Overrides statistics lock at the object (table) level:</p> <ul style="list-style-type: none"> • TRUE - Ignores the statistics lock and imports the statistics. • FALSE - The statistics will be imported only if there is no lock. |
| stat_category | <p>Specifies what statistics to import, accepting multiple values separated by a comma. Values supported:</p> <ul style="list-style-type: none"> • OBJECT_STATS — table statistics, column statistics and index statistics • SYNOPSIS — information to support incremental statistics • REALTIME_STATS — Specifies only real-time statistics. <p>The default value is 'OBJECT_STATS, SYNOPSIS, REALTIME_STATS'.</p> |

Security Model

You must have either the SYSDBA privilege or both the ANALYZE ANY DICTIONARY and ANALYZE ANY system privileges.

Exceptions

ORA-20000: Object does not exist or insufficient privileges

ORA-20001: Invalid or inconsistent values in the user statistics table

ORA-20002: Bad user statistics table, may need to upgrade it

Usage Notes

Oracle Database does not support export or import of statistics across databases of different character sets.

177.7.71 IMPORT_FIXED_OBJECTS_STATS Procedure

This procedure imports statistics for fixed tables from the user statistics table and stores them in the data dictionary.

Syntax

```
DBMS_STATS.IMPORT_FIXED_OBJECTS_STATS (
    stattab          VARCHAR2,
    statid           VARCHAR2 DEFAULT NULL,
    statown         VARCHAR2 DEFAULT NULL,
    no_invalidate   BOOLEAN   DEFAULT to_no_invalidate_type(
                                                get_param('NO_INVALIDATE')),
    force           BOOLEAN   DEFAULT FALSE);
```

Parameters

Table 177-75 IMPORT_FIXED_OBJECTS_STATS Procedure Parameters

| Parameter | Description |
|---------------|---|
| stattab | User statistics table identifier describing from where to retrieve the statistics |
| statid | Identifier (optional) to associate with these statistics within stattab |
| statown | Schema containing stattab (if different from current schema) |
| no_invalidate | Controls the invalidation of dependent cursors when statistics are gathered. The parameter takes the following values: <ul style="list-style-type: none"> TRUE: Dependent cursors are not invalidated. FALSE: Dependent cursors are marked for immediate invalidation. AUTO: This is the default value. Rolling invalidation is used to invalidate all dependent cursors over a period of time. The performance impact on the database is reduced especially in cases where a large number of cursors are invalidated. <p>The default can be changed using the SET_DATABASE_PREFS Procedure, SET_GLOBAL_PREFS Procedure, SET_SCHEMA_PREFS Procedure and SET_TABLE_PREFS Procedure.</p> |
| force | Overrides statistics lock: <ul style="list-style-type: none"> TRUE - Ignores the statistics lock and imports the statistics FALSE - The statistics will be imported only if there is no lock |

Security Model

You must have the SYSDBA or ANALYZE ANY DICTIONARY system privilege.

Exceptions

ORA-20000: Object does not exist or insufficient privileges

ORA-20001: Invalid or inconsistent values in the user statistics table

ORA-20002: Bad user statistics table, may need to upgrade it

Usage Notes

Oracle Database does not support export or import of statistics across databases of different character sets.

177.7.72 IMPORT_INDEX_STATS Procedure

This procedure retrieves statistics for a particular index from the user statistics table identified by stattab and stores them in the dictionary.

Syntax

```
DBMS_STATS.IMPORT_INDEX_STATS (
  ownname      VARCHAR2,
  indname      VARCHAR2,
  partname     VARCHAR2 DEFAULT NULL,
  stattab      VARCHAR2,
  statid       VARCHAR2 DEFAULT NULL,
```

```

statown          VARCHAR2 DEFAULT NULL,
no_invalidate   BOOLEAN DEFAULT to_no_invalidate_type(
                get_param('NO_INVALIDATE')),
force           BOOLEAN DEFAULT FALSE);

```

Parameters

Table 177-76 IMPORT_INDEX_STATS Procedure Parameters

| Parameter | Description |
|---------------|---|
| ownname | Name of the schema |
| indname | Name of the index |
| partname | Name of the index partition. If the index is partitioned and if partname is NULL, then global and partition index statistics are imported. |
| stattab | User statistics table identifier describing from where to retrieve the statistics |
| statid | Identifier (optional) to associate with these statistics within stattab |
| statown | Schema containing stattab (if different than ownname) |
| no_invalidate | Controls the invalidation of dependent cursors when statistics are gathered. The parameter takes the following values: <ul style="list-style-type: none"> TRUE: Dependent cursors are not invalidated. FALSE: Dependent cursors are marked for immediate invalidation. AUTO: This is the default value. Rolling invalidation is used to invalidate all dependent cursors over a period of time. The performance impact on the database is reduced especially in cases where a large number of cursors are invalidated. <p>You can change the default using the SET_DATABASE_PREFS Procedure, SET_GLOBAL_PREFS Procedure, SET_SCHEMA_PREFS Procedure and SET_TABLE_PREFS Procedure.</p> |
| force | Imports statistics even if index statistics are locked |

Exceptions

ORA-20000: Object does not exist or insufficient privileges

ORA-20001: Invalid or inconsistent values in the user statistics table

ORA-20005: Object statistics are locked

Usage Notes

To invoke this procedure you must be owner of the table, or you need the `ANALYZE ANY` privilege. For objects owned by `SYS`, you need to be either the owner of the table, or you need the `ANALYZE ANY DICTIONARY` privilege or the `SYSDBA` privilege.

Oracle does not support export or import of statistics across databases of different character sets.

177.7.73 IMPORT_SCHEMA_PREFS Procedure

This procedure is used to import the statistics preferences of all the tables owned by the specified owner name.

Syntax

```
DBMS_STATS.IMPORT_SCHEMA_PREFS (
  ownname      IN  VARCHAR2,
  stattab      IN  VARCHAR2,
  statid       IN  VARCHAR2 DEFAULT NULL,
  statown      IN  VARCHAR2 DEFAULT NULL);
```

Parameters

Table 177-77 IMPORT_SCHEMA_PREFS Procedure Parameters

| Parameter | Description |
|-----------|---|
| ownname | Owner name |
| stattab | Statistics table name from where to import the statistics |
| statid | (Optional) Identifier to associate with these statistics within stattab |
| statown | Schema containing stattab (if other than ownname) |

Exceptions

ORA-20000: Object does not exist or insufficient privileges

Usage Notes

- To run this procedure, you need to connect as owner, or have the SYSDBA privilege, or have the ANALYZE ANY system privilege.
- All arguments are of type VARCHAR2 and values are enclosed in quotes.
- Oracle does not support export or import of statistics across databases of different character sets.

Examples

```
DBMS_STATS.IMPORT_SCHEMA_PREFS('SH', 'STAT');
```

177.7.74 IMPORT_SCHEMA_STATS Procedure

This procedure imports statistics for all objects in the schema identified by ownname from the user statistics table and stores them in the data dictionary.

Syntax

```
DBMS_STATS.IMPORT_SCHEMA_STATS (
  ownname      VARCHAR2,
  stattab      VARCHAR2,
  statid       VARCHAR2 DEFAULT NULL,
  statown      VARCHAR2 DEFAULT NULL,
```

```
no_invalidate    BOOLEAN DEFAULT to_no_invalidate_type(
                get_param('NO_INVALIDATE')),
force           BOOLEAN DEFAULT FALSE,
stat_category   VARCHAR2 DEFAULT DEFAULT_STAT_CATEGORY);
```

Parameters

Table 177-78 IMPORT_SCHEMA_STATS Procedure Parameters

| Parameter | Description |
|---------------|--|
| ownname | Specifies the name of the schema. |
| stattab | Identifies the user table that stores the statistics to be imported. |
| statid | Specifies the ID associated with these statistics within stattab. |
| statown | Specifies the schema containing stattab (if different than ownname). |
| no_invalidate | <p>Controls the invalidation of dependent cursors when statistics are gathered. The parameter takes the following values:</p> <ul style="list-style-type: none"> TRUE: Dependent cursors are not invalidated. FALSE: Dependent cursors are marked for immediate invalidation. AUTO: This is the default value. Rolling invalidation is used to invalidate all dependent cursors over a period of time. The performance impact on the database is reduced especially in cases where a large number of cursors are invalidated. <p>You can change the default using the SET_DATABASE_PREFS Procedure, SET_GLOBAL_PREFS Procedure, SET_SCHEMA_PREFS Procedure and SET_TABLE_PREFS Procedure.</p> |
| force | <p>Specifies whether to override statistics locked at the object level. The possible values are as follows:</p> <ul style="list-style-type: none"> TRUE — Ignores the statistics lock and imports the statistics. FALSE — Imports the statistics only if there is no lock. This is the default. |
| stat_category | <p>Specifies which statistics to process. The following values are supported:</p> <ul style="list-style-type: none"> OBJECT_STATS — specifies table statistics, column statistics, and index statistics SYNOPSIS — specifies metadata for incremental statistics REALTIME_STATS — specifies only real-time statistics <p>You can specify a list of comma-delimited values. For example, 'OBJECT_STATS, SYNOPSIS' specifies table statistics, column statistics, index statistics, and synopses.</p> <p>The default value is 'OBJECT_STATS, SYNOPSIS, REALTIME_STATS'.</p> |

Security Model

To invoke this procedure you must be owner of the table or have the `ANALYZE ANY` privilege. For objects owned by `SYS`, you must be either the owner of the table or have either the `ANALYZE ANY DICTIONARY` privilege or the `SYSDBA` privilege.

Exceptions

ORA-20000: Object does not exist or insufficient privileges

ORA-20001: Invalid or inconsistent values in the user statistics table

Usage Notes

Oracle Database does not support export or import of statistics across databases of different character sets.

177.7.75 IMPORT_SYSTEM_STATS Procedure

This procedure retrieves system statistics from the user statistics table, identified by `stattab`, and stores the statistics in the dictionary.

Syntax

```
DBMS_STATS.IMPORT_SYSTEM_STATS (
  stattab      VARCHAR2,
  statid       VARCHAR2 DEFAULT NULL,
  statown      VARCHAR2 DEFAULT NULL);
```

Parameters

Table 177-79 IMPORT_SYSTEM_STATS Procedure Parameters

| Parameter | Description |
|----------------------|--|
| <code>stattab</code> | Identifier of the user statistics table where the statistics will be retrieved |
| <code>statid</code> | Optional identifier associated with the statistics retrieved from the <code>stattab</code> |
| <code>statown</code> | Schema containing <code>stattab</code> (if different from current schema) |

Exceptions

ORA-20000: Object does not exist or insufficient privileges

ORA-20001: Invalid or inconsistent values in the user statistics table

ORA-20002: Bad user statistics table; may need to be upgraded

ORA-20003: Unable to import system statistics

Usage Notes

To run this procedure, you need the `GATHER_SYSTEM_STATISTICS` role.

Oracle does not support export or import of statistics across databases of different character sets.

177.7.76 IMPORT_TABLE_PREFS Procedure

This procedure is used to set the statistics preferences of the specified table in the specified schema.

Syntax

```
DBMS_STATS.IMPORT_TABLE_PREFS (
  ownname      IN VARCHAR2,
```

```

tabname    IN  VARCHAR2,
stattab    IN  VARCHAR2,
statid     IN  VARCHAR2 DEFAULT NULL,
statown    IN  VARCHAR2 DEFAULT NULL);

```

Parameters

Table 177-80 IMPORT_TABLE_PREFS Procedure Parameters

| Parameter | Description |
|-----------|---|
| ownname | Owner name |
| tabname | Table name |
| stattab | Statistics table name from where to import the statistics |
| statid | (Optional) Identifier to associate with these statistics within stattab |
| statown | Schema containing stattab (if other than ownname) |

Exceptions

ORA-20000: Object does not exist or insufficient privileges

Usage Notes

- To run this procedure, you need to connect as owner of the table, or have the `ANALYZE ANY` system privilege.
- All arguments are of type `VARCHAR2` and values are enclosed in quotes.
- Oracle does not support export or import of statistics across databases of different character sets.

Examples

```
DBMS_STATS.IMPORT_TABLE_PREFS('SH', 'SALES', 'STAT');
```

177.7.77 IMPORT_TABLE_STATS Procedure

This procedure import statistics for a specified table from the user statistics table identified by `stattab` and stores them in the data dictionary.

Syntax

```

DBMS_STATS.IMPORT_TABLE_STATS (
  ownname          VARCHAR2,
  tabname          VARCHAR2,
  partname         VARCHAR2 DEFAULT NULL,
  stattab          VARCHAR2,
  statid           VARCHAR2 DEFAULT NULL,
  cascade          BOOLEAN  DEFAULT TRUE,
  statown          VARCHAR2 DEFAULT NULL,
  no_invalidate    BOOLEAN  DEFAULT to_no_invalidate_type(
                                get_param('NO_INVALIDATE')),
  force            BOOLEAN  DEFAULT FALSE,
  stat_category    VARCHAR2 DEFAULT DEFAULT_STAT_CATEGORY);

```

Parameters

Table 177-81 IMPORT_TABLE_STATS Procedure Parameters

| Parameter | Description |
|---------------|--|
| ownname | Specifies the name of the schema. |
| tabname | Specifies the name of the table. |
| partname | Name of the table partition. If the table is partitioned and if partname is NULL, then global and partition table statistics are imported. |
| stattab | Identifies the user statistics table that describes where to retrieve the statistics. |
| statid | Specifies the ID associated with these statistics within stattab. |
| cascade | Indicates whether to import column and index statistics for this table. The default is TRUE. |
| statown | Specifies the schema containing stattab (if different than ownname). |
| no_invalidate | Controls the invalidation of dependent cursors when statistics are gathered. The parameter takes the following values: <ul style="list-style-type: none"> TRUE: Dependent cursors are not invalidated. FALSE: Dependent cursors are marked for immediate invalidation. AUTO: This is the default value. Rolling invalidation is used to invalidate all dependent cursors over a period of time. The performance impact on the database is reduced especially in cases where a large number of cursors are invalidated. <p>You can change the default using the SET_DATABASE_PREFS Procedure, SET_GLOBAL_PREFS Procedure, SET_SCHEMA_PREFS Procedure and SET_TABLE_PREFS Procedure</p> |
| force | Specifies whether to override statistics locked at the object level. The possible values are as follows: <ul style="list-style-type: none"> TRUE — Ignores the statistics lock and imports the statistics. FALSE — Imports the statistics only if there is no lock. This is the default. |
| stat_category | Specifies which statistics to process. The following values are supported: <ul style="list-style-type: none"> OBJECT_STATS — specifies table statistics, column statistics, and index statistics SYNOPSIS — specifies metadata for incremental statistics REALTIME_STATS — specifies only real-time statistics <p>You can specify a list of comma-delimited values. For example, 'OBJECT_STATS, SYNOPSIS' specifies table statistics, column statistics, index statistics, and synopses.</p> <p>The default value is 'OBJECT_STATS, SYNOPSIS, REALTIME_STATS'.</p> |

Security Model

To invoke this procedure you must be owner of the table or have the `ANALYZE ANY` privilege. For objects owned by `SYS`, you must be either the owner of the table or have either the `ANALYZE ANY DICTIONARY` privilege or the `SYSDBA` privilege.

Exceptions

ORA-20000: Object does not exist or insufficient privileges

ORA-20001: Invalid or inconsistent values in the user statistics table

Usage Notes

Oracle Database does not support export or import of statistics across databases of different character sets.

177.7.78 INTERRUPT_ADVISOR_TASK Procedure

This procedure interrupts a currently executing Optimizer Statistics Advisor task.

The task ends its operations as it does when at a normal exit, at which point you can access intermediate results. You can also resume the task using the ["RESUME_ADVISOR_TASK Procedure"](#).

Syntax

```
DBMS_STATS.INTERRUPT_ADVISOR_TASK (
    task_name IN VARCHAR2);
```

Parameters

Table 177-82 INTERRUPT_ADVISOR_TASK Procedure Parameters

| Parameter | Description |
|-----------|--|
| task_name | The name of the Optimizer Statistics Advisor task. |

Security Model

Note the following:

- To execute this subprogram, you must have the `ADVISOR` privilege.
- You must be the owner of the task.
- This subprogram executes using invoker's rights.

Consider a case in which a task is executed by one user, interrupted, and then resumed by a different user. In this case, Optimizer Statistics Advisor bases its checks of the resumed execution on the privilege of the user who resumed the task.

Exceptions

- ORA-20000: Insufficient privileges
- ORA-20001: Invalid input values
- ORA-20012: Optimizer Statistics Advisor errors

Example 177-11 Interrupting an Optimizer Statistics Advisor Task

In this example, you start a SQL*Plus session, and then create and execute an advisor task named `my_task`:

```
DECLARE
    v_tname VARCHAR2(128) := 'my_task';
    v_ename VARCHAR2(128) := NULL;
```

```
BEGIN
  -- create a task
  v_tname := DBMS_STATS.CREATE_ADVISOR_TASK(v_tname);

  -- execute the task
  v_ename := DBMS_STATS.EXECUTE_ADVISOR_TASK(v_tname);
END;
/
```

In a separate terminal, you start a second SQL*Plus session, and then execute the following program:

```
REC DBMS_STATS.INTERRUPT_ADVISOR_TASK('my_task');
```

The first session returns an ORA-13632 to indicate the cancelation of the task:

```
ORA-13638: The user interrupted the current operation.
```

177.7.79 LOCK_PARTITION_STATS Procedure

This procedure enables the user to lock statistics for a partition.

Syntax

```
DBMS_STATS.LOCK_PARTITION_STATS (
  ownname   VARCHAR2,
  tablename VARCHAR2,
  partname  VARCHAR2);
```

Parameters

Table 177-83 LOCK_PARTITION_STATS Procedure Parameters

| Parameter | Description |
|-----------|----------------------------|
| ownname | Name of the schema to lock |
| tablename | Name of the table |
| partname | [Sub]Partition name |

Usage Notes

To invoke this procedure you must be owner of the table, or you need the `ANALYZE ANY` privilege. For objects owned by `SYS`, you need to be either the owner of the table, or you need the `ANALYZE ANY DICTIONARY` privilege or the `SYSDBA` privilege.

177.7.80 LOCK_SCHEMA_STATS Procedure

This procedure locks the statistics of all tables of a schema.

Syntax

```
DBMS_STATS.LOCK_SCHEMA_STATS (  
    ownname    VARCHAR2);
```

Parameters

Table 177-84 LOCK_SCHEMA_STATS Procedure Parameters

| Parameter | Description |
|-----------|----------------------------|
| ownname | Name of the schema to lock |

Usage Notes

- To invoke this procedure you must be owner of the table, or you need the `ANALYZE ANY` privilege. For objects owned by `SYS`, you need to be either the owner of the table, or you need the `ANALYZE ANY DICTIONARY` privilege or the `SYSDBA` privilege.
- When statistics on a table are locked, all the statistics depending on the table, including table statistics, column statistics, histograms and statistics on all dependent indexes, are considered to be locked.
- The `SET_*`, `DELETE_*`, `IMPORT_*`, `GATHER_*` procedures that modify statistics in the dictionary of an individual table, index or column will raise an error if statistics of the object is locked.
- Procedures that operates on multiple objects (such as `GATHER_SCHEMA_STATS`) will skip modifying the statistics of an object if it is locked. Many procedures have force argument to override the lock.
- This procedure either freezes the current set of the statistics or keeps the statistics empty (uncollected) to use dynamic statistics.
- The locked or unlocked state is not exported along with the table statistics when using `EXPORT_*_STATS` procedures.
- Neither the [UNLOCK_SCHEMA_STATS Procedure](#) nor the [UNLOCK_TABLE_STATS Procedure](#) is designed to unlock statistics of corresponding partitions. When you invoke the [LOCK_TABLE_STATS Procedure](#), it sets the statistics lock bit at the table level. In that case, you cannot gather statistics on dependent objects such as partitions and indexes. By the same token, if table statistics are locked, the dependents are locked and you do not need to explicitly invoke the [LOCK_PARTITION_STATS Procedure](#).

177.7.81 LOCK_TABLE_STATS Procedure

This procedure locks the statistics on the table.

Syntax

```
DBMS_STATS.LOCK_TABLE_STATS (  
    ownname    VARCHAR2,  
    tabname    VARCHAR2);
```

Parameters

Table 177-85 LOCK_TABLE_STATS Procedure Parameters

| Parameter | Description |
|-----------|--------------------|
| ownname | Name of the schema |
| tabname | Name of the table |

Usage Notes

- To invoke this procedure you must be owner of the table, or you need the `ANALYZE ANY` privilege. For objects owned by `SYS`, you need to be either the owner of the table, or you need the `ANALYZE ANY DICTIONARY` privilege or the `SYSDBA` privilege.
- When statistics on a table are locked, all the statistics depending on the table, including table statistics, column statistics, histograms and statistics on all dependent indexes, are considered to be locked.
- The `SET_*`, `DELETE_*`, `IMPORT_*`, `GATHER_*` procedures that modify statistics in the dictionary of an individual table, index or column will raise an error if statistics of the object is locked.
- Procedures that operates on multiple objects (such as `GATHER_SCHEMA_STATS`) will skip modifying the statistics of an object if it is locked. Many procedures have force argument to override the lock.
- This procedure either freezes the current set of the statistics or keeps the statistics empty (uncollected) to use dynamic statistics.
- The locked or unlocked state is not exported along with the table statistics when using `EXPORT_*_STATS` procedures.
- Neither the [UNLOCK_SCHEMA_STATS Procedure](#) nor the [UNLOCK_TABLE_STATS Procedure](#) is designed to unlock statistics of corresponding partitions. When you invoke the [LOCK_TABLE_STATS Procedure](#), it sets the statistics lock bit at the table level. In that case, you cannot gather statistics on dependent objects such as partitions and indexes. By the same token, if table statistics are locked, the dependents are locked and you do not need to explicitly invoke the [LOCK_PARTITION_STATS Procedure](#).

177.7.82 MERGE_COL_USAGE Procedure

This procedure merges column usage information from a source database by means of a `dblink` into the local database.

If column usage information already exists for a given table or column `MERGE_COL_USAGE` will combine both the local and the remote information.

Syntax

```
DBMS_STATS.MERGE_COL_USAGE (
    dblink    IN    VARCHAR2);
```

Parameters

Table 177-86 MERGE_COL_USAGE Procedure Parameters

| Parameter | Description |
|---------------------|-----------------------------|
| <code>dblink</code> | Name of <code>dblink</code> |

Usage Notes

User must be `SYS` to execute this procedure. addition the user specified during the creation of the `dblink` is expected to have privileges to select from tables in the `SYS` schema.

Exceptions

ORA-20000: Insufficient privileges

ORA-20001: Parameter `dblink` cannot be `NULL`

ORA-20002: Unable to create a `TEMP` table

177.7.83 PREPARE_COLUMN_VALUES Procedures

These procedures convert user-specified minimum, maximum, and histogram endpoint actual values into Oracle's internal representation for future storage using `SET_COLUMN_STATS`.

Syntax

```
DBMS_STATS.PREPARE_COLUMN_VALUES (
    srec      IN OUT StatRec,
    charvals  CHARARRAY);
```

```
DBMS_STATS.PREPARE_COLUMN_VALUES (
    srec      IN OUT StatRec,
    datevals  DATEARRAY);
```

```
DBMS_STATS.PREPARE_COLUMN_VALUES (
    srec      IN OUT StatRec,
    dblvals   DBLARRAY);
```

```
DBMS_STATS.PREPARE_COLUMN_VALUES (
```

```

srec      IN OUT StatRec,
fltvals   FLTARRAY);

DBMS_STATS.PREPARE_COLUMN_VALUES (
srec      IN OUT StatRec,
numvals   NUMARRAY);

DBMS_STATS.PREPARE_COLUMN_VALUES (
srec      IN OUT StatRec,
rawvals   RAWARRAY);

```

Parameters

Table 177-87 PREPARE_COLUMN_VALUES Procedure Parameters

| Parameter | Description |
|-------------|--|
| srec.epc | <p>Number of values specified in charvals, datevals, dblvals, fltvals, numvals, or rawvals. This value must be between 2 and 2050, inclusive, and it should be set to 2 for procedures which do not allow histogram information (nvarchar and rowid).</p> <p>The first corresponding array entry should hold the minimum value for the column, and the last entry should hold the maximum. If there are more than two entries, then all the others hold the remaining height-balanced or frequency histogram endpoint values (with in-between values ordered from next-smallest to next-largest). This value may be adjusted to account for compression, so the returned value should be left as is for a call to SET_COLUMN_STATS.</p> |
| srec.bkvals | <p>If you want a frequency or hybrid histogram, this array contains the number of occurrences of each distinct value specified in charvals, datevals, dblvals, fltvals, numvals, or rawvals. Otherwise, it is merely an output parameter, and it must be set to NULL when this procedure is called.</p> |
| srec.rpcnts | <p>If you want a hybrid histogram, this array contains the total frequency of values that are less than or equal to each distinct value specified in charvals, datevals, numvals, or rawvals. Otherwise, it is merely an output argument and must be set to NULL when this procedure is called.</p> <p>As an example, for a given array numvals with numvals(i)=4, rpcnts(i)=13 means that there are 13 rows in the column which are less than or equal to 4.</p> <p>Note:</p> <ul style="list-style-type: none"> • Whenever srec.rpcnts is populated, srec.bkvals must be populated as described above. • Whenever bkvals and/or rpcnts are populated, there should not be any duplicates in charvals, datevals, numvals, or rawvals. |

Datatype-specific input parameters (use one) are shown in [Table 177-88](#).

Table 177-88 Datatype-Specific Input Parameters

| Type | Description |
|--------------|--|
| charvals | The array of values when the column type is character-based. Up to the first 64 bytes of each string should be provided. Arrays must have between 2 and 2050 entries, inclusive. If the datatype is fixed CHAR, the strings must be space-padded to 15 characters for correct normalization. |
| datevals | Array of values when the column type is date-based |
| dblvals | Array of values when the column type is double-based |
| fltvals | Array of values when the column type is float-based |
| numvals | Array of values when the column type is numeric-based |
| rawvals | Array of values when the column type is RAW. Up to the first 64 bytes of each value should be provided. |
| nvmin, nvmax | Minimum and maximum values when the column type is national character set based. No histogram information can be provided for a column of this type. If the datatype is fixed CHAR, the strings must be space-padded to 15 characters for correct normalization. |
| rwmin, rwmax | Minimum and maximum values when the column type is rowid. No histogram information is provided for a column of this type. |

Output Parameters

Table 177-89 PREPARE_COLUMN_VALUES Procedure Output Parameters

| Parameter | Description |
|-------------|---|
| srec.minval | Internal representation of the minimum suitable for use in a call to SET_COLUMN_STATS |
| srec.maxval | Internal representation of the maximum suitable for use in a call to SET_COLUMN_STATS |
| srec.bkvals | Array suitable for use in a call to SET_COLUMN_STATS |
| srec.novals | Array suitable for use in a call to SET_COLUMN_STATS |
| srec.eavals | Array suitable for use in a call to SET_COLUMN_STATS |
| srec.rpcnts | Array suitable for use in a call to SET_COLUMN_STATS |

Exceptions

ORA-20001: Invalid or inconsistent input values

Usage Notes

No special privilege or role is needed to invoke this procedure.

177.7.84 PREPARE_COLUMN_VALUES_NVARCHAR Procedure

This procedure converts user-specified minimum, maximum, and histogram endpoint actual values into Oracle's internal representation for future storage using the SET_COLUMN_STATS Procedures.

Syntax

```
DBMS_STATS.PREPARE_COLUMN_VALUES_NVARCHAR (
    srec      IN OUT StatRec,
    nvmin     NVARCHAR2,
    nvmax     NVARCHAR2);
```

Parameters

Table 177-90 PREPARE_COLUMN_VALUES_NVARCHAR Procedure Parameters

| Parameter | Description |
|-------------|--|
| srec.epc | <p>Number of values specified in charvals, datevals, dblvals, fltvals, numvals, or rawvals. This value must be between 2 and 2050, inclusive, and it should be set to 2 for procedures which do not allow histogram information (nvarchar and rowid).</p> <p>The first corresponding array entry should hold the minimum value for the column, and the last entry should hold the maximum. If there are more than two entries, then all the others hold the remaining height-balanced or frequency histogram endpoint values (with in-between values ordered from next-smallest to next-largest). This value may be adjusted to account for compression, so the returned value should be left as is for a call to SET_COLUMN_STATS.</p> |
| srec.bkvals | <p>If you want a frequency or hybrid histogram, then this array contains the number of occurrences of each distinct value specified in charvals, datevals, dblvals, fltvals, numvals, or rawvals. Otherwise, it is merely an output parameter, and it must be set to NULL when this procedure is called.</p> |
| srec.rpcnts | <p>If you want a hybrid histogram, this array contains the total frequency of values that are less than or equal to each distinct value specified in charvals, datevals, numvals, or rawvals. Otherwise, it is merely an output argument and must be set to NULL when this procedure is called.</p> <p>As an example, for a given array numvals with numvals(i)=4, rpcnts(i)=13 means that there are 13 rows in the column which are less than or equal to 4.</p> <p>Note:</p> <ul style="list-style-type: none"> Whenever srec.rpcnts is populated, srec.bkvals must be populated as described above. Whenever bkvals and/or rpcnts are populated, there should not be any duplicates in charvals, datevals, numvals, or rawvals. |

Datatype-specific input parameters (use one) are shown in [Table 177-88](#).

Table 177-91 PREPARE_COLUMN_VALUES_NVARCHAR Datatype-Specific Input Parameters

| Type | Description |
|--------------|--|
| nvmin, nvmax | The minimum and maximum values when the column type is national character set based. No histogram information can be provided for a column of this type. If the datatype is fixed CHAR, the strings must be space-padded to 15 characters for correct normalization. |

Output Parameters

Table 177-92 PREPARE_COLUMN_VALUES_NVARCHAR Procedure Output Parameters

| Parameter | Description |
|-------------|---|
| srec.minval | Internal representation of the minimum suitable for use in a call to SET_COLUMN_STATS |
| srec.maxval | Internal representation of the maximum suitable for use in a call to SET_COLUMN_STATS |
| srec.bkvals | Array suitable for use in a call to SET_COLUMN_STATS. |
| srec.novals | Array suitable for use in a call to SET_COLUMN_STATS |
| srec.eavals | Array suitable for use in a call to SET_COLUMN_STATS |
| srec.rpcnts | Array suitable for use in a call to SET_COLUMN_STATS |

Exceptions

ORA-20001: Invalid or inconsistent input values

Usage Notes

No special privilege or role is needed to invoke this procedure.

Related Topics

This procedure sets column-related information.

177.7.85 PREPARE_COLUMN_VALUES_ROWID Procedure

This procedure converts user-specified minimum, maximum, and histogram endpoint datatype-specific values into Oracle's internal representation for future storage using SET_COLUMN_STATS.

Syntax

```
DBMS_STATS.PREPARE_COLUMN_VALUES_ROWID (
  srec IN OUT StatRec,
  rwmn ROWID,
  rwmx ROWID);
```

Pragmas

```
pragma restrict_references(prepare_column_values_rowid, WNDS, RNDS, WNPS, RNPS);
```

Parameters

Table 177-93 PREPARE_COLUMN_VALUES_ROWID Procedure Parameters

| Parameter | Description |
|-----------|---|
| srec | <p>Values (IN):</p> <ul style="list-style-type: none"> • epc • bkvals • rpcnts <p>Values (OUT):</p> <ul style="list-style-type: none"> • minval • maxval • bkvals • novals • eavals • rpcnts |
| rwmin | Minimum value when the column type is <code>rowid</code> . No histogram information is provided for a column of this type. |
| rwmax | Maximum value when the column type is <code>rowid</code> . No histogram information is provided for a column of this type. |

Table 177-94 StatRec Record Type Fields

| Field | Description |
|-------------|--|
| epc (IN) | <p>Number of values specified in <code>charvals</code>, <code>datevals</code>, <code>dblvals</code>, <code>fltvals</code>, <code>numvals</code>, or <code>rawvals</code>. This value must be between 2 and 2050, inclusive, and it should be set to 2 for procedures which do not allow histogram information (<code>nvarchar</code> and <code>rowid</code>).</p> <p>The first corresponding array entry should hold the minimum value for the column, and the last entry should hold the maximum. If there are more than two entries, then all the others hold the remaining height-balanced or frequency histogram endpoint values (with in-between values ordered from next-smallest to next-largest). This value may be adjusted to account for compression, so the returned value should be left as is for a call to <code>SET_COLUMN_STATS</code>.</p> |
| bkvals (IN) | <p>If you want a frequency or hybrid histogram, this array contains the number of occurrences of each distinct value specified in <code>charvals</code>, <code>datevals</code>, <code>dblvals</code>, <code>fltvals</code>, <code>numvals</code>, or <code>rawvals</code>. Otherwise, it is merely an output parameter, and it must be set to <code>NULL</code> when this procedure is called.</p> |

Table 177-94 (Cont.) StatRec Record Type Fields

| Field | Description |
|--------------|--|
| rpents (IN) | <p>If you want a hybrid histogram, this array contains the total frequency of values that are less than or equal to each distinct value specified in charvals, datevals, numvals, or rawvals. Otherwise, it is merely an output argument and must be set to NULL when this procedure is called.</p> <p>As an example, for a given array numvals with numvals(i)=4, rpents(i)=13 means that there are 13 rows in the column which are less than or equal to 4.</p> <p>Note:</p> <ul style="list-style-type: none"> • Whenever srec.rpents is populated, srec.bkvals must be populated as described above. • Whenever bkvals and/or rpents are populated, there should not be any duplicates in charvals, datevals, numvals, or rawvals. |
| minval (OUT) | Internal representation of the minimum suitable for use in a call to SET_COLUMN_STATS. |
| maxval (OUT) | Internal representation of the maximum suitable for use in a call to SET_COLUMN_STATS. |
| bkvals (OUT) | Array suitable for use in a call to SET_COLUMN_STATS. |
| novals (OUT) | Array suitable for use in a call to SET_COLUMN_STATS. |
| eavals (OUT) | Array suitable for use in a call to SET_COLUMN_STATS. |
| rpents (OUT) | Array suitable for use in a call to SET_COLUMN_STATS. |

Usage Notes

No special privilege or role is needed to invoke this procedure.

177.7.86 PUBLISH_PENDING_STATS Procedure

This procedure is used to publish the statistics gathered and stored as pending.

Syntax

```
DBMS_STATS.PUBLISH_PENDING_STATS (
    ownname          IN  VARCHAR2 DEFAULT USER,
    tabname          IN  VARCHAR2,
    no_invalidate    BOOLEAN DEFAULT
        TO_NO_INVALIDATE_TYPE(GET_PARAM('NO_INVALIDATE')),
    force            IN  BOOLEAN DEFAULT FALSE);
```

Parameters

Table 177-95 PUBLISH_PENDING_STATS Procedure Parameters

| Parameter | Description |
|-----------|-------------|
| ownname | Owner name |

Table 177-95 (Cont.) PUBLISH_PENDING_STATS Procedure Parameters

| Parameter | Description |
|---------------|---|
| tablename | Table name |
| no_invalidate | Controls the invalidation of dependent cursors when statistics are gathered. The parameter takes the following values: <ul style="list-style-type: none"> TRUE: Dependent cursors are not invalidated. FALSE: Dependent cursors are marked for immediate invalidation. AUTO: This is the default value. Rolling invalidation is used to invalidate all dependent cursors over a period of time. The performance impact on the database is reduced especially in cases where a large number of cursors are invalidated. You can change the default using the SET_DATABASE_PREFS Procedure , SET_GLOBAL_PREFS Procedure , SET_SCHEMA_PREFS Procedure and SET_TABLE_PREFS Procedure . |
| force | If TRUE, will override the lock |

Security Model

To run this procedure, you must have the same privilege for gathering statistics on the tables that will be touched by this procedure.

Exceptions

ORA-20000: Insufficient privileges

Usage Notes

- If the parameter `tablename` is NULL then `publish` applies to all tables of the specified schema.
- The default owner/schema is the user who runs the procedure.

Examples

```
DBMS_STATS.PUBLISH_PENDING_STATS ('SH', null);
```

177.7.87 PURGE_STATS Procedure

This procedure purges old versions of statistics saved in the dictionary.

To run this procedure, you must have the `SYSDBA` or both `ANALYZE ANY DICTIONARY` and `ANALYZE ANY` system privilege.

Syntax

```
DBMS_STATS.PURGE_STATS(
    before_timestamp    TIMESTAMP WITH TIME ZONE);
```

Parameters

Table 177-96 PURGE_STATS Procedure Parameters

| Parameter | Description |
|------------------|--|
| before_timestamp | Versions of statistics saved before this timestamp are purged. If NULL, it uses the purging policy used by automatic purge. The automatic purge deletes all history older than the older of (current time - statistics history retention) and (time of recent analyze in the system - 1). The statistics history retention value can be changed using ALTER_STATS_HISTORY_RETENTION Procedure. The default is 31 days. |

Exceptions

ORA-20000: Object does not exist or insufficient privileges

ORA-20001: Invalid or inconsistent values

Usage Notes

To invoke this procedure you need the ANALYZE ANY privilege and the ANALYZE ANY DICTIONARY privilege.

177.7.88 REMAP_STAT_TABLE Procedure

This procedure remaps the names of objects in the user statistics table. It allows you to import the statistics to objects with same definition but with different names.

Syntax

```
DBMS_STATS.REMAP_STAT_TABLE (
  ownname      IN   VARCHAR2,
  statab       IN   VARCHAR2,
  src_own      IN   VARCHAR2,
  src_tab      IN   VARCHAR2,
  tgt_own      IN   VARCHAR2,
  tgt_tab      IN   VARCHAR2);
```

Parameters

Table 177-97 REMAP_STAT_TABLE Procedure Parameters

| Parameter | Description |
|-----------|--|
| ownname | Owner of the statistics table. NULL means the current schema. |
| statab | User statistics table identifier |
| src_own | Owner of the table to be renamed. This argument cannot be NULL. |
| src_tab | Name of the table to be renamed. If NULL, all tables are owned by src_own. |

Table 177-97 (Cont.) REMAP_STAT_TABLE Procedure Parameters

| Parameter | Description |
|-----------|--|
| tgt_own | New name of the owner of the table. The owner name is also updated for the dependent objects such as columns and indexes. Note that an index of src_tab not owned by src_own is not renamed. This argument cannot be NULL. |
| tgt_tab | New name of the table. This argument is valid only if src_tab is not NULL. |

Exceptions

ORA-20000: Insufficient privileges

ORA-20001: Invalid input

Examples

The following statement remaps all objects of sh to shsave in user statistics table sh.ustat:

```
DBMS_STATS.REMAP_STAT_TABLE ('sh', 'ustat', 'sh', NULL, 'shsave', NULL);
```

The following statement can be used to import statistics into objects of shsave once the preceding remap procedure is completed:

```
DBMS_STATS.IMPORT_SCHEMA_STATS ('shsave', 'ustat', statown => 'sh');
```

The following statement remaps sh.customers to shsave.customers_sav:

```
DBMS_STATS.REMAP_STAT_TABLE ('sh', 'ustat', 'sh', 'customers', 'shsave', 'customers_sav');
```

177.7.89 REPORT_ADVISOR_TASK Function

This function reports the results of an Optimizer Statistics Advisor task.

Syntax

```
DBMS_STATS.REPORT_ADVISOR_TASK(
  task_name      IN   VARCHAR2,
  execution_name IN   VARCHAR2  := NULL,
  type           IN   VARCHAR2  := 'TEXT',
  section        IN   VARCHAR2  := 'ALL',
  level          IN   VARCHAR2  := 'TYPICAL')
RETURN CLOB;
```

Parameters

Table 177-98 REPORT_ADVISOR_TASK Function Parameters

| Parameter | Description |
|-----------|--|
| task_name | The name of the Optimizer Statistics Advisor task. |

Table 177-98 (Cont.) REPORT_ADVISOR_TASK Function Parameters

| Parameter | Description |
|----------------|---|
| execution_name | A name that qualifies and identifies an advisor task execution. If not specified, the function uses the latest execution of the specified task. |
| type | The type of the Optimizer Statistics Advisor report. Possible values are TEXT, HTML, and XML. |
| section | A section in the report. Possible values are SUMMARY, FINDINGS, ERRORS, and ALL. You can specify combinations of different values can be using the plus (+) and minus (-) operator, as in 'SUMMARY +FINDINGS +ERRORS', and 'ALL -ERRORS'. |
| level | The format of the report. Possible values are BASIC, TYPICAL, ALL, and SHOW_HIDDEN. You can specify SHOW_HIDDEN together with the other three input values, as in 'BASIC +SHOW_HIDDEN' and 'TYPICAL +SHOW_HIDDEN'. |

Security Model

Note the following:

- To execute this subprogram, you must have the `ADVISOR` privilege.
- You must be the owner of the task.
- You can execute this subprogram for `AUTO_STATS_ADVISOR_TASK`, which is predefined.
- This subprogram executes using invoker's rights.

The results of performing this task depend on the privileges of the executing user:

- **SYSTEM level**
Only users with both the `ANALYZE ANY` and `ANALYZE ANY DICTIONARY` privileges can perform this task on system-level rules.
- **Operation level**
The results depend on the following privileges:
 - Users with both the `ANALYZE ANY` and `ANALYZE ANY DICTIONARY` privileges can perform this task for all statistics operations.
 - Users with the `ANALYZE ANY` privilege but *not* the `ANALYZE ANY DICTIONARY` privilege can perform this task for statistics operations related to any schema except `SYS`.
 - Users with the `ANALYZE ANY DICTIONARY` privilege but *not* the `ANALYZE ANY` privilege can perform this task for statistics operations related to their own schema and the `SYS` schema.
 - Users with neither the `ANALYZE ANY` nor the `ANALYZE ANY DICTIONARY` privilege can only perform this operation for statistics operations relating to their own schema.
- **Object level**

Users can perform this task for any object for which they have statistics collection privileges.

Exceptions

- ORA-20000: Insufficient privileges
- ORA-20001: User input errors
- ORA-20012: Optimizer Statistics Advisor errors

Returns

This function returns a CLOB that contains the report.

Examples

(Optional) List and briefly describe the examples for using the API or subprogram here.

Example 177-12 Generating an HTML Report

This example creates a procedure named `myrep`, and then calls this procedure to generate an HTML report.

```
SET ECHO ON
SET FEEDBACK ON
SET SERVEROUTPUT ON
SET TRIMS ON
SET LINESIZE 300

EXECUTE DBMS_OUTPUT.ENABLE (buffer_size => 10000000);

CREATE OR REPLACE PROCEDURE myrep(p_tname VARCHAR2, p_fctype VARCHAR2, which
VARCHAR2)
IS
  v_report CLOB          := null;
  v_script CLOB          := null;
  v_fctype VARCHAR2(400) := p_fctype;
  v_tname  VARCHAR2(400) := p_tname;
  v_len    NUMBER(10);
  v_ps     NUMBER(10) := 10000;
  v_pn     NUMBER(10) := 1;
  v_ret    VARCHAR2(32767);
BEGIN
  IF which = 'REPORT'
  THEN
    -- generate a report
    v_report := DBMS_STATS.REPORT_ADVISOR_TASK(
      task_name => v_tname,
      type      => v_fctype,
      section   => 'ALL',
      level     => 'ALL');
    v_len := DBMS_LOB.getlength(v_report);
    WHILE (v_pn < v_len)
    LOOP
      DBMS_OUTPUT.PUT_LINE(DBMS_LOB.SUBSTR(v_report, v_ps, v_pn));
      v_pn := v_pn + v_ps;
    END LOOP;
  END IF;
END;
```

```

        END LOOP;
    ELSE
        -- generate a script
        v_script := DBMS_STATS.SCRIPT_ADVISOR_TASK(v_tname);
        v_len := DBMS_LOB.getlength(v_script);
        WHILE (v_pn < v_len)
        LOOP
            DBMS_OUTPUT.PUT_LINE(DBMS_LOB.SUBSTR( v_script, v_ps, v_pn));
            v_pn := v_pn + v_ps;
        END LOOP;
    END IF;
END;
/

SHOW ERRORS

SPOOL report.txt
EXECUTE myrep('my_task','HTML','REPORT');
SPOOL OFF

```

Example 177-13 Generating a Textual Report for AUTO_STATS_ADVISOR_TASK

The following example invokes the `myrep` procedure created in the preceding example for `AUTO_STATS_ADVISOR_TASK`:

```
EXEC myrep('AUTO_STATS_ADVISOR_TASK','TEXT','REPORT');
```

The following sample output shows part of the report:

```

GENERAL INFORMATION
-----
Task Name       : AUTO_STATS_ADVISOR_TASK
Execution Name  : EXEC_97
Created         : 07-08-16 10:18:10

FINDINGS
-----
--
Rule Name:          MaintainStatsHistory
Rule Description:   Maintain Statistics History

Finding:  Statistics history tables are too big.

Recommendation:  Check the other findings of this rule, as well as
the
                findings for the rules
AvoidFrequentStatsCollection,
                UseDefaultPreference, UseDefaultParams for possible
causes
                and
recommendations.
Rationale:  The size of the statistics history table could be big because
of
                violations of other rules.

-----

Rule Name:          UseDefaultPreference
Rule Description:   Use Default Preference for Stats Collection
Finding:  Global preference SYS_FLAGS is set to a non-default value '1'.

Recommendation:  Set the value of preference SYS_FLAGS to '0'.
Example:
-- Setting preference cascade to default value:
dbms_stats.set_global_prefs('CASCADE', NULL);

Rationale:  Preference SYS_FLAGS is for Oracle internal use only, setting
it
                to nondefault value '1' could cause unforeseen consequences.
.
.

```

177.7.90 REPORT_COL_USAGE Function

This function reports the recorded column (group) usage information.

Syntax

```

DBMS_STATS.REPORT_COL_USAGE (
    ownname   IN   VARCHAR2,
    tabname   IN   VARCHAR2)
RETURN CLOB;

```

Parameters

Table 177-99 REPORT_COL_USAGE Function Parameters

| Parameter | Description |
|-----------|--|
| ownname | Owner name. If NULL it reports column usage information for tables in all schemas in the database. |
| tablename | Table name. If NULL it reports column usage information for all tables of ownname. |

Usage Notes

To run this procedure, you need to have the SYSDBA administrative privilege or both ANALYZE ANY DICTIONARY and ANALYZE ANY system privileges.

177.7.91 REPORT_GATHER_AUTO_STATS Function

This function runs the auto statistics gathering job in reporting mode. That is, statistics are not actually collected, but all the objects that will be affected when auto statistics gathering is invoked are reported.

Syntax

```
DBMS_STATS.REPORT_GATHER_AUTO_STATS (  
    detail_level    VARCHAR2  DEFAULT 'TYPICAL',  
    format         VARCHAR2  DEFAULT 'TEXT')  
RETURN CLOB;
```

Parameters

Table 177-100 REPORT_GATHER_AUTO_STATS Function Parameters

| Parameter | Description |
|--------------|--|
| detail_level | <p>Detail level for the content of the report</p> <ul style="list-style-type: none"> • BASIC: The report includes <ul style="list-style-type: none"> - operation ID - operation name - operation target object - start time - end time - completion status (such as: succeeded, failed) • TYPICAL: In addition to the information provided at level BASIC, the report includes individual target objects for which statistics are gathered in this operation. Specifically, with regard to operation related details: <ul style="list-style-type: none"> - total number of target objects - total number of successfully completed objects - total number of failed objects - total number of timed-out objects (applies to only auto statistics gathering) <p>With regard to target objects:</p> <ul style="list-style-type: none"> - owner and name of each target object - target object type (such as: table, index) - start time - end time - completion status • ALL: In addition to the information provided at level TYPICAL, the report includes further information on each target object. Specifically, with regard to operation-related details: <ul style="list-style-type: none"> - job name - session ID - parameter values - error message if the operation failed <p>With regard to target objects:</p> <ul style="list-style-type: none"> - job name - batching details - estimated cost - rank in the target list - columns for which histograms were collected - list of collected extended statistics (if any) - reason for including the object in the target list - additional error details if the task has failed. <p>Note that several fields (such as job name, estimated task cost) in the report are populated only when an operation is executed concurrently (CONCURRENT preference is turned on).</p> |

Table 177-100 (Cont.) REPORT_GATHER_AUTO_STATS Function Parameters

| Parameter | Description |
|-----------|--|
| format | Report format: <ul style="list-style-type: none"> • XML • HTML • TEXT (Default) |

Usage Notes

Only user SYS can run the REPORT_GATHER_AUTO_STATS function.

177.7.92 REPORT_GATHER_DATABASE_STATS Functions

This function runs the GATHER_DATABASE_STATS function in reporting mode.

The database does not collect statistics, but reports all objects that would be affected when invoking GATHER_DATABASE_STATS. The input set of parameters is the same as in GATHER_DATABASE_STATS, with two extra parameters.

Syntax

```

DBMS_STATS.REPORT_GATHER_DATABASE_STATS (
  estimate_percent      IN      NUMBER      DEFAULT
  to_estimate_percent_type (
    GET_PARAM('ESTIMATE_PERCENT')),
  block_sample         IN      BOOLEAN     DEFAULT FALSE,
  method_opt           IN      VARCHAR2    DEFAULT
  GET_PARAM('METHOD_OPT'),
  degree               IN      NUMBER      DEFAULT TO_DEGREE_TYPE(
    GET_PARAM('DEGREE')),
  granularity          IN      VARCHAR2    DEFAULT
  GET_PARAM('GRANULARITY'),
  cascade              IN      BOOLEAN     DEFAULT to_cascade_type (
    GET_PARAM('CASCADE')),
  statab              IN      VARCHAR2    DEFAULT NULL,
  statid              IN      VARCHAR2    DEFAULT NULL,
  options              IN      VARCHAR2    DEFAULT 'GATHER',
  statown             IN      VARCHAR2    DEFAULT NULL,
  gather_sys          IN      BOOLEAN     DEFAULT TRUE,
  no_invalidate       IN      BOOLEAN     DEFAULT TO_NO_INVALIDATE_TYPE
  (
    GET_PARAM('NO_INVALIDATE')),
  gather_temp         IN      BOOLEAN     DEFAULT FALSE,
  gather_fixed        IN      BOOLEAN     DEFAULT FALSE,
  stattype            IN      VARCHAR2    DEFAULT DATA,
  obj_filter_list     IN      ObjectTab   DEFAULT NULL,
  detail_level        IN      VARCHAR2    DEFAULT 'TYPICAL',
  format              IN      VARCHAR2    DEFAULT 'TEXT')
RETURN CLOB;

```

Parameters

Table 177-101 REPORT_GATHER_DATABASE_STATS Function Parameters

| Parameter | Description |
|------------------|---|
| estimate_percent | <p>The percentage of rows to use for the sample size. The valid range is between 0.000001 and 100. The null value means to compute.</p> <p>Use the constant <code>DBMS_STATS.AUTO_SAMPLE_SIZE</code> to enable the database to determine the appropriate sample size for good statistics. This is the default. The default value can be changed using the SET_DATABASE_PREFS Procedure, SET_GLOBAL_PREFS Procedure, SET_SCHEMA_PREFS Procedure and SET_TABLE_PREFS Procedure.</p> |
| block_sample | <p>Whether or not to use random block sampling instead of random row sampling. Random block sampling is more efficient, but if the data is not randomly distributed on disk, then the sample values may be somewhat correlated. This parameter is only relevant when estimating statistics.</p> |
| method_opt | <p>Method options. This parameter accepts the following values: <code>FOR ALL [INDEXED HIDDEN] COLUMNS [size_clause]</code>.</p> <p><code>size_clause</code> is defined as <code>size_clause := SIZE {integer REPEAT AUTO SKEWONLY}</code></p> <ul style="list-style-type: none"> - <code>integer</code>: Number of histogram buckets. Must be in the range [1,2048]. - <code>REPEAT</code>: Collects histograms only on the columns that already have histograms. - <code>AUTO</code>: Oracle determines the columns on which to collect histograms based on data distribution and the workload of the columns. - <code>SKEWONLY</code>: Oracle determines the columns on which to collect histograms based on the data distribution of the columns. <p>The default is <code>FOR ALL COLUMNS SIZE AUTO</code>. The value can be changed using the SET_DATABASE_PREFS Procedure, SET_GLOBAL_PREFS Procedure, SET_SCHEMA_PREFS Procedure and SET_TABLE_PREFS Procedure.</p> |
| degree | <p>Degree of parallelism. The default for <code>degree</code> is <code>NULL</code>. The default value can be changed using the SET_DATABASE_PREFS Procedure, SET_GLOBAL_PREFS Procedure, SET_SCHEMA_PREFS Procedure and SET_TABLE_PREFS Procedure. <code>NULL</code> means use the table default value specified by the <code>DEGREE</code> clause in the <code>CREATE TABLE</code> or <code>ALTER TABLE</code> statement. Use the constant <code>DBMS_STATS.DEFAULT_DEGREE</code> to specify the default value based on the initialization parameters. The <code>AUTO_DEGREE</code> value determines the degree of parallelism automatically. This is between 1 (serial execution) and <code>DEFAULT_DEGREE</code> (the system default value based on number of CPUs and initialization parameters) according to the size of the object. When using <code>DEGREE=>NULL</code>, <code>DEGREE=>n</code>, or <code>DEGREE=>DBMS_STATS.DEFAULT_DEGREE</code>, the current implementation of <code>DBMS_STATS</code> may use serial execution if the size of the object does not warrant parallel execution.</p> |

Table 177-101 (Cont.) REPORT_GATHER_DATABASE_STATS Function Parameters

| Parameter | Description |
|-------------|--|
| granularity | <p>Determines the granularity of statistics to collect. This preference is only relevant for partitioned tables.</p> <p>The following values are valid:</p> <ul style="list-style-type: none"> • ALL — Gathers all statistics: subpartition, partition, and global. • AUTO — Determines the granularity based on the partitioning type. This is the default value. • DEFAULT — Gathers global and partition-level statistics. This option is obsolete, and while currently supported, it is included in the documentation for legacy reasons only. Use GLOBAL AND PARTITION for this functionality. • GLOBAL — Gathers global statistics. • GLOBAL AND PARTITION — Gathers the global and partition level statistics. No subpartition level statistics are gathered even if it is a composite partitioned object. • PARTITION — Gathers partition-level statistics. • SUBPARTITION — Gathers subpartition-level statistics. |
| cascade | <p>Gather statistics on the indexes as well. Using this option is equivalent to running the GATHER_INDEX_STATS Procedure on each of the indexes in the database in addition to gathering table and column statistics. Use the constant <code>DBMS_STATS.AUTO_CASCADE</code> to have Oracle determine whether index statistics to be collected or not. This is the default. The default value can be changed using the SET_DATABASE_PREFS Procedure, SET_GLOBAL_PREFS Procedure, SET_SCHEMA_PREFS Procedure and SET_TABLE_PREFS Procedure.</p> |
| stattab | <p>User statistics table identifier describing where to save the current statistics.</p> <p>The database assumes that the statistics table resides in the same schema as the object being analyzed. Thus, to use this option, one such table must exist in each schema.</p> |
| statid | <p>Identifier (optional) to associate with these statistics within <code>stattab</code>.</p> |

Table 177-101 (Cont.) REPORT_GATHER_DATABASE_STATS Function Parameters

| Parameter | Description |
|---------------|---|
| options | <p>Further specification of which objects to gather statistics for:</p> <p>GATHER: Gathers statistics on all objects in the schema.</p> <p>GATHER AUTO: Gathers all necessary statistics automatically. Oracle implicitly determines which objects need new statistics, and determines how to gather those statistics. When GATHER AUTO is specified, the only additional valid parameters are <code>stattab</code>, <code>statid</code>, <code>objlist</code> and <code>statown</code>; all other parameter settings are ignored. Returns a list of processed objects.</p> <p>GATHER STALE: Gathers statistics on stale objects as determined by looking at the <code>*_tab_modifications</code> views. Also, return a list of objects found to be stale.</p> <p>GATHER EMPTY: Gathers statistics on objects which currently have no statistics. Return a list of objects found to have no statistics.</p> <p>LIST AUTO: Returns a list of objects to be processed with GATHER AUTO</p> <p>LIST STALE: Returns a list of stale objects as determined by looking at the <code>*_tab_modifications</code> views</p> <p>LIST EMPTY: Returns a list of objects which currently have no statistics</p> |
| statown | Schema containing <code>stattab</code> , if different from current schema. |
| gather_sys | Gathers statistics on the objects owned by the <code>SYS</code> user. |
| no_invalidate | <p>Does not invalidate the dependent cursors if set to <code>TRUE</code>. The procedure invalidates the dependent cursors immediately if set to <code>FALSE</code>. Use <code>DBMS_STATS.AUTO_INVALIDATE</code>. to have Oracle decide when to invalidate dependent cursors. This is the default. The default can be changed using the SET_DATABASE_PREFS Procedure, SET_GLOBAL_PREFS Procedure, SET_SCHEMA_PREFS Procedure and SET_TABLE_PREFS Procedure.</p> |
| gather_temp | <p>Gathers statistics on global temporary tables when <code>TRUE</code>. The default is <code>FALSE</code>.</p> <p>The temporary table must be created with the <code>ON COMMIT PRESERVE ROWS</code> clause. Also, the statistics collected are based on the data in the session in which this procedure is run, but they are shared across all sessions.</p> |
| gather_fixed | <p>Gather statistics on fixed tables when <code>TRUE</code>. The default is <code>FALSE</code>.</p> <p>Only user <code>SYS</code> can collect statistics for fixed tables. The <code>ownname</code> must be <code>SYS</code> or null. When gathering statistics for fixed tables, the database ignores specified values for the following arguments:</p> <ul style="list-style-type: none"> • <code>estimate_percent</code> • <code>block_sample</code> • <code>stattab</code> • <code>statid</code> • <code>statown</code> <p>The database does not invalidate the dependent cursors on fixed tables on which stats is collected. This option is meant for internal use only.</p> |

Table 177-101 (Cont.) REPORT_GATHER_DATABASE_STATS Function Parameters

| Parameter | Description |
|-----------------|---|
| stattype | <p>The type of statistics:</p> <ul style="list-style-type: none"> • DATA — Data statistics only • CACHE — Cache statistics only • ALL — All statistics |
| obj_filter_list | <p>A list of object filters. The attribute values specified in the object filter are case-insensitive unless double-quoted. Wildcards are allowed in the attribute values.</p> <p>When specified, GATHER_DATABASE_STATS gathers statistics only on objects that satisfy at least one object filter in the list as needed. In a single-object filter, the database can specify the constraints on the object attributes. For example, non-NULL values s1 and s2 are specified for attributes a1 and a2 in one object filter. An object o is said to satisfy this object filter when (o.a1 LIKE s1) AND (o.a2 LIKE s2) is true.</p> |

Table 177-101 (Cont.) REPORT_GATHER_DATABASE_STATS Function Parameters

| Parameter | Description |
|--------------|---|
| detail_level | <p>The level of detail for the content of the report. Valid values are as follows:</p> <ul style="list-style-type: none"> • BASIC: The report includes <ul style="list-style-type: none"> - operation ID - operation name - operation target object - start time - end time - completion status (such as: succeeded, failed) • TYPICAL: In addition to the information provided at level BASIC, the report includes individual target objects for which statistics are gathered in this operation. Specifically, with regard to operation related details: <ul style="list-style-type: none"> - total number of target objects - total number of successfully completed objects - total number of failed objects - total number of timed-out objects (applies to only auto statistics gathering) <p>With regard to target objects:</p> <ul style="list-style-type: none"> - owner and name of each target object - target object type (such as: table, index) - start time - end time - completion status • ALL: In addition to the information provided at level TYPICAL, the report includes further information on each target object. Specifically, with regard to operation-related details: <ul style="list-style-type: none"> - job name - session ID - parameter values - error message if the operation failed <p>With regard to target objects:</p> <ul style="list-style-type: none"> - job name - batching details - estimated cost - rank in the target list - columns for which histograms were collected - list of collected extended statistics (if any) - additional error details if the task has failed. <p>Note that several fields (such as job name, estimated task cost) in the report are populated only when an operation is executed concurrently (CONCURRENT preference is turned on).</p> |

Table 177-101 (Cont.) REPORT_GATHER_DATABASE_STATS Function Parameters

| Parameter | Description |
|-----------|---|
| format | The format of the report. Valid values are: <ul style="list-style-type: none"> XML HTML TEXT (Default) |

Return Values

A CLOB object that contains the report

Exceptions

ORA-20000: Insufficient privileges

ORA-20001: Bad input value

Usage Notes

To run this procedure, you need to have the SYSDBA role or both ANALYZE ANY DICTIONARY and ANALYZE ANY system privileges.

177.7.93 REPORT_GATHER_DICTIONARY_STATS Functions

This function runs the GATHER_DICTIONARY_STATS procedure in reporting mode.

The database does not collect statistics, but reports all objects affected when invoking GATHER_DICTIONARY_STATS. The detail level for the report is defined by the detail_level input parameter. See the descriptions of detail_level and format in [REPORT_GATHER_DICTIONARY_STATS Functions](#). For all other input parameters, see [GATHER_DICTIONARY_STATS Procedure](#).

Syntax

```
DBMS_STATS.REPORT_GATHER_DICTIONARY_STATS (
  comp_id          IN   VARCHAR2  DEFAULT NULL,
  estimate_percent IN   NUMBER     DEFAULT
  TO_ESTIMATE_PERCENT_TYPE

  (GET_PARAM('ESTIMATE_PERCENT')),
  block_sample    IN   BOOLEAN    DEFAULT FALSE,
  method_opt      IN   VARCHAR2   DEFAULT
  GET_PARAM('METHOD_OPT'),
  degree          IN   NUMBER     DEFAULT TO_DEGREE_TYPE
  (GET_PARAM('DEGREE')),
  granularity     IN   VARCHAR2   DEFAULT
  GET_PARAM('GRANULARITY'),
  cascade         IN   BOOLEAN    DEFAULT TO_CASCADE_TYPE
  (GET_PARAM('CASCADE')),
  stattab         IN   VARCHAR2   DEFAULT NULL,
  options         IN   VARCHAR2   DEFAULT 'GATHER AUTO',
  no_invalidate   IN   BOOLEAN    DEFAULT TO_NO_INVALIDATE_TYPE
```

```

                                (GET_PARAM('NO_INVALIDATE')),
stattype                       IN    VARCHAR2    DEFAULT 'DATA',
obj_filter_list                 IN    ObjectTab    DEFAULT NULL,
detail_level                   IN    VARCHAR2    DEFAULT 'TYPICAL',
format                         IN    VARCHAR2    DEFAULT 'TEXT')
RETURN CLOB;

```

Parameters

Table 177-102 REPORT_GATHER_DICTIONARY_STATS Function Parameters

| Parameter | Description |
|------------------|---|
| comp_id | Component ID of the schema to analyze. NULL results in analyzing schemas of all RDBMS components. Refer refer to the COMP_ID column of the DBA_REGISTRY view. The procedure always gather statistics on SYS and SYSTEM schemas regardless of this argument. |
| estimate_percent | Percentage of rows to sample (NULL means compute). The valid range is between 0.000001 and 100. Use the constant DBMS_STATS.AUTO_SAMPLE_SIZE to let the database determine the appropriate sample size for good statistics. This is the default. The default value can be changed using the SET_DATABASE_PREFS Procedure , SET_GLOBAL_PREFS Procedure , SET_SCHEMA_PREFS Procedure and SET_TABLE_PREFS Procedure . |
| block_sample | Determines whether to use random block sampling instead of random row sampling. Random block sampling is more efficient, but if the data is not randomly distributed on disk then the sample values may be somewhat correlated. Only pertinent when performing estimate statistics. |
| method_opt | <p>The method options. This parameter accepts the following values:</p> <ul style="list-style-type: none"> • FOR ALL [INDEXED HIDDEN] COLUMNS [size_clause] size_clause is defined as size_clause := SIZE {integer REPEAT AUTO SKEWONLY} <ul style="list-style-type: none"> - integer: Number of histogram buckets. Must be in the range [1,2048]. - REPEAT: Collects histograms only on the columns that already have histograms. - AUTO: Oracle determines the columns on which to collect histograms based on data distribution and the workload of the columns. - SKEWONLY: Oracle determines the columns on which to collect histograms based on the data distribution of the columns. <p>The default is FOR ALL COLUMNS SIZE AUTO. The default value can be changed using the SET_DATABASE_PREFS Procedure, SET_GLOBAL_PREFS Procedure, SET_SCHEMA_PREFS Procedure and SET_TABLE_PREFS Procedure.</p> |

Table 177-102 (Cont.) REPORT_GATHER_DICTIONARY_STATS Function Parameters

| Parameter | Description |
|-------------|--|
| degree | <p>Degree of parallelism. The default for <code>degree</code> is <code>NULL</code>. The default value can be changed using the SET_DATABASE_PREFS Procedure, SET_GLOBAL_PREFS Procedure, SET_SCHEMA_PREFS Procedure and SET_TABLE_PREFS Procedure. <code>NULL</code> means use the table default value specified by the <code>DEGREE</code> clause in the <code>CREATE TABLE</code> or <code>ALTER TABLE</code> statement.</p> <p>Use the constant <code>DBMS_STATS.DEFAULT_DEGREE</code> to specify the default value based on initialization parameters. The <code>AUTO_DEGREE</code> value determines the degree of parallelism automatically. This is between 1 (serial execution) and <code>DEFAULT_DEGREE</code> (the system default value based on number of CPUs and initialization parameters) according to the size of the object. When using <code>DEGREE=>NULL</code>, <code>DEGREE=>n</code>, or <code>DEGREE=>DBMS_STATS.DEFAULT_DEGREE</code>, the current implementation of <code>DBMS_STATS</code> may use serial execution if the size of the object does not warrant parallel execution.</p> |
| granularity | <p>Determines the granularity of statistics to collect. This preference is only relevant for partitioned tables.</p> <p>The following values are valid:</p> <ul style="list-style-type: none"> • <code>ALL</code> — Gathers all statistics: subpartition, partition, and global. • <code>AUTO</code> — Determines the granularity based on the partitioning type. This is the default value. • <code>DEFAULT</code> — Gathers global and partition-level statistics. This option is obsolete, and while currently supported, it is included in the documentation for legacy reasons only. Use <code>GLOBAL AND PARTITION</code> for this functionality. • <code>GLOBAL</code> — Gathers global statistics. • <code>GLOBAL AND PARTITION</code> — Gathers the global and partition level statistics. No subpartition level statistics are gathered even if it is a composite partitioned object. • <code>PARTITION</code> — Gathers partition-level statistics. • <code>SUBPARTITION</code> — Gathers subpartition-level statistics. |
| cascade | <p>Gathers statistics on indexes also. Index statistics gathering will not be parallelized. Using this option is equivalent to running the GATHER_INDEX_STATS Procedure on each of the indexes in the schema in addition to gathering table and column statistics. Use the constant <code>DBMS_STATS.AUTO_CASCADE</code> to have Oracle determine whether index statistics to be collected or not. This is the default. The default value can be changed using the SET_DATABASE_PREFS Procedure, SET_GLOBAL_PREFS Procedure, SET_SCHEMA_PREFS Procedure and SET_TABLE_PREFS Procedure.</p> |
| stattab | <p>User statistics table identifier describing where to save the current statistics.</p> |

Table 177-102 (Cont.) REPORT_GATHER_DICTIONARY_STATS Function Parameters

| Parameter | Description |
|-----------------|---|
| options | <p>Further specification of objects for which to gather statistics:</p> <ul style="list-style-type: none"> 'GATHER' - Gathers statistics on all objects in the schema 'GATHER AUTO' - Gathers all necessary statistics automatically. Oracle implicitly determines which objects need new statistics and determines how to gather those statistics. When 'GATHER AUTO' is specified, the only additional valid parameters are comp_id, statab, statid and statown; all other parameter settings will be ignored. Also, returns a list of objects processed. 'GATHER STALE' - Gathers statistics on stale objects as determined by looking at the *_tab_modifications views. Also, returns a list of objects found to be stale. 'GATHER EMPTY' - Gathers statistics on objects which currently have no statistics. Also, returns a list of objects found to have no statistics. 'LIST AUTO' - Returns list of objects to be processed with 'GATHER AUTO' 'LIST STALE' - Returns list of stale objects as determined by looking at the *_tab_modifications views 'LIST EMPTY' - Returns list of objects which currently have no statistics |
| no_invalidate | <p>Controls the invalidation of dependent cursors when statistics are gathered. The parameter takes the following values:</p> <ul style="list-style-type: none"> TRUE: Dependent cursors are not invalidated. FALSE: Dependent cursors are marked for immediate invalidation. AUTO: This is the default value. Rolling invalidation is used to invalidate all dependent cursors over a period of time. The performance impact on the database is reduced especially in cases where a large number of cursors are invalidated. <p>You can change the default using the SET_DATABASE_PREFS Procedure, SET_GLOBAL_PREFS Procedure, SET_SCHEMA_PREFS Procedure and SET_TABLE_PREFS Procedure.</p> |
| stattype | <p>The type of statistics:</p> <ul style="list-style-type: none"> DATA — Data statistics only CACHE — Cache statistics only ALL — All statistics |
| obj_filter_list | <p>A list of object filters. When provided, this will gather statistics only on objects which satisfy at least one object filter in the list as needed. In a single object filter, we can specify the constraints on the object attributes. The attribute values specified in the object filter are case-insensitive unless double-quoted. Wildcard is allowed in the attribute values. Suppose non-NULL values s1, s2, ... are specified for attributes a1, a2, ... in one object filter. An object o is said to satisfy this object filter if (o.a1 like s1) and (o.a2 like s2) and ... is true.</p> |
| detail_level | <p>See the description in REPORT_GATHER_DICTIONARY_STATS Functions.</p> |
| format | <p>See the description in REPORT_GATHER_DICTIONARY_STATS Functions.</p> |

Return Values

A CLOB object that contains the report

Usage Notes

You must have the SYSDBA or both ANALYZE ANY DICTIONARY and ANALYZE ANY system privilege to execute this procedure.

Exceptions

ORA-20000: Index does not exist or insufficient privileges

ORA-20001: Bad input value

ORA-20002: Bad user statistics table, may need to upgrade it

177.7.94 REPORT_GATHER_FIXED_OBJ_STATS Function

This function runs the GATHER_FIXED_OBJECTS_STATS Procedure in reporting mode.

That is, statistics are not actually collected, but all the objects that will be affected when GATHER_FIXED_OBJ_STATS is invoked are reported. The input set of parameters are exactly the same as in GATHER_FIXED_OBJ_STATS with two extra parameters.

Syntax

```
DBMS_STATS.REPORT_GATHER_FIXED_OBJ_STATS (
    statab          IN  VARCHAR2 DEFAULT NULL,
    statid          IN  VARCHAR2 DEFAULT NULL,
    statown         IN  VARCHAR2 DEFAULT NULL,
    no_invalidate  IN  BOOLEAN  DEFAULT TO_NO_INVALIDATE_TYPE (
                                GET_PARAM('NO_INVALIDATE')),
    detail_level   IN  VARCHAR2  DEFAULT 'TYPICAL',
    format          IN  VARCHAR2  DEFAULT 'TEXT')
RETURN CLOB;
```

Parameters

Table 177-103 REPORT_GATHER_FIXED_OBJ_STATS Procedure Parameters

| Parameter | Description |
|-----------|--|
| statab | User statistics table identifier describing where to save the current statistics |
| statid | Identifier to associate with these statistics within statab (optional) |
| statown | Schema containing statab (if different from current schema) |

Table 177-103 (Cont.) REPORT_GATHER_FIXED_OBJ_STATS Procedure Parameters

| Parameter | Description |
|---------------|--|
| no_invalidate | <p>Controls the invalidation of dependent cursors when statistics are gathered. The parameter takes the following values:</p> <ul style="list-style-type: none">• TRUE: Dependent cursors are not invalidated.• FALSE: Dependent cursors are marked for immediate invalidation.• AUTO: This is the default value. Rolling invalidation is used to invalidate all dependent cursors over a period of time. The performance impact on the database is reduced especially in cases where a large number of cursors are invalidated. <p>You can change the default using the SET_DATABASE_PREFS Procedure, SET_GLOBAL_PREFS Procedure, SET_SCHEMA_PREFS Procedure and SET_TABLE_PREFS Procedure.</p> |

Table 177-103 (Cont.) REPORT_GATHER_FIXED_OBJ_STATS Procedure Parameters

| Parameter | Description |
|--------------|--|
| detail_level | <p>Detail level for the content of the report</p> <ul style="list-style-type: none"> • BASIC: The report includes <ul style="list-style-type: none"> - operation ID - operation name - operation target object - start time - end time - completion status (such as: succeeded, failed) • TYPICAL: In addition to the information provided at level BASIC, the report includes individual target objects for which statistics are gathered in this operation. Specifically, with regard to operation related details: <ul style="list-style-type: none"> - total number of target objects - total number of successfully completed objects - total number of failed objects - total number of timed-out objects (applies to only auto statistics gathering) <p>With regard to target objects:</p> <ul style="list-style-type: none"> - owner and name of each target object - target object type (such as: table, index) - start time - end time - completion status • ALL: In addition to the information provided at level TYPICAL, the report includes further information on each target object. | Parameter | Description |
|-----------|--|
| format | Report format: <ul style="list-style-type: none"> • XML • HTML • TEXT (Default) |

Return Values

A CLOB object that contains the report

Usage Notes

You must have the SYSDBA or ANALYZE ANY DICTIONARY system privilege to execute this procedure.

Exceptions

ORA-20000: Insufficient privileges

ORA-20001: Bad input value

ORA-20002: Bad user statistics table, may need to upgrade it

Related Topics

- [GATHER_FIXED_OBJECTS_STATS Procedure](#)
This procedure gathers statistics for all fixed objects (dynamic performance tables).

177.7.95 REPORT_GATHER_SCHEMA_STATS Functions

This function runs the GATHER_SCHEMA_STATS procedure in reporting mode.

The database does not actually gather statistics, but reports all objects that would be affected when invoking GATHER_SCHEMA_STATS. The input set of parameters is exactly the same as in GATHER_SCHEMA_STATS, with two extra parameters.

Syntax

```
DBMS_STATS.REPORT_GATHER_SCHEMA_STATS (
  ownname          IN   VARCHAR2,
  estimate_percent IN   NUMBER          DEFAULT TO_ESTIMATE_PERCENT_TYPE (
                                     GET_PARAM ('ESTIMATE_PERCENT')),
  block_sample     IN   BOOLEAN        DEFAULT FALSE,
  method_opt       IN   VARCHAR2      DEFAULT GET_PARAM ('METHOD_OPT'),
  degree           IN   NUMBER          DEFAULT TO_DEGREE_TYPE (
                                     GET_PARAM ('DEGREE')),
  granularity      IN   VARCHAR2      DEFAULT GET_PARAM ('GRANULARITY'),
  cascade          IN   BOOLEAN        DEFAULT TO_CASCADE_TYPE (
                                     GET_PARAM ('CASCADE')),
  stattab          IN   VARCHAR2      DEFAULT NULL,
  statid           IN   VARCHAR2      DEFAULT NULL,
  options          IN   VARCHAR2      DEFAULT 'GATHER',
  statown         IN   VARCHAR2      DEFAULT NULL,
  no_invalidate   IN   BOOLEAN        DEFAULT TO_NO_INVALIDATE_TYPE (
```

```

                                GET_PARAM ('NO_INVALIDATE')),
force                          IN   BOOLEAN      DEFAULT FALSE,
obj_filter_list                IN   ObjectTab    DEFAULT NULL,
detail_level                   IN   VARCHAR2     DEFAULT 'TYPICAL',
format                         IN   VARCHAR2     DEFAULT 'TEXT')
RETURN CLOB;

```

Parameters

Table 177-104 REPORT_GATHER_SCHEMA_STATS Function Parameters

| Parameter | Description |
|------------------|--|
| ownname | Schema to analyze (NULL means current schema) |
| estimate_percent | Percentage of rows to estimate (NULL means compute): The valid range is [0.000001,100]. Use the constant DBMS_STATS.AUTO_SAMPLE_SIZE to have Oracle determine the appropriate sample size for good statistics. This is the default. The default value can be changed using the SET_DATABASE_PREFS Procedure , SET_GLOBAL_PREFS Procedure , SET_SCHEMA_PREFS Procedure and SET_TABLE_PREFS Procedure . |
| block_sample | Whether or not to use random block sampling instead of random row sampling. Random block sampling is more efficient, but if the data is not randomly distributed on disk, then the sample values may be somewhat correlated. Only pertinent when doing an estimate statistics. |
| method_opt | <p>Accepts:</p> <ul style="list-style-type: none"> • FOR ALL [INDEXED HIDDEN] COLUMNS [size_clause] size_clause is defined as size_clause := SIZE {integer REPEAT AUTO SKEWONLY} <ul style="list-style-type: none"> - integer : Number of histogram buckets. Must be in the range [1,2048]. - REPEAT : Collects histograms only on the columns that already have histograms - AUTO : Oracle determines the columns on which to collect histograms based on data distribution and the workload of the columns. - SKEWONLY : Oracle determines the columns on which to collect histograms based on the data distribution of the columns. <p>The default is FOR ALL COLUMNS SIZE AUTO. The default value can be changed using the SET_DATABASE_PREFS Procedure, SET_GLOBAL_PREFS Procedure, SET_SCHEMA_PREFS Procedure and SET_TABLE_PREFS Procedure.</p> |

Table 177-104 (Cont.) REPORT_GATHER_SCHEMA_STATS Function Parameters

| Parameter | Description |
|-------------|---|
| degree | Degree of parallelism. The default for degree is NULL. The default value can be changed using the SET_DATABASE_PREFS Procedure , SET_GLOBAL_PREFS Procedure , SET_SCHEMA_PREFS Procedure and SET_TABLE_PREFS Procedure . NULL means use the table default value specified by the DEGREE clause in the CREATE TABLE or ALTER TABLE statement. Use the constant DBMS_STATS.DEFAULT_DEGREE to specify the default value based on the initialization parameters. The AUTO_DEGREE value determines the degree of parallelism automatically. This is between 1 (serial execution) and DEFAULT_DEGREE (the system default value based on number of CPUs and initialization parameters) according to the size of the object. When using DEGREE=>NULL, DEGREE=>n, or DEGREE=>DBMS_STATS.DEFAULT_DEGREE, the current implementation of DBMS_STATS may use serial execution if the size of the object does not warrant parallel execution. |
| granularity | Granularity of statistics to collect (only pertinent if the table is partitioned). 'ALL' - Gathers all (subpartition, partition, and global) statistics 'AUTO' - Determines the granularity based on the partitioning type. This is the default value. 'DEFAULT' - Gathers global and partition-level statistics. This option is obsolete, and while currently supported, it is included in the documentation for legacy reasons only. You should use the 'GLOBAL AND PARTITION' for this functionality. Note that the default value is now 'AUTO'. 'GLOBAL' - Gathers global statistics 'GLOBAL AND PARTITION' - Gathers the global and partition level statistics. No subpartition level statistics are gathered even if it is a composite partitioned object. 'PARTITION' - Gathers partition-level statistics 'SUBPARTITION' - Gathers subpartition-level statistics. |
| cascade | Gather statistics on the indexes as well. Using this option is equivalent to running the GATHER_INDEX_STATS Procedure on each of the indexes in the schema in addition to gathering table and column statistics. Use the constant DBMS_STATS.AUTO_CASCADE to have Oracle determine whether index statistics to be collected or not. This is the default. The default value can be changed using the SET_DATABASE_PREFS Procedure , SET_GLOBAL_PREFS Procedure , SET_SCHEMA_PREFS Procedure and SET_TABLE_PREFS Procedure . |
| stattab | User statistics table identifier describing where to save the current statistics |
| statid | Identifier (optional) to associate with these statistics within stattab |

Table 177-104 (Cont.) REPORT_GATHER_SCHEMA_STATS Function Parameters

| Parameter | Description |
|-----------------|--|
| options | <p>Further specification of which objects to gather statistics for:</p> <p>GATHER: Gathers statistics on all objects in the schema.</p> <p>GATHER AUTO: Gathers all necessary statistics automatically. Oracle implicitly determines which objects need new statistics, and determines how to gather those statistics. When GATHER AUTO is specified, the only additional valid parameters are ownname, stattab, statid, objlist and statown; all other parameter settings are ignored. Returns a list of processed objects.</p> <p>GATHER STALE: Gathers statistics on stale objects as determined by looking at the <code>*_tab_modifications</code> views. Also, return a list of objects found to be stale.</p> <p>GATHER EMPTY: Gathers statistics on objects which currently have no statistics. also, return a list of objects found to have no statistics.</p> <p>LIST AUTO: Returns a list of objects to be processed with GATHER AUTO.</p> <p>LIST STALE: Returns list of stale objects as determined by looking at the <code>*_tab_modifications</code> views.</p> <p>LIST EMPTY: Returns list of objects which currently have no statistics.</p> |
| objlist | List of objects found to be stale or empty |
| statown | Schema containing stattab (if different than ownname) |
| no_invalidate | <p>Controls the invalidation of dependent cursors when statistics are gathered. The parameter takes the following values:</p> <ul style="list-style-type: none"> • TRUE: Dependent cursors are not invalidated. • FALSE: Dependent cursors are marked for immediate invalidation. • AUTO: This is the default value. Rolling invalidation is used to invalidate all dependent cursors over a period of time. The performance impact on the database is reduced especially in cases where a large number of cursors are invalidated. <p>You can change the default using the SET_DATABASE_PREFS Procedure, SET_GLOBAL_PREFS Procedure, SET_SCHEMA_PREFS Procedure and SET_TABLE_PREFS Procedure.</p> |
| force | Gather statistics on objects even if they are locked |
| obj_filter_list | <p>A list of object filters. When provided, GATHER_SCHEMA_STATS will gather statistics only on objects which satisfy at least one object filter in the list as needed. In a single object filter, we can specify the constraints on the object attributes. The attribute values specified in the object filter are case- insensitive unless double-quoted. Wildcard is allowed in the attribute values. Suppose non-NULL values s1, s2, ... are specified for attributes a1, a2, ... in one object filter. An object o is said to satisfy this object filter if (o.a1 like s1) and (o.a2 like s2) and ... is true. See Applying an Object Filter List.</p> |

Table 177-104 (Cont.) REPORT_GATHER_SCHEMA_STATS Function Parameters

| Parameter | Description |

| Parameter | Description |
|-----------|--|
| format | Report format: <ul style="list-style-type: none"> • XML • HTML • TEXT (Default) |

Usage Notes

To invoke this procedure you must be owner of the table, or you need the `ANALYZE ANY` privilege. For objects owned by `SYS`, you need to be either the owner of the table, or you need the `ANALYZE ANY DICTIONARY` privilege or the `SYSDBA` privilege.

Exceptions

ORA-20000: Schema does not exist or insufficient privileges

ORA-20001: Bad input value

Examples

Applying an Object Filter List

The following example specifies that any table with a "T" prefix in the `SAMPLE` schema or any table in the `HR` schema, if stale, will have statistics gathered upon it.

```

DECLARE
  filter_lst DBMS_STATS.OBJECTTAB := DBMS_STATS.OBJECTTAB();
BEGIN
  filter_lst.extend(2);
  filter_lst(1).ownname := 'SAMPLE';
  filter_lst(1).objname := 'T%';
  filter_lst(2).ownname := 'HR';
  DBMS_STATS.GATHER_SCHEMA_STATS(NULL, obj_filter_list => filter_lst,
                                options => 'GATHER STALE');
END;
```

177.7.96 REPORT_GATHER_TABLE_STATS Function

This procedure runs the `GATHER_TABLE_STATS` Procedure in reporting mode.

That is, statistics are not actually collected, but all the objects that will be affected when `GATHER_TABLE_STATS` is invoked are reported.

Syntax

```

DBMS_STATS.REPORT_GATHER_TABLE_STATS (
  ownname          VARCHAR2,
  tabname          VARCHAR2,
  partname         VARCHAR2 DEFAULT NULL,
  estimate_percent NUMBER  DEFAULT to_estimate_percent_type
                                (get_param('ESTIMATE_PERCENT')),
  block_sample     BOOLEAN  DEFAULT FALSE,
  method_opt       VARCHAR2 DEFAULT get_param('METHOD_OPT'),
```

```

degree          NUMBER  DEFAULT to_degree_type(get_param('DEGREE')),
granularity     VARCHAR2 DEFAULT GET_PARAM('GRANULARITY'),
cascade        BOOLEAN  DEFAULT to_cascade_type(get_param('CASCADE')),
stattab        VARCHAR2 DEFAULT NULL,
statid         VARCHAR2 DEFAULT NULL,
statown        VARCHAR2 DEFAULT NULL,
no_invalidate  BOOLEAN  DEFAULT to_no_invalidate_type (
                    get_param('NO_INVALIDATE')),
stattype       VARCHAR2 DEFAULT 'DATA',
force          BOOLEAN  DEFAULT FALSE)
detail_level   VARCHAR2 DEFAULT 'TYPICAL',  format          VARCHAR2 DEFAULT
'TEXT')
RETURN CLOB;

```

Parameters

Table 177-105 REPORT_GATHER_TABLE_STATS Function Parameters

| Parameter | Description |
|------------------|--|
| ownname | Schema of table to analyze |
| tablename | Name of table |
| partname | Name of partition |
| estimate_percent | Percentage of rows to estimate (NULL means compute) The valid range is [0.000001,100]. Use the constant DBMS_STATS.AUTO_SAMPLE_SIZE to have Oracle determine the appropriate sample size for good statistics. This is the default. The default value can be changed using the SET_DATABASE_PREFS Procedure , SET_GLOBAL_PREFS Procedure , SET_SCHEMA_PREFS Procedure and SET_TABLE_PREFS Procedure . |
| block_sample | Whether or not to use random block sampling instead of random row sampling. Random block sampling is more efficient, but if the data is not randomly distributed on disk, then the sample values may be somewhat correlated. Only pertinent when doing an estimate statistics. |

Table 177-105 (Cont.) REPORT_GATHER_TABLE_STATS Function Parameters

| Parameter | Description |
|------------|---|
| method_opt | <p>Accepts either of the following options, or both in combination:</p> <ul style="list-style-type: none"> • FOR ALL [INDEXED HIDDEN] COLUMNS [size_clause] • FOR COLUMNS [column_clause] [size_clause] <p>size_clause is defined as size_clause := SIZE {integer REPEAT AUTO SKEWONLY}</p> <p>column_clause is defined as column_clause := column_name extension name extension</p> <ul style="list-style-type: none"> - integer : Number of histogram buckets. Must be in the range [1,2048]. - REPEAT : Collects histograms only on the columns that already have histograms - AUTO : Oracle determines the columns on which to collect histograms based on data distribution and the workload of the columns. - SKEWONLY : Oracle determines the columns on which to collect histograms based on the data distribution of the columns. - column_name : Name of a column - extension : can be either a column group in the format of (column_name, Column_name [, ...]) or an expression <p>The default is FOR ALL COLUMNS SIZE AUTO. The default value can be changed using the SET_DATABASE_PREFS Procedure, SET_GLOBAL_PREFS Procedure, SET_SCHEMA_PREFS Procedure and SET_TABLE_PREFS Procedure.</p> |
| degree | <p>Degree of parallelism. The default for degree is NULL. The default value can be changed using the SET_DATABASE_PREFS Procedure, SET_GLOBAL_PREFS Procedure, SET_SCHEMA_PREFS Procedure and SET_TABLE_PREFS Procedure. NULL means use the table default value specified by the DEGREE clause in the CREATE TABLE or ALTER TABLE statement. Use the constant DBMS_STATS.DEFAULT_DEGREE to specify the default value based on the initialization parameters. The AUTO_DEGREE value determines the degree of parallelism automatically. This is between 1 (serial execution) and DEFAULT_DEGREE (the system default value based on number of CPUs and initialization parameters) according to the size of the object. When using DEGREE=>NULL, DEGREE=>n, or DEGREE=>DBMS_STATS.DEFAULT_DEGREE, the current implementation of DBMS_STATS may use serial execution if the size of the object does not warrant parallel execution.</p> |

Table 177-105 (Cont.) REPORT_GATHER_TABLE_STATS Function Parameters

| Parameter | Description |

Return Values

A CLOB object that contains the report

Usage Notes

To invoke this procedure you must be owner of the table, or you need the `ANALYZE ANY` privilege. For objects owned by `SYS`, you need to be either the owner of the table, or you need the `ANALYZE ANY DICTIONARY` privilege or the `SYSDBA` privilege.

Related Topics

- [GATHER_TABLE_STATS Procedure](#)
This procedure gathers table, column, and index statistics. It attempts to parallelize as much work as possible, but there are some restrictions, which are described in the individual parameters.

177.7.97 REPORT_SINGLE_STATS_OPERATION Function

This function generates a report for the provided operation optionally in a particular pluggable database (PDB) in a multitenant environment.

Note:

A multitenant container database is the only supported architecture in Oracle Database 20c. While the documentation is being revised, legacy terminology may persist. In most cases, "database" and "non-CDB" refer to a CDB or PDB, depending on context. In some contexts, such as upgrades, "non-CDB" refers to a non-CDB from a previous release.

Syntax

```
DBMS_STATS.REPORT_SINGLE_STATS_OPERATIONS (
  opid          NUMBER,
  detail_level  VARCHAR2  DEFAULT 'TYPICAL',
  format        VARCHAR2  DEFAULT 'TEXT'
  container_id  NUMBER    DEFAULT NULL)
RETURN CLOB;
```

Parameters

Table 177-106 REPORT_SINGLE_STATS_OPERATION Function Parameters

| Parameter | Description |
|-----------|--------------|
| opid | Operation ID |

Table 177-106 (Cont.) REPORT_SINGLE_STATS_OPERATION Function Parameters

| Parameter | Description |
|--------------|---|
| detail_level | <p>Detail level for the content of the report</p> <ul style="list-style-type: none"> • BASIC: The report includes <ul style="list-style-type: none"> - operation ID - operation name - operation target object - start time - end time - completion status (such as: succeeded, failed) • TYPICAL: In addition to the information provided at level BASIC, the report includes individual target objects for which statistics are gathered in this operation. Specifically, with regard to operation related details: <ul style="list-style-type: none"> - total number of target objects - total number of successfully completed objects - total number of failed objects - total number of timed-out objects (applies to only auto statistics gathering) <p>With regard to target objects:</p> <ul style="list-style-type: none"> - owner and name of each target object - target object type (such as: table, index) - start time - end time - completion status • ALL: In addition to the information provided at level TYPICAL, the report includes further information on each target object. Table 177-106 (Cont.) REPORT_SINGLE_STATS_OPERATION Function Parameters

| Parameter | Description |
|--------------|--|
| format | Report format: <ul style="list-style-type: none"> • XML • HTML • TEXT (Default) |
| container_id | ID of the pluggable database (PDB) on which this operation was performed. Note that in a multitenant environment, operation ID does not uniquely identify an operation. That is, different operations from distinct PDBs may have the same operation ID. Hence, in a multitenant environment, if a PDB ID is not provided, then the report may contain multiple operations. In a typical (non-CDB) database environment, operation ID is unique to each operation. |

Usage Notes

To invoke this procedure you need the `ANALYZE ANY` privilege and the `ANALYZE ANY DICTIONARY` privilege.

177.7.98 REPORT_STATS_OPERATIONS Function

This function generates a report of all statistics operations that take place between two timestamps which may or may not have been provided.

It allows the scope of the report to be narrowed down so that report will include only auto statistics gathering runs. Furthermore, in a multitenant environment, users may optionally provide a set of pluggable database (PDB) IDs so that only statistics operations from the specified pluggable databases will be reported.

Syntax

```
DBMS_STATS.REPORT_STATS_OPERATIONS (
  detail_level      VARCHAR2 DEFAULT 'TYPICAL',
  format            VARCHAR2 DEFAULT 'TEXT',
  latestN          NUMBER DEFAULT NULL,
  since            TIMESTAMP WITH TIME ZONE DEFAULT NULL,
  until            TIMESTAMP WITH TIME ZONE DEFAULT NULL,
  auto_only        BOOLEAN DEFAULT FALSE,
  container_ids    DBMS_UTILITY.NUMBER_ARRAY DEFAULT DBMS_STATS.NULL_NUMTAB)
RETURN CLOB;
```

Parameters

| since | <p>The report will include only statistics operations that started after this timestamp.</p> |
| until | <p>The report will include only statistics operations that before after this timestamp.</p> |
| auto_only | <p>When TRUE, the report will contain only auto statistics gathering job runs.</p> |
| container_ids | <p>A multitenant environment contains one or more pluggable databases (PDBs). <code>container_ids</code> represents a set of PDB IDs so that only statistics operations from the specified PDBs are reported (applies to only multitenant environments).</p> |

Usage Notes

To invoke this procedure you need the `ANALYZE ANY` privilege and the `ANALYZE ANY DICTIONARY` privilege.

Examples

Note that the type for `container_ids` input parameter is `DBMS_UTILITY.NUMBER_ARRAY` which is an associative PL/SQL array collection. Although associative array type allows for more flexible `hash` table-like organization of entries, this function treats `container_ids` as a regular table collection with the first ID located at index 1 and the last id located at index `container_ids.count` without any empty array slot left between any two IDs. An example for 3 container ids is provided.

```

DECLARE
    conid_tab DBMS_UTILITY.NUMBER_ARRAY;
    report clob;
BEGIN
    conid_tab(1) := 124;
    conid_tab(2) := 63;
    conid_tab(3) := 98;
    report := DBMS_STATS.REPORT_STATS_OPERATIONS (container_ids => conid_tab);
END;
```

177.7.99 RESET_ADVISOR_TASK Procedure

This procedure resets an Optimizer Statistics Advisor task execution to its initial state. Only reset a task that is not currently executing.

Syntax

```

DBMS_STATS.RESET_ADVISOR_TASK (
    task_name IN VARCHAR2);
```

Parameters

Table 177-108 RESET_ADVISOR_TASK Procedure Parameters

| Parameter | Description |
|------------------------|--|
| <code>task_name</code> | The name of the Optimizer Statistics Advisor task. |

Security Model

Note the following:

- To execute this subprogram, you must have the `ADVISOR` privilege.
- You must be the owner of the task.
- This subprogram executes using invoker's rights.

Exceptions

- `ORA-20000`: Insufficient privileges
- `ORA-20001`: Invalid input values

- ORA-20012: Optimizer Statistics Advisor errors

177.7.100 RESET_COL_USAGE Procedure

This procedure deletes the recorded column (group) usage information.

This procedure should only be used in very rare cases when the seed column usage needs to be initialized.

Syntax

```
DBMS_STATS.RESET_COL_USAGE (
  ownname   IN   VARCHAR2,
  tablename IN   VARCHAR2);
```

Parameters

Table 177-109 RESET_COL_USAGE Procedure Parameters

| Parameter | Description |
|-----------|---|
| ownname | Owner name. If NULL it deletes column usage information for tables in all schemas in the database. |
| tablename | Table name. If NULL it deletes column usage information for all tables of ownname. If both the owner and tablename is NULL, the seed column usage is stopped if applicable. See :SEED_COL_USAGE Procedure for more information. |

Usage Notes

To run this procedure, you need to have the SYSDBA administrative privilege, or both the ANALYZE ANY DICTIONARY and the ANALYZE ANY system privileges.

177.7.101 RESET_GLOBAL_PREF_DEFAULTS Procedure

This procedure sets global preference, such as CASCADE, ESTIMATE_PERCENT and GRANULARITY, to default values.

This reverses the global preferences set by the [SET_GLOBAL_PREFS Procedure](#).

Syntax

```
DBMS_STATS.RESET_GLOBAL_PREF_DEFAULTS;
```

Usage Notes

To invoke this procedure you need the ANALYZE ANY privilege and the ANALYZE ANY DICTIONARY privilege.

177.7.102 RESET_PARAM_DEFAULTS Procedure

This deprecated procedure resets the default values of all parameters to Oracle recommended values.

Note:

This subprogram has been replaced by improved technology and is maintained only for purposes of backward compatibility. Instead of this procedure, use the [RESET_GLOBAL_PREF_DEFAULTS Procedure](#).

See also . [DBMS_STATS Deprecated Subprograms](#)

Syntax

```
DBMS_STATS.RESET_PARAM_DEFAULTS;
```

177.7.103 RESTORE_DATABASE_STATS Procedure

This procedure restores statistics of all tables of the database as of a specified timestamp (as_of_timestamp).

Syntax

```
DBMS_STATS.RESTORE_DATABASE_STATS (
  as_of_timestamp      TIMESTAMP WITH TIME ZONE,
  force                BOOLEAN DEFAULT FALSE,
  no_invalidate        BOOLEAN DEFAULT to_no_invalidate_type
                                     (GET_PARAM('NO_INVALIDATE')));
```

Parameters

Table 177-110 RESTORE_DATABASE_STATS Procedure Parameters

| Parameter | Description |
|-----------------|---|
| as_of_timestamp | The timestamp to which to restore statistics |
| force | Restores statistics even if their statistics are locked |
| no_invalidate | Controls the invalidation of dependent cursors when statistics are gathered. The parameter takes the following values: <ul style="list-style-type: none"> TRUE: Dependent cursors are not invalidated. FALSE: Dependent cursors are marked for immediate invalidation. AUTO: This is the default value. Rolling invalidation is used to invalidate all dependent cursors over a period of time. The performance impact on the database is reduced especially in cases where a large number of cursors are invalidated. You can change the default using the SET_DATABASE_PREFS Procedure , SET_GLOBAL_PREFS Procedure , SET_SCHEMA_PREFS Procedure and SET_TABLE_PREFS Procedure . |

Exceptions

ORA-20000: Object does not exist or insufficient privileges

ORA-20001: Invalid or inconsistent values

ORA-20006: Unable to restore statistics, statistics history not available

177.7.104 RESTORE_DICTIONARY_STATS Procedure

This procedure restores statistics of all dictionary tables (tables of 'SYS', 'SYSTEM' and RDBMS component schemas) as of a specified timestamp (`as_of_timestamp`).

Syntax

```
DBMS_STATS.RESTORE_DICTIONARY_STATS (
  as_of_timestamp      TIMESTAMP WITH TIME ZONE,
  force                BOOLEAN DEFAULT FALSE,
  no_invalidate        BOOLEAN DEFAULT to_no_invalidate_type
  (GET_PARAM('NO_INVALIDATE')));
```

Parameters

Table 177-111 RESTORE_DICTIONARY_STATS Procedure Parameters

| Parameter | Description |
|------------------------------|---|
| <code>as_of_timestamp</code> | Timestamp to which to restore statistics |
| <code>force</code> | Restores statistics even if their statistics are locked |
| <code>no_invalidate</code> | Controls the invalidation of dependent cursors when statistics are gathered. The parameter takes the following values: <ul style="list-style-type: none"> TRUE: Dependent cursors are not invalidated. FALSE: Dependent cursors are marked for immediate invalidation. AUTO: This is the default value. Rolling invalidation is used to invalidate all dependent cursors over a period of time. The performance impact on the database is reduced especially in cases where a large number of cursors are invalidated. You can change the default using the SET_DATABASE_PREFS Procedure , SET_GLOBAL_PREFS Procedure , SET_SCHEMA_PREFS Procedure and SET_TABLE_PREFS Procedure . |

Usage Notes

To run this procedure, you must have the SYSDBA or both ANALYZE ANY DICTIONARY and ANALYZE ANY system privilege.

Exceptions

ORA-20000: Object does not exist or insufficient privileges

ORA-20001: Invalid or inconsistent values

ORA-20006: Unable to restore statistics, statistics history not available

177.7.105 RESTORE_FIXED_OBJECTS_STATS Procedure

This procedure restores statistics of all fixed tables as of a specified timestamp (`as_of_timestamp`).

Syntax

```
DBMS_STATS.RESTORE_FIXED_OBJECTS_STATS (
  as_of_timestamp      TIMESTAMP WITH TIME ZONE,
  force                BOOLEAN DEFAULT FALSE,
  no_invalidate        BOOLEAN DEFAULT to_no_invalidate_type
                                     (GET_PARAM('NO_INVALIDATE')));
```

Parameters

Table 177-112 RESTORE_FIXED_OBJECTS_STATS Procedure Parameters

| Parameter | Description |
|------------------------------|--|
| <code>as_of_timestamp</code> | The timestamp to which to restore statistics |
| <code>force</code> | Restores statistics even if their statistics are locked |
| <code>no_invalidate</code> | Controls the invalidation of dependent cursors when statistics are gathered. The parameter takes the following values: <ul style="list-style-type: none"> • <code>TRUE</code>: Dependent cursors are not invalidated. • <code>FALSE</code>: Dependent cursors are marked for immediate invalidation. • <code>AUTO</code>: This is the default value. Rolling invalidation is used to invalidate all dependent cursors over a period of time. The performance impact on the database is reduced especially in cases where a large number of cursors are invalidated. You can change the default using the SET_DATABASE_PREFS Procedure , SET_GLOBAL_PREFS Procedure , SET_SCHEMA_PREFS Procedure and SET_TABLE_PREFS Procedure . |

Usage Notes

To run this procedure, you must have the `SYSDBA` or `ANALYZE ANY DICTIONARY` system privilege.

Exceptions

ORA-20000: Object does not exist or insufficient privileges

ORA-20001: Invalid or inconsistent values

ORA-20006: Unable to restore statistics, statistics history not available

177.7.106 RESTORE_SCHEMA_STATS Procedure

This procedure restores statistics of all tables of a schema as of a specified timestamp (`as_of_timestamp`).

Syntax

```
DBMS_STATS.RESTORE_SCHEMA_STATS (
  ownname              VARCHAR2,
```

```

as_of_timestamp    TIMESTAMP WITH TIME ZONE,
force              BOOLEAN DEFAULT FALSE,
no_invalidate     BOOLEAN DEFAULT to_no_invalidate_type

(GET_PARAM('NO_INVALIDATE')));

```

Parameters

Table 177-113 RESTORE_SCHEMA_STATS Procedure Parameters

| Parameter | Description |
|-----------------|---|
| ownname | Schema of the tables for which the statistics are to be restored |
| as_of_timestamp | The timestamp to which to restore statistics |
| force | Restores statistics even if their statistics are locked |
| no_invalidate | Controls the invalidation of dependent cursors when statistics are gathered. The parameter takes the following values: <ul style="list-style-type: none"> TRUE: Dependent cursors are not invalidated. FALSE: Dependent cursors are marked for immediate invalidation. AUTO: This is the default value. Rolling invalidation is used to invalidate all dependent cursors over a period of time. The performance impact on the database is reduced especially in cases where a large number of cursors are invalidated. <p>You can change the default using the SET_DATABASE_PREFS Procedure, SET_GLOBAL_PREFS Procedure, SET_SCHEMA_PREFS Procedure and SET_TABLE_PREFS Procedure.</p> |

Exceptions

ORA-20000: Object does not exist or insufficient privileges

ORA-20001: Invalid or inconsistent values

ORA-20006: Unable to restore statistics, statistics history not available

Usage Notes

To invoke this procedure you must be owner of the table, or you need the `ANALYZE ANY` privilege. For objects owned by `SYS`, you need to be either the owner of the table, or you need the `ANALYZE ANY DICTIONARY` privilege or the `SYSDBA` privilege.

177.7.107 RESTORE_SYSTEM_STATS Procedure

This procedure restores system statistics as of a specified timestamp (`as_of_timestamp`).

Syntax

```

DBMS_STATS.RESTORE_SCHEMA_STATS (
    as_of_timestamp    TIMESTAMP WITH TIME ZONE);

```

Parameters

Table 177-114 RESTORE_SYSTEM_STATS Procedure Parameters

| Parameter | Description |
|-----------------|--|
| as_of_timestamp | The timestamp to which to restore statistics |

Exceptions

ORA-20000: Object does not exist or insufficient privileges

ORA-20001: Invalid or inconsistent values

ORA-20006: Unable to restore statistics, statistics history not available

Usage Notes

To run this procedure, you need the GATHER_SYSTEM_STATISTICS role.

177.7.108 RESTORE_TABLE_STATS Procedure

This procedure restores statistics of a table as of a specified timestamp (as_of_timestamp). It also restores statistics of associated indexes and columns.

If the table statistics were locked at the specified timestamp the procedure will lock the statistics. The procedure will not restore user defined statistics.

Syntax

```
DBMS_STATS.RESTORE_TABLE_STATS (
  ownname          VARCHAR2,
  tablename        VARCHAR2,
  as_of_timestamp  TIMESTAMP WITH TIME ZONE,
  restore_cluster_index  BOOLEAN DEFAULT FALSE,
  force            BOOLEAN DEFAULT FALSE,
  no_invalidate    BOOLEAN DEFAULT to_no_invalidate_type
                  (GET_PARAM('NO_INVALIDATE')));
```

Parameters

Table 177-115 RESTORE_TABLE_STATS Procedure Parameters

| Parameter | Description |
|-----------------------|---|
| ownname | The schema of the table for which the statistics are to be restored |
| tablename | The table name |
| as_of_timestamp | The timestamp to which to restore statistics |
| restore_cluster_index | If the table is part of a cluster, restore statistics of the cluster index if set to TRUE |
| force | Restores statistics even if the table statistics are locked. If the table statistics were not locked at the specified timestamp, it unlocks the statistics. |

Table 177-115 (Cont.) RESTORE_TABLE_STATS Procedure Parameters

| Parameter | Description |
|---------------|--|
| no_invalidate | <p>Controls the invalidation of dependent cursors when statistics are gathered. The parameter takes the following values:</p> <ul style="list-style-type: none"> TRUE: Dependent cursors are not invalidated. FALSE: Dependent cursors are marked for immediate invalidation. AUTO: This is the default value. Rolling invalidation is used to invalidate all dependent cursors over a period of time. The performance impact on the database is reduced especially in cases where a large number of cursors are invalidated. <p>You can change the default using the SET_DATABASE_PREFS Procedure, SET_GLOBAL_PREFS Procedure, SET_SCHEMA_PREFS Procedure and SET_TABLE_PREFS Procedure.</p> |

Exceptions

ORA-20000: Object does not exist or insufficient privileges

ORA-20001: Invalid or inconsistent values

ORA-20006: Unable to restore statistics, statistics history not available

Usage Notes

To invoke this procedure you must be owner of the table, or you need the `ANALYZE ANY` privilege. For objects owned by `SYS`, you need to be either the owner of the table, or you need the `ANALYZE ANY DICTIONARY` privilege or the `SYSDBA` privilege.

177.7.109 RESUME_ADVISOR_TASK Procedure

This procedure resumes an interrupted task. It only resumes the execution that was most recently interrupted.

Syntax

```
DBMS_STATS.RESUME_ADVISOR_TASK (
    task_name IN VARCHAR2);
```

Parameters

Table 177-116 RESUME_ADVISOR_TASK Procedure Parameters

| Parameter | Description |
|-----------|--|
| task_name | The name of the Optimizer Statistics Advisor task. |

Security Model

Note the following:

- To execute this subprogram, you must have the `ADVISOR` privilege.
- You must be the owner of the task.

- This subprogram executes using invoker's rights.

Consider a case in which a task is executed by one user, interrupted, and then resumed by a different user. In this case, Optimizer Statistics Advisor bases its checks of the resumed execution on the privilege of the user who resumed the task.

Exceptions

- ORA-20000: Insufficient privileges
- ORA-20001: Invalid input values
- ORA-20012: Optimizer Statistics Advisor errors

Example 177-14 Resuming an Interrupted Task

In this example, you start a SQL*Plus session, and then create and execute an advisor task named `my_task`:

```
DECLARE
  v_tname  VARCHAR2(128) := 'my_task';
  v_ename  VARCHAR2(128) := NULL;
BEGIN
  -- create a task
  v_tname := DBMS_STATS.CREATE_ADVISOR_TASK(v_tname);

  -- execute the task
  v_ename := DBMS_STATS.EXECUTE_ADVISOR_TASK(v_tname);
END;
/
```

In a separate terminal, you start a second SQL*Plus session, and then execute the following program:

```
XEC DBMS_STATS.INTERRUPT_ADVISOR_TASK('my_task');
```

The first session returns an ORA-13632 to indicate the cancelation of the task:

```
ORA-13638: The user interrupted the current operation.
```

In the second SQL*Plus session, you resume the task execution as follows:

```
XEC DBMS_STATS.RESUME_ADVISOR_TASK('my_task');
```

177.7.110 SCRIPT_ADVISOR_TASK Function

Retrieves the script that implements the recommended actions for the problems found by Optimizer Statistics Advisor.

The generated script contains PL/SQL statements that you can choose to execute. Preceding the commands for each action are comments that list the potential side effects. You can review the comments, and choose to execute only the desired sections.

Syntax

```
DBMS_STATS.SCRIPT_ADVISOR_TASK (
  task_name      IN   VARCHAR2,
  execution_name IN   VARCHAR2  := NULL,
  dir_name       IN   VARCHAR2  := NULL,
  level         IN   VARCHAR2  := 'TYPICAL')
RETURN CLOB;
```

Parameters

Table 177-117 SCRIPT_ADVISOR_TASK Function Parameters

| Parameter | Description |
|----------------|--|
| task_name | The name of the Optimizer Statistics Advisor task. |
| execution_name | A name that qualifies and identifies an advisor execution. If not specified, then the advisor automatically generates it. If the specified execution conflicts with the name of an existing execution, then the function returns an error. |
| dir_name | Directory name to which to write the generated script. If the name is not specified (NULL), then the function includes the script in the returned CLOB. If the name is specified, then the function returns the script as a CLOB and as a new file in the specified directory. |
| level | The level of the script to generate. Possible values are <ul style="list-style-type: none"> ALL: Ignores the filter and generates a script for all findings TYPICAL: Generates a script according to the filters in place |

Security Model

Note the following:

- To execute this subprogram, you must have the `ADVISOR` privilege.
- You must be the owner of the task.
- You can execute this subprogram for `AUTO_STATS_ADVISOR_TASK`, which is predefined.
- This subprogram executes using invoker's rights.

The results of performing this task depend on the privileges of the executing user:

- SYSTEM level**
Only users with both the `ANALYZE ANY` and `ANALYZE ANY DICTIONARY` privileges can perform this task on system-level rules.

- Operation level**

The results depend on the following privileges:

- Users with both the `ANALYZE ANY` and `ANALYZE ANY DICTIONARY` privileges can perform this task for all statistics operations.
- Users with the `ANALYZE ANY` privilege but *not* the `ANALYZE ANY DICTIONARY` privilege can perform this task for statistics operations related to any schema except `SYS`.

- Users with the `ANALYZE ANY DICTIONARY` privilege but *not* the `ANALYZE ANY` privilege can perform this task for statistics operations related to their own schema and the `SYS` schema.
- Users with neither the `ANALYZE ANY` nor the `ANALYZE ANY DICTIONARY` privilege can only perform this operation for statistics operations relating to their own schema.
- Object level
Users can perform this task for any object for which they have statistics collection privileges.

Return Values

This function returns a CLOB that contains the script.

Exceptions

- ORA-20000: Insufficient privileges
- ORA-20001: Invalid input values
- ORA-20012: Optimizer Statistics Advisor errors

Example 177-15 Creating an Optimizer Statistics Advisor Script

This example creates a procedure named `myrep`, and then calls this procedure to print the script the implements the recommendations.

```
SET ECHO ON
SET FEEDBACK ON
SET SERVEROUTPUT ON
SET TRIMS ON
SET LINESIZE 300

EXECUTE DBMS_OUTPUT.ENABLE (buffer_size => 10000000);

CREATE OR REPLACE PROCEDURE myrep(p_tname VARCHAR2, p_fotype VARCHAR2, which
VARCHAR2)
IS
  v_report CLOB          := null;
  v_script CLOB          := null;
  v_fotype VARCHAR2(400) := p_fotype;
  v_tname  VARCHAR2(400) := p_tname;
  v_len    NUMBER(10);
  v_ps     NUMBER(10)    := 10000;
  v_pn     NUMBER(10)    := 1;
  v_ret    VARCHAR2(32767);
BEGIN
  IF which = 'REPORT'
  THEN
    -- generate a report
    v_report := DBMS_STATS.REPORT_ADVISOR_TASK(
      task_name => v_tname,
      type      => v_fotype,
      section  => 'ALL',
      level    => 'ALL');
    v_len := DBMS_LOB.getlength(v_report);
```

```

        WHILE (v_pn < v_len)
        LOOP
            DBMS_OUTPUT.PUT_LINE(DBMS_LOB.SUBSTR(v_report, v_ps, v_pn));
            v_pn := v_pn + v_ps;
        END LOOP;
    ELSE
        -- generate a script
        v_script := DBMS_STATS.SCRIPT_ADVISOR_TASK(v_tname);
        v_len := DBMS_LOB.getlength(v_script);
        WHILE (v_pn < v_len)
        LOOP
            DBMS_OUTPUT.PUT_LINE(DBMS_LOB.SUBSTR(v_script, v_ps, v_pn));
            v_pn := v_pn + v_ps;
        END LOOP;
    END IF;
END;
/

SHOW ERRORS

SPOOL report.txt
EXECUTE myrep('my_task', '-', 'SCRIPT');
SPOOL OFF

```

Oracle Database SQL Tuning Guide

177.7.111 SEED_COL_USAGE Procedure

This procedure seeds column usage information from a statements in the specified SQL tuning set, or in the database.

The procedure iterates over the SQL statements, compiles them, and then seeds column usage information for the columns that appear in these statements. You can monitor the workload on the system for given amount of time and seed the and seed the column usage information based on the columns that appear in statements executed during the monitoring window.

Syntax

```

DBMS_STATS.SEED_COL_USAGE (
    sqlset_name    IN    VARCHAR2,
    owner_name     IN    VARCHAR2,
    time_limit     IN    POSITIVE DEFAULT NULL);

```

Parameters

Table 177-118 SEED_COL_USAGE Procedure Parameters

| Parameter | Description |
|-------------|--|
| sqlset_name | Name of the SQL tuning set that contains the statements to be monitored. If this parameter and owner_name are both null, then the procedure monitors all statements in the database for the specified time limit. |
| owner_name | Owner of the SQL tuning set that contains the statements to be monitored. If this parameter and sqlset_name are both null, then the procedure monitors all statements in the database for the specified time limit. |
| time_limit | Time limit (in seconds). |

Security Model

To invoke this procedure you must have the `ANALYZE ANY` privilege and the `ANALYZE ANY DICTIONARY` privilege.

Exceptions

ORA-20000: Insufficient privileges

Usage Notes

This procedure also records group of columns. You can create extensions for the recorded group of columns using the [CREATE_EXTENDED_STATS Function](#) procedure. If `sqlset_name` and `owner_name` are NULL, then the procedure records the column (group) usage information for the statements executed in the system in next `time_limit` seconds.

This monitoring procedure records different information from the traditional column usage information that is visible in `SYS.COL_USAGE$`. The procedure stores information in `SYS.COL_GROUP_USAGE$`.

Examples

The following example turns on monitoring for 5 minutes or 300 seconds.

```
BEGIN
  DBMS_STATS.SEED_COL_USAGE (null,null,300);
END;
```

177.7.112 SET_ADVISOR_TASK_PARAMETER Procedure

This procedure updates the value of an Optimizer Statistics Advisor task parameter.

Syntax

```
DBMS_STATS.SET_ADVISOR_TASK_PARAMETER (
  task_name      IN   VARCHAR2,
  parameter      IN   VARCHAR2,
  value          IN   VARCHAR2);
```

Parameters

Table 177-119 SET_ADVISOR_TASK_PARAMETER Procedure Parameters

| Parameter | Description |
|-----------|--|
| task_name | The name of the Optimizer Statistics Advisor task. |
| parameter | The name of the parameter to set. The function returns an error if the specified parameter does not exist. |
| value | The new value of the parameter. |

Security Model

Note the following:

- To execute this subprogram, you must have the `ADVISOR` privilege.
- You must be the owner of the task.
- This subprogram executes using invoker's rights.

Exceptions

- `ORA-20000`: Insufficient privileges
- `ORA-20001`: Invalid input values
- `ORA-20012`: Optimizer Statistics Advisor errors

See Also:

Oracle Database SQL Tuning Guide to learn how to manage Optimizer Statistics Advisor

177.7.113 SET_COLUMN_STATS Procedures

This procedure sets column-related information.

In the version of this procedure that deals with user-defined statistics, the statistics type specified is the type to store in the dictionary, in addition to the actual user-defined statistics. If this statistics type is `NULL`, the statistics type associated with the index or column is stored.

Syntax

```
DBMS_STATS.SET_COLUMN_STATS (
  ownname      VARCHAR2,
  tabname      VARCHAR2,
  colname      VARCHAR2,
  partname     VARCHAR2 DEFAULT NULL,
  stattab      VARCHAR2 DEFAULT NULL,
  statid       VARCHAR2 DEFAULT NULL,
  distcnt      NUMBER DEFAULT NULL,
  density      NUMBER DEFAULT NULL,
```

```

nullcnt      NUMBER DEFAULT NULL,
srec         StatRec DEFAULT NULL,
avgclen     NUMBER DEFAULT NULL,
flags       NUMBER DEFAULT NULL,
statown     VARCHAR2 DEFAULT NULL,
no_invalidate BOOLEAN DEFAULT to_no_invalidate_type(
                                get_param('NO_INVALIDATE')),
force       BOOLEAN DEFAULT FALSE);

```

Use the following for user-defined statistics:

```

DBMS_STATS.SET_COLUMN_STATS (
  ownname     VARCHAR2,
  tabname     VARCHAR2,
  colname     VARCHAR2,
  partname    VARCHAR2 DEFAULT NULL,
  statab     VARCHAR2 DEFAULT NULL,
  statid     VARCHAR2 DEFAULT NULL,
  ext_stats   RAW,
  statypown  VARCHAR2 DEFAULT NULL,
  statypname VARCHAR2 DEFAULT NULL,
  statown    VARCHAR2 DEFAULT NULL,
  no_invalidate BOOLEAN DEFAULT to_no_invalidate_type(
                                get_param('NO_INVALIDATE')),
  force      BOOLEAN DEFAULT FALSE);

```

Parameters

Table 177-120 SET_COLUMN_STATS Procedure Parameters

| Parameter | Description |
|------------|---|
| ownname | Name of the schema. |
| tabname | Name of the table to which this column belongs. |
| colname | Name of the column or extension |
| partname | Name of the table partition in which to store the statistics. If the table is partitioned and partname is NULL, then the statistics are stored at the global table level. |
| statab | User statistics table identifier describing where to store the statistics. If statab is NULL, then the statistics are stored directly in the dictionary. |
| statid | Identifier (optional) to associate with these statistics within statab (Only pertinent if statab is not NULL) |
| ext_stats | User-defined statistics |
| statypown | Schema of the statistics type |
| statypname | Name of the statistics type |
| distcnt | Number of distinct values |
| density | Column density. If this value is NULL and if distcnt is not NULL, then density is derived from distcnt. |
| nullcnt | Number of NULLs |
| srec | StatRec structure filled in by a call to PREPARE_COLUMN_VALUES or GET_COLUMN_STATS |
| avgclen | Average length for the column (in bytes) |

Table 177-120 (Cont.) SET_COLUMN_STATS Procedure Parameters

| Parameter | Description |
|---------------|---|
| flags | For internal Oracle use (should be left as NULL) |
| statown | Schema containingstattab (if different than ownname) |
| no_invalidate | Controls the invalidation of dependent cursors when statistics are gathered. The parameter takes the following values: <ul style="list-style-type: none"> • TRUE: Dependent cursors are not invalidated. • FALSE: Dependent cursors are marked for immediate invalidation. • AUTO: This is the default value. Rolling invalidation is used to invalidate all dependent cursors over a period of time. The performance impact on the database is reduced especially in cases where a large number of cursors are invalidated. You can change the default using the SET_DATABASE_PREFS Procedure , SET_GLOBAL_PREFS Procedure , SET_SCHEMA_PREFS Procedure and SET_TABLE_PREFS Procedure . |
| force | Sets the values even if statistics of the column are locked |

Exceptions

ORA-20000: Object does not exist or insufficient privileges

ORA-20001: Invalid or inconsistent input values

ORA-20005: Object statistics are locked

Usage Notes

To invoke this procedure you must be owner of the table, or you need the `ANALYZE ANY` privilege. For objects owned by `SYS`, you need to be either the owner of the table, or you need the `ANALYZE ANY DICTIONARY` privilege or the `SYSDBA` privilege.

177.7.114 SET_DATABASE_PREFS Procedure

This procedure sets the statistics preferences of all the tables, excluding the tables owned by the database. These tables can be included by passing `TRUE` for the `add_sys` parameter.

Syntax

```
DBMS_STATS.SET_DATABASE_PREFS (
  pname          IN   VARCHAR2,
  pvalue         IN   VARCHAR2,
  add_sys        IN   BOOLEAN DEFAULT FALSE);
```

Parameters

Table 177-121 SET_DATABASE_PREFS Procedure Parameters

| Parameter | Description |
|-----------|---|
| pname | <p>Preference name. The existing value for following preferences can be set and default preference values will be used:</p> <ul style="list-style-type: none"> • APPROXIMATE_NDV_ALGORITHM • AUTO_STAT_EXTENSIONS • CASCADE • DEGREE • ESTIMATE_PERCENT • GLOBAL_TEMP_TABLE_STATS • GRANULARITY • INCREMENTAL • INCREMENTAL_STALENESS • INCREMENTAL_LEVEL • METHOD_OPT • NO_INVALIDATE • OPTIONS • PREFERENCE_OVERRIDES_PARAMETER • PUBLISH • STALE_PERCENT • STAT_CATEGORY • TABLE_CACHED_BLOCKS |
| pvalue | <p>Preference value. If NULL is specified, it will set the Oracle default values</p> |
| add_sys | <p>Value TRUE will include the Oracle-owned tables</p> |

Table 177-122 Statistics Preferences

| Preference | Description |
|---------------------------|--|
| APPROXIMATE_NDV_ALGORITHM | <p>Specifies the synopsis generation algorithm. A synopsis is special type of statistic that tracks the number of distinct values (NDV) for each column in a partition. Consider a synopsis as an internal management structure that samples distinct values.</p> <p>You can specify the following preferences:</p> <ul style="list-style-type: none"> REPEAT OR HYPERLOGLOG This is the default. If INCREMENTAL is enabled on the table, then the database preserves the format of any existing synopses that use the adaptive sampling algorithm. However, the database creates any new synopses in HyperLogLog format. This approach is attractive when existing performance is acceptable, and you do not want to incur the performance cost of reformatting legacy content. ADAPTIVE SAMPLING The database uses the adaptive sampling algorithm for all synopses. This is the most conservative option. HYPERLOGLOG The database uses the HyperLogLog algorithm for all new and stale synopses. In contrast to adaptive sampling, the HyperLogLog algorithm uses a randomization technique. The advantages of HyperLogLog over adaptive sampling are: <ul style="list-style-type: none"> The accuracy of the new algorithm is similar to the original algorithm. The memory required is significantly lower, which typically leads to huge reductions in synopsis size. |
| AUTO_STAT_EXTENSIONS | <p>Controls the automatic creation of extensions when database statistics are gathered.</p> <p>You can set the following values:</p> <ul style="list-style-type: none"> ON — When applicable, a SQL plan directive can trigger the creation of column group statistics based on usage of columns in the predicates in the workload. OFF — The database does not create column group statistics automatically. The database creates them only when the CREATE_EXTENDED_STATS function is executed, or when extended statistics are specified explicitly in the METHOD_OPT clause of DBMS_STATS. This is the default. |
| CASCADE | Determines whether to collect index statistics as part of gathering table statistics. |
| DEGREE | Determines the degree of parallelism used for gathering statistics. |

Table 177-122 (Cont.) Statistics Preferences

| Preference | Description |
|-------------------------|--|
| ESTIMATE_PERCENT | <p>Determines the percentage of rows to sample.</p> <p>The valid range is between 0.000001 and 100. Use the constant <code>DBMS_STATS.AUTO_SAMPLE_SIZE</code> to enable the database to determine the appropriate sample size for optimal statistics. This is the default.</p> |
| GLOBAL_TEMP_TABLE_STATS | <p>Controls whether the statistics gathered for a global temporary table should be stored as shared statistics or session statistics. This preference takes two values:</p> <ul style="list-style-type: none">• <code>SHARED</code> — All sessions see the same set of statistics• <code>SESSION</code> — Statistics gathered by the <code>GATHER_TABLE_STATS</code> procedure on a global temporary table are session-specific. Thus, the database only uses them for queries issued in the same session as the statistics gathering process. The database deletes session-specific statistics when a session terminates. |
| GRANULARITY | <p>Determines the granularity of statistics to collect. This preference is only relevant for partitioned tables.</p> <p>The following values are valid:</p> <ul style="list-style-type: none">• <code>ALL</code> — Gathers all statistics: subpartition, partition, and global.• <code>AUTO</code> — Determines the granularity based on the partitioning type. This is the default value.• <code>DEFAULT</code> — Gathers global and partition-level statistics. This option is obsolete, and while currently supported, it is included in the documentation for legacy reasons only. Use <code>GLOBAL AND PARTITION</code> for this functionality.• <code>GLOBAL</code> — Gathers global statistics.• <code>GLOBAL AND PARTITION</code> — Gathers the global and partition level statistics. No subpartition level statistics are gathered even if it is a composite partitioned object.• <code>PARTITION</code> — Gathers partition-level statistics.• <code>SUBPARTITION</code> — Gathers subpartition-level statistics. |

Table 177-122 (Cont.) Statistics Preferences

| Preference | Description |
|-------------------|--|
| INCREMENTAL | <p>Determines whether the global statistics for a partitioned table are maintained without performing a full table scan. When a table is partitioned, an application typically loads data into a new partition. As new partitions are added and data is loaded, global table statistics must be kept up to date. If the following conditions are met, then the database updates the global table statistics by scanning only the changed partitions instead of the entire table:</p> <ul style="list-style-type: none"> • The INCREMENTAL value for the partitioned table is set to TRUE. • The PUBLISH value for the partitioned table is set to TRUE. • The user specifies AUTO_SAMPLE_SIZE for ESTIMATE_PERCENT and AUTO for GRANULARITY when gathering statistics on the table. <p>If the INCREMENTAL value for the partitioned table was set to FALSE (default value), then the database uses a full table scan to maintain the global statistics. This technique is a much more resource-intensive and time-consuming operation for large tables.</p> |
| INCREMENTAL_LEVEL | <p>Controls which synopses to collect when INCREMENTAL preference is set to TRUE. It takes the following values:</p> <ul style="list-style-type: none"> • PARTITION — Gathers partition-level synopses. This is the default value. If PARTITION is set on a nonpartitioned table, then the database does not gather synopses. • TABLE — Gathers table-level synopses. Specify this value when you want to exchange this table with a partition. Before the exchange, you can run GATHER_TABLE_STATS on this table with INCREMENTAL set to TRUE and INCREMENTAL_LEVEL to TABLE. The result is that the database gathers table-level synopses on this table. After the exchange, the partition has synopses that come from the table-level synopses of the table before the exchange. You can only use preference value in the SET_TABLE_PREFS procedure: this value is not allowed in the other SET_*_PREFS procedures. |

Table 177-122 (Cont.) Statistics Preferences

| Preference | Description |
|-----------------------|---|
| INCREMENTAL_STALENESS | <p>Specifies when a partition or subpartition is considered stale. This parameter takes an enumeration of values, such as 'USE_STALE_PERCENT' and 'USE_LOCKED_STATS'. You can also specify multiple values, such as 'USE_STALE_PERCENT,USE_LOCKED_STATS,ALLOW_MIXED_FORMAT'.</p> <p>The parameter accepts the following values:</p> <ul style="list-style-type: none"> • USE_STALE_PERCENT—A partition or subpartition is not considered stale when DML changes are below the threshold set by the STALE_PERCENT preference. For example, assume that STALE_PERCENT is 10. You specify USE_STALE_PERCENT for INCREMENTAL_STALENESS. The partition has 5% DML changes. The database does not regather statistics. Assume a different case in which STALE_PERCENT is 10. You specify USE_STALE_PERCENT for INCREMENTAL_STALENESS. However, in this case the partition is locked and has 20% of DML changes. Because the partition is locked, the database does not regather statistics. • USE_LOCKED_STATS—Locked partitions or subpartitions statistics are never considered stale, regardless of DML changes. For example, assume that STALE_PERCENT is 10. You specify 'USE_LOCKED_STATS, USE_STALE_PERCENT'. The partition, which is locked, has 20% DML changes. The partition is not considered stale. The database uses existing statistics to derive global statistics. • ALLOW_MIXED_FORMAT—Adaptive sampling synopses and HyperLogLog synopses are permitted to coexist. • NULL—A partition or subpartition is considered stale when it has any DML changes. For example, assume that STALE_PERCENT is 10. You specify the value 'NULL' for INCREMENTAL_STALENESS. The partition has 5% of DML changes. The database regathers statistics. <p>Note that the following two executions are different:</p> <pre>EXEC DBMS_STATS.SET_TABLE_PREFS ('sh', 'sales', 'INCREMENTAL_STALENESS', 'NULL');</pre> <pre>EXEC DBMS_STATS.SET_TABLE_PREFS ('sh', 'sales', 'INCREMENTAL_STALENESS', null);</pre> |

Table 177-122 (Cont.) Statistics Preferences

| Preference | Description |
|---------------|--|
| METHOD_OPT | <p>The first execution uses single quotes to set the preference to the value <code>NULL</code>, whereas the second sets the preference to the default, which is <code>ALLOW_MIXED_FORMAT</code>.</p> <p>Controls column statistics collection and histogram creation. When setting preferences at the global, schema, database, or dictionary level, only <code>FOR ALL</code> syntax is allowed:</p> <ul style="list-style-type: none"> <code>FOR ALL [INDEXED HIDDEN] COLUMNS [size_clause]</code> <p>The <code>size_clause</code> is defined as <code>size_clause := SIZE {integer REPEAT AUTO SKEWONLY}</code></p> <p><code>integer</code> — Specifies the number of histogram buckets. The number must be between 1 and 2048.</p> <p><code>REPEAT</code> — Collects histograms only on the columns that already have histograms.</p> <p><code>AUTO</code> — Determines the columns on which to collect histograms based on data distribution and the workload of the columns.</p> <p><code>SKEWONLY</code> — Determines the columns on which to collect histograms based on the data distribution of the columns.</p> <p>The default is <code>FOR ALL COLUMNS SIZE AUTO</code>. You can change the value using the SET_DATABASE_PREFS Procedure, SET_GLOBAL_PREFS Procedure, SET_SCHEMA_PREFS Procedure and SET_TABLE_PREFS Procedure.</p> |
| NO_INVALIDATE | <p>Controls the invalidation of dependent cursors when statistics are gathered. The parameter takes the following values:</p> <ul style="list-style-type: none"> <code>TRUE</code>: Dependent cursors are not invalidated. <code>FALSE</code>: Dependent cursors are marked for immediate invalidation. <code>AUTO</code>: This is the default value. Rolling invalidation is used to invalidate all dependent cursors over a period of time. The performance impact on the database is reduced especially in cases where a large number of cursors are invalidated. <p>If set to <code>TRUE</code>, then the database not invalidate dependent cursors. If set to <code>FALSE</code>, then the procedure invalidates dependent cursors immediately.</p> |

Table 177-122 (Cont.) Statistics Preferences

| Preference | Description |
|--------------------------------|--|
| OPTIONS | <p>Specifies which objects require statistics to be gathered. Valid values are as follows:</p> <ul style="list-style-type: none"> GATHER — Gathers statistics on all objects in the database. This is the default. GATHER AUTO — Gathers all necessary statistics automatically. This is the default. <p>The database implicitly determines which objects need new statistics and determines how to gather those statistics. When GATHER AUTO is specified, the only additional valid parameters are comp_id, no_invalidate, stattab, statid, and statown; all other parameter settings will be ignored. Also, the database returns a list of objects processed.</p> |
| PREFERENCE_OVERRIDES_PARAMETER | <p>Determines whether to override the input value of a parameter with the preference value of that parameter for a statistics operation. Possible values are:</p> <ul style="list-style-type: none"> TRUE — Ignores input parameter values, and uses the value of the corresponding preference. FALSE — Obeys input parameter values. <p>Specifying this preference does not change the order of precedence of table, global, and default.</p> |
| PUBLISH | <p>Determines whether the database publishes newly gathered statistics after the gathering job completes. You can gather statistics without publishing them immediately. This technique enables you to test new statistics before publishing them.</p> |
| STALE_PERCENT | <p>Determines the percentage of rows in a table that must change before the statistics on that table are stale and need to be regathered.</p> <p>The valid domain for stale_percent is non-negative numbers. The default value is 10, which means that a table having more than 10% of changes is considered stale.</p> |
| STAT_CATEGORY | <p>Specifies which statistics to import or export, accepting multiple values separated by a comma. Values supported:</p> <ul style="list-style-type: none"> OBJECT_STATS — table statistics, column statistics and index statistics (default) SYNOPSIS — information to support incremental statistics REALTIME_STATS — specifies only real-time statistics. <p>The value 'OBJECT_STATS, SYNOPSIS' specifies table statistics, column statistics, index statistics, and synopsis.</p> |

Table 177-122 (Cont.) Statistics Preferences

| Preference | Description |
|---------------------|---|
| TABLE_CACHED_BLOCKS | Specifies the average number of blocks assumed to be cached in the buffer cache when calculating the index clustering factor. The preference applies only when gathering statistics using DBMS_STATS. Index statistics gathered during CREATE INDEX or REBUILD INDEX operations will use the default value 1. |

Security Model

To run this procedure, you must have the SYSDBA role or both ANALYZE ANY DICTIONARY and ANALYZE ANY system privileges.

Exceptions

ORA-20000: Insufficient privileges

ORA-20001: Invalid or illegal input values

Usage Notes

Both arguments are of type VARCHAR2 and values are enclosed in quotes, even when they represent numbers.

Examples

```
DBMS_STATS.SET_DATABASE_PREFS('CASCADE', 'DBMS_STATS.AUTO_CASCADE');
DBMS_STATS.SET_DATABASE_PREFS('ESTIMATE_PERCENT', '9');
DBMS_STATS.SET_DATABASE_PREFS('DEGREE', '99');
```

**See Also:**

Oracle Database SQL Tuning Guide to learn how to set optimizer statistics preferences

177.7.115 SET_GLOBAL_PREFS Procedure

This procedure sets statistics preferences at the global level.

Syntax

```
DBMS_STATS.SET_GLOBAL_PREFS (
  pname      IN   VARCHAR2,
  pvalue     IN   VARCHAR2);
```

Parameters

Table 177-123 SET_GLOBAL_PREFS Procedure Parameters

| Parameter | Description |
|-----------|--|
| pname | <p>Preference name. The default value for the following preferences can be set:</p> <ul style="list-style-type: none"> • APPROXIMATE_NDV_ALGORITHM • AUTO_STAT_EXTENSIONS • AUTO_TASK_STATUS • AUTO_TASK_MAX_RUN_TIME • AUTO_TASK_INTERVAL • AUTOSTATS_TARGET • CASCADE • CONCURRENT • DEGREE • ESTIMATE_PERCENT • GLOBAL_TEMP_TABLE_STATS • GRANULARITY • INCREMENTAL • INCREMENTAL_LEVEL • INCREMENTAL_STALENESS • METHOD_OPT • NO_INVALIDATE • OPTIONS • PREFERENCE_OVERRIDES_PARAMETER • PUBLISH • STALE_PERCENT • STAT_CATEGORY • TABLE_CACHED_BLOCKS • WAIT_TIME_TO_UPDATE_STATS |
| pvalue | <p>Preference value. If NULL is specified, it will set the Oracle default values</p> |

Table 177-124 Global Statistics Preferences

| Preference | Description |
|---------------------------|--|
| APPROXIMATE_NDV_ALGORITHM | <p>Specifies the synopsis generation algorithm. A synopsis is special type of statistic that tracks the number of distinct values (NDV) for each column in a partition. Consider a synopsis as an internal management structure that samples distinct values.</p> <p>You can specify the following preferences:</p> <ul style="list-style-type: none"> <li data-bbox="854 558 1373 877">• REPEAT OR HYPERLOGLOG This is the default. If INCREMENTAL is enabled on the table, then the database preserves the format of any existing synopses that use the adaptive sampling algorithm. However, the database creates any new synopses in HyperLogLog format. This approach is attractive when existing performance is acceptable, and you do not want to incur the performance cost of reformatting legacy content. <li data-bbox="854 890 1373 1010">• ADAPTIVE SAMPLING The database uses the adaptive sampling algorithm for all synopses. This is the most conservative option. <li data-bbox="854 1022 1373 1377">• HYPERLOGLOG The database uses the HyperLogLog algorithm for all new and stale synopses. In contrast to adaptive sampling, the HyperLogLog algorithm uses a randomization technique. | AUTO_STAT_EXTENSIONS | <p>Controls the automatic creation of extensions when database statistics are gathered.</p> <p>You can set the following values:</p> <ul style="list-style-type: none"> <li data-bbox="854 1493 1373 1612">• ON — When applicable, a SQL plan directive can trigger the creation of column group statistics based on usage of columns in the predicates in the workload. <li data-bbox="854 1625 1373 1816">• OFF— The database does not create column group statistics automatically. The database creates them only when the CREATE_EXTENDED_STATS function is executed, or when extended statistics are specified explicitly in the METHOD_OPT clause of DBMS_STATS. This is the default. |

Table 177-124 (Cont.) Global Statistics Preferences

| Preference | Description |
|------------------------|---|
| AUTO_TASK_STATUS | Enables or disables the high-frequency automatic optimizer statistics collection. Values are: <ul style="list-style-type: none"> ON — Enables high-frequency automatic optimizer statistics collection. OFF — Disables high-frequency automatic optimizer statistics collection. This is the default. |
| AUTO_TASK_MAX_RUN_TIME | Configures the maximum run time in seconds of an execution of high-frequency automatic optimizer statistics collection. The maximum value is 3600 (equal to 1 hour), which is the default. |
| AUTO_TASK_INTERVAL | Specifies the interval in seconds between executions of high-frequency automatic optimizer statistics collection. The minimum value is 60. The default is 900 (equal to 15 minutes). |
| AUTOSTATS_TARGET | Controls the objects considered for statistics collection. It takes the following values: <ul style="list-style-type: none"> 'ALL' - Statistics collected for all objects in system 'ORACLE' - Statistics collected for all Oracle owned objects 'AUTO' - Oracle decides on which objects to collect statistics This preference is applicable only for automatic statistics collection. |
| CASCADE | Determines whether to collect index statistics as part of gathering table statistics. |
| CONCURRENT | Determines whether statistics are gathered concurrently on multiple objects, or serially, one object at a time. Valid values are: <ul style="list-style-type: none"> MANUAL — Concurrency is enabled only for manual statistics gathering. AUTOMATIC — Concurrency is enabled only for the automatic statistics gathering. ALL — Concurrency is enabled for both manual and automatic statistics gathering. OFF — Concurrency is disabled for both manual and automatic statistics. |
| DEGREE | Determines the degree of parallelism used for gathering statistics. |
| ESTIMATE_PERCENT | Determines the percentage of rows to sample. The valid range is between 0.000001 and 100. Use the constant <code>DBMS_STATS.AUTO_SAMPLE_SIZE</code> to enable the database to determine the appropriate sample size for optimal statistics. This is the default. |

Table 177-124 (Cont.) Global Statistics Preferences

| Preference | Description |
|-------------------------|--|
| GLOBAL_TEMP_TABLE_STATS | <p>Controls whether the statistics gathered for a global temporary table should be stored as shared statistics or session statistics. This preference takes two values:</p> <ul style="list-style-type: none"> • SHARED — All sessions see the same set of statistics • SESSION — Statistics gathered by the GATHER_TABLE_STATS procedure on a global temporary table are session-specific. Thus, the database only uses them for queries issued in the same session as the statistics gathering process. The database deletes session-specific statistics when a session terminates. |
| GRANULARITY | <p>Determines the granularity of statistics to collect. This preference is only relevant for partitioned tables.</p> <p>The following values are valid:</p> <ul style="list-style-type: none"> • ALL — Gathers all statistics: subpartition, partition, and global. • AUTO — Determines the granularity based on the partitioning type. This is the default value. • DEFAULT — Gathers global and partition-level statistics. This option is obsolete, and while currently supported, it is included in the documentation for legacy reasons only. Use GLOBAL AND PARTITION for this functionality. • GLOBAL — Gathers global statistics. • GLOBAL AND PARTITION — Gathers the global and partition level statistics. No subpartition level statistics are gathered even if it is a composite partitioned object. • PARTITION — Gathers partition-level statistics. • SUBPARTITION — Gathers subpartition-level statistics. |

Table 177-124 (Cont.) Global Statistics Preferences

| Preference | Description |
|-------------------|---|
| INCREMENTAL | <p>Determines whether the global statistics for a partitioned table are maintained without performing a full table scan.</p> <p>When a table is partitioned, an application typically loads data into a new partition. As new partitions are added and data is loaded, global table statistics must be kept up to date. If the following conditions are met, then the database updates the global table statistics by scanning only the changed partitions instead of the entire table:</p> <ul style="list-style-type: none"> • The INCREMENTAL value for the partitioned table is set to TRUE. • The PUBLISH value for the partitioned table is set to TRUE. • The user specifies AUTO_SAMPLE_SIZE for ESTIMATE_PERCENT and AUTO for GRANULARITY when gathering statistics on the table. <p>If the INCREMENTAL value for the partitioned table was set to FALSE (default value), then the database uses a full table scan to maintain the global statistics. This technique is a much more resource-intensive and time-consuming operation for large tables.</p> |
| INCREMENTAL_LEVEL | <p>Controls which synopses to collect when INCREMENTAL preference is set to TRUE. It takes the following values:</p> <ul style="list-style-type: none"> • PARTITION — Gathers partition-level synopses. This is the default value. If PARTITION is set on a nonpartitioned table, then the database does not gather synopses. • TABLE — Gathers table-level synopses. Specify this value when you want to exchange this table with a partition. Before the exchange, you can run GATHER_TABLE_STATS on this table with INCREMENTAL set to TRUE and INCREMENTAL_LEVEL to TABLE. The result is that the database gathers table-level synopses on this table. After the exchange, the partition has synopses that come from the table-level synopses of the table before the exchange. You can only use preference value in the SET_TABLE_PREFS procedure: this value is not allowed in the other SET_*_PREFS procedures. |

Table 177-124 (Cont.) Global Statistics Preferences

| Preference | Description |
|-----------------------|--|
| INCREMENTAL_STALENESS | <p>Specifies when a partition or subpartition is considered stale. This parameter takes an enumeration of values, such as 'USE_STALE_PERCENT' and 'USE_LOCKED_STATS'. You can also specify multiple values, such as 'USE_STALE_PERCENT,USE_LOCKED_STATS,ALLOW_MIXED_FORMAT'.</p> <p>The parameter accepts the following values:</p> <ul style="list-style-type: none"> <p>USE_STALE_PERCENT—A partition or subpartition is not considered stale when DML changes are below the threshold set by the STALE_PERCENT preference.</p> <p>For example, assume that STALE_PERCENT is 10. You specify the value 'NULL' for INCREMENTAL_STALENESS. The partition has 5% of DML changes. The database regathers statistics.</p> |

Table 177-124 (Cont.) Global Statistics Preferences

| Preference | Description |
|------------|---|
| METHOD_OPT | <p>Note that the following two executions are different:</p> <pre data-bbox="852 436 1312 527">EXEC DBMS_STATS.SET_TABLE_PREFS ('sh', 'sales', 'INCREMENTAL_STALENESS', 'NULL');</pre> <pre data-bbox="852 594 1286 684">EXEC DBMS_STATS.SET_TABLE_PREFS ('sh', 'sales', 'INCREMENTAL_STALENESS', null);</pre> <p>The first execution uses single quotes to set the preference to the value NULL, whereas the second sets the preference to the default, which is ALLOW_MIXED_FORMAT.</p> <p>Controls column statistics collection and histogram creation. It accepts either of the following options, or both in combination:</p> <ul data-bbox="852 961 1369 1020" style="list-style-type: none"> • FOR ALL [INDEXED HIDDEN] COLUMNS [size_clause] <p>size_clause is defined as size_clause := SIZE {integer REPEAT AUTO SKEWONLY}</p> <ul data-bbox="889 1136 1377 1570" style="list-style-type: none"> - integer: Number of histogram buckets. Must be in the range [1,2048]. - REPEAT : Collects histograms only on the columns that already have histograms - AUTO : Oracle determines the columns on which to collect histograms based on data distribution and the workload of the columns - SKEWONLY : Oracle determines the columns on which to collect histograms based on the data distribution of the columns - column_name: name of a column - extension : can be either a column group in the format of (column_name, colume_name [, ..]) or an expression <p>The default is FOR ALL COLUMNS SIZE AUTO.</p> |

Table 177-124 (Cont.) Global Statistics Preferences

| Preference | Description |
|--------------------------------|---|
| NO_INVALIDATE | <p>Controls the invalidation of dependent cursors when statistics are gathered. The parameter takes the following values:</p> <ul style="list-style-type: none"> • TRUE: Dependent cursors are not invalidated. • FALSE: Dependent cursors are marked for immediate invalidation. • AUTO: This is the default value. Rolling invalidation is used to invalidate all dependent cursors over a period of time. The performance impact on the database is reduced especially in cases where a large number of cursors are invalidated. <p>If set to TRUE, then the database not invalidate dependent cursors. If set to FALSE, then the procedure invalidates dependent cursors immediately.</p> |
| OPTIONS | <p>Determines the <code>options</code> parameter used in the <code>GATHER_TABLE_STATS</code> procedure. The preference takes the following values:</p> <ul style="list-style-type: none"> • GATHER — Gathers statistics for all objects in the table. This is the default. • GATHER AUTO — Oracle recommends using GATHER AUTO to gather necessary statistics, such as histograms, after a table has been bulk loaded and acquired online statistics. This is applicable only to tables that are not using INCREMENTAL statistics. <p>For partitioned tables using INCREMENTAL statistics, GATHER_TABLE_STATS with GATHER AUTO will gather statistics for a table if it is marked stale or has no statistics. In addition, statistics will be gathered for partitions and sub-partitions that are marked stale or have no statistics.</p> <p>For tables not using INCREMENTAL statistics, GATHER_TABLE_STATS with GATHER AUTO may gather statistics for partitions and sub-partitions, even if they are not marked stale.</p> |
| PREFERENCE_OVERRIDES_PARAMETER | <p>Determines whether to override the input value of a parameter with the preference value of that parameter for a statistics operation. Possible values are:</p> <ul style="list-style-type: none"> • TRUE — Ignores input parameter values, and uses the value of the corresponding preference. • FALSE — Obeyes input parameter values. <p>Specifying this preference does not change the order of precedence of table, global, and default.</p> |

Table 177-124 (Cont.) Global Statistics Preferences

| Preference | Description |
|---------------------------|--|
| PUBLISH | <p>Determines whether the database publishes newly gathered statistics after the gathering job completes.</p> <p>You can gather statistics without publishing them immediately. This technique enables you to test new statistics before publishing them.</p> |
| STALE_PERCENT | <p>Determines the percentage of rows in a table that must change before the statistics on that table are stale and need to be regathered.</p> <p>The valid domain for <code>stale_percent</code> is non-negative numbers. The default value is 10, which means that a table having more than 10% of changes is considered stale.</p> |
| STAT_CATEGORY | <p>Specifies which statistics to import or export, accepting multiple values separated by a comma. Values supported:</p> <ul style="list-style-type: none"> • <code>OBJECT_STATS</code> — table statistics, column statistics and index statistics (default) • <code>SYNOPSIS</code> — information to support incremental statistics • <code>REALTIME_STATS</code> — specifies only real-time statistics. <p>The value '<code>OBJECT_STATS, SYNOPSIS</code>' specifies table statistics, column statistics, index statistics, and synopses.</p> |
| TABLE_CACHED_BLOCKS | <p>Specifies the average number of blocks assumed to be cached in the buffer cache when calculating the index clustering factor. The preference applies only when gathering statistics using <code>DBMS_STATS</code>. Index statistics gathered during <code>CREATE INDEX</code> or <code>REBUILD INDEX</code> operations will use the default value 1.</p> |
| WAIT_TIME_TO_UPDATE_STATS | <p>Specifies the number of minutes before timing out for locks and pins required for updating statistics. It accepts values in the range 0 to 65535. The default value is 15 minutes. The value 0 gets the locks and pins in no-wait mode.</p> |

Security Model

To run this procedure, you must have the `SYSDBA` or both `ANALYZE ANY DICTIONARY` and `ANALYZE ANY` system privilege.

Exceptions

ORA-20000: Insufficient privileges

ORA-20001: Invalid or illegal input values

Usage Notes

- This setting is honored only if there is no preference specified for the table to be analyzed.
- Both arguments are of type `VARCHAR2` and values are enclosed in quotes, even when they represent numbers.

Example 177-16 Overriding Statistics Preferences at the Global Level

You use the `SET_GLOBAL_PREFS` procedure to set the `ESTIMATE_PERCENT` preference to 5 for every table in the database that does not have a table preference set. Because `sh.costs` does not have a preference set, the global setting applies to this table.

```
SQL> EXEC DBMS_STATS.SET_GLOBAL_PREFS ('ESTIMATE_PERCENT', '5');
```

PL/SQL procedure successfully completed.

You use `SET_TABLE_PREFS` to set the `PREFERENCE_OVERRIDES_PARAMETER` preference to true for the `sh.sales` table only.

```
SQL> EXEC  
DBMS_STATS.SET_TABLE_PREFS('sh','sales','PREFERENCE_OVERRIDES_PARAMETER',  
'TRUE');
```

PL/SQL procedure successfully completed.

A script attempts to set `ESTIMATE_PERCENT` to 10 when gathering statistics for `sh.sales`. However, because `PREFERENCE_OVERRIDES_PARAMETER` is `TRUE` for this table, and because a global preference is defined, Oracle Database gathers statistics using the global setting of 5 rather than the specified setting of 10:

```
SQL> EXEC DBMS_STATS.GATHER_TABLE_STATS ('sh', 'costs',  
ESTIMATE_PERCENT=>10);
```

PL/SQL procedure successfully completed.

Example 177-17 Configuring High-Frequency Automatic Optimizer Statistics Collection

Oracle Database 19c introduces high-frequency automatic optimizer statistics collection. This lightweight task periodically gathers statistics for stale objects. The default interval is 15 minutes. In contrast to the automated statistics collection job, the high-frequency task does not perform actions such as purging statistics for non-existent objects or invoking Optimizer Statistics Advisor.

In this example, you enable high-frequency collection, set its maximum run time to a half hour, and then set the frequency interval to 10 minutes:

```
EXEC DBMS_STATS.SET_GLOBAL_PREFS('AUTO_TASK_STATUS','ON');  
EXEC DBMS_STATS.SET_GLOBAL_PREFS('AUTO_TASK_MAX_RUN_TIME','1800');  
EXEC DBMS_STATS.SET_GLOBAL_PREFS('AUTO_TASK_INTERVAL','600');
```

**See Also:**

Oracle Database SQL Tuning Guide to learn how to set optimizer statistics preferences

177.7.116 SET_INDEX_STATS Procedures

These procedures set index-related statistics.

The version of this procedure that accepts `ext_stats` sets statistics for use with domain indexes. The statistics type specified is the type to store in the dictionary, in addition to the actual user-defined statistics. If this statistics type is null, then the database stores the statistics type associated with the index or column.

Syntax

```
DBMS_STATS.SET_INDEX_STATS (
  ownname      VARCHAR2,
  indname      VARCHAR2,
  partname     VARCHAR2  DEFAULT NULL,
  statab       VARCHAR2  DEFAULT NULL,
  statid       VARCHAR2  DEFAULT NULL,
  numrows      NUMBER     DEFAULT NULL,
  numblks     NUMBER     DEFAULT NULL,
  numdist     NUMBER     DEFAULT NULL,
  avgblk      NUMBER     DEFAULT NULL,
  avgdblk     NUMBER     DEFAULT NULL,
  clstfct     NUMBER     DEFAULT NULL,
  indlevel    NUMBER     DEFAULT NULL,
  flags       NUMBER     DEFAULT NULL,
  statown     VARCHAR2   DEFAULT NULL,
  no_invalidate BOOLEAN   DEFAULT to_no_invalidate_type(
                                get_param('NO_INVALIDATE')),
  guessq      NUMBER     DEFAULT NULL,
  cachedblk   NUMBER     DEFAULT NULL,
  cachehit    NUMBER     DEFAULT NULL,
  force       BOOLEAN   DEFAULT FALSE);
```

Use the following syntax for user-defined domain index statistics:

```
DBMS_STATS.SET_INDEX_STATS (
  ownname      VARCHAR2,
  indname      VARCHAR2,
  partname     VARCHAR2  DEFAULT NULL,
  statab       VARCHAR2  DEFAULT NULL,
  statid       VARCHAR2  DEFAULT NULL,
  ext_stats    RAW,
  stattyown   VARCHAR2  DEFAULT NULL,
  stattyname   VARCHAR2  DEFAULT NULL,
  statown     VARCHAR2  DEFAULT NULL,
  no_invalidate BOOLEAN  DEFAULT to_no_invalidate_type(
```

```

                                get_param('NO_INVALIDATE')),
force          BOOLEAN  DEFAULT FALSE);

```

Parameters

Table 177-125 SET_INDEX_STATS Procedure Parameters

| Parameter | Description |
|---------------|---|
| ownname | Name of the schema |
| indname | Name of the index |
| partname | Name of the index partition in which to store the statistics. If the index is partitioned and if <code>partname</code> is NULL, then the statistics are stored at the global index level. |
| stattab | User statistics table identifier describing where to store the statistics. If <code>stattab</code> is NULL, then the statistics are stored directly in the dictionary. |
| statid | Identifier (optional) to associate with these statistics within <code>stattab</code> (Only pertinent if <code>stattab</code> is not NULL) |
| ext_stats | User-defined statistics |
| stattypown | Schema of the statistics type |
| stattypname | Name of the statistics type |
| numrows | Number of rows in the index (partition) |
| numlblks | Number of leaf blocks in the index (partition) |
| numdist | Number of distinct keys in the index (partition) |
| avglblk | Average integral number of leaf blocks in which each distinct key appears for this index (partition). If not provided, then this value is derived from <code>numlblks</code> and <code>numdist</code> . |
| avgdblks | Average integral number of data blocks in the table pointed to by a distinct key for this index (partition). If not provided, then this value is derived from <code>clstfct</code> and <code>numdist</code> . |
| clstfct | See <code>clustering_factor</code> column of the <code>all_indexes</code> view for a description |
| indlevel | Height of the index (partition) |
| flags | For internal Oracle use (should be left as NULL) |
| statown | Schema containing <code>stattab</code> (if different than <code>ownname</code>) |
| no_invalidate | Controls the invalidation of dependent cursors when statistics are gathered. The parameter takes the following values: <ul style="list-style-type: none"> TRUE: Dependent cursors are not invalidated. FALSE: Dependent cursors are marked for immediate invalidation. AUTO: This is the default value. Rolling invalidation is used to invalidate all dependent cursors over a period of time. The performance impact on the database is reduced especially in cases where a large number of cursors are invalidated. <p>You can change the default using the SET_DATABASE_PREFS Procedure, SET_GLOBAL_PREFS Procedure, SET_SCHEMA_PREFS Procedure and SET_TABLE_PREFS Procedure.</p> |

Table 177-125 (Cont.) SET_INDEX_STATS Procedure Parameters

| Parameter | Description |
|-----------|--|
| guessq | Guess quality. See the <code>pct_direct_access</code> column of the <code>all_indexes</code> view for a description. |
| cachedblk | Internal use only. Do not set. |
| cachehit | Internal use only. Do not set. |
| force | Sets the values even if statistics of the index are locked |

Security Model

To invoke this procedure you must be owner of the table, or you need the `ANALYZE ANY` privilege. For objects owned by `SYS`, you need to be either the owner of the table, or you need the `ANALYZE ANY DICTIONARY` privilege or the `SYSDBA` privilege.

Exceptions

ORA-20000: Object does not exist or insufficient privileges

ORA-20001: Invalid input value

ORA-20005: Object statistics are locked

Usage Notes

- The Optimizer uses the cached data to estimate number of cached blocks for index or statistics table access. The total cost of the operation will be combined from the I/O cost of reading not cached blocks from disk, the CPU cost of getting cached blocks from the buffer cache, and the CPU cost of processing the data.
- Oracle maintains `cachedblk` and `cachehit` at all times but uses correspondent caching statistics for optimization as part of the table and index statistics only when the user calls `DBMS_STATS.GATHER_[TABLE/INDEX/SCHEMA/DATABASE]_STATS` procedure for auto mode or `DBMS_STATS.GATHER_SYSTEM_STATS` for manual mode. In order to prevent the user from utilizing inaccurate and unreliable data, the optimizer will compute a 'confidence factor' for each `cachehit` and a `cachedblk` for each object. If the 'confidence factor' for the value meets confidence criteria, this value will be used, otherwise the defaults will be used.
- The automatic maintenance algorithm for object caching statistics assumes that there is only one major workload for the system and adjusts statistics to this workload, ignoring other "minor" workloads. If this is not the case, you must use manual mode for maintaining object caching statistics.
- The object caching statistics maintenance algorithm for auto mode prevents you from using statistics in the following situations
 - When not enough data has been analyzed, such as when an object has been recently create
 - When the system does not have one major workload resulting in averages not corresponding to real values.

Oracle Database SQL Tuning Guide to learn how to set artificial statistics

177.7.117 SET_PARAM Procedure

This deprecated procedure sets default values for parameters of DBMS_STATS procedures.

Note:

This subprogram has been replaced by improved technology and is maintained only for purposes of backward compatibility. In this case, use the [SET_GLOBAL_PREFS Procedure](#).

See also [DBMS_STATS Deprecated Subprograms](#).

You can use the GET_PARAM Function to get the current default value of a parameter.

Syntax

```
DBMS_STATS.SET_PARAM (
  pname      IN   VARCHAR2,
  pval       IN   VARCHAR2);
```

Parameters

Table 177-126 SET_PARAM Procedure Parameters

| Parameter | Description |
|-----------|--|
| pname | <p>The parameter name The default value for following parameters can be set.</p> <ul style="list-style-type: none"> CASCADE - The default value for CASCADE set by SET_PARAM is not used by export/import procedures.It is used only by gather procedures. DEGREE ESTIMATE_PERCENT METHOD_OPT NO_INVALIDATE GRANULARITY AUTOSTATS_TARGET - This parameter is applicable only for auto statistics collection. The value of this parameter controls the objects considered for statistics collection (see pval) |

Table 177-126 (Cont.) SET_PARAM Procedure Parameters

| Parameter | Description |
|-----------|---|
| pval | <p>The parameter value. If NULL is specified, it will set the default value determined by Oracle. When pname is AUTOSTATS_TARGET, the following are valid values:</p> <ul style="list-style-type: none"> 'ALL' - Statistics are collected for all objects in the system 'ORACLE' - Statistics are collected for all Oracle owned objects 'AUTO' - Oracle decides for which objects to collect statistics |

Usage Notes

- To run this procedure, you must have the SYSDBA or both the ANALYZE ANY DICTIONARY and ANALYZE ANY system privileges.
- Note that both arguments are of type VARCHAR2 and the values need to be enclosed in quotes even when they represent numbers.
- Note also the difference between NULL and 'NULL':
 - When NULL is unquoted, this sets the parameter to the value Oracle recommends.
 - In the case of the quoted 'NULL', this sets the value of the parameter to NULL.

Exceptions

ORA-20000: Object does not exist or insufficient privileges

ORA-20001: Invalid or illegal input value

Examples

```
DBMS_STATS.SET_PARAM('CASCADE', 'DBMS_STATS.AUTO_CASCADE');
DBMS_STATS.SET_PARAM('ESTIMATE_PERCENT', '5');
DBMS_STATS.SET_PARAM('DEGREE', 'NULL');
```

177.7.118 SET_PROCESSING_RATE Procedure

This procedure sets the value of rate of processing for a given operation.

Syntax

```
DBMS_STATS.SET_PROCESSING_RATE (
  opname      IN   VARCHAR2,
  procrate    IN   NUMBER);
```

Parameters

Table 177-127 SET_PROCESSING_RATE Procedure Parameters

| Parameter | Description |
|-----------|--|
| opname | Name of the operation. Valid values are as follows: <ul style="list-style-type: none"> • AGGR • ALL • CPU • CPU_ACCESS • CPU_AGGR • CPU_BYTES_PER_SEC • CPU_FILTER • CPU_GBY • CPU_HASH_JOIN • CPU_JOIN • CPU_NL_JOIN • CPU_RANDOM_ACCESS • CPU_SEQUENTIAL_ACCESS • CPU_SM_JOIN • CPU_SORT • HASH • IO • IO_ACCESS • IO_BYTES_PER_SEC • IO_RANDOM_ACCESS • IO_SEQUENTIAL_ACCESS • MEMCMP • MEMCPY |
| procrate | Processing rate. |

Security Model

You must have the `OPTIMIZER_PROCESSING_RATE` role to run this procedure.

Usage Notes

`AUTO DOP` uses processing rates to determine the optimal degree of parallelism for a SQL statement.

Exceptions

ORA-20000: Object does not exist or insufficient privileges

ORA-20001: Invalid or illegal input value

177.7.119 SET_SCHEMA_PREFS Procedure

This procedure sets the statistics preferences of all tables owned by the specified user.

Syntax

```
DBMS_STATS.SET_SCHEMA_PREFS (  
    ownname IN VARCHAR2,  
    pname   IN VARCHAR2,  
    pvalue  IN VARCHAR2);
```

Parameters

Table 177-128 SET_SCHEMA_PREFS Procedure Parameters

| Parameter | Description |
|-----------|--|
| ownname | Owner name |
| pname | Preference name. You can set the default value for the following preferences: <ul style="list-style-type: none">AUTO_STAT_EXTENSIONSCASCADEDEGREEESTIMATE_PERCENTGLOBAL_TEMP_TABLE_STATSGRANULARITYINCREMENTALINCREMENTAL_LEVELINCREMENTAL_STALENESSMETHOD_OPTNO_INVALIDATEOPTIONSPREFERENCE_OVERRIDES_PARAMETERPUBLISHSTALE_PERCENTTABLE_CACHED_BLOCKS |
| pvalue | Preference value. If NULL is specified, it sets the database default value. |

Table 177-129 Statistics Preferences

| Preference | Description |
|----------------------|--|
| AUTO_STAT_EXTENSIONS | <p>Specifies the synopsis generation algorithm. A synopsis is special type of statistic that tracks the number of distinct values (NDV) for each column in a partition. You can consider a synopsis as an internal management structure that samples distinct values.</p> <p>You can set the following preferences:</p> <ul style="list-style-type: none"> <li data-bbox="834 558 1373 877">• REPEAT OR HYPERLOGLOG This is the default. If INCREMENTAL is enabled on the table, then the database preserves the format of any existing synopses that use the adaptive sampling algorithm. However, the database creates any new synopses in HyperLogLog format. This approach is attractive when existing performance is acceptable, and you do not want to incur the performance cost of reformatting legacy content. <li data-bbox="834 890 1373 1010">• ADAPTIVE SAMPLING The database uses the adaptive sampling algorithm for all synopses. This is the most conservative option. <li data-bbox="834 1022 1373 1377">• HYPERLOGLOG The database uses the HyperLogLog algorithm for all new and stale synopses. In contrast to adaptive sampling, the HyperLogLog algorithm uses a randomization technique. The advantages of HyperLogLog over adaptive sampling are: <ul style="list-style-type: none"> <li data-bbox="883 1234 1321 1289">– The accuracy of the new algorithm is similar to the original algorithm. <li data-bbox="883 1297 1321 1377">– The memory required is significantly lower, which typically leads to huge reductions in synopsis size. |
| CASCADE | Determines whether index statistics are collected as part of gathering table statistics. |
| DEGREE | Determines degree of parallelism used for gathering statistics. |
| ESTIMATE_PERCENT | Determines the percentage of rows to estimate. The valid range is [0.000001,100]. Use the constant DBMS_STATS.AUTO_SAMPLE_SIZE to have Oracle determine the appropriate sample size for good statistics. This is the default. |

Table 177-129 (Cont.) Statistics Preferences

| Preference | Description |
|-------------------------|---|
| GLOBAL_TEMP_TABLE_STATS | <p>This preference takes the following values:</p> <ul style="list-style-type: none"> • SHARED - All sessions see the same set of statistics • SESSION - Statistics gathered by the GATHER_TABLE_STATS Procedure on a global temporary table are session specific, and hence are only going to be used by the queries issued in the same session as the statistics gathering process. Session-specific statistics are deleted when a session is ended. |
| GRANULARITY | <p>Determines the granularity of statistics to collect (only pertinent if the table is partitioned). Possible values are:</p> <p>'ALL' - Gathers all (subpartition, partition, and global) statistics</p> <p>'AUTO' - Determines the granularity based on the partitioning type. This is the default value.</p> <p>'DEFAULT' - gathers global and partition-level statistics. This option is obsolete, and while currently supported, it is included in the documentation for legacy reasons only. You should use the 'GLOBAL AND PARTITION' for this functionality. Note that the default value is now 'AUTO'.</p> <p>'GLOBAL' - Gathers global statistics</p> <p>'GLOBAL AND PARTITION' - gathers the global and partition level statistics. No subpartition level statistics are gathered even if it is a composite partitioned object.</p> <p>'PARTITION' - gathers partition-level statistics</p> <p>'SUBPARTITION' - gathers subpartition-level statistics.</p> |

Table 177-129 (Cont.) Statistics Preferences

| Preference | Description |
|-------------------|---|
| INCREMENTAL | <p>Determines whether the global statistics of a partitioned table will be maintained without doing a full table scan. With partitioned tables it is very common to load new data into a new partition. As new partitions are added and data loaded, the global table statistics need to be kept up to date. Oracle will update the global table statistics by scanning only the partitions that have been changed instead of the entire table if the following conditions hold:</p> <ul style="list-style-type: none"> • INCREMENTAL value for the partitioned table is set to TRUE • PUBLISH value for the partitioned table is set to TRUE; • User specifies AUTO_SAMPLE_SIZE for ESTIMATE_PERCENT and AUTO for GRANULARITY when gathering statistics on the table |
| INCREMENTAL_LEVEL | <p>If the INCREMENTAL value for the partitioned table was set to FALSE (default value), a full table scan is used to maintain the global statistics which is a much more resource intensive and time-consuming operation for large tables.</p> <p>Controls which synopses to collect when INCREMENTAL preference is set to TRUE It takes two values:</p> <ul style="list-style-type: none"> • TABLE - table level synopses are gathered. This is used when you want to exchange this table with a partition. You can run GATHER_TABLE_STATS on this table with INCREMENTAL to TRUE and INCREMENTAL_LEVEL to TABLE before the exchange. The result is that table level synopses are gathered on this table (currently Oracle supports only table level synopses on non-predestined tables). Once the exchange occurs, the partition will have synopses which come from the table level synopses of the table before exchange. This preference value can be only used in the SET_TABLE_PREFS Procedure. It is not allowed in the SET_GLOBAL/DATABASE/SCHEMA_PREFS procedures. • PARTITION - partition level synopses are gathered. This is the default value. If PARTITION is set on a non partitioned table, no synopses are gathered. |

Table 177-129 (Cont.) Statistics Preferences

| Preference | Description |
|-----------------------|---|
| INCREMENTAL_STALENESS | <p>Specifies when a partition or subpartition is considered stale. This parameter takes an enumeration of values, such as 'USE_STALE_PERCENT' and 'USE_LOCKED_STATS'. You can also specify multiple values, such as 'USE_STALE_PERCENT, USE_LOCKED_STATS, ALLOW_MIXED_FORMAT'.</p> <p>The parameter accepts the following values:</p> <ul style="list-style-type: none"> • USE_STALE_PERCENT—A partition or subpartition is not considered stale when DML changes are below the threshold set by the STALE_PERCENT preference. <p>For example, assume that STALE_PERCENT is 10. You specify USE_STALE_PERCENT for INCREMENTAL_STALENESS. The partition has 5% DML changes. The database does not regather statistics.</p> <p>Assume a different case in which STALE_PERCENT is 10. You specify USE_STALE_PERCENT for INCREMENTAL_STALENESS. However, in this case the partition is locked and has 20% of DML changes. Because the partition is locked, the database does not regather statistics.</p> • USE_LOCKED_STATS—Locked partitions or subpartitions statistics are never considered stale, regardless of DML changes. <p>Assume that STALE_PERCENT is 10. You specify 'USE_LOCKED_STATS, USE_STALE_PERCENT'. The partition, which is locked, has 20% DML changes. The partition is not considered stale. The database uses existing statistics to derive global statistics.</p> • ALLOW_MIXED_FORMAT—Partitions with synopses in adaptive sampling format are not considered stale, even when the APPROXIMATE_NDV_ALGORITHM preference is set to HYPERLOGLOG. The database uses existing synopses to derive global NDV. This is the default setting. • NULL—A partition or subpartition is considered stale when it has any DML changes. <p>For example, assume that STALE_PERCENT is 10. You specify the value 'NULL' for INCREMENTAL_STALENESS. The partition has 5% of DML changes. The database regathers statistics.</p> <p>Note that the following two executions are different:</p> <pre>EXEC DBMS_STATS.SET_TABLE_PREFS ('sh', 'sales',</pre> |

Table 177-129 (Cont.) Statistics Preferences

| Preference | Description |
|------------|---|
| | <pre>'INCREMENTAL_STALENESS', 'NULL'); EXEC DBMS_STATS.SET_TABLE_PREFS ('sh', 'sales', 'INCREMENTAL_STALENESS', null);</pre> <p>The first execution uses single quotes to set the preference to the value NULL, whereas the second sets the preference to the default, which is ALLOW_MIXED_FORMAT.</p> |
| METHOD_OPT | <p>Controls column statistics collection and histogram creation. It accepts either of the following options, or both in combination:</p> <ul style="list-style-type: none"> • FOR ALL [INDEXED HIDDEN] COLUMNS [size_clause] <p>size_clause is defined as size_clause := SIZE {integer REPEAT AUTO SKEWONLY}</p> <ul style="list-style-type: none"> - integer: Number of histogram buckets. Must be in the range [1,2048]. - REPEAT: Collects histograms only on the columns that already have histograms - AUTO: Oracle determines the columns on which to collect histograms based on data distribution and the workload of the columns - SKEWONLY: Oracle determines the columns on which to collect histograms based on the data distribution of the columns - column_name: name of a column - extension : can be either a column group in the format of (column_name, columne_name [, ...]) or an expression <p>The default is FOR ALL COLUMNS SIZE AUTO.</p> |

Table 177-129 (Cont.) Statistics Preferences

| Preference | Description |
|--------------------------------|---|
| NO_INVALIDATE | <p>Controls the invalidation of dependent cursors when statistics are gathered. The parameter takes the following values:</p> <ul style="list-style-type: none"> TRUE: Dependent cursors are not invalidated. FALSE: Dependent cursors are marked for immediate invalidation. AUTO: This is the default value. Rolling invalidation is used to invalidate all dependent cursors over a period of time. The performance impact on the database is reduced especially in cases where a large number of cursors are invalidated. <p>You can change the default using the SET_DATABASE_PREFS Procedure, SET_GLOBAL_PREFS Procedure, SET_SCHEMA_PREFS Procedure and SET_TABLE_PREFS Procedure.</p> |
| OPTIONS | <p>Determines the <code>options</code> parameter used in the <code>GATHER_TABLE_STATS</code> procedure. The preference takes the following values:</p> <ul style="list-style-type: none"> GATHER — Gathers statistics for all objects in the table. This is the default. GATHER AUTO — Oracle recommends using GATHER AUTO to gather necessary statistics, such as histograms, after a table has been bulk loaded and acquired online statistics. This is applicable only to tables that are not using INCREMENTAL statistics. <p>For partitioned tables using INCREMENTAL statistics, GATHER_TABLE_STATS with GATHER AUTO will gather statistics for a table if it is marked stale or has no statistics. In addition, statistics will be gathered for partitions and sub-partitions that are marked stale or have no statistics.</p> <p>For tables not using INCREMENTAL statistics, GATHER_TABLE_STATS with GATHER AUTO may gather statistics for partitions and sub-partitions, even if they are not marked stale.</p> |
| PREFERENCE_OVERRIDES_PARAMETER | <p>Determines whether to override the input value of a parameter with the preference value of that parameter for a statistics operation. Possible values are:</p> <ul style="list-style-type: none"> TRUE — Ignores input parameter values, and uses the value of the corresponding preference. FALSE — Obeys input parameter values. <p>Specifying this preference does not change the order of precedence of table, global, and default.</p> |

Table 177-129 (Cont.) Statistics Preferences

| Preference | Description |
|---------------------|--|
| PUBLISH | Determines whether newly gathered statistics will be published after the statistics gathering job completes. In releases before Oracle Database 11g Release 1 (11.1), when a statistic gathering job completed, the new statistics were automatically published in the dictionary tables. In subsequent releases, you can gather statistics without publishing them immediately. Thus, you can test new statistics before publishing them. |
| STALE_PERCENT | Determines the percentage of rows in a table that have to change before the statistics on that table are deemed stale and should be regathered. The valid domain for <code>stale_percent</code> is non-negative numbers. The default value is 10%. Note that if you set <code>stale_percent</code> to zero the <code>AUTO STATS</code> gathering job will gather statistics for this table every time a row in the table is modified. |
| TABLE_CACHED_BLOCKS | Specifies the average number of blocks assumed to be cached in the buffer cache when calculating the index clustering factor. The preference applies only when gathering statistics using <code>DBMS_STATS</code> . Index statistics gathered during <code>CREATE INDEX</code> or <code>REBUILD INDEX</code> operations will use the default value 1. |

Security Model

To run this procedure, you must be the schema owner, or have the `SYSDBA` privilege, or have the `ANALYZE ANY` system privilege.

Exceptions

ORA-20000: Object does not exist or insufficient privileges

ORA-20001: Invalid or illegal input value

Usage Notes

Both arguments are of type `VARCHAR2` and values are enclosed in quotes, even when they represent numbers.

Examples

```
DBMS_STATS.SET_SCHEMA_PREFS('SH','CASCADE','DBMS_STATS.AUTO_CASCADE');
DBMS_STATS.SET_SCHEMA_PREFS('SH','ESTIMATE_PERCENT','9');
DBMS_STATS.SET_SCHEMA_PREFS('SH','DEGREE','99');
```

See Also:

Oracle Database SQL Tuning Guide to learn how to set optimizer statistics preferences

177.7.120 SET_SYSTEM_STATS Procedure

This procedure sets systems statistics.

Syntax

```
DBMS_STATS.SET_SYSTEM_STATS (
    pname          VARCHAR2,
    pvalue         NUMBER,
    statab IN      VARCHAR2 DEFAULT NULL,
    statid IN      VARCHAR2 DEFAULT NULL,
    statown IN     VARCHAR2 DEFAULT NULL);
```

Parameters

Table 177-130 SET_SYSTEM_STATS Procedure Parameters

| Parameter | Description |
|-----------|--|
| pname | The parameter name to get, which can have one of the following values: <ul style="list-style-type: none"> iotfrspeed—I/O transfer speed in bytes for each millisecond ioseektim - Seek time + latency time + operating system overhead time, in milliseconds sreadtim - Average time to read single block (random read), in milliseconds mreadtim - Average time to read an mbrc block at once (sequential read), in milliseconds cpuspeed - Average number of CPU cycles for each second, in millions, captured for the workload (statistics collected using 'INTERVAL' or 'START' and 'STOP' options) cpuspeednw - Average number of CPU cycles for each second, in millions, captured for the no-workload (statistics collected using 'NOWORKLOAD' option). mbrc - Average multiblock read count for sequential read, in blocks maxthr - Maximum I/O system throughput, in bytes/second slavethr - Average slave I/O throughput, in bytes/second |
| pvalue | Parameter value to get |
| statab | Identifier of the user statistics table where the statistics will be obtained. If statab is null, the statistics will be obtained from the dictionary. |
| statid | Optional identifier associated with the statistics saved in the statab |
| statown | Schema containing statab (if different from current schema) |

Exceptions

ORA-20000: Object does not exist or insufficient privileges

ORA-20001: Invalid input value

ORA-20002: Bad user statistics table; may need to be upgraded

ORA-20003: Unable to set system statistics

ORA-20004: Parameter does not exist

Usage Notes

To run this procedure, you need the `GATHER_SYSTEM_STATISTICS` role.

177.7.121 SET_TABLE_PREFS Procedure

This procedure sets the statistics preferences of the specified table in the specified schema.

Syntax

```
DBMS_STATS.SET_TABLE_PREFS (  
    ownname    IN  VARCHAR2,  
    tabname    IN  VARCHAR2,  
    pname      IN  VARCHAR2,  
    pvalue     IN  VARCHAR2);
```

Parameters

Table 177-131 SET_TABLE_PREFS Procedure Parameters

| Parameter | Description |
|-----------|-------------|
| ownname | Owner name |
| tabname | Table name |

Table 177-131 (Cont.) SET_TABLE_PREFS Procedure Parameters

| Parameter | Description |
|-----------|---|
| pname | <p>Preference name. You can set the default value for following preferences:</p> <ul style="list-style-type: none">• APPROXIMATE_NDV_ALGORITHM• AUTO_STAT_EXTENSIONS• CASCADE• DEGREE• ESTIMATE_PERCENT• GRANULARITY• INCREMENTAL• INCREMENTAL_LEVEL• INCREMENTAL_STALENESS• METHOD_OPT• NO_INVALIDATE• OPTIONS• PREFERENCE_OVERRIDES_PARAMETER• PUBLISH• STALE_PERCENT• TABLE_CACHED_BLOCKS |
| pvalue | <p>Preference value. If NULL is specified, it will set the Oracle default value.</p> |

Table 177-132 Statistics Preferences

| Preference | Description |
|---------------------------|--|
| APPROXIMATE_NDV_ALGORITHM | <p>Specifies the synopsis generation algorithm. A synopsis is special type of statistic that tracks the number of distinct values (NDV) for each column in a partition. Consider a synopsis as an internal management structure that samples distinct values.</p> <p>You can specify the following preferences:</p> <ul style="list-style-type: none"> • REPEAT OR HYPERLOGLOG This is the default. If INCREMENTAL is enabled on the table, then the database preserves the format of any existing synopses that use the adaptive sampling algorithm. However, the database creates any new synopses in HyperLogLog format. This approach is attractive when existing performance is acceptable, and you do not want to incur the performance cost of reformatting legacy content. • ADAPTIVE SAMPLING The database uses the adaptive sampling algorithm for all synopses. This is the most conservative option. • HYPERLOGLOG The database uses the HyperLogLog algorithm for all new and stale synopses. In contrast to adaptive sampling, the HyperLogLog algorithm uses a randomization technique. The advantages of HyperLogLog over adaptive sampling are: <ul style="list-style-type: none"> – The accuracy of the new algorithm is similar to the original algorithm. – The memory required is significantly lower, which typically leads to huge reductions in synopsis size. |
| AUTO_STAT_EXTENSIONS | <p>Controls the automatic creation of extensions when database statistics are gathered.</p> <p>You can set the following values:</p> <ul style="list-style-type: none"> • ON — When applicable, a SQL plan directive can trigger the creation of column group statistics based on usage of columns in the predicates in the workload. • OFF— The database does not create column group statistics automatically. The database creates them only when the CREATE_EXTENDED_STATS function is executed, or when extended statistics are specified explicitly in the METHOD_OPT clause of DBMS_STATS. This is the default. |
| CASCADE | <p>Determines whether to collect index statistics as part of gathering table statistics.</p> |

Table 177-132 (Cont.) Statistics Preferences

| Preference | Description |
|-------------------------|--|
| CONCURRENT | <p>This preference determines whether statistics will be gathered concurrently on multiple objects, or serially, one object at a time:</p> <ul style="list-style-type: none">'MANUAL' - Concurrency will be turned on only for manual statistics gathering.'AUTOMATIC': Concurrency will be turned on only for the automatic statistics gathering.'ALL': Concurrency will be turned on for both manual and automatic statistics gathering.'OFF': Concurrency will be turned off for both manual and automatic statistics |
| DEGREE | <p>Determines degree of parallelism used for gathering statistics.</p> |
| ESTIMATE_PERCENT | <p>Determines the percentage of rows to estimate. The valid range is [0.000001,100]. Use the constant DBMS_STATS.AUTO_SAMPLE_SIZE to have Oracle determine the appropriate sample size for good statistics. This is the default.</p> |
| GLOBAL_TEMP_TABLE_STATS | <p>This controls whether the statistics gathered for a global temporary table should be stored as shared statistics or session statistics. It takes two values:</p> <ul style="list-style-type: none">SHARED - All sessions see the same set of statisticsSESSION - Statistics gathered by the GATHER_TABLE_STATS Procedure on a global temporary table are session specific, and hence are only going to be used by the queries issued in the same session as the statistics gathering process. Session-specific statistics are deleted when a session is ended. |

Table 177-132 (Cont.) Statistics Preferences

| Preference | Description |
|-------------|--|
| GRANULARITY | <p>Determines granularity of statistics to collect (only pertinent if the table is partitioned).</p> <p>'ALL' - Gathers all (subpartition, partition, and global) statistics</p> <p>'AUTO' - Determines the granularity based on the partitioning type. This is the default value.</p> <p>'DEFAULT' - Gathers global and partition-level statistics. This option is obsolete, and while currently supported, it is included in the documentation for legacy reasons only. You should use the 'GLOBAL AND PARTITION' for this functionality. Note that the default value is now 'AUTO'.</p> <p>'GLOBAL' - Gathers global statistics</p> <p>'GLOBAL AND PARTITION' - Gathers the global and partition level statistics. No subpartition level statistics are gathered even if it is a composite partitioned object.</p> <p>'PARTITION' - Gathers partition-level statistics</p> <p>'SUBPARTITION' - Gathers subpartition-level statistics.</p> |
| INCREMENTAL | <p>Determines whether or not the global statistics of a partitioned table will be maintained without doing a full table scan. With partitioned tables it is very common to load new data into a new partition. As new partitions are added and data loaded, the global table statistics need to be kept up to date. Oracle will update the global table statistics by scanning only the partitions that have been changed instead of the entire table if the following conditions hold:</p> <ul style="list-style-type: none"> • INCREMENTAL value for the partitioned table is set to TRUE; • PUBLISH value for the partitioned table is set to TRUE; • User specifies AUTO_SAMPLE_SIZE for ESTIMATE_PERCENT and AUTO for GRANULARITY when gathering statistics on the table. <p>If the INCREMENTAL value for the partitioned table was set to FALSE (default value), a full table scan is used to maintain the global statistics which is a much more resource intensive and time-consuming operation for large tables.</p> |

Table 177-132 (Cont.) Statistics Preferences

| Preference | Description |
|-------------------|--|
| INCREMENTAL_LEVEL | <p>This value controls what synopses to collect when INCREMENTAL preference is set to TRUE. It takes two values:</p> <ul style="list-style-type: none">• TABLE - table level synopses are gathered. This is used when you want to exchange this table with a partition. You can run <code>GATHER_TABLE_STATS</code> on this table with <code>INCREMENTAL</code> to TRUE and <code>INCREMENTAL_LEVEL</code> to <code>TABLE</code> before the exchange. The result is that table level synopses are gathered on this table (currently Oracle supports only table level synopses on non-predestined tables). Once the exchange occurs, the partition will have synopses which come from the table level synopses of the table before exchange. This preference value can be only used in the SET_TABLE_PREFS Procedure. It is not allowed in the <code>SET_GLOBAL/DATABASE/SCHEMA_PREFS</code> procedures.• PARTITION - partition level synopses are gathered. This is the default value. If <code>PARTITION</code> is set on a non partitioned table, no synopses are gathered. |

Table 177-132 (Cont.) Statistics Preferences

| Preference | Description |
|-----------------------|--|
| INCREMENTAL_STALENESS | <p>Specifies when a partition or subpartition is considered stale. This parameter takes an enumeration of values, such as 'USE_STALE_PERCENT' and 'USE_LOCKED_STATS'. You can also specify multiple values, such as 'USE_STALE_PERCENT,USE_LOCKED_STATS,ALLOW_MIXED_FORMAT'.</p> <p>The parameter accepts the following values:</p> <ul style="list-style-type: none"> • USE_STALE_PERCENT—A partition or subpartition is not considered stale when DML changes are below the threshold set by the STALE_PERCENT preference. <p>For example, assume that STALE_PERCENT is 10. You specify USE_STALE_PERCENT for INCREMENTAL_STALENESS. The partition has 5% DML changes. The database does not regather statistics.</p> <p>Assume a different case in which STALE_PERCENT is 10. You specify USE_STALE_PERCENT for INCREMENTAL_STALENESS. However, in this case the partition is locked and has 20% of DML changes. Because the partition is locked, the database does not regather statistics.</p> • USE_LOCKED_STATS—Locked partitions or subpartitions statistics are never considered stale, regardless of DML changes. <p>For example, assume that STALE_PERCENT is 10. You specify 'USE_LOCKED_STATS, USE_STALE_PERCENT'. The partition, which is locked, has 20% DML changes. The partition is not considered stale. The database uses existing statistics to derive global statistics.</p> • ALLOW_MIXED_FORMAT—Adaptive sampling synopses and HyperLogLog synopses are permitted to coexist. • NULL—A partition or subpartition is considered stale when it has any DML changes. <p>For example, assume that STALE_PERCENT is 10. You specify the value 'NULL' for INCREMENTAL_STALENESS. The partition has 5% of DML changes. The database regathers statistics.</p> |

Table 177-132 (Cont.) Statistics Preferences

| Preference | Description |
|------------|---|
| METHOD_OPT | <p>Note that the following two executions are different:</p> <pre data-bbox="846 436 1305 527">EXEC DBMS_STATS.SET_TABLE_PREFS ('sh', 'sales', 'INCREMENTAL_STALENESS', 'NULL');</pre> <pre data-bbox="846 594 1281 684">EXEC DBMS_STATS.SET_TABLE_PREFS ('sh', 'sales', 'INCREMENTAL_STALENESS', null);</pre> <p>The first execution uses single quotes to set the preference to the value NULL, whereas the second sets the preference to the default, which is ALLOW_MIXED_FORMAT.</p> <p>The value controls column statistics collection and histogram creation. It accepts either of the following options, or both in combination:</p> <ul style="list-style-type: none"> • FOR ALL [INDEXED HIDDEN] COLUMNS [size_clause] <p>size_clause is defined as size_clause := SIZE {integer REPEAT AUTO SKEWONLY}</p> <ul style="list-style-type: none"> - integer: Number of histogram buckets. Must be in the range [1,2048]. - REPEAT: Collects histograms only on the columns that already have histograms - AUTO: Oracle determines the columns on which to collect histograms based on data distribution and the workload of the columns - SKEWONLY: Oracle determines the columns on which to collect histograms based on the data distribution of the columns - column_name: name of a column - extension: can be either a column group in the format of (column_name, column_name [, ...]) or an expression <p>The default is FOR ALL COLUMNS SIZE AUTO.</p> |

Table 177-132 (Cont.) Statistics Preferences

| Preference | Description |
|--------------------------------|---|
| NO_INVALIDATE | <p>Controls the invalidation of dependent cursors when statistics are gathered. The parameter takes the following values:</p> <ul style="list-style-type: none"> • TRUE: Dependent cursors are not invalidated. • FALSE: Dependent cursors are marked for immediate invalidation. • AUTO: This is the default value. Rolling invalidation is used to invalidate all dependent cursors over a period of time. The performance impact on the database is reduced especially in cases where a large number of cursors are invalidated. <p>You can change the default using the SET_DATABASE_PREFS Procedure, SET_GLOBAL_PREFS Procedure, SET_SCHEMA_PREFS Procedure and SET_TABLE_PREFS Procedure.</p> |
| OPTIONS | <p>Determines the <code>options</code> parameter used in the <code>GATHER_TABLE_STATS</code> procedure. The preference takes the following values:</p> <ul style="list-style-type: none"> • GATHER — Gathers statistics for all objects in the table. This is the default. • GATHER AUTO — Oracle recommends using <code>GATHER AUTO</code> to gather necessary statistics, such as histograms, after a table has been bulk loaded and acquired online statistics. This is applicable only to tables that are not using <code>INCREMENTAL</code> statistics. <p>For partitioned tables using <code>INCREMENTAL</code> statistics, <code>GATHER_TABLE_STATS</code> with <code>GATHER AUTO</code> will gather statistics for a table if it is marked stale or has no statistics. In addition, statistics will be gathered for partitions and sub-partitions that are marked stale or have no statistics.</p> <p>For tables not using <code>INCREMENTAL</code> statistics, <code>GATHER_TABLE_STATS</code> with <code>GATHER AUTO</code> may gather statistics for partitions and sub-partitions, even if they are not marked stale.</p> |
| PREFERENCE_OVERRIDES_PARAMETER | <p>Determines whether to override the input value of a parameter with the preference value of that parameter for a statistics operation. Possible values are:</p> <ul style="list-style-type: none"> • TRUE — Ignores input parameter values, and uses the value of the corresponding preference. • FALSE — Obeys input parameter values. <p>Specifying this preference does not change the order of precedence of table, global, and default.</p> |

Table 177-132 (Cont.) Statistics Preferences

| Preference | Description |
|---------------|---|
| PUBLISH | Determines whether the database publishes newly gathered statistics after the gathering job completes. You can gather statistics without publishing them immediately. This technique enables you to test new statistics before publishing them. |
| STALE_PERCENT | Determines the percentage of rows in a table that must change before the statistics on that table are stale and need to be regathered. The valid domain for <code>stale_percent</code> is non-negative numbers. The default value is 10, which means that a table having more than 10% of changes is considered stale. |

Exceptions

ORA-20000: Object does not exist or insufficient privileges

ORA-20001: Invalid or illegal input values

Usage Notes

- To run this procedure, you must connect as owner of the table or have the `ANALYZE ANY` system privilege.
- All arguments are of type `VARCHAR2` and values are enclosed in quotes, even when they represent numbers.

Examples

```
DBMS_STATS.SET_TABLE_PREFS('SH', 'SALES', 'CASCADE', 'DBMS_STATS.AUTO_CASCADE');
DBMS_STATS.SET_TABLE_PREFS('SH', 'SALES', 'ESTIMATE_PERCENT', '9');
DBMS_STATS.SET_TABLE_PREFS('SH', 'SALES', 'DEGREE', '99');
```

Example 177-18 Overriding Statistics Preferences

In this example, legacy scripts set `ESTIMATE_PERCENT` explicitly rather than using the recommended `AUTO_SAMPLE_SIZE`. Your goal is to prevent users from using these scripts to set preferences on the `sh.costs` table.

No preference for `ESTIMATE_PERCENT` is set for `sh.costs` or at the global level, so the preference defaults to `AUTO_SAMPLE_SIZE`:

```
SELECT DBMS_STATS.GET_PREFS ('ESTIMATE_PERCENT', 'sh','costs') AS
"STAT_PREFS" FROM DUAL;
```

```
STAT_PREFS
-----
DBMS_STATS.AUTO_SAMPLE_SIZE
```

By default, Oracle Database accepts preferences that are passed to the statistics gathering procedures. To override these parameters, use `SET_TABLE_PREFS` to set the `PREFERENCE_OVERRIDES_PARAMETER` preference to `TRUE` for the `costs` table only:

```
EXEC DBMS_STATS.SET_TABLE_PREFS ('sh', 'costs',
'PREFERENCE_OVERRIDES_PARAMETER', 'TRUE');
```

A user-created script attempts to set `estimate_percent` to 100 when gathering statistics for `sh.costs`.

```
EXEC DBMS_STATS.GATHER_TABLE_STATS('sh', 'costs',
ESTIMATE_PERCENT=>100);
```

However, because `PREFERENCE_OVERRIDES_PARAMETER` is `TRUE` for this table, Oracle Database gathers statistics using `AUTO_SAMPLE_SIZE`, which is the default, rather than the specified value of 100.

Oracle Database SQL Tuning Guide to learn how to set optimizer statistics preferences

177.7.122 SET_TABLE_STATS Procedure

This procedure creates artificial table statistics for testing purposes.

Syntax

```
DBMS_STATS.SET_TABLE_STATS (
  ownname          VARCHAR2,
  tabname          VARCHAR2,
  partname         VARCHAR2 DEFAULT NULL,
  statab           VARCHAR2 DEFAULT NULL,
  statid           VARCHAR2 DEFAULT NULL,
  numrows         NUMBER   DEFAULT NULL,
  numblks         NUMBER   DEFAULT NULL,
  avgrlen         NUMBER   DEFAULT NULL,
  flags           NUMBER   DEFAULT NULL,
  statown         VARCHAR2 DEFAULT NULL,
  no_invalidate   BOOLEAN   DEFAULT to_no_invalidate_type (
                                get_param('NO_INVALIDATE')),
  cachedblk       NUMBER   DEFAULT NULL,
  cachehit       NUMBER   DEFAULT NULL,
  force          BOOLEAN   DEFAULT FALSE,
  im_imcu_count  NUMBER   DEFAULT NULL,
  im_block_count NUMBER   DEFAULT NULL,
  scanrate       NUMBER   DEFAULT NULL);
```

Parameters

Table 177-133 SET_TABLE_STATS Procedure Parameters

| Parameter | Description |
|----------------|---|
| ownname | Name of the schema. |
| tablename | Name of the table. |
| partname | Name of the table partition in which to store the statistics. If the table is partitioned and <code>partname</code> is NULL, then the statistics are stored at the global table level. |
| stattab | Table in which to store the statistics. If <code>stattab</code> is NULL, then the database stores the statistics in the data dictionary. |
| statid | Identifier (optional) to associate with these statistics within <code>stattab</code> . This identifier is only relevant if <code>stattab</code> is not NULL. |
| numrows | Number of rows in the table or partition. |
| numblks | Number of blocks that the table or partition occupies. |
| avgrlen | Average row length for the table or partition. |
| flags | For internal use only. Do not set. |
| statown | Schema containing <code>stattab</code> (if different than <code>ownname</code>). |
| no_invalidate | Controls the invalidation of dependent cursors when statistics are gathered. The parameter takes the following values: <ul style="list-style-type: none"> TRUE: Dependent cursors are not invalidated. FALSE: Dependent cursors are marked for immediate invalidation. AUTO: This is the default value. Rolling invalidation is used to invalidate all dependent cursors over a period of time. The performance impact on the database is reduced especially in cases where a large number of cursors are invalidated. You can change the default using the SET_DATABASE_PREFS Procedure , SET_GLOBAL_PREFS Procedure , SET_SCHEMA_PREFS Procedure and SET_TABLE_PREFS Procedure . |
| cachedblk | For internal use only. Do not set. |
| cachehit | For internal use only. Do not set. |
| force | A flag that determines the behavior when statistics are locked. If TRUE, then the procedure sets the values even if the table statistics are locked. By default, the setting is FALSE. |
| im_imcu_count | The number of In-Memory Compression Units (IMCUs) in the table or partition. |
| im_block_count | The number of In-Memory blocks in the table or partition. |
| scanrate | The rate, in MB/s, at which the database scans external tables. This parameter is relevant only for external tables. |

Security Model

To invoke this procedure you must be owner of the table, or have the `ANALYZE ANY` privilege. For objects owned by `SYS`, you must be either the owner of the table, or have the `ANALYZE ANY DICTIONARY` privilege or the `SYSDBA` privilege.

Exceptions

ORA-20000: Object does not exist or insufficient privileges

ORA-20001: Invalid input value

ORA-20002: Bad user statistics table; may need to upgrade it

ORA-20005: Object statistics are locked

Usage Notes

For testing purposes, you can manually create artificial statistics for a table, index, or the system using the `DBMS_STATS.SET_*_STATS` procedures. These procedures insert the artificial statistics into the data dictionary directly (when `stattab` is null) or into a user-created table.

Note:

The `DBMS_STATS.SET_*_STATS` procedures are intended for development testing only. Do not use them in a production database. If you set statistics in the data dictionary, then Oracle Database considers the set statistics as the “real” statistics, which means that statistics gathering jobs may not re-gather artificial statistics when they do not meet the criteria for staleness.

The most typical use cases for the `DBMS_STATS.SET_*_STATS` procedures are showing how execution plans change as the numbers of rows or blocks in a table change, or creating realistic statistics for temporary tables.

- The optimizer uses the cached data to estimate number of cached blocks for index or statistics table access. The database calculates the total cost of the operation by combining the I/O cost of reading not cached blocks from disk, the CPU cost of getting cached blocks from the buffer cache, and the CPU cost of processing the data.
- The database maintains `cachedblk` and `cachehit` at all times. However, the database uses the corresponding caching statistics for optimization as part of the table and index statistics only when the user calls the `DBMS_STATS.GATHER_[TABLE/INDEX/SCHEMA/DATABASE]_STATS` procedure for automatic mode or `DBMS_STATS.GATHER_SYSTEM_STATS` for manual mode. To prevent the user from utilizing inaccurate and unreliable data, the optimizer computes a “confidence factor” for each `cachehit` and a `cachedblk` for each object. If the confidence factor for the value meets confidence criteria, then the database uses this value; otherwise, the database uses defaults.
- The automatic maintenance algorithm for object caching statistics assumes that only one major database workload exists. The algorithm adjusts statistics to this workload, ignoring other “minor” workloads. If this assumption is false, then you must use manual mode for maintaining object caching statistics.
- The object caching statistics maintenance algorithm for automatic mode prevents you from using statistics in the following situations:
 - When not enough data has been analyzed, such as when an object has been recently created

- When the database does not have one major workload, resulting in averages that do not correspond to real values

177.7.123 SHOW_EXTENDED_STATS_NAME Function

This function returns the name of the statistics entry that is created for the user-specified extension. It raises an error if no extension has been created.

Syntax

```
DBMS_STATS.SHOW_EXTENDED_STATS_NAME (
  ownname   VARCHAR2,
  tabname   VARCHAR2,
  extension VARCHAR2)
RETURN VARCHAR2;
```

Parameters

Table 177-134 SHOW_EXTENDED_STATS_NAME Function Parameters

| Parameter | Description |
|-----------|--|
| ownname | Owner name of a table |
| tabname | Name of the table |
| extension | Can be either a column group or an expression. Suppose the specified table has two column <i>c1</i> , <i>c2</i> . An example column group can be "(<i>c1</i> , <i>c2</i>)" and an example expression can be "(<i>c1</i> + <i>c2</i>)". |

Exceptions

ORA-20000: Object does not exist or insufficient privileges

ORA-20001: Error when processing extension

Usage Notes

To invoke this procedure you must be owner of the table, or you need the `ANALYZE ANY` privilege. For objects owned by `SYS`, you need to be either the owner of the table, or you need the `ANALYZE ANY DICTIONARY` privilege or the `SYSDBA` privilege.

177.7.124 TRANSFER_STATS Procedure

This procedure transfers statistics for specified table(s) from a remote database specified by `dblink` to the local database.

The statistics at the source database are retained. It likewise transfers statistics-related structures such as synopses and DML monitoring information.

Syntax

```
DBMS_STATS.TRANSFER_STATS (
    ownname      IN      VARCHAR2,
    tabname      IN      VARCHAR2,
    dblink       IN      VARCHAR2,  options      IN      NUMBER DEFAULT NULL);
```

Parameters

Table 177-135 TRANSFER_STATS Procedure Parameters

| Parameter | Description |
|-----------|--|
| ownname | Owner name of a table. If NULL all schemas in the database. If NULL, the procedure will transfer global preferences as well. |
| tabname | Name of the table. If NULL, all tables in OWNNAME. |
| dblink | Database link name |
| options | By default the procedure does not transfer the global preferences. Specifying ADD_GLOBAL_PREFS copies global preferences. |

Usage Notes

To invoke this procedure you must be owner of the table, or you need the `ANALYZE ANY` privilege. For objects owned by `SYS`, you need to be either the owner of the table, or you need the `ANALYZE ANY DICTIONARY` privilege or the `SYSDBA` privilege.

177.7.125 UNLOCK_PARTITION_STATS Procedure

This procedure enables the user to unlock statistics for a partition.

Syntax

```
DBMS_STATS.UNLOCK_PARTITION_STATS (
    ownname      VARCHAR2,
    tabname      VARCHAR2,
    partname     VARCHAR2);
```

Parameters

Table 177-136 UNLOCK_PARTITION_STATS Procedure Parameters

| Parameter | Description |
|-----------|------------------------------|
| ownname | Name of the schema to unlock |
| tabname | Name of the table |
| partname | [Sub]Partition name |

Usage Notes

To invoke this procedure you must be owner of the table, or you need the `ANALYZE ANY` privilege. For objects owned by `SYS`, you need to be either the owner of the table, or you need the `ANALYZE ANY DICTIONARY` privilege or the `SYSDBA` privilege.

177.7.126 UNLOCK_SCHEMA_STATS Procedure

This procedure unlocks the statistics on all the tables in schema.

Syntax

```
DBMS_STATS.UNLOCK_SCHEMA_STATS (  
    ownname    VARCHAR2);
```

Parameters

Table 177-137 UNLOCK_SCHEMA_STATS Procedure Parameters

| Parameter | Description |
|-----------|--------------------|
| ownname | Name of the schema |

Usage Notes

- To invoke this procedure you must be owner of the table, or you need the `ANALYZE ANY` privilege. For objects owned by `SYS`, you need to be either the owner of the table, or you need the `ANALYZE ANY DICTIONARY` privilege or the `SYSDBA` privilege.
- When statistics on a table is locked, all the statistics depending on the table, including table statistics, column statistics, histograms and statistics on all dependent indexes, are considered to be locked.
- The `SET_*`, `DELETE_*`, `IMPORT_*`, `GATHER_*` procedures that modify statistics in the dictionary of an individual table, index or column will raise an error if statistics of the object is locked.
- Procedures that operates on multiple objects (such as `GATHER_SCHEMA_STATS`) will skip modifying the statistics of an object if it is locked. Many procedures have force argument to override the lock.
- Neither the [UNLOCK_SCHEMA_STATS Procedure](#) nor the [UNLOCK_TABLE_STATS Procedure](#) is designed to unlock statistics of corresponding partitions. When you invoke the [LOCK_TABLE_STATS Procedure](#), it sets the statistics lock bit at the table level. In that case, you cannot gather statistics on dependent objects such as partitions and indexes. By the same token, if table statistics are locked, the dependents are locked and you do not need to explicitly invoke the [LOCK_PARTITION_STATS Procedure](#).

177.7.127 UNLOCK_TABLE_STATS Procedure

This procedure unlocks the statistics on the table.

Syntax

```
DBMS_STATS.UNLOCK_TABLE_STATS (  
    ownname    VARCHAR2,  
    tablename  VARCHAR2);
```

Parameters

Table 177-138 UNLOCK_TABLE_STATS Procedure Parameters

| Parameter | Description |
|-----------|--------------------|
| ownname | Name of the schema |
| tabname | Name of the table |

Usage Notes

- To invoke this procedure you must be owner of the table, or you need the `ANALYZE ANY` privilege. For objects owned by `SYS`, you need to be either the owner of the table, or you need the `ANALYZE ANY DICTIONARY` privilege or the `SYSDBA` privilege.
- When statistics on a table is locked, all the statistics depending on the table, including table statistics, column statistics, histograms and statistics on all dependent indexes, are considered to be locked.
- The `SET_*`, `DELETE_*`, `IMPORT_*`, `GATHER_*` procedures that modify statistics in the dictionary of an individual table, index or column will raise an error if statistics of the object is locked.
- Procedures that operates on multiple objects (such as `GATHER_SCHEMA_STATS`) will skip modifying the statistics of an object if it is locked. Many procedures have force argument to override the lock.
- Neither the [UNLOCK_SCHEMA_STATS Procedure](#) nor the [UNLOCK_TABLE_STATS Procedure](#) is designed to unlock statistics of corresponding partitions. When you invoke the [LOCK_TABLE_STATS Procedure](#), it sets the statistics lock bit at the table level. In that case, you cannot gather statistics on dependent objects such as partitions and indexes. By the same token, if table statistics are locked, the dependents are locked and you do not need to explicitly invoke the [LOCK_PARTITION_STATS Procedure](#).

177.7.128 UPGRADE_STAT_TABLE Procedure

This procedure upgrades a user statistics table from an older version.

Syntax

```
DBMS_STATS.UPGRADE_STAT_TABLE (
    ownname    VARCHAR2,
    stattab    VARCHAR2);
```

Parameters

Table 177-139 UPGRADE_STAT_TABLE Procedure Parameters

| Parameter | Description |
|-----------|--------------------|
| ownname | Name of the schema |
| stattab | Name of the table |

Exceptions

ORA-20000: Unable to upgrade table

Usage Notes

To invoke this procedure you need the privileges to drop and create a table.

DBMS_STORAGE_MAP

With the `DBMS_STORAGE_MAP` package, you can communicate with the Oracle background process FMON to invoke mapping operations that populate mapping views. FMON communicates with operating and storage system vendor-supplied mapping libraries.

This chapter contains the following topics:

- [Overview](#)
- [Operational Notes](#)
- [Summary of DBMS_STORAGE_MAP Subprograms](#)

178.1 DBMS_STORAGE_MAP Overview

This terminology and descriptions will help you understand the `DBMS_STORAGE_MAP` API.

- Mapping libraries

Mapping libraries help you map the components of I/O processing stack elements. Examples of I/O processing components include files, logical volumes, and storage array I/O targets. The mapping libraries are identified in `filemap.ora`.

- Mapping files

A mapping file is a mapping structure that describes a file. It provides a set of attributes, including file size, number of extents that the file is composed of, and file type.

- Mapping elements and sub-elements

A mapping element is the abstract mapping structure that describes a storage component within the I/O stack. Examples of elements include mirrors, stripes, partitions, raid5, concatenated elements, and disks—structures that are the mapping building blocks. A mapping sub-element describes the link between an element and the next elements in the I/O mapping stack

- Mapping file extents

A mapping file extent describes a contiguous chunk of blocks residing on one element. This includes the device offset, the extent size, the file offset, the type (data or parity), and the name of the element where the extent resides. In the case of a raw device or volume, the file is composed of only one file extent component. A mapping file extent is different from Oracle extents.

178.2 DBMS_STORAGE_MAP Operational Notes

Invoking the `MAP_ELEMENT`, `MAP_FILE`, and `MAP_ALL` functions when mapping information already exists will refresh the mapping, if configuration IDs are supported. If configuration IDs are not supported, invoking these functions again will rebuild the mapping.

See Also:

Oracle Database Administrator's Guide for a discussion of the configuration ID, an attribute of the element or file that is changed.

178.3 Summary of DBMS_STORAGE_MAP Subprograms

This table lists the `DBMS_STORAGE_MAP` subprograms and briefly describes them.

Table 178-1 DBMS_STORAGE_MAP Package Subprograms

| Subprogram | Description |
|---------------------------------------|--|
| DROP_ALL Function | Drops all mapping information in the shared memory of the instance |
| DROP_ELEMENT Function | Drops the mapping information for the element defined by <code>elemname</code> |
| DROP_FILE Function | Drops the file mapping information defined by <code>filename</code> |
| LOCK_MAP Procedure | Locks the mapping information in the shared memory of the instance |
| MAP_ALL Function | Builds the entire mapping information for all types of Oracle files (except archive logs), including all directed acyclic graph (DAG) elements |
| MAP_ELEMENT Function | Builds mapping information for the element identified by <code>elemname</code> |
| MAP_FILE Function | Builds mapping information for the file identified by <code>filename</code> |
| MAP_OBJECT Function | Builds the mapping information for the Oracle object identified by the object name, owner, and type |
| RESTORE Function | Loads the entire mapping information from the data dictionary into the shared memory of the instance |
| SAVE Function | Saves information needed to regenerate the entire mapping into the data dictionary |
| UNLOCK_MAP Procedure | Unlocks the mapping information in the shared memory of the instance. |

178.3.1 DROP_ALL Function
